

AT: Big Data D.A- Northwestern

Big Data not Key

Big Data does not solve any impacts.

Tom **Siegfried**, managing editor of Science News, “Why Big Data is bad for science”, **November 2013**, <https://www.sciencenews.org/blog/context/why-big-data-bad-science>

If Star Trek: The Next Generation were to return to TV in the 21st century, Lt. Commander Data’s nickname would be “Big.” “Big Data,” after all, is the biggest buzzword of the new millennium. It’s everywhere, from genomics, biomics and a bunch of other –omics to the NSA’s database on writers who mention NSA in their blogs. Social networks, financial networks, ecological networks all contain vast amounts of data that no longer overwhelm computer hard drive storage capabilities. Scientists are now swimming in a superocean of endless information, fulfilling their wildest dreams of data nirvana. What a nightmare. You see, scientists usually celebrate the availability of a lot of data. Most of them have been extolling all the research opportunities that massive databases offer. But perhaps that’s because everybody isn’t seeing the big data picture. Here and there you can find warnings from some experts that Big Data has its downsides. “Scientific advances are becoming more and more data-driven,” write statistician Jiangqing Fan of Princeton University and colleagues. “The massive amounts of ... data bring both opportunities and new challenges to data analysis.” For one thing, huge datasets are seductive. They invite aggressive analyses with the hope of extracting prizewinning scientific findings. But sometimes Big Data In means Bad Data Out. Wringing intelligent insights from Big Data poses formidable challenges for computer science, statistical inference methods and even the scientific method itself. Computer scientists, of course, have made the accumulation of all this big data possible by developing exceptional computing power and information storage technologies. But collecting data and storing information is not the same as understanding it. Figuring out what Big Data means isn’t the same as interpreting little data, just as understanding flocking behavior in birds doesn’t explain the squawks of a lone seagull. Standard statistical tests and computing procedures for drawing scientific inferences were designed to analyze small samples taken from large populations. But Big Data provides extremely large samples that sometimes include all or most of a population. The magnitude of the task can pose problems for implementing computing processes to do the tests. “Many statistical procedures either have unknown runtimes or runtimes that render the procedure unusable on large-scale data,” writes Michael Jordan of the University of California, Berkeley. “Faced with this situation, gatherers of large-scale data are often forced to turn to ad hoc procedures that ... may have poor or even disastrous statistical properties.” Sounds bad. But it gets worse. Not only do Big Data samples take more time to analyze, they also typically contain lots of different information about every individual that gets sampled — which means, in statistics-speak, they are “high dimensional.” More dimensions raises the risk of finding spurious correlations — apparently important links that are actually just flukes.

Importance of big data is hype; small data is of greater importance.

Mike **Kavis**, Forbes’ Expert on the Cloud Computing Industry, “Forget Big Data- Small Data is Driving the Internet of Things”, **February 25, 2015**, <http://www.forbes.com/sites/mikekavis/2015/02/25/forget-big-data-small-data-is-driving-the-internet-of-things/>

Despite what some may think, big data is not a requirement for all IoT use cases. In many instances, knowing the current state of a handful of attributes is all that is required to trigger a desired event. Are the patient’s blood sugar levels too high? Are the containers in the refrigerated truck at the optimal

temperature? Does the soil have the right mixture of nutrients? Is the valve leaking? Optimizing these business processes can save companies millions of dollars through the analysis of relatively small datasets. Small data knows what a tracked object is doing. If you want to understand why the object is doing that, then big data is what you seek. So, the next time someone tells you they are embarking on an IoT initiative, don't assume that they are also embarking on a big data project.

Alt causes

Talent shortages will restrict growth of the big data sector regardless of the plan

Manyika et al 11 (May 2011. McKinsey Global Institute is a research contracting firm. This project was led by James Manyika, the director of McKinsey Global Institute and a former leader within technology companies where he focused on innovation, growth, and strategy. Michael Chui also assisted in leading the research. Chui is a partner of McKinsey Global Institute where he specializes in research on the impact of information tech and innovation on businesses, the econ, and society. "Big Data: The Next Frontier for Innovation, Competition, and Productivity" McKinsey Global Institute. http://www.mckinsey.com/insights/business_technology/big_data_the_next_frontier_for_innovation//HS)

A significant constraint on realizing value from big data will be a shortage of talent, particularly of people with deep expertise in statistics and machine learning, and the managers and analysts who know how to operate companies by using insights from big data. In the United States, **we expect big data to rapidly become a key determinant of competition across sectors.** But we project that demand for deep analytical positions in a big data world could exceed the supply being produced on current trends by 140,000 to 190,000 positions (Exhibit 4). Furthermore, **this type of talent is difficult to produce, taking years of training** in the case of someone with intrinsic mathematical abilities. **Although our quantitative analysis uses the United States as illustration, we believe that the constraint on this type of talent will be global,** with the caveat that some regions may be able to produce the supply that can fill talent gaps in other regions. **In addition, we project a need for 1.5 million additional managers and analysts in the United States who can ask the right questions and consume the results of the analysis of big data effectively. The United States—and other economies facing similar shortages—cannot fill this gap simply by changing graduate requirements and waiting for people to graduate with more skills or by importing talent** (although these could be important actions to take). **It will be necessary to retrain a significant amount of the talent in place;** fortunately, this level of training does not require years of dedicated study.

IN addition to privacy- hurdles challenge effective use of big data

Manyika et al 11 (May 2011. McKinsey Global Institute is a research contracting firm. This project was led by James Manyika, the director of McKinsey Global Institute and a former leader within technology companies where he focused on innovation, growth, and strategy. Michael Chui also assisted in leading the research. Chui is a partner of McKinsey Global Institute where he specializes in research on the impact of information tech and innovation on businesses, the econ, and society. "Big Data: The Next Frontier for Innovation, Competition, and Productivity" McKinsey Global Institute. http://www.mckinsey.com/insights/business_technology/big_data_the_next_frontier_for_innovation//HS)

Much of the value that big data can create in manufacturing requires the access and varied use of data from multiple sources across an extended enterprise so to fulfill the potential for value creation in this sector will require manufacturing companies to invest in IT as well as to make organizational changes. **The additional IT investment necessary may not be insignificant. Some of the big data levers** that we have discussed, including updating a PLM platform that can link across various IT systems, **will be costly.** Nevertheless, the long-term payoff should outweigh the cost. **Other investments will be required** to develop interfaces and protocols to share data effectively across the extended enterprise. **The standardization of interfaces will be critical and may require industry-wide partnerships to achieve.** Strongly departmentalized companies, with multiple IT systems and overlapping and/or redundant data in different operations and divisions, are clearly at a disadvantage. To obtain the benefits of design-to-value, for instance, a company needs to have a free interchange of data among marketing and sales, R&D, and production. **So, in many organizations, achieving success will require strong leadership and a cultural shift to establish the mind-sets and behaviors to breach today's silos. Many organizations will need to undertake organizational change programs to enforce the necessary shift—** groups that have never shared their data will not start to do so simply because the IT systems are in place. **Many of the levers also**

require access to data from different players in the value chain. To optimize production planning, data from various tiers of suppliers will be necessary. Demand planning will require customer data from retailers. To access such pools of data, manufacturers will need to be thoughtful about establishing the right value propositions and incentives. Many retailers, for instance, guard customer data as proprietary, but there have been instances of successful data sharing. A notable example is the vendor-managed inventory model between some large retailers and consumer packaged goods companies, pioneered on a significant scale by Wal-Mart, as we discussed in our retail case study. Manufacturing companies will also need to build the capabilities needed to manage big data. Despite the fact that the sector has been dealing with large datasets for two decades, the rising volume of data from new sources along the supply chain and from end markets requires a new level of storage and computing power and deep analytical expertise if manufacturers are to harvest relevant information and insights. There is a shortage of talent with the right experience for managing this level of complexity. Manufacturers will need not only to recruit new talent but also to remove organizational obstacles that today prevent such individuals from making maximum contribution. For example, we know of oil refineries that still rely on a manager with spreadsheets to plan equipment maintenance and upgrades—work that can be accomplished more effectively with algorithms using data collected directly from machinery. Finally, where big data applications touch consumers and other end users, there are privacy issues. One of the most promising ideas is using product sensor data to create finely targeted after-sales services or cross-selling. But wielding this lever will be possible only if consumers don't object to suppliers monitoring how they use their products. Manufacturers must therefore address privacy concerns proactively, in collaboration with policy makers, and communicate with end users about choices and data transparency.

A2: Retail module

Multiple alternate barriers to effectiveness- even in the world of the plan they still have to be overcome.

Manyika et al 11 (May 2011. McKinsey Global Institute is a research contracting firm. This project was led by James Manyika, the director of McKinsey Global Institute and a former leader within technology companies where he focused on innovation, growth, and strategy. Michael Chui also assisted in leading the research. Chui is a partner of McKinsey Global Institute where he specializes in research on the impact of information tech and innovation on businesses, the econ, and society. "Big Data: The Next Frontier for Innovation, Competition, and Productivity" McKinsey Global Institute. http://www.mckinsey.com/insights/business_technology/big_data_the_next_frontier_for_innovation//HS)

For their part, **retail executives must manage and overcome multiple barriers to realize the full potential of big data.** The first is the mind-set of employees and firms; **many people still view IT as a back-office function and therefore as a large cost center rather than as an engine for business growth.** In contrast, leading companies in their use of big data understand that their IT initiatives will be a crucial source of competitive advantage. These **companies must make sure that business and IT leaders collaborate closely so** that the use of **big data underpins improvements in efficiency improvement and opportunities for creating value.** Companies should also actively seek out and implement big-data-based innovations that will give them longterm competitive advantages. **Another common obstacle for big data leaders is their legacy IT systems.** many of these systems were installed decades ago, well before today's **big data opportunities were** considered or even possible. **These legacy systems usually include** multiple silos of **information generated in incompatible standards and formats so that they cannot be readily integrated, accessed, and analyzed.** Attempts to upgrade and integrate these systems can be so difficult and plagued with the potential for introducing new system bugs **that one retail expert complained that such an effort was "much worse than starting from scratch."** Even deploying new IT-enabled systems can present tremendous **challenges.** The gap between the predicted scale of adoption of RFID systems and their actual deployment tells a cautionary tale. RFID held the promise of providing a source of supply chain data that could be exploited using big data techniques. In the early days, RFID reader reliability was far worse than originally expected, necessitating manual inputs to correct for reader errors. This destroyed the productivity gains expected from deploying this technology. Adoption slowed, RFID tags were in lower demand, and per-tag costs did not decline as quickly as anticipated, as economies of scale were muted. Higher tag prices hurt the business case for further RFID deployment, reinforcing a negative cycle in which the application of big data levers based on this technology has been delayed. **Potentially as daunting for retail executives is the task of finding the talent that can execute big data levers.** Globally, **executives complain about the scarcity of highquality candidates for these jobs, and many retailers do not have sufficient talent in-house.** Moreover, **existing analytical and technical talent tends to be managed inefficiently,** isolated in particular departments, or scattered in different business units. **People with the requisite skills are rarely directly involved in strategic decision making and have little impact beyond answering highly specific questions.** Retailers with the foresight and intelligence to hire big data talent in sufficient numbers and then involve these hires in strategic decisions and planning will take the fullest advantage of value-creation opportunities at the expense of their less nimble competitors.

A2: Manufacturing module

The manufacturing sector is suffering in the squo

Robb 6/15/15 (Greg Robb is a Senior Economics Reporter for Market Watch. "U.S. manufacturing sector said to be in a technical recession" Market Watch <http://www.marketwatch.com/story/us-manufacturing-sector-said-to-be-technical-recession-2015-06-15> //HS)

WASHINGTON (MarketWatch) — **The U.S. factory sector, ailing from the strong dollar, global weakness and lower oil prices, has slipped into a technical recession**, new data released Monday show. The Federal Reserve said Monday that **industrial production dropped unexpectedly in May and hasn't increased since November**. **The six-month drop in output**, adjusted for inflation, **puts the sector in a technical recession**, said Alan Tonelson, a former economist for a manufacturing trade group who now writes commentary on the sector. **Industrial output sank 0.2% in May**. **Economists** polled by MarketWatch had **expected a 0.2% gain**. Compared to 12 months ago, industrial production was up 1.4% — compared to 4.8% growth was recently as November. Stocks were sharply lower after the data were released. The S&P 500 index SPX, -0.39% was down 19 points or almost 1% to 2,075. **The U.S. economy is still fighting headwinds from lower oil prices and the stronger dollar**, said Jennifer Lee, senior economist at BMO Capital Markets. Those **headwinds will likely be highlighted by the Fed as policymakers meet Tuesday and Wednesday to set monetary policy for the next six weeks**. No rate hike is expected at the meeting and the U.S. central bankers wait for signs the economy is strong enough to handle higher interest rates. See also: Fed meeting should leave a Final Four of dates for rate hike Beneath the headlines, manufacturing output was down 0.2% in May after a 0.1% gain in April. Auto production has been one bright spot, rising 1.7%. **Excluding autos, manufacturing was down 0.3%. Mining output declined 0.3% last month, after declining more than 1% on average over the past four months**. The slower rate of decrease was in part due to a reduce pace of decline in the index for oil and gas well drilling, the Fed said. **The data is "soft and unlikely to recovery anytime soon,"** said Ian Shepherdson, chief economist at Pantheon Macroeconomics. **The Empire State manufacturing survey**, an early read on conditions in June, was **also released Monday and added to the sense of weakness**. **The Empire State factory index decreased five points to a reading of negative 2.0 in June**, the Federal Reserve Bank of New York said. Economists polled by MarketWatch had expected a reading of 5.7. This is the second negative reading in the past three months for the index. And the executives had a sour view of future business conditions. **The six-month outlook index worsened to 25.8 in June from 29.8 in May. This is the lowest level since January 2013.**

A2: Aerospace

Aerospace industry does not meet expectations- productions low.

Lisa **Terry**, Airframe Material Planner, "Aerospace Logistics: Building for Growth", January **2014**, <http://www.inboundlogistics.com/cms/article/aerospace-logistics-building-for-growth/>

The world has an insatiable appetite for air travel, which is creating massive demand for new planes.

Airbus' latest Global Market Forecast predicts the need for more than 29,220 new freighter and passenger aircraft, and estimates the world's overall passenger aircraft inventory will double from 17,739 in 2013 to more than 36,500 by 2032. **"It's a paradox: The airline industry is suffering, but there have never been so many orders for new aircraft,"** says Joël Glusman, president and CEO of The Aerospace Logistics Alliance (TALA), a Miami-based cooperative that provides supply chain management, freight forwarding, and customs clearance services to aerospace companies. **This backlog, particularly from Middle East buyers, is putting pressure on the aerospace industry to produce planes more quickly, efficiently, and profitably. Aircraft manufacturers are challenged to make lighter aircraft with lower fuel consumption, using materials sourced from a geographically diverse supplier base. Technical challenges are also delaying some production timetables, causing a ripple effect through a carefully planned schedule of costly incoming parts timed to keep inventories low.** A related demand is to keep the planes flying—servicing and managing replacement parts across an increasingly global footprint. Those pressures are elevating supply chain management to an unprecedented status within aerospace organizations, which have historically emphasized research and development, and manufacturing. They're also prompting aerospace companies to hire third-party logistics (3PL) providers to manage inbound materials movement, production, maintenance, repair, and overhaul operations. **"The aerospace supply chain is five years behind the automotive and high-tech industries,"** notes Erik Goedhart, senior vice president, aerospace for Kuehne+Nagel, a global supply chain solutions provider.

Aerospace industry plummet is happening now- Washington proves

Steve **Wilhelm**, Staff Writer for Puget Sound Business Journal, "Washington state plummets in 'aerospace attractiveness' study. Experts dubious", **April 29, 2015**, <http://www.bizjournals.com/seattle/news/2015/04/29/washington-state-plummets-in-aerospace.html>

if it wasn't for Boeing (NYSE: BA), **Washington state might have no aerospace at all.** That's a conclusion one could draw from a just-released PricewaterhouseCoopers (PWC) report, entitled "2015 Aerospace Manufacturing Attractiveness Rankings." **The drop certainly isn't good for a state that is urgently trying to attract other aerospace companies so it can be less dependent on Boeing.** Currently Boeing accounts for approximately 86 percent of the 93,300 aerospace workers in Washington. But from viewpoint of those recruiting new aerospace companies, the study misses the gravitational pull of Boeing. "I think there's plenty of evidence the aerospace companies are growing, expanding and new ones are locating here in Washington," said Alex Pietsch director of the state office of aerospace. The study, Pietsch said, fails to take into account Boeing's importance in attracting aerospace companies to the region. Part of the reason for the drop is that **the new PWC report created a new ranking based on the "effective" tax rate for each state, which includes aerospace tax incentives. In that category Washington fell just below the median, 28th among the 50 states.**

Aerospace sector is strong

Murray 15 [Seb Murray

Editor at BusinessBecause. EU newspaper. Sunday 28th June 2015. "Aerospace MBA Programs Take Flight As Sector Faces Skills Crunch" <http://www.businessbecause.com/news/mba-careers/3337/aerospace-mba-programs-take-flight//jweideman>]

The global aerospace industry is set for take-off. A boom in aviation, the introduction of increasingly fuel efficient aircraft, and a falling oil price have combined to set the scene for years of growth for the aviation business. The world's biggest aircraft manufacturers have record orders. The International Air Transport Association projects airlines to generate the strongest profit margins since the mid-1960s. And, meanwhile, the Space Foundation says the world's space economy is growing at 10% a year. "For the airline business, 2015 is turning out to be a positive year," says Tony Tyler, chief executive officer at IATA. "Since the tragic events of September 2001, the global airline industry has transformed itself with major gains in efficiency." The strength of the aerospace sector has spurred a significant increase in career opportunities. Dr Christophe Bénaroya, director of the Aerospace MBA at France's Toulouse Business School, says the recruitment market has been buoyant over the past two decades. The rapid growth of new markets such as China, India and the Middle East are shaping and driving the aerospace industry. Growth is also spurred by changes in technology, manufacturing and new consumer expectations.

Growth set for dramatic recover, and its resilient—best methodology

FAA 14 [Federal aviation association. 2014. "FAA Aerospace Forecast Fiscal Years 2014-2034" https://www.faa.gov/about/office_org/headquarters_offices/apl/aviation_forecasts/aerospace_forecasts/2014-2034/media/2014_FAA_Aerospace_Forecast.pdf//jweideman]

Developing forecasts of aviation demand and activity levels continues to be challenging as the aviation industry evolves and prior relationships change. In times of amplified volatility, the process is filled with uncertainty, particularly in the short-term. Once again, the U.S. aviation industry has shown that the demand for air travel is resilient as it rebounds from its most recent downward spiral caused by the Great Recession. As 2014 begins, lingering questions remain. Are the U.S. and global economies on firm ground? Have the structural changes undertaken by the industry over the past 5 years revamped the industry from one of boom-to-bust to one of sustainable profits? Has industry consolidation finished? The FAA has developed a set of assumptions and forecasts consistent with the emerging trends and structural changes currently taking place within the aviation industry. The intent of these forecasts is to accurately predict future demand; however, due to the large uncertainty of the operating environment, the variance around the forecasts is wider than it was in prior years. The commercial aviation forecasts and assumptions are developed from econometric models that explain and incorporate emerging trends for the different segments of the industry. In addition, the commercial aviation forecasts are considered unconstrained in that they assume there will be sufficient infrastructure to handle the projected levels of activity. These forecasts do not assume further contractions of the industry through bankruptcy, consolidation, or liquidation. They also do not assume any drastic changes in federal government operations. The commercial aviation forecast methodology is a blended one. The starting point for developing the commercial aviation forecasts (air carriers and regionals) is the future schedules published by airlines through Innovata. To generate the short-term forecast (i.e., one year out) current monthly trends are used in conjunction with published monthly schedules to allow FAA forecasters to develop monthly capacity and demand forecasts for both mainline and regional carriers for fiscal and calendar years 2014-15. The medium to long-term forecasts (2015-2034) are based on the results of econometric models. The general aviation forecasts rely heavily on discussions with industry experts conducted at industry meetings, including four Transportation Research Board (TRB) meetings of Business Aviation and Civil Helicopter Subcommittees in May 2013 and January 2014 along with the results of the 2012 General Aviation and Part 135 Activity Survey. The assumptions have been updated by FAA analysts to reflect more recent data and developing trends, as well as further information from industry experts. The FAA also presents the draft forecasts and assumptions to industry staff and aviation associations, who are asked to comment on the reasonableness of the assumptions and forecasts. Their comments and/or suggestions have been incorporated into the forecasts as appropriate. FAA Aerospace Forecast Fiscal Years 2014-2034 35 ECONOMIC FORECASTS For this year's Aerospace Forecast, the FAA is using economic forecasts

developed by IHS Global Insight, Inc. to project domestic aviation demand. Furthermore, **the FAA** uses world and individual country economic projections provided by IHS Global Insight, Inc. to forecast the demand for international aviation services. Annual historical data and economic forecasts are presented in Tables 1 through 4. U.S. economic forecasts are presented on a U.S. government fiscal year (October through September) basis, whereas international forecasts are presented on a calendar year basis. As the recovery is now approaching its fifth year, the headwinds that have been faced by the economy appear to be diminishing. IHS **Global Insight expects the recovery to begin to accelerate and the U.S. economy to grow faster than in the past few years.** In the U.S., private sector debt levels have been coming down and public sector debt levels have stabilized. The housing market had its best performance since 2007 despite a rise in mortgage rates in the summer of 2013. The most recent data suggest a firming of the employment market. In the global economy, the outlook for Europe is improving and recent data from China still points to a "soft" landing (e.g. GDP growth remaining above 7 percent).

Increasing

Herb 14 [Jeremy, Staff writer for The Hill. 01/02/14. "Study predicts 5 percent defense and aerospace growth" <http://thehill.com/policy/defense/194286-study-predicts-5-percent-defense-and-aerospace-growth/>]

But **the overall defense and aerospace industry will still grow** in 2014, **thanks to boosted revenue** in the aerospace sector. "It is likely that **2014 will bring high single to double-digit levels of growth in the commercial aerospace sub-sector,** as experienced in 2012 and expected in 2013, **given the dramatic production forecasts of the aircraft manufacturers,"** Deloitte says. **The 2014 growth in the commercial aerospace industry is being driven by record-setting production levels,** due to the accelerated replacement cycle of obsolete aircraft with newer fuel-efficient planes. The report predicts that by 2023, annual production levels in the commercial aerospace industry will increase by 25 percent. The Deloitte report also cites increases in passenger demand in places like the Middle East and the Asia-Pacific region. For the defense industry, the end of the conflicts in Iraq and Afghanistan has driven defense budgets lower. The report says that defense spending is increasing in several areas — the Middle East, China, India, Russia, South Korea, Brazil and Japan — but that isn't counteracting declines elsewhere. **The U.S. defense budget has a major impact on the global trends, as the United States accounts for 39 percent of global defense spending.** The Pentagon had \$37 billion cut from its 2013 budget under sequestration. While the budget deal reached last month provided the Pentagon with \$31 billion in sequester relief over the next two years, the new Defense budget cap is still \$30 billion lower than the Pentagon's proposed 2014 budget.

Airpower high in the squo

Mizokami 14 [Kyle Mizokami writes on defense and security issues in Asia, particularly Japan. He is the founder and editor for the blogs Japan Security Watch, Asia Security for the United States Naval Institute. 12/9/14, "Top Guns: The Most Lethal Air Forces on the Planet" <http://nationalinterest.org/feature/top-guns-the-most-lethal-air-forces-the-planet-11814/>]

The U.S. Air Force The preeminent air arm of the United States, the U.S. Air Force (USAF), **is the primary service responsible for air and space missions. It manages everything from intercontinental ballistic missiles to X-37 space planes to A-10 Thunderbolt tank killers.** It coordinates military space launches, airdrops of Army paratroopers and drops bombs on ISIS insurgents. **The USAF operates 5,600 aircraft of all types, including F-22 Raptors, F-35, F-15 and F-16 fighters. It operates B-2, B-1 and B-52 strategic bombers, as well as C-5, C-17 and C-130 airlifters.** It operates these aircraft from bases **in the continental United States and overseas bases** from the United Kingdom to Japan. **The Air Force has roughly 312,000 active-duty members,** coming in just behind the People's Liberation Army Air Force, **and yet it operates more planes than the PLAAF. The USAF was the first air force worldwide to fly stealth combat aircraft, the first to fly fifth-generation fighters** and the first to commit to an all-stealth combat aircraft force. **The USAF plans on preserving its edge by purchasing 1,763 F-35s and up to 100 optionally manned Long-Range Strike Bombers.** Unmanned aerial vehicles, increasingly with stealthy profiles and attack capabilities, will gradually represent a larger proportion of the overall aircraft fleet. **The USAF**

also manages two legs of the U.S. nuclear triad, including 450 intercontinental ballistic missiles and the strategic bomber force. The U.S. Navy and Marine Corps worthy of separate mention due to their size and capabilities, the U.S. Navy and Marine Corps are combined the world's second-largest air force, with a total of over 3,700 aircraft of all types. This includes 1,159 fighters, 133 attack aircraft, 172 patrol aircraft, 247 transports and 1,231 helicopters. The aircraft of the U.S. Navy are responsible for protecting the U.S. fleet and conducting air missions from and often over the world's oceans and seas. Most of the aircraft of the Navy and Marine Corps operate from ships at sea, a difficult and dangerous job that requires a high level of training and proficiency. The most visible aspect of U.S. naval aviation are the carrier air wings that fly off eleven nuclear-powered aircraft carriers. Each wing typically consists of around sixty aircraft divided into three squadrons of F/A-18 Hornets and Super Hornets, one E-2C Hawkeye airborne early-warning squadron, one EA-18G Growler electronic warfare squadron, and one helicopter squadron. Other aspects of naval aviation include the helicopters that fly off U.S. Navy cruisers, destroyers and other surface ships, P-3 Orion and P-8 Poseidon maritime control aircraft, and variants of the P-3 that conduct electronic surveillance missions. US navy aviation also contributes to the U.S. strategic nuclear force, flying TACAMO (Take Charge And Move Out) aircraft whose mission is to provide command and control in the event of a nuclear war. U.S. Marine Corps aircraft are counted under the Navy total and serve on Navy ships, but are oriented towards Marine combined air-ground operations, with an emphasis on supporting marine ground forces.

They're updating tech-- New funding and contracts overwhelm their internal link

McCaney 15 [Kevin, founder of defense systems blog. Managing editor at Government Computer news. 1/27/15, "Air Force adds funds for developing better GPS equipment" <http://defensesystems.com/articles/2015/01/27/air-force-rockwell-mgue-m-code-gps-recdeivers.aspx//jweideman>]

The Air Force has awarded another contract in its effort to accelerate development of new, more powerful GPS receivers and meet congressional demands to get them into the hands of service members sooner rather than later. The service's Space and Missile Systems Center at Los Angeles Air Force Base has awarded Rockwell Collins a \$21.8 million contract modification to support the Military GPS User Equipment, or MGUE, program, a joint military program to develop M-Code-capable GPS receivers capable of functioning when conventional receivers are disrupted or offline. Earlier this month, the Air Force also awarded an \$8.3 contract modification to L-3 Communications to speed up work on the same program. M-Code, which stands for Military Code, is a fairly new, high-powered GPS signal designed to resist jamming and other interference, and ensure the transmission of accurate military signals. It features enhanced security, messaging formats and frequency modulation techniques, and operates in a part of the spectrum separate from civil signals. Its development began in the late 1990s after concerns were raised about the potential for blocking existing GPS signals. M-Code's design was completed in 2001 and the first M-Code signal was broadcast from a GPS Block II satellite launched in September 2005. The MGUE program has since been working on developing the M-Code receivers—and one reason for the recent moves to accelerate the program is that Congress, concerned that development was too slow, mandated that the military buy only M-Code-capable equipment by fiscal 2018. As with L-3 Communication, Rockwell Collins' next phase of the project will focus on adding pre-prototype receiver cards and conducting test support activities, with the goal of fielding M-Code receivers to the U.S. military services and NATO troops more quickly. Work on this phase is expected to be completed by the end of September 2016.

It's the best in the world

CFR 15 [This is the transcript of an interview. Speaker: Deborah Lee James Secretary, U.S. Department of the Air Force. Presider: Thomas G. Mahnken Professor and Director of Advanced Strategy, Paul H. Nitze School of Advanced International Studies, Johns Hopkins University. 3/24/15 "Charting a Future for U.S. Air Power" <http://www.cfr.org/defense-and-security/charting-future-us-air-power/p36292//jweideman>]

Tonight, with your permission what I would like to do is talk a little bit about what it means to have the best Air Force on the planet. And as far as I'm concerned, despite all the stresses and strains, and I'm going to talk to you about some of those, we are

the best Air Force on the planet. I also want to talk about how I think this affects our foreign policy, what our responsibilities are as a nation, and what some of all this means for the future. But before I get to all of the future, let's talk about where we are right now today. It was just a little bit more than a year ago, and really not all that long after I took office as secretary of the Air Force that we in the Air Force were looking toward making what we were predicting to be a rather orderly transition of our mission in Afghanistan away from combat operations and toward train, advise and assist role. In other words, we had expected and planned to have a period where a lot of those forces could come back to the United States or back to home base. It was going to be a time where we were able to regroup and reset and retrain. What we didn't expect at that time, but in fact what we got, was a series of three events. And those three events happened in relatively rapid secession. And those three things combined placed significant additional and new demands on our Air Force that we simply didn't foresee. So in other words that regroup and reset and retrain strategy that went straight out of the window. First, in February of last year, the world watched as Russian forces took military action in the Eastern Ukraine. And then in June, this outfit called ISIL or ISIS or Daesh or whatever we happen to be calling them on any given day that most Americans had never even heard of at that time. This group started a calculated offensive to take ground and to terrorize ethnic populations in northeast Syria and Iraq. And then the third event happened in August of last year when the CDC warned the world that we might just have an Ebola pandemic on our hands if somebody didn't step up and take charge and take action. And as a result of all of this, the president ordered the Air Force essentially to help in quite a big way in all three of these areas. And the United States Air Force stepped up big time to do so. For instance, it took just 14 hours for the first F-15 to show up in Lithuania in response to the Crimean crisis, which of course was part of what is an ongoing effort to reassure our allies in the Baltic region that we stand firmly with them and that we stand firmly with NATO. And then it was of course U.S. airmen who ultimately broke the siege of Mount Sinjar, began with air jobs. There were also airstrikes involved. And ultimately about 20,000 Yazidis, who otherwise were stranded and surrounded and starving, were able to make their way to be—to get off of that mountain to relative safety. And of course the Air Force has been carrying out the majority of the fight against ISIS ever since. And then there was the example of the Kentucky Air National Guard's 123rd Contingency Response Group, deployed to Dakar, Senegal in support of Operation Unified Assistance. Their airbase-in-a-box arrived on a C-17 with more than 70 airmen who helped funnel humanitarian supplies and equipment into West Africa to help fight Ebola. Now, if you notice, all of these examples demonstrate how the Air Force is really a very, very quick response force for our nation.

A2: Science

Big Data is one of countless tools resulting in scientific discovery; causality misconstrues the relationship.

Marcus, et al., Professor of Cognitive Science at NYU, "Eight (No, Nine!) Problems With Big Data", **April 6, 2014**, http://www.nytimes.com/2014/04/07/opinion/eight-no-nine-problems-with-big-data.html?_r=0

Second, big data can work well as an adjunct to scientific inquiry but rarely succeeds as a wholesale replacement. Molecular biologists, for example, would very much like to be able to infer the three-dimensional structure of proteins from their underlying DNA sequence, and scientists working on the problem use big data as one tool among many. But no scientist thinks you can solve this problem by crunching data alone, no matter how powerful the statistical analysis; you will always need to start with an analysis that relies on an understanding of physics and biochemistry.

No matter what happens, consumers will still consent for their data to be collected

Webb 13 (January 11, 2013. Jenn Webb is the Managing Editor of O'Reilly Radar and writes about Data and other emerging tech areas. "Strata Week: The complexities of forecasting the big data market" *O'Reilly Radar*. <http://radar.oreilly.com/2013/01/market-forecast-fisa-big-data-daily-life.html> //HS)

While **big data is spurring major change for organizations and research groups worldwide, it's also effecting change on a much more personal level**, argues Niall Harbison at The Next Web. "**We're witnessing the emergence of the 'self tracking' phenomenon**," he writes, "being led by the likes of the Quantified Self group, **a movement which promotes learning more about yourself through smart tracking and analysing personal data.**" Harbison looks at some emerging technologies that are affecting our daily lives, including apps such as Nike Run Plus and Mood Panda that inform self-analysis, tools like OPower and Mint that help users save money, and data tracking app Onavo Count that can warn you if you approach your smartphone data limit and even make recommendations for data plan adjustments based on your usage. Harbison also delves a bit into the Internet of Things, looking at such innovations as SleepShirt smart pajamas and the Pebble watch. In similar vein, Siddharth Taparia, SAP's senior director of portfolio and strategic marketing, writes at Forbes that "**2013 may be a year when Big Data moves from the technical to the practical, as real consumers and citizens start seeing its impact.**" He outlines five areas that will experience big changes, including how and where we spend money, how we vote, how we study and how we stay healthy. Taparia also addresses data privacy, **noting that regardless of expressed concerns over the collection, analysis and sale of personal data, consumers continue to willingly share their information.** Taparia warns that **in addition to trusted government agencies or companies looking to trade a deal or discount for information, big data "also attracts hackers and identity thieves," and notes that "[s]avvy consumers will understand how and where to best share their data, and what they get in return."**

Europe proves- big data can be balanced with privacy concerns

Einav and Levin 2014 (Liran Einav is a professor of economics at Stanford and a writer for the National Bureau of Economics. Jonathan Levin is Professor of economics at Stanford and a writer for the National Bureau of Economics. "The Data Revolution and Economic Analysis" National Bureau of Economics. <http://web.stanford.edu/~jlevin/Papers/BigData.pdf> //HS)

This card is saying (I think) we need more government access to the data it collects and maybe more data? Also there are barriers we can brush off and look it if we wanted to cause Norway and co did it.

Several challenges confront economists wishing to take advantage of large, new data sets. These include gaining access to data, developing the data management and programming capabilities needed to work with large-scale data sets, and finally (and most importantly!) thinking of creative approaches to summarize, describe, and analyze the information contained in these data. Einav and Levin Data access. **Research on topics such as labor economics, productivity, and household consumption traditionally have relied on government survey data** such as the US Census, the Panel Study of Income Dynamics (PSID), and the National Longitudinal Survey of Youth (NLSY). **For many of these data, there are well-established protocols for accessing and making use of the data. In some cases,** such as the US Census Data Research Centers, **these protocols are cumbersome and probably discourage a fair number of researchers, but at least they reflect a conscious effort to trade off between research access and confidentiality concerns. These systems are still being worked out for the large-scale administrative data that recently has been used for economic research** from the IRS, Medicare, or Social Security Administration. The privacy issues associated with the increased amount of data are important, and have been already discussed in this publication just a year ago (Goldfarb and Tucker 2012). But as Card et al. (2010) point out, **many European countries, such as Norway, Sweden, and Denmark, have gone much farther to facilitate research. the experience in these countries suggests that broader access is possible, and that reducing barriers to data access can have a profound effect on the amount of research and the quality of what is learned.**

Privacy constraints on government usage of data now

Einav and Levin 2014 (Liran Einav is a professor of economics at Stanford and a writer for the National Bureau of Economics. Jonathan Levin is Professor of economics at Stanford and a writer for the National Bureau of Economics. "The Data Revolution and Economic Analysis" National Bureau of Economics. <http://web.stanford.edu/~jlevin/Papers/BigData.pdf> //HS)

The most exciting private sector application of big data that we discussed above was using predictive modeling to automate business processes, or to improve or develop new products or services. While some 12 Einav and Levin government agencies probably are engaging in this type of activity, we are not aware of very many salient examples. However, it is easy to think of many examples where government data sets might be used to create the types of information products that are commonly seen in the private sector. One area of government activity where we could imagine such products is consumer protection. The key challenge in consumer protection is to keep individuals from making decisions they will (predictably) come to regret without proscribing individual choice. Behavioral economics has emphasized that one way to strike this balance is through the framing of decisions (e.g., well-chosen defaults), and another way is through the careful presentation of information. For instance, people can end up making major financial decisions—buying a house, saving for retirement, planning health care spending—without good information about the financial consequences. The types of predictive models discussed above are particularly good for creating personalized summary information. How many consumers who take this type of loan with this type of financial situation ultimately default? What is the range of fees paid by a similar consumer for a particular financial product or service? What is the eventual cost for patients who choose this line of medical treatment? While the government might not be the right entity to create these tools, the information it collects surely would be a useful input. A far more controversial idea would be to use predictive modeling to improve the targeting of government services. For instance, it is possible to imagine a utilitarian argument that Medicare should score individuals based on their likely response to a treatment and cover the treatment only if the score exceeded a particular level. Similarly, a tax rebate program that aimed to provide economic "stimulus" might be most effective if it were targeted specifically to those households who were predicted to have a particularly high marginal propensity to consume. These examples are useful because they correspond roughly to the sorts of things that private sector companies are now doing all the time—targeting discounts or rebates to particular consumers, or approving individuals for insurance or credit only if they meet certain scoring criteria. Of course, we tolerate this in the private sector, but many people's reaction to parallel approaches taken by the government would be horror. In this sense, it seems clear that there are constraints on the way that the government can target services that probably would rule out a range of "private sector-like" uses of predictive modeling.

FISA/SSRA

makes the argument about spillover from government affirmation of privacy rights

The constitution prohibits the collection of big data- the plan affirms that

Kosner 13 (Jul. 7, 2013. Anthony Wing Kosner is a contributor to Forbes who specializes in design and web editing, especially where technology meets the content business. "NSA's Verizon Spying Order: Fourth Amendment And Big Data On A Collision Course" *Forbes* <http://www.forbes.com/sites/anthonykosner/2013/06/07/nsas-verizon-spying-order-fourth-amendment-and-big-data-on-a-collision-course//HS>)

Beyond the scandal of why the NSA is keeping track of the telephone habits of Americans, is the larger question of what telephony big data can show—and whether the U.S. government has any business collecting it on a mass scale. The report today by The Guardian about the secret court order that commanded Verizon to release “telephone metadata” about all of its domestic business customers during a three month period last year, shows just how much of a privacy panopticon the efforts to protect national security have become. The panopticon is a prison design (see illustration above) whereby the architecture allows a small number of guards to monitor a large number of prisoners. (We didn't think we were the prisoners!) Why does this matter? Because the very concept of big data is in conflict with the Fourth Amendment protection against “general warrants.” When asked about the idea of the government as a “big data operation,” Hanni Fakhoury, staff attorney for the Electronic Frontier Foundation, responded that the “Fourth Amendment (and statutes like ECPA and FISA) are designed to eliminate this broad evidence gathering altogether.” And this indiscriminate data dump is of a piece with the Supreme Court-approved DNA data swab that can now be administered during any routine arrest. The dissenting Justice Scalia quipped that, “the founding fathers would hardly have been so eager to open their mouths for royal inspection.” This is a classic case of why scale and quantity matter. The government's case is that a phone call is like a letter you put in the mail. Your address, the sender's and the size (and weight!) of the envelope are public knowledge, but the contents of the letter are private and secure. How is it different with a phone call? The metadata about your call (exclusive of what was actually said) can include your number, the number you called and the unique serial numbers of those phones—all of which can be traced directly to individual people. Further, in the age of mobile phones, the precise locations of the callers and the duration of the call is also recorded. This problem was discussed in terms of GPS data by an Appellate court in the U.S. v. Maynard case, “A person who knows all of another's travels can deduce whether he is a weekly churchgoer, a heavy drinker, a regular at the gym, an unfaithful husband, an outpatient receiving medical treatment, an associate of particular individuals or political groups,... and not just one such fact about a person, but all such facts.” James Ball BLL -0.49%, of The Guardian provides a good discussion about what this kind of data can indeed show. The founding fathers would not have been so eager to have their dalliances recorded either! The fact is, that the U.S. government is prevented by law from becoming just such a big data operation, but so it has become! Purely in terms of data, it might seem more problematic to ask Verizon to cherry pick through their data rather than just turn all of it over, because that would put a private company in the position of knowing specific things about specific customers. It would also put Verizon in possession of knowledge of what, specifically, the government is interested in investigating. But, Fakhoury reminds me, “the law requires the government to do the cherry picking before going to a company like Verizon to get the records. Warrants and non-warrant orders, including FISA orders, have to be particularized and narrow and this order is anything but that.”

Big Data collection is too dangerous and vulnerable to theft to continue being collected- aff solves privacy

EFF 14 (Apr. 8, 2014. EFF is the Electronic Frontier Foundation. It is a non profit dedicated to defending civil liberties in the digital sphere. "Big Data in Private Sector and Public Sector Surveillance" EFF <https://www.eff.org/files/2014/04/08/eff-big-data-comments.pdf> //HS)

The collection and analysis of big data, which was a niche field within computer science just two decades ago, has exploded into a \$100 billion industry. ⁴ Big data is now used in sectors as diverse as energy, medicine, advertising, and telecommunications. Because of the explosive growth of this field, companies ranging from startups in Silicon Valley to established multi-national corporations are adopting the mantra of "collect it all," in the belief that running a variety of analytics on big data will increase the value of their products or the companies themselves. In many cases companies outsource the use of big data to intermediary entities known as data brokers, which collect, analyze, and sell consumer information that can include highly personal details like marital status, religion, political affiliation, tax status, and others. A website may have an agreement with a data broker to better identify who their customers are so they can place more effective ads – often in exchange for their customers' browsing habits and demographic information. Data brokers receive and aggregate consumer data from a variety of sources: transactional data from retailers and stores, loyalty cards, direct responses and surveys, social media and website interactions, public records, and more. ⁵ They then aggregate this information across sources and use it to create highly detailed profiles about individuals – ^{one} ⁴ "Data, data everywhere." The Economist, Feb. 25, 2010. <https://web.archive.org/web/20131207192955/http://www.economist.com/node/15557443>. Last accessed March 28, 2014. ⁵ See Dixon, Pam. "What Information Do Data Brokers Have on Consumers?" World Privacy Forum, December 18, 2013. Last accessed March 30, 2014. particular data broker is said to have 1,500 data points on over 700 million individuals. ⁶ It's been revealed that these highly detailed profiles include names like "Ethnic Second - City Strugglers," "Rural and Barely Making It," and "Credit Crunched: City Families," as well as sensitive lists such as police officers and their home addresses; lists of rape victims; genetic disease sufferers; and Hispanic payday loan responders. ⁷ The vast majority of information data brokers use to create these lists is data which consumers unintentionally expose in large part because they simply do not know how or when they are being tracked, or what information is being collected. As a result the information is almost perfectly asymmetric: brokers know a great deal about consumers, but most consumers have no idea these parties actually even exist. This asymmetry is related to the first harm consumers are exposed to as a result of private - sector big data usage, namely the significant power imbalance between consumers and the companies wielding the data and analysis tools. For example, if a company uses big data analysis to inform its hiring decisions (say by analyzing a database on the web browsing habits of potential employees acquired from a data broker), would a rejected prospective employee learn why she was not offered a job, be able to see the data that led to the decision or the algorithm that processed the data, or dispute the correctness of either? ⁸ In general, the fact that people may be treated differently based on data and algorithms that they know little about and have no recourse for correcting creates elementary fairness and transparency problems. ⁹ A related problem results from the fact that even if consumers are aware of what data they are providing about themselves and who they are providing it to, they frequently believe wrongly that the law or a company's privacy policies block certain uses of that data or its dissemination. As explained by Chris Hoofnagle and Jennifer King in their study of Californians' perceptions of online privacy: ⁶ See Brill, Julie. "Demanding transparency from data brokers." The Washington Post, August 15, 2013. http://www.washingtonpost.com/opinions/demanding-transparency-from-data-brokers/2013/08/15/00609680-0382-11e3-9259-e2aaf5a5f84_story.html. Last accessed March 30, 2014. ⁷ See Dixon, Pam. "What Information Do Data Brokers Have on Consumers?" World Privacy Forum, December 18, 2013. Last accessed March 30, 2014. ⁸ One could argue that it would be in a company's best interests to use data that is as accurate as possible. However, a company's ultimate goal is to be as profitable as possible, and big data analysis is only carried out to further that goal. No rational company would acquire better quality data when the cost of doing so would be greater than the estimated returns. This exposes the fundamental mismatch in incentives between companies (whose big data will only be as accurate as profitability dictates) and individuals

(who primarily care about whether the data about they themselves is accurate). Even a competitive market might not be able to completely resolve this issue, since making sure all the data is accurate 100% of the time will likely require human-intensive, and therefore costly, dispute/redress processes. 9 Dwork and Mulligan, "It's Not Privacy, and It's Not Fair," 66 STAN. L. REV. ONLINE 35 (2013). Californians who shop online believe that privacy policies prohibit third-party information sharing. A majority of Californians believes that privacy policies create the right to require a website to delete personal information upon request, a general right to sue for damages, a right to be informed of security breaches, a right to assistance if identity theft occurs, and a right to access and correct data. 10 Additionally, users may not know to what extent data is shared with unknown third-parties: an online project called "theDataMap" reflects this data-sharing landscape. 11 But even a good understanding of the legal and policy protections for data is insufficient to protect a consumer from harm, due in large part to the next danger: loss of privacy due to individualized analysis and tracking by private-sector use of big data. By "connecting the dots" between different, disparate datasets, or even by analyzing data from the same dataset that on its face does not seem to have any connection, companies can infer characteristics about people that they might not otherwise wish to be made public, or at least not wish to share with certain third-parties (for example, the well-known Target pregnancy example). Very few consumers realize the power of statistical analysis and other big data algorithms. Even if consumers are aware of what specific data they are sharing, they may not understand what inferences could be made based on that data. The risk of abuse of the underlying datasets remains. As the recent hack on Target's credit card systems demonstrates, even large, well-financed companies can suffer from massive data breaches that put consumers' data in the hands of a malicious third-party. 12 This danger is especially grave when companies collect and save all data possible, regardless of its current value, with the idea that a profitable use might later emerge. Unfortunately, the collection of data into more concentrated repositories creates a tempting target for malicious agents. Additionally, EFF has long been concerned that private-sector mass data accumulation strongly facilitates government data accumulation given the many ways that companies can be induced or compelled to provide data to the government. Finally, even if the above dangers are avoided, we emphasize that many "common sense" approaches to preserving privacy and anonymity in big data do not actually accomplish their goals. Malicious actors could use a variety of sophisticated statistical and information-theoretic 10 Hoofnagle, Chris Jay and King, Jennifer, "What Californians Understand about Privacy Online." (September 3, 2008). Available at SSRN: <http://ssrn.com/abstract=1262130> or <http://dx.doi.org/10.2139/ssrn.1262130> 11 See <http://thedatamap.org/> 12 Elgin, Ben; Lawrence, Dune; Matlack, Carol; Riley, Michael. "Missed Alarms and 40 Million Stolen Credit Card Numbers: How Target Blew It." Bloomberg BusinessWeek, March 13, 2014. <https://web.archive.org/web/20140313132757/http://www.businessweek.com/articles/2014-03-13/target-missed-alarms-in-epic-hack-of-credit-card-data>. Last accessed March 29, 2014. algorithms to extract identifiable data from what appears to be an anonymized dataset. 13 This is especially true if the malicious agent has access to individual datasets that might not pose a privacy risk on their own, but when combined together can be used to infer private information.

Researchers who claim Big Data has huge positive impacts are connecting meaningless data- big data is a potential threat

John Phillips, Digital Editor with CNBC.com, "Why analyzing Big Data can be bad for business", June 4, 2014, <http://www.cnbc.com/id/101644059>

Big data – where every aspect of your life is being quantified in every way imaginable – may be a term you are only just beginning to recognize. But get ready for another one: apophenia. In the movie "Silver Linings Playbook," Robert DeNiro's character – a diehard Philadelphia Eagles fan – believes various random and unrelated factors such as the position of the TV remote controls and whether or not his son watches the game with him could factor into whether his team wins or loses. While most people would refer to this as superstition, others might call it apophenia – the experience of seeing meaningful patterns or connections in random or meaningless data. The phenomenon arises from a subconscious tendency to seek out patterns – such as faces in clouds and hidden messages in music – because our brains are wired this way. And, it can

be bad for business, researchers say. "Big data tempts some researchers to believe that they can see everything at a 30,000-foot view," Danah Boyd, principal researcher at Microsoft Research and Kate Crawford, associate professor at the University of New South Wales wrote in a paper. "It is the kind of data that encourages the practice of apophenia: seeing patterns where none actually exist, simply because massive quantities of data can offer connections that radiate in all directions," the paper noted. Drawing inaccurate conclusions from big data analysis could prove costly for companies in how it influences decision making from advertising to management. One example of big data analysis gone awry was Google, which developed Flu Trends in 2008 – a tool that geographically tracks searches for flu-related words over time. The idea was that people showing flu symptoms would search specific terms on Google to help self-diagnose and that these web searches could be used to create a real-time map of flu outbreaks. While Google Flu Trends performed well for some time there was an anomaly in December 2012. According to an article in Nature magazine, Google's flu-case estimates were twice as high as those from the Center for Disease Control and Prevention. The cause? Researchers suggested that widespread media coverage of the U.S. flu season may have boosted flu-related searches, inflating the number of cases that Google's algorithm identified. A pharmacy using this data to better decide on the appropriate inventory level of flu-related drugs could have easily overstocked on such drugs. "Brands are becoming increasingly dependent upon data to manage their relationship with customers and to drive their businesses. Given this reliance, it's frankly pretty scary how data-driven decisions often seem to be arrived at and acted upon in a relatively unquestioning way," Colin Strong, managing director at GfK NOP business and technology told CNBC. "There will be very real commercial implications for companies that don't stop and question how these decisions are being arrived at," he added. "Working with big data is still subjective, and what it quantifies does not necessarily have a closer claim on objective truth" – particularly when considering messages from social media sites," Boyd and Crawford added in their paper.

Specific threats

Big Data infringes upon the privacy of consumers

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

Big data analytics are being used more widely every day for an even wider number of reasons. These new methods of applying analytics certainly can bring innovative improvements for business. For example, retail businesses are successfully using big data analytics to predict the hot items each season, and to predict geographic areas where demand will be greatest, just to name a couple of uses. **The power of big data analytics is so great that in addition to all the positive business possibilities, there are just as many new privacy concerns** being created. Here are ten of the most significant privacy risks. **1. Privacy breaches and embarrassments.** **The actions taken by businesses and other organizations as a result of big data analytics may breach the privacy of those involved, and lead to embarrassment and even lost jobs.** Consider that some **retailers have used big data analysis to predict** such intimate personal details such as **the due dates of pregnant shoppers.** **In such cases subsequent marketing activities resulted in having members of the household discover a family member was pregnant before she had told anyone, resulting in an uncomfortable and damaging family situation.** Retailers, and other types of businesses, should not take actions that result in such situations.

Big Data eliminates anonymity on the internet

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

2. Anonymization could become impossible. **With so much data, and with powerful analytics, it could become impossible to completely remove the ability to identify an individual** if there are no rules established for the use of anonymized data files. For example, **if one anonymized data set was combined with another completely separate data base, without first determining if any other data items should be removed prior to combining to protect anonymity, it is possible individuals could be re-identified.** The important and necessary key that is usually missing is establishing the rules and policies for how anonymized data files can be combined and used together.

Big Data can reveal sensitive personal information

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

3. Data masking could be defeated to reveal personal information. **if data masking is not used appropriately, big data analysis could easily reveal the actual individuals who data has been masked.** Organizations must establish effective policies, procedures and processes for using data masking to ensure privacy is preserved. **Since big data analytics is so new, most organizations don't realize there are risks, so they use data masking in ways that could breach privacy.** Many resources are available, such as those from IBM, to provide guidance in data masking for big data analytics.

Big Data incentivizes poor ethical choices

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

4. **Unethical actions based on interpretations. Big data analytics can be used to try and influence behaviors. There are my ethical issues with driving behavior.** Just because you CAN do something doesn't mean you should. For example, in the movie The Fight Club, Ed Norton's character's job was to determine if an automobile manufacturer should do a recall based strictly on financial consideration, without taking into account the associated health risks. Or, in other words, if it is cheaper for people to be killed or injured instead of fixing the faulty equipment in the vehicles. **Big data analytics can be used by organizations to make a much wider variety of business decisions that do not take into account the human lives that are involved. The potential to reveal personal information because it is not illegal, but can damage the lives of individuals, must be considered**

Inconsistent Data harms consumers- turns retail internal link- big data

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

5. **Big data analytics are not 100% accurate. While big data analytics are powerful, the predictions and conclusions that result are not always accurate.** The data files used for big data analysis can often contain **inaccurate data about individuals**, use data models that are incorrect as they relate to particular individuals, or simply be flawed algorithms (the results of big data analytics are only as good, or bad, as the computations used to get those results). **These risks increase as more data is added to data sets, and as more complex data analysis models are used without including rigorous validation within the analysis process.** As a result, **organizations could make bad decisions and take inappropriate and damaging actions.** When decisions involving individuals are made based upon inaccurate data or flawed models, **as a result individuals can suffer harm by being denied services, being falsely accused or misdiagnosed, or otherwise be treated inappropriately.**

Big Data allows for unchecked discrimination

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

6. **Discrimination. Using big data analytics to try and choose job candidates, give promotions, etc. may backfire if the analytics are not truly objective. Discrimination has been a problem for years** of course, **but** the danger is that **big data analytics makes it more prevalent**, a kind of 'automated' discrimination if you will. For example, **a bank** or other type of financial organization **may not be able to tell by a credit application the applicant's race or sexual orientation** (since it is generally illegal to base such a credit decision upon race), **but could deduce race or sexual orientation based upon a wide variety of data, collected online** and through the Internet of Things (IoT), **using big data analytics to then turn down a loan to an individual after obtaining and learning such information.**

Consumers have no legal protections from Big Data

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

7. **Few (if any) legal protections exist for the involved individuals.** Most organizations still only address privacy risks as explicitly required by existing data protection laws, regulations and contractual requirements. **While the U.S. White House, the Federal Trade Commission, and others, have recently expressed concern about the privacy risks that are created within using big data analytics, there are no legal requirements for how to protect privacy while using big data analytics.**

Big Data never goes away- infringes on privacy rights

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

8. **Big data will probably exist forever.** I've talked with many organizations about their big data use. I've read many studies and articles. **I've not found any that indicate they will delete big data repositories.** In fact, all have indicated that they instead typically view them as infinitely growing repositories; the bigger the better! **As more data is collected and retained, the more easily analytics will be able to determine more insights into individuals' lives.**

Big Data makes patents irrelevant- kills innovation

Herold no date (Rebecca Herold is a privacy advocate and consultant. She has extensive experience in online security and privacy rights. She has been named the best Privacy advocate in the world numerous times by *Computerworld Magazine*. "10 Big Data Analytics Privacy Problems" <https://www.secureworldexpo.com/10-big-data-analytics-privacy-problems> //HS)

10. Making patents and copyrights irrelevant. There is concern that **big data could make patents harder to obtain** because patent offices will not be able to verify if a submitted patent is unique **since there will be too much data to check through** within all the growing numbers of big data repositories. **Big data could make copyrights a thing of the past** because it will be too hard to control information that can be hidden or propagated infinitely within big data repositories. **As an associated effect, the royalties associated with copyrighted information are expected to decrease or possibly disappear altogether.**

AT: Border Surveillance D.A- Michigan 7

No Link – 25 mile exception

Empirically, the plan would still allow border surveillance

Santos 2015 (Maria; Bill would require law enforcement to obtain a warrant for drone surveillance

Read more at; Mar 18; redaltpolitics.com/2015/03/18/bill-require-law-enforcement-obtain-warrant-drone-surveillance/; kdf)

A returning bipartisan bill would put tighter restrictions on how police officers and government agencies can use drones to gather information. National Journal reports that Reps. Zoe Lofgren (D-Calif.) and Ted Poe (R-Texas) will reintroduce their Preserving American Privacy Act, which requires warrants to use drone surveillance, with some exceptions. Officers would also have to procure a license from the Justice Department before operating a drone. Information obtained outside these rules would become inadmissible in court. **Drones could still be used without a warrant when within 25 miles of a border or in certain emergency situations.**

No Internal – Border Drones Fail

U.S. Border drones ineffective – grounded often, too costly, minimal effect

Whitlock '15 (Craig; January 6th, 2015; U.S. surveillance drones largely ineffective along border, report says; Craig Whitlock covers the Pentagon and national security for The Post, where he has worked as a staff writer since 1998. He served as the paper's Berlin bureau chief for nearly six years, covering terrorism networks in Europe, South Asia, the Middle East and North Africa; https://www.washingtonpost.com/world/national-security/us-surveillance-drones-largely-ineffective-along-border-report-says/2015/01/06/5243abea-95bc-11e4-aabd-d0b93ff613d5_story.html; 7-3-15; mbc)

U.S. drones deployed along the borders are grounded most of the time, cost far more than initially estimated and help to apprehend only a tiny number of people trying to cross illegally, according to a federal audit released Tuesday. In a report that could undermine political support for using more drones to secure the nation's borders, the Department of Homeland Security's inspector general found "little or no evidence" that the fleet had met expectations or was effective in conducting surveillance. U.S. Customs and Border Protection has been flying surveillance drones for nearly a decade, launching them from bases in Texas, Florida, North Dakota and Arizona. The agency has nine of the Predator B model — a modified version of the MQ-9 Reaper drone flown by the Air Force — and has plans to more than double the size of its drone fleet to 24 as part of a \$443 million expansion. The inspector general, however, questioned whether those plans make any sense or would be cost-effective. In an audit of the fleet's operations during fiscal 2013, the inspector general calculated that it cost \$12,255 per flight hour to operate the drones, five times as much as Customs and Border Protection had estimated. Although the agency planned to fly four drone patrols a day — each for an average of 16 hours — the aircraft were in the air for less than a quarter of that time, the audit showed. Bad weather and a lack of personnel and spare parts hindered operations, it concluded. "The unmanned aircraft are not meeting flight hour goals," the auditors wrote, adding more broadly that Customs and Border Protection "cannot demonstrate how much the program has improved border security." As evidence, the report cited statistics showing that of the 120,939 illegal border crossers apprehended in Arizona during 2013, fewer than 2 percent were caught with the help of drones providing aerial surveillance. In Texas and the Rio Grande Valley, less than one-tenth of 1 percent of border-crossing apprehensions were attributed to drone detection. The findings echo earlier audits by the inspector general of the domestic drone program but could carry extra weight as Congress considers whether to spend more on drone surveillance to secure the borders as part of immigration legislation. In a written response to the audit, Eugene Schied, an assistant commissioner with Customs and Border Protection, disputed the characterization in the findings. The drone program, he said, "has achieved or exceeded all relevant performance expectations." Schied accused the inspector general of cherry-picking statistics and ignoring information that makes the drones appear more effective. For instance, Schied said, drones "directly contributed" to the seizure of almost 50,000 pounds of marijuana, worth an estimated \$122 million, along the Southwest border in 2013. Customs and Border Protection dismissed suggestions that a major expansion of its drone fleet would occur anytime soon. Although plans to fly as many as two dozen drones were authorized years ago, Schied said the department did not have the money to follow through and that "there is no intent at this time" to operate more than 10 of the aircraft.

Expensive surveillance failure

Peck '15 (Michael; January 16, 2015; Drones Can't Protect Our Borders; Michael Peck is a contributing writer at Foreign Policy Magazine and a writer for the War is Boring defense blog; nationalinterest.org/feature/drones-cant-protect-our-borders-12046; 7-7-15; mbc)

If America can use drones to spy on Al Qaeda terrorists, then why can't it use them to stop illegal immigrants? In theory, drones and border security should have been a perfect match. A predator drone can keep a robotic eye on America's vast borders, saving money and personnel while maintaining continuous watch for illegals. But an audit by the Department of Homeland Security's Inspector General finds that despite high hopes for its border drone program, "its impact in stemming illegal immigration has been minimal." In fact, Customs and Border Patrol's fleet of 10 Predator-Bs have accounted for less than 2 percent of illegal immigrants apprehended. Investigators found a border drone program in disarray. Some of the ills cited include:

-CBP drones are supposed to be flying 16 hours a day, 365 days a year. Instead, they only managed to fly 22 percent of those flight hours.

-CBP claimed its fleet of 10 Predator-B drones cost \$2,468 per flight hour. But auditors discovered that this figure did not include the cost of pilots, equipment and overhead. The real number? \$12,255 per flight hour.

-Of the 1,993-mile southwest border with Mexico, the Predators primarily covered just 100 miles along the Arizona border and 70 miles in Texas. -Drones were supposed to save money and manpower by responding to alerts by ground sensors, rather than having to dispatch Border Patrol agents. But investigators found few instances where this happened.

-CBP lacks internal performance measures to even assess whether the program is successful by its own standards. To add insult to inefficiency, CBP wants to buy more drones. On top of the \$360 million spent between 2005 and 2013, the agency in 2012 requested \$443 million to buy another 14 unmanned aircraft. "Notwithstanding the significant investment, we see no evidence that the drones contribute to a more secure border, and there is no reason to invest additional taxpayer funds at this time," said DHS Inspector General John Roth. "Securing our borders is a crucial mission for CBP and DHS. CBP's drone program has so far fallen far short of being an asset to that effort." Besides failing to secure our borders, border-patrol drones raise serious civil liberties issues, as watchdog groups have long warned. Will they just track illegals, or will American citizens be inevitably caught on the camera mounted on every Predator? In addition, two CBP Predators are equipped with a Pentagon-designed radar with the ominous name of VADER (Vehicle and Dismount Exploitation Radar). Originally designed to spot the Taliban in Afghanistan, VADER can't distinguish between lawful American citizens and border crossers.

No Internal – Other Surveillance Fills in

Other forms of mobile surveillance technology solves

Johnson '15 (Chariman; May 13, 2015; Chairman Johnson, Ranking Member Carper, and distinguished Members of the Committee + erves on the committees on the Budget, Commerce, Science and Transportation, Foreign Relations, Homeland Security and Governmental Affairs and Small Business and Entrepreneurship. ; www.dhs.gov/news/2015/05/13/written-testimony-cbp-senate-committee-homeland-security-and-governmental-affairs; 7-3-15; mbc)

The border environment between the ports of entry is dynamic. Working in conjunction with fixed surveillance assets, CBP's mobile technology assets provide flexibility and agility to adapt to changing border conditions and threats. Mobile technologies are deployed in California, Arizona, New Mexico, and Texas as well as several Northern border locations. Along the Southwest border, Mobile Surveillance Capability (MSC) systems provide long-range mobile surveillance and consist of a suite of radar and camera sensors mounted on Border Patrol vehicles. An agent deploys with the vehicle to operate the system, which automatically detects and tracks items of interest and provides the agent/operator with data and video of the observed subject. Mobile Vehicle Surveillance Systems (MVSS) provide short- and medium-range mobile surveillance equipment mounted on telescoping poles and consist of a suite of camera sensors mounted on Border Patrol vehicles. An agent deploys with the system, which detects, and to a more limited extent, tracks, identifies and classifies items of interest using the video feed. The agent/operator observes activity on the video monitor to detect intrusions and assist agents/officers in responding to those intrusions. Another system that is used by the Border Patrol, that does not need to be mounted to a vehicle, is the Agent Portable Surveillance System (APSS). These systems provide medium-range mobile surveillance, and are transported by two or three agents and mounted on a tripod. A single agent remains on-site to operate the system, which automatically detects and tracks items of interest and provides the agent/operator with data and video of selected items of interest. These technologies not only provide significant security benefits and multiply the capabilities of law enforcement personnel to detect, identify, and respond to suspicious activity, but they also assist with public safety along the border. This past January, Colchise County Sheriff's Office requested assistance from Border Patrol agents when a hunter was reported missing.³ Ultimately, it was an agent using mobile surveillance technology who was able to detect the hunter's flashlight and direct agents to the hunter's location. Mobile surveillance technology systems enable agents to position the technology where it is needed at a specific moment, extend our observational capabilities – in this case, by helping see through the darkness – and increase the accuracy and speed of our response. The absence of mobile surveillance technology would limit the Border Patrol's ability to detect, identify, classify, track and rapidly respond to illicit activity. Additionally, mobile platforms provide a suite of capabilities that cannot be duplicated with alternatives such as handheld equipment. For example, mobile surveillance technology is mounted on masts to increase sensor elevation over trees/obstacles and provide elevation in flat terrain. MSC systems possess radar that autonomously detect items of interest and MSC detection ranges are significantly better than those of handheld alternatives. Technology is critical to border security operations and through the deployment of these effective technologies, the Border Patrol gains more coverage of fixed surveillance gaps and situational awareness, and increases its ability to adapt to changing conditions and effectively detect, identify, track, and interdict potential threats along the Southwest border.

Other forms of persistent surveillance solve

Johnson '15 (Chariman; May 13, 2015; Chairman Johnson, Ranking Member Carper, and distinguished Members of the Committee + erves on the committees on the Budget, Commerce, Science and Transportation, Foreign Relations, Homeland Security and Governmental Affairs and Small Business and Entrepreneurship. ; www.dhs.gov/news/2015/05/13/written-testimony-cbp-senate-committee-homeland-security-and-governmental-affairs; 7-3-15; mbc)

The Integrated Fixed Tower (IFT) systems are one of the technologies acquired and deployed to the Southwest border in Arizona as part of the ATP. IFTs are fixed surveillance assets that provide long-range persistent surveillance. These systems cover very large areas and incorporate a Common Operating Picture (COP), a central hub that receives data from one or multiple tower units. The tower systems automatically detect and track items of interest, and provide the COP operator(s) with the data, video and geospatial location of selected items of interest to identify and classify them. Remote Video Surveillance Systems (RVSS) are another fixed technology asset used in select areas along the Southwest and Northern borders. These systems provide short-, medium-, and long-range persistent surveillance mounted on stand-alone towers, or other structures. The RVSS uses cameras, radio and microwave transmitters to send video to a control room and enable a control room operator to remotely detect and, to a limited extent, track, identify and classify targets using the video feed. For example, just recently¹, Border Patrol agents assigned to the Calexico Station were operating a RVSS at night when they observed a man carrying a duffle bag waving toward a vehicle that had stopped just north of the International Boundary Fence. The agents using the RVSS called in the observation to agents in the area who in turn stopped the vehicle. The driver consented to a search of the vehicle, and agents located almost 30 pounds of cocaine in the duffle bag. RVSS technology also recently disrupted a methamphetamine smuggling attempt, which ultimately led to the discovery of a sophisticated cross-border tunnel.² In some areas along the Southwest border, CBP also uses Unattended Ground Sensors (UGS), which provide short-range persistent surveillance. These sensors support our capability to detect, and to a limited extent, track and identify subjects. Sensor capabilities include seismic, passive infrared, acoustic, contact closure and magnetic, although these capabilities are not necessarily available in all deployed UGS. When a ground sensor is activated, an alarm is communicated to a data decoder that translates the sensor's activation data to a centralized computer system in an operations center. Imaging Sensors (IS) are a specific type of unattended ground sensor with an integrated camera and the ability to transmit images or video back to the operations center. As with UGS, IS are monitored in a centralized system and geospatially. Without fixed system technology such as IFT, RVSS, and UGS, the Border Patrol's ability to detect, identify, classify, and track illicit activity would be decreased. Fixed systems provide line-of-sight surveillance coverage to efficiently detect incursions in flat terrain. The Border Patrol integrates mobile and portable systems to address areas where rugged terrain and dense ground cover may allow adversaries to penetrate through blind spots or avoid the coverage areas of fixed systems.

Alternate surveillance methods solve

Williams '9 (Tiffany; IACP Technology Center Outreach Coordinator;

www.policechiefmagazine.org/magazine/index.cfm?fuseaction=display_arch&article_id=1895&issue_id=92009; 7-3-15; mbc)

The mission of the U.S. Customs and Border Protection (CBP) (U.S. Border Patrol) is to "...secure America's borders; to protect the American public against terrorism and the instruments of terror; and to enforce the laws of the United States while fostering its economic security through lawful international trade and travel."¹ As a component of the U.S. Department of Homeland Security, U.S. Border Patrol comprises approximately 20,000 agents that work at and around U.S. borders in an effort to keep Americans safe. The U.S. Border Patrol patrols the United States' southern border from Texas to California, all of the Floridian border continuing along the Louisiana (the gulf coast) border and the Caribbean Ramey sector of Puerto Rico. To the north, U.S. Border Patrol patrols the U.S. border from Washington to Maine. The U.S. Border Patrol is responsible for securing America's borders beyond the specified ports of entry. This encompasses different terrains and remote locations varying from the desolate deserts to water borders. To better secure the borders, there are three main components employed: technology, infrastructure, and personnel. The Enforcement and Information Technology (EIT) division of the U.S. Border Patrol Headquarters in Washington, D.C., focuses on the technology aspect. Due to the breadth of the issues surrounding border protection, it is not surprising that the U.S. Border Patrol's responsibility for patrolling thousands of miles of the border requires its technology "tool belt" to include emerging technologies that not only promote mobility, but also create the best possible level of surveillance and protection. Remote Surveillance Systems Patrolling remote areas of the border is an arduous task as these areas are ideal locations for persons intending to illegally cross the border. The U.S. Border Patrol is able to better patrol these areas due in part to its deployment of the Remote Video Surveillance System (RVSS). The RVSS is strategically placed along the northern and southern borders and consists of two sets of camera systems affixed to a platform atop an 80-foot pole. One is a thermal nighttime camera; the other, a color daytime camera. Their pan-tilt ability allows them to move in different directions to ensure a comprehensive level of surveillance, for example, while one set of cameras looks east, the other looks west, overlapping each other to cover all areas. To date, there are about 290 RVSS sites across both the northern and southern borders. Some of these sites are situated in such remote locations that they operate by solar energy and generators. The remote location of these RVSS sites allows the U.S. Border Patrol to focus on potentially prime crossing points for illegal traffickers. EIT division chief Steve Evans emphasizes that the system is "not a catchall." But it is one of many helpful tools used to fight illegal border crossings and ultimately allows the U.S. Border Patrol to strategically place its manpower. Mobile Surveillance Systems In conjunction with the RVSS, the Mobile Surveillance System (MSS) that is used by the U.S. Border Patrol allows the same type of security and surveillance as the RVSS, but it has the mobile component that is necessary to cover a larger area. The MSS is a camera mounted on a high pole affixed to a large flatbed truck, thus allowing it to be mobile. In addition to the camera bundles, the MSS has a radar unit that is particularly helpful in the desert environment. Moreover, the U.S. Border Patrol uses Mobile Remote Video Surveillance Systems (MRVSS), or "scope trucks," that are smaller than the MSS trucks and permit access to more remote locations. Unattended Ground Sensors The U.S. Border Patrol has been using sensors to detect motion for years; however, it has adapted to evolving technologies that are more precise and intelligent. These modern sensors are strategically placed upon the recommendation of the field agents in problem

locations. The Unattended Ground Sensors (UGS) come in three main forms: seismic, magnetic, and infrared. The seismic sensors detect ground movement; the magnetic ones recognize metal in passing vehicles; and the infrared sensors respond to the breakage of spatial planes. The U.S. Border Patrol is mindful of the environmental limitations of sensors, for example, the seismic sensors are not appropriate for northern borders because of frozen ground affecting their functionality. The U.S. Border Patrol analyzes different terrains to decipher which areas would benefit from what particular types of sensor in order to ensure their effectiveness. E3/IDENT The E3/IDENT is a technology that was created to assist in evaluating arrests and in collecting the biometrics and photographs of apprehended persons. This technology allows agents to secure this information and forward it to the Federal Bureau of Investigation (FBI). Within 8 to 10 minutes, agents will receive historic federal criminal information on individuals. Moreover, it will display whether or not an individual currently is wanted for a criminal offense. Another component is its capability to access the INS/IDENT database in order to search for possible immigration violations. Results and Moving Forward Assistant Chief of the U.S. Border Patrol, Robert Nelson, claims that EIT “fills the immediate technology gap.” Both Chiefs Nelson and Evans stress the importance of using technology to better secure U.S. borders. Chief Evans is constantly searching for and learning about emerging technologies that will better assist his team in their mission. It is imperative to note that all three components—technology, infrastructure, and personnel—play important and interconnected roles in securing U.S. borders. Overall, the combined use of all three contributed to 723,825 apprehensions in fiscal year 2008 and ultimately assisted in keeping U.S. citizens safe.

No impact – Violence

their impact assumes a level of violence that’s empirically denied by the last decade and totally implausible due to cartel interests and basic state functions—means it won’t reach the level of deterioration required for their scenario

David Shirk 14, director of the Trans-Border Institute and associate professor of political science at the University of San Diego, March 2014, “Conclusion: Toward a More Comprehensive and Community-based Approach to Public Security”, part of a report called “Building Resilient Communities in Mexico: Civic Responses to Crime and Violence”, Mexico Institute @ Wilson Center, <http://www.wilsoncenter.org/publication/resilient-communities-mexico-2014>

This points to another, perhaps unexpected change under Peña Nieto: continuity in the U.S.-Mexican security relationship across administrations. Over the last year, U.S.-Mexico security cooperation has experienced significant setbacks. At the outset, the Peña Nieto administration insisted that Mexico’s cooperation with the United States on security matters would be reined back and managed through the single “ticket window” (ventanilla única) of Mexico’s Interior Ministry. Yet, over the last year, pressure from other federal and state-level agencies has seemingly led to a softening of this policy of centralization. Many aspects of **cooperation** have continued, in part because of the close ties and tremendous interdependence that has developed **between U.S. and Mexican law enforcement agencies** working toward common objectives. Indeed, such cooperation **helped** Peña Nieto **take down the head of the Zetas, Mexico’s most notorious and violent drug cartel, as well as key leaders in the Gulf Cartel.** Ultimately, **the key question is whether** the current government’s **efforts have** actually **been accompanied by a decrease in violence.** The answer is a qualified “yes.” While **violence appears to have declined** somewhat under Peña Nieto, it definitely did not go away. Last year, **the Justice in Mexico Project’s annual report on drug violence in Mexico found** that **violent homicides** probably **reached a peak in 2010** and 2011, and began to decline significantly **in 2012.**⁶ **Thanks to a significant drop in violence** in places like **Tijuana, Monterrey, and Ciudad Juárez** the number of homicides in Mexico **dropped by the thousands.** **This trend** has **continued in 2013**, and in the final analysis will likely result in a slight reduction in Mexico’s overall homicide rate compared with the previous year, perhaps as much as 20 percent, but not quite what Peña Nieto had hoped for (See Figure 1).

No impact – Hezbollah

Hezbollah won't do it

Jen **Quraishi** 8-12-20**10** Hezbollah in Mexico Stoking Terrorism Fears <http://www.motherjones.com/mojo/2010/08/hezbollahs-mexican-cartel-connection>

The idea of Hezbollah operatives in Mexico using the chaos caused by the government's war with the drug cartels as an opportunity to launch a terrorist attack on the US is not a new one. In June, Rep. Sue Myrick (R-N.C.) asked Department of Homeland Security head Janet Napolitano to investigate the Hezbollah's presence on the US's southern border, particularly in light of the increasing number of gang members arrested in southwestern states who have tattoos in Farsi. "We have typically seen tattoos in Arabic," Rep. Myrick wrote, "but Farsi implies a Persian influence that can likely be traced back to Iran and its proxy army, Hezbollah." I don't know how good Myrick's first-hand knowledge of tattoos is, but she's right in suggesting that Hezbollah has seemed to up its presence in Mexico of late, including smuggling people across the border and drug trafficking. The Heritage Foundation goes further, reporting that though US officials have not confirmed it, Hezbollah member Jamal Nasr was likely arrested in Tijuana last month. At this point, US border militia groups and tea partiers are probably frothing at the mouth to know: does this mean Hezbollah will use the US-Mexico border as a staging ground for a terrorist attack? Sorry, folks. As Scott Stewart at STRATFOR points out, it's very unlikely. Hezbollah, as Stewart rightly emphasizes, is no longer a young hothead looking to make a name for itself. Senior Hezbollah leaders are often "influential politicians and wealthy businessmen," Stewart writes. Hezbollah sees the US as a business office, not a foxhole. And besides, if Hezbollah did attack the US, it would make itself (and Iran) a military target. And after seeing the devastation in Iraq, that's likely not something it's pursuing. "Hezbollah could conduct attacks in the United States, but it would pay a terrible price for doing so, and it does not appear that it is willing to pay that price." Stewart writes. Hezbollah leadership may be radical, but it is not irrational."

No impact – ISIS

Zero risk of ISIS crossing the border illegally when they can just do it legally—claims otherwise are just hype

Schmidt 9/15 (Michael S; US pushes back against warnings that ISIS plans to enter from Mexico; www.nytimes.com/2014/09/16/us/us-pushes-back-against-warnings-that-isis-plans-to-enter-from-mexico.html; kdf)

WASHINGTON — Militants for the Islamic State in Iraq and Syria have traveled to Mexico and are just miles from the United States. They plan to cross over the porous border and will “imminently” launch car bomb attacks. And the threat is so real that federal law enforcement officers have been placed at a heightened state of alert, and an American military base near the border has increased its security. As the Obama administration and the American public have focused their attention on ISIS in recent weeks, conservative groups and leading Republicans have issued stark warnings like those that ISIS and other extremists from Syria are planning to enter the country illegally from Mexico. But the Homeland Security Department, the F.B.I. and lawmakers who represent areas near the border say there is no truth to the warnings. “There is no credible intelligence to suggest that there is an active plot by ISIL to attempt to cross the southern border,” Homeland Security officials said in a written statement, using an alternative acronym for the group. Democrats say opponents of President Obama are simply playing on concerns about terrorism as part of their attempt to portray Mr. Obama as having failed to secure the border against illegal immigration. “There’s a longstanding history in this country of projecting whatever fears we have onto the border,” said Representative Beto O’Rourke, Democrat of Texas, who represents El Paso and other areas near the border. “In the absence of understanding the border, they insert their fears. Before it was Iran and Al Qaeda. Now it’s ISIS. They just reach the conclusion that invasion is imminent, and it never is.” At a congressional hearing last week, Representative Jeff Duncan, Republican of South Carolina, pushed back strongly against the testimony of Homeland Security Department officials and Mr. O’Rourke, saying they were ignoring a gathering threat. “Wake up, America,” Mr. Duncan said before storming out of the hearing. “With a porous southern border, we have no idea who’s in our country.” But counterterrorism officials say they are far more concerned that an ISIS militant will enter the United States the same way millions of people do each year: legally, on a commercial flight. Their efforts have focused on the more than 2,000 Europeans and 100 Americans who have traveled to Syria to fight alongside extremist groups, nearly all of them crossing over its unprotected borders. Without markings in their passports to show that they traveled to Syria, American border authorities have few ways of determining where they were and stopping them from entering the country. Warnings about the possibility of terrorists entering the United States from Mexico have been sounded in the past. During the 2012 presidential campaign both Rick Perry and Mitt Romney, the Republican nominee, said Islamic extremists working with countries in Latin America, including Mexico, posed a significant threat to the United States. “We know that Hamas and Hezbollah are working in Mexico, as well as Iran, with their ploy to come into the United States,” Mr. Perry, the governor of Texas, said at a Republican debate in 2011. “So the idea that we need to have border security with the United States and Mexico is paramount to the entire Western Hemisphere.”

No impact to ISIS working with the cartels

Gaouette 2014 (Nicole; Islamic State Talked of Entering U.S. Through Mexico; Sep 10; www.bloomberg.com/news/2014-09-10/islamic-state-talked-of-entering-u-s-through-mexico.html; kdf)

Islamic State extremists have discussed infiltrating the U.S. through its southern border with Mexico, a U.S. official said. Francis Taylor, under secretary for intelligence and analysis at the Department of Homeland Security, told a Senate committee today that the Sunni militants have been tracked discussing the idea on social-media sites such as Twitter Inc. (TWTR) “There have been Twitter and social-media exchanges among ISIL adherents across the globe speaking about that as a possibility,” Taylor said in response to a question from Senator John McCain, an Arizona Republican. Islamic State is also known by the acronyms ISIL and ISIS. Referring to the 1,933-mile (3,110-kilometer) boundary with Mexico, Taylor said he was “satisfied that we have the intelligence and the capability at our border that would prevent that activity.” Taylor’s comments before the Homeland Security and Governmental Affairs Committee came hours before President Barack Obama

was to outline in a speech plans to expand the U.S. offensive against Islamic State. Steps under consideration include blocking foreign fighters from entering Syria and Iraq, delivering more aid to moderate factions among Syrian rebels, and expanding air strikes to Islamic State targets in Syria.

K of ISIS Impacts

Claims that ISIS will cross the border are fed by racist-jingoism

Bow 2014 (Charles M; ISIS, deep in the heart of Texas; Sep 3;
www.nytimes.com/2014/09/04/opinion/isis-deep-in-the-heart-of-texas.html; kdf)

The Islamic State in Iraq and Syria, or ISIS, is coming ... to Texas? Yes, if you listen to conservatives, particularly those from Texas. First, let's say this flatly: ISIS is an outrageously barbaric group that poses a real threat to the Middle East in the short term and possibly to Western countries in the long term. And watching the beheading of American journalists by ISIS is most unsettling, to say nothing of the pain and torment it must cause the victims' families. It offends and infuriates. The heart breaks and the eyes water. And there is a natural revulsion and rousing of anger. But through the anger we must still stay levelheaded, and not allow politicians and pundits to talk us into armed conflict without clarity of mission and scope. And we also mustn't allow them to inflate the image of the enemy to such a degree that we feel that caution and patience are not options. The latter seems to be very much underway. ISIS is being presented as so great a threat that action cannot be forestalled, and that amplification of threat is even being used as a political tool in the immigration debate. The conservative website WND "reported" in July that "a top U.S. Defense Department analyst under President Bush says ISIS, the Islamic jihadists creating a Muslim caliphate in Iraq and beyond, could use the Mexican border to infiltrate America, and it could happen 'sooner rather than later.'" The site continued, "ISIS may be working to infiltrate' the U.S. with the aid of transnational drug cartels, he said, citing the violent Mexican criminal gang MS-13 as a highly likely candidate for the partnership." WND was not the only one to hype the cartel line. Representative Ted Poe of Texas said in August that there was interaction between ISIS and Mexican drug cartels and that they were "talking to each other." Fox News "reported" Friday on a so-called "situational awareness" bulletin sent out by the Texas Department of Public Safety and obtained by the "news" network. According to Fox, the bulletin read, "A review of ISIS social media messaging during the week ending August 26 shows that militants are expressing an increased interest in the notion that they could clandestinely infiltrate the southwest border of U.S., for terror attack." And members of the Obama administration — wittingly or not — fed the frenzy. In a joint news conference in August, Secretary of Defense Chuck Hagel and the chairman of the Joint Chiefs of Staff, Gen. Martin Dempsey, further inflated ISIS and raised the issue of immigration and the border. Hagel called ISIS an "imminent threat to every interest we have" and said, "This is beyond anything we've seen. We must prepare for everything." Dempsey said, "Because of open borders and immigration issues, it's an immediate threat, that is to say, the fighters who may leave the current fight and migrate home. Longer-term, it is about ISIS' vision." Broadly speaking, this is all true. Everything is possible, and one should never underestimate an enemy. But, neither should one inflate the image of the enemy. And a legitimate threat from foreign forces should not be used as political fodder for anti-immigrant, enforcement-over-citizenship border politicians. And yet, that appears to be what it has become. Gov. Rick Perry of Texas recently hinted that ISIS fighters might have already crossed the U.S.-Mexico border. According to Perry, "There's the obvious great concern that because of the condition of the border, from the standpoint of it not being secure and us not knowing who is penetrating across, that individuals from ISIS or other terrorist states could be." Perry continued, "I think it's a very real possibility that they may have already used that." Rear Adm. John Kirby, the Pentagon press secretary, said on CNN, however, that although ISIS had a desire to strike Western targets, there was "no information that leads us to believe" that ISIS fighters had crossed the border. The Conservative Judicial Watch issued a statement last week claiming: "Islamic terrorist groups are operating in the Mexican border city of Ciudad Juárez and planning to attack the United States with car bombs or other vehicle-borne improvised explosive devices (VBIED). High-level federal law enforcement, intelligence and other sources have confirmed to Judicial Watch that a warning bulletin for an imminent terrorist attack on the border has been issued. Agents across a number of Homeland Security, Justice and Defense agencies have all been placed on alert and instructed to aggressively work all possible leads and sources concerning this imminent terrorist threat." The National Counterterrorism Center director, Matthew Olsen, said that while ISIS did pose "significant threat to us" it was not "Al Qaeda pre-9/11" and "we have no credible information" that ISIS is planning to attack the United States. The ISIS-at-the-border hype appears to simply be an attempt to kill two birds with one stone — be pro-war and anti-immigration at the same time.

Their impacts are hype used to restart the war on terror

Traces of Reality 2014 (Masterminds behind ISIS Mexican Cartel Grid Jihad Revealed! (or Why the Media Thinks You're Stupid); Sep 13; tracesofreality.com/2014/09/13/masterminds-behind-isis-mexican-cartel-grid-jihad-revealed-or-why-the-media-thinks-youre-stupid/; kdf)

On this edition of Traces of Reality Radio: Guillermo and Danny reveal the true “masterminds” behind the Islamic State/Mexican drug cartel plot to “take down a power grid” in the United States and kill 90% of the public. We chronicle how and when this story began, picking apart the narrative and explaining the various reasons why it makes absolutely no sense whatsoever. We illustrate how a product of government propaganda — that serves to further legitimize the “war on terror,” justify another war, and accept a greater loss of liberty — nevertheless found willing mouthpieces within some of the larger “alternative media” outlets.

Turn: Illegal Immigration Good – Ag

Illegal immigrants benefit the economy – agricultural industry proves

Goodman '14 (H.A.; April 23, 2014; Illegal immigrants benefit the U.S. economy; Columnist, Journalist, Author, and Contributor to The Huffington Post, The Hill, published by The Baltimore Sun, The Jerusalem Post, Salon.com, The Roanoke Times and other publications; thehill.com/blogs/congress-blog/foreign-policy/203984-illegal-immigrants-benefit-the-us-economy; 7-7-15; mbc)

There are few subjects that evoke as much emotion as immigration reform, especially since future laws could result in a path to citizenship for over 11 million illegal immigrants. When analyzed from the vantage point of information derived from reputable, nonpartisan sources (the Pew Research Center, USDA, United States Department of Labor, and leading economists and researchers) then one can obtain a clearer view of this muddled discussion. The truth of the matter is that illegal immigrants are important to the U.S. economy, as well as vital to certain industries like agriculture. According to the Pew Research Hispanic Trends Project, there were 8.4 million unauthorized immigrants employed in the U.S.; representing 5.2 percent of the U.S. labor force (an increase from 3.8 percent in 2000). Their importance was highlighted in a report by Texas Comptroller Susan Combs that stated, “Without the undocumented population, Texas’ work force would decrease by 6.3 percent” and Texas’ gross state product would decrease by 2.1 percent. Furthermore, certain segments of the U.S. economy, like agriculture, are entirely dependent upon illegal immigrants. The U.S. Department of Agriculture states that, “about half of the hired workers employed in U.S. crop agriculture were unauthorized, with the overwhelming majority of these workers coming from Mexico.” The USDA has also warned that, “any potential immigration reform could have significant impacts on the U.S. fruit and vegetable industry.” From the perspective of National Milk Producers Federation in 2009, retail milk prices would increase by 61 percent if its immigrant labor force were to be eliminated. Echoing the Department of Labor, the USDA, and the National Milk Producers Federation, agricultural labor economist James S. Holt made the following statement to Congress in 2007: “The reality, however, is that if we deported a substantial number of undocumented farm workers, there would be a tremendous labor shortage.” In terms of overall numbers, The Department of Labor reports that of the 2.5 million farm workers in the U.S., over half (53 percent) are illegal immigrants. Growers and labor unions put this figure at 70 percent. But what about the immense strain on social services and money spent on welfare for these law breakers? The Congressional Budget Office in 2007 answered this question in the following manner: “Over the past two decades, most efforts to estimate the fiscal impact of immigration in the United States have concluded that, in aggregate and over the long term, tax revenues of all types generated by immigrants—both legal and unauthorized—exceed the cost of the services they use.” According to the New York Times, the chief actuary of the Social Security Administration claims that undocumented workers have contributed close to 10% (\$300 billion) of the Social Security Trust Fund. Finally, the aggregate economic impact of illegal immigration is debatable, but any claim that they’ve ruined the country doesn’t correlate to the views of any notable economist. An open letter to President George W. Bush in 2006, signed by around five hundred economists (including five Nobel laureates) stated the following: “While a small percentage of native-born Americans may be harmed by immigration, vastly more Americans benefit from the contributions that immigrants make to our economy, including lower consumer prices.” Although Harvard economist Jorge Borjas has stated that illegal immigrants from 1980-2000 have reduced the wages of high school dropouts in the U.S. he also states that the average American’s wealth has increased by 1 percent because of illegal immigration. In an op-ed published in the Los Angeles Times,

UC Davis economist Giovanni Peri stated that new laws are needed to meet demands within industries like construction, agriculture, and hospitality: “In recent decades, the high demand for these services and the pressure for keeping their cost low and prices competitive have generated incentives to hire undocumented workers.” Some people claim that illegal immigrants represent an assault on our sovereignty. If this is true, then it might be the first time in world history that a country has employed its invaders. When illegal immigrants cross the border, there’s a citizen waiting to hire them and benefit in some manner from their labor. The sooner our country realizes that immigration reform should be based upon the views of economists and nonpartisan academic researchers, rather than think tanks and radio show hosts, then Congress will finally be able to help solve this national dilemma.

AT: Business Confidence D.A- JDI

Non-Unique

The US is losing market confidence now due to surveillance.

Danielle Kehl et al., 2014, New America's Open Technology Institute, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity,"
https://www.newamerica.org/downloads/Surveillance_Costs_Final.pdf, mm

Trust in American businesses has taken a significant hit since the initial reports on the PRISM program suggested that the NSA was directly tapping into the servers of nine U.S. companies to obtain customer data for national security investigations.²⁸ The Washington Post's original story on the program provoked an uproar in the media and prompted the CEOs of several major companies to deny knowledge of or participation in the program.²⁹ The exact nature of the requests made through the PRISM program was later clarified,³⁰ but the public attention on the **relationship between American companies and the NSA still created a significant trust gap, especially in industries where users entrust companies to store sensitive personal and commercial data.** "Last year's national security leaks have also had a commercial and financial impact on American technology companies that have provided these records," noted Representative Bob Goodlatte, a prominent Republican leader and Chairman of the House Judiciary Committee, in May 2014. "They have experienced backlash from both American and foreign consumers and have had their competitive standing in the global marketplace damaged."³¹ Given heightened concerns about the NSA's ability to access data stored by U.S. companies, **it is no surprise that American companies offering cloud computing and webhosting services are among those experiencing the most acute economic fallout from NSA surveillance.** Within just a few weeks of the first disclosures, reports began to emerge that American cloud computing companies like Dropbox and Amazon Web Services were starting to lose business to overseas competitors.³² The CEO of Artmotion, one of Switzerland's largest offshore hosting providers, reported in July 2013 that his company had seen a 45 percent jump in revenue since the first leaks,³³ an early sign that the country's perceived neutrality and strong data and privacy protections³⁴ could potentially be turned into a serious competitive advantage.³⁵ **Foreign companies are clearly poised to benefit from growing fears about the security ramifications of keeping data in the United States.** In a survey of 300 British and Canadian businesses released by PEER 1 in January 2014,³⁶ 25 percent of respondents indicated that they were moving data outside of the U.S. as a result of the NSA's revelations. **An overwhelming number of the companies surveyed indicated that security and data privacy were their top concerns,** with 81 percent stating that they "want to know exactly where their data is being hosted." Seventy percent were even willing to sacrifice performance in order to ensure that their data was protected.³⁷ It appears that little consideration was given over the past decade to the potential economic repercussions if the NSA's secret programs were revealed.³⁸ This failure was acutely demonstrated by the Obama Administration's initial focus on reassuring the public that its programs primarily affect non-Americans, even though non-Americans are also heavy users of American companies' products. Facebook CEO Mark Zuckerberg put a fine point on the issue, saying that the government "blew it" in its response to the scandal. He noted sarcastically: "The government response was, 'Oh don't worry, we're not spying on any Americans.' Oh, wonderful: that's really helpful to companies [like Facebook] trying to serve people around the world, and that's really going to inspire confidence in American internet companies."³⁹ As Zuckerberg's comments reflect, certain parts of the American technology industry are particularly vulnerable to international backlash since growth is heavily dependent on foreign markets. For example, **the U.S. cloud computing industry has grown** from an estimated \$46 billion in 2008 to \$150 billion in 2014, **with nearly 50 percent of worldwide cloud-computing revenues coming from the U.S.**⁴⁰ R Street Institute's January 2014 policy study concluded that **in the next few years, new products and services that rely on cloud computing will become increasingly pervasive.** "Cloud computing is also the root of development for the emerging generation of Web-based applications—home security, outpatient care, mobile payment, distance learning, efficient energy use and driverless cars," writes R Street's Steven Titch in the study. "And **it is a research area where the United States is an undisputed leader.**"⁴¹ **This trajectory may be dramatically altered, however, as a consequence of the NSA's surveillance programs.** **Economic forecasts after the Snowden leaks have predicted significant, ongoing losses for the cloud-computing industry in the next few years.** An August 2013 study by the Information Technology and Innovation Foundation (ITIF) estimated that revelations about the NSA's PRISM program could cost the American cloud computing industry \$22 to \$35 billion over the next three years.⁴² On the low end, the ITIF projection suggests that U.S. cloud computing providers would lose 10 percent of the foreign market share to European or Asian competitors, totaling in about \$21.5 billion in losses; on the high-end, the \$35 billion figure represents about 20 percent of the companies' foreign market share. **Because the cloud computing industry is undergoing rapid growth right now—a 2012 Gartner study predicted global spending on cloud computing would increase by 100 percent from 2012 to 2016, compared to a 3 percent overall growth rate in the tech industry as a**

whole⁴³—vendors in this sector are particularly vulnerable to shifts in the market. Failing to recruit new customers or losing a competitive advantage due to exploitation by rival companies in other countries can quickly lead to a dwindling market share. The ITIF study further notes that “the percentage lost to foreign competitors could go higher if foreign governments enact protectionist trade barriers that effectively cut out U.S. providers,” citing early calls from German data protection authorities to suspend the U.S.-EU Safe Harbor program (which will be discussed at length in the next section).⁴⁴ As the R Street Policy Study highlights, “Ironically, the NSA turned the competitive edge U.S. companies have in cloud computing into a liability, especially in Europe.”⁴⁵ In a follow up to the ITIF study, Forrester Research analyst James Staten argued that the think tank’s estimates were low, suggesting that the actual figure could be as high as \$180 billion over three years.⁴⁶ Staten highlighted two additional impacts not considered in the ITIF study. The first is that U.S. customers—not just foreign companies—would also avoid U.S. cloud providers, especially for international and overseas business. The ITIF study predicted that American companies would retain their domestic market share, but Staten argued that the economic blowback from the revelations would be felt at home, too. “You don’t have to be a French company, for example, to be worried about the US government snooping in the data about your French clients,” he wrote.⁴⁷ Moreover, the analysis highlighted a second and “far more costly” impact: that foreign cloud providers, too, would lose as much as 20 percent of overseas and domestic business because of similar spying programs conducted by other governments. Indeed, the NSA disclosures “have prompted a fundamental re-examination of the role of intelligence services in conducting coordinated cross-border surveillance,” according to a November 2013 report by Privacy International on the “Five Eyes” intelligence partnership between the United States, the United Kingdom, Canada, Australia, and New Zealand.⁴⁸ Staten predicts that as the surveillance landscape around the world becomes more clear, it could have a serious negative impact on all hosting and outsourcing services, resulting in a 25 percent decline in the overall IT services market, or about \$180 billion in losses.⁴⁹ Recent reports suggest that things are, in fact, moving in the direction that analysts like Castro and Staten suggested.⁵⁰ A survey of 1,000 “[Information and Communications Technology (ICT)] decision-makers” from France, Germany, Hong Kong, the UK, and the USA in February and March 2014 found that the disclosures “have had a direct impact on how companies around the world think about ICT and cloud computing in particular.”⁵¹ According to the data from NTT Communications, 88 percent of decision-makers are changing their purchasing behaviors when it comes to the cloud, with the vast majority indicating that the location of the data is very important. The results do not bode well for recruitment of new customers, either—62 percent of those currently not storing data in the cloud indicated that the revelations have since prevented them from moving their ICT systems there. And finally, 82 percent suggested that they agree with proposals made by German Chancellor Angela Merkel in February 2014 to have separate data networks for Europe, which will be discussed in further detail in Part III of this report. Providing direct evidence of this trend, Servint, a Virginia-based webhosting company, reported in June 2014 that international clients have declined by as much as half, dropping from approximately 60 percent of its business to 30 percent since the leaks began.⁵² With faith in U.S. companies on the decline, foreign companies are stepping in to take advantage of shifting public perceptions. As Georg Mascolo and Ben Scott predicted in a joint paper published by the Wilson Center and the New America Foundation in October 2013, “Major commercial actors on both continents are preparing offensive and defensive strategies to battle in the market for a competitive advantage drawn from Snowden’s revelations.”⁵³ For example, Runbox, a small Norwegian company that offers secure email service, reported a 34 percent jump in customers since June 2013.⁵⁴ Runbox markets itself as a safer email and webhosting provider for both individual and commercial customers, promising that it “will never disclose any user data unauthorized, track your usage, or display any advertisements.”⁵⁵ Since the NSA revelations, the company has touted its privacy-centric design and the fact that its servers are located in Norway as a competitive advantage. “Being firmly located in Norway, the Runbox email service is governed by strict privacy regulations and is a safe alternative to American email services as well as cloud-based services that move data across borders and jurisdictions,” a company representative wrote on its blog in early 2014.⁵⁶ F-Secure, a Finnish cloud storage company, similarly emphasizes the fact that “its roots [are] in Finland, where privacy is a fiercely guarded value.”⁵⁷ Presenting products and services as ‘NSA-proof’ or ‘safer’ alternatives to American-made goods is an increasingly viable strategy for foreign companies hoping to chip away at U.S. tech competitiveness.⁵⁸

Turn- Credibility

Tech competitiveness is high now – only reforms signal confidence in the market.

Danielle Kehl et al., 2014, New America's Open Technology Institute, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity,"

https://www.newamerica.org/downloads/Surveillance_Costs_Final.pdf, mm

Moreover, while the recent developments may temper short-term concerns, they could also set the stage for more troubling changes in the long run. Until recently, most foreign countries have accepted the fact that the U.S. has a comparative advantage in the technology industry that is extremely difficult to challenge. In a number of cases, however, the threat of NSA surveillance may be the catalyst that forces countries to invest heavily in markets that they would otherwise have left to the U.S., including cloud computing and data storage—a shift that will be worth huge amounts of money over time.¹⁴⁶ There is some risk at the moment that the short-term logistical challenges of requiring data localization or turning away from U.S. companies will create a false sense of security among U.S. policymakers and business leaders, obscuring the fact that the United States will squander massive economic value in the long term if it fails to address issues raised by NSA surveillance.

Turn- Fusion Centers

Regulations to protect privacy on the cloud key to business confidence- Lomas 13

(Natasha, "NSA Spying Risks Undermining Trust In U.S. Cloud Computing Businesses, Warns Kroes," Tech Crunch, July 4, 2013, Accessed April 8, 2015, <http://techcrunch.com/2013/07/04/spying-bad-for-business/>)//AD

The NSA spying scandal risks undermining trust in U.S. cloud computing businesses, the European Commission's vice-president, Neelie Kroes, has warned in a speech today. Kroes also reiterated calls for "clarity and transparency" from the U.S. regarding the scope and nature of its surveillance and access to data on individuals and businesses living and conducting business in Europe in order to avoid a knock-on effect on cloud businesses. Loss of Europeans' trust could result in "multi-billion euro consequences" for U.S. cloud providers, she added. Kroes was speaking during a press conference held in Estonia, following a meeting of the EC's European Cloud Partnership Steering Board, which was held to agree on EU-wide specifications for cloud procurement. In her speech, part of which follows below, she argued that: cloud computing businesses are at particular risk of fallout from a wide-reaching U.S. government surveillance program because they rely on their customers' trust to function — trust that the data entrusted to them is stored securely. Kroes said: If businesses or governments think they might be spied on, they will have less reason to trust the cloud, and it will be cloud providers who ultimately miss out. Why would you pay someone else to hold your commercial or other secrets, if you suspect or know they are being shared against your wishes? Front or back door – it doesn't matter – any smart person doesn't want the information shared at all. Customers will act rationally, and providers will miss out on a great opportunity.

Turn- Drones

Regulations provide market certainty and enable growth-

Red Herring, 2/25/15. "Drone investment set to soar despite regulation threat."

<http://www.redherring.com/finance/drone-investment-set-soar-despite-regulation-threat/>

Drones have hit the headlines again this month, as proposed FAA regulations threaten to make package delivery via unmanned aircraft unfeasible. But while lobbyists from **some of technology's biggest names** battle to have the regulation rewritten, **investment in the drone**

sector is likely to continue growing. The Teal Group, an aerospace and defense analyst, **estimates that the industry will be worth \$91**

billion by 2024, from the \$6.4 billion invested annually today. Next year Deloitte says the number of drones valued at \$200 or more will top a million this

year. Amazon Prime Air, whose drones can travel at 50mph and can carry loads of up to five pounds – accounting for 80% of the firm's vast inventory – has shown that drones can be a viable commercial logistics option, as well as

the DHL project explored in last week's Red Herring drone piece. **Investors are taking note. Dedicated drone angels and VCs have begun to**

appear. And while the money put into drone startups is small by Silicon Valley standards, the aforementioned numbers – and some top share picks listed below – will ensure those figures rise quickly.

Investment in drone startups exceeded \$108 million over 29 deals in 2014, a 104% increase in backing

year-on-year, according to CB Insights data. VC giants such as Lightspeed Venture Partners, GGV Capital, Kleiner Perkins Caufield & Byers and other made big bets in the drone market. Drone.VC is an online syndicate

of 106 backers, who have combined to pour \$295,600 into drone technology. Its minimum investment is \$5,000, and the total carry per deal is 20%. 2014's deals include PreNav and Mavix, and the group expects to see five deals a

year. This trend has been happening for a couple of years. In 2013 14 drone tech firms closed their first rounds of funding, and last year total industry venture hit \$65m, with Airware and PrecisionHawk securing some of the more

headline-grabbing rounds. **The FAA, and the question of regulation hangs heavy in the air for drone tech firms.** But

PrecisionHawk's Lisa **Reich sees regulation more as "an enabler rather than deterrent. Today everyone is simply**

restricted from flying for commercial purposes. "Any changes point forward, at this point, would be

upside." Reich claims, on behalf of a company which has adopted a data-first approach to the market. "I think we will still see the consumer hobbyist market and the filming market surge in 2015, but that can easily change

depending on how and when the FAA's policy shapes up and shifts across markets like agriculture and insurance." So, who to invest in? PrecisionHawk and Airware would be good starts. But beyond them there are plenty of firms

making the parts essential to the development of drones for emerging markets such as logistics, agriculture and defense. IXYS Corp, for example, makes chipsets all drone companies will need. Its earnings growth could soon

explode due to demand, and valuation may double. Ambarella makes chipsets for uploading and transmitting HD video. IvenSense, which manufactures leading-edge gyroscopes for motion-tracking devices, is set to perform well,

as is Textron. Other picks have included Northrop Grumman Corporation, AeroVironment and aerospace giant Lockheed Martin. Reich admits that there are little hard data points for domestic U.S. drone growth. But Keven

Gambold, of Unmanned Experts, feels that infrastructure inspection – particularly oil, electricity and building management – will see widespread use of drones in the next 12 months. However it is GIS mapping which he believes

will be "the big win in the coming months. This allows every industry to get a bird's eye view of their workspace without hiring a helicopter crew. When they see the uses, they will all want one!" The numbers may be small for now,

but they will not be for long. Drone investment, as the technology behind it, will be soaring higher than most in 2015.

AT: China Tech D.A- Northwestern

--- Uniqueness ---

N/U: China Low Now

China is 22nd in tech innovation – 21 countries including Korea, Japan, Germany, and US thumps

Bonita Chen 15 (7/24/15, A author for the China Business Review. “Where Does China Rank in the World?” <http://www.chinabusinessreview.com/where-does-china-rank-in-the-world/> Accessed 7/30/15) EK

China has spent enormous amounts of time and money trying to absorb foreign technologies and innovate on its own, but is it paying off? According to Bloomberg’s 2015 ranking of the world’s 50 most innovative countries, **China ranked 22nd** of more than 200. **This ranking is based on** six equally weighted measures: **r**esearch and **d**evelopment expenditure per capita, gross value added by **m**anufacturing, number of **h**igh-tech companies, **p**ostsecondary education levels, the number of **r**esearch personnel per capita, and the number of patents per capita. **South Korea claimed first place, followed by Japan and Germany, and the U**nited **S**tates **finished sixth**. The United States, China, and Japan lead in hi-tech companies, while China’s Tencent Holdings Limited ranked as the tenth largest tech companies by market value. The prevalence of its use of Internet reflects China’s fast growth pace in technology. China has the largest number of global Internet users according to CIA World Factbook, and the fifth largest Internet host.

There is no innovation in China, derails their possibilities to become tech leader

Ambrami et al 14 (Regina M., Senior Lecturer, Political Science, Senior Fellow, Management Department, Wharton School of Business, and Director, Global Program, the Lauder Institute of Management and International Studies, William C. KirbyF, William C. Kirby is T. M. Chang Professor of China Studies and Spangler Family Professor of Business Administration at Harvard University, where is he concurrently the Director of Fairbank Center , Warren McFarlan, Professor of Business Administration, Emeritus, “Why China Can’t Innovate”, Harvard Business Review, <https://hbr.org/2014/03/why-china-cant-innovate>)

The Chinese invented gunpowder, the compass, the waterwheel, paper money, long-distance banking, the civil service, and merit promotion. Until the early 19th century, China’s economy was more open and market driven than the economies of Europe. Today, though, **many believe that the West is home to creative business thinkers and innovators, and that China is largely a land of rule-bound rote learners—a place where R&D is diligently pursued but breakthroughs are rare.**

When we ask why, the answers vary. Some people blame the engineers. “Most **Chinese start-ups are not founded by designers or artists, but by engineers who don’t have the creativity to think of new ideas or designs,**” argues Jason Lim, an editor at the website TechNode. **Others blame the government for the unprecedented scale of its failure to protect intellectual property rights.** Apple’s products have been pirated the world over, they point out, but only China has opened entirely fake Apple stores filled with employees who think they work for the U.S. company. Still **others blame the Chinese education system, with its modernized version** of what the Japanese scholar Ichisada Miyazaki calls “**China’s examination hell.**” How can students so completely focused on test scores possibly be innovators? From our decades of field experience and research in China, and the dozens of case studies we have collectively produced, we see some merit in all those views (but we must point out that many of the most innovative Western firms were founded by engineers). Those criticisms don’t tell the entire story, however. China has no lack of entrepreneurs or market demand. And given the government’s enormous wealth and political will, China has the potential to set the kind of economic policies and build the kind of education and research institutions that propelled the U.S. to technological dominance. But will that potential be realized? We see considerable challenges. **A look at how innovation is happening in China—from the top down, from the bottom up, through acquisition, and through education—sheds light on the complexities of the issue,** highlighting the promise and the problems China faces in its quest to become the world’s innovation leader.

China not competitive now, patent quality shows

Jonquières 14 (Guy de, Senior fellow at the European Centre for International Political Economy (ECIPE), “The flaws in China’s plan to lead world technology”, Europe’s World, http://europesworld.org/2014/02/24/the-flaws-in-chinas-plan-to-lead-world-technology/#.Vbz2p_IVikp)

China’s economic and industrial achievements over the past three decades have repeatedly stunned the rest of the world. But the country’s vaulting ambitions for the future are more breathtaking still – none more so than its goal of becoming an innovation powerhouse by the end of this decade and by 2050 a global leader in science and technology. The scale of China’s ambitions is reflected in its state-backed New Emerging Industries programme. It aims not just to catch up with, but to leapfrog the world leaders in seven sectors, including clean energy, information technology, biotechnology, advanced manufacturing and new materials. Funding is estimated at between \$1.5 trillion and \$2 trillion over five years, contributing substantially to China’s plan to lift research and development spending from 1.9% of GDP today to 2.5%. China can already claim to have made big strides in the past few years in science and technology. Among these are: It has more patent applications than any other country, having overtaken the U.S. three years ago. R&D spending has been rising by 20% a year to about \$300bn annually, second only to the U.S. and more than Germany and Japan combined. Output of scientific publications has soared and the Royal Society, Britain’s leading scientific institution, says China is on course to be the world’s biggest source by 2020. It turns out more than a million engineering graduates yearly. It now has more installed genome sequencing capacity than any other country. This is extraordinary progress by a country that ranks only 90th in the World Bank’s international league table of income per head and still has 160m people living in poverty. Not surprisingly, it has inspired forecasts in the west that China will soon win the race to dominate the industries of the future. Yet, as always with China, it pays to check what lies behind the official data. And on closer investigation, the picture turns out to be decidedly less impressive than it first appears. The surge in patenting is driven less by a spontaneous burst of innovation than by generous incentives intended to swell the number of filings. The quality of patents is far more questionable than their quantity. China itself classifies only a third of the annual total as “innovation” patents, and some independent analyses put the proportion lower still. Some Chinese scholars have warned that the patenting stampede risks devaluing the system. The quality of Chinese scientific publications is equally questionable. They attract relatively few citations, a key measure of other scientists’ opinion of their worth, and the number of papers retracted after being found to involve plagiarism and even fabrication has risen steeply. A recent investigation by Science magazine, published by the American Association for Advancement of Science, uncovered widespread evidence in China of “a flourishing academic black market, involving shady agencies, corrupt scientists and compromised editors.”

Chinese Research and Development facilities are underfunded derailing all tech innovations

Jonquières 14 (Guy de, Senior fellow at the European Centre for International Political Economy (ECIPE), “The flaws in China’s plan to lead world technology”, Europe’s World, http://europesworld.org/2014/02/24/the-flaws-in-chinas-plan-to-lead-world-technology/#.Vbz2p_IVikp)

China’s claimed advances in research look similarly shaky. The China Association for Science and Technology, a professional body, says 60% of government funding for scientific R&D is embezzled or otherwise misappropriated. Wan Gang, the science and technology minister, has declared himself “stunned, angry and distressed” at cases of graft and other abuses by China’s scientists.

China not a future tech leader, student engineers aren’t employable

Jonquières 14 (Guy de, Senior fellow at the European Centre for International Political Economy (ECIPE), “The flaws in China’s plan to lead world technology”, Europe’s World,

http://europesworld.org/2014/02/24/the-flaws-in-chinas-plan-to-lead-world-technology/#.Vbz2p_IVikp

Meanwhile, China's engineering graduates may be numerous, but their quality, too, is uncertain. A poll of leading multinational companies by McKinsey management consultants found that almost all of them considered western-educated engineers more employable than those trained in China or India. Engineering UK, an industry body, calculates that, proportionately, Britain produces two-and-a-half times more employable engineering graduates than does China. Partly for those reasons, China still depends far more heavily on technology developed elsewhere than on home-grown varieties. In 2012, China paid out 18 times more in royalties on foreign patents than it earned in royalty income from abroad. A similar story is implicit in China's determined – but only partly successful – efforts to compel foreign companies to hand over their most advanced proprietary technology in exchange for access to its market. As for genome sequencing capacity, it, too, turns out to be less impressive than it may seem. Genome sequencing requires scientific precision but basically is now a well-established repetitive routine, and the machines China uses to do it are imported.

Government censorship restricts possible innovative ideas, crushing the tech sector

Jonquières 14 (Guy de, Senior fellow at the European Centre for International Political Economy (ECIPE), "The flaws in China's plan to lead world technology", Europe's World, http://europesworld.org/2014/02/24/the-flaws-in-chinas-plan-to-lead-world-technology/#.Vbz2p_IVikp)

China is seeking to tackle the abuses, malpractices and distortions that plague its scientific and research communities. But even if its efforts succeed, its hopes of scaling the technological heights face other questions. One of the biggest is whether the forthright scientific inquiry and bold original thinking needed to advance the frontiers of science can flourish in a country whose education system is heavily geared to rote learning and whose political regime not only discourages freedom of expression but has recently launched an even harsher crackdown on dissent. In any case, China will need more than laboratory breakthroughs if it is to become an innovation leader. It will also need the industrial and institutional structures that enable inventions to be brought to global markets quickly and profitably.

There are 5 reasons why China can't be a tech power in the short term – it lacks key elements that only the US has

Anil **Gupta** and Haiyan **Wang 14** (2/24/14, Michel D. Dingman chair in strategy and globalisation at the University of Maryland's Smith School of Business and coauthor of *The Silk Road Rediscovered* (Wiley, 2014), *Getting China and India Right* (Wiley, 2009), and *The Quest for Global Dominance* (Wiley, 2008). Haiyan Wang is a Managing partner of the China India Institute and coauthor of *The Silk Road Rediscovered* (Wiley, 2014), *Getting China and India Right* (Wiley, 2009), and *The Quest for Global Dominance* (Wiley, 2008). "Asia isn't going to lead technologically anytime soon" http://europesworld.org/2014/02/24/asia-isnt-going-to-lead-technologically-anytime-soon/#.VbwYPjZRG_T Accessed 7/31/15) EK

Fourth, **the factors responsible for China's challenge regarding the productivity of its R&D** (the input-output ratio) **are structural, and therefore not amenable to quick resolution. The biggest impediments in China's path are: •The dominant role of state-owned enterprises**. With rare exceptions such as Huawei and ZTE, state-owned enterprises (SOEs) rule the landscape of big companies in China. **Their primary goal is employment and job**

creation rather than disruptive innovation that may be risky but could undercut other SOEs and create shareholder value. They also enjoy privileged access to input factors and are protected from the rigours of competition. Innovation is not a high priority goal for them, and that's arguably the reason why, other than Huawei and ZTE, there is no equivalent in China to an IBM, a GE or a Honeywell.

•**Allocation of government R&D funds based largely on who-you-know rather than what-you-know.** As Yigong Shi and Yi Rao, deans of Life Sciences at Tsinghua and Peking Universities respectively, put it in an editorial in Science magazine, when it comes to government grants **'it is an open secret that doing good research is not as important as schmoozing with powerful bureaucrats and their favourite experts...China's current research culture...wastes resources, corrupts the spirit, and stymies innovation.'** •**Emphasis on quantity over quality.** **China's R&D culture suffers from a focus on quantity over quality,** the use of local rather than international standards to reward research productivity or grant patents and a continuing weakness in the enforcement of intellectual property protection laws. The result is not just a massive focus on incremental advances but also duplication of what outside China is already proven knowledge. •Rote learning. China's educational system emphasises rote learning rather than creative problem-solving. As Lee Kai-Fu has also noted, **"the Chinese education system makes people hard working, teaches people strong fundamentals, and makes them very good at rote learning. It doesn't make them creative original thinkers."** The result is that iconoclastic minds either get channelled into conventional thinking or "become outcasts and their parents would think they'd gone crazy." •Homogeneity. Unlike the U.S., and Silicon Valley in particular, which thrives on diversity of ethnicity, national backgrounds, cultures and languages, **China is largely a sea of homogeneity. Innovation thrives in a culture of diversity where one doesn't feel the compulsion to fit in and where people with strong backbones are likely to be viewed as heroes.** As Sebastian Thrun, a transplant from Germany and the first head of Google X, the company's big-think research lab, noted in a recent interview with the U.S. journal Foreign Affairs, **"there's a genuine innovative element in America that you find in almost no other culture...people who came over had to be innovative to make their own rules and clear the land and build society up from scratch."**

India Thumper

India Tech sector booming, multiple global investors investing.

FT-2/26/15. Financial Times based of London is a 24 hour multichannel news organization. "February 26, 2015 4:47 Pm India's Technology Sector Receives Record Funding." Ft Technology. Financial Times, 26 Feb. 2015. Web. 30 July 2015. <<http://www.ft.com/intl/cms/2015/02/26/india-tech-sector-receives-record-funding>>

A spate of **deals by global venture capital groups has pushed investment in Indian technology companies to its highest level**, in a further sign of growing excitement over the country's booming internet economy. **Fresh funding for fast-growing e-commerce groups** such as Flipkart and Snapdeal **led to technology-related private equity deals jumping to a record \$2.7bn** in the final quarter of 2014, exceeding the previous high set during 2012, according to data compiled by PwC, the professional services firm. **The influx was driven by investors including SoftBank of Japan and US-based Tiger Global, which are betting increasing sums of money on the hope that Indian internet businesses will soon match the rapid growth** enjoyed over recent years by Chinese equivalents such as Tencent and Baidu. "There is a frenzy," said Mohandas Pai, an investor and entrepreneur based in Bangalore. **"American funds are coming from Silicon Valley, the Chinese and Japanese are coming having made money in the Alibaba listing... They see this as the next big market that is ready to grow."** **The number of Indians connected to the internet is forecast to expand from 300m to more than 500m by 2018, according to Morgan Stanley.** The proportion of the population shopping online is also increasing rapidly, albeit from a low base. **Partly as a result, internet companies now dominate India's investment scene, making up more than half of the value of all private equity deals struck in the fourth quarter of 2014, according to PwC. The value of technology deals also increased more than threefold** compared with the same period the year before. **Prominent investments during that period included a \$700m funding round in December for Flipkart at an estimated valuation in the region of \$11bn, led by Tiger Global, alongside smaller deals for the likes of taxi app start-up Olacabs and property portal Housing.com.** **Hype over Indian technology has increased further this year, in particular following the debut investment from Chinese internet group Alibaba, which struck a deal worth about \$500m for a stake in New Delhi-based mobile payment platform Paytm last month.** Some analysts have raised doubts over the steep valuations being accorded to loss-making technology start-ups, and are worried that a glut of funding will lead to ferocious competition and tempt inexperienced entrepreneurs to burn through cash. But Mohanjit Jolly, a partner at DFJ Ventures, a US investment group, said the size of **India's market and its "clear parallels with China" means the value of technology deals is now likely to increase further this year.** "Investors see the same size of the population [as China], the huge growth potential, the untapped market in second tier cities and towns... So my gut says that the **capital flow will continue, because India just has plenty of headroom**," he said.

India thumps

Fannin 5/27/15 (Rebecca, is a contributor to Forbes and writes about innovation trends in hotspots, she's pretty rad, "China Still Reigns But India Identified As A Next Tech Leader In Meeker's New Internet Report", <http://www.forbes.com/sites/rebeccafannin/2015/05/27/china-still-reigns-but-india-identified-as-a-next-tech-leader-in-meekers-new-internet-report/>, accessed: 7/29/15, SP)

While China clearly emerges again as a tech innovator leader in Mary Meeker's annual Internet Trends report, it's India that is the surprise factor. India is about to reach that tipping point of mass adoption of the Internet, the report concludes. With 232 million Internet users currently, India has become the world's third largest market and the top growth country, adding 63 million users in 2014. China still takes the trophy as the world's largest Internet market (followed by the U.S.), with such leaders as Tencent, Alibaba and JD.com. But growth is slowing: China saw a 7% increase in Internet users compared with a 33% uptake for India. That same trend line is seen in smartphone subscriptions. China has the world lead with 513 million smartphone subscribers, up 21% in 2014. Third-ranked smart phone market India has 140 million subscribers and a growth rate of 55%. Unlike in China, where local brands such as Tencent, Alibaba and Baidu tower, multinational brands including Facebook and LinkedIn rank India as their second-largest globally. As pointed in my book Startup Asia, American brands have struggled to make inroads in China but have become well adopted in the Indian market. They should see more gains too as India's tech ecosystem catches up with China. In another leading indicator identified in the report, India's way ahead on Internet traffic driven by mobile, with 65% of Internet traffic on mobile devices. That compares with 22% in the U.S. and 30% in China. Moreover, mobile as a percentage of a total e-commerce ranks up there too in India, at 41%, leaping past other mobile-saturated countries such as China at 33%. Likewise, Indian Internet leaders are more mobilized than their U.S. or China counterparts. Indian e-commerce brands Snapdeal and Flipkart get about 70% of their revenues from mobile, surpassing Alibaba at 51%, JD.com at 42% and eBay at 33%. Mobile wallets are rising along with e-commerce adoption in India. One startup riding this wave is Paytm with 80 million wallet users, up 17 times year over year..

India will overtake the US in the tech industry by 2017

Patrick **Thibodeau 13** (7/10/13, Patrick Thibodeau covers cloud computing and enterprise applications, outsourcing, government IT policies, data centers and IT workforce issues for Computerworld. "India to overtake U.S. on number of developers by 2017" <http://www.computerworld.com/article/2483690/it-careers/india-to-overtake-u-s--on-number-of-developers-by-2017.html> Accessed 7/27/15) EK

The U.S. may be the global center of the IT universe, but India will exceed the U.S. in the number of software developers by 2017, a new report notes. There are about 18.2 million software developers worldwide, a number that is due to rise to 26.4 million by 2019, a 45% increase, says Evans Data Corp. in its latest Global Developer Population and Demographic Study. Today, the U.S. leads the world in software developers, with about 3.6 million. India has about 2.75 million. But by 2018, India will have 5.2 million developers, a nearly 90% increase, versus 4.5 million in the U.S., a 25% increase though that period, Evans Data projects. India's software development growth rate is attributed, in part, to its population size, 1.2 billion, and relative youth, with about half the population under 25 years of age, and economic growth. India's services firms hire, in many cases, thousands of new employees each quarter. Consequently, IT and software work is seen as clear path to the middle class for many of the nation's young. For instance, in one quarter this year, Tata Consultancy Services added more than 17,000 employees, gross, bringing its total headcount to 263,600. In the same

quarter of 2010, the company had about 150,000 workers. Its real GDP growth has been about 8% over the last decade, but there are signs that growth rate may fall and that could lead to adjustment in the projections, the report said. In 2011, Evans Data projected that India would surpass the U.S. in software developers by 2015. Janel Garvin, the CEO of Evans, told Computerworld that in 2011, in the midst of the recession, the firm had a lower forecast for U.S. growth than it current does. "At that point India's growth was not as effected by the recession so the projection was that India would surpass US earlier," Garvin said. "Since that time there have been improvements in the U.S. and we've adjusted the growth projection accordingly in this latest study." "These are projections and represent the best data we can find, but they are still mathematical projections into the future, and the future is never certain," she said. What is clear is the history and the rate growth among India's fast growing IT services firms. Even firms like IBM have more workers in India than in the U.S. Over the next couple of decades, India will add about 110 million workers to its labor force, more than the U.S., China, Russia and Japan combined, says Goldman Sachs. In 2018, China will have about 1.9 million programmers, and Russia about 1.3 million, Evans Data projects. NASSCOM, India's IT industry group, expects IT exports to grow between 12 and 14% next year, driven by "anything-as-a-service," smart computing, which connects systems with physical infrastructure, and growth in the SMB market, among other sectors.

India thumps the DA – Chinese tech growth is slowing

Richter 14 Felix, data journalist for Statista, October 17th, 2014, "Emerging Markets to Lead Tech Sector Growth in 2015" (<http://www.statista.com/chart/2799/emerging-markets-to-lead-tech-sector-growth-in-2015>) 8/1/15 ANH

The global consumer electronics market has been stagnant at around \$1 trillion for the past three years. However, while mature markets are in a slump, there are other countries that continue to see considerable growth. According to a recent GfK report, the Top 10 growth markets in 2015 will all be emerging economies. Contrary to the common assumption that China is the largest growth market for the tech industry, GfK predicts that India's market for tech devices will see the biggest growth in 2015. GfK expects total sales of tech devices in India to reach \$34.8 billion in 2015, up \$4.8 billion from this year's expected total. Smartphones are the main growth driver in India, as handset prices have come down to a price that is affordable to many Indians. China's tech market, while much bigger in size than India's, is predicted to grow by \$1.8 billion in 2015, which would be a meager 1% increase over the estimated 2014 total but still enough to make China the second largest growth market in dollar terms.

South Korea Thumper

Korea will become the leader in tech innovation

Alan **McGlade 14** (2/6/14, Alan McGlade is a Managing Director at DEV. He was a CEO at MediaNet, and executive at MTV Networks and CEO of The Box Music Television, Orsudebt if StarNet, President at Adlink. “Why South Korea Will Be The Next Global Hub For Tech Startups”

<http://www.forbes.com/sites/alanmcglade/2014/02/06/why-south-korea-will-be-the-next-global-hub-for-tech-startups/> Accessed 7/29/15) EK

American business has long led the way in high tech density or the proportion of businesses that engage in activities such as Internet software and services, hardware and semiconductors. The US is fertile ground for tech start-ups with access to capital and a culture that celebrates risk taking. **Other countries have made their mark on the world stage, competing to be prominent tech and innovation hubs.** Israel has been lauded as a start-up nation with several hundred companies getting funded by venture capital each year. A number of these companies are now being acquired by the likes of Apple, Facebook and Google. Finland and Sweden have attracted notice by bringing us Angry Birds and Spotify among others. **But a new start-up powerhouse is on the horizon – South Korea. Bloomberg** News recently published the Bloomberg Global Innovation Index and **ranked South Korea first among all nations by comparing a group of indicators such as research & development capability, productivity, tech density and patent activity.** South Korea’s ranking is not a surprise. **In recent decades, South Korea has transformed into an economic heavyweight, having systematically applied substantial resources to research and development. As a result, South Korea has become the world leader in patent activity, and information and communication technology.** The country has the highest broadband penetration in the world at 97 percent and is a leader in broadband speed with an average peak connection of close to 50 megabits per second. **Success in manufacturing and exporting cutting edge electronics products has burnished the country’s image as a leader in technology but the connection goes deeper.** Koreans are avid consumers of digital media and apply the lion’s share of their bandwidth resources to online gaming. South Korea is home to the World Cyber Games, the world’s largest video game competition, and has three television channels fully dedicated to eSports featuring professional gamers. South Korea’s home grown, highly visual K-Pop music videos are streamed by the millions and have become a significant global export. Last year streaming of mok-bang through Afreeca TV, a peer-to-peer online video network, became the rage. For the uninitiated, mok-bang videos feature self-made celebrities eating massive amounts of food for hours. **Increasingly young technologists are fueling a fledgling start-up scene that is led by mobile game developers and social media innovators. This is complemented by entrepreneurs returning from overseas with an eye on conquering the globe.** These entrepreneurs are coming back with a sense of how to take on the US market, a greater willingness to assume risk, and an interest in building things that aren’t just made for Korea. This has attracted the notice of American technology companies. Google has taken an active role in nurturing South Korean companies, introducing their favorites in the US to help them build a global profile. A company called Sparklabs was formed a little over a year ago with offices in Seoul and San Francisco to incubate Korean start-ups. **There is a growing interest from overseas VCs in the South Korean venture ecosystem as well as a rise of angel groups, accelerators and event organizations to promote entrepreneurship in Korea.** Softbank Ventures, StoneBridge Capital, and Strong Ventures are a few examples of established VCs moving to get a foothold in South Korea. My firm, Digital Entertainment Ventures, is pursuing a South Korea strategy as well. However, to fully understand the Korean venture capital industry, it is critical to recognize the important role of the government in promoting and supplementing private fund-raising and investment in the venture capital market. **In 2013, South Korean President Park Geun-Hye announced the desire for a more “creative economy” and launched the new Ministry of Science, ICT and Future Planning.** For 2014, the ministry’s budget increased to more than (USD equivalent) 12 billion, with over two billion going directly into fostering growth for the startup ecosystem along with elimination of many restrictions on the venture industry’s activities. **It is logical for South Korea to follow this path. The country is smaller than the state of New York, is not rich in oil or other natural resources, and has limited agriculture and manufacturing capacity. Korean’s must promote technology and innovation to be competitive as a nation since it is not enough to just contend on cost or scale.** While the South Korean Chaebols, or large family-controlled corporate groups, focus on exporting and

manufacturing, there is a clear recognition that **South Korea needs to have a more diverse economy. Thus, the tides are shifting towards supporting smaller businesses and promoting entrepreneurship.** Formulating new business ideas and inventing IP is only the first part of the equation. **South Korea can ascend to the next level by developing a new venture ecosystem that provides operational support, a broader network and ready access to early stage capital;** one that rewards risk taking by Korea's best and brightest. **These entrepreneurs have the opportunity to target new markets but they need to be funded and properly equipped to design their products for localization by language and culture.** CEO's of early stage companies need access to advisors that can assist them in creating effective pitch presentations and preparing them for exposure to foreign markets and investors. With the right blend of investment and guidance, early-stage Korean companies can take on the US and other global markets and really scale their businesses. **Many of the fundamentals are already in place. Just as Samsung transformed the consumer electronics business, Korean start-ups are poised to have an explosive impact on digital media and services.**

Ext: South Korea Thumper

South Korea will become the leader in tech – especially broadband, mobile tech sector

Jenna **Wortham 6/2** (6/2/15, Jenna Wortham, a technology reporter and columnist for The New York Times, covers start-ups and digital culture. Her stories focus on novel ways consumers are using technology to enhance their daily lives along with emerging Internet-based business models and the personalities shaping the start-up industry. Before joining The Times in 2008, Ms. Wortham was a technology and culture reporter for Wired.com and a freelance writer for Wired magazine. Her work has also appeared in Bust magazine, The Hairpin, Vogue, The Morning News, Fader and various other publications. Ms. Wortham graduated from the University of Virginia. “What Silicon Valley Can Learn From Seoul” http://www.nytimes.com/2015/06/07/magazine/what-silicon-valley-can-learn-from-seoul.html?_r=0 Accessed 7/30/15) EK

While Silicon Valley is the largest and most enduring locus of tech innovation, a number of cities around the planet are nipping at its heels: Tel Aviv, Berlin, Bangalore. But **Seoul, the capital of South Korea, is in a sense the Valley's closest rival.** American investors are beginning to catch on, and venture capital is starting to flow west, across the Pacific. An early-stage American venture firm called 500 Startups recently spun off a small fund called 500 Kimchi, which focuses exclusively on South Korea. Last fall, Goldman Sachs led a round of investment in Woowa Brothers and its delivery service. In May, Google opened a campus in **Seoul**, its first in Asia. The office is in the trendy district of Gangnam — yes, that Gangnam — which **is already home to a growing cluster of mobile start-ups and a handful of technology incubators to mentor them.** Tim Chae, who runs 500 Kimchi, said that **American investors have begun to think of Seoul as a sort of crystal ball.** In it, they can glimpse a future where the most ambitious dreams of Silicon Valley — a cashless, carless, everything-on-demand society — have already been realized. **Nearly all of Seoul's residents use smartphones, and many of the services just now gaining in popularity in the United States have been commonplace in South Korea for years. Much of this was made possible by two decades of enormous public investment. Seoul is blanketed with free Wi-Fi that offers the world's fastest Internet speeds —** twice as fast as the average American's. Back in 1995, **the government began a 10-year plan to build out the country's broadband infrastructure and, through a series of public programs, to teach Koreans what they could do with it.** South Korea also eased regulations on service providers to ensure that consumers would have a multitude of choices — in marked contrast to America, where a handful of cable and telecommunications monopolies dominate the market. Such **healthy competition in Korea keeps the cost of access low. To maintain South Korea's lead, the country's Science Ministry recently announced a \$1.5 billion initiative to upgrade Korea's mobile infrastructure. By 2020, the government predicts, it will be 1,000 times faster — so fast you could download a feature-length movie in approximately one second.** In the same time frame, the Federal Communications Commission hopes to wire most American homes with broadband Internet with speeds of at least 100 megabits per second, or roughly one-sixtieth of South Korea's goal.

--- Link Defense ---

No Trade Off

No trade-off – cooperation now between the US and China tech companies

Carey 7/22 Pete, covers business, real estate, and tech for Mercury News, July 22nd, 2015, "Silicon Valley Follows China's Playbook in Hunt for Business"

(http://www.toptechnews.com/article/index.php?story_id=13100A20NR0F) 7/30/15 ANH

Some of Silicon Valley's biggest companies are investing billions of dollars in China's tech sector in a rush to preserve access to the country's vast markets. In recent months, Intel Relevant Products/Services, Hewlett-Packard and Cisco Relevant Products/Services Systems have doubled down on China through partnerships with Chinese companies, investments in Chinese funds and large donations aimed at making China a global competitor. "In China, you're either in or you're out," said Tai Ming Cheung, director of the Institute on Global Conflict and Cooperation at UC San Diego. **"More and more companies have had to follow the Chinese playbook and develop research and development centers in China, develop joint ventures, provide certain types of technology transfers and provide all sorts of help."** China has the world's fastest-growing market for semiconductors, according to a study by PricewaterhouseCoopers, and recently announced a plan to grow its semiconductor industry by more than 20 percent annually over the next five years. It is also a major market for other high-tech goods, giving foreign companies a big incentive to collaborate with Chinese counterparts. China has made it clear that companies that help with the goal of building up China's tech industry will be viewed more favorably than those that don't, analysts say. The trick is to do it without giving away the store, Cheung said. "You don't transfer your latest technologies," he said. "You leave a gap of one or two generations and hope you can still run faster than the Chinese can." The emphasis on helping the country develop its tech sector is driven by three key factors: the growth of China's tech industry, which has reached a point where it can be a collaborator with the more advanced U.S. companies; a push by the Chinese government to speed up that growth through investment and partnerships with U.S. companies; and a belief that to win in China, U.S. manufacturers need the access to the Chinese market that local partners can provide. "They don't have a choice," said tech analyst Jack Gold. **"If they don't do it, they'll be selling a lot less stuff. That's the bottom line."** Whatever the motives, there has been plenty of collaboration on view in Silicon Valley with announcements from HP, Intel and Cisco Systems of partnerships, investments and donations in China: Hewlett-Packard is becoming a minority shareholder in its own Chinese server, storage Relevant Products/Services and technology business, following the sale of a 51 percent majority stake to Tsinghua Holdings, a state-owned investment arm of Tsinghua University with which HP has collaborated for years. HP said the \$2.3 billion deal will create "a technology powerhouse in China." CEO Meg Whitman called HP's partnership "a bold move to win in today's China." Intel is investing \$1.5 billion for a minority 20 percent stake in Tsinghua Unigroup, a subsidiary of Tsinghua Holdings. Tsinghua recently acquired two Chinese companies that make mobile phone chips and reportedly is preparing to make a \$23 billion offer for memory chip maker Micron Technology, based in Boise, Idaho. The Intel deal should "further strengthen the competitiveness and market position of Chinese semiconductor companies," Zhao Weiguo, chairman and president of Tsinghua Unigroup, said in a news release. The Santa Clara chip giant also announced a partnership with Chinese semiconductor company Rockchip Electronics to "deliver an Intel-branded" mobile system on a chip, targeted at the inexpensive tablet market in China. Intel also is forming a partnership with Aliyun, the cloud Relevant Products/Services-computing subsidiary of China's e-tailing giant Alibaba, to develop products for the international public cloud market, using Intel technology. Cisco Systems recently announced a range of initiatives worth \$10 billion to help with China's "ongoing transformation." It signed an agreement with China's National Development and Reform Commission "to promote the development of a high-tech industry in China," and an agreement with China's universities to invest in a four-year tech program with 100 universities. The companies say they're simply adjusting to a new reality in China. But Robert Atkinson, head of the Information Technology and Innovation Foundation in Washington, D.C., believes China is breaking World Trade Organization rules against anti-competitive behavior. "The Chinese tell these companies, 'You will either form joint ventures and sell under their name in China and transfer technology or you will be kicked out of the Chinese market,'" he said. China's new guidelines for the development of its semiconductor industry "could affect the design and sales Relevant Products/Services operations Relevant Products/Services of several international semiconductor companies," PricewaterhouseCoopers warned in a 2014 study. Raman Chitkara, global technology industry leader at PricewaterhouseCoopers, said "the primary driver" behind recent partnerships and other deals is that China has become the world's biggest market. "Whether it is for automobiles, PCs, mobile phones or TVs, China has become the biggest consumer of these products. It is important for any company which wants to tap that end market to better understand how to operate in that market. That's where the local Chinese companies are better equipped." The changed atmosphere has companies scrambling for Chinese partners. "The common denominator of all these investments is the desire to have safe access to the Chinese," according to Peter Cowhey,

Qualcomm Endowed Chair in Communications and Technology Policy and dean of the School of Global Policy and Strategy at UC San Diego. "The firms believe that China is determined to have an indigenous chip and advanced electronics industry," Cowhey said. "They can either become partners in establishing that Chinese base or find themselves essentially becoming sidelined in China."

Not Zero Sum

US-China tech innovation isn't zero sum – no trade off.

Sappin 14. [Ed, "Why China's newfound innovation is a good thing for America" Washington Post -- March 7 --
www.washingtonpost.com/news/innovations/wp/2014/03/07/why-chinas-newfound-innovation-is-a-good-thing-for-america/]

Though some U.S. companies will be surpassed by their Chinese counterparts, we are not at the beginning of a no-holds-barred innovation arms race. Chinese innovation is not occurring in a vacuum. For a young company in China aspiring to be a global player, the United States will be an important proving ground. Likewise, American companies will find that China, with a flourishing consumer base, is an important test bed and market for their innovations especially as Beijing aims to promote consumer spending as announced by Premier Li Keqiang Wednesday.^a China and the United States will continue to be strong partners and competitors in business, each with an intense national pride. China's growing capability to innovate will likely entice the United States to be the fierce competitor it has always been. Think back to the 80's and 90's when the United States was challenged by Japan Inc. and Korea Inc.. New business models established segments such as Dell in desktop computing and new products in high growth segments such as the iPhone in mobile. Just a few years ago, China's BYD was a darling of the green sector due to its battery technology and electric vehicles. However, Tesla has now roared into the lead in both of these areas.^a Innovation is generally not a zero-sum game. Chinese growth does not mean the end of American innovation. Rather, it marks the beginning of a higher level of competition where one country compels more focused, more rapid and all-around better innovation from the other. Both nations should stand to gain.

Us-China economic relations aren't zero sum.

Kakaes 1/9/12 (Konstantin, is a writer at New America, where he writes about the evolving uses of drones, "No One Can Win the Future",
http://www.slate.com/articles/technology/future_tense/2012/01/u_s_scientists_are_not_competing_with_china_or_any_other_country_.html, accessed: 7/31/15, SP)

Almost a year ago, President Obama set a challenge in his State of the Union speech: "We need to out-innovate, out-educate, and out-build the rest of the world." He had just signed a law that ordered the Department of Commerce to write a report on American "competitiveness." That report was released last week and claims that "elements of the U.S. economy are losing their competitive edge which may mean that future generations of Americans will not enjoy a higher standard of living." The report is a perfect example of a line of reasoning common among Republicans and Democrats alike. The idea is that the world is more or less like the Olympics. Countries are engaged in a competition in different fields: scientific research, educational achievement, and the development of new technologies. Obama has repeatedly returned to the idea of competition, declaring in a December speech in Kansas that the United States must win the "race for good jobs." His Republican challengers have also enjoyed raising the specter of an America losing its edge (because of Obama, of course). Obama and the Republicans might disagree on the answers, but they agree on the question: "How can America compete with the rest of the world, especially China?" But this is the wrong question to be asking. We are not actually engaged in economic or technological competition with China or with anyone else. Absent a state of open war, our economic growth helps that of other countries, and vice versa. New technology developed in the United States will benefit the rest of the world, and vice versa. The extremely complicated interactions between countries—goods, people, culture, and ideas all flowing back and forth—are not akin to a sporting competition. To pretend that we are all engaged in a giant worldwide track meet for economic domination serves the interest of business above individuals. To pretend that there is a field event for technological domination actually hurts American business by imposing futile regulations on technology exports. This deeply entrenched misunderstanding about the nature of technological innovation leads to unnecessary tax breaks and prioritizes

trendy metrics of performance (where putative relative success can be measured) **over the fundamentals necessary to shaping a better society**. By **thinking we are racing with China**, or Europe, **we will end up worse off**. The case that we are in competition is often linked to the claim that the United States is somehow "falling behind." A July report by the Information Technology and Innovation Foundation that ranked countries on the basis of how "innovative" they are typifies this perspective: "It is worth reiterating that in 2000 the United States ranked first, a position it likely held for the majority of the post-war period, but in a decade it has fallen to fourth. At this rate, where will the United States rank at the end of the next decade?" The United States was "behind" Singapore, Finland, and Sweden. Comparing a country of 300 million people with a city-state and a couple of Nordic countries whose combined population is less than that of Los Angeles doesn't mean much. But it lets ITIF sound the trumpets of alarm and claim that drastic action is needed.

Market share isn't zero sum.

Moore 4. [Stephen, president of the Club for Growth, "WHAT, U.S. WORRY? Is the United States Losing Its Competitive Edge?" Hoover Institution -- July 28 -- www.hoover.org/research/what-us-worry-united-states-losing-its-competitive-edge]

Stephen Moore: Well, the fact that **China and India**--I agree with Craig--that they **are catching up**. I don't agree with him that they have a middle class like we do. **they're still substantially far behind us, but they are catching up and I would say, Peter, that's good news for the American economy. The global economy is not a zero sum game. It's not as if as China gets richer, that therefore we have to get poorer.** And just look at it this way; imagine that Craig is right and that over the next 20 years you see this acceleration in incomes that you've seen over the next ten years. That's going to mean you're going to have a billion Chinese consumers that are going to start buying automobiles and cellular telephones and all--and movies.

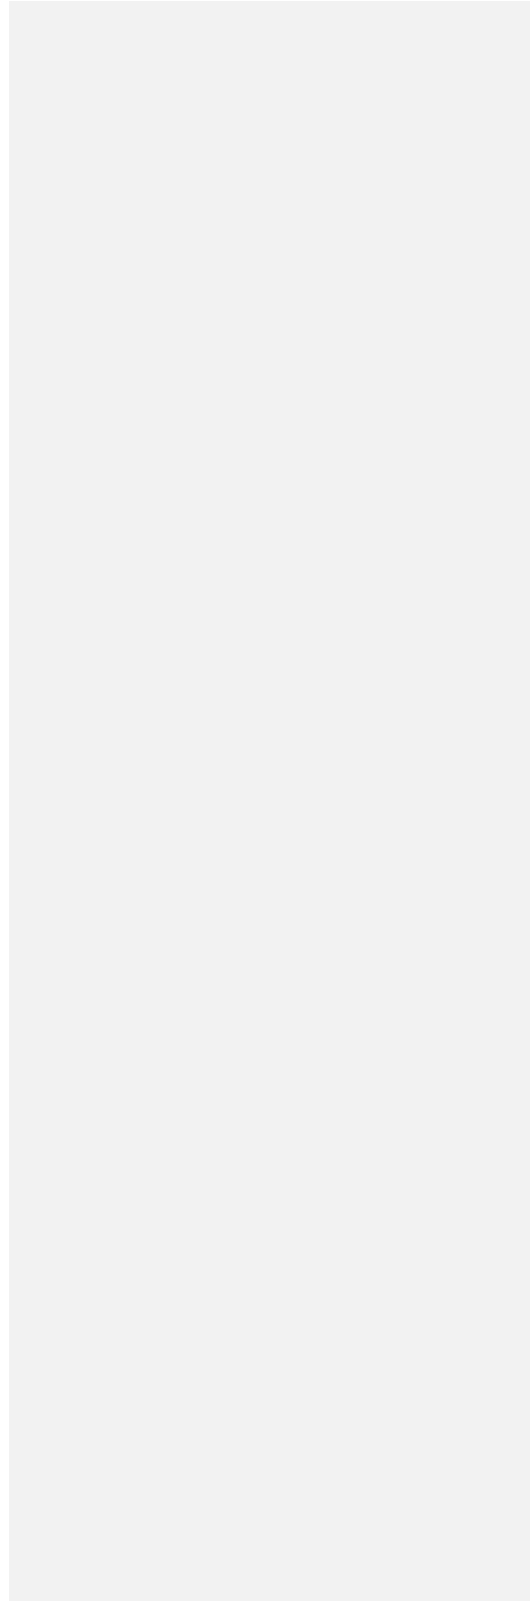

Many rising tech powers now – tech innovation isn't a zero-sum game

Anil Gupta and Haiyan Wang 14 (2/24/14, Michel D. Dingman chair in strategy and globalisation at the University of Maryland's Smith School of Business and coauthor of *The Silk Road Rediscovered* (Wiley, 2014), *Getting China and India Right* (Wiley, 2009), and *The Quest for Global Dominance* (Wiley, 2008). Haiyan Wang is a Managing partner of the China India Institute and coauthor of *The Silk Road Rediscovered* (Wiley, 2014), *Getting China and India Right* (Wiley, 2009), and *The Quest for Global Dominance* (Wiley, 2008). "Asia isn't going to lead technologically anytime soon" http://europesworld.org/2014/02/24/asia-isnt-going-to-lead-technologically-anytime-soon/#.VbwYPjZRG_T Accessed 7/31/15) EK

Chinese insiders, unlike those western observers who claim that China is about to overtake the U.S. and other advanced economies in the innovation game, appear to recognise the challenges that still lie ahead. In mid-2013, at workshops for three groups of senior executives from some of China's largest state-owned enterprises, we conducted a confidential survey that revealed that over half of them believed China would be a bigger economic power than the U.S. by 2025, but only 13% believed that it would also overtake the U.S. technologically. **Fifth, the prospects are that in the long run some of today's big emerging economies will close the gap in technological innovation with the U.S., Europe, Japan and South Korea, and the most likely candidates for doing so are China and India.** Despite the economic turmoil engulfing almost all emerging economies, the IMF predicts that in 2014, the Chinese and Indian economies will grow by 7% and 5-6% respectively – significantly faster than Brazil or Russia. China is very likely to emerge as the world's largest economy by 2025, and India as the third largest by 2030. With their growing economic size, these two countries are almost certain to increase further their investment in R&D, and they also have some of the strongest institutions of higher education in the emerging world. They will benefit, too, from network linkages between the large numbers of highly skilled Chinese and Indian immigrants in key technology hubs such as Silicon Valley and institutions back in their homelands. **The eventual rise of China, India and a few other economies as technology powers will be the culmination of a trend towards the emergence of a multi-polar world economy that has been underway for the last two to three decades.** This is almost certain to have positive implications for all economies, including today's developed economies. Much innovation constitutes 'public' goods, either right off the bat or after patents expire or competitors figure out how to legally reverse engineer a pioneer's ideas. **The emergence of new innovation hubs**

therefore has strong non-zero-sum characteristics that will benefit not just the newcomers but established players, too.

--- Impacts ---

Impact D: China Econ Resilient

Chinese economy resilient – predicted growth and empirics disprove collapse

Fingleton 6/28 Eamonn, East Asian economy expert and editor for Forbes magazine, June 28th, 2015, “Chinese Stock Prices May Be Crazy, But the Economy Will Keep on Truckin', Says Top China Watcher” (<http://www.forbes.com/sites/eamonnfingleton/2015/06/28/chinese-stock-prices-may-be-crazy-but-the-economy-isnt/>) 7/31/15 ANH

With the Shanghai index down nearly 20 percent from vertiginous heights reached in mid-May, a lot of people are wondering what next – and not a few are suggesting the Chinese economy is headed off a cliff. Pat Choate begs to differ. “The connection between Chinese stocks and the real economy is zero,” he pronounces. “Chinese corporations do not need high stock prices to keep expanding. They are government-owned entities financed by a government-owned banking sector.” An institutional economist who was Ross Perot’s running mate in the 1996 presidential election, he ranks among America’s most experienced China watchers. As such, he has never fallen for the story that the Chinese economy has been teetering on the brink of disaster (a story that has been a hardy perennial at least as far back as 2001, when Gordon Chang published *The Coming Collapse of China*). He estimates that China’s GDP growth over the next five years is likely to average between 5 and 6 percent. That is lower than the 7.4 percent achieved in 2014 but, as he points out, it is far faster than any other major economy is likely to achieve. It is moreover to be expected that as China’s share of total global economic output increases, its GDP growth will inevitably begin to tail off. That said, Choate believes China still has major opportunities ahead in, for instance, building fast train networks and otherwise improving its infrastructure. Meanwhile it is likely to acquire ever more of the West’s most valuable production technologies, enabling it therefore powerfully to leverage its worker productivity. An ironic factor in all this is that many Chinese blue chips do not seem particularly expensive. Although price-earnings ratios of 80 and more have been widely publicized, the companies involved tend to be of secondary importance. By contrast, Petrochina, recently China’s big gest corporation by market capitalization, was on a trailing PE of 16.7 — not remarkably higher than Exxon Mobil’s 12.6. The small premium indeed would seem justified given China’s greater economic growth prospects. Similarly China Mobile is on a PE of 15.0, versus 20.0 for Verizo. (Full disclosure: Verizon’s latest year’s earnings were depressed by special items and the company is on a prospective PE of 12.0.)

Impact Turn

China's strategy of bolstering tech at the expense of the US post the NSA revelations guarantees its collapse. The impact is inevitable.

Abrami, 15 (Regina, Senior Lecturer in Political Science and a Senior Fellow in the Management Department of Wharton School of Business, and Director of the Global Program, the Lauder Institute of Management and International Innovation Policy in China: Building a Thucydides's Tech Trap?" 7/20/15, <https://blogs.nottingham.ac.uk/chinapolicyinstitute/2015/07/20/innovation-policy-in-china-building-a-thucydides-tech-trap/>)

China is building a trap that will impede its long term political and economic strategic interests. Put simply, reliance on market-distorting policies is a sure means to do two things: (1) further tensions with the United States and the European Union, and (2) calcify China's existing knowledge economy. In the context of WTO regulations, a highly mobile, educated Chinese elite, venture capitalists, and angel investors top-down protectionism is an archaic, ill-equipped means to develop disruptive capabilities. Instead of seeding potentially far-reaching ideas, China's innovation policies channel energies to state administrators and their dictates, creating a culture of compliance instead of creativity. Take the case of China's recently proposed banking regulations. They require an increasing share of only "secure and controllable" technologies in the sector. To obtain this designation, firms need to demonstrate that a given piece of hardware or software can be "self-controlled." In published rules, such status seems to be contingent on three things: (a) the Chinese government's ability to maintain and control accessibility (i.e., "backdoors" and source codes); (b) foreign supplier provision of R&D centers in China; and (c) the origin of a product's intellectual property being China. Improved cybersecurity is the stated official motive for these regulations, but critics have described these proposed regulations as an intolerable mix of protectionism and forced technology transfer aimed to eliminate foreign firms from China's lucrative ICT sector. It would not be the first time. The phrase, "de-I.O.E.," dates to 2008 when Wang Jian, now Alibaba's Chief Technology Officer and former Assistant Managing Director at Microsoft Research Asia, moved to do away with the company's existing IT network which depended on the three big players, IBM (I), Oracle (O), and EMC (E). Wang's long game was a shift to cloud computing to globalize the company's operations, cut costs, and ultimately create an alternative to the dominant mobile operating systems found in China – namely, Android and iOS (Apple). Aliyun was Alibaba's cloud result, with its mobile platform operating system, YunOS released in 2011. The Chinese government has supported Alibaba's efforts wholeheartedly, making YunOS the only approved mobile operating system on the 2014 central government procurement list. With this climate for business, there can be little wonder that China's Academy of Sciences thought it prudent to develop products in this area as well, releasing the more patriotically named "China Operating System" (COS) in 2014. YunOS and COS, nonetheless, remain market duds. Android continues to rule in China, even as the number of foreign ICT products getting kicked off China's central government procurement list continues to grow. It prevails because of the ecosystem that put it where it is today, and perhaps especially the Open Handset Alliance which brings together 84 firms of varying national origin, to ensure open source standards for their industry, including compatible versions of Android. Indeed, where Chinese firms have responded to market-driven needs, they have usually excelled, often incrementally innovating along the way. "Pony" Ma (Ma Huateng), Tencent founder, in describing the instant messaging service, We Chat, for example, described its success as the result of "micro-innovations." Similar incremental innovations occur at all points along China-based supply chains, including cost reductions, process improvements, and quality performance changes, each geared to suit customer preferences and enhance producer margins. As a result, Chinese firms have at times won the "fight for the middle," ultimately acquiring a dominant market share at home and abroad in many lower and mid-market product segments. Therefore, the Chinese government's push to frame homegrown innovation as a zero sum game with the world is a sure-fire way to ensure that the only gates closing down technologically will not be China's but everyone else's. Not only will trade disputes with China continue as a result but, as seems the case already, leaders will take their disputes to the front page. Hacking, snooping, and stealing are hardly new in the business of international ICT competition, but when dominant powers openly point fingers, as Obama and others now do, it is time for the Chinese government to consider that it may have picked an unnecessary fight. Chinese firms are feisty enough in their own right. Surely making it easier for the rest of the world to restrain them cannot be China's end game? State-led technonationalism has no place in today's world of spatially expansive value chains.

AT: Circumvention MSDI

Circumvention Backfires

Circumvention will stop due to large negative effects- aff still solves.

Pitter 14' June 5th <https://www.hrw.org/news> senior national security counsel in Human Rights Watch's US Program, monitors, analyzes and writes on US national security policies

According to a recently disclosed 2011 FISA court opinion, roughly 250 million Internet communications were acquired under Section 702; as of April 5, 2013, there were 117,675 active "targets." Those targets, by the way, don't have to be individuals. Under guidelines previously secret but disclosed by Snowden, they can be "facilities" or "places," too -- meaning each target can potentially rope huge numbers of people into the dragnet. All of this collection has been happening under gag orders that prevent the companies from speaking publicly about it or informing their customers in any meaningful way. **If this trust continues to erode, it will have huge ramifications for U.S. business and foreign policy interests. Technology companies are already losing billions of dollars and overseas customers who want their data stored away from the snooping eyes of the U.S. government. Studies estimate a loss of between \$35 billion and \$180 billion to the U.S. cloud computer industry over the next three years. And U.S. diplomats are now at a distinct disadvantage when negotiating economic and foreign policy agreements abroad.** The leaks have dealt a blow to America's standing when criticizing countries with repressive regimes, who threaten fundamental rights such as freedom of expression and association -- rights that Washington purports to hold dear. Hypocrisy does not sell. **It's time for both the president and Congress to wake up to the damage these programs wreak on U.S. prestige and security and get serious about meaningful reforms.** We need reforms that will end mass collection of personal data -- not just for Americans, but for millions of people around the world accused of no wrongdoing.

A2: Cross Border Sharing

No circumvention – international law forbids circumvention of domestic privacy policies

Human Rights Commission “13 Principles for a Human Rights Respecting State Surveillance Framework” **2013** <https://www.accessnow.org/page/-/docs/Joint%20Statement%20on%20Surveillance%20HRC24.pdf>

SAFEGUARDS FOR INTERNATIONAL COOPERATION¶ In response to changes in the flows of information, and in communications technologies and services, States may¶ need to seek assistance from a foreign service provider. Accordingly, the mutual legal assistance treaties¶ (MLATs) and other agreements entered into by States should ensure that, where the laws of more than one state¶ could apply to communications surveillance, the available standard with the higher level of protection for¶ individuals is applied. States may not use MLAT processes and foreign requests for protected information to¶ circumvent domestic legal restrictions on communications surveillance.

Counter-Surveillance

Surveillance technologies abuse individuals – Circumvention key to prevent abuse.

(Torin **Monahan**, Arizona State University, School of Justice & Social Inquiry, “Counter-surveillance as Political Intervention?” December 2006, Pg 522-523)//Colt45

Because in the eyes of these groups surveillance technologies catalyze abuse by individuals, the answer is to draw attention to the cameras through provocative websites or, more overtly, to circumvent and/or destroy them. The interventions of these activist groups concentrate on the technical side of modern surveillance, and, while they are explicitly critical of social or institutional structures, the tendency is to individualize the problems by individualizing the abusive actors*/who are identified either as police or security guards. Still, it must be noted that attention to police officers or other agents of surveillance is marginal in their presentations. As the next section will show, counter-surveillance can also be targeted at the institutional agents enmeshed within corporate or law-enforcement systems and/or located behind the cameras.

Surveillance creates a disciplinary power relationship within us – Circumvention key to destabilizing surveillance systems.

(Torin **Monahan**, Arizona State University, School of Justice & Social Inquiry, “Counter-surveillance as Political Intervention?” December 2006, Pg 527-528)//Colt45

When viewed from a distance, surveillance and counter-surveillance appear to be engaged in a complicated dance, with the larger, cumbersome partner pushing and pulling while the smaller, defter dancer negotiates herself or himself*/and others*/out of harm’s way. The oafish leader is, of course, the state and corporate apparatus surveilling the public, and the partner is the collective of activist adversaries circumventing or destabilizing surveillance systems. Drawing upon Michel Foucault’s insights about the disciplinary potential of modern bureaucratic regimes, one could read this as a disciplinary or panoptic relationship (Foucault 1977). But Foucault was also insistent upon the productive capacity of power to generate and sustain social relations apart from any property of control that might be possessed by individuals. As Gilles Deleuze wonderfully explicates: “Power has no essence; it is simply operational. It is not an attribute but a relation: the power-relation is the set of possible relations between forces, which passes through the dominated forces no less than through the dominating ...” (Deleuze 1988, 27). Therefore, the metaphor of the panopticon (or all-seeing prison) is not a static or transcendent statement of disciplinary power, but is instead a contingent and situated articulation of modernity in a fluid field of production regimes (Foucault 1980; Deleuze 1992). In explicit response to Foucault’s work, Michel de Certeau’s book *The Practice of Everyday Life* provides a point of departure for thinking about the agency of individuals and groups within disciplinary power structures. For de Certeau (1984), the practices of the dominant dancer clearly would be strategic ones of building control structures to regulate the activities of those in the field of power, whereas the practices of the defter dancer would be much more tactical, poaching-off the existing structures to create new meanings and possibilities. The two dancers may be in opposition, but that does not change the fact that they are engaged in a reciprocal relationship and collective activity but*/importantly*/without comparable degrees of power. It is this tense connection that is worth probing, even if there is never an embrace or a union, because after all the exchanges of strategic structuring and tactical appropriation the dance has

moved somewhere across the floor and created a pattern, or a logic, or a world that was not there before.⁷

Metadata not necessary

Metadata collection of phone records are used to circumvent warrants – leads to warrantless surveillance.

Cahall et al 13 (Bailey Cahall writer for New America, David Sterman is a program Associate for the International Security Program, Emily Schneider is a Senior Program Associate, International Security Program, Peter Bergen Vice President, Director of Studies, Director, International Security, Future of War, and Fellows Programs, 6-5-2013, "Do NSA's Bulk Surveillance Programs Stop Terrorists?," New America, <https://www.newamerica.org/international-security/do-nsas-bulk-surveillance-programs-stop-terrorists/> //Colt45

Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terrorist-related activity, such as fundraising for a terrorist group. Furthermore, our examination of the role of the database of U.S. citizens' telephone metadata in the single plot the government uses to justify the importance of the program – that of Basaaly Moalin, a San Diego cabdriver who in 2007 and 2008 provided \$8,500 to al-Shabaab, al-Qaeda's affiliate in Somalia – calls into question the necessity of the Section 215 bulk collection program.

According to the government, the database of American phone metadata allows intelligence authorities to quickly circumvent the traditional burden of proof associated with criminal warrants, thus allowing them to "connect the dots" faster and prevent future 9/11-scale attacks. Yet in the Moalin case, after using the NSA's phone database to link a number in Somalia to Moalin, the FBI waited two months to begin an investigation and wiretap his phone. Although it's unclear why there was a delay between the NSA tip and the FBI wiretapping, court documents show there was a two-month period in which the FBI was not monitoring Moalin's calls, despite official statements that the bureau had Moalin's phone number and had identified him. , This undercuts the government's theory that the database of Americans' telephone metadata is necessary to expedite the investigative process, since it clearly didn't expedite the process in the single case the government uses to extol its virtues.

Circumvention Causes Trade Backlash

Other countries trying to circumvent the NSA violates international trade law.

(Bysarah **Lazare**, a staff writer for Common Dreams., 4-10-2014, "US: EU Circumvention of NSA Spying Would Violate Trade Law," Common Dreams, <http://www.commondreams.org/news/2014/04/10/us-eu-circumvention-nsa-spying-would-violate-trade-law>)//Colt45

Following Edward Snowden's revelations that the U.S. is spying on people and governments across the world, European Union countries have floated proposals to build a Europe-centric communications system designed to bypass NSA surveillance. But on Friday, the top U.S. trade negotiating body charged that such a move would violate international trade law. "Recent proposals from countries within the European Union to create a Europe-only electronic network (dubbed a 'Schengen cloud' by advocates) or to create national-only electronic networks could potentially lead to effective exclusion or discrimination against foreign service suppliers that are directly offering network services, or dependent on them," states a report released Friday by the office of U.S. Trade Representative Michael Froman. The USTR takes aim at the German state-backed Deutsche Telekom for advocating laws to stop European electronics data from being routed outside the EU in a bid to protect privacy. The report slams this approach as "draconian" and charges that it "appears to be a means of providing protectionist advantage to EU-based ICT suppliers."

AT: Circumvention- Michigan 7

AT: Circumvention – reform good

Reform will snowball

Patel 6/25/2015 (Faiza [co-director of the Brennan Center’s Liberty and National Security Program];
When will surveillance reform stop being just 'cool'?; www.brennancenter.org/blog/when-will-surveillance-reform-stop-being-just-cool; kdf)

Last week, former National Security Agency Director Michael Hayden declared that he was “cool” with the recently enacted USA Freedom Act, which reined in government bulk collection of Americans’ phone records. His characterization of that program as “little” is no doubt accurate. Information from the archive of documents released by NSA whistleblower Edward Snowden has revealed many other programs that pose equal or greater risks to Americans’ privacy. But Hayden is too quick to assume that the phone records program will be the only reform. The passage of the USA Freedom Act is the first curtailment of intelligence authorities since the 9/11 attacks and should mark the beginning — not the end — of reform. It’s no surprise that Congress chose to tackle the phone record program first. It is relatively straightforward for people to understand, and its goal of amassing a vast database of information about Americans is patently difficult to square with our constitutional values. Two review boards found it to be of minimal counterterrorism value, and a federal appeals court declared it illegal. Even the intelligence community and the president were amenable to reform. But Congress is well aware that this reform is insufficient. Many of the votes against the act in the House and Senate came from lawmakers who believe it didn’t go far enough.

AT Fill in: Corporations/Other countries spy

Government surveillance is unique and invites tyranny

Robertson 2015 (James [served on the FISC from 2002 to 2005, resigning the day after warrantless wiretaps were exposed]; Forward of What went wrong with the FISA court; https://www.brennancenter.org/sites/default/files/analysis/What_Went_%20Wrong_With_The_FISA_Court.pdf; kdf)

Many people are surprised to learn that there is no “right to privacy” in the Constitution. Privacy is more of a cultural construct than a legal one in this country, and we are aiding and abetting its steady erosion with our dependence on the Internet, our credit cards and smartphones, our flirtation with social media, and our capitulation to commercial exploitation of Big Data. In a sense, **we are all under surveillance, all the time** — our whereabouts, activities, and transactions reduced to metadata and available to anyone who can break the code — and we have brought it upon ourselves. Surveillance by the government, however, is another matter. Distrust or at least wariness of a government that collects data about us lies deep in the amygdala of our civic consciousness. This administration may be operating lawfully and with full regard to our rights and privileges, but what about that one? Have we been reading too many novels, or is there a real threat of tyranny? Here, of course, is where the Constitution comes in, with the Fourth Amendment’s guarantee of “[t]he right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures.” I have no criticism of the FISA Court. I know and deeply respect every one of its presiding judges for the last 30 years, and I am well acquainted with many of the other FISA judges who have served. They are, every one of them, careful and scrupulous custodians of the extraordinary and sensitive power entrusted to them. The staff that supports the FISA Court, the Justice Department lawyers who appear before the FISA Court, and the FBI, CIA and NSA personnel who present applications to the FISA Court are superb, dedicated professionals. What I do criticize is the mission creep of the statute all of those people are implementing.

No Circumvention

Circumvention won't happen if surveillance is prohibited

Ackerman, 15 --- American national security reporter and blogger, national security editor for the Guardian (6/1/2015, Spencer, The Guardian, "Fears NSA will seek to undermine surveillance reform; Privacy advocates are wary of covert legal acrobatics from the NSA similar to those deployed post-9/11 to circumvent congressional authority," Lexis, JMP)

Despite that recent history, veteran intelligence attorneys reacted with scorn to the idea that NSA lawyers will undermine surveillance reform. Robert Litt, the senior lawyer for director of national intelligence, James Clapper, said during a public appearance last month that creating a banned bulk surveillance program was "not going to happen".

"The whole notion that NSA is just evilly determined to read the law in a fashion contrary to its intent is bullshit, of the sort that the Guardian and the left - but I repeat myself - have fallen in love with. The interpretation of 215 that supported the bulk collection program was creative but not beyond reason, and it was upheld by many judges," said the former NSA general counsel Stewart Baker, referring to Section 215 of the Patriot Act.

This is the section that permits US law enforcement and surveillance agencies to collect business records and expired at midnight, almost two years after the whistleblower Edward Snowden revealed to the Guardian that the Patriot Act was secretly being used to justify the collection of phone records from millions of Americans.

With one exception, the judges that upheld the interpretation sat on the non-adversarial Fisa court, a body that approves nearly all government surveillance requests and modifies about a quarter of them substantially. The exception was reversed by the second circuit court of appeals.

Baker, speaking before the Senate voted, predicted: "I don't think anyone at NSA is going to invest in looking for ways to defy congressional intent if USA Freedom is adopted."

AT: Internet Freedom Impacts – Defense

Zero chance of solving internet freedom

Morozov 15 [Evgeny Morozov, Who's the true enemy of internet freedom - China, Russia, or the US?, The Guardian, <http://www.theguardian.com/commentisfree/2015/jan/04/internet-freedom-china-russia-us-google-microsoft-digital-sovereignty>]

Given that Russia and China are not known for their commitment to freedoms of expression and assembly, it is tempting to view their quest for information sovereignty as yet another stab at censorship and control. In fact, even when the far more benign government of Brazil toyed with the idea of forcing American companies to store user data locally – an idea it eventually abandoned – it was widely accused of draconian overreach. However, Russia, China and Brazil are simply responding to the extremely aggressive tactics adopted by none other than the US. In typical fashion, though, America is completely oblivious to its own actions, believing that there is such a thing as a neutral, cosmopolitan internet and that any efforts to move away from it would result in its “Balkanisation”. But for many countries, this is not Balkanisation at all, merely de-Americanisation. US companies have been playing an ambiguous role in this project. On the one hand, they build efficient and highly functional infrastructure that locks in other countries, creating long-term dependencies that are very messy and costly to undo. They are the true vehicles for whatever is left of America's global modernisation agenda. On the other hand, the companies cannot be seen as mere proxies for the American empire. Especially after the Edward Snowden revelations clearly demonstrated the cosy alliances between America's business and state interests, these companies need to constantly assert their independence – occasionally by taking their own government to court – even if, in reality, most of their interests perfectly align with those of Washington. This explains why Silicon Valley has been so vocal in demanding that the Obama administration do something about internet privacy and surveillance: if internet companies were seen as compromised parties here, their business would collapse. Just look at the misfortunes of Verizon in 2014: uncertain of the extent of data-sharing between Verizon and the NSA, the German government ditched its contract with the US company in favour of Deutsche Telekom. A German government spokesman said at the time: “The federal government wants to win back more technological sovereignty, and therefore prefers to work with German companies.” However, to grasp the full extent of America's hypocrisy on the issue of information sovereignty, one needs to look no further than the ongoing squabble between Microsoft and the US government. It concerns some email content – relevant to an investigation – stored on Microsoft's servers in Ireland. American prosecutors insist that they can obtain such content from Microsoft simply by serving it a warrant – as if it makes no difference that the email is stored in a foreign country. In order to obtain it, Washington would normally need to go through a complex legal process involving bilateral treaties between the governments involved. But now it wants to sidestep that completely and treat the handling of such data as a purely local issue with no international implications. The data resides in cyberspace – and cyberspace knows no borders! The government's reasoning here is that the storage issue is irrelevant; what is relevant is where the content is accessed – and it can be accessed by Microsoft's employees in the US. Microsoft and other tech giants are now fighting the US government in courts, with little success so far, while the Irish government and a handful of European politicians are backing Microsoft. In short, the US government insists that it should have access to data regardless of where it is stored as long as it is handled by US companies. Just imagine the outcry if the Chinese government were to demand access to any data that passes through devices manufactured by Chinese companies – Xiaomi, say, or Lenovo – regardless of whether their users are in London or New York or Tokyo. Note the crucial difference: Russia and China want to be able to access data generated by their citizens on their own soil, whereas the US wants to access data generated by anybody anywhere as long as American companies handle it. In

opposing the efforts of other countries to reclaim a modicum of technological sovereignty, Washington is likely to run into a problem it has already encountered while promoting its nebulous “internet freedom” agenda: its actions speak louder than its words. Rhetorically, it is very hard to oppose government-run digital surveillance and online spin in Russia, China or Iran, when the US government probably does more of it than all of these countries combined. Whatever motivates the desire of Russia and China to exert more control over their digital properties – and only the naive would believe that they are not motivated by concerns over domestic unrest – their actions are proportional to the aggressive efforts of Washington to exploit the fact that so much of the world’s communications infrastructure is run by Silicon Valley. One’s man internet freedom is another man’s internet imperial.

Squo solves—net neutrality

Garside March 3, 2015 (Juliette; Net neutrality is like free speech – and the internet needs rules, says FCC boss; www.theguardian.com/technology/2015/mar/03/net-neutrality-free-speech-fcc-tom-wheeler; kdf)

The US’s top media regulator hit back at critics of new net neutrality rules voted into law last week, comparing them to the first amendment and saying neither government nor private companies had the right to restrict the openness of the internet. The Federal Communications Commission chairman, Tom Wheeler, was speaking in Barcelona at Mobile World Congress, the world’s largest telecoms trade show, just as European governments are meeting to thrash out their own principles for keeping the internet open. “This is no more regulating the internet than the first amendment regulates free speech in our country,” Wheeler said. “If the internet is the most powerful and pervasive platform in the history of the planet, can it exist without a referee? There needs to be a referee with a yardstick, and that is the structure we have put in place. A set of rules that say activity should be just and reasonable, and somebody who can raise the flag if they aren’t.” Telecoms companies across Europe and America have railed against Wheeler’s reforms, saying they will discourage investment in better cable and wireless networks and simply benefit bandwidth-hungry services like Netflix and YouTube, which do not normally pay for their content to be carried across the internet. In the US, Verizon and AT&T, the two largest mobile operators, have said they will try to reverse the new rules in the courts. Meanwhile, Wheeler told conference attendees in Barcelona: “Those who were opposed to the open internet rules like to say this is Depression-era monopoly regulation. We built our model for net neutrality on the regulatory model that has been wildly successful in the US for mobile.” The FCC rules will treat telecoms companies in a similar way to utilities such as electricity. Internet Service Providers will be explicitly prohibited from blocking, throttling or prioritising internet traffic for commercial reasons. Where complaints are raised, the FCC will decide on a case-by-case basis whether what network owners are doing is “fair and just”. The FCC has said it would not intervene areas such as pricing, network unbundling and technical operating requirements. The European parliament is in the midst of negotiations with member states and network operators over final net neutrality rules, which could be published later this spring. A source at one of Europe’s largest mobile carriers said the fear was that Europe would introduce similar rules, only to find itself out of step when the FCC is forced to back down by a legal challenge or a change of president.

AT: Internet k2 economy

Internet not key to growth

Lowrey 2011 (Annie; Freaks, geeks, and the GDP; Mar 8;

www.slate.com/articles/business/moneybox/2011/03/freaks_geeks_and_gdp.html; kdf)

If you have attended any economists' cocktail parties in the past month or so—lucky you!—then you have probably heard chatter about Tyler Cowen's e-book, *The Great Stagnation*. The book seeks to explain why in the United States median wages have grown only slowly since the 1970s and have actually declined in the past decade. Cowen points to an innovation problem: Through the 1970s, the country had plenty of "low-hanging fruit" to juice GDP growth. In the past 40 years, coming up with whiz-bang, life-changing innovations—penicillin, free universal kindergarten, toilets, planes, cars—has proved harder, pulling down growth rates across the industrialized world. But wait! you might say. In the 1970s, American businesses started pumping out amazing, life-changing computing technologies. We got graphing calculators, data-processing systems, modern finance, GPS, silicon chips, ATMs, cell phones, and a host of other innovations. Has the Internet, the most revolutionary communications technology advance since Gutenberg rolled out the printing press, done nothing for GDP growth? The answer, economists broadly agree, is: Sorry, but no—at least, not nearly as much as you would expect. A quarter century ago, with new technologies starting to saturate American homes and businesses, economists looked around and expected to find computer-fueled growth everywhere. But signs of increased productivity or bolstered growth were few and far between. Sure, computers and the Web transformed thousands of businesses and hundreds of industries. But overall, things looked much the same. The GDP growth rate did not tick up significantly, nor did productivity. As economist Robert Solow put it in 1987: "You can see the computer age everywhere but in the productivity statistics." An overlapping set of theories emerged to explain the phenomenon, often termed the "productivity paradox." Perhaps the new technologies advantaged some firms and industries and disadvantaged others, leaving little net gain. Perhaps computer systems were not yet easy enough to use to reduce the amount of effort workers need to exert to perform a given task. Economists also wondered whether it might just take some time—perhaps a lot of time—for the gains to show up. In the past, information technologies tended to need to incubate before they produced gains in economic growth. Consider the case of Gutenberg's printing press. Though the technology radically transformed how people recorded and transmitted news and information, economists have failed to find evidence it sped up per-capita income or GDP growth in the 15th and 16th centuries. At one point, some economists thought that an Internet-driven golden age might have finally arrived in the late 1990s. Between 1995 and 1999, productivity growth rates actually exceeded those during the boom from 1913 to 1972—perhaps meaning the Web and computing had finally brought about a "New Economy." But that high-growth period faded quickly. And some studies found the gains during those years were not as impressive or widespread as initially thought. Robert Gordon, a professor of economics at Northwestern, for instance, has found that computers and the Internet mostly helped boost productivity in durable goods manufacturing—that is, the production of things like computers and semiconductors. "Our central theme is that computers and the Internet do not measure up to the Great Inventions of the late nineteenth and early twentieth century, and in this do not merit the label of Industrial Revolution," he wrote. Gordon's work leads to another theory, one espoused by Cowen himself. Perhaps the Internet is just not as revolutionary as we think it is. Sure, people might derive endless pleasure from it—its tendency to improve people's quality of life is undeniable. And sure, it might have revolutionized how we find, buy, and sell goods and services. But that still does not necessarily mean it is as transformative of an economy as, say, railroads were. That is in part because the Internet and computers tend to push costs toward zero, and have the capacity to reduce the need for labor. You are, of course, currently reading this article for free on a Web site supported not by subscriptions, but by advertising. You probably read a lot of news articles online, every day, and you probably pay nothing for them. Because of the decline in subscriptions, increased competition for advertising dollars, and other Web-driven dynamics, journalism profits and employment have dwindled in the past decade. (That Cowen writes a freely distributed blog and published his ideas in a \$4 e-book rather than a \$25 glossy airport hardcover should not go unnoted here.) Moreover, the Web- and computer-dependent technology sector itself does not employ that many people. And it does not look set to add workers: The Bureau of Labor Statistics estimates that employment in information technology, for instance, will be lower in 2018 than it was in 1998. That the Internet has not produced an economic boom might be hard to believe, Cowen admits. "We have a collective historical memory that technological progress brings a big and predictable stream of revenue growth across most of the economy," he writes. "When it comes to the web, those assumptions are turning out to be wrong or misleading. The revenue-intensive sectors of our economy have been slowing down and the big technological gains are coming in revenue-deficient sectors." But revenue is not always the end-all, be-all—even in economics. That brings us to a final explanation: Maybe it is not the growth that is deficient. Maybe it is the yardstick that is deficient. MIT professor Erik Brynjolfsson * explains the idea using the example of the music industry. "Because you and I stopped buying CDs, the music industry has shrunk, according to revenues and GDP. But we're not listening to less music. There's more music consumed than before." The improved choice and variety and availability of music must be worth something to us—even if it is not easy to put into numbers. "On paper, the way GDP is calculated, the music industry is disappearing, but in reality it's not disappearing. It is disappearing in revenue. It is not disappearing in terms of what you should care about, which is music." As more of our lives are lived online, he wonders whether this might become a bigger problem. "If everybody focuses on the part of the economy that produces dollars, they would be increasingly missing what people actually consume and enjoy. The disconnect becomes bigger and bigger." But providing an alternative measure of what we produce or consume based on the value people derive from Wikipedia or Pandora proves an extraordinary challenge—indeed, no economist has ever really done it. Brynjolfsson says it is possible, perhaps, by adding up various "consumer surpluses," measures of how much consumers would be willing to pay for a given good or service, versus how much they do pay. (You might pony up \$10 for a CD, but why would you if it is free?) That might give a rough sense of the dollar value of what the Internet tends to provide for nothing—and give us an alternative sense of the value of our technologies to us, if not their ability to produce growth or revenue for us. Of course, if our most radical and life-altering technologies are not improving incomes or productivity or

growth, then we still have problems. Quality-of-life improvements do not put dinner on the table or pay for Social Security benefits. Still, even Cowen does not see all doom and gloom ahead, with incomes stagnating endlessly as we do more and more online and bleed more and more jobs and money. Who knows what awesome technologies might be just around the bend?

AT: Circumvention -Georgetown

2AC Frontline – (Specific to the Packet Aff Act)

() Zero link – the version of the plan we wrote is designed to end a practice – not just an authority.

() We get permanent fiat – any other interpretation turns debate from a “should” question to a “will question”. Neg would always win and we’d also learn a lot less.

() We still solve perception. Independently, plan’s language makes circumvention far tougher.

Shackford ‘15

Scott Shackford is an associate editor at Reason. This article is internally quoting Mark Jaycox, a legislative analyst for the Electronic Frontier Foundation - “Is the USA Freedom Act the Best We Can Expect Right Now?” - Reason - 5/20 <http://reason.com/blog/2015/05/20/is-the-usa-freedom-act-the-best-we-can-e>

It doesn't appear to be easy to support the USA Freedom Act. The Act's full real name is the "Uniting and Strengthening America by Fulfilling Rights and Ending Eavesdropping, Dragnet-Collection, and Online Monitoring Act." Knowing the full name of the act helps explain why privacy supporters aren't shouting from the rafters over the legislation, even if they are supporting it. As is the case with many other bills with elaborate names, the USA Freedom Act doesn't actually do what its name states. The USA Freedom Act (H.R. 2048) is Congress' response to the public revelation and the following outrage that the National Security Agency (NSA) has been for years secretly collecting mass amounts of domestic metadata from virtually all Americans as part of its goal of sniffing out terrorists. It has been doing so under the aegis of Section 215 of the PATRIOT Act, which allows the NSA and FBI to collect all sorts of data and records that are relevant to an ongoing investigation. But the NSA and the Foreign Intelligence Surveillance (FISA) Court that oversaw approval of records collection requests took a very, very wide view of what was "relevant," and that included, among other things, the phone records of every single American. There was an awareness among privacy experts that this was happening, but because the entire process was classified, the ability for anybody, even members of Congress, to do much about it was limited. Then Edward Snowden came around and released information showing how remarkably expansive the NSA surveillance actually was. This all came as a surprise to Rep. James Sensenbrenner (R-Wis.), who introduced the PATRIOT Act in 2001. He said it was never his intent to authorize mass collection of the data of Americans in the first place. The USA Freedom Act, which Sensenbrenner has also sponsored, is intended to reform these procedures. But what the USA Freedom Act actually does is fairly modest compared to the amount of surveillance authority the NSA had claimed for itself. It will end the bulk collection of phone metadata collection under Section 215, but that's not the only avenue by which the federal government claims authority to collect huge amounts of private information. Furthermore, right now we're seeing the third attempt to get the act passed, and the strength of the reforms has been watered down along the way. Indeed, some of the reforms called for in the act (storing the telecommunications data with the companies rather than the government and requiring the government to request it) came from former NSA Director Keith Alexander. The support of the Obama Administration has itself given some pause, due to its role in fighting lawsuits against the program and the blatant deception of current Director of Intelligence James Clapper before the Senate about the existence of mass phone record collection. What the USA Freedom Act is intended to do is end mass domestic data collection through Section 215, as well as in the secretive National Security Letters, and require "specific selection terms" to limit mass records requests. It also reforms the FISA court to designate several independent advisors to the court to help provide "legal arguments that advance the protection of individual privacy and civil liberties," making the FISA court a slightly more adversarial place rather than the apparent rubber stamp factory it had been. It will also mandate a declassification review process for FISA court decisions. But it's also really hard to try to gauge the impact of the bill as written, and that's coloring perceptions of its value. Making the situation more complicated is a federal court ruling that is actually friendly to privacy reformers. On May 7, the Second Circuit Court of Appeals ruled that Section 215 never actually authorized the NSA to engage in mass phone metadata collection in the first place. The court ruled that the NSA had stretched the definition of "relevance" and "investigation" too far by scooping up pretty

much everything and storing it just in case it might be useful later. But the court also did not demand any immediate changes, partly because it knew Congress was already working on legislation to deal with the pending sunset of Section 215, which expires June 1. This ruling prompted some rethinking of the USA Freedom Act by the Electronic Frontier Foundation (EFF). The group had previously endorsed each iteration of the act, increasingly reluctantly as it was watered down with each session. In response to the court ruling, though, EFF withdrew its support and went neutral, calling for legislators to now strengthen the act. Mark Jaycox, a legislative analyst for EFF who has been writing about the USA Freedom Act, still has positive things to say about it, but doesn't want Congress to settle for less than it has to. It's the first reform of NSA surveillance since the 1970s. There should be more to it. **"The USA Freedom Act should be stronger,"** Jaycox says. **"Congress should** be pushing for more control for themselves and more for the public." **EFF would like Congress to return to the first iteration of the act that called for** a stronger adversarial position within the FISA court, not just an adviser. They want **Congress to address other authorizations used to justify bulk metadata collection, not just Section 215** and National Security Letters. **They want better "minimization" procedures to make sure information that isn't directly connected to an investigation is properly purged. And they want to remove an "emergency exception"** that allows the government to snoop on any "non-United States person" for 72 hours without any court authorization at all. Given that the court ruling determined that the NSA had been operating outside of the law's intent, should we be concerned that **any attempt to partly rein in surveillance powers without completely eliminating them will ultimately lead back to more abuse?** Who gets to decide what a "specific selection term" is? The same people who determined that every single phone record of every American was "relevant" to investigating potential terrorist attacks on Americans? Jaycox is aware that this abuse concern helps feed the belief **the USA Freedom Act doesn't go nearly far enough. We've seen the intelligence community and the administration stretch definitions,** Jaycox says. "We've seen them come up to the line and cross it completely. Section 215 is an example. I think that's where the hesitancy comes from." It's the FISA court that was supposed to stand in the way of the NSA abusing the language, but that clearly didn't happen. Congress can legislate words to be as narrow as they like, Jaycox notes, "But at the end of the day it's going to be a judge that's reviewing these orders." And thus, there's the push for more transparency and declassification of FISA court decisions, in the hopes of making it more clear how the judges themselves are interpreting the law. The modest reforms weren't enough for some privacy-minded House members like Rep. Justin Amash (R-Mich.), Rep. Thomas Massie (R-Ky.), and Rep. Jared Polis (D-Colo.). They all voted no. Amash later explained on Facebook that he feared passing the USA Freedom Act in the wake of the court ruling would have the impact of authorizing bulk data collection rather than restricting it: "H.R. 2048 falls woefully short of reining in the mass collection of Americans' data, and it takes us a step in the wrong direction by specifically authorizing such collection in violation of the Fourth Amendment to the Constitution. Americans, and members of **Congress, should** demand that Congress **instead pass the original, bipartisan version of the USA FREEDOM Act** from 2013, **which strengthened—not weakened—Section 215's relevance standard to end bulk collection while still allowing the government the flexibility it needs to pursue genuine threats against the United States.**" And this morning Amash posted a letter signed by him and 58 others in the House who voted no, explaining that their opposition to the USA Freedom Act was that the surveillance reforms did not go far enough.

() Extend our Greene ev – it's great at proving plan's language reduces circumvention risks.

() Plan restores strong language – that's sufficient to end circumvention.

Granick '14

Jennifer Granick is the Director of Civil Liberties at the Stanford Center for Internet and Society. Jennifer was the Civil Liberties Director at the Electronic Frontier Foundation. Jennifer practices, speaks and writes about computer crime and security, electronic surveillance, consumer privacy, data protection, copyright, trademark and the Digital Millennium Copyright Act. From 2001 to 2007, Jennifer was Executive Director of CIS and taught Cyberlaw, Computer Crime Law, Internet intermediary liability, and Internet law and policy. Before teaching at Stanford, Jennifer earned her law degree from University of California, Hastings College of the Law and her undergraduate degree from the New College of the University of South Florida. "USA Freedom Act: Oh, Well. Whatever. Nevermind." – [Just Security](http://justsecurity.org/10675/usa-freedom-act-oh-well-whatever-nevermind/) - May 21, 2014 <http://justsecurity.org/10675/usa-freedom-act-oh-well-whatever-nevermind/>

The initially promising USA Freedom Act could have ended the previously secret government practices of **collecting Americans'** calling records, internet transactional **information** and who knows what else **in bulk. Today's version would allow**

broad collection to continue under the guise of reform. The initial version of the bill would have reinforced existing statutory language requiring a showing of “relevance to an authorized investigation” before agents can get an order requiring production of business records, dialing and routing information, and other data, and would have added other limits to ensure massive collection would stop. It also would have implemented reforms to content surveillance under section 702 of the FISA Amendments Act, stopping “back door” searches for Americans’ communications. Last week, a Managers’ Amendment watered those provisions down, substituting new language that would allow agents to use a “specific selection term” as the “basis for production”. The bill defined “specific selection term” as something that “uniquely describe[s] a person, entity, or account.” Given the intelligence community’s success at getting FISA judges to reinterpret obvious language — e.g. “relevance” — in counter-intuitive ways, people wondered what this new language might mean. There’s deep public mistrust for the intelligence community and for the FISA court, which conspired to allow bulk collection under spurious legal justifications for years. Worse, there’s deep public mistrust for the law itself, since the intelligence community’s “nuanced” definitions of normal words have made the public realize that they do not understand the meaning of words like “relevance”, “collection”, “bulk”, or “target”.

AT: Noncompliance — General

Court ruling on Section 215 covers other bulk surveillance programs — it will be enforced.

Ackerman 15 — Spencer Ackerman, national security editor for Guardian US, former senior writer for Wired, won the 2012 National Magazine Award for Digital Reporting, 2015 (“Fears NSA will seek to undermine surveillance reform,” The Guardian, June 1st, Available Online at <http://www.theguardian.com/us-news/2015/jun/01/nsa-surveillance-patriot-act-congress-secret-law>, Accessed 06-08-2015)

Jameel Jaffer, the deputy legal director of the ACLU, expressed confidence that the second circuit court of appeals’ decision last month would effectively step into the breach. The panel found that legal authorities permitting the collection of data “relevant” to an investigation cannot allow the government to gather data in bulk – setting a potentially prohibitive precedent for other bulk-collection programs.

“We don’t know what kinds of bulk-collection programs the government still has in place, but in the past it’s used authorities other than Section 215 to conduct bulk collection of internet metadata, phone records, and financial records. If similar programs are still in place, the ruling will force the government to reconsider them, and probably to end them,” said Jaffer, whose organization brought the suit that the second circuit considered.

Noncompliance isn’t a reason not to do the plan — the real problems are the laws that authorize the surveillance.

Jaffer 13 — Jameel Jaffer, ACLU Deputy Legal Director and Director of ACLU Center for Democracy, 2013 (““There Have Been Some Compliance Incidents”: NSA Violates Surveillance Rules Multiple Times a Day,” ACLU Blog, August 16th, Available Online at <https://www.aclu.org/blog/there-have-been-some-compliance-incidents-nsa-violates-surveillance-rules-multiple-times-day?redirect=blog/national-security/nsa-privacy-violations-even-more-frequent-we-imagined>, Accessed 06-05-2015)

One final note: The NSA’s noncompliance incidents are a big deal, but we **shouldn’t let them become a distraction.** The **far bigger problem** is with the law itself, which gives the NSA almost unchecked authority to monitor Americans’ international calls and emails. The problem arises, in other words, not just from the NSA’s non-compliance with the law, but from its compliance with it.

AT: NSA Noncompliance

The NSA and FBI will now have to abide by Congressional mandate — the era of looking the other way on surveillance has ended.

Buttar 15 — Shahid Buttar, constitutional lawyer and executive director of the Bill of Rights Defense Committee, 2015 ("Senate Moves to Check Executive Spying Power," The Progressive, May 27th, Available Online at <http://progressive.org/news/2015/05/188151/senate-moves-check-executive-spying-power>, Accessed 06-07-2015)

The political shift indicates a direction for future reform.

Who Wins and Who Loses?

The most obvious losers are the NSA and FBI. After 15 years of breaking already permissive laws, yet not congressional blank checks, the agencies must finally start complying with constitutional limits.

Within the agencies, senior leaders of the intelligence establishment also emerge looking like clowns. Section 215 survived this long only because agency officials—including Director of National Intelligence James Clapper and former NSA Director Michael Hayden—lied under oath to evade oversight. The Senate's decision to end a program that senators learned about from whistleblowers, instead of those officials, further discredits their legacies.

Even if they remain above the law by evading the prosecution for perjury sought by multiple members of Congress, their careers will be defined by congressional and judicial rejection of illegal programs they built in secret.

To the extent intelligence officials are clowns, the many congressional leaders from both parties who supported them are stooges. Establishment Democrats and Republicans alike uncritically accepted lies, deferred to them and went along with the Beltway consensus - in sharp contrast to their populist colleagues who proved willing to uphold their oath of office to "defend the Constitution against all enemies, foreign and domestic."

Several winners also emerged from this drama.

Congressional rejection of mass spying vindicates several principles at once, including transparency, oversight, checks and balances, the separation of powers and constitutional rights enshrined in the First and Fourth Amendments. Each of those values is cherished across the political continuum, making them especially powerful during a presidential election year.

Senator Paul is another clear winner. He demonstrated leadership, surged among the crowded GOP field of 2016 presidential hopefuls and effectively seized control of the Senate from the majority leader. With its senators leading both the surveillance/secretcy/corruption caucus, as well as the competing constitutional/privacy/accountability caucus, Kentucky could also claim victory.

The US Constitution may be the most important winner. By proxy, "We the People of the United States" actually scored two victories at once.

Narrowly, the expiration of Patriot Act Section 215 advances Fourth Amendment privacy interests. Even though mass surveillance will continue for now under other legal authorities, one program through

which our government monitors phone calls and tracks everyone's behavior, regardless of wrongdoing, will end.

More broadly, this vote begins a long-overdue process of limiting executive powers, expanded during a period of seeming emergency, which grew entrenched despite proving ineffective as well as constitutionally offensive. In this sense, congressional assertiveness supports democracy in a long-running battle to avoid the erosion from within foreseen by both Alexis de Tocqueville and President and Supreme Allied Commander Dwight Eisenhower.

What Comes Next?

With reformers having triumphed in Congress, the debate over surveillance reform must expand. Further reforms are necessary to enable an adversarial process and greater transparency at the secret Foreign Intelligence Surveillance Court, and also to limit other legal authorities - like Executive Order 12333 and FISA Section 702 - used to justify unconstitutional domestic surveillance.

It's a good thing that a bipartisan measure, the Surveillance State Repeal Act (HR 1466), is poised to do exactly that. Rep. Mark Pocan (D-Wisconsin) and Rep. Thomas Massie (R-Kentucky) introduced the SSRA to force the agencies to justify the expansion of any powers from a constitutional baseline, rather than one contrived by a decade of executive lies.

Congress has long abandoned its role of checking and balancing runaway executive power, but the Senate's recent vote suggests an overdue awakening. Members should heed the political wind, and embrace bipartisan calls for aggressive limits as the starting point for comprehensive surveillance reform.

NSA noncompliance is genuine error, not deliberate avoidance — and mistaken surveillance data is purged.

BloombergBusiness 14 — BloombergBusiness, Byline David Lerman, 2014 (“U.S. Spy Agency Reports Improper Surveillance of Americans,” BloombergBusiness Online, December 24th, Available Online at <http://www.bloomberg.com/news/articles/2014-12-24/spy-agency-to-release-reports-documenting-surveillance-errors>, Accessed 06-05-2015)

After foreign intelligence is acquired, “it must be analyzed to remove or mask certain protected categories of information, including U.S. person information, unless specific exceptions apply,” the NSA said in a statement before posting the documents.

The extent of that collection has never been clear.

The agency said today it has multiple layers of checks in place to prevent further errors in intelligence gathering and retention.

“The vast majority of compliance incidents involve unintentional technical or human error,” NSA said in its executive summary. “NSA goes to great lengths to ensure compliance with the Constitution, laws and regulations.”

Report Violations

The intelligence community is required to report potential violations to the oversight board, as well as the Office of the Director of National Intelligence.

In some cases, surveillance of foreign targets continued even when those targets were in the U.S., although such “non-compliant data” were later purged, according to the reports released today.

Some analysts sent intelligence information to other analysts who weren't authorized to receive it, according to the documents. That information was deleted from recipients' files when discovered.

Congress Checks

Congressional action on Section 215 demonstrates that Congress has stepped up to the plate to enforce anti-surveillance measures — prefer the most recent evidence. This is a sea change in behavior that will lead to aggressive enforcement on other Executive surveillance issues.

Buttar 15 — Shahid Buttar, constitutional lawyer and executive director of the Bill of Rights Defense Committee, 2015 (“Senate Moves to Check Executive Spying Power,” The Progressive, May 27th, Available Online at <http://progressive.org/news/2015/05/188151/senate-moves-check-executive-spying-power>, Accessed 06-07-2015)

A revolution came to Washington in the wee hours of Saturday morning, just after the stroke of midnight. After 15 years of congressional deference to mass surveillance, Congress finally took action— ironically, by failing to take action—and did its job to check and balance executive power.

On May 23, after a hard-fought congressional debate, the Senate effectively allowed portions of the notorious Patriot Act to expire as previously scheduled, appropriately rejecting a compromise branded as the Freedom Act.

It is the first time Congress has meaningfully checked and balanced the national security agencies since 2001. It will not be the last.

Where Did This Come From?

Congress approved the Patriot Act in 2001 with neither debate nor an understanding of what it entailed. Since then, it has accepted—from both the Bush and the Obama administrations—secret legal interpretations contorting statutes into mass surveillance programs recently held illegal by a federal appellate court, as well as lies under oath by senior officials aiming to hide domestic spying programs from congressional and public oversight.

The American people have never gone along quietly.

During the Bush administration, years before the Edward Snowden revelations amplified mass outrage in 2013, nearly 500 cities and eight states issued official declarations decrying mass surveillance. Cities from Lexington, Massachusetts to Bisbee, Arizona (including others in between like New York City, Los Angeles and Dallas), and states as politically diverse as California and Idaho raised their voices.

Since the Snowden revelations, Americans from coast to coast have taken action to challenge domestic spying. We have taken action online, from online petitions shaming the absent chair of a crucial congressional oversight committee, to campaigns promoting mass encryption to force constitutional compliance on the agencies technologically, despite their disdain for legal limits. We have taken action in the streets, outside NSA headquarters, outside the White House, at rallies on Capitol Hill and in our state legislatures. We have fought back with music, sculpture, DJ mixes, poetry and comedy.

While the domestic phone metadata program's days may be numbered, this drama is just beginning.

Hawks may force another Senate vote on Section 215 on the eve of the phone dragnet's expiration. Beyond their desperate effort to save the program, the Freedom Act's rejection paves the way for

further surveillance reform to address other legal authorities under which unconstitutional and ineffective domestic spying will continue even after this authority finally expires.

Congress is willing to enforce —they’ve taken up the issue of surveillance. Prefer the most recent evidence.

Yahoo News 15 — Yahoo News, Byline Scott Bomboy, 2015 (“USA Freedom Act signed, so what’s next for NSA spying?,” Yahoo News, June 3rd, Available Online at <http://news.yahoo.com/usa-freedom-act-signed-next-nsa-spying-111450759.html>, Accessed 06-08-2015)

Surveillance will certainly continue under other parts of the act and under other government programs designed to combat terrorism. But the fight in Congress may just be getting started.

The New York Times says that Senator Mike Lee and Senator Pat Leahy are moving on to targeting the government program that allows e-mails older than six months to be read by investigators. Congressional reformers may also seek to limit the Foreign Intelligence Surveillance Act.

And there is debate in the House and Senate about other spying provisions.

“Some of us don’t think USA Freedom sufficiently ends bulk metadata collection. In fact, [the government] will still contend after the act passes that they can bulk collect all of the websites and emails and all that content,” said Representative Thomas Massie. “Read it closely, it’s only about your phone calls.”

Congress is prepared to enforce surveillance legislation — debate over USA Freedom Act proves.

Buffalo News 15 — Buffalo News Editorial Board, 2015 (“Freedom Act recognizes privacy rights without endangering national security,” Buffalo News, June 5th, Available Online at <http://www.buffalonews.com/opinion/buffalo-news-editorials/freedom-act-recognizes-privacy-rights-without-endangering-national-security-20150605>, Accessed 06-08-2015)

The ensuing debate was appropriately loud and passionate. The main problems with the program were determined to be its secrecy and lack of sufficient oversight to ensure that the NSA was not overstepping its legal bounds. The collection of metadata, itself, was also troubling, even though the NSA wasn’t listening to the content of calls. Rather the agency was analyzing the data and attempting to match it with known or suspected terrorist activities. In that, there may be value. The sifting of data can still take place, as long as the NSA gets a court order to access records held by the phone companies.

The continuing need for aggressive government action against terrorism should, at this point, go without saying. The important point was to determine how government surveillance should work, not whether it was needed. It was also true, though, that the Patriot Act was passed during the post-9/11 fever that gripped the country, including government. Nearly 14 years later, it was time to consider the issue at least somewhat more dispassionately.

The change seems to be a plausible one, though the test of that is yet to come. The United States has not suffered a single foreign-born terrorist attack since 2001 and it is fair to conclude that the telephone surveillance program may have played some role in that.

The Patriot Act escaped close scrutiny until the Snowden revelations. That's just one of the reasons that the USA Freedom Act needs to be closely monitored. Congress needs to satisfy itself that the NSA and any other agencies involved are **complying with the new law**, which President Obama signed on Tuesday night, but it also needs to verify with those agencies that the law is doing the job intended and in a way that serves the legitimate interests of national security.

Still, it's good to see that Congress was able to evaluate the Patriot Act in a way that was inclusive of all interested parties and to produce what looks like a workable compromise. **It's what Congress is supposed to do and what it hasn't done for far too long.**

FISA Court Checks

FISA Court solves — the USA Freedom Act removes the secrecy.

AP 15 — Associated Press, Byline Ken Dilanian, 2015 (“Questions and answers about newly approved USA Freedom Act,” Yahoo News, June 3rd, Available Online at <http://news.yahoo.com/questions-answers-newly-approved-usa-freedom-act-072501403.html>, Accessed 06-08-2015)

Q: What else will change under the USA Freedom Act?

A: The new law gives private companies more leeway to **publicly report information** about the number of national security surveillance demands they receive. And it requires **declassification of FISA Court opinions containing significant legal decisions**, or a summary if declassification is not possible. That is designed to prevent secret interpretations such as the one that allowed bulk collection of U.S. phone records.

AT: Noncompliance — General

No circumvention – bureaucratic forces and leaks

William Saletan **13**, writes about politics, science, technology, and other stuff for Slate and the author of Bearing Right, The Taming of the Spook, 6/1/2013, The Slate, http://www.slate.com/articles/news_and_politics/frame_game/2013/07/nsa_history_how_bureaucrats_leaks_and_courts_tamed_government_surveillance.html ||RS

In January 2007, the President's Surveillance Program officially ceased. At that point, according to the report, "delivery of email and phone-call content to NSA from the major telecom companies ended." In 2008, Congress passed the FISA Amendments Act. That law, as the Guardian and other critics note, facilitated NSA surveillance. But it also mandated the NSA Inspector General's report. In 2009, Obama took over the White House and began to tighten the oversight. Briefings were extended more widely to Congress. In 2011, bulk collection of Internet metadata stopped. That doesn't mean phone or Internet surveillance has ended altogether. It hasn't. It doesn't mean such programs won't be abused or that they're sufficiently supervised. But it does suggest two things. First, contrary to libertarian dogma, government surveillance doesn't always expand. Bureaucratic forces—rules, politics, personal integrity, and finite resources—tend to impose limits and layers of oversight. Second, contrary to government dogma, leaks are a crucial part of this ecosystem of restraint. Without that December 2005 Times story, there's no January 2006 briefing of the full FISC, and the program's reliance on presidential rather than court approval surely would have continued for more than a year. Without Snowden, Congress wouldn't be reexamining the NSA or filing bills to keep the agency in check. And we wouldn't be able to read the inspector general's report in the Guardian. That's what I learned from reading this history of the surveillance program. For the most part, the government has tried to do the right thing. Little by little, it has made progress in cleaning itself up. And Snowden, for all his flaws, is part of the cleansing.

Agencies comply with Section 702 and the FISA courts—no circumvention

Chong 13 – Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("The NSA Documents, Part VII: The Compliance Report," Lawfare, <http://www.lawfareblog.com/nsa-documents-part-vii-compliance-report>, August 24, 2013, Quay)

Some undisclosed portion of the tasking incidents described in the report "involved facilities where at the time of tasking the Government knew or should have known that one of the users of the selector was a United States person." Details of one cited example of such an incident have been redacted. In another incident, the NSA failed to prevent a pending Section 702 tasking request "from being effectuated," although DHS had informed the NSA that the target of the request was "an LPR" (likely stands for "lawful permanent resident"). All Section 702-acquired data was purged in the cited incidents. The Joint Assessment concludes that these incidents are "isolated instances of insufficient due diligence." Most detasking incidents in the reporting period involved non-U.S. persons who had traveled to the U.S.; only one of the detasking delays involved a U.S. person who had been erroneously assessed and targeted as non-U.S. person. The NSA detasked several selectors used by the individual based on the revised assessment, but did not detask one of the individual's telephone numbers for three weeks due to a "miscommunication within an NSA targeting office." The Joint Assessment concludes that better records and additional detasking procedures could prevent such detasking delays from occurring in the future. An undisclosed number of NSA noncompliance incidents involved using U.S. person identifiers to query Section 702 repositories. The Joint Assessment notes that the FISC's October 3, 2011 and November 30, 2011 orders approved modifications to NSA's modification procedures permitting the agency to use U.S. person identifiers to query telephony and non-upstream acquired electronic communications data. The query terms must be approved according to internal NSA procedures, and must be designed to yield foreign intelligence information. In each of the incidents, an NSA analyst made one of two errors: either conducting a query that the NSA had previously determined was a U.S. person identifier, or forgetting to filter out Section 702-acquired data while conducting a federated query ("a query using the same term or terms in multiple NSA databases") using a known U.S. person identifier. The Joint Assessment notes that none of the analysts involved in the incidents were unaware that only approved U.S. person identifiers may be used to query Section 702-acquired data. Although "few" compliance incidents resulted from technical issues in the reporting period, the Joint Assessment notes that "technical issues can have larger implications" because they frequently involve multiple selectors. Thus all Section 702 agencies devote "substantial resources" toward preventing, identifying and remedying such issues. Collection equipment and other systems are tested before deployment, monitoring programs are employed to detect anomalies, joint oversight team members participate in technical briefings to better understand the impact of technical system development on information collection and processing. Some undisclosed number of the compliance incidents during the reporting period caused the NSA systems to overcollect data in violation of what had been authorized under the Section 702 certifications. Further details on particular incidents involving overcollection have been redacted. Two system errors in the reporting period led to delays in detasking

facilities. In one such incident, an adjustment made in the NSA's system during transition between certifications resulted in unauthorized targeting of users in the U.S. for up to three days. The Joint Assessment begins its subsection on the NSA's human errors with the observation that **human errors are the cause of many compliance incidents**. Some human errors are isolated events; others represent a pattern that suggests the need for new training or procedures. As in "the last several reporting periods," the report notes, one of the most common errors in this reporting period involved selectors that were missed in the detasking process, and which were among those used by a target discovered to be in or traveling to the U.S. Subsections on the causes of CIA and FBI noncompliance are heavily redacted. The Joint Assessment describe two types of FBI noncompliance incidents: those concerning errors in the processing of requests and those involving improper targeting. In one processing incident, involving an individual located in the U.S., an FBI supervisory agent intended to reject an acquisition instead accidentally approved it, and the system fail-safe malfunctioned. Information on incidents involving FBI noncompliance with targeting procedures has been substantially redacted. Lastly, an undisclosed number of incidents involved data overproduction by an electronic communication service provider with a Section 702(h) directive. The report states that all of the incidents had different causes, but in each case agency personnel identified the overproduction through automated systems or by properly reporting within their agencies that the acquired data did not match the authorized scope of collection. The Joint Assessment concludes with the general observation "that the agencies have continued to implement the procedures and to follow the guidelines in a manner that reflects a focused and concerted effort by agency personnel to comply with the requirements of Section 702." Although reiterating that no intentional violations or circumventions of the FISA were identified, and that the number of compliance incidents is small, particularly when compared to total collection efforts, the joint oversight team emphasizes the importance of and its own role in continued noncompliance investigation and monitoring of collection activity.

Court ruling on Section 215 covers other bulk surveillance programs — it will be enforced.

Ackerman 15 — Spencer Ackerman, national security editor for Guardian US, former senior writer for Wired, won the 2012 National Magazine Award for Digital Reporting, 2015 ("Fears NSA will seek to undermine surveillance reform," The Guardian, June 1st, Available Online at <http://www.theguardian.com/us-news/2015/jun/01/nsa-surveillance-patriot-act-congress-secret-law>, Accessed 06-08-2015)

Jameel Jaffer, the deputy legal director of the ACLU, expressed confidence that the second circuit court of appeals' decision last month would effectively step into the breach. The panel found that legal authorities permitting the collection of data "relevant" to an investigation cannot allow the government to gather data in bulk – setting a potentially prohibitive precedent for other bulk-collection programs.

"We don't know what kinds of bulk-collection programs the government still has in place, but in the past it's used authorities other than Section 215 to conduct bulk collection of internet metadata, phone records, and financial records. If similar programs are still in place, the ruling will force the government to reconsider them, and probably to end them," said Jaffer, whose organization brought the suit that the second circuit considered.

The DOJ solves circumvention

Bennett 13 – Wells C. Bennett is Managing Editor of Lawfare and a Fellow in National Security Law at the Brookings Institution. Before coming to Brookings, he was an Associate at Arnold & Porter LLP. ("The Latest NSA Documents VI: Non-Compliance Redux, With More DOJ," Lawfare, <http://www.lawfareblog.com/latest-nsa-documents-vi-non-compliance-redux-more-doj>, September 13, 2013, Quay)

Some examples of the new marching orders for minimization and oversight: at least twice during the September 3 Order's authorizing period, NSA must perform a "spot check" of a sample of call detail records, so as to ensure that the agency isn't scooping up any content. The Justice Department also figures prominently here. DOJ attorneys must review, again on no less than two times during the authorization period, NSA metadata query activities, including the justifications given for queries. NSA also must provide copies of all briefing and training materials to the Justice Department Moreover, prior to reporting back the FISC on compliance activities, NSA and Justice personnel must meet, a week before the FISC authorization's expiry, and discuss NSA's conformity with FISC orders. The outcome of that meeting must be reduced to writing and submitted to the court, when the NSA seeks to renew the

metadata authorization. Justice Department personnel likewise must, a week prior to any authorization's lapse, meet with the NSA Inspector General and review oversight and compliance matters. Finally, any proposed automated metadata query processes must be vetted and approved by NSA, the Justice Department, and the FISC. The outlines of a theme can be made out: **DOJ oversight is on the rise**. So query subject to strict rules? Yes. But ask the FISC each time whether it is okay to query? No. Perhaps this marked a modest thaw, in that the FISC restored to the NSA some unilateral—if quite controlled, more heavily DOJ-supervised—authority to consult its vast caches of telephony metadata.

Noncompliance isn't a reason not to do the plan — the real problems are the laws that authorize the surveillance.

Jaffer 13 — Jameel Jaffer, ACLU Deputy Legal Director and Director of ACLU Center for Democracy, 2013 ("There Have Been Some Compliance Incidents": NSA Violates Surveillance Rules Multiple Times a Day," ACLU Blog, August 16th, Available Online at <https://www.aclu.org/blog/there-have-been-some-compliance-incidents-nsa-violates-surveillance-rules-multiple-times-day?redirect=blog/national-security/nsa-privacy-violations-even-more-frequent-we-imagined>, Accessed 06-05-2015)

One final note: The NSA's noncompliance incidents are a big deal, but we **shouldn't let them become a distraction. The far bigger problem is with the law itself, which gives the NSA almost unchecked authority** to monitor Americans' international calls and emails. The problem arises, in other words, not just from the NSA's non-compliance with the law, but from its compliance with it.

Freedom Act the stage for broader oversight reform – the plan generates compliance

HRW 6/3, Internally quoting Cynthia M. Wong is the senior researcher on the Internet and human rights for Human Rights Watch, US: Modest Step to Curb Spy Excesses, 6/3/15, <http://www.hrw.org/news/2015/06/03/us-modest-step-curb-spy-excesses> || RS

(Washington, DC) – The United States Congress has taken a first small step toward curbing excessive government surveillance by passing the USA Freedom Act. The law imposes long overdue limits on the scope of records collection and new measures to increase transparency and oversight of surveillance by the National Security Agency (NSA).

"The USA Freedom Act's passage marks what could be a turn of the tide against mass surveillance in the US," said Cynthia Wong, senior Internet researcher at Human Rights Watch. "Although the bill's reforms are only a modest first step, this is the first time Congress has affirmatively restrained the NSA since the attacks of September 11, 2001."

Intelligence agency compliance is inevitable – they are just slow

Soufan 14 (Ali Soufan, reporter and book reviewer for Wall Street Journal, "The Shadow Lawmakers"- review of Michael Glennon's book – National Security and Double Government, Wall Street Journal, 12/30/14, <http://www.wsj.com/articles/book-review-national-security-and-double-government-by-michael-j-glennon-1419983619>)

Ultimately, though, the flaw with the book is that Mr. Glennon is too enamored of his thesis of an unchanging government. "Few who follow world events can doubt that the Obama administration's approach to multiple national security issues has been essentially the same as that of the Bush administration," he writes. Yes, both administrations were forced to contend with ground wars in Afghanistan and Iraq, and the ongoing war on terrorism. But those aren't examples of Trumanite control. They were, and to a large extent continue to be, unavoidable realities. Yes, the high-risk detention facility at Guantanamo remains open despite Mr. Obama's campaign promises to close it. But the president has been stymied on this front not by a shadowy national-

security apparatus, but by the very public face of government that Mr. Glennon claims is hors de combat in these matters: Congress. In fact, policies have shifted significantly under Mr. Obama in some of the most controversial areas of national security. The current administration, for example, had already halted the “enhanced interrogation techniques” described in the recently released Senate report. It’s true that no one has been held accountable for these abhorrent abuses. But the president closed secret prisons, or so-called Black Sites, and abolished waterboarding and other acts of abuse. These were significant decisions and not mere political theater. The same is true of the Obama administration’s determination to bring accused foreign terrorists back to face U.S. civilian courts. We can debate the merits of the action, but there’s no doubt it was a substantive change. None of this negates Mr. Glennon’s thesis or mutes the warning bell he sounds in these pages. Bureaucrats can and do go wild: Witness the recent IRS scandals. But in my experience inside government and out of it, the system catches up eventually, and the change that really matters flows from the top down, implemented by the private, second government that Mr. Glennon depicts so effectively.

AT: NSA Noncompliance

No circumvention – prefer legal experts

Spencer **Ackerman 6/1**, the national security editor for Guardian US, a former senior writer for Wired, and he won the 2012 National Magazine Award for Digital Reporting, Fears NSA will seek to undermine surveillance reform, 6/1/2015 The Guardian, <http://www.theguardian.com/us-news/2015/jun/01/nsa-surveillance-patriot-act-congress-secret-law> ||RS

Despite that recent history, veteran intelligence attorneys reacted with scorn to the idea that NSA lawyers will undermine surveillance reform. Robert Litt, the senior lawyer for director of national intelligence, James Clapper, said during a public appearance last month that creating a banned bulk surveillance program was “not going to happen”. “The whole notion that NSA is just evilly determined to read the law in a fashion contrary to its intent is bullshit, of the sort that the Guardian and the left – but I repeat myself – have fallen in love with. The interpretation of 215 that supported the bulk collection program was creative but not beyond reason, and it was upheld by many judges,” said the former NSA general counsel Stewart Baker, referring to Section 215 of the Patriot Act. This is the section that permits US law enforcement and surveillance agencies to collect business records and expired at midnight, almost two years after the whistleblower Edward Snowden revealed to the Guardian that the Patriot Act was secretly being used to justify the collection of phone records from millions of Americans. With one exception, the judges that upheld the interpretation sat on the non-adversarial Fisa court, a body that approves nearly all government surveillance requests and modifies about a quarter of them substantially. The exception was reversed by the second circuit court of appeals. Baker, speaking before the Senate voted, predicted: “I don’t think anyone at NSA is going to invest in looking for ways to defy congressional intent if USA Freedom is adopted.”

No NSA noncompliance – leaks

William **Saletan 13**, writes about politics, science, technology, and other stuff for Slate and the author of Bearing Right, The Taming of the Spook, 6/1/2013, The Slate, http://www.slate.com/articles/news_and_politics/frame_game/2013/07/nsa_history_how_bureaucrats_leaks_and_courts_tamed_government_surveillance.html ||RS

In June 2005, DOJ and NSA began to plan the transfer of other NSA surveillance authorities to the court. Six months later, that process was blown open: The New York Times exposed Bush’s “warrantless eavesdropping.” The Times story ignited an outcry and forced NSA to open the program to broader review. One communications company that had been giving the NSA its metadata under presidential authorization told the government to get a court order. In January 2006, the new NSA director, Keith Alexander, finally briefed all members of the FISC, not just the chief judge. In May 2006, the court agreed to authorize NSA collection of “business records” (phone metadata) but “limit[ed] the number of people that could access the data and required more stringent oversight by and reporting to DOJ.” The court caused a 73 percent reduction in the number of foreign targets scrutinized by the NSA, and it rejected the agency’s request for broad collection of domestic communications content.

NSA’s non-compliance rates are low

Chong 13 – Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney’s Office for the Southern District of New York. She graduated from Duke University in 2009. (“The NSA Documents, Part VII: The Compliance Report,” Lawfare, <http://www.lawfareblog.com/nsa-documents-part-vii-compliance-report>, August 24, 2013, Quay)

Section 4 summarizes the oversight team’s findings as to underlying causes of compliance incidents and its assessment of the involved agency’s attempts to prevent recurrences. Again, numbers have been largely redacted from this section of the Joint Assessment. For example, the total number of compliance incidents that involved noncompliance with the targeting and/or minimization procedures of any particular agency remains classified. But the report reveals that the compliance incident rate is 0.49%, described as a “low” rate that nonetheless represents an increase from compliance incident rate in the prior reporting period. Many of these incidents are trivial, involving only the NSA’s failure to notify the NSD and ODNI of certain facts within the timeframe stipulated in the NSA targeting procedures—a median delay of about one business day. Eliminating these particular compliance incidents yields what the reports

describes as a "better measure of substantive compliance with the applicable targeting and minimization procedures." Thus adjusted, the compliance incident rate for this reporting period drops from 0.49% to 0.20%.

Non-compliance incidents are usually trivial

Chong 13 – Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("The NSA Documents, Part VII: The Compliance Report," Lawfare, <http://www.lawfareblog.com/nsa-documents-part-vii-compliance-report>, August 24, 2013, Quay)

The report lists six separate types of compliance incidents involving the NSA's targeting or minimization procedures. Tasking issues involve "incidents where noncompliance with the targeting procedures resulted in an error in the initial tasking of the selector." Detasking issues involves "errors in the detasking of the selector." Notification delays occur when "a notification requirement contained in the targeting procedures was not satisfied." Documentation issues involve "incidents where the determination to target a selector was not properly documented." Overcollection occurs when the NSA's collection systems acquire data regarding untasked selectors while in the process of acquiring communications of properly tasked selectors. Minimization issues simply refer to problems with NSA's compliance with its own minimization procedures. The vast majority of compliance incidents during the reporting period—212 out of 338—were notification delays. There were also 48 tasking incidents, 51 detasking incidents, 2 incidents of overcollection, 15 minimization incidents and 10 documentation incidents. The report redacts a chart that depicts the compliance incident rates of previous reporting periods. Most noncompliance incidents in the reporting period did not involve U.S. persons but involved, for example, typographical errors in tasking that resulted in no collection, detasking delays with respect to facilities used by non-U.S. persons who had entered the country, or notification errors regarding similar detaskings that were not delayed. However, several incidents involved U.S. persons. These involved (1) tasking errors that led to the tasking of facilities used by U.S. persons, (2) delays in tasking facilities after the NSA determined the user of the selector was a U.S. person, and (3) unintentional querying of Section 702 repositories using a U.S. person identifier.

Oversight of the NSA is effective—solves circumvention

DeLong 13 – John M. DeLong is the Director of Compliance for the National Security Agency. He's not biased because he's the leader of compliance, not an employee of the NSA that has an incentive in covering up secrets. ("For Agencies, the Intersection of Technology and Compliance Is Complex," FedTech, <http://www.fedtechmagazine.com/article/2013/02/agencies-intersection-technology-and-compliance-complex>, Winter 2013, Quay)

As almost every chief compliance officer would attest, technology is both a risk and a benefit. But beneath the surface of that maxim lies an even greater truth: Changes in technology often carry the most risk. The National Security Agency is increasingly leveraging technology throughout its compliance program, which allows us to augment — not wholly replace — human safeguards. We use technology to maintain the continuity of our external authorizations, from signed paperwork down to the bits and bytes. We also use technology to record and review our activities, making sure that we follow the laws and policies that guide NSA's operations. Sometimes, where appropriate, we even embed legal and policy guidance directly into our IT architecture. Implementing overlapping safeguards is almost always a good thing in this arena. And technology is a huge multiplier in the agency's compliance program, for quality control and for the good of the nation. Before I discuss how changes in technology can affect compliance, I'm compelled to explain generally, how NSA's operational activities are governed. If the process were a sewing needle, it would have to be threaded at least four times before the first stitch — and this process would often repeat itself. Like all government agencies, NSA's activities are governed by external authorizations. Often, the first step in obtaining such authorizations is for NSA to describe proposals to its overseers. Not surprisingly, this requires us to explain the relevant technology as well as its anticipated interaction with the global technology environment. We must also discuss how the proposed activities would advance national security without sacrificing privacy protections. Next, external entities — such as the Justice Department, the Office of the Director of National Intelligence and the Foreign Intelligence Surveillance Court — review and, as appropriate, approve proposed activities and the procedures that NSA must follow. After that, the agency's compliance program works to keep employees, operations and technology aligned with these procedures, through change and over time.

NSA and FBI will now have to abide by Congressional mandate — the era of looking the other way on surveillance has ended.

Buttar 15 — Shahid Buttar, constitutional lawyer and executive director of the Bill of Rights Defense Committee, 2015 ("Senate Moves to Check Executive Spying Power," The Progressive, May 27th, Available Online at <http://progressive.org/news/2015/05/188151/senate-moves-check-executive-spying-power>, Accessed 06-07-2015)

The political shift indicates a direction for future reform. Who Wins and Who Loses? The most obvious losers are the NSA and FBI. After 15 years of breaking already permissive laws, yet not congressional blank checks, the agencies must finally start complying with constitutional limits. Within the agencies, senior leaders of the intelligence establishment also emerge looking like clowns. Section 215 survived this long only because agency officials—including Director of National Intelligence James Clapper and former NSA Director Michael Hayden—lied under oath to evade oversight. The Senate's decision to end a program that senators learned about from whistleblowers, instead of those officials, further discredits their legacies. Even if they remain above the law by evading the prosecution for perjury sought by multiple members of Congress, their careers will be defined by congressional and judicial rejection of illegal programs they built in secret. To the extent intelligence officials are clowns, the many congressional leaders from both parties who supported them are stooges. Establishment Democrats and Republicans alike uncritically accepted lies, deferred to them and went along with the Beltway consensus - in sharp contrast to their populist colleagues who proved willing to uphold their oath of office to "defend the Constitution against all enemies, foreign and domestic." Several winners also emerged from this drama. Congressional rejection of mass spying vindicates several principles at once, including transparency, oversight, checks and balances, the separation of powers and constitutional rights enshrined in the First and Fourth Amendments. Each of those values is cherished across the political continuum, making them especially powerful during a presidential election year. Senator Paul is another clear winner. He demonstrated leadership, surged among the crowded GOP field of 2016 presidential hopefuls and effectively seized control of the Senate from the majority leader. With its senators leading both the surveillance/secretcy/corruption caucus, as well as the competing constitutional/privacy/accountability caucus, Kentucky could also claim victory. The US Constitution may be the most important winner. By proxy, "We the People of the United States" actually scored two victories at once. Narrowly, the expiration of Patriot Act Section 215 advances Fourth Amendment privacy interests. Even though mass surveillance will continue for now under other legal authorities, one program through which our government monitors phone calls and tracks everyone's behavior, regardless of wrongdoing, will end. More broadly, this vote begins a long-overdue process of limiting executive powers, expanded during a period of seeming emergency, which grew entrenched despite proving ineffective as well as constitutionally offensive. In this sense, congressional assertiveness supports democracy in a long-running battle to avoid the erosion from within foreseen by both Alexis de Tocqueville and President and Supreme Allied Commander Dwight Eisenhower. What Comes Next? With reformers having triumphed in Congress, the debate over surveillance reform must expand. Further reforms are necessary to enable an adversarial process and greater transparency at the secret Foreign Intelligence Surveillance Court, and also to limit other legal authorities - like Executive Order 12333 and FISA Section 702 - used to justify unconstitutional domestic surveillance. It's a good thing that a bipartisan measure, the Surveillance State Repeal Act (HR 1466), is poised to do exactly that. Rep. Mark Pocan (D-Wisconsin) and Rep. Thomas Massie (R-Kentucky) introduced the SSRA to force the agencies to justify the expansion of any powers from a constitutional baseline, rather than one contrived by a decade of executive lies. Congress has long abandoned its role of checking and balancing runaway executive power, but the Senate's recent vote suggests an overdue awakening. Members should heed the political wind, and embrace bipartisan calls for aggressive limits as the starting point for comprehensive surveillance reform.

Let's be realistic—the NSA and FBI aren't rogue agencies and don't do whatever the hell they want to

Wittes 13 – Benjamin Wittes is editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution. He is the author of several books and a member of the Hoover Institution's Task Force on National Security and Law. ("The NSA, Oversight, the Law, and Why Compliance is the Ball Game," Lawfare, <http://www.lawfareblog.com/nsa-oversight-law-and-why-compliance-ball-game>, September 27, 2013, Quay)

Two big forces constrain the use of Big Data material once collected. The first is law. Unless you believe that the intelligence community is a lawless enterprise that will not follow the rules, this puts a premium on the substantive content of the law Congress writes to govern this area. In other words, the reason it matters what the rules are is that we assume that the law actually will constrain NSA. The second, to return to DeLong's quip, is the compliance regime. How scared should you be of our new model—a model in which we have a wide aperture for collection, really restrictive rules of use, and substantive legal rules as a major force restraining improper use? One can, I believe, only answer that question with reference to how confident you are in the compliance procedures that undergird it. It is really important to distinguish between the technical capacity to do something and whether that thing is actually going to happen. The D.C. police could easily raid my house today. They have the technical capacity to do it. Yet I have near-total confidence that it will not happen. The FBI could wiretap my phone. It certainly has the technical capacity to do so, yet I have a near-total confidence that it will not happen. The reason for my confidence is two-fold: the substantive law would not support either action, and there are robust compliance measures that mean that were lawless action were to take place,

there would be accountability at many levels and I would have a remedy. In the era of Big Data, the compliance regime is a big part of the whole ballgame. If you believe the compliance regime inadequate, after all, the government already has the data. But one thing we have learned an enormous amount about is the compliance procedures that NSA uses. They are remarkable. They are detailed. They produce data streams that are extremely telling—and, to my mind, deeply reassuring.

Yes compliance – internal structures and checks

Dan **Verton 14**, Editorial Director at FedScoop and a former USMC intelligence officer, 5/23/14, Despite political rhetoric, the rules matter at NSA, Fedscoop, <http://fedscoop.com/despite-political-rhetoric-the-rules-matter-at-nsa> | | RS

When the House this week voted in favor of curtailing NSA surveillance activities, few people in the U.S. intelligence community were watching more closely than John DeLong.

That's because DeLong is the agency's rules enforcer. And the USA Freedom Act, which passed by a vote of 303-121, would fundamentally alter the current set of rules governing NSA's bulk collection of telephone metadata. If the measure passes the Senate and becomes law, it will fall to DeLong to ensure NSA employees understand the new legal limits governing their actions. As NSA's director of compliance, DeLong gets paid to worry about the conduct of NSA's estimated 35,000 code-breakers, analysts and staff (the actual number is classified). The 300 members of DeLong's office conduct employee training, staff hotlines to answer questions, develop and test IT systems for privacy compliance and conduct spot-checks on processes and procedures. And contrary to the claims of NSA detractors, the compliance effort at the agency is high-profile and has the attention of the most senior agency leaders. "I work directly for the director [of NSA], so I'm able to walk in and advise and consult and have access to what I need to carryout my functions," said DeLong in an exclusive interview with FedScoop at the National Cryptologic Museum, across from NSA headquarters at Fort Meade, Md. "The inspector general and I are right down the hall from each other — very much peers." DeLong also works closely with the agency's chief counsel and the newly-created Civil Liberties and Privacy Office. "It's really a team approach to keeping NSA accountable and building quality [into the system] and making sure we can prove that we're acting in accordance with the rules, authorities and permissions," DeLong said. A graduate of Harvard with a degree in physics and mathematics, DeLong has served as NSA's compliance director since 2009. The five years he's been at NSA have included some of the most difficult times in the agency's 62 year history. But it was one particular day in 2014 – Jan. 17, to be exact – when the rules changed suddenly. That was the day President Barack Obama responded to the national outcry over the bulk data collection authorities granted to NSA by Congress with an executive order that placed new restrictions on NSA. DeLong remembers the day as an example of NSA's commitment to privacy and accountability. "The next hour, folks were in the conference room next to my office and we implemented those changes that day," DeLong said. "That, I would call an accountable organization. The minute [the rules] change, we're responsive to that change." Many more changes have occurred since then, many of them focused on internal security and protecting privacy. Certain systems now require two person control for access, DeLong said. In addition, the agency has deployed enhanced insider threat monitoring capabilities and developed what DeLong calls a "hierarchy of control" to focus on what system administrators can and cannot do with data. NSA is also actively working with several universities to develop technologies that will enable the agency to integrate privacy protections and compliance controls into the hardware and software used throughout the agency. "If an action is not permitted, or if we're not permitted to collect something, the technology should just not allow that," DeLong said. "We've kind of, I think, hit the sweet spot in many of those areas, figuring out how to make sure the laws and the policies get encoded directly into the machines and the computer systems we have, such that they're as much a part of the compliance team as the people we talk to when they walk in the doors." But that sweet spot isn't only about technology. "We're going to still train people on their obligations," DeLong said. "We're going to do both." He calls it the "belt and suspenders approach" to having overlapping safeguards. As for NSA's ability to stop another Edward Snowden from stealing and exposing tens of thousands of classified documents to the public and to America's enemies, DeLong isn't willing to say every security gap has been eliminated. But he is willing to say NSA employees have options for reporting abuses or privacy violations without having to betray the nation. And those options – reporting it to the compliance office, inspector general and general counsel, among others – were in place when Snowden chose to go to the media, DeLong said. "This is one of those times. It's a dynamic time. There's a lot changing," DeLong said. "What doesn't change is accountability, respect for the law and the rule of law."

There's a culture of trust within the NSA and a comprehensive vetting process

DeLong 13 – John M. DeLong is the Director of Compliance for the National Security Agency. He's not biased because he's the leader of compliance, not an employee of the NSA that has an incentive in covering up secrets. ("For Agencies, the Intersection of Technology and Compliance Is Complex," FedTech, <http://www.fedtechmagazine.com/article/2013/02/agencies-intersection-technology-and-compliance-complex>, Winter 2013, Quay)

Finally, NSA has internal and external oversight mechanisms that evaluate its compliance with the specific procedures in the context of the initial descriptions that led to them. This oversight — some of which is constant, some periodic — includes everything from in-person reviews to written reports. For NSA, being "compliant" means threading the needle through all four stages. At any of these points, changes in technology certainly may compound risk. It's no secret that technology can rapidly transform or shift, and NSA constantly interacts with all three branches of the federal government at various stages of the process described above. Our initial descriptions must be accurate. The prescribed specific procedures must incorporate those descriptions, whether explicitly or implicitly. Our implementation must be consistent. And when we are evaluated, we must verify that it all worked according to plan — through any changes and over time. The authorities, laws and policies we operate under are a sacred trust between the nation and NSA. We treat compliance with the same respect. We're charged with delivering national security, but not at any price. A compliance program that is well designed and implemented can adapt to today's technology. To be sure, there are numerous best practices and tools in the compliance toolkit that make it possible. In the national security context, with the four-stage process described above, there is an even greater responsibility to operate with rigor, accuracy and precision. It's not just technology itself but the interplay between the process and constantly changing technology that keeps compliance personnel — and everyone else at NSA — ever vigilant.

NSA noncompliance is genuine error, not deliberate avoidance — and mistaken surveillance data is purged.

BloombergBusiness 14 — BloombergBusiness, Byline David Lerman, 2014 ("U.S. Spy Agency Reports Improper Surveillance of Americans," BloombergBusiness Online, December 24th, Available Online at <http://www.bloomberg.com/news/articles/2014-12-24/spy-agency-to-release-reports-documenting-surveillance-errors>, Accessed 06-05-2015)

After foreign intelligence is acquired, "it must be analyzed to remove or mask certain protected categories of information, including U.S. person information, unless specific exceptions apply," the NSA said in a statement before posting the documents. The extent of that collection has never been clear. The agency said today it has multiple layers of checks in place to prevent further errors in intelligence gathering and retention. "The vast majority of compliance incidents involve unintentional technical or human error," NSA said in its executive summary. "NSA goes to great lengths to ensure compliance with the Constitution, laws and regulations." Report Violations The intelligence community is required to report potential violations to the oversight board, as well as the Office of the Director of National Intelligence. In some cases, surveillance of foreign targets continued even when those targets were in the U.S., although such "non-compliant data" were later purged, according to the reports released today. Some analysts sent intelligence information to other analysts who weren't authorized to receive it, according to the documents. That information was deleted from recipients' files when discovered.

The NSA attempts to minimize non-compliance incidents

Chong 13 – Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("The November NSA Trove VI: More Congressional Stuff," Lawfare, <http://www.lawfareblog.com/november-nsa-trove-vi-more-congressional-stuff>, November 22, 2013, Quay)

First is a six-page memorandum, dated April 10, 2009 and addressed to the majority staff director of the Senate Select Committee on Intelligence. In it, the NSA updates the Committee on some already-identified compliance issues and informs congressional overseers of one new matter. Of the already-identified batch, the first item is NSA's problematic implementation of a FISC-authorized business records (BR) order, wherein 2,476 telephone numbers determined to be associated with terrorism were prematurely added to a special list for retention and query before undergoing formal NSA review designed to ensure that they met the reasonable articulable suspicion (RAS) standard. Second, the memo notes NSA's attempts to mitigate its inadvertent "overcollection" of data; third, it mentions a joint pilot program between NSA and the DIA's Joint Intelligence Task Force-Combating Terrorism (JITF-CT), under which JITF-CT had been allowed to access

counterterrorism-related SIGINT information. **That database was then shut down, amid compliance concerns** Which brings us to new stuff. For the first time, the memo discloses to the Committee NSA's decision to suspend an entity's access to an NSA system called X-KEYSCORE (XKS); the entity's name is redacted from the memo. Ditto details about the system and the problems that led to its suspension.

The NSA purges unnecessary information

Chong 13 – Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("The November NSA Trove VI: More Congressional Stuff," Lawfare, <http://www.lawfareblog.com/november-nsa-trove-vi-more-congressional-stuff>, November 22, 2013, Quay)

Our second oversight document landed in Congress a little more than a month later. The five-page "Notification and Update" memorandum is dated June 29, 2009 and addressed from the NSA's Legislative Affairs Office to the staff director of the House Permanent Select Committee on Intelligence. **The document** is in part a cover letter: it **attaches** (but does not include) **the NSA's so-called "End-to-End Review," its internal evaluation of compliance problems found in Pen Register/Trap & Trace (PR/TT) and BR collection programs.** For its part, **the memo also outlines some of those problems, and reassures the Committee that NSA is taking steps to remediate four compliance issues which had been brought to the attention of Committee staff directors days earlier.** As to those issues, **the June memo first discusses the FISC's approval of NSA's use of a master "defeat" list to purge unwanted information from several NSA data repositories.** Second, it **notes NSA's practice of sharing the unminimized results of queries of Pen Register/Trap & Trace (PR/TT) metadata with non-PR/TT-cleared NSA analysts and the FISC's subsequent order** authorizing this sharing with only specially trained analysts.

Congress knew about Section 215

Wittes and Chong 13 – Benjamin Wittes is editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution. He is the author of several books and a member of the Hoover Institution's Task Force on National Security and Law. Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("Congress is Still Naked," Lawfare, <http://www.lawfareblog.com/congress-still-naked>, September 19, 2013, Quay)

There are really two distinct issues at play here. **The first is whether the intelligence community kept the House and Senate intelligence committees apprised of the program,** as the law requires. **The second is whether other members of the legislature,** who are not members of the intelligence committees but nonetheless had to vote on the reauthorization, **were given relevant information.** As to the first issue, **there really is no question: Both committees were kept fully apprised, as they have both made clear.** At the time the matter first leaked, Senators Dianne Feinstein and Saxby Chambliss, chair and vice-chair of the Senate Intelligence Committee, for example, **issued a statement saying that "[t]he executive branch's use of this authority has been briefed extensively to the Senate and House Intelligence and Judiciary Committees,** and detailed information has been made available to all members of Congress prior to each congressional reauthorization of this law." Representatives Mike Rogers and Dutch Ruppersberger of the House Intelligence Committee, likewise released a statement expressing support for the program and saying that "the Committee routinely reviews all FISA activities." **So the question is really limited to whether non-committee members were kept informed** in advance of their votes. **This is, notably, not a requirement of law. So the question is whether the administration went above and beyond the requirements of the law out of respect for the gravity of what it was asking the legislature to do.** At least in advance of the 2010 reauthorization vote, the answer to this question is also unambiguous. **In December 2009, the executive branch sent a detailed briefing paper to the House and Senate Intelligence Committees.** And Senators Feinstein and Kit Bond wrote a "Dear Colleague" letter inviting all of their colleagues—not just those on the committee—to review the document: Members of the Select Committee on Intelligence have previously requested that the Executive Branch permit each Member of Congress access to information on the nature and significance of intelligence authority on which they are asked to vote. In response to these requests, **the Attorney General and the Director of National Intelligence have provided a classified paper to the House and Senate Intelligence Committees** on important intelligence collection made possible by authority that is subject to the approaching sunset, **and asked for our assistance in making it available, in a secure setting, directly and personally to any interested Member. We would like to invite each Member of the Senate to read this classified paper** in the Intelligence Committee's offices in 211 Hart Senate Office Building. The Attorney General and DNI have offered to make Department of Justice and Intelligence Community personnel available to meet with any Member who has questions. We will be pleased to make members of our staff available for the same purpose. On the House side, Rep. Alcee Hastings, a Member of the intelligence committee, made the following statement on the House floor in February 2010: Mr. Speaker, I rise to inform Members that the Intelligence Committee has received a classified document from the Department of Justice that is related to the PATRIOT Act authorities currently set to expire at the end of the month. The House may consider a 1-year extension of the PATRIOT Act today so the Intelligence Committee will be making this document available for Member review in the committee offices located in HVC-304. Staff from the Intelligence and Judiciary Committees, as well as personnel from the Justice Department and with the Office of the Director of National Intelligence, will be available to answer any questions that Members may have. Members who want to review the document should call the Intelligence Committee to schedule an appointment. (156 Cong. Rec. H838, Feb. 25, 2010) Similarly, **there is no question at all that all senators had access to the 2011 briefing paper.** Another "Dear Colleague" letter informed members that "At the request of our Committee, the Attorney General and DNI have now provided an updated classified report for review by Members in connection with this year's February 28, 2011 sunset. As was requested last year, they have asked that any interested Member review this report in a secure setting." In other words, **in the**

worst case scenario, the intelligence committees were kept fully informed, both houses of Congress received classified briefing papers for all members to see in advance of the 2010 vote and both arranged for all-member access, and both houses received such a paper again in 2011—with one arranging for all-member access and one neglecting to do so.

Congress knew—and if they didn't, it was their fault, not NSA circumvention

Wittes and Chong 13 – Benjamin Wittes is editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution. He is the author of several books and a member of the Hoover Institution's Task Force on National Security and Law. Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("Congress is Still Naked," Lawfare, <http://www.lawfareblog.com/congress-still-naked>, September 19, 2013, Quay)

But here's the thing: not sharing the specific document is not the same thing as not sharing information. And there's every reason to think that, notwithstanding Chairman Rogers's apparent failure to send the 2011 briefing papers to all members of the House, the House Intelligence Committee shared information about the program with members in the run-up to the vote. The committee has said in a statement that "Prior to voting on the PATRIOT Act reauthorization and the FAA reauthorization, Chairman Rogers hosted classified briefings to which all Members were invited to have their questions about these authorities answered." Indeed, the Obama administration provided members of Congress or their staff 13 briefings on telephony metadata surveillance from 2009 on—nine of which took place in 2011. As Politico lists: Feb. 14, 2011: Senate All Senators were offered the opportunity discuss Sec.215 of the Patriot Act in the VPOTUS office off of Senate Floor, Director of National Intelligence James Clapper, FBI Director Robert Mueller, Alexander Feb. 28, 2011: SJC/SSCI Briefing Patriot Act reauthorization (Classified), Feb. 28, 2011: HJC Briefing Patriot Act reauthorization (Classified), March 9, 2011: HJC Hearing Patriot Act reauthorization (Unclassified), Hinnen. March 15, 2011: Meeting Durbin Patriot Act amendment (Classified), March 17, 2011: HPSCI Hearing Patriot Act reauthorization, Hinnen, FBI's Sean Joyce, Alexander. March 30, 2011: HJC Hearing Patriot Act Reauthorization (Unclassified), Hinnen. May 13, 2011: House Rep Conf Patriot Act Reauthorization, Mueller. May 24, 2011: House Dem Caucus Patriot Act Reauthorization, Mueller. We don't know the full range of what was discussed in those briefings. One disadvantage to oral briefings, as opposed to briefing papers, is that there's always room for dispute over how fulsome the briefings were. But it is clear that House members who did not receive the 2011 briefing paper—and were not around for the version that was shared the previous year—were offered alternative means for learning about the programs detailed in those papers. Members of the House claim to have been blindsided by revelations of bulk metadata collection and have complained about these briefings. But all signs suggest that their ignorance was largely of their own making. For example, self-proclaimed PATRIOT Act architect Rep. Jim Sensenbrenner (R-Wis.), among the most prominent critics of NSA surveillance in the wake of the disclosures, did not attend any of the classified briefings on the government's use of Section 215. MSNBC recently reported. And there are reasons to suspect that the briefings may have been more fulsome than members well skilled in butt-covering may choose to remember. For one thing, the administration was pretty candid in public settings about Section 215. On September 22, 2009, in a House Judiciary Subcommittee hearing on the reauthorization of key provisions of the PATRIOT Act, Todd Hinnen, then Deputy Assistant Attorney General for law and policy in DOJ's National Security Division, confirmed that a "sensitive collection program" was being conducted under the provision. The business records provision [Section 215] allows the government to obtain any tangible thing it demonstrates to the FISA court is relevant to a counterterrorism or counterintelligence investigation . . . It also supports an important, sensitive collection program about which many members of the subcommittee or their staffs have been briefed. Later, in March 2011, when testifying before the House Judiciary on the executive's use of Section 215 (during Sensenbrenner's chairmanship), Hinnen expressly stated, "Some orders have also been used to support important and highly sensitive intelligence collection operations, on which this committee and others have been separately briefed." It is telling that Sensenbrenner could not be troubled to describe this testimony accurately. As both Wells and the Estimable Ms. Wheel herself have described, in a letter to the Attorney General this year, Sensenbrenner simply cropped this statement out of Hinnen's testimony and then complained that Hinnen's "testimony left the Committee with the impression that the Administration was using the business records sparingly and for specific materials."

The Obama administration gave information to Congress about Section 215

Wittes and Chong 13 – Benjamin Wittes is editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution. He is the author of several books and a member of the Hoover Institution's Task Force on National Security and Law. Jane Chong is a 2014 graduate of Yale Law School. She researched national security issues at Brookings as a Ford Foundation Law School Fellow and has previously interned in the narcotics and terrorism units at the U.S. Attorney's Office for the Southern District of New York. She graduated from Duke University in 2009. ("Congress is Still Naked," Lawfare, <http://www.lawfareblog.com/congress-still-naked>, September 19, 2013, Quay)

There's one other reason to believe the administration briefed members in a reasonable fashion: The administration wrote the briefing paper and transmitted it—four times over two years to two different houses of Congress—intending that it be shown widely to members. So we know beyond any shadow of a doubt that the administration wanted members to have certain detailed information about the program. We also know that there were a lot of briefings by that administration concerning this program to those same members in the same time frame as

the administration wanted those members to read that briefing paper. Hmmm. Wonder what they could have been talking about in those briefings.... Ms. Wheel insists that the 65 freshman members of the House who were not provided the 2011 briefing might have swung the 250-153 vote for FISA reauthorization. She's almost certainly wrong. On July 24, 2013, well after the public revelations of Section 215 bulk metadata collection hit the press and the butt-covering had begun, the House had the chance for a do-over. It voted on the Amash-Conyers amendment to halt NSA's "indiscriminate" collection of telephony metadata. The House declined on a 217-to-205 vote to adopt it. To put the matter simply, while Ms. Wheel's specific point about the 2011 briefing paper is correct, the importance she attaches to the point is wildly off. **The administration went way beyond what the law requires in terms of keeping Congress informed** of its activity. It endeavored to make sure individual members knew something about the highly sensitive programs they were voting on. And the committees facilitated access to information for members, many of whom did not avail themselves of the opportunity. As we said yesterday, Congress is naked. Judge Eagan may have erred in implying that members all had access to the 2011 briefing paper, but she's not wrong in her larger insistence that Congress—and its members—knew what 215 was when it reauthorized it.

AT: Executive Noncompliance

Empirics go off – Bush could not circumvent

William Saletan 13, writes about politics, science, technology, and other stuff for Slate and the author of Bearing Right, The Taming of the Spook, 6/1/2013, The Slate, http://www.slate.com/articles/news_and_politics/frame_game/2013/07/nsa_history_how_bureaucrats_leaks_and_courts_tamed_government_surveillance.html ||RS

But in many ways, the story told in the report is really about the mellowing of the surveillance state. An ill-defined, unilaterally imposed, poorly supervised spying operation was gradually brought under control.

The surveillance program didn't just become domestic. It became domesticated. In its early days, the program ran wild. It was authorized solely by the White House. According to the report, "The Vice President's Counsel drafted the Authorizations and personally delivered them to NSA." Crucial conversations about the program's formation and organization were undocumented. Nobody from the Department of Justice was in the loop. Nobody from the Foreign Intelligence Surveillance Court was told until January 2002, and no court personnel other than the chief judge and a single law clerk was informed until four years later. At the outset, only four members of Congress were briefed. The NSA's own inspector general didn't find out about the program until August 2002, because, as the agency's counsel explained, "the President would not allow the IG to be briefed sooner." Why was this project unchecked? Some of the blame lies with Dick Cheney's authoritarian protector complex and his obsessive secrecy. But much of the chaos, the report suggests, arose from the panicked intensity of the 9/11 aftermath. Another attack was feared at any moment.

Expanded surveillance, in hopes of stopping it, was assumed to be short-term. Everyone was worried about security, not privacy. Within days after 9/11, major communications companies, on their own initiative, began contacting NSA to offer help. The program's first authorization, signed by Bush on Oct. 4, 2001, specified that the surveillance would be permitted "during a limited period." At that time, nobody expected it to be continuously reauthorized. According to then-NSA director Michael Hayden, that's one reason why, for nearly a year, the NSA's inspector general wasn't told about the program: It wasn't really perceived as a program. Over time, the surveillance expanded in some ways. It was used against the Iraq Intelligence Service in 2003 and was later extended, through "contact chaining," to some Americans. But the larger trend was restraint. First came internal worries. Hayden accepted the program's legality but didn't like its hyper-secrecy. He pressed the White House to inform Congress and the FISC. According to the report, "By August 2002, General Hayden and the NSA General Counsel wanted to institutionalize oversight of the Program by bringing in the IG." Surveillance of Iraqi intelligence officials, initiated in 2003, was halted after the collapse of Saddam Hussein's regime. The first big blow came in March 2004, when DOJ's Office of Legal Counsel concluded that one of the program's collection methods, involving bulk Internet metadata, was illegal. When the White House tried to circumvent that finding, several DOJ officials, including then-Deputy Attorney General James Comey, threatened to quit. At that point, Bush backed down. According to the report, "the President rescinded the authority to collect bulk Internet metadata and gave NSA one week to stop collection and block access to previously collected bulk Internet metadata." The Guardian cautions that ultimately, the DOJ rebellion "did not end the IP metadata collection ... It simply brought it under a newly created legal framework." That's true. But the new framework made a difference. By forcing NSA to involve the FISC, DOJ brought a judicial overseer to the table. NSA had to answer questions from the court's advisers. When the court wasn't satisfied, it could veto or restrict the surveillance. The court's initial order, issued in July 2004, for the first time "specified the datalinks from which NSA could collect, and it limited the number of people that could access the data." Thereafter, the court, not the president, had the power to let the authorization expire every 90 days.

Executive Checks

Executive checks bad practices

Soufan 14 (Ali Soufan, reporter and book reviewer for Wall Street Journal, “The Shadow Lawmakers”- review of Michael Glennon’s book – National Security and Double Government, Wall Street Journal, 12/30/14, <http://www.wsj.com/articles/book-review-national-security-and-double-government-by-michael-j-glennon-1419983619>)

Ultimately, though, the flaw with the book is that Mr. Glennon is too enamored of his thesis of an unchanging government. “Few who follow world events can doubt that the Obama administration’s approach to multiple national security issues has been essentially the same as that of the Bush administration,” he writes. Yes, both administrations were forced to contend with ground wars in Afghanistan and Iraq, and the ongoing war on terrorism. But those aren’t examples of Trumanite control. They were and to a large extent continue to be, unavoidable realities. Yes, the high-risk detention facility at Guantanamo remains open despite Mr. Obama’s campaign promises to close it. But the president has been stymied on this front not by a shadowy national-security apparatus, but by the very public face of government that Mr. Glennon claims is hors de combat in these matters: Congress. In fact, policies have shifted significantly under Mr. Obama in some of the most controversial areas of national security. The current administration, for example, had already halted the “enhanced interrogation techniques” described in the recently released Senate report. It’s true that no one has been held accountable for these abhorrent abuses. But the president closed secret prisons, or so-called Black Sites, and abolished waterboarding and other acts of abuse. These were significant decisions and not mere political theater. The same is true of the Obama administration’s determination to bring accused foreign terrorists back to face U.S. civilian courts. We can debate the merits of the action, but there’s no doubt it was a substantive change. None of this negates Mr. Glennon’s thesis or mutes the warning bell he sounds in these pages. Bureaucrats can and do go wild: Witness the recent IRS scandals. But in my experience inside government and out of it, the system catches up eventually, and the change that really matters flows from the top down, implemented by the private, second government that Mr. Glennon depicts so effectively.

Courts Check

Federal Agencies will comply with the Supreme Court

Spriggs 97 (James F. Spriggs, II, Associate Professor of Political Science at the University of California-Davis, "Explaining Federal Bureaucratic Compliance with Supreme Court Opinions," Political Research Quarterly, Volume 50, September 1997, Jstor Accessed]

Federal government agencies complied with 93.2 percent of the Supreme Court's opinions and narrowly complied with 6.8 percent of opinions. Also, bureaucracies never defied nor evaded any of the Court's decisions, meaning that agencies never failed to incorporate at least some aspect of the Court's legal rules into their implementations. The agency responses that manifested narrow compliance did not flout the Court's authority but they interpreted its opinions in self-interested ways. This is an interesting and important empirical finding because it demonstrates that agencies, contrary to some speculation, are not engaging in much noncompliance. When the Court writes legal rules adverse to agency interests, government bureaucracies usually faithfully interpret and implement them.

Courts decisions ensure agency compliance especially in the context of privacy- prefer studies without systemic case selection

Matthew E. K. **Hall 11**, an assistant professor of Political Science and Law at Saint Louis University, earned his Ph.D. in political science, with distinction, from Yale University. His work has appeared in American Politics Review, the Journal of Empirical Legal Studies, and the Journal of Law and Policy, The Nature of Supreme Court Power, Cambridge University Press, 2011, p 160-163, https://books.google.com/books?id=bLDmbwUTm0wC&dq=%22bureaucratic+compliance%22+AND+%22Supreme+Court%22&source=gbs_navlinks_s ||RS

The Supreme Court as a Mechanism for Social Change My assessment of the Supreme Court's power to initiate social change runs counter to the conclusions of most empirical studies on this topic. My findings directly contradict assertions that "litigation is ineffectual" (Scheingold 1974, 130), that "U.S. courts can almost never be effective producers of significant social reform" (Rosenberg 2008, 422), that "the Court is quite constrained in its ability to secure social change" (Baum 2003), and that "the Court is almost powerless to affect the course of national policy" (Dahl 1957, 293). In direct contrast to these claims, I find that the Court possesses remarkable power to alter the behavior of state and private actors in a wide range of policy issues. In those situations in which its rulings can be directly implemented by lower-court judges, the Court commands impressive powers even when facing "serious resistance" (Rosenberg 2008, 420) "[w]ithout the support of real power holders" (Scheingold 1974, 130). Some scholars insist that when the Court has the support of these "real power holders ... litigation is unnecessary" (Scheingold 1974, 130); my findings also contradict this claim. In those cases in which the Court could not implement its rulings through lower courts, it was only the combination of Court action with public support that induced change. Although public pressure may have eventually initiated reform without Court action, it is highly unlikely that this change would have occurred as quickly as it did without intervention from the Court in issue areas such as reapportionment, public aid to religious schools, and minority set-aside programs. In some situations, the Court is able to achieve what even broad national majorities could not accomplish through other political institutions. Of course, the Court is not always successful at initiating change, nor would any reasonable student of the American political system expect it to be. Any statement about the Court's power is relative to the expectations of the reader; those who previously understood Court rulings to be universally implemented may be struck by the relative weakness of the Court in my study. Nonetheless, when compared to the prevailing view of the Court's power in the judicial politics literature, my study depicts the Court as a remarkably powerful institution, capable of

enhancing or inhibiting political reform, enshrining or dismantling social inequalities, and expanding or suppressing individual rights. More importantly, my study highlights an important distinction between those Court rulings that can be directly implemented by lower courts and those that cannot. This distinction, though simple and intuitive, explains vastly different behavior outcomes in different types of Court rulings. It also suggests why other empirical studies of judicial power may have been led astray; without systematic case selection procedures to ensure avoiding selection bias, other studies of judicial power may have tended to place too much emphasis on unpopular lateral issues. Although some scholars have hinted at particular elements of the distinction between vertical and lateral issues, none have fully explored the concept or suggested the significance of its many repercussions.⁵ Accordingly, I must respectfully disagree with Rosenberg's assertion that "courts act as 'fly-paper' for social reformers who succumb to the 'lure of litigation'" (2008, 427). Instead, I find that social reformers have achieved great success by turning to the courts in their quest for privacy rights, free speech rights, states' rights, religious freedom, and the rights of criminal defendants. Admittedly, social reformers should think carefully about the relative advantages and disadvantages of a litigation strategy, compared to a legislative or electoral strategy for reform. My findings suggest that reformers should consider whether the institutional situation and public opinion surrounding their cause would make it likely for any favorable court ruling to be implemented. If the reform sought could be directly implemented by lower courts or if the reformers face no strong opposition from the public, the courts may offer a highly effective route to social change. If, however, reformers hope for a change that cannot be implemented by lower courts and that faces strong opposition, a litigation strategy may indeed be unwise. Finally, it should be emphasized that the Court is not especially equipped to advance a conservative or liberal political agenda.⁶ The Court's unique power to nullify legal sanctions will sometimes aid liberal movements, by protecting abortionists or flag burners. Other times, this power will be used to promote conservative causes, by shielding states from federal law suits and gun owners from federal prosecution. Nor does the Court's tendency to enact popular rulings advance one ideology over another: Whereas the reapportionment and public aid to religious schools rulings probably helped liberal causes, the affirmative action and minimum wage rulings likely promoted a conservative agenda.

Congress Checks

Congressional action on Section 215 demonstrates that Congress has stepped up to the plate to enforce anti-surveillance measures — prefer the most recent evidence. This is a sea change in behavior that will lead to aggressive enforcement on other Executive surveillance issues.

Buttar 15 — Shahid Buttar, constitutional lawyer and executive director of the Bill of Rights Defense Committee, 2015 (“Senate Moves to Check Executive Spying Power,” The Progressive, May 27th, Available Online at <http://progressive.org/news/2015/05/188151/senate-moves-check-executive-spying-power>, Accessed 06-07-2015)

A revolution came to Washington in the wee hours of Saturday morning, just after the stroke of midnight. After 15 years of congressional deference to mass surveillance, Congress finally took action— ironically, by failing to take action—and did its job to check and balance executive power.

On May 23, after a hard-fought congressional debate, the Senate effectively allowed portions of the notorious Patriot Act to expire as previously scheduled, appropriately rejecting a compromise branded as the Freedom Act.

It is the first time Congress has meaningfully checked and balanced the national security agencies since 2001. It will not be the last.

Where Did This Come From?

Congress approved the Patriot Act in 2001 with neither debate nor an understanding of what it entailed. Since then, it has accepted—from both the Bush and the Obama administrations—secret legal interpretations contorting statutes into mass surveillance programs recently held illegal by a federal appellate court, as well as lies under oath by senior officials aiming to hide domestic spying programs from congressional and public oversight.

The American people have never gone along quietly.

During the Bush administration, years before the Edward Snowden revelations amplified mass outrage in 2013, nearly 500 cities and eight states issued official declarations decrying mass surveillance. Cities from Lexington, Massachusetts to Bisbee, Arizona (including others in between like New York City, Los Angeles and Dallas), and states as politically diverse as California and Idaho raised their voices.

Since the Snowden revelations, Americans from coast to coast have taken action to challenge domestic spying. We have taken action online, from online petitions shaming the absent chair of a crucial congressional oversight committee, to campaigns promoting mass encryption to force constitutional compliance on the agencies technologically, despite their disdain for legal limits. We have taken action in the streets, outside NSA headquarters, outside the White House, at rallies on Capitol Hill and in our state legislatures. We have fought back with music, sculpture, DJ mixes, poetry and comedy.

While the domestic phone metadata program's days may be numbered, this drama is just beginning.

Hawks may force another Senate vote on Section 215 on the eve of the phone dragnet's expiration. Beyond their desperate effort to save the program, the Freedom Act's rejection paves the way for

further surveillance reform to address other legal authorities under which unconstitutional and ineffective domestic spying will continue even after this authority finally expires.

Congress is willing to enforce —they’ve taken up the issue of surveillance. Prefer the most recent evidence.

Yahoo News 15 — Yahoo News, Byline Scott Bomboy, 2015 (“USA Freedom Act signed, so what’s next for NSA spying?,” Yahoo News, June 3rd, Available Online at <http://news.yahoo.com/usa-freedom-act-signed-next-nsa-spying-111450759.html>, Accessed 06-08-2015)

Surveillance will certainly continue under other parts of the act and under other government programs designed to combat terrorism. But the fight in Congress may just be getting started.

The New York Times says that Senator Mike Lee and Senator Pat Leahy are moving on to targeting the government program that allows e-mails older than six months to be read by investigators. Congressional reformers may also seek to limit the Foreign Intelligence Surveillance Act.

And there is debate in the House and Senate about other spying provisions.

“Some of us don’t think USA Freedom sufficiently ends bulk metadata collection. In fact, [the government] will still contend after the act passes that they can bulk collect all of the websites and emails and all that content,” said Representative Thomas Massie. “Read it closely, it’s only about your phone calls.”

Congress is prepared to enforce surveillance legislation — debate over USA Freedom Act proves.

Buffalo News 15 — Buffalo News Editorial Board, 2015 (“Freedom Act recognizes privacy rights without endangering national security,” Buffalo News, June 5th, Available Online at <http://www.buffalonews.com/opinion/buffalo-news-editorials/freedom-act-recognizes-privacy-rights-without-endangering-national-security-20150605>, Accessed 06-08-2015)

The ensuing debate was appropriately loud and passionate. The main problems with the program were determined to be its secrecy and lack of sufficient oversight to ensure that the NSA was not overstepping its legal bounds. The collection of metadata, itself, was also troubling, even though the NSA wasn’t listening to the content of calls. Rather the agency was analyzing the data and attempting to match it with known or suspected terrorist activities. In that, there may be value. The sifting of data can still take place, as long as the NSA gets a court order to access records held by the phone companies.

The continuing need for aggressive government action against terrorism should, at this point, go without saying. The important point was to determine how government surveillance should work, not whether it was needed. It was also true, though, that the Patriot Act was passed during the post-9/11 fever that gripped the country, including government. Nearly 14 years later, it was time to consider the issue at least somewhat more dispassionately.

The change seems to be a plausible one, though the test of that is yet to come. The United States has not suffered a single foreign-born terrorist attack since 2001 and it is fair to conclude that the telephone surveillance program may have played some role in that.

The Patriot Act escaped close scrutiny until the Snowden revelations. That's just one of the reasons that the USA Freedom Act needs to be closely monitored. Congress needs to satisfy itself that the NSA and any other agencies involved are **complying with the new law**, which President Obama signed on Tuesday night, but it also needs to verify with those agencies that the law is doing the job intended and in a way that serves the legitimate interests of national security.

Still, it's good to see that Congress was able to evaluate the Patriot Act in a way that was inclusive of all interested parties and to produce what looks like a workable compromise. **It's what Congress is supposed to do and what it hasn't done for far too long.**

FISA/FISC Checks

FISA Court solves — the USA Freedom Act removes the secrecy.

AP 15 — Associated Press, Byline Ken Dilanian, 2015 ("Questions and answers about newly approved USA Freedom Act," Yahoo News, June 3rd, Available Online at <http://news.yahoo.com/questions-answers-newly-approved-usa-freedom-act-072501403.html>, Accessed 06-08-2015)

Q: What else will change under the USA Freedom Act?

A: The new law gives private companies more leeway to publicly report information about the number of national security surveillance demands they receive. And it requires declassification of FISA Court opinions containing significant legal decisions, or a summary if declassification is not possible. That is designed to prevent secret interpretations such as the one that allowed bulk collection of U.S. phone records.

No rubber stamp arguments – ACLU lawyer agrees

Evan **Perez 13**, a reporter in the Washington bureau of The Wall Street Journal where he covers the Justice Department, 6/9/13, Secret Court's Oversight Gets Scrutiny, Wall Street Journal, www.wsj.com/articles/SB10001424127887324904004578535670310514616 ||RS

Timothy Edgar, who was a top lawyer with the American Civil Liberties Union, said he believed the FISA court was a rubber stamp until he saw the process firsthand when he became a senior civil-liberties official in the Office of the Director of National Intelligence in 2006. "It's definitely not a rubber stamp," he said in an interview Sunday. "On a very superficial level, they tend to approve pretty much everything that comes before them. They do meet in secret. It's just more complicated than that." The reason so many orders are approved, he said, is that the Justice Department office that manages the process vets the applications rigorously. The lawyers there see themselves not as government advocates so much as neutral arbiters of the law between the executive branch and the courts, he said, so getting the order approved by the Justice Department lawyers is perhaps the biggest hurdle to approval. The culture of that office is very reluctant to get a denial," he said. The last known conflict between the FISA court and the executive branch occurred during the Bush administration's warrantless program. President George W. Bush bypassed the court for what he called the Terrorist Surveillance Program. Judges scolded the Justice Department after it told the court that it had used information collected under the warrantless program to obtain FISA court orders. Criticism from the court, along with pressure from Congress and the public, prompted the Bush administration to submit that program to the court's oversight.

FISC Courts are not rubber stamps – judicial and congressional oversight

Evan **Perez 13**, a reporter in the Washington bureau of The Wall Street Journal where he covers the Justice Department, 6/9/13, Secret Court's Oversight Gets Scrutiny, Wall Street Journal, www.wsj.com/articles/SB10001424127887324904004578535670310514616 ||RS

In trying to reassure the public about NSA data-gathering programs, Mr. Obama has cited the FISA court's role, and that of Congress, which in 2011 reauthorized the Patriot Act to allow the records collection. Mr. Obama said on Friday the public doesn't have to take his word that the programs are being conducted with restrictions to respect privacy, because "we've got congressional oversight and judicial oversight. And if people can't trust not only the executive branch but also don't trust Congress and don't trust federal judges to make sure that we're abiding by the Constitution, due process and rule of law, then we're going to have some problems here." Ben Rhodes, Mr. Obama's deputy national security adviser, on Saturday rejected criticism of the

programs, saying they are "rigorously overseen by all three branches of government." Speaking to reporters in California for Mr. Obama's meeting with Chinese leader Xi Jinping, Mr. Rhodes said that "the executive branch has built-in procedures for reviewing these programs through inspector generals and other mechanisms to make sure that there's not abuse, and to make sure they were putting in place appropriate safeguards to protect the privacy and civil liberties of the American people."

No rubber stamp – warrants are vetted through the DOJ and executive branch

Matthew C. **Waxman 13**, Adjunct Senior Fellow for Law and Foreign Policy, Has the FISA Court Gone Too Far?, July 12, 2013, Council on Foreign Relations, <http://www.cfr.org/intelligence/has-fisa-court-gone-too-far/p31095> | |RS

Some critics have characterized FISC as a rubber stamp, citing the fact that the overwhelming majority of surveillance requests by the Justice Department have been approved, reportedly all requests were approved last year. Given that this is a non-adversarial system--no one arguing the other side--do you think this is balanced, workable? I don't think the characterization of the FISA process as a "rubber stamp" is accurate for several reasons. First of all, warrant requests are always ex parte (i.e., non-adversarial), and most regular warrants are approved in the criminal justice context as well. The reason being that government agents don't usually go to a judge at all unless they are quite confident that they have solid grounds for a warrant. Second, most of the scrutiny of FISA warrant requests occurs well before they even go to the Foreign Intelligence Surveillance Court, in the form of intense and high-level vetting within the executive branch and the Justice Department. And third, the government is able to maintain a high success rate of approvals in the Foreign Intelligence Surveillance Court because it protects its credibility with that court by not bringing weak applications.

FISC requests are vetted down to the last detail

Wittes 13 – Benjamin Wittes is editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution. He is the author of several books and a member of the Hoover Institution's Task Force on National Security and Law. ("The NSA, Oversight, the Law, and Why Compliance is the Ball Game," Lawfare, <http://www.lawfareblog.com/nsa-oversight-law-and-why-compliance-ball-game>, September 27, 2013, Quay)

Sen. Feinstein asked both me and Edgar to write up our oral presentations to the extent they differed from our prepared statements. Since mine involves one major substantive point I did not make in the written statement, I thought I would do so in the form of a Lawfare post adapted from my oral statement yesterday and making the same two broad, high-altitude points about the stakes involved in this discussion of FISA reform. When I was walking into the hearing yesterday afternoon, I had a conversation, standing in the aisle, with DeLong and Edgar about the coming hearing. Edgar informed us that he had been annoyed to find four typos in his written testimony. DeLong, without missing a beat, jokingly but quite aptly responded: "You know, if that were us, we would have to notify the FISA Court about each of them and the committee about each of them." It was an amusing quip, but also an informative and telling one, which captures something deep and important about two key aspects of the current debate. The first involves the integrity of the oversight structures. The second involves the extent to which our comfort level with data acquisition and exploitation in the era of Big Data needs to depend pervasively on the compliance regime that undergirds it. Compliance is not a sexy subject. But in this context, it is a big part of the whole ball game.

Packet Aff Specific

2AC Frontline – (Specific to the Packet Aff Act)

() Zero link – the version of the plan we wrote is designed to end a practice – not just an authority.

() We get permanent fiat – any other interpretation turns debate from a “should” question to a “will question”. Neg would always win and we’d also learn a lot less.

() We still solve perception. Independently, plan’s language makes circumvention far tougher.

Shackford ‘15

Scott Shackford is an associate editor at Reason. This article is internally quoting Mark Jaycox, a legislative analyst for the Electronic Frontier Foundation – “Is the USA Freedom Act the Best We Can Expect Right Now?” - Reason - 5/20
<http://reason.com/blog/2015/05/20/is-the-usa-freedom-act-the-best-we-can-e>

It doesn't appear to be easy to support the USA Freedom Act. The Act's full real name is the "Uniting and Strengthening America by Fulfilling Rights and Ending Eavesdropping, Dragnet-Collection, and Online Monitoring Act." Knowing the full name of the act helps explain why privacy supporters aren't shouting from the rafters over the legislation, even if they are supporting it. As is the case with many other bills with elaborate names, the USA Freedom Act doesn't actually do what its name states. The USA Freedom Act (H.R. 2048) is Congress' response to the public revelation and the following outrage that the National Security Agency (NSA) has been for years secretly collecting mass amounts of domestic metadata from virtually all Americans as part of its goal of sniffing out terrorists. It has been doing so under the aegis of Section 215 of the PATRIOT Act, which allows the NSA and FBI to collect all sorts of data and records that are relevant to an ongoing investigation. But the NSA and the Foreign Intelligence Surveillance (FISA) Court that oversaw approval of records collection requests took a very, very wide view of what was "relevant," and that included, among other things, the phone records of every single American. There was an awareness among privacy experts that this was happening, but because the entire process was classified, the ability for anybody, even members of Congress, to do much about it was limited. Then Edward Snowden came around and released information showing how remarkably expansive the NSA surveillance actually was. This all came as a surprise to Rep. James Sensenbrenner (R-Wis.), who introduced the PATRIOT Act in 2001. He said it was never his intent to authorize mass collection of the data of Americans in the first place. The USA Freedom Act, which Sensenbrenner has also sponsored, is intended to reform these procedures. But what the USA Freedom Act actually does is fairly modest compared to the amount of surveillance authority the NSA had claimed for itself. It will end the bulk collection of phone metadata collection under Section 215, but that's not the only avenue by which the federal government claims authority to collect huge amounts of private information. Furthermore, right now we're seeing the third attempt to get the act passed, and the strength of the reforms has been watered down along the way. Indeed, some of the reforms called for in the act (storing the telecommunications data with the companies rather than the government and requiring the government to request it) came from former NSA Director Keith Alexander. The support of the Obama Administration has itself given some pause, due to its role in fighting lawsuits against the program and the blatant deception of current Director of Intelligence James Clapper before the Senate about the existence of mass phone record collection. What the USA Freedom Act is intended to do is end mass domestic data collection through Section 215, as well as in the secretive National Security Letters, and require "specific selection terms" to limit mass records requests. It also reforms the FISA court to designate several independent advisors to the court to help provide "legal arguments that advance the protection of individual privacy and civil liberties," making the FISA court a slightly more adversarial place rather than the apparent rubber stamp factory it had been. It will also mandate a declassification review process for FISA court decisions. But it's also really hard to try to gauge the impact of the bill as written, and that's coloring perceptions of its value. Making the situation more complicated is a federal court ruling that is actually friendly to privacy reformers. On May 7, the Second Circuit Court of Appeals ruled that Section 215 never actually authorized the NSA to engage in mass phone metadata collection in the first place. The court ruled that the NSA had stretched the definition of "relevance" and "investigation" too far by scooping up pretty much everything and storing it just in case it might be useful later. But the court also did not demand any immediate changes, partly because it knew Congress was already working on legislation to deal with the pending sunset of Section 215, which expires June 1. This ruling prompted some rethinking of the USA Freedom Act by the Electronic Frontier Foundation (EFF). The group had previously endorsed each iteration of the act, increasingly reluctantly as it was watered down with each session. In response to the court ruling, though, EFF withdrew its support and went neutral, calling for legislators to now strengthen the act. Mark Jaycox, a legislative analyst for EFF who has been writing about the USA Freedom Act, still has positive things to say about it, but doesn't want Congress to settle for less than it has to. It's the first reform of NSA surveillance since the 1970s. There should be more to it. "The USA Freedom Act should be stronger,"

Jaycox says, "Congress should be pushing for more control for themselves and more for the public." EFF would like Congress to return to the first iteration of the act that called for a stronger adversarial position within the FISA court, not just an adviser. They want Congress to address other authorizations used to justify bulk metadata collection, not just Section 215 and National Security Letters. They want better "minimization" procedures to make sure information that isn't directly connected to an investigation is properly purged. And they want to remove an "emergency exception" that allows the government to snoop on any "non-United States person" for 72 hours without any court authorization at all. Given that the court ruling determined that the NSA had been operating outside of the law's intent, should we be concerned that any attempt to partly rein in surveillance powers without completely eliminating them will ultimately lead back to more abuse? Who gets to decide what a "specific selection term" is? The same people who determined that every single phone record of every American was "relevant" to investigating potential terrorist attacks on Americans? Jaycox is aware that this abuse concern helps feed the belief the USA Freedom Act doesn't go nearly far enough. "We've seen the intelligence community and the administration stretch definitions," Jaycox says. "We've seen them come up to the line and cross it completely. Section 215 is an example. I think that's where the hesitancy comes from." It's the FISA court that was supposed to stand in the way of the NSA abusing the language, but that clearly didn't happen. Congress can legislate words to be as narrow as they like, Jaycox notes, "But at the end of the day it's going to be a judge that's reviewing these orders." And thus, there's the push for more transparency and declassification of FISA court decisions, in the hopes of making it more clear how the judges themselves are interpreting the law. The modest reforms weren't enough for some privacy-minded House members like Rep. Justin Amash (R-Mich.), Rep. Thomas Massie (R-Ky.), and Rep. Jared Polis (D-Colo.). They all voted no. Amash later explained on Facebook that he feared passing the USA Freedom Act in the wake of the court ruling would have the impact of authorizing bulk data collection rather than restricting it: "H.R. 2048 falls woefully short of reining in the mass collection of Americans' data, and it takes us a step in the wrong direction by specifically authorizing such collection in violation of the Fourth Amendment to the Constitution. Americans, and members of Congress, should demand that Congress instead pass the original bipartisan version of the USA FREEDOM Act from 2013, which strengthened—not weakened—Section 215's relevance standard to end bulk collection while still allowing the government the flexibility it needs to pursue genuine threats against the United States." And this morning Amash posted a letter signed by him and 58 others in the House who voted no, explaining that their opposition to the USA Freedom Act was that the surveillance reforms did not go far enough.

() **Extend our Greene ev – it's great at proving plan's language reduces circumvention risks.**

() **Plan restores strong language – that's sufficient to end circumvention.**

AT: Circumvention – General

The president perceives legal constraints as working.

Prakash, University of Virginia law professor, and Ramsey, University of San Diego law professor, 2012

[Saikrishna and Michael, “The Goldilocks Executive” <http://www.texasrev.com/wp-content/uploads/Prakash-Ramsey-90-TLR-973.pdf>, p.994-5, accessed 9-30-13, TAP]

6. The Executive’s Perception of Legal Constraint.—A final feature of a modern practice that is inconsistent with Posner and Vermeule’s description is that the Executive Branch feels constrained by law. In part this can be seen from the way it behaves. As discussed above, the Executive Branch asks Congress to enact legislation and make appropriations rather than doing so independently. The Executive Branch brings alleged wrongdoers before courts for punishment rather than punishing independently. The Executive Branch obeys court orders to act or refrain from acting, as implicitly required by the Constitution.

But also of significance is the Executive Branch’s internal recognition of legal constraints. The President employs an enormous and growing staff of lawyers spread among all executive offices and agencies.

Anecdotal evidence suggests that legal determinations made within the Executive Branch have the effect of constraining Executive Branch action. In one particular episode in the Bush Administration, the Office of Legal Counsel (OLC) reportedly refused to approve the legality of a surveillance program strongly favored by the White House, culminating in a showdown in the Attorney General’s hospital room.⁹⁷ Apparently, when the Attorney General backed the OLC conclusions, the President acquiesced. More generally, Trevor Morrison argues that OLC legal conclusions are reached with a sense of independence from presidential policy preferences and have substantially influenced presidential decision making.⁹⁸ To be sure, Executive Branch lawyers often may seek to justify presidential actions under law. They may identify with the Executive and hope to expand its legal discretion. But that role in itself undermines Posner and Vermeule’s claims, for if the President is truly unbound by law, why expend resources dealing with the law’s nonexistent bounds?

We accept that the President’s lawyers search for legal arguments to justify presidential action, that they find the President’s policy preferences legal more often than they do not, and that the President sometimes disregards their conclusions. But the close attention the Executive pays to legal constraints suggests that the President (who, after all, is in a good position to know) believes himself constrained by law. Perhaps Posner and Vermeule believe that the President is mistaken. But we think, to the contrary, it represents the President’s recognition of the various constraints we have listed and his appreciation that attempting to operate outside the bounds of law would trigger censure from Congress, courts, and the public.

AT: Circumvention – Court

Courts solve – deter presidential indiscretion.

Prakash, University of Virginia law professor, and Ramsey, University of San Diego law professor, 2012

[Saikrishna and Michael, “The Goldilocks Executive” <http://www.texasrev.com/wp-content/uploads/Prakash-Ramsey-90-TLR-973.pdf>, p.990-2, accessed 9-30-13, TAP]

3. The Courts.—The courts constrain the Executive, both because courts are necessary to the Executive imposing punishments and because ¶ courts can enforce the Constitution and laws against the Executive. It is true, ¶ as Posner and Vermeule say, that courts often operate ex post and that they may defer to executive determinations, especially in sensitive areas such as ¶ national security. But these qualifications do not render the courts meaningless as a Madisonian constraint.

First, to impose punishment, the Executive must bring a criminal case ¶ before a court. If the court, either via jury or by judge, finds for the ¶ defendant, the Executive does not suppose that it can nonetheless impose ¶ punishment (or even, except in the most extraordinary cases, continue ¶ detention). This is so even if the Executive is certain that the court is ¶ mistaken and that failure to punish will lead to bad results. As a result, the ¶ Executive’s ability to impose its policies upon unwilling actors is sharply ¶ limited by the need to secure the cooperation of a constitutionally independent branch, one that many suppose has a built-in dedication to the rule of ¶ law.⁸⁴ And one can hardly say, in the ordinary course, that trials and convictions in court are a mere rubber stamp of Executive Branch conclusions.

Second, courts issue injunctions that bar executive action. Although it ¶ is not clear whether the President can be enjoined,⁸⁵ the rest of his branch ¶ surely can and thus can be forced to cease actions that judges conclude violate federal law or the Constitution.⁸⁶ As a practical matter, while courts ¶ issue such injunctions infrequently, injunctions would be issued more often if ¶ an administration repeatedly ignored the law.

Third, courts’ judgments sometimes force the Executive to take action, ¶ such as adhering to a court’s reading of a statute in areas related to benefits, ¶ administrative process, and even commission delivery. Though the claim in ¶ *Marbury v. Madison*⁸⁷ that courts could issue writs of mandamus to executive ¶ officers was dicta,⁸⁸ it was subsequently confirmed in *Kendall v. United ¶ States ex rel. Stokes*,⁸⁹ a case where a court ordered one executive officer to ¶ pay another.⁹⁰

Finally, there is the extraordinary practice of the Executive enforcing ¶ essentially all judgments. The occasions in which the Executive has refused ¶ to enforce judgments are so few and far between that they are the stuff of ¶ legend. To this day, we do not know whether Andrew Jackson said, “John ¶ Marshall has made his decision, now let him enforce it.”⁹¹ Lincoln’s ¶ disobedience of Chief Justice Taney’s writ of habeas corpus is so familiar ¶ because it was so singular.

Yet to focus on actual court cases and judgments is to miss the broader ¶ influence of the courts. Judicial review of executive action matters because ¶ the knowledge of such review affects what the Executive will do. Executives ¶ typically do not wish to be sued, meaning that they often will take measures ¶ designed to stave off such suits and avoid actions that raise the risk of ¶ litigation. The ever-present threat that someone will take a case to court and ¶ defeat the Executive acts as a powerful check on

executive decision making. ¶ The Executive must take account of law, including law defined as what a ¶ court will likely order.

AT: Circumvention – Congress

Structural reform like the plan is able to reign in the executive branch.

Quirk, University of British Columbia U.S. politics and representation professor with the Phil Lind Chair, and Bendix, Keene State College political science assistant professor, 2015

[Paul and William, No. 68, March 2015, "Secrecy and negligence: How Congress lost control of domestic surveillance" <http://www.brookings.edu/~media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf>, p.1-2, accessed 7-15-15, TAP]

We describe and explain Congress's deliberative failure on phone and Internet surveillance policy. We show that along with a lack of consistent public concern for privacy, and the increasing tendency toward partisan gridlock, Congress's institutional methods for dealing with secret surveillance programs have undermined its capacity to deliberate and act effectively with respect to those programs. Although the current political environment is hardly conducive to addressing such problems, we discuss long-term goals for institutional reform to enhance this capacity. We see no easy or decisive institutional fix. But **without some structural change, the prospects look dim for maintaining significant limitations** on investigatory intrusion in an era of overwhelming concern for security.

Northwestern**

Doesn't Turn Perception Adv-- AT: leaks inevitable

The NSA is cracking down on and deterring new whistleblowers

CF 14 [The Courage Foundation. International non-profit organization supporting whistleblowers/provides legal counsel and funds. 7/28/14 "CIA spying on its own "internal channels" for whistleblowers" <https://couragefound.org/2014/07/cia-spying-on-its-own-internal-channels///jweideman>]

From internal channels to insider threats **It is already difficult enough for government employees in the US to come forward with their concerns. If intelligence community officials fear reprisal, they have even less incentive to expose wrongdoing through internal channels.** US Senators Chuck Grassley and Ron Wyden have publicly warned that if public employees are committed to blowing the whistle and internal channels are compromised, it is to be expected that some will anonymously seek other ways to voice their misgivings. Truly meaningful whistleblower protections need to include the option of a legitimate channel for confidential disclosures... **However, if potential whistleblowers believe that disclosing waste, fraud or abuse means putting a target on their backs for retaliation, they will be intimidated into silence.** The failure to provide such protected alternatives could result in whistleblowers choosing to make unprotected disclosures in public forums, with potential negative consequences for national security. **The CIA's illegal monitoring of whistleblower communications has been seen as part of the Obama Administration's Insider Threat programme,** which categorically treats leaks of classified information about wrongdoing as aiding America's enemies. Introduced in an October 2011 executive order as a **direct response to US Army whistleblower Chelsea Manning's disclosures, the programme covers "virtually every federal department and agency"**, including those who are not concerned with national security matters. A series of reports by McClatchy over the past year describe a range of measures designed to encourage public officials to report on colleagues who they perceive to be exhibiting unusual behaviour. The programme has taken profiling to extreme lengths: late last year it was revealed that the personal details of 5,000 US citizens who had purchased a book on defeating polygraph tests had been retained on the off-chance that they might apply for a job in a federal agency at some point in the future. This new controversy about the Insider Threat programme exacerbates an already deeply problematic situation for potential whistleblowers within the US intelligence community. **Recent public statements by officials responsible for whistleblower protection within the NSA display a reluctance to take complaints seriously, suggesting that within that agency at least, officials see their role as containing rather than engaging with the concerns of employees.**

Obama's cracking down

Currier 13 [Cora Currier was a reporting fellow at ProPublica and previously on the editorial staff of the New Yorker. ProPublica, July 30, 2013, "Charting Obama's Crackdown on National Security Leaks" <https://www.propublica.org/special/sealing-loose-lips-charting-obamas-crackdown-on-national-security-leaks//jweideman>]

Bradley **Manning's conviction under the Espionage Act is the latest development in the Obama administration's push to prosecute leaks.** We've updated our timeline with the most recent events. **Despite promises to strengthen protections for whistleblowers, the Obama administration has launched an aggressive crackdown on government employees who have leaked national security information to the press.** With charges filed against NSA leaker Edward Snowden this June, the administration has brought a total of seven cases under the Espionage Act, which dates from World War I and criminalizes disclosing information "relating to the national defense." Prior to the current administration, there had been only three known cases resulting in indictments in which the Espionage Act was used to prosecute government officials for leaks. The administration has also targeted journalists. In May, it was revealed that **the Department of Justice had secretly seized AP reporters' phone records while investigating a potential CIA leak and targeted a Fox News reporter as part of a criminal leak case (outlined below).** No

journalist has been charged with a crime. But the news prompted an outcry that Obama's hard line on leaks could have a "chilling effect" on investigative reporting that depends on inside sources. (In response, the Justice Department issued new guidelines limiting when journalists' records can be sought.) A spokesman for the Department of Justice told us the government "does not target whistleblowers." (Read their full statement.) As they point out, government whistleblower protections shield only those who raise their concerns through the proper channels within their agency—not through leaks to the media or other unauthorized persons. Director of National Intelligence James Clapper summed up the government's approach in a 2010 memo: "people in the intelligence business should be like my grandchildren—seen but not heard."

Want greater limits

Gallagher 13 [Ryan Gallagher is a journalist who reports on surveillance, security, and civil liberties. SLATE. OCT. 16 2013. "Secret Surveillance Court Insists It's Not a Rubber Stamp"
http://www.slate.com/blogs/future_tense/2013/10/16/fisc_judge_reggie_walton_says_secret_surveillance_court_isn_t_a_rubber_stamp.html//jweideman]

Since it was founded in 1979, the secret court that signs off on NSA spying has rejected just 11 of the 34,000 surveillance requests it has received. But now the Foreign Intelligence Surveillance Court is attempting to shoot down the suggestion that it is merely a rubber stamp. In a letter sent to senators and published online Tuesday, FISC Judge Reggie Walton attempts to quash the idea that the court is a pushover. Walton says that before signing off on government spying requests, the court sometimes orders changes to be made to the proposed surveillance. The FISC has begun monitoring these changes and says that from July-September, "24.4% of matters submitted ultimately involved substantive changes to the information provided by the government or to the authorities granted as a result of Court inquiry or action." What qualified as a "substantive change" isn't explained, but Walton says "typographical corrections" did not count. The judge adds that the 24.4 percent figure is likely "typical in terms of the historic rate of modifications." In other words, this means that about three-quarters of the government's surveillance requests to the FISC are signed off with minor changes, if any at all. The FISC was formed under the Foreign Intelligence Surveillance Act following a series of domestic spying scandals in the 1970s. It is often referred to as the "FISA court" and is believed to be located in a secretive high-security room at the Prettyman Courthouse in Washington, D.C. The court plays an important role in overseeing NSA spy initiatives but did not receive national scrutiny until recent leaks of secret surveillance documents by former NSA contractor Edward Snowden. In June, the FISC was thrust into the spotlight when the first of a series of scoops published by the Guardian revealed that it had signed off on an order compelling a business subsidiary of Verizon to turn over millions of Americans' phone records on a daily basis. In the fallout from the Snowden leaks, the FISC has been repeatedly slammed for its apparent deference to sweeping and controversial government demands. But documents declassified following Snowden's disclosures have shown that the secret court's judges have sometimes called out unlawful NSA surveillance and in at least one case threatened senior officials with contempt charges for repeatedly providing false information to the court. The declassified documents have shown that the judges sometimes appear highly frustrated at the government's conduct and their lack of power to fully rein in abuses. Indeed, as the Washington Post reported in August, Judge Walton has acknowledged that the court's power to carry out critical oversight "is limited and that it must trust the government to report when it improperly spies on Americans." Several lawmakers are currently pushing for reforms to the FISC, with proposed bills in the House and Senate aiming to address concerns about how it functions. The court hears only the government's side of the argument, but there is bipartisan support behind the idea of bringing in a constitutional or civil liberties advocate to the court in a bid to ensure that the balance between security and privacy is more evenly weighed.

AT: Circumvention—Statutory Limits Solve

Statutory limits are effective—they won't try to find alternative legal reasoning

Ackerman 7/13 [Spencer Ackerman is an American national security reporter and blogger. He began his career at The New Republic and wrote for Wired magazine's national security blog, works at the Guardian. 7/13/15, "Fears NSA will seek to undermine surveillance reform; Privacy advocates are wary of covert legal acrobatics from the NSA similar to those deployed post-9/11 to circumvent congressional authority"]

<http://go.galegroup.com/turing.library.northwestern.edu/ps/i.do?id=GALE|A416089653&v=2.1&u=northwestern&it=r&p=AONE&sw=w&authCount=1//jweideman>

Privacy advocates fear the National Security Agency will attempt to weaken new restrictions on the bulk collection of Americans' phone and email records with a barrage of creative legal wrangles, as the first major

reform of US surveillance powers in a generation looked likely to be a foregone conclusion on Monday. Related: Bush-era surveillance powers expire as US prepares to roll back NSA power The USA Freedom Act, a bill banning the NSA from collecting US phone data in bulk and compelling disclosure of any novel legal arguments for widespread surveillance before a secret court, has already been passed by the House of Representatives and on Sunday night the Senate voted 77 to 17 to proceed to debate on it. Between that bill and a landmark recent ruling from a federal appeals court that rejected a longstanding government justification for bulk surveillance, civil libertarians think they stand a chance at stopping attempts by intelligence lawyers to undermine reform in secret. Attorneys for the

intelligence agencies react scornfully to the suggestion that they will stretch their authorities to the breaking point. Yet reformers remember that such legal tactics during the George W Bush administration allowed the NSA to shoehorn bulk phone records

collection into the Patriot Act. Rand Paul, the Kentucky senator and Republican presidential candidate who was key to allowing sweeping US surveillance powers to lapse on Sunday night, warned that NSA lawyers would now make mincemeat of the USA Freedom Act's prohibitions on bulk phone records collection by taking an expansive view of the bill's definitions, thanks to a pliant, secret surveillance court. "My fear, though, is that the people who interpret this work at a place known as the rubber stamp factory, the Fisa [Court]," Paul said on the Senate floor on Sunday. Paul's Democratic ally, Senator Ron Wyden, warned the intelligence agencies and the Obama administration against attempting to unravel NSA reform. "My time on the intelligence committee has taught me to always be vigilant for secret interpretations of the law and new surveillance techniques that Congress doesn't know about," Wyden, a member of the intelligence committee, told the Guardian. "Americans were rightly outraged when they learned that US intelligence agencies relied on secret law to monitor millions of law-abiding US citizens. The American people are now on high alert for new secret interpretations of the law, and intelligence agencies and the Justice Department would do well to keep that lesson in mind." The USA Freedom Act is supposed to prevent what Wyden calls "secret law". It contains a provision requiring congressional notification in the event of a novel legal interpretation presented to the secret Fisa Court overseeing surveillance. Yet in recent memory, the US government permitted the NSA to circumvent the Fisa Court entirely. Not a single Fisa court judge was aware of Stellar Wind, the NSA's post-9/11 constellation of bulk surveillance programs, from 2001 to 2004. Energetic legal tactics followed to fit the programs under existing legal authorities after internal controversy or outright exposure. When the continuation of a bulk domestic internet metadata collection program risked the mass resignation of Justice Department officials in 2004, an internal NSA draft history records that attorneys found a different legal rationale that "essentially gave NSA the same authority to collect bulk internet metadata that it had". After a New York Times story in 2005 revealed the existence of the bulk domestic phone records program, attorneys for the US Justice Department and NSA argued, with the blessing of the

Fisa Court, that Section 215 of the Patriot Act authorized it all along -- precisely the contention that the 2nd circuit court of appeals rejected in May. Despite that recent history, veteran intelligence attorneys reacted with scorn to the idea that NSA lawyers will undermine surveillance reform. Robert Litt, the senior lawyer for director of national intelligence James Clapper, said during a public appearance last month that creating a banned bulk surveillance program was "not going to happen". "The whole notion that NSA is just evilly determined to read the law in a fashion contrary to its intent is bullshit, of the sort that the Guardian and the left -- but I repeat myself --

have fallen in love with. The interpretation of 215 that supported the bulk collection program was creative but not beyond reason, and it was upheld by many judges," said former NSA general counsel Stewart Baker, referring to Section 215 of the Patriot Act.

They won't circumvent legal limits

Risen 14 [Tom Risen is a technology and business reporter for U.S. News & World Report. 7/2/14, "Privacy Watchdog Says NSA Spying Legal, Effective"]

<http://www.usnews.com/news/articles/2014/07/02/privacy-watchdog-says-nsa-spying-legal-effective//jweideman>]

"The program has led the government to identify previously unknown individuals who are involved in international terrorism, and it has played a key role in discovering and disrupting specific terrorist plots aimed at the United States and other countries," the new report says. As part of the report on Section 702 of the Foreign Intelligence Surveillance Act, only two of the five members of the panel backed individual warrants for each time the NSA performs "backdoor" searches of Americans' communications. **The law forbids the targeting of U.S. citizens, but the privacy board's report explains that Americans' communications can be collected when they communicate with or are mentioned in the conversations of non-U. S. citizens.** The Foreign Intelligence Surveillance Court reviews and approves efforts by intelligence agencies to request data from phone or Internet companies. **The Board has seen no trace of any such illegitimate activity associated with the program, or any attempt to intentionally circumvent legal limits,"** the report says. **But the applicable rules potentially allow a great deal of private information about U.S. persons to be acquired** by the government. The Board therefore offers a series of policy recommendations to ensure that the program appropriately balances national security with privacy and civil liberties." The board's 10 recommendations aim to uncover the extent to which communications involving Americans are being collected, and include a request that the NSA should give written statements explaining why it wants certain data.

AT: 12333—Obama Won't Use

Obama won't invoke 12333- too much congressional and civil liberties opposition

Gallagher '14, reporter on government surveillance, technology, and civil liberties

Ryan, "OBAMA FACES CALLS TO REFORM REAGAN-ERA MASS SURVEILLANCE ORDER",
<https://firstlook.org/theintercept/2014/09/02/obama-12333-surveillance-nsa-rights-groups-letter/>, EC

A coalition of civil liberties groups and members of Congress are calling on President Obama to urgently review a controversial executive order being used by the National Security Agency to conduct mass surveillance.¶ Executive Order 12333, a Reagan-era authority, allows the NSA to covertly sweep up vast amounts of private data from overseas communication networks with no court oversight. Last week, The Intercept revealed how 12333 underpins a secret search engine the NSA built to share more than 850 billion records on phone calls, emails, cellphone locations, and internet chats with other U.S. government agencies, including domestic law enforcement. The search system, named ICREACH, contains information on the private communications of foreigners as well as, it appears, millions of Americans not accused of any wrongdoing.¶ Now, more than 40 organizations and rights groups – including Amnesty International, Human Rights Watch, and the American Civil Liberties Union – are calling on Obama and his surveillance review panel to ensure there is no "disproportionate or unnecessary collection" taking place under 12333.¶ In a letter to the President, dated 29 August and released on Tuesday, the groups say that the surveillance undermines "the fundamental rights of internet users everywhere" and demand that secret legal opinions or interpretations that relate to 12333 be declassified by the government. The letter states:¶ We, the undersigned former government officials, organizations, and members of Congress, write to express our concerns about the U.S. government's surveillance activities conducted under the authority of Executive Order 12333. Many involve communications that are protected by the U.S. Constitution, and all implicate international human rights law, including the International Covenant on Civil and Political Rights, to which the United States is a party. These activities undermine the fundamental rights of internet users everywhere.

AT: 12333—SSRA Solves

SSRA bans the use of 12333 for surveillance

O'Donnell 5/27 [Maggie works with Elizabeth Beavers as the Program Assistant for Militarism and Civil Liberties. Lobbyist. 5/27/15, "Essential Reforms to Mass Surveillance"

http://fcnl.org/blog/of_peace_and_politics/essential_reforms_to_mass_surveillance///jweideman]

2) On Executive Order 12333 issued by President Ronald Reagan in 1981, EO 12333 authorizes the collection of the content of communication from Americans. While Americans cannot be individually targeted without a court order, if communication is "incidentally collected," this executive order permits the data to be saved. Widely considered to be a massive legal loophole today, this executive order allows Americans' communications even if they are not suspected of wrongdoing or the subject of an investigation. Reports indicate that these ordinary individuals "incidentally" spied on—Americans and non-Americans—far outnumber foreign nationals that the NSA purposefully targets for surveillance. EO 12333 has never been subject to meaningful debate or oversight from Congress or court. SSRA would ban the use of Executive Order 12333 to conduct warrantless surveillance of Americans

AT: Personnel Impact—Surveillance Worse

Psychological and historical evidence proves mass surveillance enables law enforcement to go “fishing” – exacerbates racism

Rushin 13 — Assistant Professor of Law with a focus on criminal law (Stephen Rushin, 2013, “The Legislative Response to Mass Police Surveillance,” p. 13, http://practicum.brooklaw.edu/sites/default/files/print/pdfs/journals/brooklyn-law-review/volume-79/issue-1/blr_v79i.pdf), acui

Legal scholars and policymakers should look at this trend in policing innovation as a potential tool for both crime control and a source of potential widespread privacy violations. **A growing body of evidence confirms that law enforcement uses these surveillance technologies to target minority groups.** ⁶⁵ **Psychological and historical evidence suggests that the availability of pervasive surveillance tools may facilitate law enforcement corruption.** ⁶⁶ **With the unregulated ability to monitor an entire community, law enforcement may be incentivized to conduct fishing expeditions that “exacerbate racism, stereotyping, or profiling.”** ⁶⁷ This elevates the risk of **false positives** and harms citizens’ perceptions of procedural fairness.⁶⁸ Thus, while the digitally efficient investigative state may be an important development for crime prevention, it also raises numerous privacy concerns.

Psychological and behavioral research proves that mass surveillance allows for abuse

Rushin 11 — Assistant Professor of Law with a focus on criminal law (Stephen Rushin, 2011, “The Judicial Response to Mass Police Surveillance,” p. 299-301, <http://poseidon01.ssrn.com/delivery.php?ID=435099002092126082126083101064115107105086054036036018076005004025123026006111120023119126122100023056020090108127105020102010006074049005029101076084104068020114023022050044089095000126110002021067122074080081069126027123096108113122016094006093068&EXT=pdf&TYPE=2>), acui

The unlimited and unregulated use of surveillance technologies, particularly those that collect vast amounts of data, has several potentially dangerous consequences. Again, given the lack of solid, empirical evidence about this subject matter, **I extrapolate from psychological and behavioral research to predict possible harmful implications of mass police surveillance. First, there is mounting evidence that law enforcement uses these surveillance tools to target unpopular minorities without particularized suspicion of criminal wrongdoing.** ¹³⁰ In Birmingham, United Kingdom, journalists recently revealed an extensive network of surveillance cameras and ALPR cameras nicknamed “Project Champion,” which were being utilized by police to indiscriminately monitor local Muslims with “virtually no consultation, oversight or regard for the law.” ¹³¹ The project was designed to monitor any individuals entering and leaving a predominantly Muslim suburb.¹³² The data was then to be uploaded to regional and national law enforcement databases.¹³³ Even more disconcerting, police in Birmingham allegedly attempted to conceal the actual purpose of the surveillance cameras and ALPR cameras.¹³⁴ Many advocates have expressed concern over similar programs instituted by law enforcement in the United States.¹³⁵ **The Human Rights Commission claims that Muslims in the San Francisco Bay Area and elsewhere have been subjected to constant surveillance by law enforcement, as part of a broader pattern of racial profiling and discrimination.** ¹³⁶ **And there are growing allegations that the FBI targeted Muslim Americans for surveillance simply because of their religious beliefs.** ¹³⁷ **Absent legislative regulation, there is a grave risk that police may use these emerging technologies for the dragnet surveillance of unpopular minorities.** ¹³⁸ **Second, the unregulated collection of extensive surveillance data of the innocent increases the likelihood of abuse and corruption.** This is a particularly relevant concern to the **digitally efficient investigative state**, as the unregulated use of ALPR, surveillance cameras, and facial recognition can lend themselves to vast data collection. If nothing else, **the collection of extensive personal data may incentivize law enforcement to conduct “fishing expeditions” that directly gainsay the purpose of the Fourth Amendment.** ¹³⁸ At its core, the Fourth Amendment is a tool to “police the police.” ¹³⁹ The Fourth Amendment “positively invites constructions that change with changing circumstances,” ¹⁴⁰ but fishing expeditions have consistently and uniformly been viewed as among the most blatant and unreasonable forms of Fourth Amendment violations.¹⁴¹ **With extensively collected personal data, law enforcement can engage in pervasive searches without any**

particularized suspicion. Daniel Solove has gone as far as to suggest that these fishing expeditions could include automated searches that would exacerbate racism, stereotyping, or profiling.¹⁴² The availability of expansive amounts of personal data can also facilitate the use of that information for other dishonest purposes. It is not implausible that the State could “amass data for use in silencing or attacking enemies, critics, undesirables, or radicals.”¹⁴³ The Federal Bureau of Investigation’s (FBI) use of data collected about Martin Luther King, Jr. serves as a poignant reminder of the potential for law enforcement abuse. Some scholars have suggested that the FBI first investigated King for potential links to communism, but once these ties were discredited, several prominent FBI leaders used the collected data to expose King’s private sexual behavior in an effort to discredit and attack his beliefs.¹⁴⁴ President Richard Nixon also notoriously used his powerful political position to collect “embarrassing information to discredit the former Defense Department analyst [Daniel Ellsberg],” and of course “break in to the Democratic National Committee headquarters in the Watergate office building in Washington, D.C.”¹⁴⁵ In addition, the Nixon Administration worked closely with then FBI Director Herbert Hoover to wiretap governmental employees and members of the press deemed to be potential adversaries by the President.¹⁴⁶ The King and Nixon incidents underscore the possibility that law enforcement can selectively and surreptitiously collect information to calumniate critics and political adversaries.¹⁴⁷ The digitally efficient investigative state collects copious amounts of data on individual movement through the use of ALPR, surveillance cameras, and facial recognition. This amplifies concerns that if not properly regulated, the collection of personal surveillance data could present two unique threats of police abuse: the potential for unscrupulous fishing expeditions and the use of data for ulterior, nefarious purpose.

AT: Court Capital D.A- Wake

Thumpers

Obamacare Decision thumps the DA

Edson 6/4- Rich Edson is a Washington correspondent for Fox News Channel. Prior to that, he served as Fox Business Network's Washington correspondent. ("No Plan B? White House, states in bind if Supreme Court strikes ObamaCare subsidies", <http://www.foxnews.com/politics/2015/06/04/no-plan-b-white-house-states-in-bind-if-supreme-court-strikes-obamacare/>)

With a major Supreme Court decision on ObamaCare potentially just days away, neither the Obama administration nor state governments seem to have a comprehensive plan in place in the event the court strikes down a key component of the law. Rather than offering a plan B, the White House is only giving assurances of the strength of its legal case. "Our message to the American people is that they should be confident in their health care they have now because it is rooted in a sound legal basis," said Josh Earnest, the White House press secretary. The Supreme Court is expected this month to deliver its decision in King v. Burwell. That ruling will decide whether Americans can receive Affordable Care Act tax subsidies in states that use the federal exchange known as HealthCare.gov -- as opposed to states that use their own exchanges. Those challenging the subsidies point to a section in the ACA that specifies tax subsidies can come through an "Exchange established by the State." Opponents argue that language requires those seeking tax subsidies to do so only through state-based health insurance exchanges. Yet 34 states are using the federal exchange, having failed to set up their own. A ruling against them could have severe consequences. The Kaiser Family Foundation estimates a ruling banning subsidies for Americans in those 34 states would cost more than 6 million people about \$1.7 billion in monthly health-care tax credits. Some state governments relying on the federal exchange say they are planning for that possibility. "I am continuing to take steps, as part of my contingency plan, in order to protect 382,000 Pennsylvanians from potentially losing subsidies that help them afford health care coverage," said Pennsylvania Gov. Tom Wolf. "[M]y administration submitted an application to set up a State-Based Marketplace to ensure Pennsylvanians do not lose coverage in the event of an adverse Supreme Court decision." Michigan and Texas say they're watching the case closely, as are dozens of other potentially affected states. But absent a fix from a divided Congress, states without them may have to create their own exchanges, investing significantly in establishing them with no guarantee of their success. States with exchanges already spent billions of federal dollars establishing them to mixed results. That money is gone. States without exchanges would have to create ones using their own funding, if the court rules against the subsidies. Some exchanges have done well, like in Connecticut. Maryland scrapped its initial system and replaced it with a better one. Others, like Oregon, have failed. "The state of Oregon's exchange has just completely collapsed and they're giving up and they're going to let the federal government take over. But in the process they've wasted \$300 million of taxpayer money and the same thing may happen in Rhode Island," said John C. Goodman, an economist and the president of the Goodman Institute for Public Policy Research. "The federal government is threatening to take over the exchange in Hawaii. At least half the state exchanges are having serious financial problems." Of the state exchanges' performances, the administration will only say it is committed to their success. "We remain committed to working with states to ensure that all Americans have the ability to shop for quality, affordable health coverage," said Meaghan Smith, the director of communications for health care at the Department of Health and Human Services. "CMS continues to work with states on the options and steps they need to take to best serve their state's consumers in 2016 and beyond," she said of the Centers for Medicare and Medicaid Services. Republicans in Congress,

meanwhile, say they're crafting a plan B. Rep. Paul Ryan, R-Wis., said Thursday "we will be ready with an alternative plan" if the court strikes down the subsidies.

Gay Marriage Decision Thumps the DA

Rothfield 6/4- Reporter for WOWK-TV the West Virginia Media station in Huntington, West Virginia. Broadcasting on channel 13, it is the CBS affiliate ("Couples wait for U.S. Supreme Court gay marriage ruling", Ariel, <http://www.wowktv.com/story/29244166/couples-wait-for-us-supreme-court-gay-marriage-ruling>)

June is national pride month and as many in the tri-state region prepare to celebrate with parades and festivals, many eyes will also be focused on Washington D.C. **The U.S. Supreme Court is expected to hand down a landmark decision any day, answering whether or not states like Ohio and Kentucky have to allow same sex marriages.** "It never even occurred to us that this would probably be possible in our lifetime," said Ellen Allen. Nearly three years into Allen's relationship with her partner Sue, the two decided they wanted to get married. At the time, however, West Virginia did not allow same-sex couples to marry so Ellen and her bride-to-be traveled to Massachusetts to tie the knot legally. "Not so long ago, inter-racial marriage was not allowed and that's hard for us to even fathom. This is a similar situation of denying people their basic civil rights," said Allen. Since Allen and her partner tied the knot, **37 states, including West Virginia, gave same-sex marriages the green light.** Now, **the U.S. Supreme Court is expected to make a historical ruling by the end of the month.** **"We'll be watching. Everybody will be on Twitter, we'll be on Facebook. We're all connected and watching,"** said Allen. The nine justices must decide if states, particularly Kentucky and Ohio, have to allow same-sex marriages and if it's not required, whether all states must recognize same-sex marriages performed in other states. They're heavy questions Ellen said could change her and Sue's entire world. "The cascade of benefits, the protections, the legal protections," she said. "If it ends up being a state-decided issue, I think we'll see people going to places like any of us go. We go to places we are welcomed." **The high court has until the end of the month,** which also happens to be Pride Month, to issue it's decision.

Redistricting Thumps

Desilver 6/3- Drew DeSilver is a senior writer at Pew Research Center. ("Supreme Court could reshape voting districts, with big impact on Hispanics", <http://www.pewresearch.org/fact-tank/2015/06/03/supreme-court-could-reshape-voting-districts-with-big-impact-on-hispanics/>)

Last week, the U.S. Supreme Court decided to take up a Texas case that challenges the way nearly every U.S. voting district – from school boards to Congress – is drawn. The case, in essence, asks the court to specify what the word "person" means in its "one person, one vote" rule. **The outcome of the case could have major impacts on Hispanic voting strength** and representation from coast to coast. Ever since a series of landmark rulings in the 1960s, districts have been drawn "as nearly of equal population as is practicable." (As Supreme Court Chief Justice Earl Warren wrote for the majority in Reynolds v. Sims, "Legislators represent people, not trees or acres. Legislators are elected by voters, not farms or cities or economic interests.") The high court didn't directly say what "equal population" meant, but states and localities have almost invariably used total population figures. And that population is determined by the decennial census. However, the appellants in the Texas case, Evenwel v. Abbott, argue that districts

instead should be drawn to have equal numbers of eligible voters. (The case involves redistricting within states, not reapportioning congressional seats among states.) Congressional Districts by Share Eligible to Vote and Share Hispanic That's a big distinction, because in many states, districts with nearly equal total populations can have dramatically different numbers of eligible voters (that is, U.S. citizens ages 18 and older). We approximated the disparity using 2013 demographic data for all 435 U.S. House districts from the Census Bureau's American Community Survey: Eligible voters ranged from 81.3% of the population (Florida's 11th District, located north of the Tampa Bay area) to 42.9% (California's 40th District, comprising East Los Angeles and adjacent communities). California's 40th, in fact, has barely half as many voting-age citizens (308,276) as Oregon's 4th District (597,613, the most of any district). As the map (above) and chart (right) might suggest, there's a strong negative correlation between share of eligible voters and share of Hispanic population. Of the 25 districts with the highest Hispanic population shares, 19 also are among the 25 districts with the lowest eligible-voter share. This is because so many Hispanics aren't eligible to vote, either because they're not U.S. citizens or because they're younger than 18. By our calculations, only about 45% of the nation's nearly 54 million Hispanics are eligible to vote. There also are clear partisan differences between districts with high and low shares of eligible voters. Of the 35 districts where less than 60% of the population are voting-age citizens, 29 are held by Democrats; Democrats represent 19 of the lowest-ranking 20. On the other end, Republicans represent 31 of the 42 districts where 77% or more of the population are voting-age citizens, and 16 of the highest 20. What would happen if the Supreme Court were to rule in favor of the Texas appellants (who, it should be noted, already have lost at the district-court level) is unknown. One possibility is that districts with relatively few eligible voters would be redrawn to include more of them – that could mean bringing more whites and Republicans into what are now largely Hispanic, Democratic-voting districts, or combining such districts to bring up the eligible-voter population. And that, in turn, could affect Hispanic representation in the House, which has risen from five in 1973 to 17 in 1993 and 28 in 2013. All of this should be taken as illustrative rather than definitive. There are factors beyond age and U.S. citizenship that affect eligibility. Our data do not reflect other aspects, such as residency rules, imprisonment, prior felony convictions and mental incompetency. Americans living overseas may be eligible to vote but aren't covered by the American Community Survey. (Two political scientists, Samuel Popkin and Michael McDonald, addressed those issues in their influential 2001 paper on turnout rates.) Most important, while the American Community Survey asks about immigration and U.S. citizenship status, the decennial census does not. And because the decennial census counts everyone (which the ACS, being a sample-based survey, does not), it has been the only source of data for drawing district lines. That means that if the Supreme Court requires districts to be drawn with equal numbers of eligible voters, it may also have to decide just how those eligible-voter numbers are to be determined.

Obstension Scenarios

Judicial abstention props up military adventurism and illegal arms sales

Scales and Spitz 12 (Ann Scales, prof at U Denver law school. Laura Spitz, prof at U Colorado Law School. The Jurisprudence of the Military-Industrial Complex Seattle Journal for Social Justice Volume 1 | Issue 3 Article 51 10-11-2012)

First, our nation's history and legitimacy rest upon a separation of military power from democratic governance. For that reason, the armed forces are subject to constitutional constraint. Second, however, as an aspect of separation of powers, courts try not to interfere in areas of foreign policy and military affairs. Often this is referred to as the "political question" doctrine, a determination that a matter is beyond the capabilities of judges. The strongest argument for this deference is that the political branches—or the military itself—have superior expertise in military matters. That may be true in some situations. I am not sure, for example, the Supreme Court would have been the best crowd to organize the invasion of Normandy. But what we now have is an increasingly irrational deference.⁷ Consider three cases: a. In *Korematsu v. United States*,⁸ the Supreme Court said the internment of Japanese-Americans at the beginning of 1942 was constitutional, based upon a military assessment of the possibility of espionage in preparation for a Japanese invasion of the United States. It turns out that the information provided by the military to the Supreme Court was falsified.⁹ But note two things: (1) the nation was in the midst of a declared world war, and (2) in subsequent less urgent circumstances, *Korematsu* would seem to argue strongly for military justifications to have to be based upon better, more reliable information than was offered there. b. In the 1981 case of *Rostker v. Goldberg*,¹⁰ the Supreme Court decided that it was constitutional for Congress to exclude women from the peacetime registration of potential draftees, even though both the Department of Defense and the Army Chief of Staff had testified that including women would increase military readiness. But Congress got the benefit of the military deference doctrine as a cover for what I think was a sinister political purpose—to protect the manliness of war—and the Supreme Court felt perfectly free to ignore what those with the real expertise had to say. c. Most recently, in *Hamdi v. Rumsfeld*,¹¹ the Fourth Circuit held that a U.S. citizen who had been designated an "enemy combatant"¹² could be detained indefinitely without access to counsel. In this case, however, not only is there no declared war,¹³ but also, the only evidence regarding Mr. Hamdi was a two-page affidavit by a Defense Department underling, Mr. Mobbs. Mobbs stated that Mr. Hamdi was captured in Afghanistan, and had been affiliated with a Taliban military unit. The government would not disclose the criteria for the "enemy combatant" designation, the statements of Mr. Hamdi that allegedly satisfied those criteria, nor any other bases for the conclusion of Taliban "affiliation."¹⁴ And that is as good as the evidence for life imprisonment without trial has to be. Deference to the military has become abdication. In other words, what we presently have is not civilian government under military control, but something potentially worse, a civilian government ignoring military advice,¹⁵ but using the legal doctrine of military deference for its own imperialist ends. Third, the gigantic military establishment and permanent arms industry are now in the business of justifying their continued existences. This justification is done primarily, as you know, by retooling for post-Cold War enemies—the so-called "rogue states"—while at the same time creating new ones, for example by arming corrupt regimes in Southeast Asia.¹⁶ I was reminded of this recently when we went to see comedian Kate Clinton. She thought Secretary Powell had taken too much trouble in his presentation

attempting to convince the Security Council that Iraq had weapons of mass destruction.¹⁷ Why not, she asked, “just show them the receipts?” Fourth, **we have seen the exercise of extraordinary influence by arms makers on both domestic and foreign policy.** For domestic pork barrel and campaign finance reasons, **obsolete or unproven weapons systems continue to be funded even when the military does not want them!**¹⁸ And, **just when we thought we had survived the nuclear arms race nightmare, the United States has undertaken to design new kinds of nuclear weapons,**¹⁹ even when those designs have little military value.²⁰ Overseas, **limitations on arms sales are being repealed, and arms markets that should not exist are being constantly expanded**²¹ for the sake of dumping inventory, even if those weapons are eventually used for “rogue” purposes by rogue states. **This system skews security considerations, and militarizes foreign policy.** Force has to be the preferred option because other conduits of policy are not sufficiently well-funded. Plus, those **stockpiled weapons have got to be used or sold so that we can build more.** Fifth, enlarging upon this in a document entitled The National Security Policy of the United States, **we were treated last September to “the Bush doctrine,” which for the first time in U.S. history declares a preemptive strike policy.** This document states, “America will act against emerging threats before they are fully formed.”²² If they are only emerging and not fully formed, you may wonder, how will we know they are “threats”? Because someone in Washington has that perception, and **when the hunch hits, it is the official policy of this country to deploy the military.**²³ **All options—including the use of nuclear weapons—are always on the table.**

Presidential adventurism causes nuclear war

Symonds 4-5-13 [Peter, leading staff writer for the World Socialist Web Site and a member of its International Editorial Board. He has written extensively on Middle Eastern and Asian politics, contributing articles on developments in a wide range of countries, “Obama’s “playbook” and the threat of nuclear war in Asia,” <http://www.wsws.org/en/articles/2013/04/05/pers-a05.html>]

The **Obama** administration **has engaged in reckless provocations against North Korea** over the past month, **inflaming tensions in North East Asia and heightening the risks of war.** Its campaign has been accompanied by the relentless demonising of the North Korean regime and claims that the US military build-up was purely “defensive”. However, the Wall Street Journal and CNN revealed yesterday that the Pentagon was following a step-by-step plan, dubbed “the playbook”, drawn up months in advance and approved by the Obama administration earlier in the year. The flights to South Korea by nuclear capable B-52 bombers on March 8 and March 26, by B-2 bombers on March 28, and by advanced F-22 Raptor fighters on March 31 were all part of the script.¶ There is of course nothing “defensive” about B-52 and B-2 nuclear strategic bombers. The flights were designed to demonstrate, to North Korea in the first instance, the ability of the US military to conduct nuclear strikes at will anywhere in North East Asia. The Pentagon also exploited the opportunity to announce the boosting of anti-ballistic missile systems in the Asia Pacific and to station two US anti-missile destroyers off the Korean coast.¶ According to CNN, the “playbook” was drawn up by former defence secretary Leon Panetta and “supported strongly” by his replacement, Chuck Hagel. The plan was based on US intelligence assessments that “there was a low probability of a North Korean military response”—in other words, that Pyongyang posed no serious threat. Unnamed American officials claimed that Washington was now stepping back, amid concerns that the US provocations “could lead to miscalculations” by North Korea.¶ However, having deliberately ignited one of the most dangerous flashpoints in Asia, **there are no signs that the Obama administration is backing off.** Indeed, on Wednesday, Defence Secretary Hagel emphasised the military threat posed by North Korea, declaring that it presented “a real and clear danger”. The choice of words was deliberate and menacing—an echo of the phrase “a clear and present danger” used to justify past US wars of aggression.¶ The unstable and divided North Korean regime has played directly into the hands of Washington. Its bellicose statements and empty military threats have nothing to do with a genuine struggle against imperialism and are inimical to the interests of the international working class. Far from opposing imperialism, its Stalinist leaders are looking for a deal with the US and its allies to end their decades-long economic blockade and open up the country as a new cheap labour platform for global corporations.¶ As the present standoff shows, Pyongyang’s acquisition of a few crude nuclear weapons has in no way enhanced its defence against an American attack. The two B-2 stealth bombers that flew to South Korea could unleash enough nuclear weapons to destroy the country’s entire industrial and military capacity and murder even more than the

estimated 2 million North Korean civilians killed by the three years of US war in Korea in the 1950s.¶ North Korea's wild threats to attack American, Japanese and South Korean cities only compound the climate of fear used by the ruling classes to divide the international working class—the only social force capable of preventing war.¶ Commentators in the international media speculate endlessly on the reasons for the North Korean regime's behaviour. But the real question, which is never asked, should be: why is the Obama administration engaged in the dangerous escalation of tensions in North East Asia? The latest US military moves go well beyond the steps taken in December 2010, when the US and South Korean navies held provocative joint exercises in water adjacent to both North Korea and China.¶ Obama's North Korea "playbook" is just one aspect of his so-called "pivot to Asia"—a comprehensive diplomatic, economic and military strategy aimed at ensuring the continued US domination of Asia. **The US has stirred up flashpoints throughout the region and created new ones, such as the conflict between Japan and China over the disputed Senkaku/Diaoyu islands** in the East China Sea. Obama's chief target is not economically bankrupt North Korea, but its ally China, which Washington regards as a dangerous potential rival. Driven by the deepening global economic crisis, **US imperialism is using its military might to assert its hegemony over Asia and the entire planet.**¶ The US has declared that its military moves against North Korea are designed to "reassure" its allies, Japan and South Korea, that it will protect them. Prominent figures in both countries have called for the development of their own nuclear weapons. US "reassurances" are aimed at heading off a nuclear arms race in North East Asia—not to secure peace, but to reinforce the American nuclear monopoly.¶ **The ratcheting-up of tensions over North Korea places enormous pressures on China** and the newly-selected leadership of the Chinese Communist Party. An unprecedented public debate has opened up in Beijing over whether or not to continue to support Pyongyang. The Chinese leadership has always regarded the North Korean regime as an important buffer on its northeastern borders, but now fears that the constant tension on the Korean peninsula will be exploited by the US and its allies to launch a huge military build-up.¶ Indeed, all of the Pentagon's steps over the past month—the boosting of anti-missile systems and practice runs of nuclear capable bombers—have enhanced the ability of the US to fight a nuclear war against China. Moreover, the US may not want to provoke a war, but **its provocations always run the risk of escalating dangerously out of control.**

Undoubtedly, Obama's "playbook" for war in Asia contains many more steps beyond the handful leaked to the media. **The Pentagon plans for** all eventualities, including the possibility that a Korean crisis could bring the US and China head to head **in a catastrophic nuclear conflict.**

Arms sales increase the probability of regional conflict and leads to US-Russia-China escalation

Klare 13 (Michael Klare is a professor of peace and world security studies at Hampshire College The Booming Global Arms Trade Is Creating a New Cold War
<http://www.motherjones.com/politics/2013/05/global-arms-trade-new-cold-war>)

These are just some examples of **recent arms deals** (or ones under discussion) that **suggest a fresh willingness** on the part of the major powers **to use weapons transfers as instruments of geopolitical intrusion and competition.** **The reappearance of such behavior suggests a troubling resurgence of Cold War-like rivalries.** Even if senior leaders in **Washington, Moscow, and Beijing** are not talking about resurrecting some twenty-first-century version of the Cold War, **anyone with a sense of history can see that they are headed down a grim, well-trodden path toward crisis and confrontation.** What gives this an added touch of irony is that **leading arms suppliers and recipients, including the United States,** recently **voted** in the U.N. General Assembly **to approve the Arms Trade Treaty** that was meant to impose significant constraints on the global trade in conventional weapons. Although **the treaty has many loopholes, lacks an enforcement mechanism, and will require years to achieve full implementation,** it represents the first genuine attempt by the international community to place real restraints on weapons sales. "This treaty won't solve the problems of Syria overnight, no treaty could do that, but it will help to prevent future Syrias," said Anna MacDonald, the head of arms control for Oxfam International and an ardent treaty supporter. "It will help to reduce armed violence. It will help to

reduce conflict." This may be the hope, but such **expectations will quickly be crushed if the major weapons suppliers, led by the US and Russia, once again come to see arms sales as the tool of choice to gain geopolitical advantage in areas of strategic importance.** Far from bringing peace and stability—as the proponents of such transactions invariably claim—**each new arms deal now holds the possibility of taking us another step closer to a new Cold War with all the heightened risks of regional friction and conflict that entails.** Are we, in fact, seeing a mindless new example of the old saw: that those who don't learn from history are destined to repeat it?

US-Russia miscalculation causes extinction

Barrett et al. 1/6 (Anthony M. Barrett- Global Catastrophic Risk Institute, Seth D. Baum- Center for Research on Environmental Decisions, Columbia University, Kelly R. Hostetler- Department of Geography, Pennsylvania State University, 2013, "Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia", http://sethbaum.com/ac/fc_NuclearWar.pdf)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, **could have globally catastrophic effects such as severely reducing food production for years,** 1,2,3,4,5,6 potentially **leading to collapse of modern civilization worldwide and even the extinction of humanity.** 7,8,9,10 **Nuclear war between the US and Russia could occur by various routes, including accidental or unauthorized launch;** deliberate first attack by one nation; **and inadvertent attack.** In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. **In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack.** 11,12 **Brinkmanship strategies incorporate elements of all of the above, in that they involve deliberate manipulation of the risk of otherwise unauthorized or inadvertent attack as part of coercive threats that "leave something to chance,"** i.e., **"taking steps that raise the risk that the crisis will go out of control and end in a general nuclear exchange."** 13,14) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, though numerous measures were also taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. 15,16,17 For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counter-attack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack. 18,19,20 Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced. 21,22 However, it has also been argued that **inadvertent nuclear war between the United States and Russia has continued to present a substantial risk.** 23,24,25,26,27,28,29,30,31,32,33 **While the United States and Russia are not actively threatening each other with war, they have remained ready to launch nuclear missiles in response to indications of attack.** 34,35,36,37,38 **False indicators of nuclear attack could be caused in several ways.** First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time. 39 Second, terrorist groups or other actors might cause attacks on either the United States or Russia that resemble some kind of nuclear attack by the other nation by actions such as exploding a stolen or improvised nuclear bomb, 40,41,42 especially if such an event occurs during a crisis between the United States and Russia. 43 A variety of nuclear terrorism scenarios are possible. 44 Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States. 45,46,47 Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security. 48,49 **It has long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.-Russian crisis conditions,** 50,51,52,53 **with the Cuban Missile Crisis being a prime historical example of such a crisis.** 54,55,56,57,58 **It is**

possible that U.S.-Russian relations will significantly deteriorate in the future, increasing nuclear tensions.⁵⁹ There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks.^{60,61,62,63}

Nuclear conflict with China is an EXISTENTIAL risk – causes nuclear winter

Wittner 11 (11/30/11 Dr. Lawrence, Prof of History Emeritus at SUNY Albany, “Is a Nuclear War with China Possible?”)

But what would that "victory" entail? An attack with these Chinese nuclear weapons would immediately slaughter at least 10 million Americans in a great storm of blast and fire, while leaving many more dying horribly of sickness and radiation poisoning. The Chinese death toll in a nuclear war would be far higher. Both nations would be reduced to smoldering, radioactive wastelands. Also, radioactive debris sent aloft by the nuclear explosions would blot out the sun and bring on a "nuclear winter" around the globe -- destroying agriculture, creating worldwide famine, and generating chaos and destruction. Moreover, in another decade the extent of this catastrophe would be far worse. The Chinese government is currently expanding its nuclear arsenal, and by the year 2020 it is expected to more than double its number of nuclear weapons that can hit the United States. The U.S. government, in turn, has plans to spend hundreds of billions of dollars "modernizing" its nuclear weapons and nuclear production facilities over the next decade.

Arms sales rapidly escalate Middle East war

Cunningham 12 (Erin, Erin Cunningham is GlobalPost’s editor for the Middle East, Africa, Afghanistan and Pakistan. Erin has reported from the Middle East, South Asia and the Balkans for five years, covering Kosovo's independence, the military surge in Afghanistan, protests in Cairo's Tahrir Square, the first democratic elections in Tunisia, and Israeli military operations in Gaza. Small arms fuel Middle East conflicts <http://www.globalpost.com/dispatch/news/regions/middle-east/121128/small-arms-middle-east-conflict-weapons>)

From Libya to Syria, Yemen and the Gaza Strip, everything from shotguns and semi-automatic rifles to anti-tank and anti-aircraft weapons are making local and regional conflicts more lethal, scarring the societies where the weapons end up. And analysts say the problem is only getting worse. “Things have intensified since the Arab Spring,” said Martin Butcher, arms policy adviser at London-based Oxfam, about the region’s weapons trade. “There were particularly troubled hotspots in the Middle East, where illegal or grey market transfers were the norm,” he said, referring to a type of weapons transaction that may begin as legal but diverts arms to illegal end-markets. As the unrest spread, he said, so did the illicit weapons flows. “It’s starting to get worse,” he concluded. Long-term conflicts in the Middle East have helped flood the region with small arms. Some of the weapons arrive as bribes from Western governments to oppressive regimes for maintaining peace with Israel or are acquired by armed groups

challenging state power, such as Kurdish separatists in Turkey and Iraq. Gathering comprehensive, accurate data on the region's small arms trade is difficult because regional governments lack transparency. But according to the Congressional Research Service, the US Congress's public policy research arm, **the Middle East is the developing world's largest arms market. The United States is the leading exporter of legal small arms to governments across the region.** It sold \$1.1 billion of weapons to Bahrain, Egypt and Yemen from 2005 to 2010. Some of the arms have ended up on the black market and in the hands of smugglers like Abu Ibrahim. His Bedouin kin in Sinai's north have engaged in a low-intensity conflict with heavy-handed security forces for years. The conflict is fueled largely by the presence of illicit small arms, including recent shipments from post-Gaddafi Libya, where ordinary people joined rebels pillaging arsenals during the civil war. During the tumult that accompanied the Arab Spring, weakened or toppled governments in Egypt, Libya and Syria withdrew from borders and other guarded areas, giving up weapons stocks as they fled rebel fighters. Across the Sinai Peninsula — where police and intelligence forces recently retreated under fire from armed protesters — smugglers, Islamic militants, criminal networks and armed gangs are amassing even more weapons that have poured across Egypt's porous border with Libya. Locals say that in addition to assault rifles, Soviet-made large-caliber machine guns, US-manufactured Glock pistols, Chinese shotguns, anti-tank weapons and rocket-propelled grenade launchers are all feeding the frequent armed confrontations between militants, locals and Egyptian security forces. "This has always been a passageway for wars," Ibrahim said. "We're not treated well by the authorities. If we were, we wouldn't need weapons." **Illegal weapons shipments from Libya and Iran are helping fuel the full-scale civil war in Syria,** where a peaceful uprising developed into an armed conflict that's killed around 30,000 people, according to anti-government activists. Oxfam's Butcher pointed to reports saying weapons are being shipped directly from Benghazi, the cradle of Libya's uprising, to the rebel Free Syria Army via Lebanon. **"It is absolutely clear that the sustained battle in Aleppo couldn't possibly have happened without a large amount of arms coming in from outside,"** he said. Syria's largest city has been at the center of a pitched battle between the Free Syrian Army and the forces of President Bashar al-Assad for months. **"There is a very steady flow of arms going in — from Lebanon, Iraq, Turkey and even Jordan,"** said Nicolas Marsh, an arms researcher at the Norwegian Initiative for Small Arms Transfers, a coalition of civil society groups seeking to reduce armed violence. **"If the opposition in Syria had run out of ammunition, they would have lost right away." Illegal small arms can tilt the balance of power in some conflicts, but they often help entrench stalemates in which the breakdown of infrastructure and services increases perceptions of insecurity — and intensifies violence.**

Middle East wars cause extinction

Russell, 9 (James A. Russell, Senior Lecturer, National Security Affairs, Naval Postgraduate School, '9 (Spring)

"Strategic Stability Reconsidered: Prospects for Escalation and Nuclear War in the Middle East" IFRI, Proliferation Papers//, #26, http://www.ifri.org/downloads/PP26_Russell_2009.pdf)

Strategic stability in the region **is** thus **undermined by** various factors: (1) asymmetric interests in the bargaining framework that can introduce unpredictable behavior from actors; (2) **the presence of non-state actors that introduce unpredictability into relationships between the antagonists;** (3) **incompatible assumptions about the structure of the deterrent relationship** that makes the bargaining framework strategically unstable; (4) perceptions by Israel and the United States that its window of opportunity for military action is closing, which could prompt a preventive attack; (5) the prospect that

Iran's response to pre-emptive attacks could involve unconventional weapons, which could prompt escalation by Israel and/or the United States; (6) the lack of a communications framework to build trust and cooperation among framework participants. These systemic weaknesses in the coercive bargaining framework all suggest that escalation by any the parties could happen either on purpose or as a result of miscalculation or the pressures of wartime circumstance. Given these factors, it is disturbingly easy to imagine scenarios under which a conflict could quickly escalate in which the regional antagonists would consider the use of chemical, biological, or nuclear weapons. It would be a mistake to believe the nuclear taboo can somehow magically keep nuclear weapons from being used in the context of an unstable strategic framework. Systemic asymmetries between actors in fact suggest a certain increase in the probability of war – a war in which escalation could happen quickly and from a variety of participants. Once such a war starts, events would likely develop a momentum all their own and decision-making would consequently be shaped in unpredictable ways. The international community must take this possibility seriously, and muster every tool at its disposal to prevent such an outcome, which would be an unprecedented disaster for the peoples of the region, with substantial risk for the entire world.

AT Executive Recognition Authority

President doesn't have exclusive recognition authority

Grand 15- Cara J. JD Candidate Duke University Law School 2016 ("ZIVOTOFSKY V. KERRY: OF PASSPORTS, POLITICS, AND FOREIGN POLICY POWERS", Duke Journal of Constitutional Law, lexis)

Even if the Supreme Court does find sufficient basis to conclude that section 214(d) constitutes an amendment to United States foreign recognition policy toward Jerusalem, there is currently a dearth of evidence demonstrating that the executive has broad exclusive authority to set foreign recognition policy, and as such, that section 214(d) would violate separation of powers. While Secretary Kerry never asserts that there is any explicit foundation for an exclusive presidential recognition power in the Constitution, he continues to argue that the "primary source" of this power is the "receive ambassadors" clause of Article II. n133 He explains that because the President's exclusive power to receive an ambassador includes the power to decide whether to establish diplomatic relations with that ambassador's countries of origin, "the recognition power is vested solely in the President." n134 This argument is logically flawed, because it incorrectly assumes that receiving ambassadors is the only means of recognizing a foreign nation. Kerry himself seems to admit this later on in the same argument, when he explains, "[s]imilarly, the President has the power to 'make Treaties' with the advice and consent of the Senate . . . in a manner that fully accords with his recognition policy." n135 Here, the Secretary appears to acknowledge another form of recognition decision, while simultaneously admitting that the President cannot act unilaterally in implementing it. [*56] The Secretary's principal remaining arguments for exclusive executive recognition power are that Congress is not equipped to handle recognition decisions, n136 and that several Supreme Court justices has spoken to this effect. n137 These arguments are tenuous at best. While the many historical examples he cites of early constitutional interpretations make a strong case that the President does have some inherent foreign recognition power, n138 they fail to establish that this power is exclusive. In addition, by criticizing Zivotofsky's position because "the Constitution's text prescribes no role for the Congress in recognition decisions," the Secretary places a higher burden upon Zivotofsky than upon himself, because he does not allege any explicit constitutional support for his argument either. The D.C. Circuit, which ultimately sided with the Secretary, did acknowledge that "[n]either the text of the Constitution nor originalist evidence provides much help in answering the question of the scope of the President's recognition power." n139 However, it adopted the Secretary's interpretations of early post-ratification historical examples, which do nothing to elucidate the full range of the executive's recognition power. n140 As Professor Robert Reinstein has noted, every post-ratification example the D.C. Circuit cited for an exclusive recognition power either proved only that the executive has some non-exclusive recognition power, or even that executive power is subordinate to congressional recognition power. n141 As such, if the Supreme Court does declare an exclusive Presidential foreign recognition power, it will need to draw upon stronger constitutional grounds than the Secretary's constitutional arguments provide. [*57] In rendering its decision, the D.C. Circuit also relied heavily upon Supreme Court dicta, explaining that "carefully considered language of the Supreme Court, even if technically dictum, generally must be treated as authoritative[.]" n142 Despite admitting that the Supreme Court has never held that the President holds exclusive recognition authority, it claimed that Supreme Court has stated such in dicta. n143 However, the court's reliance upon dicta was misplaced. As Judge Tatel noted in his concurrence, neither party, nor any of the amici, have been able to point to a time in our history when the President and Congress have clashed over an issue of recognition. n144 As such, none of the cases the court cited provided any insight as to the scope

of the President's recognition authority within the third category of the Youngstown framework. n145 In fact, of the six Supreme Court opinions that the D.C. Circuit cited, five never stated, even in dicta, that the President's recognition power is exclusive and thus not subject to any contrary acts of Congress. n146 Five of the cases merely asserted the dominance of the President's recognition power over the judiciary, while another explained only that the President could implement recognition decisions in the absence of the Senate's advice and consent. n147 In using this erroneously interpreted dicta as its primary basis for reaching the conclusion that the President holds exclusive recognition authority, the court skirted a necessary discussion regarding where the separation of power actually lies between the executive and legislative branches when it comes to foreign recognition decisions. n148

Decisions Don't Affect Capital

Individual decisions don't affect capital.

Gibson et al., '3

[James (Professor in Political Science at Washington University in St. Louis); Gregory Caldeira (Professor in Political Science at Ohio State University); and Lester Spence (Professor in Political Science at Washington University in St. Louis), "Measuring Attitudes Towards the U.S. Supreme Court", American Journal of Political Science, Vol. 47, No. 2, April 2003]

Perhaps more important is the rather limited relationship between performance evaluations and loyalty to the Supreme Court. These two types of attitudes are of course not entirely unrelated, but commitments to the Supreme Court are not largely a function of whether one is pleased with how it is doing its job. Even less influential are perceptions of decisions in individual cases. When people have developed a "running tally" about an institution—a sort of historical summary of the good and bad things an institution has done—it is difficult for any given decision to have much incremental influence on that tally. Institutional loyalty is valuable to the Court^{precisely} because it is so weakly related to actions the Court takes at the moment.

Courts Rule on Ideology

Justices rule based on ideology and personal considerations.

Pacelle, Prof PoliSci Georgia Southern, **2002**

[Richard L. Pacelle, Jr., Prof of Poli Sci @ Georgia Southern University, The Role of the Supreme Court in American Politics: The Least Dangerous Branch? 2002 p 140-1]

Every decision that a Supreme Court justice makes is inherently political. The Court hears a small number of cases, focusing on the most important issues of the times. Accepting that the Court's decisions are political and have important policy consequences does not explain how those decisions were made. As Prankfurter claimed, "Constitutional law is at all not a science, but applied politics" (O'Brien 1997, 137). To at least some degree, justices are making law and making policy. Judicial restraint would minimize the amount of policymaking. How do Supreme Court justices make the individual decisions that lead to a Court opinion? On the most basic grounds, there are two sets of factors or determinants that justices consider when they weigh the alternatives in a case: legal and extralegal. These are sometimes referred to by the unwieldy terms interpretivism and non-interpretivism, respectively Table 6.1 shows the legal and extralegal factors justices typically use in making their decisions. Suffice it to say that 011 normative grounds, the legal factors are considered preferable to the extralegal. Proponents of judicial restraint say that interpretivism is a process of law while non-interpretivism is a process of politics (McKeever 1993, 29). The terms legal and extralegal refer to a variety of modes of judicial interpretation. The legal factors represent a number of approaches that suggest that justices do their utmost to put their policy views, prejudices, and biases aside when they confront an issue, and decide cases by referring to factors that have a grounding in the law. The legal model argues that judges do not have great discretion in deciding cases. A number of analysts reject this formulaic perception of mechanical jurisprudence. The so-called legal realists'* have refuted the idea that judges lack such discretion, arguing, in effect, that judges make law. Extralegal factors, on the other hand, allow the justices to include political considerations in their calculations and to use their ideological views to inform their decisions. While the legal factors may be the desirable ones, it is clear that extralegal factors may be a better practical explanation for judicial decisionmaking. On the simplest, most general level, the differences between legal and extralegal are reflected in the differences between finding the law and making the law.

Capital irrelevant – court votes on ideology.

Cohen, CBS News Chief Legal Analyst, **09**

[Andrew Cohen, CBS News' Chief Legal Analyst and Legal Editor, 6/30/09, "Supreme Court Term in Review" <http://www.cbsnews.com/blogs/2009/06/30/courtwatch/entry5126577.shtml>]

Not that it needs to, but the Supreme Court has not reached a 50 percent approval rating in national polling in quite some time. And this phenomenon is not likely to change even if (or when) Judge Sotomayor replaces Justice Souter and the Court begins to look more like the rest of America. The sad fact is that a great majority of Americans have no real clue about how the Justices reach their decisions, how they should reach their decisions, or why they rule the way they rule. Compared with the Congress, the Court is a big hit. But compared with the Congress virtually anything this side of Bernard Madoff is a big hit. Nothing the Court did this past term, and nothing it is likely to do in the coming term, is likely to change this dynamic. The Supreme Court proved again in its 2009-2010 that its partisan divides are firmly entrenched. Gone is the Chief Justice's early fantasy of more unanimous rulings in more diverse cases. Gone is the illusion, often recited like a mantra at confirmation hearings, that the Justices will necessarily respect precedent and revere consensus. We should stop fooling ourselves into thinking that things will be different. They never are.

Capital irrelevant - Consensus shows decisions based on ideology, not capital.

Cross and Nelson, '1

[Frank (Professor of Business Law at UT Austin) and Blake (Assistant Professor of Political Science at Penn State, "STRATEGIC INSTITUTIONAL EFFECTS ON SUPREME COURT DECISIONMAKING" 95 Nw. U.L. Rev. 1437, 2001)]

The normative political model, sometimes called the attitudinal model, contends that judges make decisions so as to advance their political or ideological [*1444] policy ends, without regard to either the demands of the normative legal model or the concerns of other institutions.ⁿ³⁹ It is normative in that it assumes that judges are unconstrained and have single-peaked utility functions. In this model, judges decide so as to advance their ideological policy ends, without regard for the formal requirements of law (e.g., constraining precedents and text) and without concern for the reaction of external entities. The political model may find support in legal sources beyond the legal realists and the contemporary critical legal theorists.ⁿ⁴⁰ Supreme Court Justices are commonly characterized as "liberal" or "conservative" - political terms describing the ideological import of their decisions. Significantly, this model of decisionmaking does not necessitate an extremely cynical view of judges, as the political model may reflect subconscious psychology and cognitive dissonance.ⁿ⁴¹ With the growth of clerk populations, it is easy for "the appellate judge to determine a result based on personal notions of fairness and right, and then to leave to the staff attorney the task of constructing reasons to support that result."ⁿ⁴² The political model can be descriptively accurate, even absent conscious judicial policymaking. In contrast to the normative legal model, considerable empirical data supports the claims of the political model of judicial decisionmaking. Many studies have already been described in the legal literature.ⁿ⁴³ Some prominent judges have taken issue with these studies and raised some methodological challenges,ⁿ⁴⁴ though the challenges are readily answered.ⁿ⁴⁵ Perhaps [*1445] the most persuasive evidence can be found in a meta-analysis of studies on judicial decisionmaking conducted by Dan Pinello.ⁿ⁴⁶ He identified 140 research papers that empirically analyzed judicial decisionmaking by party affiliation. A majority of these papers reported data in a manner that could be incorporated in his meta-analysis, and he found that virtually every study showed a positive association between judicial voting and judicial ideology.ⁿ⁴⁷ The studies together contained over 222,000 judicial votes, and the judges' political party explained thirty-eight percent of the variance in their voting.

Overruling Bad Decisions Boosts Capital

Overruling doesn't cost capital – overruling bad decisions boosts capital.

Linton, assoc general counsel Americans United for Life, **1993**

[Paul Benjamin Linton, Associate General Counsel for Litigation, Americans United for Life, 1993, "PLANNED PARENTHOOD V. CASEY: THE FLIGHT FROM REASON IN THE SUPREME COURT" 13 St. Louis U. Pub. L. Rev. 15]

The Court describes this first circumstance as "hypothetical."ⁿ²⁷² The distinct impression left by this passage is that decisions of the Supreme Court overruling earlier decisions on matters of constitutional interpretation are rare and thus should not be too readily emulated, lest the "legitimacy" of the Court be called into question. But this impression is wrong. On more than 200 occasions, the Court has overturned previous decisions, and in nearly three-fourths of those cases, the Court overruled because the earlier decision had wrongly interpreted the Constitution.ⁿ²⁷³ What does this remarkable track record of "judicial correction" mean? At the very least, that the "legitimacy" of the Court is not affected by its acknowledgement of prior error, even when that error involved an interpretation of the Constitution. Indeed, as in Brown and West Coast Hotel, the Court has often enhanced its credibility by overruling decisions that were wrong when originally decided. One more overruling decision, if otherwise appropriate, could not reasonably be expected to damage that credibility.

Overruling bad decisions boosts capital.

Peters, Assis. Prof of Law Wayne State U Law School, **2K**

[Christopher Peters, Assistant Professor of Law, Wayne State University Law School, October 2000, "Assessing the New Judicial Minimalism" 100 Colum. L. Rev. 1454]

Might there be some tension in extolling the connection between rights and the continuity of the common law method, as I did in Part III.C, while at the same time appealing to the adaptability of the common law method, as I have just done in responding to the inertia objection? In the context of overrulings of precedent, this tension may indeed exist. When the Court overrules its own precedent - at least when it does so in fairly short order, as in Adkins and West Coast Hotel - it acts like a legislature repealing a statute, and thus arguably forfeits some of its credibility as a trustworthy decisionmaker about rights.ⁿ³⁰³ Of course, it can also be argued that the Court bolsters its credibility by quickly repudiating decisions that are obviously wrong.ⁿ³⁰⁴

Judicial Capital Doesn't Spillover

Capital doesn't spill over to other decisions.

Redish, Professor of Law and Public Policy at Northwestern, '97

[Martin "'Federalist Society Symposium: Washington, D.C.: November 14 - November 16, 1996: Panel Three: Disciplining Congress: The Boundaries of Legislative Power", 13 J. L. & Politics 585, 1997]

The limited pie theory associated with Professor Choper,ⁿ³⁹ is that the Supreme Court has a limited pie of institutional capital, of institutional goodwill, and if it spends some of that on constitutional federalism, it will be deprived of its opportunity to use that for where it really is needed - individual rights. The reason institutional capital is really needed in individual rights is [*604] primarily that the states can protect themselves in the jungles of the political process, while individuals cannot. To that, my colleague Michael Perry and others have added what implicitly underlies this: that individual rights are simply more important than constitutional federalism.ⁿ⁴⁰ I like to take the position that a true constitutional liberal should strongly believe in adherence to constitutional, not just political, limits on federalism, because federalism serves an important function as a buffer between the government and the individual. The whole idea, the genius of the structure set up by the Framers, was that the system of separation of powers, the system of federalism, and the system of individual rights would all interlock as different fail-safe mechanisms. If federalism and separation of powers are working properly as divisions of government power, tyranny would be prevented, and presumably the number of instances where individuals and government conflict over their rights would be reduced. The story that best illustrates how constitutional federalism can protect against tyranny is the story that I gather is true about Mussolini when he was given a copy of the National Recovery Act, which ultimately was held unconstitutional, and he looks at it and he says in Italian, "Ah, now there's a dictator." And I think that illustrates how dangerous it is in terms of the values of our constitutional system to vest full power within the federal government. The limited pie theory, as a justification, makes no sense because it assumes a kind of fungibility of institutional capital that just doesn't comport with reality. How people feel about individual rights decisions will not be determined by whether the Supreme Court has said anything about constitutional federalism. Reactions to *Roe v. Wade*ⁿ⁴¹ or *Miranda v. Arizona*ⁿ⁴² are based on people's concerns about those decisions. What the Supreme Court says or doesn't say about constitutional federalism will have little, if any, effect on reactions to those decisions. [*605]

Judicial Capital Doesn't Affect Rulings

No clear connection between capital and decisionmaking.

Grosskopf and Mondak, '98

[Anke (Assistant Prof of Political Science @ Long Island University) and Jeffrey (Professor of Political Science @ U of Illinois), 1998, "Do attitudes toward specific supreme court decisions matter? The impact of Webster and Texas v Johnson on Public Confidence in the Supreme Court" Political Research Quarterly, vol. 51 no 3 633-54]

Some evidence supports our political capital perspective, but **the empirical record remains unsatisfying**. Tanenhaus and Murphy (1981) found that approval of Supreme Court rulings accounted for roughly 15 percent of the little variance in diffuse support they detected. However, due to the nine-year gap between the waves of their panel survey, the authors could not attribute change in support to any specific court rulings. **Caldeira (1986) showed that aggregate confidence in the Court varies in response to judicial actions**, such as support for defendants' rights, **but** Caldeira also could **not trace this effect to specific decisions**. Caldeira subsequently (1987) demonstrated that public response to Supreme Court decisions affected aggregate support for Franklin Roosevelt's court-packing plan. However, because the dependent variable was not support for the Court, these results speak only indirectly to the political capital thesis. Unlike survey-based research, **laboratory experiments** (Mondak 1991, 1992) **provide** direct **support for the claim that attitudes toward decisions affect assessments of the Court**. Unfortunately, the generalizability of such findings is uncertain due to the use of hypothetical scenarios, specialized research contexts, and nonrepresentative (i.e., college student) samples.

Judges don't consider capital when deciding.

Landau, JD Harvard and clerk to US CoA judge, 2005

[David Landau, JD Harvard Law, clerk to Honorable Sandra L. Lynch, U.S. Court of Appeals for the First Circuit, 2005, "THE TWO DISCOURSES IN COLOMBIAN CONSTITUTIONAL JURISPRUDENCE: A NEW APPROACH TO MODELING JUDICIAL BEHAVIOR IN LATIN AMERICA" 37 Geo. Wash. Int'l L. Rev. 687]

Theoretically, **attitudinalists could argue that judges rule in accordance with their own ideological preferences** honestly, **rather than strategically**, because for some reason judges simply are not capable of, or prefer not to, act strategically. In practice, however, **this is not what they say. Attitudinalists instead say that the factual environment renders strategic action unnecessary**, at least **for U.S. Supreme Court justices, because**, for example, federal judges have life tenure, **U.S. Supreme Court justices have no real ambition for higher office, and congressional overrides are rarely a realistic danger**.ⁿ²⁵ **The Supreme Court's rules** and structures, along with those of the American political system in general, **give** life-tenured **justices** [ⁿ²⁶ **enormous latitude to reach decisions based on their personal policy preferences**].ⁿ²⁶ In other words, **both** strategic and attitudinal **models**, in practice, **assume that judges are willing and able to act strategically**. Where the two theories differ is in their factual assumptions: Strategic models support the belief that judges face various types of constraints that force them to support decisions that differ from their preferred policy points, while attitudinalists believe that **the institutional environment leaves** at least those judges that they study - generally **U.S. Supreme Court justices - free to make decisions that are exactly in accord with their preferred policies**. Similarly, followers of strategic theory could theoretically believe that judges act strategically to maximize achievement of some set of goals other than their ideological policy preferences. For example, perhaps judges could prefer "legalistic" goals like adherence to precedent, but would have to defect strategically from absolute adherence to those goals given the presence of other institutions with some clout, like the U.S. Congress. In practice, however, this is not what happens. Instead, strategic theorists virtually always model judges as strategically furthering sets of ideological policy goals, which are the exact same goals modeled by the attitudinal theorists.ⁿ²⁷ What we have, then, are **two theories that in practice tend to collapse into one**. In both theories, actors are assumed: (1) to have preferences; and (2) to act strategically for the maximization of those preferences.ⁿ²⁸ In addition, attitudinalists and strategic theorists both believe in a particular kind of rational choice theory: Specifically, the **actors' preferences are assumed to be solely ideological, policy-based goals** derived from the political realm. It is important to emphasize that both theories also believe that

the [*697] proper way to test judicial behavior is to look at what judges actually do, not at what they say: Thus, what matters is the outcome, not the reasoning of the case.

Judicial Capital is Resistant

Court decisions do not burn capital – strong presumption that decisions should be accepted.

Fontana, associate professor of law at George Washington University Law School, '8

[David, "The Supreme Court: Missing in Action", Dissent, Vol. 55, No. 2, Spring 2008, RSR]

Second, Court decisions do not necessarily create the backlash that many on the left fear. If the Court had decided cases in favor of rights before the tide had turned against the Bush administration, its decisions might have elicited formulaic and near-obligatory compliance. There is considerable evidence suggesting a strong presumption in American public opinion that the Court's decisions should be widely accepted and then complied with by the other branches of government. Even when citizens disagree with Supreme Court decisions, an overwhelming majority of them are loyal to the Court and inclined to think that the less popular branches of government should fall into line—even when the Court issues controversial decisions such as Bush v. Gore.

Judicial capital is resistant – one controversial decision won't destroy it.

Grosskopf and Mondak, '98

[Anke (Assistant Prof of Political Science @ Long Island University) and Jeffrey (Professor of Political Science @ U of Illinois), 1998, "Do attitudes toward specific supreme court decisions matter? The impact of Webster and Texas v Johnson on Public Confidence in the Supreme Court" Political Research Quarterly, vol. 51 no 3 633-54]

Opinion about the Supreme Court may influence opinion about the Court's decisions, but is the opposite true? Viewed from the perspective of the Court's justices, it would be preferable if public reaction to rulings did not shape subsequent levels of support for the Court. If opinion about the Court were fully determined by early political socialization and deeply rooted attachments to democratic values, then justices would be free to intervene in controversial policy questions without risk that doing so would expend political capital. Consistent with this perspective, a long tradition of scholarship argues that the Supreme Court is esteemed partly because it commands a bedrock of public support, or a reservoir of goodwill, which helps it to remain legitimate despite occasional critical reaction to unpopular rulings (Murphy and Tanenhaus 1968; Easton 1965, 1975; Caldeira 1986; Caldeira and Gibson 1992). The sources of this diffuse support are usually seen as rather stable and immune from short-term influences, implying that evaluations of specific decisions are of little or no broad importance. For instance, Caldeira and Gibson (1992) find that basic democratic values, not reactions to decisions, act as the strongest determinants of institutional support.

Middle East War Impact D

It will fail regardless of presidential action – multiple reasons

Black '11 (4/16 (Conrad, National post, (f/k/a The Financial Post) (Canada), Lexis, "A recipe for peace; We know what a future Israeli-Palestinian peace deal will look like. The question is: When will the Arabs say yes?", April 16, 2011,

There is something faintly nostalgic about former U.S. national security advisor Brent Scowcroft's Financial Times op-ed, published Wednesday, calling for Barack Obama to "broker a new Mideast Peace." The man, the media and the message are all, as Hillary Clinton would say, "so yesterday." It's a little like watching vintage films from the era when American leaders were first "brokering peace" in the Mideast, such as American Graffiti or The Graduate. Brent Scowcroft was the U.S. national security advisor to President Gerald Ford, and he returned to the post under President George H.W. Bush. He is a distinguished foreign-policy and strategic policy specialist, but has never been considered overly original, a reputation that will not be shaken by his new suggestion. is a justly respected newspaper, but its editorial line is always the urbane, gentlemanly, British impulse to speak softly, move in increments, generally advance the conventional wisdom; and don't stretch the imagination, catch a cold thinking outside the box, or get seriously riled up over anything short of a genuine outrage. In this case, however, the conventional wisdom is nonsense. The counsel for President Obama to "broker peace" is on par with Pakistani President Musharraf's advice to Tony Blair to "do Palestine." The Palestinians could have peace with Israel tomorrow if they wanted it. In any event, Barack **Obama is not trusted by Israel.** His chief initiative in the area to date has been to deny the existence of the agreement George W. Bush made with Ariel Sharon, whereby Israel would vacate Gaza, would dismantle some West Bank settlements, and would confine extensions of other settlements in contested areas to natural population growth. (The world's obsession with **settlement abandonment as the key to peace** -which Obama seems to share -**is foolish: If Israel dismantled every settlement,** or even turned them over for occupation by returning Palestinians, **a new pretext to keep the pot boiling would be devised.**) **The larger,** more basic, **problem is rooted in history.** Amid the desperate conditions of the First World War, the British sold the same real estate twice: to the Jews to promote pro-Allied opinion in the United States and the international Jewish community, and to the Arabs to incite rebellion against the occupying Ottoman Turks. The predictable happened when both buyers tried to take possession, and there has never been any answer except to divide the diminutive space in two. This has been the subject of three wars, all of them sparked by the Arabs, and none successfully (although the intervention of Richard Nixon in the 1973 war -after he had supplied the Israelis with a virtually new air force -enabled the Egyptians to claim a partial success). Always, it is claimed that a return to the 1967 borders is the basis of peace, although those borders would leave Israel nine miles wide on its Mediterranean shore, and the West Bank and Gaza sections of Palestine separated by 50 miles. The Arabs effectively had those borders, under the control of Jordan and Egypt, in 1967. Yet they went to war and and lost -events that would not normally be expected to generate reverence for the status quo ante. The facts, which must be perfectly well-known to Brent Scowcroft, are that **it is impossible to deal with the Palestinians while Hamas controls Gaza and the PLO the West Bank;** that **it is impossible to broker anything while the surrounding Arab powers are in turmoil;** that **this U.S. administration is not taken seriously by anybody in the area after the denial of the Bush-era settlements arrangement** and the failure of its Iran policy; and the solution, when the Palestinians are ready, has, as Scowcroft himself notes, largely been identified already. There will have to be some exchanges of territory, to make Israel wider between the Mediterranean and the West Bank. Scowcroft envisions a united Jerusalem serving as the capital of both countries. I don't think so; I think side-by-side Jerusalems, with the Arabs controlling their area beyond Orient House and a special arrangement and assured access to designated holy sites for all faiths throughout both countries. The Palestinian right of return would be to Palestine, and this fairy tale of one big happy Holy Land where all would be brothers, but in fact the Muslims would outnumber the Jews and expel or massacre them yet again, should finally have a silver stake driven through its heart. A clairvoyant is not required to see that this is where it will end up. Nor is one required to see that, as Arab populations have begun to stop being distracted by the red herring of Israel and have focused on the misgovernment from which they have suffered, no Israeli flags have been burned nor Palestinian flags waved about by non-Palestinians. Israel is absolutely legitimate as a Jewish state, and was so constituted by the unanimous permanent members of the United Nations Security Council, on the motion of Stalin's ambassador, seconded by Truman's. The borders have been open to legitimate debate. But when the Palestinians determine that they will no longer be used as cannonfodder, a cause célèbre that enables the leaders of the Muslim powers to misgovern, oppress and pillage their countries, and deflect discontent by waving the bloody shirt of Palestine, the borders could be quickly established along the lines mentioned. If the Palestinians could draw the lesson of the spectacular economic growth of the West Bank, which Israel has assisted, and where Prime Minister Salam Fayyad favours peace and is the first Palestinian leader whose CV does not contain a long stint as an extremist or terrorist; and of the contrast with the collapsed economy in Gaza, which has happily served as a launch-site for rockets aimed at Israeli civilians since Sharon vacated it; then peace would be imminent. **For a sensible and experienced man such as** Brent **Scowcroft to suggest** that President **Obama is in any position to broker anything** in a Middle East where the Arab governments are fighting for their lives with their own people and Hamas is still trying to kill

all the Jews, **is disconcerting**. Even Richard Goldstone, the token anti-Israel Jew recruited by the United Nations to write a smear job on Israel's hugely provoked reprisals against Gaza, has recanted his fraudulent report. Israel has its faults, but it is a legitimate Jewish state, a successful society of laws and enterprise. The Palestinians have grievances, but a **remedy is at hand**. Israel will take half a loaf. If Palestine would also, there would be peace. **But it won't happen until it is clear what Egypt, Syria and Lebanon will look like, and whether anything will be done to curb** the baleful influence in the area of **Iran**. If he was minded to, President could do something about that, but it isn't a matter of brokerage and there is no sign of it coming.

No Israel conflict- no side wants to go to war

Sappenfeld '6 [Mark, "Wider war in Middle East? Not likely." Christian Science Monitor]

Of the dangers presented by the conflict between Israel and Hizbullah in southern Lebanon, **the possibility of a broader Middle East war is among the less likely**. In the 1967 Arab-Israeli war – and repeatedly since – **Israel has shown its clear military supremacy. So dominant has been Israel's advantage in both technology and tactics that former foes such as Jordan and Egypt sued for peace in those wars, while Tel Aviv's avowed enemies – Syria and Iran – have turned to backing terrorists. At this moment, the calculus doesn't appear to have changed.** There is no coalition of Arab governments willing to unite militarily against Israel. Syria's military prowess has crumbled since the fall of the Soviet Union – its greatest benefactor – while Iran remains too geographically remote to strike effectively. The result is a new paroxysm of the proxy war that has existed in the region for a generation – ebbing and flowing as Hizbullah, armed and financed by Iran and Syria, harass Israel without provoking a major Middle East war, military analysts say. **"No state is willing to deal with Israel conventionally," says Seth Jones, a terrorism expert at the RAND Corp.** The shape of the conflict so far – sparked by Hizbullah's raid into northern Israel and capture of two Israeli soldiers – reveals both the capabilities and limitations of each side. Historically, Hizbullah has been able to do little more than nip at Israel's northern border with incursions and sporadic rocket attacks. By and large, its arsenal is primitive, comprising various short-range rockets that can destroy buildings only with a direct hit, yet are difficult to aim with any precision. It has continually fired rockets into northern Israel. Hizbullah's longer-range rockets Yet there are signs of increasing sophistication, perhaps due to help from Iran, experts say. On Friday, Hizbullah launched a more advanced missile, which struck an Israeli warship. Hizbullah rockets are also penetrating deeper into Israel than ever before, with several striking Haifa, Israel's third-largest city, on Sunday. Israel claims that four of the missiles were the Iranian-made Fajr-3, with a 28-mile range. For its part, Israel has so far relied mostly on air strikes as its military response. Monday, Israel acknowledged that its forces had invaded Lebanon, though they returned shortly after. Israel invaded southern Lebanon in 1982. Its army occupied the territory for three years, then withdrew because of the strain of the occupation and broad international condemnation. History also offers a note of caution to Israel's foes. In 1967, Israel responded to Egyptian aggression by taking the Sinai Peninsula and the Gaza Strip from Egypt, the West Bank from Jordan, and the Golan Heights from Syria. Years later, when Syria and Israel fought over control of Lebanon in 1982, Israeli jet fighters reportedly shot down 80 Syrian planes without losing any of its own. Israel's military superiority is built on American support and a skill honed by decades of fighting for the very existence of the nation. Israel receives the best equipment that the United States can offer its allies. **"They have some of the most highly advanced weapons systems in the world," says Dr. Jones. Israel's air force, in particular, has no rival in the region,** which makes air strikes the most effective – and most probable – means of Israeli retaliation and aggression. **Yet Israel has so far focused most of its attacks on Lebanon,** despite Hizbullah's links to Syria and Iran. Indeed, both sides have long used Lebanon as a way to harass the other, since Lebanon's military is almost irrelevant, analysts say. **Even though Israel accuses Syria and Iran of backing Hizbullah's attacks, it hesitates to attack them directly.** The reason is simple: Though Syria's aging military is no match for Israel's, it has missiles that could strike any part of Israel, as well as stocks of chemical weapons. Moreover, the 60 miles from the Israeli border to the Syrian capital of Damascus is one of the most heavily fortified zones in the world. "Syria doesn't have the capacity to win [a war against Israel], but it can cause lots of suffering," says Nadav Morag, former senior director for domestic policy in the Israel National Security Council. Iran more formidable than Syria By contrast, Iran presents a far more formidable challenge – but one that is so remote from Israel geographically as to make hostilities difficult. As with Syria, Iran's greatest threat lies in its missiles. Yet the prospect of firing missiles at America's greatest ally – at a time when it is surrounded by American forces in Iraq and Afghanistan – is decidedly risky. Likewise, **the notion of an Israeli air strike against Iran presents enormous**

logistical hurdles. Although Iran does not possess a credible air force and has only mid-grade Russian air-defense systems to contend with Israeli jets, **Israel would surely be denied overfly rights by the Arab countries that surround them**, meaning it would have to take a circuitous and difficult oversea route to Iran. It would probably be a measure taken only as a last resort., Mr. Morag says.

Israel faces no threat and nobody will provoke them to lashout

Cetron and Davies '7 (Cetron, Marvin J. is president of Forecasting International ; and Davies, Owen former senior editor at Omni magazine and is a freelance writer The Futurist 9-1-07

if Israel ever needed America's unquestioning patronage, it no longer does, despite its embarrassing inability to defeat Hezbollah in the Lebanon conflict of July 2006. **Prime Minister Ehud Olmert made that clear when** (apparently inadvertently) **he admitted** in December 2006 **that his country does indeed possess nuclear weapons. Israel's neighbors may be hostile, but if they sometimes are suicidal as individuals, as nations they are not. Even if they are capable of destroying Israel, as Iran may soon be, they will take no action against it that would provoke a nuclear response.**

No spillover – self-interest overwhelms

Satloff '6 (Satloff, Washington Institute for Near East Policy, executive director, 2006, Robert Satloff, "Forget the Domino Theories," 12/9/06

Linkage also has its more ominous side. **The most common is the fear** that, left unresolved, **the Israeli-Palestinian conflict could explode into a Middle East-wide war**. A second variation locates the epicenter of regional instability in the Persian Gulf. A generation ago the fear was that the export of Iran's Islamic revolution would undermine pro-West Arab states. Today, as Defense Secretary Robert Gates said during his confirmation hearings, the fear is that Sunni-Shiite violence in Iraq will spread like a contagion through the region, leaving ethnic bloodletting in its wake. **The problem** with all these theories **is that after a generation of theorizing about Middle East dominoes, the evidence is piling up: The linkages simply don't exist**. First, military success in the Gulf does not translate into diplomatic success in the region. The Madrid process, a regional initiative, may have had a promising opening session, but once it got down to real bargaining, it ran up against the stark realities of the Israeli-Palestinian and Israeli-Syrian divides. And the idea of building on Saddam Hussein's demise to promote change on the Israeli-Palestinian front may have hastened Yasser Arafat's movement into irrelevance, but it ran aground on the dismal intra-Palestinian political realities of what followed him. Second, local disasters do not translate into regional disasters. **Despite Iran's subversion, terrorism, bullying and threats, every Arab state survived the export of the Islamic revolution**. And despite the near unanimity of received wisdom about the Middle East, **there is no evidence to support the proposition that Israeli-Palestinian violence has substantial regional repercussions, let alone that it could lead to regional war. The best evidence for this counterintuitive conclusion comes from the Palestinian uprising** that began after the collapse of the Camp David summit **in 2000**. With more than 3,000 Palestinian and 1,000 Israeli fatalities, the bloodshed in the subsequent three years was the worst in the history of the Israeli-Palestinian conflict. Yet **the regional impact was virtually zero. Not one Arab state threatened to fight alongside the Palestinians, and none even came to their aid militarily**; indeed, only faraway Iran tried to send weapons. The Arab "street" did not rise in protest. **Neither Jordan nor Egypt severed its peace treaty with Israel, and no Arab state faced significant protests. The conflict -- certainly a horrible experience for Israelis and Palestinians -- was contained. The lesson of the past generation is that** most states in **the Arab Middle East have grown stronger, not weaker. Arab leaders**

are interested first and foremost in survival, which means protecting their national interests not subscribing to romantic notions of ethnic or religious ideology. That is why, for example, Gates's warning about Arab states intervening in Iraq to defend fellow Sunni Arabs from Shiite ethnic cleansing is far-fetched.

Threats of regional spillover are hollow

Westbrook 2 (Bob, "Middle East War Scenario", 2-19, <http://www.trumpetsounds.com/warscenario.html>)

Though these actions would trigger an Israel/Palestinian war, it would not necessarily initiate a broader Middle East war. You may have noticed that until now, most of the major players among the Arab nations have been content to make a lot of noise but do little on behalf of the Palestinians. Whether the Arab/Muslim nations would take up arms against Israel to "protect" the Palestinians is debatable.

Peace has no impact on regional stability

Luttwak 7 (Edward, Senior Associate – Center for Security and International Studies, "The Middle of Nowhere", Prospect Magazine, May, http://www.prospect-magazine.co.uk/article_details.php?id=9302)

Yes, it would be nice if Israelis and Palestinians could settle their differences, but it would do little or nothing to calm the other conflicts in the middle east from Algeria to Iraq, or to stop Muslim-Hindu violence in Kashmir, Muslim-Christian violence in Indonesia and the Philippines, Muslim-Buddhist violence in Thailand, Muslim-animist violence in Sudan, Muslim-Igbo violence in Nigeria, Muslim-Muscovite violence in Chechnya, or the different varieties of inter-Muslim violence between traditionalists and Islamists, and between Sunnis and Shia, nor would it assuage the perfectly understandable hostility of convinced Islamists towards the transgressive west that relentlessly invades their minds, and sometimes their countries. Arab-Israeli catastrophism is wrong, twice over, first because the conflict is contained within rather narrow boundaries, and second because the Levant is just not that important any more.

No Trust in Supreme Court

Agiesta 15, (Jennifer Agiesta, CNN polling director, Poll: Trust Lacking in Supreme Court over handling of key issues, CNN Politics, June 8, 2015, <http://www.cnn.com/2015/06/08/politics/cnn-poll-supreme-court-health-care-same-sex-marriage/>)

With major Supreme Court decisions on health care and same-sex marriage expected this month, many lack trust in the Supreme Court's handling of those two issues, according to a new CNN/ORC poll. Yet most approve of the way the court is handling its job generally. A majority, 52%, say they approve of the way the court is handling its job, while 41% disapprove. That's an improvement from an even 48% to 48% split two years ago. Still, when Americans are asked how much they trust the court on a range of issues it will be considering this term or the next, the worst ratings come on health care and same-sex marriage. Only about half say they have at least a moderate amount of trust in the court on health care (50%) or same-sex marriage (49%). There is more faith in the Supreme Court on other key issues on the docket, with most saying they trust the court at least a moderate amount on freedom of speech (69%), voting rights (65%) and the death penalty (60%). ¶

Lack of Public Confidence in Supreme Court

AP 15, (Associated press, 5 things to know about American public opinion on the Supreme Court's health care case, Fox Business, June 24, 2015, <http://www.foxbusiness.com/markets/2015/06/24/5-things-to-know-about-american-public-opinion-on-supreme-court-health-care/>)

LITTLE CONFIDENCE IN COURT'S OBJECTIVITY ¶ Nearly half of Americans are not too confident or not confident at all that the Supreme Court can rule objectively in the case, according to the April AP-GfK poll. Just 1 in 10 are very or extremely confident, while another 4 in 10 are moderately confident. ¶ Six in 10 opponents of the law, compared with 44 percent of the law's supporters, are not confident in the court's ability to rule objectively. ¶ A CBS News-New York Times poll released Monday found that three-quarters of Americans think that the justices sometimes let their personal or political views influence their decisions rather than deciding solely based on their legal analysis. ¶

Status-Quo policies will never have any legitimacy – the programs are perceived to contradict the constitution.

Judis 13 (John Judis, senior editor of the New Republic, June 10, 2013, "The Constitutional Amnesia of the NSA Snooping Scandal", <http://carnegieendowment.org/2013/06/10/constitutional-amnesia-of-nsa-snooping-scandal>)

President Barack Obama has assured us that we need not be worried about the National Security Agency listening to our phone calls or monitoring our Internet use. The NSA's programs, he said, represent "modest encroachments on privacy" that are "worth us doing" to protect the country from terrorists. Count me among those who are not reassured by Obama's statement. I know better—from my schoolboy knowledge of the Constitution and from my own experience during the '60s with unwarranted government surveillance. I don't usually

like to base moral judgments on what the Constitution does or does not allow, but in this case, it makes sense to do so. The Constitution had two very different purposes: One was to create a functioning government; the other, forged in the wake of the American revolution, was to establish constraints that would prevent the abuse of state power. The First Amendment was designed to do the latter; and so was the Fourth, which prohibits “unreasonable searches and seizures.” The administration’s obsessive pursuit of press leaks threatens the First Amendment’s freedom of the press; and the NSA’s surveillance violates the Fourth Amendment’s ban on general warrants—on indiscriminate searches without probable cause. The administration claims that these actions were approved by Congress and authorized by the courts. But I am not impressed that some senators and judges approved these efforts. American history is littered with bad decisions from narrowed minded, short-sighted legislators and jurists. I’ll take my stand with senators Wyden, Udall, Durbin, and Paul on these issues rather than with Senator Lindsay Graham or Roger Vinson, the judge who signed off on the NSA’s surveillance and who also ruled that the Affordable Care Act was unconstitutional. One reason that I am particularly angry about what the administration has done is that I’ve seen it all before. In the wake of the Cold War, both the Federal Bureau of Investigation and Central Intelligence Agency acquired tremendous power to investigate and deter what Washington believed was political subversion. There was little oversight of either agency. In the late ‘40s and ‘50s, the FBI identified and monitored domestic Communists, whom its director J. Edgar Hoover believed to be under every bed sheet, while the CIA operated abroad. Then, in the 1960s, both agencies turned their considerable power and attention to the domestic threat to official Washington posed by opponents of the Vietnam War. Some of what they looked at it was genuine criminal activity—people planting bombs or kidnapping newspaper heiresses—but most of it had nothing to do with criminal activity or with any foreign directed subversion. It simply consisted of determined dissent from what the Johnson and Nixon administrations were doing. Take my own case. I was a politically active radical and socialist during much of the ‘60s and the first half of the ‘70s. I got started in the civil rights and anti-war movements; I was a member of Students for a Democratic Society, although in northern California that didn’t mean much. I was an editor of a theoretical journal euphemistically titled Socialist Revolution (at a time when the real hardliners described themselves as small-c communists), and I was a leader of a nationwide socialist organization called the New American Movement, which tried to pick up where the less crazy parts of SDS left off. I had my own vague vision of what a socialist America would look like, but almost everything that I did was directed at immediate issues like ending the Vietnam War or later impeaching Richard Nixon. I was not a bomb thrower. I advocated running candidates in elections. I taught classes on Marx’s Capital and American history at a school we organized in Oakland. But during this period, I was under almost constant surveillance by the FBI and by other intelligence or police agencies. I received regular visits from the FBI (I told them I wouldn’t talk to them), and they also visited my parents and friends. As my FBI file, which I later obtained, attested, my movements were being monitored even when I didn’t know it. (Most of it is, unfortunately, blacked out.) In organizing demonstrations, I encountered people who turned out to be government agents. I was pulled over by the police with guns drawn for no apparent reason. And I also received inquiries about my tax returns from the IRS even though I was living on about \$3000 a year during much of this period. These inquiries, which to this day may or may not have had something to do with my politics, certainly make me sympathetic to the rightwing groups who were barraged by inquiries from the IRS—whether or not these inquiries were directed by higher-ups in the administration. There were, obviously, people who were subject to far greater harassment than I was, and who played a much greater role in the new left. But that’s what makes my case interesting. I can pretty safely say that there was no good reason to put me under surveillance. After the Watergate scandal, Congress finally recognized that the FBI and CIA had widely overstepped their Constitutional bounds. In 1978, Congress passed the Foreign Intelligence Surveillance Act. It was supposed to limit agency surveillance to people whom the agency suspected, on sufficient grounds to convince a judge, were actually agents of a foreign power. The government agencies weren’t supposed to fool with anybody else. But 35 years later, we learn a government agency has been empowered to monitor all of us all the time. That indiscriminate power, like the power that the CIA and FBI held after World War II, can be directed against domestic dissent. Obama says that the debate over the NSA’s activities is “healthy for our democracy” and a “sign of maturity.” But I think it’s a sign of forgetfulness—of Constitutional amnesia—on the part of Obama and his Attorney General Eric Holder, not to mention the administration’s vaunted intelligence chiefs who want to divert attention from the subject of the leaks, which is their own behavior, onto the leaker. I am hoping Democrats as well as Republicans in Congress remind the administration what the Constitution was designed to do and what the original FISA legislation was meant to do, but judging from the performance of most congressional leaders so far, I am not holding my breath.

Even justices on the Supreme Court say it's illegitimate

Michaelson 6/27 (Dr. Jay Michaelson, writer of five books with topics relating to gay rights, June 27 2015, "Did The Four Dissenting Justices In Gay Marriage Case Just Suggest Treason?", <http://www.thedailybeast.com/articles/2015/06/27/did-dissenting-justices-suggest-treason.html>)

In controversial cases, is the role of jurist to inflame controversy, or quell it? In *Loving v. Virginia*, the 1967 case which found race-based marriage bans unconstitutional, Chief Justice Earl Warren built a 9-0 consensus—just as he'd done years earlier in *Brown vs. Board of Education*. He knew that a country divided by race ought to be united, if possible, by a Supreme Court mindful of fundamental values—even if the Court was, as the constitution requires, overturning the will of the majority. The four dissents in the landmark case on same-sex marriage, *Obergefell v. Hodges*, one by each of the conservative justices on today's Supreme Court, take a very different view. With invective and hyperbole, they pour fuel on the fire of the controversy over same-sex marriage. Rather than merely state their views and disagreements, they use heated language to accuse the five-person majority of imperialism, a "putsch," and worse. Thus, the unprecedented calls of elected officials for open revolt against the Supreme Court—a shocking display of treason—are now accompanied by calls from within the Court itself that *Obergefell* is illegitimate, and the Supreme Court itself no longer worthy of full respect. Ironically, in alleging a new law for the Court, these four justices have brought one into being. Justice Scalia has, as usual, grabbed the spotlight with juvenile taunting usually reserved for the playground. But in fact, all four opinions are shocking. Chief Justice Roberts (joined by Scalia and Thomas) makes a solid, and unsurprising, substantive case. There is, after all, no explicit right to marriage (for gays or anyone else) in the Constitution; it is, rather, a fundamental right inferred into the Fourteenth Amendment's guarantees of due process and equal protection. Thus, one might expect a judicial conservative like Roberts to be suspicious of expanding it, particularly when doing so runs against the expressed will of a majority of state legislatures. But the way he chose to cast his argument ill befits his status as chief justice. "The majority's decision is an act of will, not legal judgment," he writes. That is absurd: the court's decision runs thirty pages, full of all the legal judgments, precedents, and statements of principle one would expect. But that's just the beginning. Across four pages, Chief Justice Roberts analogizes *Obergefell* to the *Lochner v. New York* decision, one of the most notoriously wrongheaded in Supreme Court history. *Lochner* means nothing to most people, but to anyone who's finished the first year of law school, it's a swear word. He's still not done. The Chief Justice of the United States then states (quoting a concurring opinion by Justice Kennedy) that "the legitimacy of this Court ultimately rests 'upon the respect accorded to its judgments.' That respect flows from the perception—and reality—that we exercise humility and restraint in deciding cases according to the Constitution and law. The role of the Court envisioned by the majority today, however, is anything but humble or restrained. Over and over, the majority exalts the role of the judiciary in delivering social change." In other words, the majority is arrogant, unrestrained, and thus not to be respected. It has an "extravagant conception of judicial supremacy." "Those who founded our country would not recognize the majority's conception of the judicial role." And "The Court's accumulation of power does not occur in a vacuum. It comes at the expense of the people. And they know it." Why not just tell the Religious Right to buy pitchforks and blowtorches? Chief Justice Roberts' ironic opinion is immoderate in alleging immoderacy, extreme in alleging extremism. Justice Scalia came next. And he begins thus: "I join THE CHIEF JUSTICE's opinion in full. I write separately to call attention to this Court's threat to American democracy." It seems inevitable that rhetoric like this will stir the next Confederate flag-waving zealot to an act of, if not domestic terrorism, at least outrageous revolt. How could it be otherwise? And yet this, too, was only the first line. The next line is, at best, disingenuous: "The substance of today's decree is not of immense personal importance to me." As if. This from the man who, 12 years ago, wrote in his *Lawrence v. Texas* dissent that the Court "has largely signed on to the so-called homosexual agenda promoted by some homosexual activists directed at eliminating the moral opprobrium that has traditionally attached to homosexual conduct." Is that what the LGBT equality movement is about? Throughout Justice Scalia's hysterical writing in LGBT-related cases, he has doggedly maintained that their subjects are merely "homosexual conduct" and "homosexual sodomy." That there are, in fact, gay and lesbian people is not part of Justice Scalia's worldview, as he has shown time and time again. There is only homosexual conduct. And yet he says, like a "no homo" jock in a locker room, "Hey, I don't care if you're gay." Once again, just getting started. Today's decree says that my

Ruler, and the Ruler of 320 million Americans coast-to-coast, is a majority of the nine lawyers on the Supreme Court. That is outrageous rhetoric and an outrageous sentiment. The decision is not a “decree.” The Court is not a “Ruler”—it is an Article III interpreter of the Constitution, at its most important when it protects minorities against the will of the majority. Even demeaning Supreme Court justices as “lawyers” is a sign of disrespect. Other statements are similar. “This is a naked judicial claim to legislative—indeed, super-legislative—power; a claim fundamentally at odds with our system of government.” “What really astounds is the hubris reflected in today’s judicial Putsch.” And, “With each decision that is unabashedly based not on law, but on the ‘reasoned judgment’ of a bare majority of this Court—we move one step closer to being reminded of our impotence.” Others have already quoted Justice Scalia’s rhetoric—“jiggery-pokery” and the rest—at length, so I won’t spend much time with it here. Because in fact, his jurisprudence is far more shocking. Watch this: When the Fourteenth Amendment was ratified in 1868, every State limited marriage to one man and one woman, and no one doubted the constitutionality of doing so. That resolves these cases. When it comes to determining the meaning of a vague constitutional provision—such as “due process of law” or “equal protection of the laws”—it is unquestionable that the People who ratified that provision did not understand it to prohibit a practice that remained both universal and uncontroversial in the years after ratification. We have no basis for striking down a practice that is not expressly prohibited by the Fourteenth Amendment’s text, and that bears the endorsement of a long tradition of open, widespread, and unchallenged use dating back to the Amendment’s ratification. I have quoted this passage at length so there is no misunderstanding. What Justice Scalia is saying here is that if it was “universal and uncontroversial” in 1868, it’s obviously okay now. That principle, of course, would allow states to ban interracial marriages, including that of Justice Thomas. It would allow states to bring back the doctrine that a woman surrenders all her rights to her husband upon marriage. It is shocking. To be sure, it is also of a piece with Justice Scalia’s “originalism” and is not, as such, novel. But its strict application here places Justice Scalia in a bizarre twilight-zone of 19th century values. Likewise, Justice Thomas’s description of “the dangerous fiction of treating the Due Process Clause as a font of substantive rights.” That “fiction” has protected rights to contraception, to abortion, and to all kinds of intimate family matters. Justice Thomas’s reactionary jurisprudence would erase half a century of gains in the area of civil rights. And likewise Justice Alito’s talking-point dictum that the opinion will be “used to vilify Americans who are unwilling to assent to the new orthodoxy.” This, of course, is a commonplace on the Religious Right—but its appearance in a Supreme Court opinion is nonetheless shocking. But it is Justice Alito’s parting jab which resonates the most. Obergefell, he writes, evidences “the deep and perhaps irredeemable corruption of our legal culture’s conception of constitutional interpretation.” This from someone who joined an opinion overturning fifty years of due process jurisprudence, and another arguing a return to 1868’s family values. “All Americans,” he concludes, “should worry about what the majority’s claim of power portends.” Claim of power—as if the Constitution does not empower the Court to do exactly what it has done: use reasoning and interpretation to defend constitutional rights against laws that would abridge them. These are, as the saying goes, fighting words, and more importantly, they are words that will inspire others to fight. They are what some call “stochastic terrorism,” the broadcasting of a message so incendiary as to inspire some “lone wolf” to violence—if not actual violence, then precisely the kinds of anti-democratic, anti-American defiance we have already seen among some politicians. Were the targets of such acts only gays and lesbians, it would be bad enough. But these four dissents have encouraged disrespect of the Supreme Court itself. Agree or disagree with the Court’s method of interpreting the Constitution, they are acts of vandalism against one of the foundations of our democracy.

Court legitimacy down now – conservatives are calling for the ruling to still be challenged up until the 2016 election

Ring 6/26 (Trudy Ring, journalist for [advocate.com](http://www.advocate.com), June 26 2015, “Right Wing Vowing to Refuse and Resist”, <http://www.advocate.com/politics/marriage-equality/2015/06/26/right-wing-vowing-refuse-and-resist>)

Antigay activists have begun responding to this morning’s marriage equality ruling, and their responses are full of comparisons to the Dred Scott decision of 1857, which ruled that African-Americans had no citizenship rights, and 1973’s Roe v. Wade, which legalized abortion nationwide. They’re talking a lot about disenfranchisement of citizens who voted for marriage bans. They are also not conceding defeat. Some are making general statements about not obeying the decision, although it’s unclear what form that will take. But the National Organization for Marriage is again calling for a federal constitutional amendment to ban same-sex marriage, something endorsed by Republican presidential hopefuls including Mike Huckabee and Bobby Jindal. It’s also promoting the First

Amendment Defense Act, which has been introduced in Congress and would prohibit federal agencies from denying grants, tax exemptions, certifications or licenses because of a business or individual's belief that marriage should be limited to heterosexual couples, and similar state-level bills. Other efforts to block marriage equality include a bill proposed in the U.S. House by Rep. Steve King of Iowa, which would strip the federal courts of jurisdiction over marriage. None of these efforts are likely to succeed, at least at the federal level; in some states, "license to discriminate" legislation may have a chance. **The right wing is also calling for marriage to be an issue in the 2016 presidential election.** Herewith, some reactions, with written statements styled as the authors wrote them: "Just as with Roe v. Wade in 1973, the courts will not have the final say on this profound social matter. The American people will stand up for their right to have a voice and a vote, especially as they experience the ways in which redefining marriage fundamentally impairs their freedom to live and work in accordance with their beliefs. With this ruling, the Supreme Court has set our government on a collision course with America's cherished religious freedoms, explicitly guaranteed in the First Amendment of the Constitution. Americans will not stop standing for transcendent truth, nor accept the legitimacy of this decision. Truth is not decided by polls or the passage of time, but by the One who created time and everything that exists therein. We will not lapse into silence but will continue to speak uncompromisingly for the truth about what marriage is, always has been, and always will be: the union of one man and one woman." — Tony Perkins, president, Family Research Council "This is not the first time that the Supreme Court has issued an immoral and unjust ruling. In 1857, the Court ruled in the infamous Dred Scott v. Sandford case that African-Americans could not become citizens of the United States and determined that the government was powerless to reject slavery. In 1927 the Court effectively endorsed eugenics by ruling that people with mental illness and other 'defectives' could be sterilized against their will, saying 'three generations of imbeciles are enough.' And in Roe v. Wade, the Court invented a constitutional right to abortion by claiming it was an integral element of the right to privacy. Over 55 million unborn babies have died as a result. We urge the American people and future presidents to regard today's decision just as President Abraham Lincoln regarded the Dred Scott ruling when he said in his first inaugural address that 'if the policy of the government upon vital questions, affecting the whole people, is to be irrevocably fixed by decisions of the Supreme Court, the instant they are made ... the people will have ceased to be their own rulers, having to that extent practically resigned their government into the hands of that eminent tribunal. Today's decision is by no means the final word concerning the definition of marriage; indeed it is only the beginning of the next phase in the struggle. NOM is committed to reversing this ruling over the long term and ameliorating it over the short term." — Brian Brown, president, National Organization for Marriage "This decision not only denies reality but also robs citizens of their right to self-government. From the gaseous emanations of their own imaginations, five of our supremacist justices have discerned a heretofore nonexistent constitutional requirement that homoerotic unions be recognized as 'marriages.' Just as Dred Scott and Roe v. Wade gave birth to relentless cultural turmoil, division, and suffering, so too will the Obergefell decision. By imposing on the country a deceit buttressed by false allegations that opposition to the legal recognition of non-marital unions as marriages is motivated by 'animus,' these five judges have watered the seeds of strife planted by sexual anarchists. ... This pernicious SCOTUS decision also provides evidence that the moral arc of America—at least with regard to marriage — bends not toward justice, wisdom, or morality but, rather, toward perversity and injustice. Liberals are once again on the shameful side of history and will once again foment cultural conflict and human suffering." — Laurie Higgins, cultural analyst, Illinois Family Institute "**This morning's ruling rejects not only thousands of years of time-honored marriage but also the rule of law in the United States. In states across the nation, voters acted through the democratic process to protect marriage and the family.** Yet, courts around the country chose to disregard the will of the people in favor of political correctness and social experimentation. And we witnessed firsthand the consequences, as individuals were repeatedly targeted by the government for not actively supporting homosexual marriage. **Sadly, our nation's highest Court, which should be a symbol of justice, has chosen instead to be a tool of tyranny, elevating judicial will above the will of the people.** There is no doubt that this morning's ruling will imperil religious liberty in America, as individuals of faith who uphold time-honored marriage and choose not to advocate for same-sex unions will now be viewed as extremists. But to the Court, we send this unequivocal message: We will continue to uphold God's plan for marriage between one man and one woman, and we call on all Christians to continue to pray for the nation, and for those whose religious liberties will be directly impacted by this ruling." — Tim Wildmon, president, American Family Association "This case is about much more than marriage and will go down in history alongside other appalling Supreme Court rulings, like Dred Scott and Roe. Just as the lives of more than 55 million babies lost through abortion echo through the chambers of the Court every day, so the negative impact of this illegitimate decision will sound before the Court for years to come. **The Court solves nothing with this ill-advised ruling, but only intensifies the culture wars,** as it did in Roe, **by cutting short a healthy debate about the definition of marriage, family, and sexuality that our country is having. All Americans should stand against such overreach,** whatever their views on marriage. ... Concerned Women for America will continue to work to support marriage in all areas,

including combating the harmful effects of cohabitation, divorce, and the redefinition of marriage.” — Penny Nance, CEO and president, Concerned Women for America “Although this result was predicted by many observers, the action of the Court is nonetheless startling in its rejection of a societal understanding of marriage that goes back to the dawn of civilization. It tramples on the democratic process by overturning the will of more than 60 percent of American voters and creates a new federal constitutional right in an area where our founding document is silent. We are also concerned that this decision will fan the flames of government hostility against individuals, businesses and religious organizations whose convictions prevent them from officiating at, participating in, or celebrating such unions. We’ve already watched this hostility operate against wedding vendors, military chaplains, and others, and anticipate that today’s decision will open the door to an unwelcome escalation of this problem. Ultimately, however, no court can change the eternal truth that marriage is, and always has been, between a man and a woman. Regardless of today’s decision, Focus on the Family will continue to address the importance of one man, one woman marriage to families, society and especially for children who have a right to both a mother and a father.” — Jim Daly, president, Focus on the Family “While there are many things we can endure any attempt to redefine marriage is a line we cannot and will not cross. That’s why we cannot obey. We just simply have no choice in this matter. ... It matters nothing about how many justices of the Supreme Court think they can change the natural created order. ... If they are that removed from reality that they think they can write an opinion and somehow constitutionalize something that is contrary to the natural created order then that’s a decision we can’t respect, and there have been significant decisions by the Supreme Court in its history that fall in that category, like the Dred Scott decision, and that’s a decision that Abraham Lincoln advocated that there should be no respect for.” — Mat Staver, founder and chairman, Liberty Counsel “We of course are concerned about the freedom of conscience of millions of Americans who continue to believe that marriage is the union of one man and one woman and that both mothers and fathers are important and essential for children. ... We hope that millions of Americans who still believe a marriage is between one man and one woman will continue to proclaim that truth today.” — Austin Nimocks, Alliance Defending Freedom

Red states have had a history of not obeying court rulings they view as “illegitimate”

Culhane 6/26 (John Culhane, professor of law and co-director of the Family Health Law and Policy Institute at Widener Law, June 26 2015, “Beware the red state backlash against today’s historic ruling.”, http://www.politico.com/magazine/story/2015/06/gay-marriage-legal-backlash-119468.html?m=m_t1_2h#.VY2XXvm4TIV)

Justice Anthony Kennedy, as the crucial fifth vote in favor of a constitutional right to marry for gay and lesbian couples, has just cemented his legacy as the Thurgood Marshall of the LGBT movement. In an opinion of astonishing breadth and rhetorical eloquence, he led the Supreme Court through a decision rich in its description of the importance of marriage to the dignity and equality of all couples—and their families. “It is now clear that the challenged laws burden the liberty of same-sex couples, and...they abridge central precepts of equality,” he wrote. No laws thus described could possibly stand. But the Supreme Court’s historic decision in Obergefell v. Hodges can’t mask this reality: In many states, gay and lesbian couples will have great difficulty exercising their newfound marriage rights. In some ways, this new chapter of the gay marriage fight will likely mirror abortion rights in the wake of Roe v. Wade—a right technically legal but frustratingly difficult to exercise in many corners of the country. It’s too simple to see this decision as bringing down the curtain on the national debate over marriage equality, especially since almost two-thirds of Americans now feel that same-sex couples should have a constitutional right to marry. The debate is indeed now largely over in blue states. But today’s decision will supply a hefty dose of oxygen to efforts already underway in red state legislatures to continue to deny marriage rights to gay couples. This won’t be a full-on “Jim Crow Redux.” For one thing, the long struggle to defeat segregation and disenfranchisement laws itself led the Supreme Court to develop a robust doctrine of equality. The LGBT rights movement has benefited from that legacy, and the Court can be expected to continue using it to police efforts to compromise marriage equality. But make no mistake: In certain corners of the country, it’s only going to get tougher for gay and lesbian couples to exercise their now-legal right to wed. And the motivation of lawmakers is the same—to take away constitutional rights. North Carolina laid down an early marker with the recent enactment—over Governor Pat McCrory’s veto—of a law that allows public employees to refuse to participate in the steps needed to make a same-sex marriage valid. In sweeping language, the law allows the clerks who issue the licenses and the magistrates who perform the marriages to opt out performing their duties “based upon any sincerely held religious exemption.” The law isn’t limited to same-sex weddings—a racist magistrate could also refuse to perform an interracial or interfaith wedding—but it’s abundantly clear that same-sex unions were the motivation for this ill-considered measure. The North Carolina law makes clear that someone has to issue a marriage license to a same-sex couple, but there’s no provision requiring the refusenik to state any religious objection beforehand. This lack of notice is sure to lead to some couples suffering public embarrassment upon having a clerk turn and walk away rather than processing their license application. And even though the law tries to ensure that the couple can proceed through the required steps, it’s possible that all the magistrates in a particular county could refuse to perform a wedding, thereby touching off a scramble to

find a magistrate from another county willing to do so. How can such a law be permissible? Don't public officials have a duty to carry out their jobs? Usually, yes. And this law might well be unconstitutional, as it burdens what the Court has just found to be same-sex couples' fundamental right to marry. But establishing the law's unconstitutionality will take time and money. Meanwhile, other conservative states can be expected to follow suit, or take even more radical steps, in short order. After all, North Carolina—which, remember, cast its electoral votes for Obama in 2008—is hardly the most conservative state. Here's an example: the Alabama Senate recently passed a bill that would express the lawmakers' disdain for same-sex marriages by getting the state out of the marriage licensing business entirely. Although the measure stalled in the House, Obergefell could reignite efforts to move it forward. The law would replace licenses with private contracts that would then be filed with the state—a rash move that would destabilize all gay and straight marriages within the state (since contracts can be varied) and create enormous problems for interstate recognition of marriages. Other laws don't as directly block access to marriage for gay and lesbian couples, but are designed to make life harder for same-sex couples. The blowback against Indiana's religious freedom law—which would have allowed businesses to refuse to provide wedding-related services to same-sex couples—was essentially repealed after public outcry. Soon thereafter, though, Mississippi put a similar law in place, without a specific reference to the right of private businesses to discriminate. But it effectively allows discrimination to happen by stating that no one's religious freedom can be substantially burdened without a "compelling reason." Isn't the right to marry a "compelling reason"? After today's decision, yes, but a private business's decision not to provide services to same-sex couples doesn't directly affect their right to marry. The couple would be forced to argue more broadly about the right to be free from discrimination. That argument is hard to make in Mississippi—and in a majority of other states—where anti-discrimination laws don't cover sexual orientation. In many of these states, a similar combination of religious freedom protections and a gap in the anti-discrimination laws will allow religious liberty to trump gay couples' interests. For example, Michigan just passed a law that allows adoption agencies to refuse to provide services to any prospective parents if placing a child with those parents would violate the organization's "sincerely held religious beliefs." This one isn't as likely to prove a real barrier to same-sex couples seeking to adopt, because the law also requires a declining agency to refer the prospective parents to another agency, or to the state's website listing other agencies that will work with the couple. Yet the law is another important case of marriage equality pushback. It puts the state on the side of anti-gay discrimination, because the agencies refusing gay couples receive state money. It segments the adoption market, by ghettoizing same-sex couples. And it furthers the narrative that gay and lesbian couples lack a necessary ingredient—either a mother or a father—that Obergefell effectively rejects in finding that the marriages of same- and opposite-sex couples are equal. These and other initiatives are dramatic illustration of the fact that the people and lawmakers in conservative states won't give up so easily on gay rights. The more interesting question is how widespread and long-lasting the backlash will be.

Conservatives mounting backlash against court on same-sex marriage decision

(Tess, journalist and temporary editorial assistant at Vice News, 06/29/15, Vice News, "Conservatives Prepare Backlash Against US Supreme Court's Same-Sex Marriage Decision", <https://news.vice.com/article/conservatives-prepare-backlash-against-us-supreme-courts-same-sex-marriage-decision>, 06/29/15)

As landmarks and businesses across the country were emblazoned in rainbows celebrating the historic Supreme Court ruling last Friday that made same-sex marriage legal in all 50 states, some conservatives began plotting their backlash. ¶ The 5-4 ruling in favor for same-sex marriage sparked an outcry from some members of the GOP and conservative leaders who claim that religious beliefs are under attack. ¶

Republican presidential contender Sen. Ted Cruz of Texas described the stretch from Thursday to Friday, which included a Supreme Court ruling favorable to President Obama's Affordable Care Act, as "some of the darkest 24 hours in our nation's history." ¶

Cruz said that the rulings on Obamacare, as the ACA is popularly known, and against state bans on same-sex marriage constituted "naked and shameless judicial activism" that has "undermined the fundamental legitimacy of the United States Supreme Court." ¶ He also announced a plan to introduce a constitutional amendment that would subject "lawless" Supreme Court justices to intermittent re-election. ¶ In order to provide the people themselves with a constitutional remedy to the problem of judicial activism and the means for throwing off judicial tyrants, I am proposing an amendment to the United States Constitution that would subject the justices of the Supreme Court to periodic judicial-retention elections," Cruz wrote in the National Review. "Every justice, beginning with the second national election after his or her appointment, will answer to the American people and the states in a retention election every eight years. Those justices deemed unfit for retention by both a majority of the American people as a whole and by majorities of the electorates in at least half of the 50 states will be removed from office and disqualified from future service on the Court." ¶ Wisconsin Gov. Scott Walker, who is expected to soon declare his candidacy for the Republican presidential nomination, also slammed the ruling and called for the passage of a constitutional amendment that would allow states to define marriage. ¶ Walker urged Obama and political leaders across the country "to join me in reassuring millions of Americans that the government will not force them to participate in activities that violate their deeply held religious

beliefs." Following Friday's decision, former Arkansas governor and Republican presidential candidate Mike Huckabee's campaign posted a video of his infant grandson that compares his soiled diapers to the recent rulings. Huckabee released a statement calling the SCOTUS ruling on gay marriage "judicial tyranny." ¶ "I will not acquiesce to an imperial court any more than our Founders acquiesced to an imperial British monarch," he said. "The Supreme Court can no more repeal the laws of nature and nature's God on marriage than it can the law of gravity." ¶ Huckabee also suggested that Christians will resist the court's decision with widespread civil disobedience, comparing the effort to Dr. Martin Luther King's fight against racial discrimination. ¶ "They will go the path of Dr. Martin Luther King, who in his brilliant essay the letters from a Birmingham jail reminded us, based on what St. Augustine said, that an unjust law is no law at all," he said. "And I do think that we're going to see a lot of pastors who will have to make this tough decision." ¶ Rick Santorum, a former Republican senator of Pennsylvania who is running for the presidency, also struggled to come to terms with the ruling. ¶ "What this court said is that anybody who does not toe the line is going to be viewed the same way as someone who doesn't support other civil rights, which is you will be a bigot," he told the Washington Examiner. "Every institution that stands by any type of biblical world view is going to have to deal with the reality that the government is going to tell you that you can no longer believe this and get any accommodation from the government." ¶ "We're losing," he added, "because we're not trying to win." ¶ Jeb Bush, former Republican governor of Florida, and the Sunshine State's junior Republican Sen. Marco Rubio both took more measured approaches, coming short of calling for constitutional amendments, but they upheld the value of "traditional marriage." ¶ "I believe the Supreme Court should have allowed the states to make this decision," Bush said. "In a country as diverse as ours, good people who have opposing views should be able to live side by side. It is now crucial that as a country we protect religious freedom and the right of conscience and also not discriminate." ¶ Rubio echoed this relatively moderate spirit. ¶ "While I disagree with this decision, we live in a republic and must abide by the law," Rubio declared. "A large number of Americans will continue to believe in traditional marriage," and a large number of Americans will be pleased with the Court's decision today. In the years ahead, it is my hope that each side will respect the dignity of the other." ¶ Campaign watchdogs had earlier speculated that Bush might possibly emerge as the first serious pro-gay Republican candidate after he appointed a number of Republican advocates for gay rights to his inner advisory circle. ¶ In some states, political leaders have suggested that Friday's historic ruling could be circumvented or obstructed, at least for a time. ¶ Texas Gov. Greg Abbott released a statement on Friday underscoring the government's "constitutional duty" to protect the religious liberty of Texans. Texas Attorney General Ken Paxton announced on Sunday that county clerks could deny same-sex couples marriage licenses, they will probably be sued for doing so, he said, but noted that "numerous lawyers stand ready to assist clerks defending their religious beliefs." ¶ Officials in Louisiana and Mississippi initially argued that the Supreme Court's decision would not be effective in their states until the Fifth Circuit Court of Appeals ruled on another gay marriage case, which it had deferred to wait for the Supreme Court's judgment. But Louisiana Gov. Bobby Jindal indicated that his state would eventually comply with the ruling, and on Monday it was reported that his state had issued its first marriage license to a same-sex couple after local attorneys determined that there was no reason for a delay. In Mississippi, the state attorney general also issued a letter on Monday informing clerks that they could issue such licenses. ¶ In Alabama, two counties have flatly refused to issue marriage licenses to anyone, and Roy Moore, the chief justice of the Alabama Supreme Court, has made no secret of his resistance to gay marriage. ¶ In Tennessee, two state legislators are working on a bill that would protect religious clergy who refuse to perform same-sex marriages, while a lawmaker in Utah is reportedly preparing legislation that would end the issuing of marriage licenses by the state, ¶ Frank S. Page, president of the Southern Baptist Convention Executive Committee, said that the Supreme Court's decision heralds "a time of deep, spiritual darkness." Mississippi talk radio host Bryan Fischer posted an opinion piece on the American Family Association website with the headline: "Rainbow Jihadists of SCOTUS Blow Up Twin Towers of Truth and Righteousness." ¶

N/U Legitimacy Low

The Supreme Court's legitimacy is low and declining

Jost 14 (Kenneth, professor of law at Georgetown University and Supreme Court editor of CQ Press with a JD from Georgetown University, 2014, "The Court's Ideological Blocs", pg. 1, <http://library.cqpress.com.proxy.lib.umich.edu/scc/document.php?id=ctreprts-jost-2014-1619-93697-2634288&type=hitlist&num=0,06/24/15>)

The decisions of the U.S. Supreme Court are seldom without controversy, and American history has seen fierce public debate over the Court's proper role in the democracy. With lifetime tenure, justices are in principle immune from the vagaries of public opinion. But new issues inevitably come to the Court because of emerging trends in society, and evolving norms and values have always been part of these cases.[¶] As the Court continues to weigh momentous cases on important social issues, the history of past decisions, such as *Roe v. Wade*, continue to be contemplated by legal scholars. Did the Court move too "fast"? How should decisions on evolving social issues be adjudicated in light of prevailing views in society? In 2012, the landmark ruling on the Affordable Care Act was handed down. Many legal scholars noted that the Court's standing with the public and perceived legitimacy was part of the calculus, as 2012 polling data suggested that the Court's traditionally high approval ratings had declined considerably. In advance of the ruling, the American people were divided over how the Court should handle the issue.[¶] Scholars are now trying to make sense of the Court's 2013 decisions — on gay marriage, the Voting Rights Act, affirmative action, and much more — and to see how public opinion might have affected the legal rulings. Writing at the political science blog "The Monkey Cage," Erik Voten of Georgetown examines the various academic hypotheses and some of the relevant research literature; he concludes that applying an "attitudinal model" helps explain certain judicial decisions.[¶] For background research perspective on the gay marriage case, see this reading list, compiled by George Washington University political scientist John Sides. Emory University political scientist Tom Clark also notes in a useful recent blog post that "the justices are indeed sensitive to the dynamics of public opinion on important issues in society. The Court's responsiveness to public opinion is something that political scientists have long studied."

N/U Supreme Court Biased

Supreme Court is biased towards cooperation's

Farganis 12 (Dion, political scientist specializing in Constitutional Law and Judicial Politics, JD candidate at the University of Minnesota Law School, 01/20/12, "Do Reasons Matter? The Impact of Opinion Content on Supreme Court Legitimacy", pg. 206, <http://prq.sagepub.com/content/65/1/206.full.pdf+html>, 06/24/15)

What would have happened if the Supreme Court's opinion in Bush v. Gore had been based on polling data instead of legal arguments? How might the public have reacted to the decision in Brown v. Board of Education if the justices had said that integration was "simply the right thing to do," rather than relying on constitutional provisions and case law? Conventional wisdom certainly holds that neither of these scenarios would have ended well for the Court. Indeed, commentators have long maintained that there are certain types of arguments that justices can legitimately use to defend their rulings and certain types that they cannot (Bobbitt 1982; Chemerinsky 2002; Marmor 2005; Wells 2007). Written opinions that rely on factors such as constitutional text and precedent are thought to help secure the Court's legitimacy; personal beliefs, political ideology, and a host of other "extraconstitutional" justifications, most observers contend, do not (Baker 2004; also see Baird and Gangl 2006; Casey 1974). But are these assumptions well founded? Do the ways in which justices explain their decisions actually affect the Court's legitimacy? Previous studies have focused on other factors affecting the Court's institutional standing, such as public response to specific decisions (Grosskopf and Mondak 1998; Hoekstra and Segal 1996; Nicholson and Howard 2003) or general perceptions of procedural fairness (Baird and Gangl 2006; Casey 1974; Gibson 1989, 1991; Petrick 1968; Scheb and Lyons 2000, 2001; Tyler and Rasinski 1991). However, the extent to which legitimacy can be shaped by the actual arguments and justifications in the Court's opinions themselves remains somewhat unclear (but see Hume 2006). Does the content of the Court's rulings—the rationales that justices provide to explain their votes—influence the Court's institutional well-being? That is, when it comes to Supreme Court legitimacy, do reasons matter?

N/U Drones

The US already has low legitimacy due to the controversies surrounding the drone program

Kennedy 13 (Greg Kennedy, PhD supervision in the areas of American Foreign Policy and Intelligence Studies, 2013, "Drones: Legitimacy and Anti-Americanism",

http://www.strategicstudiesinstitute.army.mil/pubs/Parameters/Issues/WinterSpring_2013/3_Article_Kennedy.pdf)

The appearance of new weapons' technologies often gives rise to questions of legitimacy. The use of missile weapons against armored knights was considered illegitimate and unchivalrous by some, as well as a destabilizing influence on the conduct of civilized warfare. An acknowledged and accepted set of rules, designed to limit the vulnerability of the ruling elite in combat, made longbow and crossbow technology illegitimate in the eyes of that warrior-class.¹ German U-boat actions against commerce in World War I, the use of aerial bombardment against civilian populations, and defoliation agents in Vietnam, are modern examples of new technologies whose legitimacy was contested in times of conflict.² Questions of legitimacy, however, have not always been linked to the condition of war or to a specific technology. British concentration camps during the Boer War were examples of illegitimate policies related to warfare devoid of any specific technological change. Their illegitimacy came not from technology but from the legal and ethical questions raised by the implementation of those methods of waging war.³ Throughout these debates over technology and policies, the term legitimacy seldom meant the same thing. Legitimacy has been used in such circumstances interchangeably with concepts such as proportional, moral, ethical, lawful, appropriate, reasonable, legal, justifiable, righteous, valid, recognized, and logical. The recent phenomena of using unmanned vehicles, or drones, to deliver lethality in situations of conflict is yet another instance in which a type of technology has proliferated before considerations of its legitimacy have been agreed upon: The exponential rise in the use of drone technology in a variety of military and non-military contexts represents a real challenge to the framework of established international law and it is both right as a matter of principle, and inevitable as a matter of political reality, that the international community should now be focusing attention on the standards applicable to this technological development, particularly its deployment in counterterrorism and counter-insurgency initiatives, and attempt to reach a consensus on the legality of its use, and the standards and safeguards which should apply to it.⁴ The current debate over the legitimacy of America's use of drones to deliver deadly force is taking place in both public and official domains in the United States and many other countries.⁵ The four key features at the heart of the debate revolve around: who is controlling the weapon system; does the system of control and oversight violate international law governing the use of force; are the drone strikes proportionate acts that provide military effectiveness given the circumstances of the conflict they are being used in; and does their use violate the sovereignty of other nations and allow the United States to disregard formal national boundaries? Unless these four questions are dealt with in the near future the impact of the unresolved legitimacy issues will have a number of repercussions for American foreign and military policies: **Without a new doctrine for the use of drones that is understandable to friends and foes, the United States risks achieving near-term tactical benefits in killing terrorists while incurring potentially significant longer-term costs to its alliances, global public opinion, the war on terrorism and international stability.**⁶ This article will address only the first three critical questions. The question of who controls the drones during their missions is attracting a great deal of attention. The use of drones by the Central Intelligence Agency (CIA) to conduct "signature strikes" is the most problematic factor in this matter. Between 2004 and 2013, CIA drone attacks in Pakistan killed up to 3,461—up to 891 of them civilians.⁷ Not only is the use of drones by the CIA the issue, but subcontracting operational control of drones to other civilian agencies is also causing great concern.⁸ Questions remain as to whether subcontractors were controlling drones during actual strike missions, as opposed to surveillance and reconnaissance activities. Nevertheless, the intense questioning of John O. Brennan, President Obama's nominee for director of the CIA in February 2013, over drone usage, the secrecy of their controllers and orders, and the legality of their missions confirmed the level of concern America's elected officials have regarding the legitimacy of drone use. Furthermore, perceptions and suspicions of illegal clandestine intelligence agency operations, already a part of the public and official psyche due to experiences from Vietnam, Iran-Contra, and Iraq II and the weapons of mass destruction debacle, have been reinforced by CIA management of drone capability. Recent revelations about the use of secret Saudi Arabian facilities for staging American drone strikes into Yemen did nothing to dissipate such suspicions of the CIA's lack of legitimacy in its use of drones.⁹ The fact that the secret facility was the launching site for drones used to kill American citizens Anwar al-Awlaki and his son in September 2011, both classified by the CIA as al-Qaeda-linked threats to US security, only deepened such suspicions. Despite the fact that Gulf State observers and officials knew about American

drones operating from the Arabian peninsula for years, the existence of the CIA base was not openly admitted in case such knowledge should “. . . damage counter-terrorism collaboration with Saudi

Arabia.”¹⁰ The fallout from CIA involvement and management of drone strikes prompted Senator Dianne Feinstein, Chairwoman of the Senate Intelligence Committee, to suggest the need for a court to oversee targeted killings. Such a body, she said, would replicate the Foreign Intelligence Surveillance Court, which oversees eavesdrop-ping on American soil.¹¹ Most importantly, such oversight would go a long way towards allaying fears of the drone usage lacking true political accountability and legitimacy. In addition, as with any use of force, drone strikes in overseas contingency operations can lead to increased attacks on already weak governments partnered with the United States. They can lead to retaliatory attacks on local governments and may contribute to local instability. Those actions occur as a result of desires for revenge and frustrations caused by the strikes. Feelings of hostility are often visited on the most immediate structures of authority—local government officials, government buildings, police, and the military.¹² It can thus be argued that, at the strategic level, drone strikes are fuelling anti-American resentment among enemies and allies alike. Those reactions are often based on questions regarding the legality, ethicality, and operational legitimacy of those acts to deter opponents. Therefore, specifically related to the reaction of allies, the military legitimacy question arises if the use of drones endangers vital strategic relationships.¹³ One of the strategic relationships being affected by the drone legitimacy issue is that of the United States and the United Kingdom. Targeted killing, by drone strike or otherwise, is not the sole preserve of the United States. Those actions, however, attract more negative attention to the United States due to its prominence on the world’s stage, its declarations of support for human rights and democratic freedoms, and rule-of-law issues, all which appear violated by such strikes. This complexity and visibility make such targeted killings important for Anglo-American strategic relations because of the closeness of that relationship and the perception that Great Britain, therefore, condones such American activities. Because the intelligence used in such operations is seen by other nations as a shared Anglo-American asset, the use of such intelligence to identify and conduct such killings, in the opinion of many, makes Great Britain culpable in the illegality and immorality of those operations.¹⁴ Finally, the apparent gap between stated core policies and values and the ability to practice targeted killings appears to be a starkly hypocritical and deceitful position internationally, a condition that once again makes British policymakers uncomfortable with being tarred by such a brush.¹⁵ The divide between US policy and action is exacerbated by drone technology, which makes the once covert practice of targeted killing commonplace and undeniable. It may also cause deep-rooted distrust due to a spectrum of legitimacy issues. Such questions will, therefore, undermine the US desire to export liberal democratic principles. Indeed, it may be beneficial for Western democracies to achieve adequate rather than decisive victories, thereby setting an example of restraint for the international order.¹⁶ The United States must be willing to engage and deal with drone-legitimacy issues across the entire spectrum of tactical, operational, strategic, and political levels to ensure its strategic aims are not derailed by operational and tactical expediency.

N/U Race surveillance

Courts are perceived to be racist – hurts legitimacy

HRW 08 (Human Rights Watch, international NGO that researches and advocates for human rights, March 7, 2008, “UN Faults US on Racism”, <http://www.hrw.org/news/2008/03/06/un-faults-us-racism>)

The UN’s Committee on the Elimination of Racial Discrimination harshly criticized the US record on race after considering oral and written testimony submitted by the US government. In its conclusions issued today, the committee urged the US to rectify the “stark racial disparities” in criminal justice systems throughout the country. The United States should immediately adopt the UN’s recommendations to alleviate the widespread racial bias it found in the criminal justice system. Human Rights Watch said today. “The UN is telling the US that it needs to deal with an ugly aspect of its criminal justice system,” said Alison Parker, deputy director of the US Program at Human Rights Watch. “The committee outright rejected the government’s claim that more black kids get life without parole sentences because they commit more crimes.” The UN committee condemned what it found to be racial disparities in the death penalty and in the sentencing of youth to life without parole for crimes committed when they were under 18, a practice the committee wants stopped. Further, the committee called on authorities to take steps, including a moratorium on the death penalty, to root out racial bias. The committee also dismissed claims by the US government that it did not have the power to examine the detention of non-citizens at Guantanamo. It urged the US to guarantee “enemy combatants” judicial review of the lawfulness and conditions of their detention. “Once again, the Bush administration has been told by a major human rights body that it is not above the law when it comes to the war on terrorism,” Parker said. “The US should reverse its decision to deny judicial review to non-citizen enemy combatant detainees.” The committee criticized US practices in numerous other areas, including: The Bush administration’s view that its human rights treaty obligations do not apply to laws or practices that are race-neutral on their face but discriminatory in effect; Racial segregation in housing and in public schools; Systemic inadequacies in indigent criminal defense, which have a disproportionate impact on racial minorities; The disenfranchisement of millions of US citizens because they have been convicted of a felony, even though they have fully served their sentences or have been released on parole. The Committee on the Elimination of Racial Discrimination is the UN body of experts responsible for monitoring countries’ compliance with the Convention on the Elimination of all Forms of Racial Discrimination, a human rights treaty ratified by the United States in 1994. The committee’s comments and responses to state party reports are authoritative interpretations of states’ obligations under the treaty. As is its regular practice, the committee considered US compliance with the treaty following the government’s submission of a report, due in November 2003 but finally submitted by the US in April 2007. A US delegation participated in the committee’s meeting to examine the report on February 21 and 22, 2008 in Geneva, and responded to questions.

N/L- Generic

Public approval doesn't influence the legitimacy of the court, neither do Partisan bills Rosen'12[Jeffery, legal affairs editor at The New Republic and president and CEO of the National Constitution Center, "The Supreme Court Has a Legitimacy Crisis, But Not For the Reason You Think:" the New Republic 6/11/2012 <http://www.newrepublic.com/article/politics/103987/the-supreme-court-has-legitimacy-crisis-not-the-reason-you-think> LM]

Last week, a New York Times/CBS poll found that only 44 percent of Americans approve of the Supreme Court's job performance and 75 percent say the justices are sometimes influenced by their political views. But although the results of the poll were striking, commentators may have been too quick to suggest a direct link between the two findings. In the Times article on the poll, for example, Adam Liptak and Allison Kopicki suggested that the drop in the Court's 66 percent approval ratings in the late 1980s "could reflect a sense that the court is more political, after the ideologically divided 5-to-4 decisions in Bush v. Gore and Citizens United." At the beginning of his tenure, Chief Justice John Roberts said that he subscribed to a similar theory. "I do think the rule of law is threatened by a steady term after term after term focus on 5-4 decisions," Roberts told me. But a new study by Nathaniel Persily of Columbia Law School and Stephen Ansolabehere of Harvard suggests that the relationship between the Court's declining approval ratings and increased perceptions of the Court's partisanship may be more complicated than the New York Times and the Chief Justice suggest. According to the study, Americans already judge the Court according to political criteria: They generally support the Court when they think they would have ruled the same way as the justices in particular cases, or when they perceive the Court overall to be ruling in ways that correlate with their partisan views.⁵ If this finding is correct, the most straightforward way for the Court to maintain its high approval ratings is to hand down decisions that majorities of the public agree with. And, like its predecessors, the Roberts Court has, in fact, managed to mirror the views of national majorities more often than not. In a 2009 survey, Persily and Ansolabehere found that the public strongly supported many of the Supreme Court's recent high-profile decisions, including conservative rulings recognizing gun rights and upholding bans on partial birth abortions, as well as liberal rulings upholding the regulation of global warming and striking down a Texas law banning sex between gay men. But if the public agrees with most of the Court's decisions, why is it more unpopular than ever? Part of the answer has to do with the fact that there are a handful of high profile decisions on which the Court is out of step with public opinion, including the Kelo decision allowing a local government to seize a house under eminent domain and the Boumediene case extending habeas corpus to accused enemy combatants abroad, and recent First Amendment decisions protecting unpopular speakers, such as funeral protesters, manufacturers of violent video games, and corporations (in the Citizens United case.) All of these decisions were unpopular with strong majorities of the public. But Persily and Ansolabehere also found that even decisions that closely divide the public can lead to a decrease in the Court's approval rating over time, by increasing the perception among half the public that the Court is out of step with its partisan preferences. Bush v. Gore is perhaps the clearest example. In the short term, the Court's overall approval ratings didn't suffer: Republicans liked the decision, while Democrats didn't, and the two effects canceled each other out. But Persily and his colleagues found that ten years later, Bush v. Gore continues to define the Court for many citizens, destroying confidence in the Court among Democrats while reinvigorating it among Republicans. Since an important component of the Court's overall approval rating is whether Americans perceive themselves to be in partisan agreement with the Court as an institution, Bush v. Gore has led to a statistically significant decline in approval among Democrats as a whole. At the beginning of his tenure, Chief Justice Roberts said he wanted to avoid 5-4 decisions because if people perceived the Court as a partisan institution, they would lose confidence in the institution more generally. But Persily and Ansolabehere's study suggests a more complicated reality: Americans support the Court when they perceive themselves to be in partisan agreement with it, and they lose confidence when they perceive the justices to be moving in a different partisan direction than their own. The study found that most Americans either don't know or guessed wrong about which party's presidents appointed the majority of justices: only a third knew that a majority of justices were appointed by Republican presidents. And the study also found that Republicans who can correctly identify the fact that Republican presidents appointed a majority of justices tend to support the Court, while Democrats who can correctly identify the fact that Democrats appointed a minority of justices express less support. That means that the conservative justices would be wrong to conclude that just because two thirds of the country wants the Court to strike down part of the health care law, similar numbers of Americans

would rally around a 5-4 decision against it. Over the long term, 5-4 decisions along party lines tend to decrease support for the Court among Democrats and increase support among Republicans, simply by reminding Americans of the partisan composition of the Court. If President Obama and other Democrats attack a 5-4 decision striking down health care as an act of Republican partisanship, this would increase the perception among Democrats that the Court doesn't share their partisan views. And Democrats who currently oppose the mandate may come to oppose the conservative justices' overturning of the mandate even more. "If the court strikes down the mandate, and elites, including the President, frame the decision in partisan terms, the decision will reinforce the roots of partisanship that many Americans see in the Court's recent decisions," Persily told me. Given that reality, Chief Justice Roberts may have been too quick to conclude that 5-4 partisan divisions would decrease the Court's legitimacy over time. The decrease in confidence among Democrats may be offset by the increase in confidence among Republicans. But Roberts was certainly correct that the Court should be held to different standards. As Roberts suggested, in an age when the White House and Congress are increasingly viewed as partisan institutions, avoiding polarization on the Supreme Court is a "special opportunity." It is also a defining test of his leadership. Jeffrey Rosen is the legal affairs editor of The New Republic.

The recent Obamacare ruling still hurts legitimacy – While Obamacare may be popular, the process of the ruling hurts the court's credibility.

Suderman 6/25 (Peter Suderman, senior editor at reason.com who writes regularly on healthcare and the federal government, June 25 2014, "In Upholding Obamacare's Subsidies, Justice Roberts Rewrites the Law—Again" <http://reason.com/blog/2015/06/25/in-upholding-obamacares-subsidies-justic>)

Supreme Court Chief Justice John Roberts has rewritten the law to save Obamacare—again. Roberts' majority opinion today in King v. Burwell, which ruled that the Obama administration's decision to allow health insurance subsidies flow through the law's federal exchanges, leaves no doubt that Roberts considers it his duty to keep the law afloat. "Congress passed the Affordable Care Act to improve health insurance markets, not to destroy them," he writes. "If at all possible, we must interpret the Act in a way that is consistent with the former, and avoids the latter." And so Roberts decided that a law which explicitly and repeatedly states that subsidies are limited to exchanges "established by a State," and which defines "State" as one of the 50 states or the District of Columbia, actually allows subsidies in exchanges established by a State or the federal government. Roberts' decision does not interpret Obamacare; it adds to it and reworks it, and in the process transforms it into something that it is not. Roberts has not merely tweaked the law; he has rewritten it to mean the opposite of what it clearly means. Why include the phrase "established by a State under Section 1311"—the section dealing with state-based exchanges—except to limit the subsidies to those particular exchanges? Roberts' opinion reconceptualizes this limiting language as inclusive. The Chief Justice frames his decision as a form of respectful deference to congressional intent. As my colleague Damon Root noted earlier, his opinion cautions that in "every case we must respect the role of the Legislature, and take care not to undo what it has done. A fair reading of legislation demands a fair understanding of the legislative plan." But Roberts' opinion is far more than a fair reading of the legislative plan; it is a Court-imposed decision as to what that plan must be. As Justice Antonin Scalia writes in a scathing dissent, Roberts presumes, with no definitive evidence, that his interpretation is the one that Congress intended. "What makes the Court so sure that Congress 'meant' tax credits to be available everywhere?" Scalia asks. "Our only evidence of what Congress meant comes from the terms of the law, and those terms show beyond all question that tax credits are available only on state Exchanges." Roberts' opinion declares its intent to uphold the law's basic policy scheme, arguing that there would be adverse insurance market effects to a decision in favor of the challengers. In other words, there would have been policy implications to a ruling for the plaintiffs. That is almost certainly true, but it is not an excuse to rewrite the clear language of the law. As Scalia says in the dissent, "The Court protests that without the tax credits, the number of people covered by the individual mandate shrinks, and without a broadly applicable individual mandate the guaranteed-issue and community-rating requirements 'would destabilize the individual insurance market.' If true, these projections would show only that the statutory scheme contains a flaw; they would not show that the statute means the opposite of what it says." The majority has decided how Obamacare's policy scheme should work, and redrafted the statute accordingly. If Roberts had truly wanted to defer to Congress, he could have ruled that the law means what says rather than what it does not, and effectively handed the issue back to the legislature, letting Congress decide whether and how to update the law in accordance with its own wishes. Instead, Roberts made the choice for Congress—taking its power to

craft law for itself. As Scalia writes, "the Court's insistence on making a choice that should be made by Congress both aggrandizes judicial power and encourages congressional lassitude." This is not the first time that Roberts has rewritten the law in order to uphold it. In 2012, he declared that the law's individual mandate to purchase insurance was unconstitutional under the Constitution's Commerce Clause—and yet upheld it by declaring that the law's penalty was instead permissible as a tax. In the same decision, he also found that the law's threat to revoke all federal Medicaid funding from states that decline to participate in Obamacare's expansion of the program was unconstitutionally coercive. But rather than strike the whole thing down, Roberts rewrote it, allowing the Medicaid expansion, and the rest of the law, to continue but without the same threat to state budgets. In his dissent, Scalia argues that there's a pattern to these rulings. "Under all the usual rules of interpretation, in short, the Government should lose this case. But normal rules of interpretation seem always to yield to the overriding principle of the present Court: The Affordable Care Act must be saved." If anything, it's even worse. What Roberts has saved is not the law so much as the Obama administration's dubious, textually unsupported interpretation and implementation of Obamacare. This is not judicial restraint. It is judicial hubris. And while it would be overstatement to say that this damages the legitimacy of the Court, it certainly reflects on the legacy and status of the law. As even Roberts admits in his opinion, the law "contains more than a few examples of inartful drafting" and generally "does not reflect the type of care and deliberation that one might expect of such significant legislation." It is a shoddy, messy piece of legislation, held together, barely, by Supreme Court duct tape. At this point, then, the law is as much a joint project between the administration and the Roberts court as it is a creation of Congress. As Scalia snarks at the end of his dissent, "we should start calling this law SCOTUScare." Regardless of what we call it, that's effectively what it has become.

AT- Legitimacy is constant

No change in court legitimacy – support usually returns back to normal levels and change is only gradual.

Gibson & Nelson 14 (James L. Gibson, Professor of Government at Washington University in St. Louis, and Michael J. Nelson, Ph.D. Candidate at Washington University in St. Louis, February 7, 2014, “The Legitimacy of the U.S. Supreme Court: Conventional Wisdoms, and Recent Challenges Thereto”, <http://mjnelson.org/papers/AnnualReview.pdf>)

One of the current key controversies in the literature concerns the theoretical and empirical connection between diffuse and specific support. The conventional view of the Court’s legitimacy suggests that levels of diffuse support are relatively immune to short-term changes in specific support (Caldeira and Gibson 1992; Gibson and Caldeira 1992). Empirically, fundamental political values— particularly support for democratic institutions and processes—serve as the most important predictors of diffuse support; because these fundamental values tend to be formed early in life and are obdurate, an individual’s level of diffuse support for the Court tends to remain relatively stable over time (Caldeira and Gibson 1992). Moreover, existing theoretical and empirical evidence suggests that most individual-level change in the Court’s support is temporary due to a process of regeneration. Mondak and Smithey (1997) suggest that the deleterious effect of dissatisfaction with a singular decision on individual-level support for the court is short-lived; after a shock, diffuse support gradually increases, eventually returning to its equilibrium level, as democratic values regenerate support for the Court. This claim has been validated empirically using representative, national samples; Durr, Martin, and Wolbrecht (2000) show that short term disruptions in an individual’s support for the Court have effects that only last for a short period. Still, this is not to say that the U.S. Supreme Court is invincible. Baird (2001) suggests that the relationship between specific and diffuse support is a gradual, incremental one. Individuals seem to keep a “running tally” of decisions, crediting the Court when it makes a pleasing decision and subtracting from the tally when the Court makes a disagreeable decision. This running tally theory suggests that the Court’s diffuse support could suffer once some accumulated threshold level of dissatisfaction is reached. Conversely, specific support can be transformed into obdurate diffuse support through a string of pleasing policy decisions; such a change is gradual, underscoring the varied and varying relationships observed between indicators of the two concepts (Gibson, Caldeira, and Baird 1998; Baird 2001). Thus, the relationship between diffuse and specific support is “sticky,” and is far from a one-to-one correlation. This theory is one way to account for variation in levels of diffuse support for the Court among African Americans. Gibson and Caldeira (1992) show that diffuse support for the Court is comparatively lowest among those African Americans who grew up before the Court acted to remedy civil rights violations against them, and among those growing up after the civil rights revolution. Post-civil rights African Americans provide some of the only evidence to date that accumulated grievances can undermine diffuse support in the institution. Yet the relationship is “sticky” inasmuch as the civil rights generation of African Americans did not adjust its attitudes toward the Court as the justices turned away from the expansion of civil rights. However, new research on the Court’s public support has challenged this conventional view, suggesting that individual-level performance dissatisfaction with the Court translates directly and simultaneously into a decrease in diffuse support. The strongest empirical support for this theory comes in a recent article by Bartels and Johnston (2013), who claim that “[c]ontrary to conventional wisdom, a potent ideological foundation underlies Supreme Court legitimacy vis-à-vis subjective ideological disagreement with the Court’s policy-making” (Bartels and Johnston 2013, 197, emphasis in original). Relying on a nationally-representative survey, Bartels and Johnston present empirical evidence that, as individuals’ disagreement with the ideological direction of the Court’s decisions increases, their diffuse support for the Court decreases. Moreover, Bartels and Johnston report data from a survey experiment whose results suggest that even a singular unpopular decision can result in a decrease in individual-level diffuse support. Similarly, Christenson and Glick (2013), analyzing responses to the U.S. Supreme Court’s important 2012 Affordable Care Act decision, found that both exposure to information about the case and individual-level agreement or disagreement with the decision affect change in levels of diffuse support among respondents. These are important empirical findings from the standpoint of legitimacy theory. If each individual decision issued by the Court has the potential to imperil its legitimacy, then we should expect the Court to change its behavior in order to protect the institution. Indeed, a Court whose public support rests on popular approval of its decisions, rather than a long-standing deep pool of public esteem, should be less likely to issue decisions that protect the rights of minorities, to exercise the power of judicial review to check the popularly-elected branches of

government, and to issue decisions that counter the wishes of a majority of Americans. Given the important constitutional and political role of the Court in the American democratic system of governance, it is nearly impossible to overstate the importance of this theoretical and empirical contention.¹ We hesitate to accept this revisionist theory, noting that neither the Bartels and Johnston nor the Christenson and Glick studies include in their analyses measures of democratic values, which existing research has shown to be the single most important predictor of institutional support, nor traditional measures of specific support. In a recent paper, Gibson and Nelson (forthcoming (b)) demonstrate that, once we account for these two factors, individual evaluations of the Court's performance have some independent effect on support for the Court, though the magnitude of that effect is dwarfed by the effect of an individual's democratic values. Thus, it seems that, while specific support may have some direct relationship with diffuse support, that relationship is, at best, a small one.¹² But even if the revisionist view is the correct one, a cascade effect resulting in a permanent diminution of the Court's support is unlikely to occur in practice in the contemporary era. As Gibson and Nelson (forthcoming (b)) note, the current U.S. Supreme Court is balanced ideologically, both in terms of the alignment of the Court's justices and the composition of its decisions; in fact, the distribution of the Court's decisions in recent terms have been nearly half liberal and half conservative, giving everyone—regardless of their ideology—some decisions to disagree with and about the same number to like. Scholars who focus only on the negative effects of unwanted decisions, without also taking into account the positive effects of decisions viewed favorably, overestimate the volatility in institutional legitimacy, and their alarmist views about the consequences of the Court deviating from the preferences of the majority are over-stated. Ironically perhaps, an ideologically divided Court most likely has some benefits for the legitimacy of the institution. As this discussion suggests, ascertaining the relationship between specific and diffuse support is a key unresolved area in the literature, with enormous substantive importance for our understanding of both the Court's role in the political system and its decision making. Crucial to this effort will be the use of panel data to observe within-individual change in diffuse and specific support over time, allowing researchers to move beyond studies of aggregate change to a more nuanced understanding of how individual-level dissatisfaction with the Court's decision affects its diffuse support immediately and the extent to which that effect persists over time. Building this understanding is essential in order to create a complete understanding of the Court's place in American democracy

Legitimacy can't change – even if a judge's political ideology is questioned, Americans believe that their decisions are still based primarily on the constitution.

Gibson & Nelson 14 (James L. Gibson, Professor of Government at Washington University in St. Louis, and Michael J. Nelson, Ph.D. Candidate at Washington University in St. Louis, February 7, 2014, "The Legitimacy of the U.S. Supreme Court: Conventional Wisdoms, and Recent Challenges Thereto", <http://mjnelson.org/papers/AnnualReview.pdf>)

Even if attitudes toward the Supreme Court as an institution are not polarized, there can be little debate over the proposition that the U.S. Supreme Court is today deeply embedded in American politics. When Americans cast their votes for a presidential candidate, many are explicitly thinking about how their vote might shape the make-up of the Supreme Court (e.g., Stolberg 2012 – see also Ross 2012). The Court makes decisions on issues of momentous importance (e.g., Obamacare) for American politics. Moreover, the Court is often divided in its decisions, on occasion, bitterly so, and for the first time in ages, the partisan attachments of the justices line up perfectly with their ideological predilections (e.g., Liptak 2011). That the U.S. Supreme Court is a supremely politicized institution in contemporary American politics is undeniable. But how is this fact of politicization compatible with the view that the American people subscribe to the "myth of legality" – "the belief that judicial decisions are based on autonomous legal principles" and "that cases are decided by application of legal rules formulated and applied through a politically and philosophically neutral process of legal reasoning" (Scheb and Lyons 2000, 929; see also Casey 1974)? If the public believes that judges do nothing more than interpret and apply law through the discretionless processes of syllogisms and stare decisis (sometimes referred to as "mechanical jurisprudence" – see Pound 1908), many threats to judicial legitimacy dissipate. By this view, judges are legal technicians simply doing what they are supposed to do in an objective and value-free manner (see Dworkin 2009).¹³ Denying judicial discretion pre-empts the need for direct political accountability, and thereby enhances judicial legitimacy.¹⁴ But what if the public, like scholars, understands the Court's decision-making process as ideological in nature? What if the American people agree with two of the most prominent analysts of the U.S. Supreme Court in their observation that: "Simply put, Rehnquist votes the way he does because he is extremely conservative; Marshall voted the way he did because he was extremely liberal" (Segal and Spaeth 2002, 86).¹⁵ If it is true that Legal Realism has carried the day¹⁶ – indeed, as Packer (2006, 83) and others (e.g., Peller 1985, Singer

1988) have put it: "We are all realists now."¹⁷ – then how can the Court's legitimacy survive? As Bybee (2012, 750) put it: "... perceptions that judges may be deciding cases on the basis of personal political convictions raises questions about the legitimacy of the system. Where the public confronts a judicial process that always speaks in terms of legal principle and yet is sometimes governed by policy preferences, suspicions of judicial hypocrisy may easily arise, fueling the belief that judges are willfully affecting an air of legal impartiality in order to disguise their pursuit of political goals." Thus, public beliefs that justices decide cases on the basis of ideology, rather than law, raise a potential threat to the legitimacy of the institution. But is the realist model of judicial decision making, in which judicial ideologies and values play a large role in policy making, really incompatible with the popular legitimacy of the U.S. Supreme Court? Although this seems like a simple question, little extant empirical research has attempted to provide answers. And the American people's views of how Supreme Court justices make their decisions are likely more complicated than simply specifying the answer as "yes, they rely on their own values, and are therefore not legitimate" or "no, they strictly follow the law, ignoring their own values, and therefore are legitimate." Moreover, the empirical literature presents us with some important puzzles and unexplained findings and processes, suggesting that the views of the American people are more complex and perhaps even more sophisticated than typically imagined. From existing research on public attitudes toward law and courts, we know that, generally, to know more about courts is to hold them in higher esteem. This finding holds in many parts of the world (e.g., Gibson, Caldeira, and Baird 1998), including the American states (Benesh 2006). It seems that knowing about courts often means knowing that courts are special institutions, different from ordinary political institutions, and, as such, that they are worthy of the esteem of the citizenry. However, the meaning of this simple empirical relationship is far from simple to understand. The puzzle is this: Presumably, those who know more about courts also know more about the realities of how courts actually operate and how judges actually make decisions, and they therefore accept some version of Legal Realism because it is a veridical description of decision making. Yet, if realism undermines legitimacy, why do the most knowledgeable citizens extend greater legitimacy to the Court while simultaneously believing in some version of realism? Put statistically, if (1) increased awareness of courts is positively correlated with a more realistic understanding of how judges make decisions and (2) the realist reality is that judges are policy makers who rely on their own values in making decisions, then (3) awareness should be negatively correlated with institutional support. That positive correlations are so routinely found must indicate some sort of breakdown in the presumed causal chain. Either knowledge does not produce a realistic understanding of decision making, or legitimacy does not depend upon citizens being duped into believing in theories of mechanical jurisprudence and the myth of legality. This conundrum was directly addressed by Gibson and Caldeira (2011) with nationally representative data. The most certain and important conclusion of their analysis is that the legitimacy of the U.S. Supreme Court does not depend on the perception that judges merely "apply" the law in some sort of mechanical and discretionless process. It seems that the American people know that the justices of -18- the Supreme Court exercise discretion in making their decisions. They are also aware that the justices' discretion is guided to at least some degree by ideological and even partisan considerations. None of these understandings seem to contribute to undermining the legitimacy of the Supreme Court. Instead, legitimacy seems to flow from the view that discretion is being exercised in a principled, rather than strategic, way. These findings do not mean that the American people reject the rule of law (indeed, empirical evidence indicates that Americans are unusually strongly attached to the rule of law – Gibson 2007b); nor that judicial legitimacy would be maintained were the Court to eschew the trappings of law. Indeed, it seems likely that a key source of the belief that judges engage in principled decision making is the association of courts with symbols of fairness and legality (Gibson, Lodge, and Woodson 2014; see also Gibson and Caldeira 2009). Just as revisionist judicial scholars (e.g., Bailey and Maltzman 2011; Black and Owens 2009; Richards and Kritzer 2002) are today challenging the extreme variant of the Attitudinal Model by suggesting ways in which law is important to decision making, we suspect neither that the American people view law as irrelevant to judging, nor that judges engage in completely unconstrained policy making. The empirical evidence Gibson and Caldeira adduce suggests that being informed about courts may mean that one understands that judges make decisions in a principled fashion; they are not merely politicians in robes. The mistake of some research might be to assume that principled decision making can only be understood as mechanical decision making. The most important argument these authors make is that the American people seem to accept that judicial decision making can be discretionary and grounded in ideology, while simultaneously principled and sincere. Judges differ from ordinary -19- politicians in acting sincerely, and their sincerity adds tremendously both to their legitimacy and the legitimacy of their institution.¹⁸ Baird and Gangl (2006) also investigate this hypothesis, although their analysis is based on the judgments of college students. They posit that perceptions of legalistic decision-making enhance the perceived fairness of the decision-making process, a key underpinning of judicial legitimacy. In their experiment, they used media reports to try to convince the students that a Court decision was based more on political (legal realism) than legal (mechanical jurisprudence) considerations. Tellingly, the experiment failed on this score, with a majority of the students believing that the justices followed legalistic

considerations even when told about the role of ideological factors (2006, 602). Although this result limits the value of the experiment, it does demonstrate the powerful framing effects of the belief in legalistic decision making and how deeply embedded it is among the political beliefs of many Americans. Importantly, their analysis also demonstrates that greater belief in the myth of legality is associated with greater perceptions of fairness (see also Baird 2001). Baird and Gangl also report an unexpected finding for which they have no explanation. Perceptions of legalistic decision making enhance fairness judgments, but perceptions of political decision making do not detract from fairness. Political decision making is portrayed in their experiment by the belief that the “members of the Court engaged in bargaining and compromise to reach this decision.” Whether the student believed that bargaining was involved had no impact on perceived procedural fairness (2006, 605).¹⁹ What Baird and Gangl may not have appreciated, however, is that two forms of political decision making exist: principled and strategic. Bargaining and compromise can be principled; this process of decision making can focus on real issues and legitimate ideological and legal disagreement. But bargaining and compromise can also be strategic, especially when the actors are attempting to maximize their self-interest (e.g., political ambition) rather than reach a negotiated solution to the issue at hand. We suspect that to the extent that the American people view discretionary and ideologically based decision making as principled, those views will not undermine the Supreme Court’s legitimacy.²⁰ So, in the end, the generation of political scientists and journalists who have propounded Legal Realism and the Attitudinal Model seems to have done little to undermine the legitimacy of the Supreme Court. The American people seem to understand the true nature of decision making in the third branch, but at the same time regard courts as highly legitimate within the American political scheme. Judges are certainly politicians, but what distinguishes judges in the minds of the American people is that judges exercise discretion in a principled fashion. Were other politicians to act more like judges, perhaps the legitimacy of all American political institutions would be elevated.

N/L- PRISM

Prism is uncontroversial- no backlash

Logiurato 13' [Brett, M.A political science & Politics Editor, "The NSA's PRISM Program Is Shockingly Uncontroversial with the American Public, Business Insider, 6/17/13 <http://www.businessinsider.com/prism-surveillance-poll-nsa-obama-approval-2013-6> LM]

President Barack Obama's approval rating is sinking like a stone in a new CNN/ORC poll — but it's not because of Americans' reactions to the National Security Agency surveillance program known as "PRISM." In fact, **the public overwhelmingly approves of the program.** The poll found that 66 percent of Americans say the Obama administration was right to gather and analyze information from major internet companies to help locate suspected terrorists. Here's the full wording of the question posed in the poll: [F]or the past few years the Obama administration has reportedly been gathering and analyzing information from major internet companies about audio and video chats, photographs, e-mails and documents involving people in other countries in an attempt to locate suspected terrorists. The government reportedly does not target internet usage by U.S. citizens and if such data is collected, it is kept under strict controls. Do you think the Obama administration was right or wrong in gathering and analyzing that internet data? Overall, according to the poll, the public has exhibited a collective shrug to new revelations detailing the scope of the NSA's surveillance efforts. On its collection of phone data, the public is less gung-ho about the program, but still supportive — 51 percent say the Obama administration is right, while 48 percent say it's wrong. Incidentally, **partisans on both sides of the aisle are most likely to support the programs.** Self-identified Republicans and Democrats approve of both programs, while Independents are much less enthusiastic.

Courts have low legitimacy with PRISM – the program is seen as a violation of current laws

Alford and Ullman 13 (Gigi Alford, Senior Program Officer for Internet Freedom, and Ilana Ullman, Program Associate for Internet Freedom, June 12 2013, "Private Data, Secret Surveillance, and the Need for Public Debate", <https://freedomhouse.org/blog/private-data-secret-surveillance-and-need-public-debate#.VYsKtvViko>)

Almost as troubling as the recent revelations about the U.S. government's sweeping collection and analysis of the personal information of law-abiding internet and phone users are the inadequate "just trust us" response to the outrage and the administration's lack of decisive action to regain the faith of a tense American public and wary netizens abroad. Under the U.S. constitution, citizens are guaranteed protection from unreasonable searches and seizures by their government. Violent events, such as the Boston Marathon bombings, leave no question about the serious need for strong security measures. However, maintaining an appropriate balance between security and privacy requires constant public vigilance. Any state surveillance of personal communications is an intrusion into the private domain. While exceptional circumstances may render this intrusion necessary and justified, it is only permissible when associated with a targeted investigation, conducted according to a court-supervised and transparent process, and guided by fundamental human rights principles. Freedom House outlined its views on this subject last week in its oral statement at the UN Human Rights Council session on freedom of expression. Unfortunately, it appears that the requirements for permissible surveillance were not met in the instances of secret U.S. court orders that have recently come to light— both the large-scale seizure of Verizon customers' metadata and the secret internet data collection

operation code-named PRISM—which appear to involve incredibly broad data gathering and storage by the National Security Agency (NSA) and the Federal Bureau of Investigation (FBI). **These examples raise concerns that current legal and judicial protections are no longer sufficient to prevent government spying from creeping into the private lives of law-abiding individuals.** Technology has evolved significantly, with new applications and means of communication being developed on an almost daily basis, including new modalities for surveillance. **These changes demand public debate and consensus on new limits and laws to prevent the abuse of novel technologies.** It is unsettling that the evidence that has surfaced of late appears to contradict past and current statements and sworn testimony by government officials, including Director of National Intelligence James Clapper's testimony before the Senate Intelligence Committee in March 2013. When asked, "Does the NSA collect any type of data at all on millions or hundreds of millions of Americans?" Clapper responded, "No, sir.... Not wittingly. There are cases where they could, inadvertently perhaps, collect—but not wittingly." **These inconsistencies damage public faith in government leaders and undermine confidence in the constitutional system of checks and balances.** The administration should, without delay, work toward restoring this trust and its moral authority at home and abroad by fully explaining its current surveillance policies and their justification, including the risks and benefits. Meanwhile, **Congress should hold hearings to shed more light on what has happened to date and reassess these policies for the future.** While various official and external responses to the leaked information have offered assurances that safeguards are in place and rigorous procedures are followed by the Foreign Intelligence Surveillance Act (FISA) court, these assurances cannot be independently verified. It is relevant to note that in 2012, the court did not deny even one of 1,856 FISA applications from the Justice Department. **Other defenses that have been articulated on behalf of the surveillance programs are not only impossible to corroborate, but also misleading or misguided.** For example: Content vs. metadata: Much of the argument in defense of the FISA-authorized telephone metadata collection has focused on the assertion that the NSA is not listening in on phone calls, but rather capturing "metadata," such as phone numbers, call duration, and phone location history. Metadata are ultimately personal information, which many individuals don't and shouldn't want the U.S. government—or any government—to vacuum up without their consent. **Collecting metadata is a significant violation of privacy,** as much can be inferred, **whether correctly or incorrectly,** about individuals' private lives based on metadata alone, including their religious beliefs, political affiliations, social contacts, medical issues, and so forth. Only foreign nationals targeted: There are numerous problems with this claim, not the least of which is its incongruence with the borderless nature of the internet. Foreign government leaders, including democratic U.S. allies, are rightly making the case that their citizens are stunned by this defense. And dissidents in nondemocratic countries are left to wonder whether U.S. agencies share their information with local authorities. Meanwhile, **U.S. citizens are stunned that NSA agents are required to have a mere 51 percent confidence in a person's "foreignness" to search and store their personal internet communications data.** Even if the program only targets non-U.S. citizens, **data about U.S. citizens are still caught in the trowl.** It is time for a serious, open, and public debate on government surveillance that goes beyond pat assurances and partial revelations. **The only way for this debate to lead to transparent and effective lawmaking is for the U.S. government to officially disclose to the public the existing laws and procedures surrounding its surveillance programs.** A free country does not need to become a surveillance state to maintain public safety and carry out legitimate investigations of criminals online. President Obama and Congress must take a principled stand and heed public calls for a frank and unfettered conversation about what has happened and how to move forward.

LT- Plan Creates Legitimacy

No decision by the Supreme Court is more illegitimate than any decision- Supreme Court acting on any surveillance policy gains them legitimacy

Fisher 13' [Daniel, Senior editor at Forbes, covering legal affairs, "After PRISM: How Much Surveillance Is Too Much? The Supreme Court Has To Decide", 6/7/13 <http://www.forbes.com/sites/danielfisher/2013/06/07/the-supreme-court-has-to-decide-how-much-information-is-too-much/2/> LM]

One question for U.S. courts will be whether that is a more acceptable approach than collecting the data on government computers like the ones at NSA center in Utah my colleague Kashmir Hill had an entertaining time visiting earlier this year. The Supreme Court has also outlawed placing hidden GPS receivers to track the cars of suspects, under the 18th-century concept that physically attaching the device to the car constituted an invasion of the owner's property. Scalia cobbled together a majority to ban such GPS trafficking using the outmoded property doctrine last year, but the liberal justices who joined him, and even conservative Justice Samuel Alito, criticized the decision as being hopelessly behind the times. "In the pre-computer age, the greatest protections of privacy were neither constitutional nor statutory, but practical," Alito wrote. But in an era where the government can access all manner of electronic signals, and store them for future use, people are no longer secure in their movements. What happens when the government can stitch together the images from thousands of outdoor video cameras and use computer algorithms to identify and track a suspect just as reliably as if he had a GPS unit hidden in his backpack? My suspicion is the court will have to consider the legality of virtual searches eventually, as some advocates proposed in the GPS case when they said police shouldn't be able to track anybody for 30 days straight because of the higher level of information they gain from the practice. **Privacy scholars say the biggest question is whether the Supreme Court eventually will embrace the view that simply watching, when done to excess, violates the Fourth Amendment.** One protection for citizens emerged this week as the U.K. newspaper The Guardian released the secret court order requiring Verizon to turn over daily calling records of its customers. Programs this massive can't remain secret. In the wake of the Verizon disclosure, Richards said, privacy advocates will be working on new lawsuits to try and overturn the reasoning in Clapper, which made secret data-collection programs practically immune to suit because they are secret. "It's inevitable," he said. "A lot of people are preparing to bring privacy suits to force a judicial resolution of this question."

Link turn – Americans actually support reducing surveillance

Newport 13 (Frank Newport, Gallup poll Editor in Chief, June 12 2013, "Americans Disapprove of Government Surveillance Programs", <http://www.gallup.com/poll/163043/americans-disapprove-government-surveillance-programs.aspx>)

More Americans disapprove (53%) than approve (37%) of the federal government agency program that as part of its efforts to investigate terrorism obtained records from U.S. telephone and Internet companies to "compile telephone call logs and Internet communications." These results are from a June 10-11 Gallup poll. Although the current survey context was different, these results are similar to those obtained in a May 2006 Gallup poll measuring support for a government program that "obtained records from three of the largest U.S. telephone companies in order to create a database of billions of telephone numbers dialed by Americans." In that survey, 43% approved and 51% disapproved. There are significant partisan differences in views of the government's program to obtain call logs and Internet communication. Democrats are more likely to approve, by 49% to 40%. Independents (34% vs. 56%) and Republicans (32% to 63%) are much more likely to disapprove than approve. In 2006, when Gallup asked the similar question about a program that came to light at that point, Republicans were significantly more likely to approve than Democrats. The differences in partisan reaction between 2006 and 2013 reflect the party of the president under whose watch the programs were carried out at those two points in time. Twenty-one percent of Americans disapprove of the government's

actions, but say there could be circumstances in which it would be right for the government to carry out such a program, yielding a combined total of 58% of all Americans who either approve or could theoretically approve under certain circumstances. A June 9-10 CBS News poll also found a majority (58%) of Americans disapproving of the government "collecting phone records of ordinary Americans." A June 6-9 survey conducted by Pew Research Center and The Washington Post found that 56% of Americans said a program in which the National Security Agency "has been getting secret court orders to track telephone call records of millions of Americans in an effort to investigate terrorism" was "acceptable." The combined 58% in the Gallup survey who either approve or say there might be circumstances in which such a program would be right is similar to the acceptable percentage in the Pew/Post wording. Thirty-Five Percent of Americans Very Concerned About Violation of Their Privacy Rights A separate question included in Gallup's survey found that 35% of Americans said they would be "very concerned" about violation of their own privacy rights if the government had computerized logs of their telephone calls or Internet communications. Another 22% said they would be "somewhat concerned." Sixty-four percent of Americans are following news about this issue very or somewhat closely, which is slightly above average for all news stories tested by Gallup over the past two decades. Mixed Sentiment About the Leaker's Action U.S. officials are engaged in a manhunt for Edward Snowden, the former U.S. government contractor who claimed to be the source of the leak. Americans break roughly even when asked if it was right (44%) or wrong (42%) for Snowden to share that information with the press. A plurality of Republicans said he did the right thing in leaking the news of the surveillance programs, while a plurality of Democrats said he did the wrong thing. Americans are more positive about the media's actions in this matter, with 59% saying it was right for The Guardian and The Washington Post newspapers to publish the information once they received it. Implications Results from the Gallup poll indicate that Americans have somewhat flexible views about the government's surveillance program and/or that they are still forming their opinions on the issue. A majority of Americans say that they might find the type of government surveillance program that has come to light in recent days as acceptable under some circumstances, but less than half say they approve of the program as it stands. The reactions to these types of government programs have remained constant over the past seven years, although Republicans and Democrats have essentially flipped their attitudes over that time period, reflecting the change from Republican President George W. Bush to Democratic President Barack Obama. Americans are divided as to whether the self-confessed leaker, Edward Snowden, is a hero or a villain, while one-third of Americans fault the press for advancing the story.

So does the international community.

Vincent 5/15 (Sarah Vincent, CDT's Human Rights and Surveillance Fellow, May 15 2015, "UN Member States Call for US Surveillance Reforms", <https://cdt.org/blog/un-member-states-call-for-us-surveillance-reforms/>"

On Monday, US officials went before the gathered United Nations Member States in Geneva and were greeted with a message that was loud and clear: all surveillance, no matter where it takes place or whose data it involves, must comply with human rights law. As Congress and the Executive Branch continue to face urgent demands from the American public to reform surveillance, they would do well to heed this global call for change as well. In particular, the Administration should give immediate and serious consideration to countries' recommendations to recognize that human rights apply to all surveillance; that any surveillance program must be subject to adequate judicial, congressional, and independent oversight; and that anyone whose fundamental rights are violated by surveillance activities must have access to effective redress. As CDT explained last week, the UN Human Rights Council conducted the Universal Periodic Review ("UPR") of the United States, which occurs once every four and a half years and entails a public review of the country's compliance with all of its obligations under human rights law. Every UN Member State had the right to participate in the US' review, and Monday's session demonstrated a remarkable cohesiveness among the serious issues that were raised—and showed that NSA surveillance remains a matter of strong and detailed concern to the global community. Among the 17 countries that commented on US surveillance (or privacy rights more broadly), several emphasized something the Administration has thus far refused to acknowledge: namely, that the US must respect human rights whenever it conducts surveillance operations, including surveillance of people who are outside the United States and are not Americans. As CDT and the ACLU observed in a report to the Human Rights Council prior to the session, the Snowden documents indicate that the NSA has been intercepting the private data of hundreds of millions of people around the world every day,

and the Administration's failure to recognize that these activities give rise to human rights obligations remains a conspicuous and grave one. In addition to this general critique, several countries specifically indicated that the US must adopt better judicial, legislative, and independent oversight of its surveillance programs. Such oversight is an essential element of the right to privacy, and is a basic safeguard that CDT has been working hard to promote both within the US and internationally. A number of countries also highlighted the fact that US surveillance places a burden on individual rights from the moment the NSA acquires private data, regardless of whether analysts later view or use it—a point that echoes a similar finding by a US Second Circuit Court of Appeals last week in a case concerning the agency's bulk collection of records of phone calls to, from, and within the US. Next month, the US is expected to state publicly whether it accepts these and other surveillance-related recommendations. We believe the Administration should accept the following obligations, among others, as a matter of official policy: Respect and protect the human rights of all people when conducting surveillance: "Ensure that all surveillance policies and measures comply with international human rights law, particularly the right to privacy, regardless of the nationality or location of those affected, including through the development of effective safeguards against abuses" (recommendation made by Brazil). Do the same when requiring companies to disclose users' data: "Respect international human rights obligations regarding the right to privacy when intercepting digital communications of individuals, collecting personal data or requiring disclosure of personal data from third parties" (recommendation made by Germany). Conduct surveillance only on the basis of clear, comprehensive, non-discriminatory laws, and review existing laws accordingly: Review US federal laws and policies "in order to ensure that all surveillance of digital communications is consistent with its international human rights obligations and is conducted on the basis of a legal framework which is publicly accessible, clear, precise, comprehensive and non-discriminatory" (recommendation made by Liechtenstein). Restrict large-scale global surveillance, ensure sufficient oversight, and provide redress for violations: "Take all necessary measures to ensure an independent and effective oversight by all Government branches of the overseas surveillance operations of the National Security Agency, especially those carried out under Executive Order 12333, and guarantee access to effective judicial and other remedies for people whose right to privacy would have been violated by the surveillance activities of the United States" (recommendation made by Switzerland; similar recommendation made by Hungary). Take proactive measure to prevent abuses: "Take adequate and effective steps to guarantee against arbitrary and unlawful acquisition of [private] data" (recommendation made by Kenya; similar recommendation made by Costa Rica). It is to the Administration's credit that (as several participating countries noted) it has taken the Human Rights Council's review of its human rights record with evident seriousness thus far. US Ambassador Keith Harper remarked before the assembled delegates that "every nation benefits from having a mirror held before it," and the US' decision to send a high-level delegation representing a range of federal agencies reflects the sincerity of that view. In the case of surveillance, however, there's no escaping the fact that the mirror has revealed profound flaws. It is imperative for the Executive Branch to take action accordingly by formally declaring that it will accept and uphold the positions described above.

Courts actually change the public's perception to support the ruling – any increase in distrust is nonexistent

Zilis 14 (Michael Zilis, Adjunct Professor of Political Science at DePaul University who holds a Ph.D. in Political Science from the University of Michigan, August 29 2014, "Investigating the Effects of Judicial Legitimacy on Micro-Level Opinion", http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2453199)

In order to explore the relationship between institutional legitimacy and policy support – the relationship that defines the endorsement effect – I begin with two assumptions, both buttressed by a wealth of research (see Baird and Gangl 2006; Clawson and Waltenburg 2003; Gibson and Caldeira 2009a, 2009b; Gibson, Caldeira, and Spence 2003a, 2003b; Gibson and Nelson 2014a, 2014b; Linos and Twist 2013; Woodson, Gibson, and Lodge 2011). (1) The Court's legitimacy is both strong and durable. (2) The Court can influence popular support for policies when it rules, but its influence is context-dependent; the degree and substance of media coverage moderates Court influence. These assumptions raise a puzzle that becomes more apparent when one considers two possible, albeit simplified, realities. The first involves a high profile ruling that receives largely supportive media coverage, which I define as coverage that emphasizes procedural fairness (Baird and Gangl 2006), reviews in detail the findings of the Court, 8 and minimizes the attention it pays to critics of a decision, including dissenting justices. Many cases receive coverage that can be characterized as supportive (Zilis 2014). In such a scenario, the public response will largely depend on what an individual thinks about the Court (Mondak 1990). For the strongest supporters of the

institution, its decision, filtered through the lens of a sympathetic press, should bolster approval of a policy. The link between credible institution and policy is quite clear in such a scenario. For those that place less trust in the Court, support for the policy may also increase due to the institution's power of persuasive legitimacy (Bartels and Mutz 2009; Mondak 1994), but distrust of the source will limit the magnitude of this effect (e.g. symbolic legitimation will fail to materialize). Nonetheless, when a high salience ruling meets with supportive press coverage, we should observe a robust endorsement effect, with the strongest supporters of the Court offering the most positive views of the policy it upholds. What about when a decision garners unsupportive press coverage? Evidence suggests that popular approval of the ruling will be low but, if Gibson, Caldeira, and colleagues are to be believed, that the Court's reputation itself will not suffer. Which raises the question: what is the relationship between legitimacy and policy approval in such a scenario? If a high credibility institution offers a high profile endorsement of a policy, by what mechanism would support for that policy fail to materialize? To explore this question more fully, consider two individuals: one expressing a low degree of confidence in the Court, another expressing a high degree. There are two potential explanations that could capture the responses of these individuals to a much criticized ruling. On the one hand, institutional legitimacy may function as a type of political capital, causing the high trust individual to express more support for the decision, relative to the low trust individual, in spite of her alarm about it (Mondak 1992). This scenario, which we will call the Endorsement Effect Hypothesis, suggests that the judiciary has the ability to draw from its reservoir of support when its decisions come under attack as a means of increasing support for them. Unfavorable media coverage would be most damaging to the Court when it reaches individuals who already express low level of trust in the institution. This response pattern is exactly what has been implied (but rarely tested) in much of the existing research on the endorsement effect. On the other hand, the process may be reversed entirely. It may be that trust in the institution has a comparatively small effect on policy approval in a complex media environment. Rather, individuals who evince both strong and weak loyalty to the Court should express similar levels of approval for rulings when they come under attack. Behind this process is a relevance mechanism. There is evidence that people evaluate the relevance of messages when forming their attitudes (Chong and Druckman 2007a). Furthermore, research demonstrates that complex or contested messages can foster elaboration, causing individuals to engage in a greater degree of relevant thought. Thus, "the role of source credibility may depend on how closely a message is scrutinized" (Mondak 1990). Mondak's early work on judicial persuasion is particularly relevant here, both for the attention it pays to legitimacy issues and media context and for the questions it leaves unresolved. His findings regarding source effects come from comparisons of the Supreme Court with other, less credible actors. But building on his insights, as well as those of Chong and Druckman (Druckman 2001; Chong and Druckman 2007a), we can hypothesize that criticism of Court decisions paves the way for Americans to evaluate the merits of the criticism while at the same time making the endorsement cue irrelevant (the Relevance Hypothesis). Though it is not the case that the Court will suffer a reputational cost when its decisions are depicted in unfavorable terms, it may lose the ability to increase policy approval based on its reputation alone. To explore questions about the effect of institutional support on policy approval more fully, I next offer data that is uniquely situated to trace micro level opinion and, more importantly, causality. A panel study of reactions to the Supreme Court's 2012 Affordable Care Act ruling allows me to examine whether an individual's views about the Court before the decision influenced the degree of support he or she offered for the law after the Court had ruled.

Yes Favor Plaintiffs

A violation of the fourth amendment means that the Supreme Court will rule in favor of the plaintiff in Evenwel v. Abbott

Shapiro 15 (Ilya, senior fellow in the constitutional studies at the Cato Institute “Symposium: Taking voter equality seriously” 7/29/15 <http://www.scotusblog.com/2015/07/symposium-taking-voter-equality-seriously/>) Foronda

Instead, OPOV solves the old “rotten borough” problem, where some British parliamentarians represented constituencies where very few – or no! – people lived. This became an issue in the United States as the country urbanized but depopulated rural areas maintained disproportionate voting power in state legislatures and congressional delegations. The Supreme Court ruled in the 1964 case of Reynolds v. Sims that political map-designers can’t dilute the franchise that way and instead must draw districts with roughly equal numbers of people.^a In other words, each person’s vote should be equal, as guaranteed by the Constitution; nobody gets more votes based on wealth, education, occupation, sex, race, or geography. None of this is or should be controversial.^a But a funny thing happened on the way to electoral utopia: just as the Industrial Revolution fomented radical population shifts, modern immigration patterns have created disparities in the number of voters per district. Just as it was intolerable for a rural district with 500 voters to have the same representation in a state legislature as an urban district with 5000 voters, it’s now constitutionally suspect to have that disparity between a heavily (non-citizen) foreign-born district and one with mostly native-born citizens. In each case, the Supreme Court must intervene to maintain voter equality.^a While the specific case now before the Court, Evenwel v. Abbott, doesn’t present the stark 10:1 ratio in voting power I just stylized, the disparities are nonetheless significant: as detailed by the challengers to Texas’s districting map detail (see tables on pages 8-10 of their jurisdictional statement), some state senate districts deviate by as much as fifty percent from the ideal. That means that twice as many voters may elect a state senator in one district as in the smallest district.^a In sum, regardless of one’s views of Evenwel’s particular facts, it has to be the case that disparities between the number of voters in state districts raises a constitutional issue. Otherwise, even 10:1 or 100:1 ratios wouldn’t be a problem. And if all we’re talking about here is line-drawing rather than first principles, then the challengers win.^a Cato’s briefing^a I don’t want to simply summarize the challengers’ arguments, so let me focus instead on two points that Cato is developing for our Evenwel merits brief: (1) the inaptness of the so-called “federal analogy” (which I’ll explain); and (2) that when the Voting Rights Act (VRA) conflicts with the Constitution, the latter trumps.^a The federal analogy^a When the Supreme Court was asked more than fifty years ago to uphold grossly disproportionate state legislative districts, Alabama argued that states should be allowed to implement a “little federal system” that would be “framed after the Federal System of government—namely one senator in each county of the state.”^a The Court correctly realized then that “the federal analogy [is] inapposite and irrelevant to state legislative districting schemes.” After all, the states are “separate and distinct governmental entities which have delegated some, but not all, of their formerly held powers to the single national government,” whereas “[p]olitical subdivisions of States—counties, cities, or whatever—never were and never have been considered as sovereign entities, [but rather] have been traditionally regarded as subordinate governmental instrumentalities created by the State to assist in the carrying out of state governmental functions.” Further, because “[t]he system of representation in the two Houses of the Federal Congress . . . [arose] from unique historical circumstances,” “the Founding Fathers clearly had no intention of establishing a pattern or model for the apportionment of seats in state legislatures when the system of representation in the Federal Congress was adopted.”^a The Court is now presented with a new, twenty-first-century federal analogy, this time relating to the other chamber of Congress. Texas and its supporters are arguing that because the Constitution allocates congressional representatives by total population rather than voter population, states should be able to do the same for their own legislative districts.^a This federal analogy works no better than the last one. Careful study of the original public meaning and history of both Section 2 of Article I and Section 2 of the Fourteenth Amendment show that the rule they established is one for dealing with separate states that possess a great deal of legal autonomy – first and foremost in defining for themselves who shall have the right to vote. Once again, states are asking that they be allowed to treat their legislative districts as if they were separate states.^a Since the federal rule provides no support for state inequalities, we’re left back at the same simple principle the Court has consistently upheld, that “[t]he conception of political equality from the Declaration of

Independence, to Lincoln’s Gettysburg Address, to the Fifteenth, Seventeenth, and Nineteenth Amendments can mean only one thing—one person, one vote.^a The Voting Rights Act vs. the Constitution^a Another argument has been put forward to justify violating OPOV – that Section 2 of the VRA requires gerrymandering state legislative districts to create majority-Hispanic districts where possible, and that this “compelling interest” justifies the effect of unequal voter strength. This argument fails because even if the VRA does ask states to do such gerrymandering, such legislation can’t trump the Constitution.

Where the VRA conflicts with the Fourteenth Amendment, the VRA must give way.^a Let me explain. States are now caught in the inevitable trap of (1) maintaining majority-minority districts under complex, overlapping legal precedents and (2) administering electoral schemes that do little to advance racial equality while doing much to undermine voter equality. In the background of this conflict, there lurks a cacophony of precedent and oft-conflicting court-administered standards that have arisen from cases interpreting Section 2 of the VRA. **Basic constitutional guarantees of equal protection inherent in the Fourteenth**

Amendment – such as OPOV – get lost in this thicket.^a Avoiding racial discrimination is particularly difficult in jurisdictions where “total population” and “citizens of voting age population” (CVAP) – standard metrics for evaluating whether a district violates OPOV – diverge due to varied concentration of non-citizens. As I’ve described before, jurisdictions navigating between the VRA’s Scylla and the Constitution’s Charybdis are bound to wreck individual rights – here, voter equality – on judicial shoals.^a Over the years, the Supreme Court has repeatedly recognized the potential for devaluing individual votes by drawing majority-minority districts in a manner that accords greater weight to minority votes in protected districts and diminishes the relative weight of voters elsewhere. In 2000, in *Chen v. City of Houston*, the Fifth Circuit also recognized this danger while ultimately ruling the other way. Nevertheless, here the special district court adhered to that flawed lower-court precedent – refusing to acknowledge CVAP as integral to OPOV and thus a required element of equal protection.^a At least one Justice – Justice Clarence Thomas, dissenting from the denial of certiorari in the *Chen* case in 2001 – has already recognized the urgency of the problem: “Having read the Equal Protection Clause to include a ‘one-person, one-vote’ requirement, and having prescribed population variance that, without additional evidence, often will satisfy the requirement, we have left a critical variable in the requirement undefined.”^a The VRA’s Section 2 and the Fourteenth Amendment have thus reached an impasse that has been highlighted by a conflict among lower courts’ application of OPOV. (The Fifth Circuit has held that states can choose either total population or CVAP on the grounds that the Equal Protection Clause is ambiguous, the Fourth Circuit reached the same conclusion but through the “political question” doctrine, and the Ninth Circuit held that states can only use total population, in a split 2-1 decision that provoked a strong dissent by Judge Kozinski.) It’s thus heartening that **the Court** took up *Evenwel* – and hopefully it **will resolve that conflict once and for all by explaining the proper use of different population metrics. The noble principle of OPOV needs to be saved from the legal morass of Voting Rights Act jurisprudence.**

Abortion Thumps

SCOTUS planning to revisit abortion for a new ruling in the fall

Lyle **Denniston, 7/23** (Lyle Denniston, Reporter for the Supreme Court of the United States Blog, "Appeals court wants Court to take new look at abortion," <http://www.scotusblog.com/2015/07/appeals-court-wants-court-to-take-new-look-at-abortion/> July 23, 2015) K.GEKKER

A federal appeals court, arguing that the Supreme Court's abortion rights rulings leave too little room for states to limit the procedure to protect fetal life, has urged the Justices to reconsider a basic idea behind Roe v. Wade. The idea, never explicitly abandoned by the Court, is that states are forbidden to ban abortions before a fetus is capable of living outside the woman's body. The U.S. Court of Appeals for the Eighth Circuit, in a new ruling on Wednesday involving the nation's most restrictive abortion control law, argued that the so-called "fetal viability" approach has become "unsatisfactory" because it has not kept pace with changes in fetal medicine. Although the North Dakota law at issue was struck down, the three-judge panel made it clear it ruled that way because the Court had given it no choice, but that it was troubled at having to do so. State legislatures, not courts, should be making decisions about the state of medical science, it said. This marked the second time in recent months that the same three Eighth Circuit judges have raised doubts about using fetal viability as the crucial factor in analyzing state power to curtail or bar abortions. They did so in a ruling in May, striking down a less restrictive Arkansas law. In that case, the state's lawyers had not challenged the testimony on when a developing fetus would be viable. The panel thus said that lawyers, especially for a state defending an abortion ban, had a special duty to put before a court the latest in fetal medicine findings. The three judges had heard the Arkansas and North Dakota cases on the same day, but issued separate rulings, released about two months apart. This time, with North Dakota's lawyers strongly disputing the viability point, those judges moved further in their critique, directly calling on the Supreme Court to reconsider. "Good reasons exist," it said, "for the Court to reevaluate its jurisprudence....To begin, the Court's viability standard has proven unsatisfactory because it gives too little consideration" to a goal that the Justices themselves have said they support, protecting a state's "substantial interest in potential life throughout pregnancy." Those words are a quotation taken from the Court's 1992 decision in a Pennsylvania abortion case (Planned Parenthood v. Casey) partly reaffirming Roe v. Wade. That decision, though, had left in place the view that, before fetal viability, a state could not constitutionally prohibit abortions, although it could impose some forms of regulation. The abortion issue is likely to return to the Court at its next Term, in several cases. Already awaiting the Court's reaction are new cases from Mississippi and Texas testing a state's power to limit abortions by imposing new medical practice standards on clinics and doctors. State lawyers in Arkansas and North Dakota have the option of asking the Court to review their new laws, which are direct rather than indirect measures to stop abortions at earlier stages in pregnancy. The North Dakota law would ban abortions after about six weeks of pregnancy, because it would impose a ban as soon as a fetal heartbeat could be detected, and it is generally understood that this could occur as early as the sixth week. The Arkansas law is also keyed to detection of a fetal heartbeat, but it would not impose a ban until the twelfth week of pregnancy. The Eighth Circuit struck down both, finding that neither could meet the long-standing "fetal viability" test, since the Supreme Court had ruled several times that viability was not likely before the twenty-fourth week. In both of its rulings, the Eighth Circuit panel had credited arguments and evidence which suggested that doctors are now able to keep fetuses alive if they are delivered at earlier

stages of pregnancy than the twenty-fourth week. The panel actually took note of a report of one fetus surviving after being delivered at twenty-one weeks and six days. In the North Dakota case, the panel appeared also to credit the argument of state lawyers that the science of fetal survivability has now advanced to the point that a fetus can be saved, as a “test tube baby,” by being taken out of the woman’s body as early as the sixth day, and then replaced for continued development to childbirth. If a state could act to protect the developing pregnancy at that very early point, it would come close to being able to regulate close to the moment of conception — a long-term goal of abortion opponents. The Eighth Circuit, besides analyzing what it took to be new evidence about the viability issue, interpreted Supreme Court decisions since *Roe v. Wade* as actually recognizing that fetal viability is not a fixed phenomenon, and may be established at earlier points in pregnancy than the twenty-fourth week. That is the kind of policy issue, the panel said in its latest ruling, that the Justices’ abortion rulings have taken away from state legislatures. The Eighth Circuit also interpreted more recent rulings by the Court on abortion rights as being more focused on fetal protection. “The evolution in the Supreme Court’s jurisprudence,” it said, “reflects its increasing recognition of states’ profound interest in protecting unborn children.” North Dakota’s lawyers have the option of asking for en banc rehearing of the case by the full Eighth Circuit, or else taking the case directly on to the Supreme Court. Arkansas’ lawyers failed earlier this month to get en banc rehearing in their case in the Eighth Circuit. The two rulings by the panel were made by Circuit Judges Duane Benton, Bobby E. Shepherd, and Lavenski R. Smith. The Arkansas ruling was issued “per curiam” — that is, for the panel without designating a specific author. Judge Shepherd authored the North Dakota opinion, with support of his two colleagues.

Abortion Top of the Docket

Adler 7/25 (Jonathan, Washington post journalist and author, “ Appeals court to reinstitute constitutional limits on state abortion restrictions”, <https://www.washingtonpost.com/news/volokh-conspiracy/wp/2015/07/25/appeals-court-urges-supreme-court-to-revisit-constitutional-limits-on-state-abortion-restrictions/>)

The Supreme Court is likely to revisit the contentious subject of abortion next term, as lower courts have split over whether various restrictions on abortion and regulations of abortion providers constitute impermissible “undue burdens” on the constitutionally protected abortion right. Under existing precedent, states may regulate and even seek to discourage abortion provided that the “purpose or effect” of the regulations is not to “place a substantial obstacle in the path of a woman seeking an abortion” before the fetus has attained viability. Under this standard, lower courts have split on the permissibility of various rules governing the prescription of abortifacient drugs and regulations governing abortion providers, among other things. One case teed up for Supreme Court review concerns a Texas law that, among other things, requires abortion clinics to meet the same standards as ambulatory surgical centers and requires doctors performing abortions to have admitting privileges at a nearby hospital. It’s estimated these rules would force the closure of half of the existing abortion clinics in Texas. They were nonetheless upheld by a panel of the U.S. Court of Appeals for the 5th Circuit, only to be put on hold by the Supreme Court, pending a petition for certiorari. If a cert petition is filed in the Texas case, it would seem almost certain to be granted. In the meantime, other federal appellate courts continue to consider challenges to state-level abortion restrictions. In one such case, *MKB Management Corp. v. Stenehjem*, the U.S. Court of Appeals for the 8th Circuit urged the Supreme Court to do more than apply its existing “undue burden” standard. Instead, the judges suggested, the high court should reconsider its abortion jurisprudence from the ground up. The law at issue in *MKB* prohibits doctors

from performing abortions if the fetus has a detectable heartbeat. This North Dakota law clearly runs afoul of the current “undue burden” test as it would prohibit some abortions before fetal viability. On this basis, the 8th Circuit panel had no difficulty striking the law down. But the 8th Circuit panel did not stop there. It went on (for five pages) to urge the Supreme Court to revisit existing abortion jurisprudence, expressly citing the criteria the Supreme Court itself identified in *Casey* as valid grounds for reconsidering an existing precedent. Excerpts of the 8th Circuit opinion follow. Although controlling Supreme Court precedent dictates the outcome in this case, good reasons exist for the Court to reevaluate its jurisprudence. . . .

Lethal Injection Thumps

Court faces controversy now- Lethal injects prove

CNA/EWTN, 6/29/15 (CNA/EWTN NEWS, news channel that reports on controversial topics, "Supreme Court Upholds Use of Controversial Lethal-Injection Drug," nregister.com, <http://www.nregister.com/daily-news/supreme-court-upholds-use-of-controversial-lethal-injection-drug/>, accessed date: 7/31/15) Salehitezangi

The Supreme Court has ruled in favor of the continued use of a drug that has been accused of causing excruciating pain in several controversial state executions. The 5-4 ruling in *Glossip v. Gross* was announced June 29. Lawyers for three death-row inmates in Oklahoma had argued before the court that the state's three-drug protocol for executions violated constitutional bans on cruel and unusual punishment. The execution protocol includes the sedative midazolam. The drug's effectiveness was recently called into question when it was used in several unusually prolonged executions in Ohio, Arizona and Oklahoma in which inmates appeared to suffer significantly during their deaths. In the 2014 execution of Oklahoma inmate Clayton Lockett, the sedated man's body writhed, and he breathed heavily for more than 40 minutes until he died of a heart attack. Oklahoma officials had argued that the protocol was consistent with the Supreme Court's previous lethal-injection ruling. In 2008, the court had said that the first drug used in any three-drug execution protocol must prevent inmates from experiencing intense pain. That ruling approved a protocol that used the drug sodium thiopental rather than midazolam. During arguments in May, Supreme Court Justice Elena Kagan had pressed Oklahoma officials defending the law on how a drug with unknown effects could be justified for use in an execution. Justice Samuel Alito suggested that states have been forced to use the drug because death-penalty opponents have pressured drug companies not to produce or sell more reliable drugs. Controversy over the drug had led some states to revisit execution methods such as the electric chair and firing squad. In January, the U.S. bishops' pro-life committee chairman, Cardinal Sean O'Malley of Boston, had prayed that the court's review of death-penalty protocols would "lead to the recognition that institutionalized practices of violence against any person erode reverence for the sanctity of every human life." Archbishop Paul Coakley of Oklahoma City on May 1 told CNA that there are non-lethal ways "to ensure justice and protect society." In the U.S., 32 states and the federal government allow the use of the death penalty.

Controversy Inevitable

Controversy in the court is inevitable

Barry **Friedman**, 7/7/15 (Barry Friedman, American academic with an expertise in federal courts, working at the intersections of law, politics and history. Teaches a variety of courses including Constitutional Law, Federal Courts, and Criminal Procedure, "Great Controversy Is Usually the Exception for the Supreme Court", [The New York Times](http://www.nytimes.com), <http://www.nytimes.com/roomfordebate/2015/07/06/is-the-supreme-court-too-powerful/great-controversy-is-usually-the-exception-for-the-supreme-court>, accessed date: 7/30/15)

"The old chorus rises, as it is rising now," The New York Times editorialized almost 100 years ago, during yet another time of controversy over the Supreme Court. "It will die into silence, as it has died before ... Congresses have their little hour of strut and rave. The court stays." Controversy over the Supreme Court is as inevitable as death and taxes. Still, asking whether we would be better off without the court is like asking whether we would be better off without gravity or rain. It is part of the basic ecosystem of American governance. The court is secure, in part, because it has learned to stay out of trouble. Over the short haul, the ideological left wins some cases, the right others. And so the court is left alone. It's been a long time since there was any serious attack on the justices or their way of doing business. Most cases get decided with little fanfare. They deal with mundane issues that, whatever their legal interest, hardly gain a toehold in the public's short attention span. Don't deceive yourself that the justices stand up for individual rights when the chips are down. Their record in that regard is abysmal. While we wait for the court to come into line, a lot of people can be unhappy, or even harmed, possibly a majority of the country. But like it or not, it's our way of doing business.

Impact Turn

Turn – ruling in favor of plaintiffs is key to uphold the Constitution and rule of law.

Shapiro, 7/29 (Ilya, staff writer for ScotusBlog, a senior fellow in constitutional studies at the Cato Institute, “Symposium: Taking voter equality seriously,” ScotusBlog, 7/29/15, <http://www.scotusblog.com/2015/07/symposium-taking-voter-equality-seriously/#more-230543>) Zhang

The “one person, one vote” standard (OPOV) has become an axiomatic part of election law: Whatever mischief happens during the decennial redistricting process, states can’t draw districts with wildly disproportionate populations, such that a vote in lightly populated districts is worth much more than a vote in heavily populated districts. It’s an easy principle to understand. OPOV solves the old “rotten borough” problem, where some British parliamentarians represented constituencies where very few – or no! – people lived. This became an issue in the United States as the country urbanized but depopulated rural areas maintained disproportionate voting power in state legislatures and congressional delegations. The Supreme Court ruled in the 1964 case of Reynolds v. Sims that political map-designers can’t dilute the franchise that way and instead must draw districts with roughly equal numbers of people. In other words, each person’s vote should be equal, as guaranteed by the Constitution; nobody gets more votes based on wealth, education, occupation, sex, race, or geography. None of this is or should be controversial. But a funny thing happened on the way to electoral utopia: modern immigration patterns have created disparities in the number of voters per district. Just as it was intolerable for a rural district with 500 voters to have the same representation in a state legislature as an urban district with 5000 voters, it’s now constitutionally suspect to have that disparity between a heavily (non-citizen) foreign-born district and one with mostly native-born citizens. In each case, the Supreme Court must intervene to maintain voter equality. While the specific case now before the Court, Evenwel v. Abbott, doesn’t present the stark 10:1 ratio in voting power I just stylized, the disparities are nonetheless significant: as detailed by the challengers to Texas’s districting map detail (see tables on pages 8-10 of their jurisdictional statement), some state senate districts deviate by as much as fifty percent from the ideal. That means that twice as many voters may elect a state senator in one district as in the smallest district. In sum, regardless of one’s views of Evenwel’s particular facts, it has to be the case that disparities between the number of voters in state districts raises a constitutional issue. Otherwise, even 10:1 or 100:1 ratios wouldn’t be a problem. And if all we’re talking about here is line-drawing rather than first principles, then the challengers win. Over the years, the Supreme Court has repeatedly recognized the potential for devaluing individual votes by drawing majority-minority districts in a manner that accords greater weight to minority votes in protected districts and diminishes the relative weight of voters elsewhere. In 2000, in Chen v. City of Houston, the Fifth Circuit also recognized this danger while ultimately ruling the other way. Nevertheless, here the special district court adhered to that flawed lower-court precedent – refusing to acknowledge CVAP as integral to OPOV and thus a required element of equal protection. The VRA’s Section 2 and the Fourteenth Amendment have thus reached an impasse that has been highlighted by a conflict among lower courts’ application of OPOV. (The Fifth Circuit has held that states can choose either total population or CVAP on the grounds that the Equal Protection Clause is ambiguous, the Fourth Circuit reached the same conclusion but through the “political question” doctrine, and the Ninth Circuit held that states can only use total population, in a split 2-1 decision that provoked a strong dissent by Judge Kozinski.) It’s thus heartening that the Court took up Evenwel – and hopefully it will resolve that conflict once and for all by explaining the proper use

of different population metrics. The noble principle of OPOV needs to be saved from the legal morass of Voting Rights Act jurisprudence.

Won't Kill Iran

A republican president would not ruin the Iran deal – too many constraints

Cadei 15 (Emily, political correspondent at Newsweek "Could a Republican President Undo an Iran Deal?" 7/7/15 www.newsweek.com/could-republican-president-undo-iran-deal-351127) Foronda

If the United States reaches a nuclear deal with Iran, as negotiators are scrambling to do this week (the deadline has been extended until Friday), the outcry from Republicans on the 2016 campaign trail is likely to be fierce. Some have already promised to undo any agreement reached with Iran, or at least roll it back significantly. "On January 20, 2017, if I were elected president I would pull back from this awful deal on the very first day," Wisconsin Gov. Scott Walker told radio host Lars Larson last week. In reality, that's highly unlikely. Experts on the region and nuclear pacts say unraveling any deal once it goes into force will be fraught with diplomatic, financial and security risks that will make it all but impossible for a Republican president to just scrap it right off the bat. Former Florida Gov. Jeb Bush hinted as much in an op-ed on the conservative web site Townhall.com, though unlike Walker, he did not come out and say he'd rip an agreement on Day One. "Undoing the damage done by a fundamentally flawed nuclear deal will not be easy," wrote Bush. But he insisted doing so is "essential for the security of the United States." It's more likely, however, that moves by Tehran—not Washington, D.C.—will either propel the nuclear deal forward or put it in jeopardy. Iran has a history of testing the limits of its international agreements, particularly when it comes to its nuclear program, points out Ambassador Dennis Ross, counselor at the Washington Institute for Near East Policy. Tensions over implementing the new deal, including different interpretations of the limitations, are inevitable. But "a lot depends on when they test the limits and in what ways they test the limits," Ross says. He says if the Iranians are smart, they won't try and test Washington until after some time into a new administration is in power. At that point, it would be up to the new administration how forcefully to push back. "If we get an agreement that's actually successfully implemented for a year and a half [under Obama], I don't think any Republican president would cut up a deal," says Ilan Goldenberg, director of the Middle East Security Program at the Center for a New American Security, a D.C. think tank. That, Goldenberg notes, would shatter the international consensus reached among the group known as the P5+1, which includes permanent United Nations Security Council members the U.S., France, the United Kingdom, Russia and China, as well as Germany. It would also roil a region already in flames and up the prospects for Iranian reprisals. And it could harm international energy markets, which are eager to get their hands on Iran's significant oil reserves, if and when Western sanctions against the country are lifted under the prospective deal. "I don't think Iran is going to walk away from this quickly," says Goldenberg, previously a senior Middle East policy adviser at the State Department and Pentagon. "I think they'll implement the agreement," at least in the early stages. That would likely force the next administration to hold up its side of the bargain, as well, at least initially. "I can see a Republican administration coming in and holding their nose and implementing it," Goldenberg says. "But not vigorously implementing it." The questions are more likely to come in the ensuing years, as the politics shift and new challenges emerge.

Defense

UQ: Crimes Rates High / Rising

2015 marks the rise of crime rates

Gold 6/5 (Ashley Gold, 6-5-2015, "Why has the murder rate in some US cities suddenly spiked?," BBC News, <http://www.bbc.com/news/world-us-canada-32995911>) LO

Murder and violent crime rates have risen in multiple US cities since the beginning of 2015, after falling for two decades. Some have put this down to a so-called Ferguson effect, referring to the protests against perceived police brutality, that sometimes became violent. Could that be true? What do the statistics say? There are no national figures on crime in the US available yet for 2015, but some cities have released their own figures. In New York City, the murder rate has gone up by 20% in 2015 compared with the first few months of 2014. Mayor Bill de Blasio called a special news conference at which he acknowledged the increase, but said it could be contained. He said he had faith in the New York Police Department that they will "turn the tide". In other cities, there are similar increases reported. In Baltimore, murders are up 37% and in Los Angeles, violent crime is up by 27% (although murders are down 2%). In Houston, murders are up nearly 50% so far this year. What is the Ferguson effect? This is a term coined by St Louis Police Chief Sam Dotson, whose police officers had been one of the forces dealing with the summer protests and riots in Ferguson, Missouri, following the fatal shooting of black teenager Michael Brown. He said in November his police officers had been drawing back from everyday enforcement due to fears they could be charged. As a result, he said, the "criminal element is feeling empowered". The phrase was repeated recently by Heather MacDonald, a fellow at the US Manhattan Institute, in a piece for the Wall Street Journal. The Ferguson effect, she said, was taking hold across the country "under the onslaught of anti-cop rhetoric". Multiple police officers Ms MacDonald spoke to told her police morale is at an all-time low and they are now worried about being charged, recorded and assaulted while trying to do their jobs and keep communities safe. "Unless the demonisation of law enforcement ends, the liberating gains in urban safety will be lost," she wrote. Baltimore's police boss, Anthony Batts, said the riots had another effect on crime. Scores of pharmacies had been looted and the surge in the supply of drugs has "thrown off the balance" between gangs in the city, he said. "There's enough narcotics on the streets of Baltimore to keep it intoxicated for a year," he said.

US crime rate experiencing sudden spike

Batley 6/4 (Melaine Batley, 6-4-2015, "Sudden Spike in Violent Crime Across US Raises Alarm," Newsmax, <http://www.newsmax.com/US/crime-violent-homicide-cities/2015/06/04/id/648724/>) LO

Major cities across the United States are seeing their crime rates skyrocket, sparking alarm about the causes, particularly given that there had been a two-decade drop in crime. A city-by-city look shows: In Baltimore, shootings are up 82.5 percent, or nearly double from last year, the Baltimore Brew reported. In Chicago, there have been over 900 shootings this year, a 40 percent increase, and a 29 percent increase in homicides in the first three months of the year. USA Today reported. In New York City, murders have increased 20 percent and the mayor has already announced that he will put an additional 330 cops on the street by Monday in response to the spike in homicides and shootings. In Los Angeles, violent crime rates increased by more than 25 percent and the city is also deploying more officers to areas where crime is on the rise, The Los Angeles Times reported. And according to Townhall.com: In St. Louis, there have been 55 murders this year In Dallas, violent crime is up 10 percent In Atlanta, homicides are up 32 percent In Milwaukee, homicides have increased by 180 percent Some attribute the rise in crime to a "Ferguson" effect, or a rise in anti-police sentiment born out of the protests and clashes around the country that followed the deaths of unarmed black men at the hands of police, The Week reported. A dynamic may have emerged in which criminals are more brazen and police are more cautious in fighting crime. "There's a war on cops. Not bad cops, not bad apples, but all cops and the police know it. The conduct of the suspects is never in question — they're always right, it's usually drawn on racial lines. It's a complete, toxic formula to actually do police work," said former Los Angeles Police Department Homicide Detective Mark Fuhrman, according to Townhall.com. The police are simply scaling back, exactly what everybody's chanting for in all of these protests. 'Don't be so aggressive. Don't stop and frisk. Don't stop and ask where people are going. Don't make traffic stops.' So, they are," Fuhrman said, and now crime's skyrocketing. But others say that linking the protests to an increase in crime is misleading. "This is all part of an attempt to tell black people that if we exercise our First Amendment rights, we are somehow now responsible for people who engage in crime," said CNN political analyst Van Jones. "Why should the black community have to choose between police abuse and police neglect? That's a false choice."

Crime rates rising – specifically targeting black and the inner-city poor

Wood 6/6 (Chip Wood, 6-6-2015, "Why Crime Rates Are Soaring," The NewAmerican, <http://www.thenewamerican.com/reviews/opinion/item/21015-why-crime-rates-are-soaring>) LO

It's being called "the Ferguson effect." It's the explosion of violent crimes in major U.S. cities, thanks to the ways police have been demoralized — and criminals have been emboldened — in the aftermath of police shootings of supposedly innocent blacks. In Baltimore, there were 43 homicides in the month of May. This is the highest murder rate there in more than 40 years, when the city's population was almost 50 percent bigger than it is now. This brings the death toll for the year to 116 people, the vast majority of them blacks. Heather Mac Donald, the Thomas W. Smith fellow at the Manhattan Institute, described the situation in a May 29 column, "The New Nationwide Crime Wave." Her piece carried the subtitle, "The consequences of the 'Ferguson effect' are already appearing. The main victims of growing violence will be inner-city poor." Here's how her article began: The nation's two-decades-long crime decline may be over. Gun violence in particular is spiraling upward in cities across America. In Baltimore, the most pressing question every morning is how many people were shot the previous night. Gun violence is up more than 60% compared with this time last year, according to Baltimore police, with 32 shootings over Memorial Day weekend. May has been the most violent month the city has seen in 15 years. But Baltimore isn't the only major city that has seen crime rates soar. Homicides in Atlanta were up 32 percent in the first five months of the year. In Chicago, which already was contending for the title "Murder Capital of the Country" because of the high death rate there, homicides are up 17 percent so far this year. In New York, homicides are up almost 13 percent. In St. Louis, robberies were up 43 percent during the first four months of this year. During the same period, homicides increased by 25 percent. St. Louis Police Chief Sam Dotson said a major reason for the increase is that "the criminal element is feeling empowered." Of course it is! What else would you expect to happen when the media are only too eager to portray police as racist killers and when public officials, from city mayors to the president of the United States, are all too willing to play into this false narrative? Remember the demonization of police that occurred after the shooting of Michael Brown in Ferguson, Missouri? Although it was later proved that Brown attacked police officer Darren Wilson and wasn't standing with his hands up, trying to surrender, the lie that he was doing so led to the slogan "Hands up, don't shoot" being used by demonstrators all over the country. The mainstream media were only too willing to repeat every dishonest smear against the police. Publicity hound and racist agitator Al Sharpton got massive exposure for every scurrilous attack on the police that he uttered. Who cared what the truth was? The real tragedy here is that it is blacks who are the biggest victims of the soaring crime rates. They're being raped, robbed, shot and molested by black criminals in increasing numbers. Before this year, violent crimes in America had been declining for the past two decades. Now, crime rates are soaring. As Mac Donald wrote: If these decriminalization and deincarceration policies backfire, the people most harmed will be their supposed beneficiaries: blacks, since they are disproportionately victimized by crime. Right! But will this be enough to get the Democrats who run virtually every big city in America to change their policies or for the mainstream media to expose the lies that help fuel the mayhem? Not a chance. I'm afraid things will only get worse, especially in our inner cities, before they get better — maybe a lot worse. Until next time, keep some powder dry.

Crime doesn't impact economy much

No clear crime-economy relationship

John Roman 9-23-2013 Urban Institute, Justice Policy Center Sr Fellow

<http://www.citylab.com/work/2013/09/puzzling-relationship-between-crime-and-economy/6982/>The Puzzling Relationship Between Crime and the Economy Criminologists say bad economies create more crime; economists say the opposite. But recent data reveals neither explanation is right.

Looking at the relationship between GDP and crime back to the earliest reliable crime data from 1960 supports both positions, **suggesting there is no relationship between economic growth and crime**. In the first part of the series, rising GDP is associated with rapidly increasing crime. In the second part, it is associated with declining crime. In the middle, there is no relationship at all. **Most macroeconomic data show the same pattern**. Consider consumer confidence data going back to the inception of the University of Michigan Consumer Sentiment data in 1978. Again, the **consumer confidence data show no relationship between consumer sentiment and crime rates**. That, however, is because the relationship was strongly negative prior to 1992 (meaning more confident consumers=less crime). After 1992, the pattern reverses, and the better the economy, the more crime there is. **The bottom line: Crime is episodic and there is no singular effect** of the economy on crime. In order to understand and prevent crime, it is therefore necessary to understand what type of period we are in. It's also necessary to understand what forces are at work locally, rather than focus on the national picture. Next week, I will address that point.

Weak internal link – overall data is mixed

Eleftherios Goulas & Athina Zervoyianni April 2012 University of Patras (Greece) Econ Department

http://www.rcfea.org/RePEc/pdf/wp51_12.pdfWP 12-51 The Rimini Centre for Economic Analysis (RCEA), Italy ECONOMIC GROWTH AND CRIME: DOES UNCERTAINTY MATTER?

Nevertheless, despite the growing literature, empirical studies have not yet produced a definite conclusion regarding the impact of crime on economic growth. **Existing findings are often contradictory, with some estimates suggesting a strong adverse influence of crime on growth while other studies report evidence indicating no effect at all**. For example, Peri (2004) finds crime to have a statistically significant impact in reducing both per capita income growth and employment growth using panel data at provincial level from Italy for 1951-1999. His results, however, indicate the possibility of non-linearities in the crime-growth relationship. Burnham et al. (2004) explore the impact of central-city crime on US county-level per-capita income growth and report results suggesting no clear crime-growth relationship. In particular, while they find a statistically significant adverse violent-crime effect on growth, the impact of property crime is weak and in some specifications perverse. On the other hand, a World Bank study (World Bank, 2006), based on data from 43 countries for 1975-2000, reports results suggesting a strong negative effect of crime on growth even after controlling for human-capital accumulation and income inequality, that is, variables which are likely to be causally linked to crime. Cárdenas (2007) also finds a significantly negative association between crime and per-capita output growth in a panel of 65 countries using homicides data for 1971-1999 and a country-fixed effects specification. **Mauro & Carmeci (2007) find that crime impacts negatively on income levels but exerts no significant long-run adverse influence on growth rates** employing the pooled-mean-group estimator (Pesaran et al. (1999)) and homicides data from 19 Italian regions during the period 1963-1995. Dettoto & Pulina (2009) explore the cointegration status between six types of crime and employment growth using Italian national-level data between 1970 and 2004. Their results indicate that property crime, but not homicides, causes lower long-run employment growth. In a more recent study, Dettoto & Otranto (2010) apply an autoregressive model, in which real GDP growth is explained by past GDP and a crime proxy, to monthly data for Italy during the period 1979-2002 and find only a relatively small annualized real-GDP growth reduction due to crime. **Chatterjee & Ray (2009), based on a large cross-country data set for the period 1991-2005 and controlling for human capital and institutional quality, also find no strong evidence of a uniformly negative association between crime and growth** and this applies both to total crime and to sub-categories of crime.

Their evidence flawed—no systematic study to correlate economy and crime

BY DEBRA RESCHKE A mixed bag of conditions could have various effects on crime RETAIL CRIME IN AN ECONOMIC DOWNTURN National Petroleum News [serial online]. April 2009;101(4):24. Available from: MasterFILE Premier, Ipswich, MA. Accessed July 6, 2015.

Although it is generally assumed that fluctuations in the economy alter crime, evidence that categorically proves it is hard to find. "There's never been a systematic study that shows it," said Peter Manning, Brooks Professor of Criminal Justice at Northeastern University. He explained the lack of proof by echoing Erickson's statement; the lag between the change in the economy and crime rate makes it difficult to predict. Also, according to Manning, several various different political and philosophical opinions tend to go along with these types of studies as well as possibly erroneous ideas. "The idea that people who commit these crimes become more impulsive (in economic downturns) is simply not true," he said. In fact, he added, robbers, in either bear or bull markets, are usually unemployed and, therefore, unrelated to the economy. What has been more widely studied and documented are the characteristics of retail robbers. Findings suggest the people who commit robberies at places like c-stores are usually impulsive by nature, low skilled and fairly young, said Manning

The correlation between crime and the economy is not consistent.

JOHN ROMAN senior fellow in the Justice Policy Center at the Urban Institute, where he focuses on evaluations of innovative crime-control policies and justice programs **Sep 24, 2013** The Puzzling Relationship Between Crime and the Economy
<http://www.citylab.com/work/2013/09/puzzling-relationship-between-crime-and-economy/6982/>

But as the figures below show, the relationship between crime and the economy is not as obvious as it seems, and focusing on that relationship obscures more important predictors. Looking at the relationship between GDP and crime back to the earliest reliable crime data from 1960 supports both positions, suggesting there is no relationship between economic growth and crime. In the first part of the series, rising GDP is associated with rapidly increasing crime. In the second part, it is associated with declining crime. In the middle, there is no relationship at all. Most macroeconomic data show the same pattern. Consider consumer confidence data going back to the inception of the University of Michigan Consumer Sentiment data in 1978. Again, the consumer confidence data show no relationship between consumer sentiment and crime rates. That, however, is because the relationship was strongly negative prior to 1992 (meaning more confident consumers=less crime). After 1992, the pattern reverses, and the better the economy, the more crime there is. The bottom line: Crime is episodic and there is no singular effect of the economy on crime. In order to understand and prevent crime, it is therefore necessary to understand what type of period we are in. It's also necessary to understand what forces are at work locally, rather than focus on the national picture. Next week, I will address that point

Link Defense

Focus on crime reduction doesn't solve

Theo Lorenc (et al), 2014, London School of Hygiene

<http://www.ncbi.nlm.nih.gov/books/NBK262852/> Crime, fear of crime and mental health: synthesis of theory and systematic reviews of interventions and qualitative evidence. Public Health Research, No. 2.2 (Chapt 3) Theo Lorenc (et al),1,* Mark Petticrew,1 Margaret Whitehead,2 David Neary,2 Stephen Clayton,2 Kath Wright,3 Hilary Thomson,4 Steven Cummins,5 Amanda Sowden,3 and Adrian Renton.6. March 2014 1 Department of Social and Environmental Health Research, London School of Hygiene and Tropical Medicine, London, UK 2 Department of Public Health and Policy, University of Liverpool, Liverpool, UK 3 Centre for Reviews and Dissemination, University of York, York, UK 4 MRC Social and Public Health Sciences Unit (SPHSU), University of Glasgow, Glasgow, UK 5 School of Geography, Queen Mary University of London, London, UK 6 Institute for Health and Human Development, University of East London, London, UK * Corresponding author

Broader social interventions appear more promising than crime-focused environmental interventions as a means of improving fear of crime, health and well-being. The qualitative evidence suggests that fear of crime may impact on physical activity. More broadly, crime and fear of crime appear to be linked to health and well-being mainly as aspects of socioeconomic disadvantage. This review indicates the following gaps in the literature: evaluation research on the health impacts of crime reduction interventions; more robust research on interventions to reduce fear of crime; systematic reviews of non-environmental interventions to reduce fear of crime and systematic reviews of qualitative evidence on other crime-related topics.

Surveillance doesn't reduce crime

Ali Winston 9-11-2013 The East Bay Express

<http://www.eastbayexpress.com/oakland/we-are-being-watched/Content?oid=3706988> We Are Being Watched Our fear of another 9/11 resulted in the erosion of our privacy rights. And now our fear of crime is pushing the surveillance state to a whole new level

The Domain Awareness Center -- Oakland's planned surveillance hub that is being designed to collect data from at least 150 city and port cameras, 40 license plate readers, gunshot detectors, alarm notifications, and intelligent video programs -- **is the broadest surveillance project** in the region and has attracted the most criticism. Funded entirely through federal grant money and being built on a contract by Science Applications International Corporation (SAIC) -- a defense contractor with a record of making shoddy products; producing cost overruns; and defrauding municipal, federal, and foreign governments -- the surveillance center has also attracted heavy criticism for its lack of privacy or data retention policies, as well as for its plans to incorporate cameras from the Oakland Unified School District, the Oakland Coliseum, and freeways. **But expanded** electronic **surveillance has also** garnered widespread **support from** city **residents** who are **fed up with crime** and are willing to trade their privacy rights and civil liberties for the chance of being safer -- much as Americans have done throughout the past decade in the fight against terrorism. "People who probably in a 'normal' or less fearful crime-ridden situation would not think about wanting more cameras, but in the reality of today, I'm getting people saying, 'Can't we get more cameras in these places?'" said Dan Kalb, who represents North Oakland (one of the city's less crime-impacted neighborhoods) on the city council. "They want to be able to walk back from BART to their homes -- four blocks -- without fearing having to do it. People are taking cabs from Rockridge BART home. It's a shame that it's gotten to that point." While much of the official rhetoric about the surveillance center has revolved around Oakland's high crime rate, **a substantial body of research reveals that video surveillance does not impact violent crime.** **In London**, where there are 4.2 million surveillance cameras, police studies last decade concluded that the expansion of **the surveillance state had not resulted in decreased crime.** **Furthermore**, video **surveillance** by law enforcement **raises concerns about racial profiling.** In Lansing, Michigan, an independent study of surveillance cameras concluded that black residents were twice as likely to be under continual surveillance than white residents.

No data support surveillance deterrence – it doesn't reduce crime but trades off with more effective approaches

Mark Schlosberg August 2007 The California ACLU Affiliates

https://www.aclunc.org/docs/criminal_justice/police_practices/under_the_watchful_eye_the_proliferation_of_video_surveillance_systems_in_california.pdf Under the Watchful Eye The Proliferation of Video Surveillance Systems in California (and Nicole A. Ozer, co author)

Even in the face of this evidence, **law enforcement** and government officials in California **continue to claim that cameras deter crime**. In San Francisco, for example, the Director of the Mayor's Office of Criminal Justice admitted, at a public hearing on the proposed expansion of the city's video surveillance program, that he was unaware of any studies demonstrating the effectiveness of cameras and that there had been no comprehensive study of San Francisco's system. **Yet**, he continued to assert that cameras would deter crime.⁸¹ Likewise, in Clovis, Police Captain Robert Keyes asserted that cameras contributed to a reduction in crime, despite the fact that **"there's nothing other than anecdotal evidence"** to support that.⁸² **The ACLU survey found** that no California jurisdiction with video surveillance cameras has conducted a comprehensive evaluation of their effectiveness. As **comprehensive studies strongly suggest cameras do not deter crime**, the rationale of deterrence falls short of justifying either the cameras' expense or their intrusion into privacy. Another justification for video surveillance is that its purported ability to capture evidence of criminal activity could potentially increase the success of criminal prosecutions. In London, the role of CCTV cameras in identifying the men involved in the 2005 terrorist attacks has been highly publicized. Cameras undoubtedly capture some evidence of criminal activity, but in the limited studies available, **evidence suggests that the impact of video footage on prosecutions may not be as significant** as policy-makers expect. First, some evidence suggests that cameras make little difference in the number of crimes actually solved. The Glasgow study cited above, for example, found that "the cameras appeared to have little effect on the clearance rates for crimes and offenses generally. Comparing statistics before and after installation of the cameras, the clear-up rate increased slightly, from 62 to 64 percent. Once these figures were adjusted for general trends, however, the research analysts concluded that the clear-up rate fell from 64 to 60 percent."⁸³ Second, while some crimes are certainly captured on film, some **law enforcement agencies appear to overestimate** the degree to which the footage helps law enforcement actually convict criminals. In Maryland, for example, Margaret Burns, a spokesperson for the state attorney's office, told reporters for the Washington Times that the office has not "found them to be a useful tool to prosecutors . . . they're good for circumstantial evidence, but it definitely isn't evidence we find useful to convict somebody of a crime . . . We have not used any footage to resolve a violent-crime case."⁸⁴ According to a study by the Maryland state attorney's office, of the nearly 2,000 arrests made on the basis of video camera footage, the vast majority concluded in an outright dismissal or a conviction for minor crimes. The office is now questioning the large amount of taxpayer money spent on the program. "Do these prosecutorial results support millions of dollars in tax expenditures? There will have to be a public debate about this," Burns said.⁸⁵ In Cincinnati, Ohio, police also found cameras to be ineffective. A University of Cincinnati study found that the city's program, which began in 1998, merely shifted crime beyond the view of the cameras. According to Captain Kimberly Frey, "We've never really gotten anything useful from them . . . we've never had a successful prosecution . . . we're trying to use . . . money for other things. Video surveillance costs more than the cameras alone: The dollars used to buy the system are not spent in a vacuum. **Public safety budgets are stretched very thin**, especially in many urban areas, so money dedicated to video **surveillance often comes at the expense of potentially more effective measures, such as lighting, community policing initiatives, and increased foot patrols. Compare the lack of evidence of video surveillance's ability to reduce crime with the remarkable results that improved lighting produces**. A survey commissioned by the British Home Office looked at 13 lighting studies in Great Britain and the United States and evaluated the cumulative impact. The study found a 20 percent average decrease in crime, with reductions in every area of criminal activity including violent crime. In fact, in two areas "financial savings from reduced crimes greatly exceeded the financial costs of the improved lighting." The report concluded: Street lighting benefits the whole neighborhood rather than particular individuals or households. It is not a physical barrier to crime, it has no adverse civil liberties implications, and it can increase public safety and effective use of neighborhood streets at night. In short, **improved lighting seems to have no negative effects and demonstrated benefits** for law-abiding citizens.⁸⁷ Intensive **foot patrols have shown similar results**—reductions in crime, including violent crime, of 15 to 20 percent.⁸⁸ These findings suggest that from a law enforcement and public safety perspective alone, **the dedication of scarce resources to video surveillance systems may not only be an inefficient and ineffective** use of funds, **it may actually be counterproductive**.

A2 Fear of Crime

Fear of crime impacts are minimal

Theo Lorenc (et al), 2014, London School of Hygiene

<http://www.ncbi.nlm.nih.gov/books/NBK262852/> Crime, fear of crime and mental health: synthesis of theory and systematic reviews of interventions and qualitative evidence. Public Health Research, No. 2.2 (Chapt 3) Theo Lorenc (et al),1,* Mark Petticrew,1 Margaret Whitehead,2 David Neary,2 Stephen Clayton,2 Kath Wright,3 Hilary Thomson,4 Steven Cummins,5 Amanda Sowden,3 and Adrian Renton.6. March 2014 1 Department of Social and Environmental Health Research, London School of Hygiene and Tropical Medicine, London, UK 2 Department of Public Health and Policy, University of Liverpool, Liverpool, UK 3 Centre for Reviews and Dissemination, University of York, York, UK 4 MRC Social and Public Health Sciences Unit (SPHSU), University of Glasgow, Glasgow, UK 5 School of Geography, Queen Mary University of London, London, UK 6 Institute for Health and Human Development, University of East London, London, UK * Corresponding author

As noted earlier (see Emotional response: further considerations), many researchers have called for greater precision in the measurement of fear of crime, on several dimensions. With respect to the distinction between perceived risk and emotional responses, the findings cited earlier may suggest that the latter have a greater impact on health and well-being outcomes although, because of the non-systematic nature of this review, this finding should be regarded as indicative only. With respect to the distinction between dispositional fear and episodic fear, both have been found to be associated with health outcomes; of the studies cited earlier, five use non-time-specific measures^{208,224,226–228} and two measure frequency of worry.^{223,225} With regard to the distinction between functional and pathological fear, limited data are available on health outcomes, although this would be a promising avenue of investigation. Studies have elicited respondents' perceptions of the impact of fear on quality of life^{91,98} and used this to make the distinction between functional and pathological fear, but we did not locate any studies that make the distinction independently and then measure the association with quality of life or other well-being outcomes. Potential differences in the health impacts of fear by type of crime have also, to our knowledge, not been investigated. **The mental health impacts of fear of crime are probably relatively limited** across the population as a whole. **The utility loss has been estimated at 0.00065 of a QALY per person per year** or around one-fifth of the mental health impacts of crime itself,^{122,234} although to our knowledge no modelling work has been carried out on the basis of more in-depth empirical studies such as that by Stafford et al.²²⁷ to provide more accurate estimates.

Fear of crime can't be separated from ACTUAL crime

Theo Lorenc (et al), 2014, London School of Hygiene

<http://www.ncbi.nlm.nih.gov/books/NBK262852/> Crime, fear of crime and mental health: synthesis of theory and systematic reviews of interventions and qualitative evidence. Public Health Research, No. 2.2 (Chapt 3) Theo Lorenc (et al),1,* Mark Petticrew,1 Margaret Whitehead,2 David Neary,2 Stephen Clayton,2 Kath Wright,3 Hilary Thomson,4 Steven Cummins,5 Amanda Sowden,3 and Adrian Renton.6. March 2014 1 Department of Social and Environmental Health Research, London School of Hygiene and Tropical Medicine, London, UK 2 Department of Public Health and Policy, University of Liverpool, Liverpool, UK 3 Centre for Reviews and Dissemination, University of York, York, UK 4 MRC Social and Public Health Sciences Unit (SPHSU), University of Glasgow, Glasgow, UK 5 School of Geography, Queen Mary University of London, London, UK 6 Institute for Health and Human Development, University of East London, London, UK * Corresponding author

As discussed in the theory review, **some form of dualistic distinction between 'rational' and 'irrational' or 'symbolic' fear has been widely utilised as a fundamental distinction in the theoretical literature**. Rational fear would be fear that responds to actual risk (i.e. in which the affective component is purely driven by the cognitive component), whereas all other fear – which has been hypothesised to be driven by a wide range of factors (see following section) – would then be irrational. This framing of the issue has perhaps been a factor in some researchers' and policy-makers' reluctance to separate questions about fear of crime from questions about crime (as we argue is necessary above; see The policy context of fear of crime), from an understandable desire to avoid labelling people's fears as irrational or 'merely' symbolic. However, **many theorists have argued that this distinction is itself an oversimplification**, and fails to take account of how estimations of risk and affective reactions actually inter-relate in the context of lived experience. Some thinkers on fear of crime have attempted to produce revised versions of the distinction between the kind of fear of crime that responds to immediate risk and the kind that expresses broader symbolic resonances, which can take account of these critiques, such as Jackson's¹¹¹ distinction between 'experience' and 'expression'. However, it seems clear that such revisions still face problems in integrating existing theories premised on an absolute distinction between rationality and irrationality with a more critical perspective that would see rationality in more pluralistic or context-sensitive terms. We would argue that the **qualitative evidence tends to show the impossibility of isolating the rational dimension of fear from the symbolic dimension**, for several reasons. One has to do with the complexity of the causal pathways, as discussed in the theory review. Even taking into account the various distortions that may affect cognitive assessments of risk, the latter do not explain more than a small amount of the variation in affective responses, and a wide range of other factors may impact on people's emotional experiences. Some factors (e.g. conditions in the physical environment) may be linked to both the cognitive and the affective aspects of fear in distinct ways, and interact in unpredictable ways depending on contextual or individual-level determinants. The practical difficulty of generalising about these pathways, such that the 'rational' core of fear, represented by

the impact on affective fear from cognitive risk perceptions, could be isolated from the 'irrational' components represented by the impacts of other factors, is highly challenging.

Separating fear and crime risks bad policymaking

Theo Lorenc (et al), 2014, London School of Hygiene

<http://www.ncbi.nlm.nih.gov/books/NBK262832/> Crime, fear of crime and mental health: synthesis of theory and systematic reviews of interventions and qualitative evidence. Public Health Research, No. 2.2 (Chapt 7) Theo Lorenc (et al),^{1,*} Mark Petticrew,¹ Margaret Whitehead,² David Neary,² Stephen Clayton,² Kath Wright,³ Hilary Thomson,⁴ Steven Cummins,⁵ Amanda Sowden,³ and Adrian Renton.⁶ March 2014 ¹ Department of Social and Environmental Health Research, London School of Hygiene and Tropical Medicine, London, UK ² Department of Public Health and Policy, University of Liverpool, Liverpool, UK ³ Centre for Reviews and Dissemination, University of York, York, UK ⁴ MRC Social and Public Health Sciences Unit (SPHSU), University of Glasgow, Glasgow, UK ⁵ School of Geography, Queen Mary University of London, London, UK ⁶ Institute for Health and Human Development, University of East London, London, UK * Corresponding author

In terms of public health and social policy research more generally, the consequence of seeing fear of crime as a dimension of well-being would seem to be to encourage its use as part of a battery of measures examining people's perceptions of the social and physical environments, along with measures such as social cohesion, perceived trust, satisfaction with the environment and so on. Indeed, several of the studies of non-crime interventions in the effectiveness review do exactly this. Further uptake of fear of crime as an outcome measure in evaluations of social and environmental interventions – particularly along with measures of health behaviours and health status – would be a valuable contribution to the evidence base. However, such an increased uptake of **fear of crime as an outcome measure is likely to face a number of challenges**. One is the difficulty of translating between distinct disciplinary 'framings.' As discussed in the review of theory, **the irreconcilability of the different academic discourses** required to understand the impacts of crime on health and well-being corresponds to serious differences between the conceptual frameworks used by different groups of stakeholders. In particular, the relatively narrow range of approaches that predominate in crime- and policing-related fields may pose a problem for communication with decision-makers in other policy and practice areas. This may partly account for the issue identified by Perry¹³⁰ that approaches widely recognised as valuable within public health, such as universal primary prevention, have generally not been taken up within crime-related fields (see Chapter 3, Crime and health). Moreover, as discussed earlier (see Chapter 3, Fear of crime: measures and contexts), **there are serious unanswered questions as to how to interpret fear-of-crime outcomes**. Arguments for the basic incoherence of the concept have been repeatedly made, and do not seem to have become substantially less valid over time. The meaning of even strong trends in the empirical data on fear of crime, such as the substantial and steadily maintained year-on-year decline in worry about crime in the UK over the last 15 or 20 years, remains fundamentally unclear. British Crime Survey data³¹⁰ show worry about burglary declining steadily from a high of 26% in 1994 to 10% in 2010–11, and worry about violent crime declining similarly from 25% in 1998 to 13% in 2010–11. As noted earlier, the utilisation of the concept in the context of policy and practice has also been beset by ambiguities. These apparently insoluble problems have given rise to a widespread sense that the fear-of-crime agenda no longer provides an adequate theoretical framework, and that a transition to a more inclusive concept is required.⁷¹ Thus, **it may be challenging to integrate fear of crime into a more general picture of environmental impacts on well-being**, as it is still unclear what the environmental determinants of fear of crime really are, and what aspects of fear impact on well-being. Although we make a few suggestions below, it seems unlikely that the controversies around this issue will be settled in the foreseeable future. In other words, although there is reason to think that measuring fear of crime can help to access some dimensions of the environment–well-being link, it is far from clear exactly which dimensions these are. To some extent, these questions can be addressed only by further empirical research. However, it must be admitted that **the long but inconclusive history of fear-of-crime research to date does not inspire confidence in the outcome of such a process**.

Offense

Racism Turn

Racism turn

Theo Lorenc (et al), 2014, London School of Hygiene

<http://www.ncbi.nlm.nih.gov/books/NBK262852/> Crime, fear of crime and mental health: synthesis of theory and systematic reviews of interventions and qualitative evidence. Public Health Research, No. 2.2 (Chapt 7) Theo Lorenc (et al),1,* Mark Petticrew,1 Margaret Whitehead,2 David Neary,2 Stephen Clayton,2 Kath Wright,3 Hilary Thomson,4 Steven Cummins,5 Amanda Sowden,3 and Adrian Renton.6. March 2014 1 Department of Social and Environmental Health Research, London School of Hygiene and Tropical Medicine, London, UK 2 Department of Public Health and Policy, University of Liverpool, Liverpool, UK 3 Centre for Reviews and Dissemination, University of York, York, UK 4 MRC Social and Public Health Sciences Unit (SPHSU), University of Glasgow, Glasgow, UK 5 School of Geography, Queen Mary University of London, London, UK 6 Institute for Health and Human Development, University of East London, London, UK * Corresponding author

Integration of fear of crime reduction with broader initiatives Although the effectiveness evidence is inconclusive – and leaving aside the challenges identified in the previous section – the qualitative and theory reviews suggest that narrowly **focused interventions to reduce fear of crime** (such as intensified policing, or the provision of information about crime) **are less likely to be effective than interventions that address either general problems in the environment** (e.g. environmental improvements, housing renewal, and urban regeneration more generally) **or the social, economic and political determinants of fear. The latter might include**, for example, **interventions to** promote social cohesion, reduce alcohol and drug use, **address racism and other forms of discrimination** and promote the empowerment and decision-making capacity of communities. The absence of a clear message from the available data on the effectiveness of these broader interventions is problematic, but the other data considered in this project indicate that such strategies are promising ways to reduce fear of crime, and further evaluation research would be valuable.

Drones Turns

Drones Are Helping Criminals

Jack **Nicas**, 1-28-2015, Aviation journalist, "Criminals, Terrorists Find Uses for Drones, Raising Concerns," WSJ, <http://www.wsj.com/articles/criminals-terrorists-find-uses-for-drones-raising-concerns-1422494268>

Drones are becoming a tool for criminals and terrorists, worrying authorities who say the small unmanned aircraft are difficult to detect and stop, a concern heightened this week by the accidental crash of a drone at the White House. Law-enforcement officials have discovered criminals smuggling drugs and other contraband across the U.S. border and into prisons using the types of consumer drones increasingly popular with entrepreneurs and hobbyists. And authorities in the U.S., Germany, Spain and Egypt have foiled at least six potential terrorist attacks with drones since 2011. U.S. authorities are worried that the problem is growing and that drones could be modified to mount attacks with explosives or chemical weapons, according to a presentation this month by federal intelligence and security officials to their counterparts in law enforcement and people who oversee critical infrastructure.

Criminals Are Using Drones for Spotting Marijuana

Dylan **Love**, 4-23-2014, Tech reporter, "British Criminals Are Using Drones To Steal Marijuana," Business Insider, <http://www.businessinsider.com/british-using-drones-to-steal-marijuana-2014-4>

The latest killer application for drone use seems to be in marijuana reconnaissance, reports ITPortal. Criminal gangs in the UK's rural Shropshire County are reportedly using flying robots equipped with infrared cameras to spot hidden marijuana growing operations from the sky, then blackmailing the growers or downright stealing their crop from the house. In the past, law enforcement has similarly used abnormal infrared heat signatures as a means of prosecuting marijuana cultivators, but these means are being used to a different end by criminal elements in search of drugs or money. One of these fly-by-night marijuana thieves spoke to a local paper about what he does: "[Pot farms] are fair game. It is not like I'm using my drone to see if people have nice televisions. I am just after drugs to steal and sell. If you break the law then you enter me and my drone's world." Drones are only getting more affordable and their use more widespread. The Pocket Drone, a Kickstarter project that successfully raised nearly a million dollars to bring small, affordable drones to the market, offers customers almost everything they need to get flying for \$446. Tom Watson, Shropshire area MP and chairman of the All-Party Parliamentary Group on Drones, said, "It is no surprise enterprising criminals would want to get the upper hand in the criminal underworld by using drones.

Burglars Are Using Drones to Aid Them

David **Barrett**, 5-18-2015, Home Affairs Correspondent, "Burglars use drone helicopters to target homes," Telegraph.co.uk, <http://www.telegraph.co.uk/news/uknews/crime/11613568/Burglars-use-drone-helicopters-to-identify-target-homes.html>

Unmanned drones are being piloted over private homes by burglars in a bid to identify potential targets, police have confirmed. Detectives fear the mini-helicopters, which can be bought for as little as £30, are being deployed to take surveillance photographs from above, posing a brand new threat to home security.

Suffolk Constabulary confirmed it had received at least one report of drones being used by burglars to "case" properties. The drones are highly-maneuverable and – depending on the model – can carry advanced, high definition cameras which can capture video and still images. It is feared that because the technology allows thieves to explore properties from the air they will be used to identify security weak spots, such as older-style patio or French doors which can be easily forced. Because of their abilities to get close-in to potential targets, drones are thought to present an even greater threat than websites such as Google's Street View and Google Earth services, which have previously been accused of assisting thieves with satellite and kerb-side images of properties.

Informant Turns

Informants are unreliable and often commit crimes more serious crimes than the one they are supposed to investigate.

ACLU (American Civil Liberties Union), **No Date** Given <https://www.aclu.org/unnecessary-evil> UNNECESSARY EVIL (ac: 7-6-15)

Unlike witnesses, **informants are motivated by self-advancement. Informants work for the government, often secretly, to gather and provide information or to testify in exchange for cash or leniency in punishment for their own crimes.** Preliminary research indicates that up to 80% of all drug cases in America may be based on information provided by informants. An informant can be a useful law enforcement tool – a necessary evil – if used properly. **But putting police work in the hands of known criminals and blindly trusting that justice will be done is an unnecessary evil. Unfortunately, today's informant system does just that. It lacks the oversight mechanisms and regulations necessary to ensure that informants are telling the truth. Too often, informants are pressured into lying at the expense of innocent people in order to save their own skin. A steady parade of scandals also demonstrates the sad reality that too many times law enforcement has turned a blind eye to the serious, violent crimes being committed by informants while assisting with investigations of less serious crimes, such as non-violent drug offenses. Add to all of this, the vast over-reliance on informants in policing communities of color, and you have a recipe for disaster. Blind trust in the informant system is dangerous. Our public's safety and the integrity of our justice system demand that policymakers put in place strong oversight mechanisms and regulations to ensure informant reliability.**

Informants are unreliable, often continue to commit crime, and being pressured into becoming one can put nonviolent offenders at risk

by Alexandra **Natapoff** JUNE 15, 2010 published in Prison Legal News June, 2010, [https://www.prisonlegalnews.org/news/2010/jun/15/secret-justice-criminal-informants-and-americas-underground-legal-system/From street corners to jails to courthouses to prisons, every year the government negotiates thousands of deals with criminal offenders in which suspects can avoid arrest or punishment in exchange for information. These deals typically take place off-the-record, subject to few rules and little oversight.](https://www.prisonlegalnews.org/news/2010/jun/15/secret-justice-criminal-informants-and-americas-underground-legal-system/From%20street%20corners%20to%20jails%20to%20courthouses%20to%20prisons,%20every%20year%20the%20government%20negotiates%20thousands%20of%20deals%20with%20criminal%20offenders%20in%20which%20suspects%20can%20avoid%20arrest%20or%20punishment%20in%20exchange%20for%20information.%20These%20deals%20typically%20take%20place%20off-the-record,%20subject%20to%20few%20rules%20and%20little%20oversight.) While criminal informants—sometimes referred to as “snitches”—can be important investigative tools, using them has some serious costs: informants often continue to commit crimes, while the information they provide is infamously unreliable. **Taken together, these facts make snitching an important and problematic aspect of the way America does justice. The practice of trading information for guilt is so pervasive that it has literally become a thriving business. For example, Ann Colomb and her three sons were wrongfully convicted in 2006 of running a crack cocaine ring in Louisiana. They were convicted based on the fabricated testimony of dozens of jailhouse informants—participants in a for-profit snitch ring operating in the local federal prison. As part of that ring, prisoners were buying and selling information about pending cases to offer to prosecutors in order to reduce their own sentences. When police rely on criminal informants, innocent people can pay a heavy price. Acting on a bad tip from a local drug dealer-turned-informant, Atlanta police sought a no-knock warrant for the home of Mrs. Kathryn Johnston. In order to get the warrant, the officers invented an imaginary snitch, telling the magistrate judge that a non-existent “reliable confidential informant” had bought crack at Mrs. Johnston's home. While executing the warrant on November 21, 2006, police shot and killed the 92-year-old grandmother. Criminal informants often continue to commit crimes while working for the government. To its embarrassment, the Secret Service discovered that one of their top former informants, Albert Gonzalez, was running one of the largest credit card data theft rings in the country. Gonzalez had used his connections with the government to promote his illegal activities and also to tip off other hackers on how to avoid detection.**

Rules to manage and stop informants from committing crimes aren't followed

Jeff **Donn** 2003 Associated Press Writer for the LA times <http://articles.latimes.com/2003/mar/16/news/adna-danger16> Informants May Get a Pass on Murder

For decades in cities from coast to coast, FBI agents recruited killers and crime bosses as informants and then looked the other way as they continued to commit violent crimes. When the practice first came to light in Boston -- unleashing an ongoing investigation that has already sent one agent to prison for obstruction of justice -- FBI officials in Washington portrayed it as an aberration. But Associated Press interviews with nine former agents -- men with a combined 190 years of experience in more than 25 bureau offices from Los Angeles to Washington -- indicate that the practice was widespread during their years of service between the late 1950s and the 1990s. The former agents, and two federal law enforcement officials who have worked closely with the bureau, said the practice sometimes emboldened informants, leading them to believe that they could get away with almost anything. The degree to which the practice continues today is unclear; current FBI agents and administrators are secretive about the bureau's work with informants. However, a senior FBI official indicated that bureau rules designed to prevent serious crimes by informants may not always be followed by agents in the field.

Immigration Turns

Increasing border security will increase crime

Pia M. **Orrenius** and Roberto **Coronado 2005**, Research Department Federal Reserve Bank of Dallas.
http://ccis.ucsd.edu/wp-content/uploads/WP_131.pdf

Not surprisingly, we find evidence of a positive and significant correlation between the volume of apprehensions of illegal immigrants and the incidence of violent crime. **The underlying relationship is likely one in which the reliance of border crossers on smugglers, and the pervasiveness of drug smuggling, contribute to violent crime along the border. If that is the case, one might expect that enforcement leads to more violent crime, as more border patrol should increase smuggler usage.** We find that yes, **sector increases in enforcement may increase violent crime rates in the own sector as well as the neighboring sectors.** At the same time, higher average enforcement along the border leads to significantly less violence.

Empirically proven-immigration doesn't lead to higher crime rates

Stuart **Anderson 2012**. Anderson is executive director of the National Foundation for American Policy and an adjunct scholar at the Cato Institute.

http://www.arcohistory.org/U.S._History/Assignments/Entries/2014/12/4_Fishbowl__Immigration_files/It%20Is%20a%20Myth%20That%20Illegal%20Immigration%20Leads%20to%20Higher%20Crime%20Rates.pdf

"According to the most recent figures from the U.S. Department of Justice, **the violent crime rate in Arizona in 2008 was the lowest it has been since 1971; the property crime rate fell to its lowest point since 1966.** In the past decade, as illegal immigrants were drawn in record numbers by the housing boom, the rate of violent crimes in Phoenix and the entire state fell by more than 20 percent, a steeper drop than in the overall U.S. crime rate." **National studies have reached the conclusion that foreign-born (both legal and illegal immigrants) are less likely to commit crimes than the native-born.**

Deferred action reduces crime

Max **McClure**, 8-29-2012, Stanford University, "Obama administration's immigration reform initiative could reduce crime, Stanford economist finds,"

<http://news.stanford.edu/news/2012/august/immigration-reform-crime-082912.html>

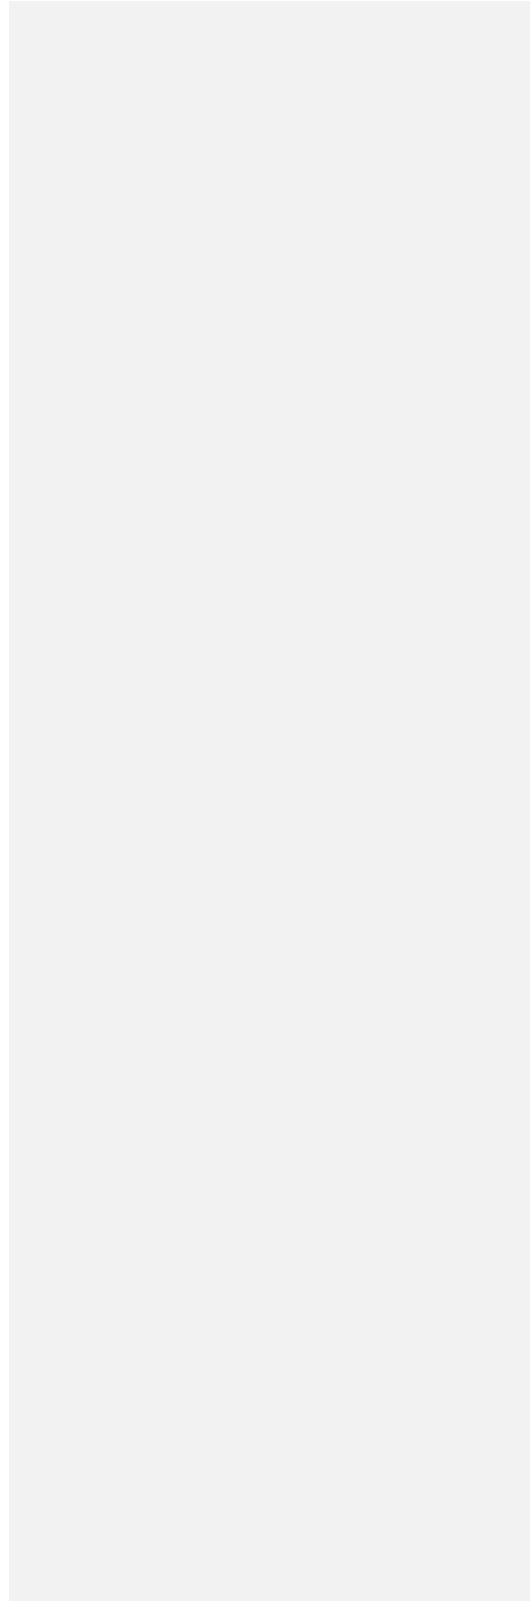

Baker compared IRCA applications with FBI crime statistics on a county-by-county basis, **and found that more legalizations meant less crime.** Legalizing 1 percent of the population in a county corresponded to a 2 percent decrease in crime per capita – around 200,000 fewer crimes every year on a national level. Baker's evidence suggests that this decline is, in fact, directly tied to IRCA-enabled legalizations. The results aren't explained by other factors, like long-term crime trends or an increase in police numbers. There are a number of possible reasons for why legalization might have this effect. Legal immigrants are more likely to cooperate with the police during investigations. The immigrants, primarily men, were also less likely to live alone once they were legalized – an important detail, since family men are less prone to criminal behavior. But, Baker says, the most important change was likely the most direct. "Once these men are legalized, they're essentially granted access to a formal, legal labor market," said Baker. This means more jobs, higher salaries and better opportunities for advancement.

Immigrants key to low crime rates – L.A. proves

Hansen 15 (Matt Hansen, 6-19-2015, "Why immigrants make America's crime rate plunge," No Publication, <http://theweek.com/articles/561334/why-immigrants-make-americas-crime-rate-plunge>)
LO

Hollywood famously envisioned an America free of criminals in 2002's *Minority Report*. But Steven Spielberg didn't need Tom Cruise or his soothsaying mutants to predict what crime would look like in the year 2054: A more accurate prophecy was just outside the set. The way the city of Los Angeles looks today — diverse, with no clear ethnic majority — is likely how the rest of the country will look by 2050, demographic studies from the U.S. Census Bureau have found. And researchers with *Los Angeles 2050*, a study commissioned by the Goldhirsh Foundation, say this could have a real impact on something that preoccupies many Americans: crime. According to the study, **the crime rate in Los Angeles has fallen to historic lows, in line with a nationwide trend. But L.A. — a city in which 35 percent of residents were not born in the U.S. — has actually seen crime rates go down at a faster rate than cities with fewer immigrants.** Other research backs up the link. A 2008 study from the Public Policy Institute of California found that despite comprising 35 percent of the state's population, **only 17 percent of California's prisoners were foreign-born immigrants. This means that adult males born in the United States were jailed nearly 3.3 times more often than men born outside the country.** And a 2009 study from the Rand Corporation found that kids growing up in first-generation immigrant households were less likely to be victims of violence than kids growing up in U.S.-born households, even when they lived in the same low-income neighborhoods. The researchers said their findings indicated that living in an immigrant household was "a protective mechanism even in distressed neighborhoods" where violence was common. The future of America's endangered languages "There are various theories aimed at understanding why we find lower crime rates among the first generation, most are linked to the contention that the process of migrating isn't easy," Bianca Bersani of the University of Massachusetts Boston told *The Week* in an email. She has conducted her own independent studies of individuals, rather than neighborhoods, comparing crime rates across generations, and says her own research supports these findings. First, **migration is difficult**, Bersani noted, **so immigrants are likely self-selecting. Likewise, many immigrants without legal status risk deportation and thus may be more likely to obey the law. First generation immigrants may also have a more positive outlook towards law enforcement and the legal system** than second generation immigrants or native-born Americans. Another thing to consider is **family structure, she said: Immigrant families are often intact, featuring two-parents.** But there's a flip side, too. As immigrants live longer in the United States, research indicates that they catch up to native-born Americans in terms of crime. By that time, second-generation immigrants have become "typical U.S. born youth," Bersani said. Her research shows that "second generation immigrant criminal behavior is no different from typical native-born youth offending," she said, and that when put under the same influences as native-born American kids, second-generation immigrant kids make similar choices. "Looking back 100 years we see a story similar to today whereby first generation immigrants displayed lower levels of offending compared to their second-generation children," she said. "At the same time these children progressed up the social ladder and are now considered part and parcel of mainstream U.S. society." In Los Angeles, at least, the immigration that has made it into one of the country's most diverse cities is seen as an asset, both as a measure against crime and as a driver for tourism and economics. The city is home to the most Mexicans, Filipinos, Iranians, Salvadorans, and Koreans outside of their native countries. The University of Southern California has routinely claimed the most international students in the country. For the researchers at *Los Angeles 2050*, this bodes well for their city. "In the case of public safety, **racial diversity is one of Los Angeles' greatest assets**," they wrote. And perhaps the same will be said of more American cities in the future.

More A2 Terror

Al Qaeda

Al Qaeda has insufficient funds and is too busy watching pornography.

Mueller, 11. (John Mueller; is Professor of Political Science at Ohio State University. He is the author of *Atomic Obsession* and a co-author, with Mark Stewart, of the forthcoming book *Terror, Security, and Money: Balancing the Risks, Benefits, and Costs of Homeland Security*. He is also editor of the webbook *Terrorism Since 9/11: The American Cases*. 8/2/11.) FOREIGN AFFAIRS. "The Truth about Al Qaeda". Retrieved from: <https://www.foreignaffairs.com/articles/2011-08-02/truth-about-al-qaeda>. //JW

The public has now endured a decade of dire warnings about the imminence of a terrorist atomic attack. In 2004, the former CIA spook Michael Scheuer proclaimed on television's 60 Minutes that it was "probably a near thing," and in 2007, the physicist Richard Garwin assessed the likelihood of a nuclear explosion in an American or a European city by terrorism or other means in the next ten years to be 87 percent. **By 2008, Defense Secretary Robert Gates mused that what keeps every senior government leader awake at night is "the thought of a terrorist ending up with a weapon of mass destruction, especially nuclear." Few, it seems, found much solace in the fact that an al Qaeda computer seized in Afghanistan in 2001 indicated that the group's budget for research on weapons of mass destruction** (almost all of it focused on primitive chemical weapons work) **was some \$2,000 to \$4,000.** In the wake of the killing of Osama bin Laden, officials now have more al Qaeda computers, which reportedly contain a wealth of information about the workings of the organization in the intervening decade. **A multi-agency task force** has completed its assessment, and according to first reports, it **has found that al Qaeda members have primarily been engaged in dodging drone strikes and** complaining about how cash-strapped they are. Some reports suggest **they've also been looking at quite a bit of pornography.**

ISIS

ISIS cannot convert ebola into a bioterror weapon

Evans, '14. (Nicholas G. Evans; bioethicist at University of Pennsylvania specializing in biosecurity, bioterrorism and ethics of pandemic disease. 10/10/14.) SLATE. "EBOLA IS NOT A WEAPON". Retrieved from:

http://www.slate.com/articles/health_and_science/science/2014/10/ebola_and_bioterrorism_the_virus_is_not_a_bioweapon_despite_media_myths.html // JW

Stop it. Just stop it. Ebola isn't a potential weapon for terrorists. It isn't as reported by Forbes and the Daily Mail, **a low-tech weapon of bioterror for ISIS. It isn't the final refuge of a lone wolf on a suicide mission**, in the words of Fox News. **It isn't a U.S.-built race-targeting bioweapon**, as the leader of the Nation of Islam declared. **Ebola** is very real, and very scary. But this **outbreak isn't a recipe for a bioweapon. Not unless you want to be the most incompetent bioterrorist in history**. First, **the virus isn't a viable bioweapon candidate**. It doesn't spread quickly—its R0, a measure of how infectious a virus is, is about 2. That means that, in a population where everyone is at risk, each infected person will, on average, infect two more people. But because **someone with Ebola is infectious only when she shows symptoms, we've got plenty of chances to clamp down on an outbreak in a country with a developed public health system.**

2ac Won't Pass

No Cuba legislation—massive opposition in Congress

Kim 7/2 – Politico

Seung Min, Why the GOP Congress could be trouble for Obama in Cuba, 7/2/15, <http://www.politico.com/story/2015/07/why-the-gop-congress-could-be-trouble-for-obama-in-cuba-119668.html>

President Barack Obama knows he didn't need Congress to formally relaunch a U.S. Embassy in Cuba. But Republicans are already plotting revenge for when Obama does need them down the road. Within hours of Obama's announcement to open an embassy in Cuba, Republicans in Congress were threatening to deny funding to the embassy while blocking any ambassador to lead it — underscoring the deep antipathy toward Obama's Cuba policy on Capitol Hill. And lifting that decades-old embargo? Fat chance, Republicans say. "The support to keep pressure on the Castro regime is stronger now than it has ever been in Congress," Rep. Mario Diaz-Balart (R-Fla.), a Cuban-American lawmaker and one of the most vocal critics of Obama's Cuba policy, said in an interview. Obama has already acted without Congress, easing some trade and travel restrictions to Cuba as well as taking the island nation off the U.S. list of state sponsors of terrorism. But the White House would need lawmakers to green-light funding for an embassy and to officially end the embargo. Though he appears unlikely to nominate a permanent ambassador, that would take Congress' assent, too. Obama has some congressional allies on Cuba, mostly Democrats but also a handful of Republicans. After that, it's a wall of opposition, from GOP leadership that opposes restoring full diplomatic relations, to committee chairs skeptical of the administration's Cuba policy, to a raft of Republican presidential contenders waving a loud megaphone to showcase their Cuba opposition. Sen. Ted Cruz (R-Texas), a 2016 presidential candidate who is of Cuban descent, said in a statement Wednesday that he would work to block funding for a U.S. Embassy in Cuba and any nominee for ambassador Obama recommends, "unless and until the president can demonstrate that he has made some progress in alleviating the misery of our friends, the people of Cuba." The Obama administration doesn't need Congress's approval to simply switch its existing "interests section" in Havana to a full-fledged embassy. But it would need lawmakers to sign off on additional funding. The State Department asked Congress for roughly \$6 million for fiscal 2016 to convert the interests section to an embassy. It's clear the current building would need upgrades: A May 2014 inspector general report said the facility, located on the waterfront Malecón boulevard in Havana, is "subject to high winds and salt air and requires constant attention." Administration officials "believe that they have the resources available in the State Department to at least start the embassy," Sen. Dick Durbin (D-Ill.) said in an interview Wednesday. Republicans "cannot stop the president from his policy change; they can embarrass the United States by limiting investment." But Republicans have already shown plenty of appetite for a Cuba fight. House Republicans have a funding bill for the State Department that restricts money for an embassy or a similar diplomatic facility in Havana, beyond funds already in place before Obama's announcement in December to normalize relations with Cuba. The measure would also bar money from being spent on opening a Cuban embassy in Washington. It's unclear when the State Department appropriations bill, which has already cleared a House committee, would come to the floor. It wasn't on a list of legislation released Wednesday that House Republicans will take up in July. The Senate hasn't yet released its funding bill for the State Department. But the lawmaker who would spearhead it is Sen. Lindsey Graham (R-S.C.), who chairs the panel that oversees

State funding and vowed in December to use every tool in his power to block funds for an embassy in Cuba. Senate aides didn't indicate Wednesday whether the chamber's funding bill for the State Department would include such restrictions. The Senate Appropriations Committee will take up that bill next week. "As president, I would not honor this decision with Cuba and I would close the embassy until the Castro brothers actually change their behavior," Graham, another 2016 contender, said Wednesday. Another key leverage point Republicans would have is if Obama nominates an ambassador to Cuba. But given deep opposition from the likes of Sen. Marco Rubio (R-Fla.), Cruz and others, and the likelihood of a drawn-out nomination battle he might not win, Obama might decide against it. If he choose to not nominate an ambassador, observers have said the U.S. Embassy could function without one. The U.S. currently has a chief of mission at the interests section in Havana: Jeffrey DeLaurentis, who is considered a top contender for the ambassadorship. He'll become the chargé d'affaires as soon as diplomatic relations are normalized. Durbin, a strong advocate of normalizing ties with Cuba, conceded that the prospects for confirming an ambassador were slim in the GOP-led Senate. "We have three Cuban-American senators and any one of them, if they decided to, could be a hold on that ambassador," said Durbin, referring to Rubio, Cruz and Sen. Robert Menendez (D-N.J.). Still, the Obama administration's Cuba overtures have driven a rift through Capitol Hill that doesn't fall neatly along party lines. For instance, some Senate Republicans representing farm states such as Jerry Moran of Kansas favor opening up more relations with Cuba, since more agricultural exports there could be an economic boon back home. Sen. Jeff Flake (R-Ariz.) was part of the congressional mission that rescued Alan Gross, a U.S. contractor held by the Cuban government for five years until his release in December. Flake praised Obama's steps to open an embassy, saying it would lead to more travel and contacts between U.S. citizens and Cubans. "It's long past time for U.S. policy toward Cuba to be associated with something other than five decades of failure," Flake said. Flake is pushing legislation that would end the travel ban on U.S. citizens and legal residents to Cuba; it's backed by more than 40 other senators, including a half-dozen Republicans. Another bill, by Sen. Amy Klobuchar (D-Minn.), that would end the Cuba trade embargo has 17 co-sponsors. Notably, both measures are backed by Sen. Rand Paul (R-Ky.), a 2016 presidential hopeful who sparred with Rubio in December over Cuba, saying the Florida senator was "acting like an isolationist who wants to retreat to our borders and perhaps build a moat." (Rubio has said of Paul: "He has no idea what he's talking about.") But with opposition from Republican leaders and key committee chairs on the administration's Cuba policy, those bills will have little chance of success. The top two Republicans on Capitol Hill are both strong opponents of normalizing relations with Cuba. Speaker John Boehner (R-Ohio) indicated again Wednesday that any conversation in the House about easing relations with Cuba would be a nonstarter.

1ar Won't Pass

Congress won't lift the embargo

Parsons and Wilkinson 7/1 – Los Angeles Times

Christi and Tracy, With embassies to reopen, Obama urges Congress to 'move forward' on Cuba, 7/1/15, <http://www.latimes.com/world/mexico-americas/la-fg-obama-embassy-cuba-20150701-story.html#page=1>

For now, Congress appears unlikely to lift the economic embargo, which was first imposed in the 1960s and stiffened several times, and allow U.S. businesses to invest freely in Cuba. Critics in both parties lined up Wednesday to emphasize their opposition. Rep. Ileana Ros-Lehtinen (R-Fla.), a member of the House Foreign Affairs Committee, said Congress may not approve money for the new embassy or confirm an ambassador after Obama nominates one. Sen. Robert Menendez (D-N.J.), former chairman of the Senate Foreign Relations Committee, also slammed the White House move. "Once again the regime is being rewarded while they jail dissidents, silence political opponents, and harbor American fugitives and cop killers," he said in a statement.

No Republicans support for lifting the embargo

Beam 7/2 – Associated Press

Adam, Mitch McConnell says Senate unlikely to confirm any envoy to Cuba, 7/2/15, <http://www.pressherald.com/2015/07/02/mitch-mcconnell-says-senate-unlikely-to-confirm-any-envoy-to-cuba/>

Senate Majority Leader Mitch McConnell said the Republican majority is unlikely to confirm an ambassador to Cuba, as the United States prepares to reopen its embassy in the communist country after more than 50 years of hostile relations. In a speech to a local chamber of commerce in Kentucky, McConnell called Cuba "a thuggish regime" that is "a haven for criminals" fleeing prosecution in the United States. "I'm having a hard time figuring out what we got out of this, you know? You would think that the normalization of relations with Cuba would be accompanied by some modification of their behavior," McConnell said. "I don't see any evidence at all that they are going to change their behavior. So I doubt if we'll confirm an ambassador, they probably don't need one." President Obama has urged Congress to lift the country's trade embargo with Cuba as part of his effort to re-establish ties. But McConnell noted Thursday that many of the restrictions placed on Cuba would require legislation, "and we're going to resist that." "It is a police state that is mired in the '50s and '60s," he said. "I don't know how it ends, but I do think there is going to be resistance." McConnell's comments were part of a larger criticism of Obama's foreign policy initiatives, saying that he "can't think of a single place, not one, where we're in better shape now than we were when he came into office." But McConnell said he is seeking common ground with Obama to accomplish some things at home, including passing legislation to keep the federal Highway Trust Fund solvent.

2ac PC Thumper

Obama spending PC on a litany of other issues

Kumar 6/30 – McClatchy DC

Anita, Obama: I might walk away from Iran deal, 6/30/15, <http://www.mcclatchydc.com/news/politics-government/white-house/article25839220.html>

Obama said that last week was a good week – which some analysts are calling his best week as president – when the Supreme Court upheld the Affordable Care Act and same-sex marriage, Congress passed hard-fought trade legislation and he delivered a heartfelt eulogy for a slain pastor in Charleston. “Last week was gratifying,” he said. He said he plans to use his political capital to work with Congress to rebuild aging infrastructure, change the criminal justice system and boost job training. “I might see if we can make next week even better.”

2ac Gun Control Thumper

Obama spending PC on gun control

Kumar 7/2 – International Business Times

Kalyan, Obama Turns Gaze On Gun Control Reforms: Survey Shows Slimming Support For Obama Line On Guns, 7/2/15, <http://www.ibtimes.com.au/obama-turns-gaze-gun-control-reforms-survey-shows-slimming-support-obama-line-guns-1454168>

Mr Obama in the past expended much of his political capital by meeting with failure in pursuing gun control reform, after the Connecticut, school shooting in 2012, in which 20 children and six adults were killed. Now the reinvigorated administration, charged up after the Supreme Court victories and broad support for his Charleston eulogy are exuding a bold confidence to act on it. Obama's personal political listserv also sent out an email calling for supporters to "stand against gun violence," reported The Guardian.

1ar Gun Control Thumper

Massive push for gun control

Kumar 7/2 – International Business Times

Kalyan, Obama Turns Gaze On Gun Control Reforms: Survey Shows Slimming Support For Obama Line On Guns, 7/2/15, <http://www.ibtimes.com.au/obama-turns-gaze-gun-control-reforms-survey-shows-slimming-support-obama-line-guns-1454168>

Recent developments in the U.S. have helped president Barack Obama to revisit his unfinished agenda that includes gun control reforms. Among the land mark recent developments that buoyed Mr Obama are Supreme Court decisions on Obamacare and same-sex marriage. Then there was the nation-wide outrage over the Charleston church shootings on nine black parishioners in a South Carolina church, calling for curbs on guns. Mr Obama's efforts to re-emerge as a "full-throated progressive" with the message of hope and change that he oozed at the start of the 2008 presidential campaign is getting a new reinforcement with the president turning his gaze into new areas of reform, including gun control. "In the past 10 days, through the intervention of America's top judges combined with public revulsion towards the murderous actions of a white supremacist, Obama has seen the national mood shift sharply in his direction," the Guardian noted. It said Obama's signature healthcare reform, Obamacare, has been upheld and gay marriage got elevated into a constitutional right and the Confederate flag has been torn down across South.

It's massively unpopular

Kumar 7/2 – International Business Times

Kalyan, Obama Turns Gaze On Gun Control Reforms: Survey Shows Slimming Support For Obama Line On Guns, 7/2/15, <http://www.ibtimes.com.au/obama-turns-gaze-gun-control-reforms-survey-shows-slimming-support-obama-line-guns-1454168>

Meanwhile, the CNN/ORC poll has found that only 42 percent people are approving the way Mr Obama is handling gun policy compared to 53 percent, not approving it. In the two polls in 2013, after the Sandy Hook killings, the president's approval on gun policy had reached 46 percent. The issue has serious racial undertones, with 61 percent whites disapproving of the president's gun policies and 79 percent of blacks approving it. That is why, many congressional and pro-gun sources are saying support for broad gun control and ban on new assault weapons ban are almost dead on Capitol Hill.

Jennifer and Jonathan, Battle Lines in G.O.P. Set Stage for Surveillance Vote, 5/30/15,
<http://www.nytimes.com/2015/05/31/us/surveillance-vote-in-senate-is-tangled-in-gop-debate.html>

Since 2011, when Republicans took control of the House, Congress has lurched from one deadline to the next, as Republicans and Democrats have sparred bitterly over funding for the government, the ability to lift the debt ceiling and other policy matters. But unlike those fights, the Senate's showdown this weekend over the future of the government's dragnet of American phone records is not a result of a partisan fracas. It is an ideological battle within the Republican Party, pitting the Senate majority leader against the speaker of the House and, in the Senate, newcomers against long-serving members, and defense hawks against a rising tide of younger, more libertarian-minded members often from Western states. Senate leaders are expected to try to assemble a compromise surveillance bill on Sunday that can get the required votes to proceed before the authorizing law expires Monday. President Obama and his director of national intelligence, James R. Clapper Jr., added more pressure with sharp statements on Friday and Saturday calling for immediate approval of a surveillance bill passed by the House. "A small group of senators is standing in the way, and, unfortunately, some folks are trying to use this debate to score political points," Mr. Obama said in his weekly address. "But this shouldn't and can't be about politics. This is a matter of national security." Even if a compromise can be reached in a rare Sunday session in the Senate, all signs point to at least a temporary expiration on Monday of a key section of the Patriot Act that the government has been using to sweep up vast amounts of telephone "metadata." Last month, the House overwhelmingly passed a bill that would overhaul the Patriot Act and curtail the metadata surveillance exposed by Edward J. Snowden, the former contractor for the National Security Agency. But in the Senate, that measure failed on a procedural vote this month, and efforts to pass a short-term extension collapsed under objections by three senators. On Sunday, Senator Mitch McConnell of Kentucky, the majority leader, will try again. But opponents of a quick resolution, like Senator Rand Paul, Republican of Kentucky, can easily force a delay. Mr. Paul said Saturday that he would move to end the current law, although he was silent about passing a new one. "Tomorrow I will force the expiration of the N.S.A. illegal spy program," he said in an email to supporters. Representative Devin Nunes of California, the chairman of the House Intelligence Committee, said, "They can take things into the middle of the week." He added, "This is very likely to go on for a few days." Over the congressional recess last week, Senate Republican leaders reached out to Representative Robert W. Goodlatte of Virginia, the House Judiciary Committee chairman, to see if he would negotiate a compromise with Senator Richard M. Burr of North Carolina, the Senate Intelligence Committee chairman and a strong opponent of changes to current law. Mr. Goodlatte declined. Several factors have combined to force the showdown. The revelations of the breadth of the program have increased voter distrust of it, members of Congress said. American companies have complained that foreign customers have been turned off by their products because of fears that their privacy would be at risk if they purchased computers and cellphones made in the United States. Democrats and an increasing number of Republicans make up a growing alliance of members as concerned with civil liberties as national security. "People who could not agree on anything have **come together on this issue**," said Neema Singh Guliani, a legislative counsel with the American Civil Liberties Union. "That has created a different

dynamic in Congress, which has been so partisan over the last several years. These divisions are not along party lines. They are over something else entirely."

PC Theory False

Political capital not key to the agenda

Dickinson 9 – Professor of Political Science

Matthew, professor of political science at Middlebury College and taught previously at Harvard University where he worked under the supervision of presidential scholar Richard Neustadt, 5-26-2009, Presidential Power: A NonPartisan Analysis of Presidential Politics, "Sotomayor, Obama and Presidential Power," <http://blogs.middlebury.edu/presidentialpower/2009/05/26/sotomayor-obama-and-presidential-power/>

As for Sotomayor, from here the path toward almost certain confirmation goes as follows: the Senate Judiciary Committee is slated to hold hearings sometime this summer (this involves both written depositions and of course open hearings), which should lead to formal Senate approval before Congress adjourns for its summer recess in early August. So Sotomayor will likely take her seat in time for the start of the new Court session on October 5. (I talk briefly about the likely politics of the nomination process below). What is of more interest to me, however, is what her selection reveals about the basis of presidential power. Political scientists, like baseball writers evaluating hitters, have devised numerous means of measuring a president's influence in Congress. I will devote a separate post to discussing these, but in brief, they often center on the creation of legislative "box scores" designed to measure how many times a president's preferred piece of legislation, or nominee to the executive branch or the courts, is approved by Congress. That is, how many pieces of legislation that the president supports actually pass Congress? How often do members of Congress vote with the president's preferences? How often is a president's policy position supported by roll call outcomes? These measures, however, are a misleading gauge of presidential power – they are a better indicator of congressional power. This is because how members of Congress vote on a nominee or legislative item is rarely influenced by anything a president does. Although journalists (and political scientists) often focus on the legislative "endgame" to gauge presidential influence – will the President swing enough votes to get his preferred legislation enacted? – this mistakes an outcome with actual evidence of presidential influence. Once we control for other factors – a member of Congress' ideological and partisan leanings, the political leanings of her constituency, whether she's up for reelection or not – we can usually predict how she will vote without needing to know much of anything about what the president wants. (I am ignoring the importance of a president's veto power for the moment.) Despite the much publicized and celebrated instances of presidential arm-twisting during the legislative endgame, then, most legislative outcomes don't depend on presidential lobbying. But this is not to say that presidents lack influence. Instead, the primary means by which presidents influence what Congress does is through their ability to determine the alternatives from which Congress must choose. That is, presidential power is largely an exercise in agenda-setting – not arm-twisting. And we see this in the Sotomayor nomination. Barring a major scandal, she will almost certainly be confirmed to the Supreme Court whether Obama spends the confirmation hearings calling every Senator or instead spends the next few weeks ignoring the Senate debate in order to play Halo III on his Xbox. That is, how senators decide to vote on Sotomayor will have almost nothing to do with Obama's lobbying from here on in (or lack thereof). His real influence has already occurred, in the decision to present Sotomayor as his nominee.

Political capital isn't key

-tons of other factors are comparatively more important

Beckmann and Kumar 11

Matt, Professor of Political Science, and Vimal, How presidents push, when presidents win: A model of positive presidential power in US lawmaking, Journal of Theoretical Politics 2011 23: 3

For political scientists, however, the resources allocated to formulating and implementing the White House's lobbying offensive appear puzzling, if not altogether misguided. Far from highlighting each president's capacity to marshal legislative proposals through Congress, the prevailing wisdom now stresses contextual factors as

predetermining his agenda's fate on Capitol Hill. From the particular 'political time' in which they happen to take office (Skowronek, 1993) to the state of the budget (Brady and Volden, 1998; Peterson, 1990), the partisan composition of Congress (Bond and Fleisher, 1990; Edwards, 1989) (see also Gilmour (1995), Groseclose and McCarty (2001), and Sinclair (2006)) to the preferences of specific 'pivotal' voters (Brady and Volden, 1998; Krehbie, 1998), current research suggests a president's congressional fortunes are basically beyond his control. The implication is straightforward, as Bond and Fleisher indicate: ...presidential success is determined in large measure by the results of the last election. If the last election brings individuals to Congress whose local interests and preferences coincide with the president's, then he will enjoy greater success. If, on the other hand, most members of Congress have preferences different from the president's, then he will suffer more defeats, and no amount of bargaining and persuasion can do much to improve his success. (Bond and Fleisher, 1990: 13

Winners Win

Winners win – PC is a false concept

Hirsh 13

Michael, chief correspondent, There's No Such Thing as Political Capital, 2/7/13,
<http://www.nationaljournal.com/magazine/there-s-no-such-thing-as-political-capital-20130207>

But the abrupt emergence of the immigration and gun-control issues illustrates how suddenly shifts in mood can occur and how political interests can align in new ways just as suddenly. Indeed, the pseudo-concept of political capital masks a larger truth about Washington that is kindergarten simple: You just don't know what you can do until you try. Or as Ornstein himself once wrote years ago, "Winning wins." In theory, and in practice, depending on Obama's handling of any particular issue, even in a polarized time, he could still deliver on a lot of his second-term goals, depending on his skill and the breaks. Unforeseen catalysts can appear, like Newtown. Epiphanies can dawn, such as when many Republican Party leaders suddenly woke up in panic to the huge disparity in the Hispanic vote. Some political scientists who study the elusive calculus of how to pass legislation and run successful presidencies say that political capital is, at best, an empty concept, and that almost nothing in the academic literature successfully quantifies or even defines it. "It can refer to a very abstract thing, like a president's popularity, but there's no mechanism there. That makes it kind of useless," says Richard Bense, a government professor at Cornell University. Even Ornstein concedes that the calculus is far more complex than the term suggests. Winning on one issue often changes the calculation for the next issue; there is never any known amount of capital. "The idea here is, if an issue comes up where the conventional wisdom is that president is not going to get what he wants, and he gets it, then each time that happens, it changes the calculus of the other actors" Ornstein says. "If they think he's going to win, they may change positions to get on the winning side. It's a bandwagon effect."

Especially true for Obama

Hirsh 13

Michael, chief correspondent, There's No Such Thing as Political Capital, 2/7/13,
<http://www.nationaljournal.com/magazine/there-s-no-such-thing-as-political-capital-20130207>

On Tuesday, in his State of the Union address, President Obama will do what every president does this time of year. For about 60 minutes, he will lay out a sprawling and ambitious wish list highlighted by gun control and immigration reform, climate change and debt reduction. In response, the pundits will do what they always do this time of year: They will talk about how unrealistic most of the proposals are, discussions often informed by sagacious reckonings of how much "political capital" Obama possesses to push his program through. Most of this talk will have no bearing on what actually happens over the next four years. Consider this: Three months ago, just before the November election, if someone had talked seriously about Obama having enough political capital to oversee passage of both immigration reform and gun-control legislation at the beginning of his second term—even after winning the election by 4 percentage points and 5 million votes (the actual final tally)—this person would have been called crazy and stripped of his pundit's license. (It doesn't exist, but it ought to.) In his first term, in a starkly polarized country, the president had been so frustrated by GOP resistance that he finally issued a limited executive order last August permitting immigrants who entered the country illegally as children to work without fear of deportation for at least two years. Obama didn't dare to even bring up gun control, a Democratic "third rail" that has cost the party elections and that actually might have been even less popular on the right than the president's health care law. And yet, for reasons that have very little to do with Obama's personal prestige or popularity—variously put in terms of a "mandate" or "political capital"—chances are fair that both will now happen. What changed? In the case of gun control, of course, it wasn't the election. It was the horror of the 20 first-graders who were slaughtered in Newtown, Conn., in mid-December. The sickening reality of little girls and boys riddled with bullets from a high-capacity assault weapon seemed to precipitate a sudden tipping point in the national conscience. One thing changed after another. Wayne LaPierre of the National Rifle Association marginalized himself with poorly chosen comments soon after the massacre. The pro-gun lobby, once a phalanx of opposition, began to fissure into reasonables and crazies. Former Rep. Gabrielle Giffords, D-Ariz., who was shot in the head two years ago and is still struggling to speak and walk, started a PAC with her husband to appeal to the moderate middle of gun owners. Then she gave riveting and poignant testimony to the Senate, challenging lawmakers: "Be bold." As a result, momentum has appeared to build around some kind of a plan to curtail sales of the most dangerous weapons and ammunition and the way people are permitted to buy them. It's impossible to say now whether such a bill will pass and, if it does, whether it will make anything more than cosmetic changes to gun laws. But one thing is clear: The political tectonics have shifted dramatically in very little time. Whole new possibilities

exist now that didn't a few weeks ago.¶ Meanwhile, the Republican members of the Senate's so-called Gang of Eight are pushing hard for a new spirit of compromise on immigration reform, a sharp change after an election year in which the GOP standard-bearer declared he would make life so miserable for the 11 million illegal immigrants in the U.S. that they would "self-deport." But this turnaround has very little to do with Obama's personal influence—his political mandate, as it were. It has almost entirely to do with just two numbers: 71 and 27. That's 71 percent for Obama, 27 percent for Mitt Romney, the breakdown of the Hispanic vote in the 2012 presidential election. Obama drove home his advantage by giving a speech on immigration reform on Jan. 29 at a Hispanic-dominated high school in Nevada, a swing state he won by a surprising 8 percentage points in November. But the movement on immigration has mainly come out of the Republican Party's recent introspection, and the realization by its more thoughtful members, such as Sen. Marco Rubio of Florida and Gov. Bobby Jindal of Louisiana, that without such a shift the party may be facing demographic death in a country where the 2010 census showed, for the first time, that white births have fallen into the minority. It's got nothing to do with Obama's political capital or, indeed, Obama at all.¶ The point is not that "political capital" is a meaningless term. Often it is a synonym for "mandate" or "momentum" in the aftermath of a decisive election—and just about every politician ever elected has tried to claim more of a mandate than he actually has. Certainly, Obama can say that because he was elected and Romney wasn't, he has a better claim on the country's mood and direction. Many pundits still defend political capital as a useful metaphor at least. "It's an unquantifiable but meaningful concept," says Norman Ornstein of the American Enterprise Institute. "You can't really look at a president and say he's got 37 ounces of political capital. But the fact is, it's a concept that matters, if you have popularity and some momentum on your side."¶ **The real problem is that the idea of political capital—or mandates, or momentum—is so poorly defined that presidents and pundits often get it wrong.** "Presidents usually overestimate it," says George Edwards, a presidential scholar at Texas A&M University. "The best kind of political capital—some sense of an electoral mandate to do something—is very rare. It almost never happens. In 1964, maybe. And to some degree in 1980." For that reason, **political capital is a concept that misleads far more than it enlightens.** It is distortionary. It conveys the idea that we know more than we really do about the ever-elusive concept of political power, and it discounts the way unforeseen events can suddenly change everything. Instead, **it suggests, erroneously, that a political figure has a concrete amount of political capital to invest, just as someone might have real investment capital—that a particular leader can bank his gains, and the size of his account determines what he can do at any given moment in history.**¶ Naturally, any president has practical and electoral limits. Does he have a majority in both chambers of Congress and a cohesive coalition behind him? Obama has neither at present. And unless a surge in the economy—at the moment, still stuck—or some other great victory gives him more momentum, it is inevitable that the closer Obama gets to the 2014 election, the less he will be able to get done. Going into the midterms, Republicans will increasingly avoid any concessions that make him (and the Democrats) stronger.¶ But the abrupt emergence of the immigration and gun-control issues illustrates how suddenly shifts in mood can occur and how political interests can align in new ways just as suddenly. Indeed, the pseudo-concept of political capital masks a larger truth about Washington that is kindergarten simple: You just don't know what you can do until you try. Or as Ornstein himself once wrote years ago, "Winning wins." In theory, and in practice, depending on Obama's handling of any particular issue, even in a polarized time, he could still deliver on a lot of his second-term goals, depending on his skill and the breaks. Unforeseen catalysts can appear, like Newtown. Epiphanies can dawn, such as when many Republican Party leaders suddenly woke up in panic to the huge disparity in the Hispanic vote.¶ Some political scientists who study the elusive calculus of how to pass legislation and run successful presidencies say that political capital is, at best, an empty concept, and that almost nothing in the academic literature successfully quantifies or even defines it. "It can refer to a very abstract thing, like a president's popularity, but there's no mechanism there. That makes it kind of useless," says Richard Bensel, a government professor at Cornell University. Even Ornstein concedes that the calculus is far more complex than the term suggests. Winning on one issue often changes the calculation for the next issue; there is never any known amount of capital. "The idea here is, if an issue comes up where the conventional wisdom is that president is not going to get what he wants, and he gets it, then each time that happens, it changes the calculus of the other actors" Ornstein says. "If they think he's going to win, they may change positions to get on the winning side. It's a bandwagon effect."¶ **ALL THE WAY WITH LBJ**¶ Sometimes, **a clever practitioner of power can get more done just because he's aggressive** and knows the hallways of Congress well. Texas A&M's Edwards is right to say that the outcome of the 1964 election, Lyndon Johnson's landslide victory over Barry Goldwater, was one of the few that conveyed a mandate. But one of the main reasons for that mandate (in addition to Goldwater's ineptitude as a candidate) was President Johnson's masterful use of power leading up to that election, and his ability to get far more done than anyone thought possible, given his limited political capital. In the newest volume in his exhaustive study of LBJ, *The Passage of Power*, historian Robert Caro recalls Johnson getting cautionary advice after he assumed the presidency from the assassinated John F. Kennedy in late 1963. Don't focus on a long-stalled civil-rights bill, advisers told him, because it might jeopardize Southern lawmakers' support for a tax cut and appropriations bills the president needed. "One of the wise, practical people around the table [said that] the presidency has only a certain amount of coinage to expend, and you oughtn't to expend it on this," Caro writes. (Coinage, of course, was what political capital was called in those days.) Johnson replied, "Well, what the hell's the presidency for?"¶ **Johnson didn't worry about coinage, and he got the Civil Rights Act enacted, along with much else: Medicare, a tax cut, antipoverty programs. He appeared to understand not just the ways of Congress but also the way to maximize the momentum** he possessed in the lingering mood of national grief and determination by picking the right issues, as Caro records. "Momentum is not a mysterious mistress," LBJ said. "It is a controllable fact of political life." Johnson had the skill and wherewithal to realize that, at that moment of history, he could have unlimited coinage if he handled the politics right. He did. (At least until Vietnam, that is.)¶ And then there are the presidents who get the politics, and the issues, wrong. It was the last president

before Obama who was just starting a second term, George W. Bush, who really revived the claim of political capital, which he was very fond of wielding. Then Bush promptly demonstrated that he didn't fully understand the concept either. ¶ At his first news conference after his 2004 victory, a confident-sounding Bush declared, "I earned capital in the campaign, political capital, and now I intend to spend it. That's my style." The 43rd president threw all of his political capital at an overriding passion: the partial privatization of Social Security. He mounted a full-bore public-relations campaign that included town-hall meetings across the country. ¶ Bush failed utterly, of course. But the problem was not that he didn't have enough political capital. Yes, he may have overestimated his standing. Bush's margin over John Kerry was thin—helped along by a bumbling Kerry campaign that was almost the mirror image of Romney's gaffe-filled failure this time—but that was not the real mistake. The problem was that whatever credibility or stature Bush thought he had earned as a newly reelected president did nothing to make Social Security privatization a better idea in most people's eyes. Voters didn't trust the plan, and four years later, at the end of Bush's term, the stock-market collapse bore out the public's skepticism. Privatization just didn't have any momentum behind it, no matter who was pushing it or how much capital Bush spent to sell it. ¶ The mistake that Bush made with Social Security, says John Sides, an associate professor of political science at George Washington University and a well-followed political blogger, "was that just because he won an election, he thought he had a green light. But there was no sense of any kind of public urgency on Social Security reform. It's like he went into the garage where various Republican policy ideas were hanging up and picked one. I don't think Obama's going to make that mistake.... Bush decided he wanted to push a rock up a hill. He didn't understand how steep the hill was. I think Obama has more momentum on his side because of the Republican Party's concerns about the Latino vote and the shooting at Newtown." Obama may also get his way on the debt ceiling, not because of his reelection, Sides says, "but because Republicans are beginning to doubt whether taking a hard line on fiscal policy is a good idea," as the party suffers in the polls. ¶ THE REAL LIMITS ON POWER ¶ **Presidents are limited in what they can do by time and attention span**, of course, just as much as they are by electoral balances in the House and Senate. But **this**, too, **has nothing to do with political capital. Another well-worn meme of recent years was that Obama used up too much political capital passing the health care law in his first term. But the real problem was that the plan was unpopular, the economy was bad, and the president didn't realize that the national mood** (yes, again, the national mood) **was at a tipping point against big-government intervention**, with the tea-party revolt about to burst on the scene. For Americans in 2009 and 2010—haunted by too many rounds of layoffs, appalled by the Wall Street bailout, aghast at the amount of federal spending that never seemed to find its way into their pockets—government-imposed health care coverage was simply an intervention too far. So was the idea of another economic stimulus. Cue the tea party and what ensued: two titanic fights over the debt ceiling. Obama, like Bush, had settled on pushing an issue that was out of sync with the country's mood. ¶ Unlike Bush, Obama did ultimately get his idea passed. But the bigger political problem with health care reform was that it distracted the government's attention from other issues that people cared about more urgently, such as the need to jump-start the economy and financial reform. Various congressional staffers told me at the time that their bosses didn't really have the time to understand how the Wall Street lobby was riddling the Dodd-Frank financial-reform legislation with loopholes. Health care was sucking all the oxygen out of the room, the aides said. ¶ Weighing the imponderables of momentum, the often-mystical calculations about when the historic moment is ripe for an issue, will never be a science. It is mainly intuition, and its best practitioners have a long history in American politics. This is a tale told well in Steven Spielberg's hit movie Lincoln. Daniel Day-Lewis's Abraham Lincoln attempts a lot of behind-the-scenes vote-buying to win passage of the 13th Amendment, banning slavery, along with eloquent attempts to move people's hearts and minds. He appears to be using the political capital of his reelection and the turning of the tide in the Civil War. But it's clear that a surge of conscience, a sense of the changing times, has as much to do with the final vote as all the backroom horse-trading. "The reason I think the idea of political capital is kind of distorting is that it implies you have chits you can give out to people. It really oversimplifies why you elect politicians, or why they can do what Lincoln did," says Tommy Bruce, a former political consultant in Washington. ¶ Consider, as another example, the storied political career of President Franklin Roosevelt. Because the mood was ripe for dramatic change in the depths of the Great Depression, FDR was able to push an astonishing array of New Deal programs through a largely compliant Congress, assuming what some described as near-dictatorial powers. But in his second term, full of confidence because of a landslide victory in 1936 that brought in unprecedented Democratic majorities in the House and Senate, Roosevelt overreached with his infamous Court-packing proposal. All of a sudden, the political capital that experts thought was limitless disappeared. FDR's plan to expand the Supreme Court by putting in his judicial allies abruptly created an unanticipated wall of opposition from newly reunited Republicans and conservative Southern Democrats. FDR thus inadvertently handed back to Congress, especially to the Senate, the power and influence he had seized in his first term. Sure, Roosevelt had loads of popularity and momentum in 1937. He seemed to have a bank vault full of political capital. But, once again, a president simply chose to take on the wrong issue at the wrong time; this time, instead of most of the political interests in the country aligning his way, they opposed him. Roosevelt didn't fully recover until World War II, despite two more election victories. ¶ In terms of Obama's second-term agenda, **what all these shifting tides of momentum and political calculation mean is this: Anything goes**. Obama has no more elections to win, and he needs to worry only about the support he will have in the House and Senate after 2014. But if he picks issues that the country's mood will support—such as, perhaps, immigration reform and gun control—**there is no reason to think he can't win far more victories than any of the careful calculators of political capital now believe is possible**, including battles over tax reform and deficit reduction. ¶ Amid today's atmosphere of Republican self-doubt, a new, more mature Obama seems to be emerging, one who has his agenda clearly in mind and will ride the mood of the country more adroitly. **If he can get some early wins**—as he already has, apparently, on the fiscal cliff and the upper-income tax increase—**that will create momentum, and one win may well lead to others. "Winning wins."**

Winners win

Rottinghaus 12 – Professor of Political Science @ Houston

Brandon, Obama Will Have to Bargain for His Mandate, <http://www.usnews.com/debate-club/does-barack-obama-have-a-mandate/obama-will-have-to-bargain-for-his-mandate> November 7

It would be tempting for the White House (and pundits) to suggest to the voters that the president gained a mandate at the end of a hard won victory. Yet, the truth is that **mandates are not concretely "born" but are instead "bargained."** Political science scholars argue that **mandates are perceptions of political opportunity by presidents who use them as a bargaining tool.** A president will claim a mandate if he believes he can prospectively mobilize more voters than members of Congress to support his policy views. **Historically, claiming a mandate is the equivalent of putting a major policy change on the national agenda.** In general, presidents claim mandates to attempt to use that language and positioning to pressure Congress. For the 2012 election to be a "mandate" in this way, the president must claim not only that the people back him but also what specific policies they are suggested to support. The president's speech on election night only vaguely hinted that his healthcare initiative was proving successful and popular. **It remains to be seen in the coming days whether or not the White House suggests a mandate for a specific policy or initiative which they can use to bargain with Congress.** Even if a mandate is claimed, Congress has to agree with the White House about the veracity of the claim. If Congress rejects the president's claims of a mandate—or, as House Speaker John Boehner did in a statement after the president's re-election, assert that the American people re-elected a Republican Congress, too—then the Republicans in the House and Senate are poised to discredit any claim of an Obama mandate and balk at negotiations over new Obama policy initiatives or solutions to immediate issues involving automatic tax and spending increases to take place at the first of the year. It is not clear that either side has an advantage in these negotiations, considering the dynamic with either the present or future Congress. Imminent scholar of democracy Robert Dahl wrote that "no elected leader is uniquely privileged to say what an election means." Clearly the president's **victory signals faith in** him and his **efforts to handle the nation's fragile economy and** delicate foreign **policy.** Voters clearly trusted his vision for the future, even if only slightly more than Mitt Romney's vision. Yet these outcomes do not make a mandate. **The White House must push for something tangible or the president's re-election is just an invitation to struggle for four more years.**

Impacts

AT Asia War

No Asian war- economic and regional cooperation

Bitzinger & Desker 8 – senior fellow and dean of S. Rajaratnam School of International Studies respectively (Richard A. Bitzinger, Barry Desker, “Why East Asian War is Unlikely,” Survival, December 2008, http://pdfserve.informaworld.com/-/678328_731200556_906256449.pdf)

The Asia-Pacific region can be regarded as a zone of both relative insecurity and strategic stability. It contains some of the world's most significant flashpoints – the Korean peninsula, the Taiwan Strait, the Siachen Glacier – where tensions between nations could escalate to the point of major war. It is replete with unresolved border issues; is a breeding ground for transnational terrorism and the site of many terrorist activities (the Bali bombings, the Manila superferry bombing); and contains overlapping claims for maritime territories (the Spratly Islands, the Senkaku/Diaoyu Islands) with considerable actual or potential wealth in resources such as oil, gas and fisheries. Finally, the Asia-Pacific is an area of strategic significance with many key sea lines of communication and important chokepoints. Yet despite all these potential crucibles of conflict, the Asia-Pacific, if not an area of serenity and calm, is certainly more stable than one might expect. To be sure, there are separatist movements and internal struggles, particularly with insurgencies, as in Thailand, the Philippines and Tibet. Since the resolution of the East Timor crisis, however, the region has been relatively free of open armed warfare. Separatism remains a challenge, but the break-up of states is unlikely. Terrorism is a nuisance, but its impact is contained. The North Korean nuclear issue, while not fully resolved, is at least moving toward a conclusion with the likely denuclearisation of the peninsula. Tensions between China and Taiwan, while always just beneath the surface, seem unlikely to erupt in open conflict any time soon, especially given recent Kuomintang Party victories in Taiwan and efforts by Taiwan and China to re-open informal channels of consultation as well as institutional relationships between organisations responsible for cross-strait relations. And while in Asia there is no strong supranational political entity like the European Union, there are many multilateral organisations and international initiatives dedicated to enhancing peace and stability, including the Asia-Pacific Economic Cooperation (APEC) forum, the Proliferation Security Initiative and the Shanghai Co-operation Organisation. In Southeast Asia, countries are united in a common geopolitical and economic organisation – the Association of Southeast Asian Nations (ASEAN) – which is dedicated to peaceful economic, social and cultural development, and to the promotion of regional peace and stability. ASEAN has played a key role in conceiving and establishing broader regional institutions such as the East Asian Summit, ASEAN+3 (China, Japan and South Korea) and the ASEAN Regional Forum. All this suggests that war in Asia – while not inconceivable – is unlikely.

Interdependence and democracy

Vannarith 10—Executive Director of the Cambodian Institute for Cooperation and Peace. PhD in Asia Pacific Studies, Ritsumeikan Asia Pacific U (Chheang, Asia Pacific Security Issues: Challenges and Adaptive Mechanism, <http://www.cicp.org.kh/download/CICP%20Policy%20brief/CICP%20Policy%20brief%20No%203.pdf>)

Large scale interstate war or armed conflict is unthinkable in the region due to the high level of interdependency and democratization. It is believed that economic interdependency can reduce conflicts and prevent war. Democracy can lead to more transparency, accountability, and participation that can reduce collective fears and create more confidence and trust among the people in the region. In addition, globalism and regionalism are taking the center stage of national and foreign policy of many governments in the region except North Korea. The combination of those elements of peace is

necessary for peace and stability in the region and those elements are present and being improved in this region.

Embargo Good/Reform

Embargo Good/Encourages Reform

The embargo is pushing Cuba towards reform – ending it early causes backsliding

Sandy **Fitzgerald**, 7/5/2013, Newsmax, "democracy advocates urge obama to keep cuban trade ban," <http://www.newsmax.com/US/Cuba-embargo-democracy-Farinas/2013/07/05/id/513503>

The trade embargo on Cuba must stay to starve Havana's communist government of cash, pro-democracy activists have told the State Department.¶ A steady flow of cash into Castro's government could help it crush the island's pro-democracy efforts, warned Cuban hunger striker Guillermo Farinas who met behind closed doors with Obama administration officials in Washington. ¶ The Obama administration has yet to comment about the meetings, which included one with Farinas at Foggy Bottom in late June, reports the Washington Times.¶ The meetings were described as "extraordinary and very helpful by Mauricio Claver Carone, executive director of the U.S.-Cuba Democracy PAC in Washington. "[U.S. policymakers] now get to actually see it and feel it firsthand from the protagonists themselves," he said.¶ U.S. and Cuban officials in June held a landmark meeting to discuss re-establishing direct mail between the countries, and plan a July 17 meeting to talk about migration regulations. ¶ Raoul Castro, 82, who replaced his older brother, Fidel, has allowed some reforms since he took over in 2008, including easing travel bans. He plans to step down in 2018, when his second five-year term in office ends. The United States has been in a stalemate with Cuba since 1961, when the elder Castro agreed to allow the former Soviet Union to house ballistic weapons in Cuba.¶ Even though Fidel Castro has not been in office for several years, Cuba is still on Washington's terrorism sponsors list.¶ In addition, Cuba is still detaining American Alan Gross, who was arrested in 2009 while in Cuba working for an International Development-funded program.¶ Cuban authorities sentenced Gross to 15 years in prison for illegally delivering satellite phones to Jewish Cubans.¶ The Washington meetings suggest a thaw in the two countries' relationships, a change that some U.S. lawmakers — particularly Cuban-American Republicans — criticize.¶ Florida GOP Rep. Ileana Ros-Lethinen said Thursday that she and other Cuban-American lawmakers met with the democracy advocates, and she remains skeptical about changes and believes the embargo needs to continue until "Cuba becomes a free and democratic society."¶ The State Department isn't commenting about what was discussed at the Foggy Bottom meetings. William Ostick, a spokesman for the department's Bureau of Western Hemisphere said the State Department will continue its concern about the Cuban government's use of detention and violence against critics.

Cuba reforms gaining momentum now, but will take time to pay off

Ted **Piccone**, 1/9/2012, "Cuba is Changing, Slowly but Surely," ACC. 6-16-2013, <http://www.brookings.edu/research/reports/2012/01/19-cuba-piccone>,

A closer look, however, reveals something more profound—a wholesale mental shift, outlined clearly by President Raul Castro over the last two years, that the time has come to move the Cuban people from wholesale dependence on the state to a new era of individual responsibility and citizenship. ¶ This is going to take time. The economic reforms or "updating" of Cuba's Soviet-style economic system, approved last spring at the Communist Party's first National Congress in 14 years, are just beginning to be enacted. They include an expansion of licenses for private enterprise (over 350,000 have been granted), opening more idle land to farmers and cooperatives, allowing businesses to hire employees, empowering people to buy and sell their houses and cars, and opening new lines of credit with no legal

ceilings on how much Cubans can borrow. Non-state actors are allowed now to sell unlimited services and commodities directly to state-owned enterprises and joint ventures, thereby opening new channels of commercial activity between farmers and tourist hotels, for example. Think Viet Nam or China. The reforms include tough measures too, like shrinking the buying power of the longstanding ration card that every Cuban gets to purchase subsidized basic goods, cutting unemployment benefits, and eventually dismissing anywhere from 500,000 to one million employees from the state sector as bureaucratic middlemen become obsolete and tax revenues rise. ¶ These changes, while painful, are reason enough to be optimistic about Cuba's economic future. But something much more fundamental is at work—a turn away from government control of pricing and subsidizing products throughout the economy to a more decentralized framework of subsidizing persons based on need. At heart, the Castro government is prepared to move Cuba from a society based on equity of results to equality of opportunity, infused with a culture of humanism. Not that Cuba's system ever offered true equality, as one taxi driver reminded me as we drove down Havana's famous seaside Malecon. The door, however, is now opening wider to the inevitable rise in inequality that comes from capitalism, even restrained forms of it. Whether one is able to prosper as a self-employed restaurateur, or is the beneficiary of generous relatives sending remittances and goods home from Miami, new gradations in Cuba's economic and social strata are on the way. As long as someone arrives at their wealth legally and pays their taxes, assured one senior party official, they are free to become rich.

Cuba is reforming now, but it still isn't close to free market status

Patricia Mallen, 7/11/2013, International Business Times, "cuba announces financial reforms, opens up to foreign investment," <http://www.ibtimes.com/cuba-announces-financial-reforms-opens-foreign-investment-1341269>

"We will be working for deep reforms for the rest of the year and well into the next," Murillo, who is in charge of the reform commission, told Reuters. "**The very first step has been to eliminate prohibitions and restrictions.**"¶ Murillo said that the government was planning to give companies more autonomy and give entrepreneurs more freedom to grow. He clarified, however, that "the model of the revolution is based in social propriety, and not private, even though the latter creates jobs."¶ The plan is to allow state-owned companies to keep 50 percent of profits, after taxes, and then reinvest them in production. Up to now, all profits went to the government. News agency Prensa Latina reports that reforms include shutting down all companies that lose money for more than two years. "Our goal is to improve business efficiency and finish with the debt that has been dragging our economy down," Murillo said.¶ The other key aspect of the reform is to open the country to foreign investment. "We are aware that our island needs more foreign investment," Murillo admitted. He specified, nonetheless, that the government will only welcome foreign companies that bring technology, financing and jobs.

Additionally, only the status quo can solve the aff – the embargo will be lifted once Cuba reforms, but lifting it too early only strengthens the regime, turning the case.

Gordon Chang, 2/20/2008, Commentary Magazine, "In defense of the Cuban embargo," <http://www.commentarymagazine.com/2008/02/20/in-defense-of-the-cuban-embargo/>

Even if we lift the embargo, Castro's successors will not allow their economy to be overrun by American tourists, investors, and corporate executives. Fidel's legitimacy, we should remember, is largely founded on his ridding the island of foreign exploiters and his creating home-grown socialism. Cuban leaders, in any event, would allow only enough commerce to maintain their regime, just as North Korea's Kim Jong Il is doing today. It is a Fukuyama-induced fantasy to think that history has ended and that we can rid ourselves of despicable autocrats with just letters of credit and bills of lading. The Castro boys, Fidel and successor Raul, have survived just about everything during five decades and are not about to surrender to globalization.¶ An embargo helped kill communism in Europe, and it can also end it in the Caribbean. One day we will establish normal trading relations with Cuba, but that should not be before the people there govern themselves. "The post-Fidel era is clearly at hand, and the Bush administration has done almost nothing to prepare for it," the New York Times said. Prepare for what? The embargo has been working all along, and it is up to the Cuban dictators to relax their grip, not us.

AT LA Relations – Alt Causes

Poor relations inevitable—other priorities

Hakim 11 President Emeritus of the Inter-American Dialogue [Peter Hakim, The United States and Latin America: The Neighbourhood has Changed, The International Spectator: Italian Journal of International Affairs, Volume 46, Issue 4, 2011]

During the following ten years, US foreign policy attention turned sharply to the Middle East. Washington's integrationist strategy for the Americas unravelled as its weaknesses and inconsistencies became increasingly visible. For their part, Latin American governments became increasingly independent and assertive in their foreign policies, diversified in their international relations, and more inclined to challenge US leadership and initiative. The United States has not yet come fully to grips with this changing context of hemispheric relations. The G.W. Bush and Obama administrations remained, at least rhetorically, wedded to the idea of partnerships and shared responsibilities with Latin America, but these concepts seem less and less relevant to the region's evolving context.

What the past two decades of US–Latin American relations may have most clearly revealed is how difficult it is for Washington to define and execute a coherent policy in the region—with officials constrained by domestic politics, far more urgent demands on its foreign policy resources, and an increasingly independent and self-assured Latin America. The fact is that US policies toward Latin American and the Caribbean are almost invariably derivative policies. They tend not to be the result of a careful calculation of US interests and values and a clear view of what it will take to advance them. Instead, they tend to be mostly shaped by US domestic political considerations or by the demands of global issues.

Proliferation Defense

Proliferation won't increase the risk of conflict

Beardsley and Asal 9

Department of Political Science State University of New York, Albany

One additional implication follows from the proposed logic. The actors themselves have control over the probability of each escalation scenario. Actors that go into a crisis, presumably over a lesser issue, with absolutely no intention of escalating past a certain point should not be expected to have a probability of full escalation greater than zero. Since states rarely threaten nuclear use, it would be a tenuous assertion to say that all crises involving nuclear actors have some lingering implicit threat. As a result, the effect of nuclear weapons should be contingent on the saliency of the crisis to the actors involved. In low-salient conflicts that an actor has no intention to escalate if needed, nuclear weapons should have no bearing. If nuclear weapons do have an impact on crisis outcomes, it will be in more salient crises in which the probability of full escalation is greater than zero—although still presumably small.

New nuclear states won't go to war

Waltz 3

Kenneth Waltz, Professor of Political Science, Columbia, THE SPREAD OF NUCLEAR WEAPONS, 2003, p. 141. (DRGOC/C485)

Can weak and poor states manage to deploy second-strike forces? The answer is "yes," quite easily. This answer contradicts Sagan's, and many others', belief that second-strike forces are difficult to build and deploy. Decades of American military worries feed this view. But as Bernard Brodie put it if a "small nation could threaten the Soviet Union with only a single thermonuclear bomb, which, however, it could and would certainly deliver on Moscow," the Soviet Union would be deterred. I would change that sentence by substituting "might" for "would" and by adding that the threat of a fission bomb or two would also do the trick. We now know that Britain, thinking as we did that the Soviet Union was hard to deter, pretended to have H-bombs when it had none. Sagan believes that the American air force and navy had to be goaded into developing second-strike forces. He cites the Killian Report of 1955, written by civilians, as providing the push that caused the military to become concerned with the survivability of strategic weapons. In one sense, he is right. Our military services were more interested in their traditional missions and weapons than they were in nuclear deterrence. The navy's initial response to the Polaris program was to say that it was a national program, not a naval one. (Eisenhower wondered what the difference might be.) An unconventional naval officer Hymill Rickover, drove the program through ahead of time and on budget. For this, the navy never forgave him. Congress had to add his name to the lists of officers to be promoted because the navy would not do so. Military organizations are renowned for their resistance to innovation.

AT Engagement Scenario

And lifting the embargo before Cuba reforms is an act of appeasement – that emboldens adversaries and makes the US look weak to the entire world

Brookes '9 (Peter is a Heritage Foundation senior fellow and a former deputy assistant secretary of defense. "KEEP THE EMBARGO, O" April 15, 2009, http://www.nypost.com/p/news/opinion/opedcolumnists/item_Oul9gWKYCFsACA0D6IVpvL)

In the end, though, it's still Fidel Castro and his brother Raul who'll decide whether there'll be a thaw in ties with the United States -- or not. And in usual Castro-style, Fidel himself stood defiant in response to the White House proclamation, barely recognizing the US policy shift. Instead, and predictably, Fidel demanded an end to el bloqueo (the blockade) -- without any promises of change for the people who labor under the regime's hard-line policies. So much for the theory that if we're nice to them, they'll be nice to us. Many are concerned that the lack of love from Havana will lead Washington to make even more unilateral concessions to create an opening with Fidel and the gang. Of course, the big empanada is the US economic embargo against Cuba, in place since 1962, which undoubtedly is the thing Havana most wants done away with -- without any concessions on Cuba's part, of course. Lifting the embargo won't normalize relations, but instead legitimize -- and wave the white flag to -- Fidel's 50-year fight against the Yanquis, further lionizing the dictator and encouraging the Latin American Left. Because the economy is nationalized, trade will pour plenty of cash into the Cuban national coffers -- allowing Havana to suppress dissent at home and bolster its communist agenda abroad. The last thing we should do is to fill the pockets of a regime that'll use those profits to keep a jackboot on the neck of the Cuban people. The political and human-rights situation in Cuba is grim enough already. The police state controls the lives of 11 million Cubans in what has become an island prison. The people enjoy none of the basic civil liberties -- no freedom of speech, press, assembly or association. Security types monitor foreign journalists, restrict Internet access and foreign news and censor the domestic media. The regime holds more than 200 political dissidents in jails that rats won't live in. We also don't need a pumped-up Cuba that could become a serious menace to US interests in Latin America, the Caribbean -- or beyond. (The likes of China, Russia and Iran might also look to partner with a revitalized Cuba.) With an influx of resources, the Cuban regime would surely team up with the rulers of nations like Venezuela, Nicaragua and Bolivia to advance socialism and anti-Americanism in the Western Hemisphere. The embargo has stifled Havana's ambitions ever since the Castros lost their Soviet sponsorship in the early 1990s. Anyone noticed the lack of trouble Cuba has caused internationally since then? Contrast that with the 1980s some time. Regrettably, 110 years after independence from Spain (courtesy of Uncle Sam), Cuba still isn't free. Instead of utopia, it has become a dystopia at the hands of the Castro brothers. The US embargo remains a matter of principle -- and an appropriate response to Cuba's brutal repression of its people. Giving in to evil only begets more of it. Haven't we learned that yet? Until we see progress in loosing the Cuban people from the yoke of the communist regime, we should hold firm onto the leverage the embargo provides.

AT: Cyber D.A-MSDI

Not protected now

The U.S. is very vulnerable – new digital controls, weak cyber security and a lack of professionals prove

Michael **Assante**, Mr. Assante is director of Industrial Control Systems as well as Supervisory Control and Data Acquisition Networks for the SANS Institute., 11-11-2014, "America's Critical Infrastructure Is Vulnerable To Cyber Attacks," Forbes, <http://www.forbes.com/sites/realspin/2014/11/11/americas-critical-infrastructure-is-vulnerable-to-cyber-attacks/2/>

America's critical infrastructure—the utilities, refineries, military defense systems, water treatment plants and other facilities on which we depend every day—has become its soft underbelly, the place where we are now most vulnerable to attack. Over the past 25 years, hundreds of thousands of analog controls in these facilities have been replaced with digital systems. Digital controls provide facility operators and managers with remote visibility and control over every aspect of their operations, including the flows and pressures in refineries, the generation and transmission of power in the electrical grid, and the temperatures in nuclear cooling towers. In doing so, they have made industrial facilities more efficient and more productive. But the same connectivity that managers use to collect data and control devices allows cyber attackers to get into control system networks to steal sensitive information, disrupt processes, and cause damage to equipment. Hackers, including those in China, Russia and the Middle East, have taken notice. While early control system breaches were random, accidental infections, industrial control systems today have become the object of targeted attacks by skilled and persistent adversaries. Industrial control systems are being targeted. The recently discovered Industrial Control System modules of the HAVEX trojan are one example. The malware infiltrated an indeterminate number of critical facilities by attaching itself to software updates distributed by control system manufacturers. When facilities downloaded the updates to their network, HAVEX used open communication standards to collect information from control devices and send that information to the attackers for analysis. This type of attack represents a significant threat to confidential production data and corporate intellectual property and may also be an early indicator of an advanced targeted attack on an organization's production control systems. Other hacks represent a direct threat to the safety of U.S. citizens. Earlier this year, the FBI released information on Ugly Gorilla, a Chinese attacker who invaded the control systems of utilities in the United States. While the FBI suspects this was a scouting mission, Ugly Gorilla gained the cyber keys necessary for access to systems that regulate the flow of natural gas. Considering that cyber attackers are numerous and persistent—for every one you see there are a hundred you don't—those developments should sound alarms among executives at companies using industrial controls and with the people responsible for protecting American citizens from attacks. To their credit, both businesses and the U.S. government have begun to take action; however, neither is adequately addressing the core of the issue. The threat isn't static. Businesses continue to believe that cybersecurity issues can be addressed solely through technology. The problem was created by technology so the solution must be more technology, they reason, ignoring the spirit of Einstein's observation that "no problem can be solved from the same level of consciousness that created it." Technology is static and the threat is not. Hackers will always find a way to beat technology-based solutions. That's why we have to do more than create barriers to keep out intruders. We have to man our digital borders with people who have the same skill and determination as the attackers similar to the use of technology, the ability to regulate a solution is inherently limited. Regulation creates a

compliance mentality in which policies and investments are based on achieving and maintaining compliance. Compliance is predictable, which makes it the hacker's best friend. Lack in security professionals who understand both digital security and control system technology Legislation (HR 3696) has been introduced in the U.S. Congress that would increase the sharing of information related to control system breaches to better arm security professionals to prevent future breaches. That is a worthwhile goal; unfortunately, there is a dire lack of security professionals with an understanding of both digital security and control system technology to benefit from this information sharing. Filling this gap is where the lion's share of the cybersecurity effort must go. It is estimated in the latest Project SHINE report that the United States has more than half a billion control system devices connected to the Internet. The SANS Institute, the largest cybersecurity training organization in the world, estimates that in the U.S. power industry alone thousands of new or existing control systems security professionals must be deployed or further developed in the next five years to adequately address the challenge of control system security within the electric sector.

Cyber-terrorists have the upper hand – major attack is a question of when, not if

Aasha **Bodhani**, 1-19-2015, Award-winning journalist / Industry Features Editor at The IET, "Cyber-security: organisations vulnerable to new swathe of attacks in 2015," No Publication, <http://eandt.theiet.org/magazine/2015/01/special-report-cyber-security.cfm>

2014 was a bad year for cyber security, and experts warn that 2015 could be even worse. The scale of attacks indicates that cyber crime is not only a considerable challenge but that the bad guys are winning. Rather than implement effective security, many organisations are simply gambling that they do not represent an attractive enough target compared with their peers. The cyber world has become an increasingly attractive playground for criminals, activists and terrorists motivated to become noticed, make money, cause havoc or bring down corporations and governments through online attacks. In 2013 alone, IBM reported, 1.5 million monitored cyber attacks took place in the US, so it is not a surprise that cyber-security specialist and senior vice president of products at Clearswift Guy Bunker warns: "threats are an everyday event and breaches are 'when' not 'if'." To make matters worse, cyber criminals are not only hacking the obvious such as smartphones, e-health devices and credit card theft; they are beginning to see driverless vehicles, e-cigarettes and smart kitchen appliances as potential targets. Before 2014 got under way, security consultancy Websense predicted a number of attack types would blossom. Its recent '2014 Predictions Accuracy' report shows that the experts had identified some key problems correctly. The report states that as the cloud became the preferred location for storing data, cyber criminals focused their attention on attacking the cloud. Other predictions that appear to have come true include a shift from simple data theft at corporation level to nation-state level, a decrease in the quantity of new malware resulting in more targeted attacks and cyber criminals targeting the weakest links in the information chain, such as third-party vendors, contractors, point-of-sale devices and out-of-date software.

Cyber Risk High – The US fails to implement security.

Tony **Kovaleski**, Liz **Wagner** and Mark **Villarreal**, 2-1-2015, "Critical Infrastructure Vulnerable to Cyber Attack," NBC Bay Area, <http://www.nbcbayarea.com/news/local/Critical-Infrastructure-Vulnerable-to-Cyber-Attacks-Experts-Warn-290370921.html>

Recent security breaches at Sony Pictures, Target and Home Depot have put a spotlight on the vulnerabilities of the nation's cyber systems. But an NBC Bay Area investigation reveals concerns from some of the country's leading cyber security experts that threats have moved beyond movies, credit cards and bank accounts, to the ability to hack into computer systems that control vital infrastructure. For nearly two decades, the United States government has known and warned about potential threats to critical infrastructure, including nuclear plants, electric substations, gas pipelines, transit systems, chemical facilities and drinking water supplies. "It's those systems, that if we lose them, it's going to have a serious impact on our way of life," said Perry Pederson, a Washington, D.C.-based expert on cyber security. In 2007, when Pederson worked for the Department of Homeland Security (DHS), he helped design a government test now known as Project Aurora. The experiment involved hacking into a replica of an Idaho power plant's control system and causing it to smoke, shake and self-destruct. "It ultimately proved and demonstrated on video that you can destroy physical equipment with a cyber-attack," Pederson said. "It's a type of vulnerability we should be concerned about." But Pederson said the United States isn't employing the lessons learned from the experiment. "Aurora should have been a wakeup call, and we just hit the snooze button and go back to sleep." Pederson said.

Lack necessary protections against cyber attacks now

Katherine **Brocklehurst, 1-27-2015**, Working with network security technologies ranging from protocols to core encryption to intrusion detection/prevention to web application firewalls, she's touched every layer in the ISO model. Katherine is a subject matter expert on security and compliance policies, and works on this every day in the field of security configuration management as senior solutions manager at Tripwire. "Cyberterrorists Attack on Critical Infrastructure Could Be Imminent," State of Security, <http://www.tripwire.com/state-of-security/security-data-protection/security-controls/cyberterrorists-attack-on-critical-infrastructure-could-be-imminent/>

In a November 20, 2014, hearing for the House Intelligence Committee, NSA Director Admiral Michael Rogers said several foreign governments had already hacked into U.S. energy, water and fuel distribution systems, potentially damaging essential services, according to Bloomberg. "This is not theoretical," Rogers said. "This is something real that is impacting our nation and those of our allies and friends every day." DHS Warns U.S. Utility Was Hacked In May 2014, the Department of Homeland Security and its Industrial Control Systems Cyber Emergency Response Team issued an ICS-CERT report warning of several known attacks against U.S. utilities in the first quarter of 2014. They cited details of one unnamed utility that had been breached and warned U.S. utilities to be on guard for intrusion activity. The complete article on this information is available here. CYBER THREATS CAN BE PHYSICAL Increasing cyber threat concerns are having an impact on critical infrastructure organizations because the physical implications have the potential to be catastrophic—cybersecurity rated as the fourth highest issue for energy executives in 2014, up from sixth place in 2013. This shows dramatic progress; it was not even in the top ten concerns for utilities two years ago. According to the 2014 annual report from industry consultants Black & Veatch conducted in May of 2014: "We are seeing an industry that is actively moving forward with the deployment of comprehensive asset protection plans following several high-profile cyber and physical threat events." 48% OF ELECTRIC UTILITIES SURVEYED NEED CYBER THREAT PROTECTION Still – a survey of electric utility representatives showed that 48% of respondents

indicated they did not have integrated security systems with the “proper segmentation, monitoring and redundancies” needed for cyber threat protection. Only 32% said they had these protections in place.

Surveillance hurts ability to fight cyber attacks

NSA surveillance actually decreases ability to fight cyber-attacks by decreasing the overall security of the internet.

Eduard Kovacs on July 30, 2014 NSA Surveillance Programs Directly Damage Internet Security: Report

<http://www.securityweek.com/nsa-surveillance-programs-directly-damage-internet-security-report>

"The NSA has both weakened overall trust in the network and directly harmed the security of the Internet." A report published by the New America Foundation's Open Technology Institute on Tuesday details the impact of NSA surveillance activities on the United States economy, foreign policy and Internet security. **There have been numerous discussions on the intelligence agency's controversial spying programs over the past year,** ever since former NSA contractor Edward Snowden started leaking classified information obtained from the organization's systems. However, the Open Technology Institute argues that most discussions have revolved around the impact of surveillance programs on privacy and civil liberties, and not so much on how they affect the interests of the United States and the global Internet community. The 64-page paper focuses on the costs to cybersecurity, the direct economic costs to U.S. businesses, the economic and technological costs of data localization and data protection proposals, and political costs to American foreign policy. Internet Security Weakened by NSA. **Internet security has been greatly impacted by NSA spying because in addition to monitoring online communications,** the agency has been involved in various activities that, according to the authors of the report, **"fundamentally threaten the basic security of the Internet."** For example, **the report points to the NSA's attempts to intentionally weaken critical cryptographic standards.** One of these algorithms was until recently included in cryptographic libraries used by default by RSA and other companies. **The agency is also said to be spending hundreds of millions of dollars on getting companies to intentionally create backdoors in their products,** including communication devices, commercial encryption systems and IT networks. In addition to getting companies to insert security holes into their products, the NSA keeps information about zero-day vulnerabilities to itself, instead of notifying the companies whose solutions are affected. This leaves organizations and regular users exposed to attacks from the NSA, and also from other entities that might have knowledge of the flaws, the report said. The Open Technology Institute believes costs to cybersecurity also stem from the activities of the NSA's Tailored Access Operations (TAO) unit, whose employees rely on an aggressive set of tools to hack into computers, phones, routers and even SCADA systems. One of the tactics used by this unit involves targeting networks and network providers, including the undersea cables that carry Internet traffic between continents. The TAO unit is also said to have impersonated several major US companies, including Facebook and LinkedIn, in an effort to insert malware and steal sensitive information.

NSA surveillance undermines our ability to prevent cyber attacks

DAVID HAMILTON NOV 18, 2014 The Real Lesson From Recent Cyberattacks: Let's Break Up The NSA It's supposed to guard against cyberintrusion. Remember? <http://readwrite.com/2014/11/18/hacking-cyber-attack-break-up-the-nsa>

Over the weekend, the U.S. State Department shut down its unclassified email network after finding evidence that hackers might have been prowling around. It's in good company: **in the past several**

weeks, hackers have poked around in computers at the White House, the Postal Service and the National Weather Service—not to mention JPMorgan and nine other big banks. If only there was a federal agency dedicated to protecting federal information systems and critical U.S. infrastructure from criminals and foreign attackers. Oh, wait—there is. It's the National Security Agency. And to all appearances, it's botched the job so badly you'd think it wasn't really trying in the first place. Maybe it wasn't. The NSA has historically been a house divided against itself. On one side, it ostensibly works to "ensure appropriate security solutions are in place to protect and defend information systems, as well as our nation's critical infrastructure." This mission, the NSA says, aims to ensure "confidence in cyberspace." Then there's the other side of the NSA, which listens in on the communications of U.S. adversaries, conducts mass surveillance of Americans and foreigners and undertakes military-style cyber attacks against other nations and alleged terrorists. Oh, and that also deliberately tries to undermine security tools used to guard both civilian and government systems against intrusion. For instance, the NSA's secret 2013 budget request—provided by Edward Snowden and published by the New York Times, ProPublica and other outlets a year ago—revealed that the agency seeks to "introduce vulnerabilities into commercial encryption systems, IT systems, networks, and endpoint communication devices used by targets." In other words, the NSA routinely undermines the security tools that government agencies, businesses and consumer services use to protect messages and data from attackers. It's a little as if car makers were surreptitiously making it easier for repo men to unlock and drive away your vehicle—right in the midst of an auto-theft epidemic. The NSA apparently does this in the misguided belief that its own spooks will be the only ones to notice and exploit these vulnerabilities. But criminals and foreign governments are smart, too, and just as eager to exploit security holes created by accident or design. In 2010, for instance, Chinese hackers were able to break into individual Gmail accounts by using "secret" backdoors that Google had installed specifically to comply with U.S. government search-warrant requests.

NSA surveillance undermines protection from cyber-attacks.

LeakSource, 2015 What Goes Around Comes Around: NSA Cyberattacks Helping Other Countries (Iran) Learn to Hack Better <http://leaksource.info/2015/02/16/what-goes-around-comes-around-nsa-cyberattacks-helping-other-countries-iran-learn-to-hack-better/>

The NSA's concern of inadvertently aiding Iran's cyberattack capabilities is striking given the government's recent warning about the ability of adversaries to develop more advanced viruses. A top official at the Pentagon's Defense Advanced Research Projects Agency's (DARPA) appeared on 60 Minutes this Sunday and claimed that cyberattacks against the U.S. military are becoming more potent. "The sophistication of the attacks is increasing," warned Dan Kaufman, director of DARPA's Information Innovation Office. The NSA document suggests that offensive cyberattacks on other states do not merely provoke counterattacks—those attacks can teach adversaries how to launch their own. "Iran continues to conduct distributed denial-of-service (DDOS) attacks against numerous U.S. financial institutions, and is currently in the third phase of a series of such attacks that began in August 2012," the document says. "SIGINT indicates that these attacks are in retaliation to Western activities against Iran's nuclear sector and that senior officials in the Iranian government are aware of these attacks." This would not be the first time the U.S. has inadvertently assisted Iran's attack capabilities. Last month, former CIA officer Jeffrey Sterling was convicted of multiple felony counts for telling New York Times

reporter James Risen about an agency program designed to feed Iran false data about nuclear engineering in order to create setbacks, but which instead may have provided useful information the Iranians were able to exploit to advance their nuclear research. As of 2013, the NSA said that while it had no indications “**that Iran plans to conduct such an attack against a U.S. or UK target, we cannot rule out the possibility of such an attack, especially in the face of increased international pressure on the regime.**” The NSA “can’t comment or speculate on the motivations of those who aim to harm the United States or our allies,” a spokesperson for the agency said. “The National Security Agency works with foreign partners to protect our interests and citizens in cyberspace.”

NSA surveillance efforts compromise our ability to improve cybersecurity

Danielle **Kehl** How the NSA Hurts Our Economy, Cybersecurity, and Foreign Policy **2014**

http://www.slate.com/blogs/future_tense/2014/07/31/usa_freedom_act_update_how_the_nsa_hurts_our_economy_cybersecurity_and_foreign.html

Lastly, **there’s growing evidence that certain NSA surveillance techniques are actually bad for cybersecurity.** As the Institute of Electrical and Electronics Engineers recently explained: “**The United States might have compromised both security and privacy in a failed attempt to improve security.**” We’ve learned in the past year that **the NSA has been deliberately weakening the security of the Internet, including commercial products** that we rely on every day, in order to improve its own spying capabilities. **The agency has apparently tried everything from secretly undermining essential encryption tools and standards to inserting backdoors** into widely used computer hardware and software products, stockpiling vulnerabilities in commercial software, **and building a vast network of spyware inserted onto computers and routers around the world.** A former U.S. ambassador to the U.N. Human Rights Council, Eileen Donahoe, wrote a forceful article back in March about how the NSA’s actions threaten our national security.

The NSA weakens encryption and increases risk of cyber attack

Matt **Buchanan**, 9-6-**2013**, "How the N.S.A. Cracked the Web," New Yorker, <http://www.newyorker.com/tech/elements/how-the-n-s-a-cracked-the-web>

It’s been nearly three months since Edward Snowden started telling the world about the National Security Agency’s mass surveillance of global communications. But the latest disclosures, by the Guardian, New York Times, and ProPublica are perhaps the most profound yet: **the N.S.A.** and its partner agency in the United Kingdom, the Government Communications Headquarters, **possess significant capabilities to circumvent widely used encryption software in order to access private data.** Encryption poses a problem for intelligence agencies by scrambling data with a secret code so that even if they, or any other third-party, manages to capture it, they cannot read it—unless they possess the key to decrypt it or have the ability to crack the encryption scheme. Encryption has become only more pervasive in the decade since the N.S.A.’s “aggressive, multipronged effort to break widely used Internet encryption technologies” began in 2000. When you log into Gmail or Facebook, chat over iMessage, or check your bank account, the data is typically encrypted. This is because encryption is vital for everyday Web transactions; if for instance, you were to log in to your Gmail account using a park’s open wireless network and your username and password were transmitted in plain form, without being encrypted, your credentials could potentially be captured by anyone using that same network. Both the Times and the Guardian write that the N.S.A. and the G.C.H.Q. have “cracked much of the encryption” on the Web. But we don’t know precisely how much: the Times writes that the “full extent of the N.S.A.’s decoding capabilities is known only to a limited group of top analysts from the so-called Five Eyes: the N.S.A. and its counterparts in Britain,

Canada, Australia and New Zealand.” But it deploys “custom-built, superfast computers to break codes,” and it works with “technology companies in the United States and abroad to build entry points into their products.” While the Times and the Guardian do not make clear precisely which encryption schemes the N.S.A. and its partners have rendered effectively useless—and which companies the agency has partnered with—there are some hints about what the N.S.A. has accomplished with Bullrun, its project to defeat network encryption. **The N.S.A. has** apparently possessed “groundbreaking capabilities” against encrypted voice and text communication since 2010, which the Guardian says **made “vast amounts’ of data collected through internet cable taps newly ‘exploitable.”** The N.S.A. appears to have found a way around some Internet-level encryption protocols that use outdated standards, but are nonetheless ubiquitous: the Guardian writes, **“The agency has capabilities against widely used online protocols**, such as HTTPS, voice-over-IP and Secure Sockets Layer.” **And the** Times notes that the **“most intensive efforts have focused on the encryption in universal use in the United States**, including Secure Sockets Layer, or SSL; virtual private networks, or V.P.N.s; **and the protection used on fourth-generation, or 4G, smartphones.**” The hypertext transfer protocol (H.T.T.P.) is the basis for Web communication—it’s the “http” in your browser’s address bar. S.S.L. is one of the most common cryptographic protocols on the Web and is supported by nearly all Web sites. (It’s also used by instant-messaging and other programs to secure transmissions over the Internet.) H.T.T.P.S. is essentially the application of the S.S.L. protocol to H.T.T.P., making online services like e-mail and banking secure. A virtual private network enables a user to have a private connection on a public network in which their transmissions are protected. Under normal circumstances, the use of these protocols would shield data from the N.S.A.’s dragnet surveillance of communications. Cryptographic and security experts have been able to piece together some ideas about the extent of the agency’s capabilities. Mike Janke, the C.E.O. of the encrypted-communications company Silent Circle—which shut down its encrypted e-mail service a few weeks ago—said over the phone that, based on information and literature he has seen, he believes the N.S.A. developed “a massive push-button scale” ability to defeat or circumvent S.S.L. encryption in virtually real time. He added, “the reality of it is that most of the security world has known that lower level encryption—S.S.L., H.T.T.P.S., V.P.N.s—are highly susceptible to being defeated because of their architecture.” Bruce Schneier, who has seen the Snowden documents, wrote that **the N.S.A. has circumvented common Web encryption “primarily by cheating, not by mathematics.” Instead of busting the algorithms that power encryption schemes,** Schneier is suggesting that **the N.S.A. has** found a way around it. Matthew Green, a prominent crypto researcher, suggests that the N.S.A. may have **compromised the encryption software that implements the algorithms that determine how data is scrambled**—in particular, software made by Microsoft and used by many Web servers for encryption. The Times writes that the “the agency maintains an internal database of encryption keys for specific commercial products, called a Key Provisioning Service, which can automatically decode many messages.” Intriguingly, it adds, “independent cryptographers say many are probably collected by hacking into companies’ computer servers, where they are stored.” If the agency possesses the keys, there is no need to crack the encryption algorithm. Thomas Drake, an N.S.A. whistleblower who was profiled by Jane Mayer in the magazine, said over the phone that he believes the 2010 breakthrough was possibly more dramatic and may refer to the defeat of “some of the main-line encryption” algorithms in wide use, like the R.S.A. algorithm or the Advanced Encryption Standard at 256-bit level. (The length of the key used to encrypt and decrypt information, measured in bits, is one of many aspects of what determines how hard an encryption scheme is to crack: 128-bit encryption is now relatively easy; 2048-bit is much harder.) This kind of capability was hinted at in James Bamford’s piece a year ago about the N.S.A.’s massive new data center in Utah: **The most damning aspect of the new disclosures is that the N.S.A. has worked to make widely used technology less secure.** The Times reports that in 2006, **the N.S.A. intentionally introduced a vulnerability into an encryption standard adopted by both the National Institute of Standards and Technology and the International Organization for Standardization.** This is deeply problematic, Green writes, because the cryptographic industry is “highly dependent on NIST standards.” The N.S.A. also uses its Commercial Solutions Center, which invites companies, including start-ups, to show their technology to the agency under the guise of improving security, in order to “leverage sensitive, cooperative relationships with specific industry partners” and covertly make those products more susceptible to N.S.A.’s surveillance. Schneier, who has reviewed the documents, describes the process thusly: **“Basically, the NSA asks companies to subtly change their products in undetectable ways: making the random number generator less random, leaking the key somehow, adding a common exponent to a public-key exchange protocol, and so on.”** This is why the N.S.A. specifically asked the Times and Guardian to not publish their articles and the documents detailing the program warn explicitly and repeatedly of the need for secrecy: “Do not ask about or speculate on sources or methods.” The Times notes that the **N.S.A. expects to “gain full unencrypted access to an unnamed major Internet phone call and text service”** sometime this year. The Guardian further specifies that it is a “major internet peer-to-peer voice and text communications,” which sounds like it might be Skype—owned by Microsoft and previously named as an N.S.A. partner. Drake said that he was certain that Skype has been “compromised.” And, in one instance, the Times notes that “after the government learned that a foreign intelligence target had ordered new computer hardware, the American manufacturer agreed to insert a back door into the product before it was shipped.” This is worse than the legal mandate the N.S.A. and the F.B.I. pushed for in the nineties to force technology companies to build backdoors into their products, because, as Chris Soghoian, the principal technologist for the American Civil Liberties Union said, “with a secret backdoor you’ll think it’s secure,” rather than simply avoiding

the technology. Schneier writes, "My guess is that most encryption products from large U.S. companies have NSA-friendly back doors, and many foreign ones probably do as well." The pervasive effort to engineer backdoors into commercial technology strikes upon a broader question, raised by Soghoian: "Can we rely on technology provided by corporations with extensive relations with the U.S. government?" Despite the scope of the N.S.A.'s program, and its apparent success against Internet-level encryption, strong encryption schemes do remain uncracked by the N.S.A., and they are "your best bet" for privacy, said Janke. Pretty Good Privacy, a common encryption program, if used with the latest algorithms, remains safe, he added, as does the encryption used in Z.R.T.P., which is used by Silent Circle's voice and text products to encrypt communications. Janke believes in their security in large part because "it's good enough for the government to approve it for their use." Soghoian says that the "the kind of stuff we need is already available, it's just not in our browsers and not with Google and Facebook." (However, in response to the N.S.A. revelations, Google has fast-tracked its plan to encrypt data as it zips between its own data centers to prevent it from being subject to intelligence-agency prying.) Janke notes that on a local level, TrueCrypt, a hard-drive encryption program, along with Apple's native hard-disk encryption tool both remain unbroken. Though Drake said he would only trust 2048-bit level encryption schemes and that he relies largely on open-source software, he would not reveal how he protects his own communications. "I just don't want others to know how I protect myself," he said. "I literally do not trust anything commercial." In response to the latest revelations, Representative Rush Holt of New Jersey has introduced a bill, the Surveillance State Repeal Act, which would, among other things, bar the N.S.A. from installing such backdoors into encryption software. While a statement from the Director of National Intelligence, James Clapper—published after the reports by the Times and the Guardian—said that the fact that the N.S.A. works to crack encrypted data was "not news," Holt said, correctly, that **"if in the process they degrade the security of the encryption we all use, it's a net national disservice."** The upshot is that it is now known that "the N.S.A. cannot be trusted on the issue of cyber security," said Soghoian. He continued, "My sincere hope is that the N.S.A. loses its shine. **They're the bad guy; they're breaking into systems; they're exploiting vulnerabilities.**" It's conceivable that they have good intentions. And yet, Soghoian continued, "they act like any other hacker. They steal data. They read private communications." With that methodology, how easy can it be, though, to give the agency the benefit of the doubt? As many have, Thomas Drake compared the worldview of what he calls the "rogue agency" to the total surveillance of George Orwell's "1984," in which the only way to escape was "to cower in a corner. I don't want to live like that. I've already lived that and it's not pleasant."

NSA has made US more vulnerable to hacker for many reasons

Brendan [Sasso, 4-30-2014](http://www.nextgov.com/cybersecurity/2014/04/how-nsa-undermines-cybersecurity-protect-you/83482/), "How the NSA Undermines Cybersecurity to Protect You," Nextgov, <http://www.nextgov.com/cybersecurity/2014/04/how-nsa-undermines-cybersecurity-protect-you/83482/>

But critics argue that the National Security Agency has actually undermined cybersecurity and made the United States more vulnerable to hackers. At its core, the problem is the NSA's dual mission. **On one hand, the agency is tasked with securing U.S. networks and information. On the other hand, the agency must gather intelligence on foreign threats to national security.** Collecting intelligence often means hacking encrypted communications. **That's nothing new for the NSA;** the agency traces its roots back to code-breakers deciphering Nazi messages during World War II. **So in many ways, strong Internet security actually makes the NSA's job harder.** "This is an administration that is a vigorous defender of surveillance," said Christopher Soghoian, the head technologist for the American Civil Liberties Union. **"Surveillance at the scale they want requires insecurity." The leaks from Edward Snowden have revealed a variety of efforts by the NSA to weaken cybersecurity and hack into networks. Critics say those programs, while helping NSA spying, have made U.S. networks less secure. According to the leaked documents, the NSA inserted a so-called back door into at least one encryption standard that was developed by the National Institute of Standards and Technology. The NSA could use that back door to spy on suspected terrorists, but the vulnerability was also available to any other hacker who discovered it.** NIST, a Commerce Department agency, sets scientific and technical standards that are widely used by both the government and the private sector. **The agency has said it would never "deliberately weaken a cryptographic standard," but it remains unclear whether the agency was aware of the back door or whether the NSA tricked NIST into adopting the compromised standard. NIST is required by law to consult with the NSA for its technical expertise on cybersecurity. The revelation that NSA somehow got NIST to build a back door into an encryption standard has seriously damaged NIST's reputation with**

security experts. “NIST is operating with a trust deficit right now,” Soghoian said. “Anything that NIST has touched is now tainted.” It’s a particularly bad time for NIST to have lost the support of the cybersecurity community.

NSA has hindered- not helped- cybersecurity

Brendan Sasso, 4-30-2014, “How the NSA Undermines Cybersecurity to Protect You,” Nextgov, <http://www.nextgov.com/cybersecurity/2014/04/how-nsa-undermines-cybersecurity-protect-you/83482/>

The U.S. government “is as concerned as the public is with the security of these products.” “The United States pursues its intelligence mission with care to ensure that innocent users of those same technologies are not affected,” she said. According to Vines, the NSA relies on the same encryption standards it recommends to the public to protect its own classified networks. “We do not make recommendations that we cannot stand behind for protecting national security systems and data,” she said. But due to concern over the NSA damaging Internet security, the president’s review group on surveillance issues recommended that the U.S. government promise not to “in any way subvert, undermine, weaken, or make vulnerable generally available commercial encryption.” “Encryption is an essential basis for trust on the Internet; without such trust, valuable communications would not be possible,” the group wrote in its report, which was released in December. “For the entire system to work, encryption software itself must be trustworthy.” In response to the report, the administration adopted a new policy on whether the NSA can exploit “zero-days”—vulnerabilities that haven’t been discovered by anyone else yet. According to the White House, there is a “bias” toward publicly disclosing flaws in security unless “there is a clear national security or law enforcement need.” In a blog post Monday, Michael Daniel, the White House’s cybersecurity coordinator, said that disclosing security flaws “usually makes sense.” “Building up a huge stockpile of undisclosed vulnerabilities while leaving the Internet vulnerable and the American people unprotected would not be in our national security interest,” he said. But Daniel added that, in some cases, disclosing a vulnerability means that the U.S. would “forego an opportunity to collect crucial intelligence that could thwart a terrorist attack, stop the theft of our nation’s intellectual property, or even discover more dangerous vulnerabilities.” He said that the government weighs a variety of factors, such as the risk of leaving the vulnerability un-patched, the likelihood that anyone else would discover it, and how important the potential intelligence is. But privacy advocates and many business groups are still uncomfortable with the U.S. keeping security flaws secret. And many don’t trust that the NSA will only exploit the vulnerabilities with the most potential for intelligence and least opportunity for other hackers. “The surveillance bureaucracy really doesn’t have a lot of self-imposed limits.” Now I think people dealing with that bureaucracy have to understand they can’t take anything for granted.” Most computer networks are run by private companies, and the government must work closely with the private sector to improve cybersecurity. But companies have become reluctant to share security information with the U.S. government, fearing the NSA could use any information to hack into their systems. “When you want to go into partnership with somebody and work on serious issues—such as cybersecurity—you want to know you’re being told the truth,” Black said.

NSA hurt cyber-security by making backdoor required which increases risk of compromise

Trevor **Timm**, 3-4-2015, "Building backdoors into encryption isn't only bad for China, Mr President," Guardian, <http://www.theguardian.com/commentisfree/2015/mar/04/backdoors-encryption-china-apple-google-nsa>

In a stunningly short-sighted move, the FBI - and more recently the NSA - have been pushing for a new US law that would force tech companies like Apple and Google to hand over the encryption keys or build backdoors into their products and tools so the government would always have access to our communications. It was only a matter of time before other governments jumped on the bandwagon, and China wasted no time in demanding the same from tech companies a few weeks ago. As President Obama himself described to Reuters, China has proposed an expansive new "anti-terrorism" bill that "would essentially force all foreign companies, including US companies, to turn over to the Chinese government mechanisms where they can snoop and keep track of all the users of those services." Obama continued: "Those kinds of restrictive practices I think would ironically hurt the Chinese economy over the long term because I don't think there is any US or European firm, any international firm, that could credibly get away with that wholesale turning over of data, personal data, over to a government." Bravo! Of course these are the exact arguments for why it would be a disaster for US government to force tech companies to do the same. (Somehow Obama left that part out.) As Yahoo's top security executive Alex Stamos told NSA director Mike Rogers in a public confrontation last week, building backdoors into encryption is like "drilling a hole into a windshield." Even if it's technically possible to produce the flaw - and we, for some reason, trust the US government never to abuse it - other countries will inevitably demand access for themselves. Companies will no longer be in a position to say no, and even if they did, intelligence services would find the backdoor unilaterally - or just steal the keys outright.

No impact to cyberterrorism

Zero impact to cyber-attacks --- overwhelming consensus of qualified authors goes neg

- No motivation---can't be used for coercive leverage
- Defenses solve---benefits of offense are overstated
- Too difficult to execute/mistakes in code are inevitable
- AT: Infrastructure attacks
- Military networks are air-gapped/difficult to access
- Overwhelming consensus goes neg

Colin S. **Gray 13**, Prof. of International Politics and Strategic Studies @ the University of Reading and External Researcher @ the Strategic Studies Institute @ the U.S. Army War College, April, "Making Strategic Sense of Cyber Power: Why the Sky Is Not Falling," U.S. Army War College Press, <http://www.strategicstudiesinstitute.army.mil/pdffiles/PUB1147.pdf>

CONCLUSIONS AND RECOMMENDATIONS: **THE SKY IS NOT FALLING**. This analysis has sought to explore, identify, and explain the strategic meaning of cyber power. The organizing and thematic question that has shaped and driven the inquiry has been "So what?" Today we all do cyber, but this behavior usually has not been much informed by an understanding that reaches beyond the tactical and technical. I have endeavored to analyze in strategic terms what is on offer from the largely technical and tactical literature on cyber. What can or might be done and how to go about doing it are vitally important bodies of knowledge. But at least as important is understanding what cyber, as a fifth domain of warfare, brings to national security when it is considered strategically. Military history is stocked abundantly with examples of tactical behavior unguided by any credible semblance of strategy. This inquiry has not been a campaign to reveal what cyber can and might do; a large literature already exists that claims fairly convincingly to explain "how to . . ." But what does cyber power mean, and how does it fit strategically, if it does? These Conclusions and Recommendations offer some understanding of this fifth geography of war in terms that make sense to this strategist, at least. ¶ 1. Cyber can only be an enabler of physical effort. Stand-alone (popularly misnamed as "strategic") cyber action is inherently grossly limited by its immateriality. The physicality of conflict with cyber's human participants and mechanical artifacts has not been a passing phase in our species' strategic history. Cyber action, quite independent of action on land, at sea, in the air, and in orbital space, certainly is possible. But the strategic logic of such behavior, keyed to anticipated success in tactical achievement, is not promising. To date, "What if . . ." speculation about strategic cyber attack usually is either contextually too light, or, more often, contextually unpersuasive.⁴⁹ However, this is not a great strategic truth, though it is a judgment advanced with considerable confidence. Although societies could, of course, be hurt by cyber action, it is important not to lose touch with the fact, in Libicki's apposite words, that "i[n] the absence of physical combat, cyber war cannot lead to the occupation of territory. It is almost inconceivable that a sufficiently vigorous cyber war can overthrow the adversary's government and replace it with a more pliable one."⁵⁰ In the same way that the concepts of sea war, air war, and space war are fundamentally unsound, so also the idea of cyber war is unpersuasive. ¶ It is not impossible, but then, neither is war conducted only at sea, or in the air, or in space. On the one hand, cyber war may seem more probable than like environmentally independent action at sea or in the air. After all, cyber warfare would be very unlikely to harm human beings directly, let alone damage physically the machines on which they depend. These near-facts (cyber attack might cause socially critical machines to behave in a rogue manner with damaging physical consequences) might seem to render cyber a safer zone of belligerent engagement than would physically violent action in other domains. But most likely there would be serious uncertainties pertaining to the consequences of cyber action, which must include the possibility of escalation into other domains of conflict. Despite popular assertions to the contrary, cyber is not likely to prove a precision weapon anytime soon.⁵¹ In addition, assuming that the political and strategic contexts for cyber war were as serious as surely they would need to be to trigger events warranting plausible labeling as cyber war, the distinctly limited harm likely to follow from cyber assault would hardly appeal as prospectively effective coercive moves. On balance, it is most probable that cyber's strategic future in war will be as a contributing enabler of effectiveness of physical efforts in the other four geographies of conflict. Speculation about cyber war, defined strictly as hostile action by networked computers against networked computers, is hugely unconvincing. ¶ 2. Cyber defense is difficult, but should be sufficiently effective. The structural advantages of the offense in cyber conflict are as obvious as they are easy to

overstate. Penetration and exploitation, or even attack, **would need to be by surprise.** It can be swift almost beyond the imagination of those enclured by the traditional demands of physical combat. Cyber attack may be so stealthy that it escapes notice for a long while, or it might wreak digital havoc by complete surprise. And need one emphasize, that at least for a while, hostile cyber action is likely to be hard (though not quite impossible) to attribute with a cyberized equivalent to a "smoking gun." Once one is in the realm of the catastrophic "What if . . ." the world is indeed a frightening place. On a personal note, this defense analyst was for some years exposed to highly speculative briefings that hypothesized how unquentionably cunning plans for nuclear attack could so promptly disable the United States as a functioning state that our nuclear retaliation would likely be still-born. I should hardly need to add that the briefers of these Scary Scenarios were obliged to make a series of Heroic Assumptions. ¶ **The literature of cyber scare is more than mildly reminiscent of the nuclear attack stories with which I was assailed in the 1970s and 1980s.** As one may observe regarding what Winston Churchill wrote of the disaster that was the Gallipoli campaign of 1915, "[t]he terrible 'ifs' accumulate." 52 Of course, there are dangers in the cyber domain. Not only are there cyber-competent competitors and enemies abroad; there are also Americans who make mistakes in cyber operation. Furthermore, there are the manufacturers and constructors of the physical artifacts behind (or in, depending upon the preferred definition) cyber-space who assuredly err in this and that detail. **The more sophisticated—usually meaning complex—the code for cyber, the more certain must it be that mistakes both lurk in the program and will be made** in digital communication. ¶ What I have just outlined minimally is not a reluctant admission of the fallibility of cyber, but rather a statement of what is obvious and should be anticipated about people and material in a domain of war. All human activities are more or less harassed by friction and carry with them some risk of failure, great or small. A strategist who has read Clausewitz, especially Book One of *On War*, 53 will know this. Alternatively, anyone who skims my summary version of the general theory of strategy will note that Dictum 14 states explicitly that "Strategy is more difficult to devise and execute than are policy, operations, and tactics: friction of all kinds comprise phenomena inseparable from the making and execution of strategies." 54 Because of its often widely distributed character, the physical infrastructure of an enemy's cyber power is typically, though not invariably, an impracticable target set for physical assault. Happily, this probable fact should have only annoying consequences. The discretionary nature and therefore the variable possible characters feasible for friendly cyberspace(s), mean that the more dangerous potential vulnerabilities that in theory could be the condition of our cyber-dependency ought to be avoidable at best, or bearable and survivable at worst. Libicki offers forthright advice on this aspect of the subject that deserves to be taken at face value: ¶ [T]here is no inherent reason that improving information technologies should lead to a rise in the amount of critical information in existence (for example, the names of every secret agent). Really critical information should never see a computer; if it sees a computer, it should not be one that is networked; and if the computer is networked, it should be air-gapped. ¶ Cyber defense admittedly is difficult to do, but so is cyber offense. To quote Libicki yet again, "[i]n this medium [cyberspace] the best defense is not necessarily a good offense; it is usually a good defense." 56 Unlike the geostrategic context for nuclear-framed competition in U.S.–Soviet/Russian rivalry, the geographical domain of cyberspace definitely is defensible. Even when the enemy is both clever and lucky, it will be our own design and operating fault if he is able to do more than disrupt and irritate us temporarily. ¶ When cyber is contextually regarded properly—which means first, in particular, when it is viewed as but the latest military domain for defense planning—it should be plain to see that cyber performance needs to be good enough rather than perfect. 57 Our Landpower, sea power, air power, and prospectively our space systems also will have to be capable of accepting combat damage and loss, then recovering and carrying on. There is no fundamental reason that less should be demanded of our cyber power. Second, given that cyber is not of a nature or potential character at all likely to parallel nuclear dangers in the menace it could contain, we should anticipate international cyber rivalry to follow the competitive dynamic path already followed in the other domains in the past. Because the digital age is so young, the pace of technical change and tactical invention can be startling. However, the mechanization RMA of the 1920s and 1930s recorded reaction to the new science and technology of the time that is reminiscent of the cyber alarmism that has flourished of recent years. 58 We can be confident that **cyber defense should be**

able to **function well enough, given the strength of political, military, and commercial motivation for it to do so.** The technical context here is a medium that is a constructed one, which provides air-gapping options for choice regarding the extent of networking. Naturally, a price is paid in convenience for some closing off of possible cyberspace(s), but all important defense decisions involve choice, so what is novel about that? There is nothing new about accepting some limitations on utility as a price worth paying for security.¶ 3. Intelligence is critically important, but information should not be overvalued. The strategic history of cyber over the past decade confirms what we could know already from the science and technology of this new domain for conflict. Specifically, cyber power is not technically forgiving of user error. Cyber warriors seeking criminal or military benefit require precise information if their intended exploits are to succeed. Lucky guesses should not stumble upon passwords, while **efforts to disrupt** electronic Supervisory Control and Data Acquisition (SCADA) systems **ought to be unable to achieve widespread harmful effects.** But obviously there are practical limits to the air-gap operation, given that control (and command) systems need to be networks for communication. However, Internet connection needs to be treated as a potential source of serious danger.¶ It is one thing to be able to be an electronic nuisance, to annoy, disrupt, and perhaps delay. But it is quite another to be capable of inflicting real persisting harm on the fighting power of an enemy. **Critically important military computer networks are, of course, accessible neither to the inspired amateur outsider, nor to the malignant political enemy.** Easy passing reference to a hypothetical “cyber Pearl Harbor” **reflects both poor history and ignorance of contemporary military common sense.** Critical potential military (and other) **targets for cyber attack are extremely hard to access and influence (I believe and certainly hope), and the technical knowledge, skills, and effort required to do serious harm to national security is forbiddingly high.** This is not to claim, foolishly, that cyber means absolutely could not secure **near-catastrophic results.** However, it is to say that **such a scenario is extremely improbable.** Cyber defense is advancing all the time, as is cyber offense, of course. But so discretionary in vital detail can one be in the making of cyberspace, that confidence—real confidence—in cyber attack could not plausibly be high. It should be noted that I am confining this particular discussion to what rather idly tends to be called cyber war. In political and strategic practice, it is unlikely that war would or, more importantly, ever could be restricted to the EMS. Somewhat rhetorically, one should pose the question: Is it likely (almost anything, strictly, is possible) that cyber war with the potential to inflict catastrophic damage would be allowed to stand unsupported in and by action in the other four geographical domains of war? I believe not.¶ Because we have told ourselves that ours uniquely is the Information Age, we have become unduly respectful of the potency of this rather slippery catch-all term. As usual, it is helpful to contextualize the allegedly magical ingredient, information, by locating it properly in strategic history as just one important element contributing to net strategic effectiveness. This mild caveat is supported usefully by recognizing the general contemporary rule that information per se harms nothing and nobody. The electrons in cyber-ized conflict have to be interpreted and acted upon by physical forces (including agency by physical human beings). As one might say, intelligence (alone) sinks no ship; only men and machines can sink ships! That said, there is no doubt that if friendly cyber action can infiltrate and misinform the electronic information on which advisory weaponry and other machines depend, considerable warfighting advantage could be gained. I do not intend to join Clausewitz in his disdain for intelligence, but I will argue that in strategic affairs, intelligence usually is somewhat uncertain. 59 Detailed up-to-date intelligence literally is essential for successful cyber offense, but it can be healthily sobering to appreciate that the strategic rewards of intelligence often are considerably exaggerated. The basic reason is not hard to recognize. Strategic success is a complex endeavor that requires adequate performances by many necessary contributors at every level of conflict (from the political to the tactical). ¶ When thoroughly reliable intelligence on the enemy is in short supply, which usually is the case, the strategist finds ways to compensate as best he or she can. The IT-led RMA of the past 2 decades was fueled in part by the prospect of a quality of military effectiveness that was believed to flow from “dominant battle space knowledge,” to deploy a familiar concept. 60 While there is much to be said in praise of this idea, it is not unreasonable to ask why it has been that our ever-improving battle space knowledge has been compatible with so troubled a course of events in the 2000s in Iraq and Afghanistan. What we might have misunderstood is not the value of knowledge, or of the information from which knowledge is quarried, or even the merit in the IT that passed information and knowledge around. Instead, we may well have failed to grasp and grip understanding of the whole context of war and strategy for which battle space knowledge unquestionably is vital. One must say “vital” rather than strictly essential, because relatively ignorant armies can and have fought and won despite their ignorance. History requires only that one’s net strategic performance is superior to that of the enemy. One is not required to be deeply well informed about the enemy. It is historically quite commonplace for armies to fight in a condition of more-than-marginal reciprocal and strategic cultural ignorance. Intelligence is king in electronic warfare, but such warfare is unlikely to be solely, or even close to solely, sovereign in war and its warfare, considered overall as they should be.¶ 4. Why the sky will not fall. More accurately, one should say that **the sky will not fall because of hostile action against us in cyberspace unless we are improbably careless and foolish.** David J. Betz and Tim Stevens strike the right note when they conclude that “[i]f cyberspace is not quite the hoped-for Garden of Eden, it is also not quite the pestilential swamp of the imagination of the cyber-alarmists.” 61 Our understanding of cyber is high at the technical and tactical level, but remains distinctly rudimentary as one ascends through operations to the more rarified altitudes of strategy and policy. **Nonetheless, our scientific, technological, and tactical knowledge and understanding clearly indicates that the sky is not falling and is unlikely to fall in the future as a result of hostile cyber action. This analysis has weighed the more technical and tactical literature on cyber and concludes, not simply on balance, that**

cyber alarmism has little basis save in the imagination of the alarmists. There is military and civil peril in the hostile use of cyber, which is why we must take cyber security seriously, even to the point of buying redundant capabilities for a range of command and control systems. So seriously should we regard cyber danger that it is only prudent to assume that we will be the target for hostile cyber action in future conflicts, and that some of that action will promote disruption and uncertainty in the damage it will cause.¶ That granted, this analysis recommends strongly that the U.S. Army, and indeed the whole of the U.S. Government, should strive to comprehend cyber in context. Approached in isolation as a new technology, it is not unduly hard to be overimpressed with its potential both for good and harm. But if we see networked computing as just the latest RMA in an episodic succession of revolutionary changes in the way information is packaged and communicated, the computer-led IT revolution is set where it belongs, in historical context. In modern strategic history, there has been only one truly game-changing basket of technologies, those pertaining to the creation and delivery of nuclear weapons. Everything else has altered the tools with which conflict has been supported and waged, but has not changed the game. The nuclear revolution alone raised still-unanswered questions about the viability of interstate armed conflict. However, it would be accurate to claim that since 1945, methods have been found to pursue fairly traditional political ends in ways that accommodate nonuse of nuclear means, notwithstanding the permanent presence of those means.¶ The light cast by general strategic theory reveals what requires revealing strategically about networked computers. Once one sheds some of the sheer wonder at the seeming miracle of cyber's ubiquity, instantaneity, and (near) anonymity, one realizes that cyber is just another operational domain, though certainly one very different from the others in its nonphysicality in direct agency. Having placed cyber where it belongs, as a domain of war, next it is essential to recognize that its nonphysicality compels that cyber should be treated as an enabler of joint action, rather than as an agent of military action capable of behaving independently for useful coercive strategic effect. There are stand-alone possibilities for cyber action, but they are not convincing as attractive options either for or in opposition to a great power, let alone a superpower. No matter how intriguing the scenario design for cyber war strictly or for cyber warfare, the logic of grand and military strategy and a common sense fueled by understanding of the course of strategic history, require one so to contextualize cyber war that its independence is seen as too close to absurd to merit much concern.

No risk or impact related to cyberterror

Bicchieri 2015 [LORENZO FRANCESCHI - staff writer at VICE Motherboard in Brooklyn, New York, where he covers hacking, information security, and digital rights. "The 'ISIS Cyberwar' Hype Machine Is Doing More Harm Than Good", MotherBoard,]

Yet, that didn't stop a new round of breathless hype. On Sunday, The Hill wrote that ISIS was preparing for "cyberwar" and an "all-out cyber crusade." Looks like ISIS wannabes successfully hacked the media once again. "Toss out a shitty video that claims that you do things that you're not—doesn't matter, we'll still overreact," Peter W. Singer, an author and well-known expert in cybersecurity, told Motherboard. Instead of responding with a "keep calm and carry on" attitude "we lose our shit." That being said, it's worth pointing out that ISIS could do real damage by doing espionage online, monitoring and tracking down dissidents who live in ISIS-controlled territories. That might have already happened. Last November someone targeted a Syrian citizen media group known as Raqqa Is Being Slaughtered Silently (RSS), which documents human rights crimes in Raqqa, the self-proclaimed capital of the ISIS caliphate. To date, however, there hasn't been a case of actual cyberterrorism—an act targeting computers systems that result in physical violence, as the FBI defines it. In fact, squirrels have been way more damaging to US critical infrastructure than cyberterrorists. Singer criticized the article, which he said is good for a "cyber laugh." But jokes apart, Singer warned that hyping ISIS hacking abilities rewards the group with useful attention that it can turn into recruiting power. Instead of responding with a "keep calm and carry on" attitude, Singer added, "we lose our shit." This encourages and incentivizes ISIS to keep attacking, or at least claim attacks—something that doesn't help anyone. Robert M. Lee, an active duty Air Force cyber warfare operations officer, agreed with Singer, and dismissed the hype on Twitter. "Terrorist groups will continue to use the internet to spread their message and perform hacktivist-type acts but nothing of significant damage," he wrote. "Performing significant damage requires more than just internet connected devices. It requires advanced logistical support and expertise." "Describing savvy use of social media as cyberwar is akin to describing Miley Cyrus as the Clausewitz of cyberwar." In other words, being good at social media, as ISIS is, doesn't mean you'll be a good hacker. The truth, as we reported before, is that all the cyberattacks attributed to ISIS in the recent past have been unsophisticated attacks carried out by what looks like online fanboys not at all affiliated with the group.

As Singer put it, "it's either sympathizers or people doing it for shits and giggles." As Singer explained in 2012, "cyberterrorism" is overhyped, just like our obsessive fear of sharks. As he put it, we are "15,000 times more likely to be hurt or killed by an accident involving a toilet," yet Discovery Channel has Shark Week and not Toilet Week.

No cyber impact

Jason Healey 2013 Jason, Director of the Cyber Statecraft Initiative at the Atlantic Council, "No, Cyberwarfare Isn't as Dangerous as Nuclear War", 3/20, www.usnews.com/opinion/blogs/world-report/2013/03/20/cyber-attacks-not-yet-an-existential-threat-to-the-us

America does not face an existential cyberthreat today, despite recent warnings. Our cyber vulnerabilities are undoubtedly grave and **the threats we face are severe but far from comparable to nuclear war.** ¶ The most recent alarms come in a Defense Science Board report on how to make military cybersystems more resilient against advanced threats (in short, Russia or China). It warned that the "cyber threat is serious, with potential consequences similar in some ways to the nuclear threat of the Cold War." Such fears were also expressed by Adm. Mike Mullen, then chairman of the Joint Chiefs of Staff, in 2011. He called cyber "The single biggest existential threat that's out there" because "cyber actually more than theoretically, can attack our infrastructure, our financial systems." ¶ **While it is true that cyber attacks might do these things, it is also true they have not only never happened but are far more difficult to accomplish than mainstream thinking believes.** The consequences from cyber threats may be similar in some ways to nuclear, as the Science Board concluded, but mostly, they are incredibly dissimilar. ¶ Eighty years ago, the generals of the U.S. Army Air Corps were sure that their bombers would easily topple other countries and cause their populations to panic, claims which did not stand up to reality. **A study of the 25-year history of cyber conflict,** by the Atlantic Council and Cyber Conflict Studies Association, **has shown** a similar dynamic where **the impact of disruptive cyberattacks has been consistently overestimated.** ¶ Rather than theorizing about future cyberwars or extrapolating from today's concerns, the history of cyberconflict that have actually been fought, shows that cyber incidents have so far tended to have effects that are either widespread but fleeting or persistent but narrowly focused. **No attacks, so far, have been both widespread and persistent. There have been no authenticated cases of anyone dying from a cyber attack. Any widespread disruptions, even the 2007 disruption against Estonia, have been short-lived** causing no significant GDP loss. ¶ Moreover, as with conflict in other domains, cyberattacks can take down many targets but keeping them down over time in the face of determined defenses has so far been out of the range of all but the most dangerous adversaries such as Russia and China. Of course, if the United States is in a conflict with those nations, cyber will be the least important of the existential threats policymakers should be worrying about. **Plutonium trumps bytes in a shooting war.** ¶ This is not all good news. Policymakers have recognized the problems since at least 1998 with little significant progress. Worse, the threats and vulnerabilities are getting steadily more worrying. **Still, experts have been warning of a cyber Pearl Harbor for 20 of the 70 years since the actual Pearl Harbor.** ¶ The transfer of U.S. trade secrets through Chinese **cyber espionage could someday accumulate into an existential threat. But it doesn't seem so seem just yet,** with only handwaving estimates of annual losses of 0.1 to 0.5 percent to the total U.S. GDP of around \$15 trillion. That's bad, but **it doesn't add up to an existential crisis** or "economic cyberwar."

Cyber threats are exaggerated hype – alarmist rhetoric and won't escalate

Thomas Rid, 2012 reader in war studies at King's College London, is author of "Cyber War Will Not Take Place" and co-author of "Cyber-Weapons.", March/April 2012, "Think Again: Cyberwar", <http://www.foreignpolicy.com/articles/2012/02/27/cyberwar?page=full>

"Cyberwar Is Already Upon Us." No way. "Cyberwar is coming!" John Arquilla and David Ronfeldt predicted in a celebrated Rand paper back in 1993. Since then, **it seems to have arrived** -- at least by the account of the U.S. military establishment, which is busy competing over who should get what share of

the fight. Cyberspace is "a domain in which the Air Force flies and fights," Air Force Secretary Michael Wynne claimed in 2006. By 2012, William J. Lynn III, the deputy defense secretary at the time, was writing that cyberwar is "just as critical to military operations as land, sea, air, and space." In January, the Defense Department vowed to equip the U.S. armed forces for "conducting a combined arms campaign across all domains -- land, air, maritime, space, and cyberspace." Meanwhile, growing piles of books and articles explore the threats of cyberwarfare, cyberterrorism, and how to survive them. Time for a reality check: Cyberwar is still more hype than hazard. Consider the definition of an act of war: It has to be potentially violent, it has to be purposeful, and it has to be political. The cyberattacks we've seen so far, from Estonia to the Stuxnet virus, simply don't meet these criteria. Take the dubious story of a Soviet pipeline explosion back in 1982, much cited by cyberwar's true believers as the most destructive cyberattack ever. The account goes like this: In June 1982, a Siberian pipeline that the CIA had virtually booby-trapped with a so-called "logic bomb" exploded in a monumental fireball that could be seen from space. The U.S. Air Force estimated the explosion at 3 kilotons, equivalent to a small nuclear device. Targeting a Soviet pipeline linking gas fields in Siberia to European markets, the operation sabotaged the pipeline's control systems with software from a Canadian firm that the CIA had doctored with malicious code. No one died, according to Thomas Reed, a U.S. National Security Council aide at the time who revealed the incident in his 2004 book, *At the Abyss*; the only harm came to the Soviet economy. But did it really happen? After Reed's account came out, Vasily Pchelintsev, a former KGB head of the Tyumen region, where the alleged explosion supposedly took place, denied the story. There are also no media reports from 1982 that confirm such an explosion, though accidents and pipeline explosions in the Soviet Union were regularly reported in the early 1980s. Something likely did happen, but Reed's book is the only public mention of the incident and his account relied on a single document. Even after the CIA declassified a redacted version of Reed's source, a note on the so-called Farewell Dossier that describes the effort to provide the Soviet Union with defective technology, the agency did not confirm that such an explosion occurred. The available evidence on the Siberian pipeline blast is so thin that it shouldn't be counted as a proven case of a successful cyberattack. Most other commonly cited cases of cyberwar are even less remarkable. Take the attacks on Estonia in April 2007, which came in response to the controversial relocation of a Soviet war memorial, the Bronze Soldier. The well-wired country found itself at the receiving end of a massive distributed denial-of-service attack that emanated from up to 85,000 hijacked computers and lasted three weeks. The attacks reached a peak on May 9, when 58 Estonian websites were attacked at once and the online services of Estonia's largest bank were taken down. "What's the difference between a blockade of harbors or airports of sovereign states and the blockade of government institutions and newspaper websites?" asked Estonian Prime Minister Andrus Ansip. Despite his analogies, the attack was no act of war. It was certainly a nuisance and an emotional strike on the country, but the bank's actual network was not even penetrated; it went down for 90 minutes one day and two hours the next. The attack was not violent, it wasn't purposefully aimed at changing Estonia's behavior, and no political entity took credit for it. The same is true for the vast majority of cyberattacks on record. Indeed, there is no known cyberattack that has caused the loss of human life. No cyberoffense has ever injured a person or damaged a building. And if an act is not at least potentially violent, it's not an act of war. Separating war from physical violence makes it a metaphorical notion; it would mean that there is no way to distinguish between World War II, say, and the "wars" on obesity and cancer. Yet those ailments, unlike past examples of cyber "war," actually do kill people. "A Digital Pearl Harbor Is Only a Matter of Time." Keep waiting. U.S. Defense Secretary Leon Panetta delivered a stark warning last summer: "We could face a cyberattack that could be the equivalent of

Pearl Harbor." Such alarmist predictions have been ricocheting inside the Beltway for the past two decades, and some scaremongers have even upped the ante by raising the alarm about a cyber 9/11. In his 2010 book, *Cyber War*, former White House counterterrorism czar Richard Clarke invokes the specter of nationwide power blackouts, planes falling out of the sky, trains derailing, refineries burning, pipelines exploding, poisonous gas clouds wafting, and satellites spinning out of orbit -- events that would make the 2001 attacks pale in comparison. But the empirical record is less hair-raising, even by the standards of the most drastic example available. Gen. Keith Alexander, head of U.S. Cyber Command (established in 2010 and now boasting a budget of more than \$3 billion), shared his worst fears in an April 2011 speech at the University of Rhode Island: "What I'm concerned about are destructive attacks," Alexander said, "those that are coming." He then invoked a remarkable accident at Russia's Sayano-Shushenskaya hydroelectric plant to highlight the kind of damage a cyberattack might be able to cause. Shortly after midnight on Aug. 17, 2009, a 900-ton turbine was ripped out of its seat by a so-called "water hammer," a sudden surge in water pressure that then caused a transformer explosion. The turbine's unusually high vibrations had worn down the bolts that kept its cover in place, and an offline sensor failed to detect the malfunction. Seventy-five people died in the accident, energy prices in Russia rose, and rebuilding the plant is slated to cost \$1.3 billion. Tough luck for the Russians, but here's what the head of Cyber Command didn't say: The ill-fated turbine had been malfunctioning for some time, and the plant's management was notoriously poor. On top of that, the key event that ultimately triggered the catastrophe seems to have been a fire at Bratsk power station, about 500 miles away. Because the energy supply from Bratsk dropped, authorities remotely increased the burden on the Sayano-Shushenskaya plant. The sudden spike overwhelmed the turbine, which was two months shy of reaching the end of its 30-year life cycle, sparking the catastrophe. If anything, the Sayano-Shushenskaya incident highlights how difficult a devastating attack would be to mount. The plant's washout was an accident at the end of a complicated and unique chain of events. Anticipating such vulnerabilities in advance is extraordinarily difficult even for insiders; creating comparable coincidences from cyberspace would be a daunting challenge at best for outsiders. If this is the most drastic incident Cyber Command can conjure up, perhaps it's time for everyone to take a deep breath. "Cyberattacks Are Becoming Easier." Just the opposite. U.S. Director of National Intelligence James R. Clapper warned last year that the volume of malicious software on American networks had more than tripled since 2009 and that more than 60,000 pieces of malware are now discovered every day. The United States, he said, is undergoing "a phenomenon known as 'convergence,' which amplifies the opportunity for disruptive cyberattacks, including against physical infrastructures." ("Digital convergence" is a snazzy term for a simple thing: more and more devices able to talk to each other, and formerly separate industries and activities able to work together.) Just because there's more malware, however, doesn't mean that attacks are becoming easier. In fact, potentially damaging or life-threatening cyberattacks should be more difficult to pull off. Why? Sensitive systems generally have built-in redundancy and safety systems, meaning an attacker's likely objective will not be to shut down a system, since merely forcing the shutdown of one control system, say a power plant, could trigger a backup and cause operators to start looking for the bug. To work as an effective weapon, malware would have to influence an active process -- but not bring it to a screeching halt. If the malicious activity extends over a lengthy period, it has to remain stealthy. That's a more difficult trick than hitting the virtual off-button. Take Stuxnet, the worm that sabotaged Iran's nuclear program in 2010. It didn't just crudely shut down the centrifuges at the Natanz nuclear facility; rather, the worm subtly manipulated the system. Stuxnet stealthily infiltrated the plant's networks, then hopped onto the protected control systems, intercepted input values from

sensors, recorded these data, and then provided the legitimate controller code with pre-recorded fake input signals, according to researchers who have studied the worm. Its objective was not just to fool operators in a control room, but also to circumvent digital safety and monitoring systems so it could secretly manipulate the actual processes. Building and deploying Stuxnet required extremely detailed intelligence about the systems it was supposed to compromise, and the same will be true for other dangerous cyberweapons. Yes, "convergence," standardization, and sloppy defense of control-systems software could increase the risk of generic attacks, but the same trend has also caused defenses against the most coveted targets to improve steadily and has made reprogramming highly specific installations on legacy systems more complex, not less.

Many barriers to a cyber-attack

Martin **Libicki**, October 2014, A Dangerous World? Threat Perceptions and US National Security, ed. Christopher Peeble & John Mueller, Martin Libicki is a senior management scientist at the RAND Corporation, where his research focuses on the effects of information technology on domestic and national security. He is the author of several books, including Conquest in Cyberspace: National Security and Information Warfare and Information Technology Standards: Quest for the Common Byte. He has also written two cyberwar monographs: Cyberwar and Cyberdeterrence and Crisis and Escalation in Cyberspace. Prior to joining RAND, Libicki was a senior fellow at the National Defense University, page # at end of card

An attack as large as posited would be unprecedented. No comparable major cyberattack has occurred since the Internet became accessible to the world's public 20 years ago. Although prior absence is no proof that it will never happen, it may be premature to declare a major attack inevitable. All the trend lines— good and bad— are rising at the same time: (a) the sophistication of attackers and defenders; (b) the salience of cyberattack as a weapon, but also the rising sensitivity to the prospect that such attacks are possible and must be countered; (c) the bandwidth available for organizing a flooding attack, but also to ward it off; and (d) the complexity of operational software (which increases the number of places where vulnerabilities can be found), but also the complexity of security software and systems (which deepens the number of levels an attack must overcome to succeed). (2014-10-14). A Dangerous World? Threat Perception and U.S. National Security (Kindle Locations 2518-2524). Cato Institute. Kindle Edition.

No impact to a cyber-attack

Brandon **Valeriano** and Ryan **Maness** 11/21/12, Lecturer in Social and Political Sciences at the University of Glasgow AND Ph.D. candidate at the University of Illinois at Chicago, "The Fog of Cyberwar," Foreign Affairs, www.foreignaffairs.com/articles/138443/brandon-valeriano-and-ryan-maness/the-fog-of-cyberwar?page=show

Some cyberattacks over the past decade have briefly affected state strategic plans, but none has resulted in death or lasting damage. For example, the 2007 cyberattacks on Estonia by Russia shut down networks and government websites and disrupted commerce for a few days, but things swiftly went back to normal. The majority of cyberattacks worldwide have been minor: easily corrected annoyances such as website defacements or basic data theft -- basically the

least a state can do when challenged diplomatically. Our research shows that although warnings about cyberwarfare have become more severe, the actual magnitude and pace of attacks do not match popular perception. Only 20 of 124 active rivals -- defined as the most conflict-prone pairs of states in the system -- engaged in cyberconflict between 2001 and 2011. And there were only 95 total cyberattacks among these 20 rivals. The number of observed attacks pales in comparison to other ongoing threats: a state is 600 times more likely to be the target of a terrorist attack than a cyberattack. We used a severity score ranging from five, which is minimal damage, to one, where death occurs as a direct result from cyberwarfare. Of all 95 cyberattacks in our analysis, the highest score -- that of Stuxnet and Flame -- was only a three.

Its just alarmist rhetoric

Jerry Brito (senior research fellow at the Mercatus Center and directs the Technology Policy Program at George Mason University) and Tate Watkins (research associate for the Technology Policy Program and the State and Local Policy Project at George Mason University) April 26, 2011 "Loving the Cyber Bomb? The Dangers of Threat Inflation in Cybersecurity Policy"
http://mercatus.org/sites/default/files/publication/WP1124_Loving_cyber_bomb.pdf

Cybersecurity is an important policy issue, but the alarmist rhetoric coming out of Washington that focuses on worst-case scenarios is unhelpful and dangerous. Aspects of current cyber policy discourse parallel the run-up to the Iraq War and pose the same dangers. Pre-war threat inflation and conflation of threats led us into war on shaky evidence. By focusing on doomsday scenarios and conflating cyber threats, government officials threaten to legislate, regulate, or spend in the name of cybersecurity based largely on fear, misplaced rhetoric, conflated threats, and credulous reporting. The public should have access to classified evidence of cyber threats, and further examination of the risks posed by those threats, before sound policies can be proposed, let alone enacted. Furthermore, we cannot ignore parallels between the military-industrial complex and the burgeoning cybersecurity industry. As President Eisenhower noted, we must have checks and balances on the close relationships between parties in government, defense, and industry. Relationships between these parties and their potential conflicts of interest must be considered when weighing cybersecurity policy recommendations and proposals. Before enacting policy in response to cyber threats, policymakers should consider a few things. First, they should end the cyber rhetoric. The alarmist rhetoric currently dominating the policy discourse is unhelpful and potentially dangerous. Next, they should declassify evidence relating to cyber threats. Overclassification is a widely acknowledged problem, and declassification would allow the public to verify before trusting blindly. They must also disentangle the disparate cyber threats so that they can determine who is best suited to address which threats. In cases of cyber crime and cyber espionage, for instance, private network owners may be best suited and may have the best incentive to protect their own valuable data, information, and reputations. After disentangling threats, policymakers can then assess whether a market failure or systemic problem exists when it comes to addressing each threat. Finally, they can estimate the costs and benefits of regulation and its alternatives and determine the most effective and efficient way to address disparate cyber threats.

No impact – effects of cyber-attacks are just temporary pinpricks to the system

Erik **Gartzke** is Professor of Government at the University of Essex and Associate Professor of Political Science at the University of California San Diego (“The Foreign Policy Essay: Erik Gartzke on “Fear and War in Cyberspace”” 12/1, <http://www.lawfareblog.com/2013/12/foreign-policy-essay-erik-gartzke-on-fear-and-war-in-cyberspace/>)

Should we fear cyberspace? The internet is said to be a revolutionary leveler, reducing the hard won military advantages of western powers, even as the dependence of developed nations on computer networks leaves them vulnerable to attack. Incidents like the Stuxnet worm and cyber attacks against U.S. government computers, apparently launched from servers in China, seem to testify to the need for concern. Yet, even if these details are correct—and some are not—**there is no reason to believe that the internet constitutes an Achilles heel for the existing world order.** To the contrary, cyberwar promises major advantages for status quo powers like the United States.

Contrasting a Logic of Possibilities with a Logic of Consequences

The ability to harm is ubiquitous. Anyone passing on the street could just punch you in the face. Still, violence is relatively rare in large part because little is typically gained from most potential uses of force. Perpetrators must ask not just “what harm can I inflict?” but “how can I benefit by inflicting harm?” In short, cyberwar requires a logic of consequences. Just as a morbid fear of being sucker punched at random may be misplaced, concern about cyberwar can be exaggerated if there is little to suggest how internet aggression can be of benefit to potential perpetrators.

Efficacy separates the widespread potential for harm from actual aggression. Nations, groups and persons threaten force to influence, compelling others to cooperate or deterring aggression. Violence is also exercised to alter the balance of power. If the damage inflicted is temporary, however, then aggression must be followed up with other actions, or an attack serves no purpose. Creating “a window of opportunity” cannot matter unless one intends to exercise the opportunity.

Fighting on the Internet

In isolation, **the internet is an inferior venue for achieving objectives** traditionally **associated with military violence, particularly coercion.** Traditional military capabilities are observable. Armies can be seen standing near city gates. Missiles can be observed in firing positions ready to launch. Capability coerces precisely because the effects of a contest can be anticipated. A city does not need to be stormed for inhabitants to imagine the consequences of an attack. Cyber coercion is problematic because capabilities are difficult to communicate without harming military potency. Targets cannot assess credibility unless they are given access to details of a planned cyber attack, but attackers cannot share this information with defenders without undermining their own attack. If instead a defender accedes to unverified threats, then it will invite a multitude of false claims.

Harm threatened can compel if it is credible and does not weaken the exercise of force. Harm inflicted can be used to threaten future harm, but only if the act of harming is a good indicator of future effectiveness. This works pretty well with war elephants, infantry brigades or high speed penetrating

bombers, where capability is not determined by whether the enemy knows they exist. But again the success of cyber aggression is unusually reliant on conditions of surprise and even an internet attacker that has succeeded before can be tempted to bluff if bluffing will be believed.

The bigger issue, however, is that the effects of internet attacks are temporary. Unlike a rocket strike on an oil refinery or demolition of critical elements of the transportation grid, cyber attacks generally achieve “soft kills,” temporary incapacitation that can be reversed relatively quickly at moderate cost. Unless it has a lasting effect on the balance of power, internet aggression serves either as an irritant, or as an adjunct to other, more traditional, forms of coercion or force.

Imagine that some unspecified cyber attack disables communication or transportation nodes in a target country. What then? While inconvenienced, the target will eventually get the lights back on and vehicles running. The target will then attempt to retaliate. Permanent harm inflicted over the internet can weaken an opponent and serve as a motive for aggression. Yet, harm inflicted over the internet, or at Pearl Harbor for that matter, only benefits the attacker if it can extract concessions from the target, or if the attack can be made to permanently weaken an opponent.

Considerable damage was done to the U.S. Pacific Fleet in the Pearl Harbor attack, but it failed to force the United States to be bargaining table, a critical component of Japan’s grand strategy. Though Japan’s leadership knew that total war with the United States would result in their defeat, they hoped for a limited contest. Cyberwar with no follow-on strategy is much more foolish than the Japanese plan in 1941 to the degree that the effects of an attack can be repaired more quickly. Any attack over the internet must either convert short-term advantages into long-term effects, or wager that the enemy will accept defeat in cyberspace lying down. A cyber Pearl Harbor has no purpose unless it is accompanied by a terrestrial attack precisely because the target is capable and is destined to respond to any serious attack with a vigorous reprisal. If the target is unlikely to succumb to traditional forms of aggression, then cyber attack makes very little sense, either.

Cyberwar Benefits the Strong

While many can imagine a cyber attack on the United States, few find it practical to speculate about physical invasion of U.S. territory. Yet, short of invasion, all that can be achieved by cyber attack are the kinds of pin pricks that anger and mobilize an enemy, rather than leading to concessions or defeat. It is far less difficult to imagine powerful nations invading weaker states. It is thus as an adjunct to existing capabilities that cyberwar is destined to prove most useful.

Cyberterror threats are exaggerated – too many vested interests for accurate predictions

Jerry **Brito** (senior research fellow at the Mercatus Center and directs the Technology Policy Program at George Mason University) and Tate **Watkins** (research associate for the Technology Policy Program and the State and Local Policy Project at George Mason University) April 26, **2011** “Loving the Cyber Bomb? The Dangers of Threat Inflation in Cybersecurity Policy”
http://mercatus.org/sites/default/files/publication/WP1124_Loving_cyber_bomb.pdf

An industrial complex reminiscent of the Cold War's may be emerging in cybersecurity today.

Some serious threats may exist, **but we have also seen evidence of threat inflation. Alarm raised over potential cyber threats has led to a cyber industry build-up and political competition over cyber pork.**

1. Build-up In many cases, those now inflating the scope and probability of cyber threats might well benefit from increased regulation and more government spending on information security.

Cybersecurity is a big and booming industry.¹⁶³ The U.S. government is expected to spend \$10.5 billion per year on information security by 2015, and analysts have estimated the worldwide market to be as much as \$140 billion per year.¹⁶⁴ The Department of Defense has also said it is seeking more than \$3.2 billion in cybersecurity funding for 2012.¹⁶⁵ In recent years, in addition to **traditional information security providers** like McAfee, Symantec, and Checkpoint, **defense contractors and consulting firms have recognized lucrative opportunities in cybersecurity.**¹⁶⁶ To weather probable cuts on

traditional defense spending, and to take advantage of the growing market, these firms have positioned themselves to compete with information security firms **for government contracts.**¹⁶⁷ Lockheed Martin, Boeing, L-3 Communications, SAIC, and BAE Systems have all launched cybersecurity business divisions in recent years.¹⁶⁸ Other traditional defense contractors, like Northrop Grumman, Raytheon, and ManTech International, have also invested in information security products and services.¹⁶⁹ Such investments appear to have positioned defense firms well. In 2009, the top 10 information technology federal contractors included Lockheed Martin, Boeing, Northrop Grumman, General Dynamics, Raytheon, SAIC, L-3 Communications, and Booz Allen Hamilton.¹⁷⁰ Traditional IT firms also see more opportunities to profit from cybersecurity business in both the public and private sectors.¹⁷¹ Earlier this year, a software security company executive noted —a very large rise in interest in spending on computer security by the government.¹⁷² And as one IT market analyst put it: —It's a cyber war and we're fighting it. In order to fight it, you need to spend more money, and some of the core beneficiaries of that trend will be the security software companies.¹⁷³ Some companies from diverse industries have also combined forces in the cybersecurity buildup. In 2009, a combination of defense, security, and tech companies, including Lockheed, McAfee, Symantec, Cisco, Dell, Hewlett-Packard, Intel, Juniper Networks, and Microsoft, formed a cybersecurity technology alliance to study threats and innovate solutions.¹⁷⁴ **IT lobbyists, too, have looked forward to cybersecurity budget increases,** to the dismay

of at least one executive at a small tech firm, who claimed, —**Money gets spent on the vendors who spend millions lobbying Congress.**¹⁷⁵ There are serious real online threats, and security firms, government agencies, the military, and private companies clearly must invest to protect against such threats. But **as with the Cold War bomber and missile gap frenzies, we must be wary of parties with vested interests exaggerating threats,** leading to unjustified and superfluous defense spending in the name of national security.

Don't believe their impacts – the cyber-industrial complex ensures wild exaggeration

Jerry **Brito** (senior research fellow at the Mercatus Center and directs the Technology Policy Program at George Mason University) **and** Tate **Watkins** (research associate for the Technology Policy Program and the State and Local Policy Project at George Mason University) April 26, **2011** “Loving the Cyber Bomb? The Dangers of Threat Inflation in Cybersecurity Policy”

http://mercatus.org/sites/default/files/publication/WP1124_Loving_cyber_bomb.pdf

The rhetoric of —cyber doom employed by proponents of increased federal intervention, however, lacks clear evidence of a serious threat that can be verified by the public. As a result, the United States may be witnessing a bout of threat inflation similar to that seen in the run-up to the Iraq War. Additionally, a cyber-industrial complex is emerging, much like the military-industrial complex of the Cold War. This complex may serve to not only supply cybersecurity solutions to the federal government, but to drum up demand for them as well

Even new cyberterror threats are exaggerated

Tom **Esper** (writer for ZDnet) January **2011** "Cyber-war risk is exaggerated, says OECD study"
<http://www.zdnet.co.uk/news/security/2011/01/17/cyber-war-risk-is-exaggerated-says-oecd-study-40091451/>

In a cyber-warfare report released on Monday, the OECD said that the risk of a catastrophic attack on critical national systems has been exaggerated. The majority of cyberattacks are low level and cause inconvenience rather than serious or long-term disruption, according to report co-author professor Peter Sommer of the London School of Economics. "There are many scare stories, which, when you test, don't actually pan out," Sommer said. "When you analyse malware, a lot is likely to be short term, or fail." Sophisticated malware such as Stuxnet, which targets industrial control processes, is the exception, not the norm, according to Sommer. Stuxnet used a number of zero-day vulnerabilities to target programmable logic controllers in frequency converter drives used mainly to control motors in uranium-enrichment facilities. Policy makers should be aware that a number of different cyber-events, disasters or physical attacks could come together to create a "perfect storm", says the report. However, a pure cyber-war would be unlikely to occur, with attacks on computer systems more likely to be used in conjunction with other, physical types of attacks.

No motivation – terrorists perceive other methods as more worthwhile

Sandeep **Bhardwaj** (Research Officer, Institute of Peace and Conflict Studies) August **2008**
"Cyberterrorism: Threat Exaggerated?"
http://www.ipcs.org/Terrorism_kashmirLevel2.jsp?action=showView&kValue=2675&subCatID=1014&status=article&mod=g

In conclusion, while the threat of cyber terrorism in terms of hacking, viruses and cyber attacks remains real, it is less serious than it is perceived to be. For a terrorist, a simple cost-benefit analysis would make clear that an IED, built with much less technical know-how, has a much larger impact than bringing down government networks. However, a much more pertinent and significant threat which is often ignored, is the help terrorists get from internet to make their operations easier, global and hence more effective. The internet is a tool that can be used to increase productivity and this could well refer to how much destruction can be caused in the world.

Cyberterror risk is exaggerated— but the really catastrophic attacks are impossible to pull off

Peter Singer 2012 Director, 21st Century Defense Initiative, Senior Fellow, Foreign Policy, November 2012, “The Cyber Terror Bogeyman”, Brookings, <http://www.brookings.edu/research/articles/2012/11/cyber-terror-singer>

About 31,300. That is roughly the number of magazine and journal articles written so far that discuss the phenomenon of cyber terrorism. Zero. That is the number of people that who been hurt or killed by cyber terrorism at the time this went to press. In many ways, cyber terrorism is like the Discovery Channel’s “Shark Week,” when we obsess about shark attacks despite the fact that you are roughly 15,000 times more likely to be hurt or killed in an accident involving a toilet. But by looking at how terror groups actually use the Internet, rather than fixating on nightmare scenarios, we can properly prioritize and focus our efforts. Part of the problem is the way we talk about the issue. The FBI defines cyber terrorism as a “premeditated, politically motivated attack against information, computer systems, computer programs and data which results in violence against non-combatant targets by subnational groups or clandestine agents.” A key word there is “violence,” yet many discussions sweep all sorts of nonviolent online mischief into the “terror” bin Various reports lump together everything from Defense Secretary Leon Panetta’s recent statements that a terror group might launch a “digital Pearl Harbor” to Stuxnet-like sabotage (ahem, committed by state forces) to hacktivism, WikiLeaks and credit card fraud. As one congressional staffer put it, the way we use a term like cyber terrorism “has as much clarity as cybersecurity — that is, none at all.” Another part of the problem is that we often mix up our fears with the actual state of affairs. Last year, Deputy Defense Secretary William Lynn, the Pentagon’s lead official for cybersecurity, spoke to the top experts in the field at the RSA Conference in San Francisco. “It is possible for a terrorist group to develop cyber-attack tools on their own or to buy them on the black market,” Lynn warned. “A couple dozen talented programmers wearing flip-flops and drinking Red Bull can do a lot of damage.” The deputy defense secretary was conflating fear and reality, not just about what stimulant-drinking programmers are actually hired to do, but also what is needed to pull off an attack that causes meaningful violence. The requirements go well beyond finding top cyber experts. Taking down hydroelectric generators, or designing malware like Stuxnet that causes nuclear centrifuges to spin out of sequence doesn’t just require the skills and means to get into a computer system. It’s also knowing what to do once you are in. To cause true damage requires an understanding of the devices themselves and how they run, the engineering and physics behind the target. The Stuxnet case, for example, involved not just cyber experts well beyond a few wearing flip-flops, but also experts in areas that ranged from intelligence and surveillance to nuclear physics to the engineering of a specific kind of Siemens-brand industrial equipment. It also required expensive tests, not only of the software, but on working versions of the target hardware as well. As George R. Lucas Jr., a professor at the U.S. Naval Academy, put it, conducting a truly mass-scale action using cyber means “simply outstrips the intellectual, organizational and personnel capacities of even the most well-funded and well-organized terrorist organization, as well as those of even the most sophisticated international criminal enterprises.” Lucas said the threat of cyber terrorism has been vastly overblown. “To be blunt, neither the 14-year-old hacker in your next-door neighbor’s upstairs bedroom, nor the two- or three-person al-Qaida cell holed up in some apartment in Hamburg are going to bring down the Glen Canyon and Hoover dams,” he said.

No cyber war

A Cyber war will never happen

Anna **Leach** 10/20/11, Author for The Journal of Strategic Studies, "killer cyberattacks wont happen", http://www.theregister.co.uk/2011/10/20/cyber_war_wont_be_real/

People worried about **a cyber-war** should calm down and stop worrying because it **will never happen**, a war studies academic has said. In the paper Cyber War Will Not Take Place Dr Thomas Rid confidently argues that **hacking and computer viruses never actually kill people**. An act of war must have the potential to be lethal, says Dr Rid, of King's College London, writing in The Journal of Strategic Studies, but hacking and cyber-attacks have much more in common with spying than, say, nuclear bombs. He believes that **although a "cyber war" conforms to the traditional definition of a two-sided conflict, a lethal one will never take place**. "The threat intuitively makes sense," Dr Rid says. "Almost everybody has an iPhone, an email address and a Facebook account. We feel vulnerable to cyber-attack every day. Cyber-war seems the logical next step." But worriers are misguided: Dr Rid states that to constitute cyber-warfare an action must be a "potentially lethal, instrumental and political act of force, conducted through the use of software". Yet, he says, **no single cyber attack has ever been classed as such and no single digital onslaught has ever constituted an act of war**. He concludes: **"Politically motivated cyber-attacks are simply a more sophisticated version of activities that have always occurred within warfare: sabotage, espionage and subversion."** Wait for those deadly country-wide digital infrastructure attacks, Dr Rid, just you wait.

No impact to cyber war/ won't escalate

Fox 11—Assistant Editor, InnovationNewsDaily (Stuart, 2 July 2011, "Why Cyberwar Is Unlikely," <http://www.securitynewsdaily.com/cyberwar-unlikely-deterrence-cyber-war-0931>

In the two decades since cyberwar first became possible, there hasn't been a single event that politicians, generals and security experts agree on as having passed the threshold for strategic cyberwar. In fact, the attacks that have occurred have fallen so far short of a proper cyberwar that many have begun to doubt that cyberwarfare is even possible. The reluctance to engage in strategic cyberwarfare stems mostly from the uncertain results such a conflict would bring, the lack of motivation on the part of the possible combatants and their shared inability to defend against counterattacks. Many of the systems that an aggressive cyberattack would damage are actually as valuable to any potential attacker as they would be to the victim. The five countries capable of large-scale cyberwar (Israel, the U.S., the U.K., Russia and China) have more to lose if a cyberwar were to escalate into a shooting war than they would gain from a successful cyberattack. "The half-dozen countries that have cyber capability are deterred from cyberwar because of the fear of the American response. **Nobody wants this to spiral out of control," said James Lewis, senior fellow and director of technology and public policy at the Center for Strategic and International Studies in Washington, D.C.** "The countries that are capable of doing this don't have a reason to," Lewis added. **"Chinese officials have said to me, 'Why would we bring down Wall Street when we own so much of it?' They like money almost as much as we do."** Big deterrent: retaliation Deterrence plays a major factor in preventing cyberwar. Attacks across the Internet would favor the aggressor so heavily that no country has developed an effective defense. Should one country initiate a cyberattack, the victim could quickly counter-attack, leaving both

countries equally degraded, Lewis told InnovationNewsDaily. Even if an attacker were to overcome his fear of retaliation, the low rate of success would naturally give him pause. Any cyberattack would target the types of complex systems that could collapse on their own, such as electrical systems or banking networks. But experience gained in fixing day-to-day problems on those systems would allow the engineers who maintain them to quickly undo damage caused by even the most complex cyberattack.

said George Smith, a senior fellow at Globalsecurity.org in Alexandria, Va. "You mean to tell me that the people who work the electrical system 24 hours a day don't respond to problems? What prevents people from turning the lights right back on?" Smith told SecurityNewsDaily. "And attacks on the financial system have always been a non-starter for me. I mean, [in 2008] the financial system attacked the U.S.!"

Cyber war infeasible

Paul Clark, 2012 MA candidate – Intelligence Studies @ American Military University, senior analyst – Chenega Federal Systems, 4/28/12 (Paul, "The Risk of Disruption or Destruction of Critical U.S. Infrastructure by an Offensive Cyber Attack," American Military University)

The Department of Homeland Security worries that our critical infrastructure and key resources (CIKR) may be exposed, both directly and indirectly, to multiple threats because of CIKR reliance on the global cyber infrastructure, an infrastructure that is under routine cyberattack by a "spectrum of malicious actors" (National Infrastructure Protection Plan 2009). CIKR in the extremely large and complex U.S. economy spans multiple sectors including agricultural, finance and banking, dams and water resources, public health and emergency services, military and defense, transportation and shipping, and energy (National Infrastructure Protection Plan 2009). The disruption and destruction of public and private infrastructure is part of warfare, without this infrastructure conflict cannot be sustained (Geers 2011). Cyber-attacks are desirable because they are considered to be a relatively "low cost and long range" weapon (Lewis 2010), but prior to the creation of Stuxnet, the first cyber-weapon, the ability to disrupt and destroy critical infrastructure through cyber-attack was theoretical. The movement of an offensive cyber-weapon from conceptual to actual has forced the United States to question whether offensive cyber-attacks are a significant threat that are able to disrupt or destroy CIKR to the level that national security is seriously degraded. It is important to understand the risk posed to national security by cyber-attacks to ensure that government responses are appropriate to the threat and balance security with privacy and civil liberty concerns. The risk posed to CIKR from cyber-attack can be evaluated by measuring the threat from cyber-attack against the vulnerability of a CIKR target and the consequences of CIKR disruption. As the only known cyber-weapon, Stuxnet has been thoroughly analyzed and used as a model for predicting future cyber-weapons. The U.S. electrical grid, a key component in the CIKR energy sector, is a target that has been analyzed for vulnerabilities and the consequences of disruption predicted – the electrical grid has been used in multiple attack scenarios including a classified scenario provided to the U.S. Congress in 2012 (Rohde 2012). Stuxnet will serve as the weapon and the U.S. electrical grid will serve as the target in this risk analysis that concludes that there is a low risk of disruption or destruction of critical infrastructure from an offensive cyber-weapon because of the complexity of the attack path, the limited capability of non-state adversaries to develop cyber-weapons, and the existence of multiple methods of mitigating the cyber-attacks. To evaluate the threat posed by a Stuxnet-like cyber-weapon, the complexity of the weapon, the available attack vectors for the weapon, and the resilience of the weapon must be understood. The complexity – how difficult and expensive it

was to create the weapon – identifies the relative cost and availability of the weapon; inexpensive and simple to build will be more prevalent than expensive and difficult to build. Attack vectors are the available methods of attack; the larger the number, the more severe the threat. For example, attack vectors for a cyberweapon may be email attachments, peer-to-peer applications, websites, and infected USB devices or compact discs. Finally, the resilience of the weapon determines its availability and affects its usefulness. A useful weapon is one that is resistant to disruption (resilient) and is therefore available and reliable. These concepts are seen in the AK-47 assault rifle – a simple, inexpensive, reliable and effective weapon – and carry over to information technology structures (Weitz 2012). The evaluation of Stuxnet identified malware that is “unusually complex and large” and required code written in multiple languages (Chen 2010) in order to complete a variety of specific functions contained in a “vast array” of components – it is one of the most complex threats ever analyzed by Symantec (Falliere, Murchu and Chien 2011). To be successful, Stuxnet required a high level of technical knowledge across multiple disciplines, a laboratory with the target equipment configured for testing, and a foreign intelligence capability to collect information on the target network and attack vectors (Kerr, Rollins and Theohary 2010). The malware also needed careful monitoring and maintenance because it could be easily disrupted; as a result Stuxnet was developed with a high degree of configurability and was upgraded multiple times in less than one year (Falliere, Murchu and Chien 2011). Once introduced into the network, the cyber-weapon then had to utilize four known vulnerabilities and four unknown vulnerabilities, known as zero-day exploits, in order to install itself and propagate across the target network (Falliere, Murchu and Chien 2011). Zero-day exploits are incredibly difficult to find and fewer than twelve out of the 12,000,000 pieces of malware discovered each year utilize zero-day exploits and this rarity makes them valuable, zero-days can fetch \$50,000 to \$500,000 each on the black market (Zetter 2011). The use of four rare exploits in a single piece of malware is “unprecedented” (Chen 2010). Along with the use of four unpublished exploits, Stuxnet also used the “first ever” programmable logic controller rootkit, a Windows rootkit, antivirus evasion techniques, intricate process injection routines, and other complex interfaces (Falliere, Murchu and Chien 2011) all wrapped up in “layers of encryption like Russian nesting dolls” (Zetter 2011) – including custom encryption algorithms (Karnouskos 2011). As the malware spread across the now-infected network it had to utilize additional vulnerabilities in proprietary Siemens industrial control software (ICS) and hardware used to control the equipment it was designed to sabotage. Some of these ICS vulnerabilities were published but some were unknown and required such a high degree of inside knowledge that there was speculation that a Siemens employee had been involved in the malware design (Kerr, Rollins and Theohary 2010). The unprecedented technical complexity of the Stuxnet cyber-weapon, along with the extensive technical and financial resources and foreign intelligence capabilities required for its development and deployment, indicates that the malware was likely developed by a nation-state (Kerr, Rollins and Theohary 2010). Stuxnet had very limited attack vectors. When a computer system is connected to the public Internet a host of attack vectors are available to the cyber-attacker (Institute for Security Technology Studies 2002). Web browser and browser plug-in vulnerabilities, cross-site scripting attacks, compromised email attachments, peer-to-peer applications, operating system and other application vulnerabilities are all vectors for the introduction of malware into an Internet-connected computer system. Networks that are not connected to the public internet are “air gapped,” a technical colloquialism to identify a physical separation between networks. Physical separation from the public Internet is a common safeguard for sensitive networks including classified U.S. government networks. If the target network is air gapped, infection can only occur through physical means – an infected disk or

USB device that must be physically introduced into a possibly access controlled environment and connected to the air gapped network. The first step of the Stuxnet cyber-attack was to initially infect the target networks, a difficult task given the probable disconnected and well secured nature of the Iranian nuclear facilities. Stuxnet was introduced via a USB device to the target network, a method that suggests that the attackers were familiar with the configuration of the network and knew it was not connected to the public Internet (Chen 2010). This assessment is supported by two rare features in Stuxnet – having all necessary functionality for industrial sabotage fully embedded in the malware executable along with the ability to self-propagate and upgrade through a peer-to-peer method (Falliere, Murchu and Chien 2011). Developing an understanding of the target network configuration was a significant and daunting task based on Symantec’s assessment that Stuxnet repeatedly targeted a total of five different organizations over nearly one year (Falliere, Murchu and Chien 2011) with physical introduction via USB drive being the only available attack vector. The final factor in assessing the threat of a cyber-weapon is the resilience of the weapon. There are two primary factors that make Stuxnet non-resilient: the complexity of the weapon and the complexity of the target. Stuxnet was highly customized for sabotaging specific industrial systems (Karnouskos 2011) and needed a large number of very complex components and routines in order to increase its chance of success (Falliere, Murchu and Chien 2011). The malware required eight vulnerabilities in the Windows operating system to succeed and therefore would have failed if those vulnerabilities had been properly patched; four of the eight vulnerabilities were known to Microsoft and subject to elimination (Falliere, Murchu and Chien 2011). Stuxnet also required that two drivers be installed and required two stolen security certificates for installation (Falliere, Murchu and Chien 2011); driver installation would have failed if the stolen certificates had been revoked and marked as invalid. Finally, the configuration of systems is ever-changing as components are upgraded or replaced. There is no guarantee that the network that was mapped for vulnerabilities had not changed in the months, or years, it took to craft Stuxnet and successfully infect the target network. Had specific components of the target hardware changed – the targeted Siemens software or programmable logic controller – the attack would have failed. Threats are less of a threat when identified; this is why zero-day exploits are so valuable. Stuxnet went to great lengths to hide its existence from the target and utilized multiple rootkits, data manipulation routines, and virus avoidance techniques to stay undetected. The malware’s actions occurred only in memory to avoid leaving traces on disk, it masked its activities by running under legal programs, employed layers of encryption and code obfuscation, and uninstalled itself after a set period of time, all efforts to avoid detection because its authors knew that detection meant failure. As a result of the complexity of the malware, the changeable nature of the target network, and the chance of discovery, Stuxnet is not a resilient system. It is a fragile weapon that required an investment of time and money to constantly monitor, reconfigure, test and deploy over the course of a year. There is concern, with Stuxnet developed and available publicly, that the world is on the brink of a storm of highly sophisticated Stuxnet-derived cyber-weapons which can be used by hackers, organized criminals and terrorists (Chen 2010). As former counterterrorism advisor Richard Clarke describes it, there is concern that the technical brilliance of the United States “has created millions of potential monsters all over the world” (Rosenbaum 2012). Hyperbole aside, technical knowledge spreads. The techniques behind cyber-attacks are “constantly evolving and making use of lessons learned over time” (Institute for Security Technology Studies 2002) and the publication of the Stuxnet code may make it easier to copy the weapon (Kerr, Rollins and Theohary 2010). However, this is something of a zero-sum game because knowledge works both ways and cyber-security techniques are also evolving, and “understanding attack techniques more clearly is

the first step toward increasing security” (Institute for Security Technology Studies 2002). **Vulnerabilities are discovered and patched**, intrusion detection and malware signatures are expanded and updated, and **monitoring** and analysis processes and methodologies are **expanded** and honed. **Once the element of surprise is lost, weapons and tactics are less useful**, this is the core of the argument that “uniquely surprising” **stratagems like Stuxnet are single-use, like Pearl Harbor and the Trojan Horse**, the “very success [of these attacks] **precludes their repetition**” (Mueller 2012). **This paradigm has already been seen in the “son of Stuxnet” malware – named Duqu by its discoverers – that is based on the same modular code platform that created Stuxnet (Ragan 2011). With the techniques used by Stuxnet now known, other variants such as Duqu are being discovered and countered by security researchers (Laboratory of Cryptography and System Security 2011). It is obvious that the effort required to create, deploy, and maintain Stuxnet and its variants is massive and it is not clear that the rewards are worth the risk and effort.** Given the location of initial infection and the number of infected systems in Iran (Falliere, Murchu and Chien 2011) it is believed that Iranian nuclear facilities were the target of the Stuxnet weapon. **A significant amount of money and effort was invested in creating Stuxnet but yet the expected result – assuming that this was an attack that expected to damage production – was minimal at best.** Iran claimed that **Stuxnet caused only minor damage**, probably at the Natanz enrichment facility, the Russian contractor Atomstroyeksport reported that no damage had occurred at the Bushehr facility, and an unidentified “senior diplomat” suggested that Iran was forced to shut down its centrifuge facility “for a few days” (Kerr, Rollins and Theohary 2010). **Even the most optimistic estimates believe that Iran’s nuclear enrichment program was only delayed by months, or perhaps years (Rosenbaum 2012).** The actual damage done by Stuxnet is not clear (Kerr, Rollins and Theohary 2010) and the primary damage appears to be to a higher number than average replacement of centrifuges at the Iran enrichment facility (Zetter 2011). Different targets may produce different results. The Iranian nuclear facility was a difficult target with limited attack vectors because of its isolation from the public Internet and restricted access to its facilities. **What is the probability of a successful attack against the U.S. electrical grid** and what are the potential consequences should this critical infrastructure be disrupted or destroyed? An attack against the electrical grid is a reasonable threat scenario since **power systems are “a high priority target for military and insurgents”** and there has been a trend towards utilizing commercial software and integrating utilities into the public Internet that has “increased vulnerability across the board” (Lewis 2010). **Yet the increased vulnerabilities are mitigated by an increased detection and deterrent capability** that has been “honed over many years of practical application” now that power systems are using standard, rather than proprietary and specialized, applications and components (Leita and Dacier 2012). The **security of the electrical grid is also enhanced by increased awareness** after a smart-grid hacking demonstration in 2009 and the identification of the Stuxnet malware in 2010; as a result **the public and private sector are working together in an “unprecedented effort” to establish robust security guidelines** and cyber security measures (Gohn and Wheelock 2010).

Their authors conflate threats

Paul Clark, MA candidate – Intelligence Studies @ American Military University, senior analyst –
Chenega Federal Systems, 2012

(Paul, “The Risk of Disruption or Destruction of Critical U.S. Infrastructure by an Offensive Cyber Attack,”
American Military University)

This increased focus on cyber-security has led to concern that **the perceived risk is greater than the actual risk**, a situation that has resulted in an imbalance between security and privacy and civil liberties (American Civil Liberties Union 2012). **In 1993** a Rand Corporation paper **predicted that “cyberwar is coming”** and **twenty years later the prediction is the same** and critics argue that cyber-war is **“more hype than hazard”**. **A review of high profile cyberattacks shows that, with the exception of Stuxnet and the limited Israeli disruption of Syrian air defense networks, most cyber-attacks are** categorized as **information theft, network compromise, or website defacement** (Lewis 2012). **Even the high profile threat of an “Electronic Pearl Harbor”** (Bronk 2009), **despite being repeated by senior government officials** like U.S. Defense Secretary Leon Panetta (Rid 2012), **has been found to be only a slight possibility** (Wilson 2005). There is no doubt that cyber-security is important. **Businesses** recognize this importance and **spent more than \$80 billion on computer network security in 2011** (Johnson 2012) and the federal government is expected to be spending \$10.5 billion per year by 2015 (Brito and Watkins 2012). **This response is appropriate when** data shows that the vast majority of **cyber-attacks are focused on espionage and the theft of intellectual property**. It is not clear why **senior government officials** and corporate executives **focus on high-impact low-probability events and engage in “alarmist rhetoric”** (Brito and Watkins 2011) **that skews the public perception of risk and creates an atmosphere of fear. The danger of an inappropriate response in reaction to an inflated threat** and prevalence of misinformation **is exemplified by the politicized intelligence that led to the invasion of Iraq** in 2003 (Brito and Watkins 2011). Understanding how information on the risk posed by cyber-attacks is poorly communicated and the public reaction to an increased perception of risk – fear – is important in identifying when the perceived risk is greater than the actual risk; when risk is more hype than threat. Critics of current cyber-security policy believe that **threats are being conflated; this results in a threat appearing larger than it is** (Brito and Watkins 2012). In essence, a wide variety of cyber-activity – political and social activity, criminal activity for profit, espionage, and offensive cyber-attack – are treated as presenting the same level of threat. **There is a wide divide between easily mounted and easily defended denial of service attacks on public websites and high-potential cyber-weapons** capable of severely **disrupting or destroying critical infrastructure** (Rid and McBurney 2012). **The rise of automated tools that allow for low-level cyber-attacks to be easily mounted has caused a significant increase in the number of cyber-attacks, a statistic often cited as proof of increased risk, but qualified cyber-security organizations have discarded the number of cyber-attacks as a metric and consider it to be meaningless** as a method of assessing the scope and effects of cyber-attacks (Wilson 2005). **Without differentiating** between generic malicious software and highly specialized and targeted offensive **cyber-attacks, the risk of cyber-attacks on critical infrastructure systems like the electrical grid cannot be properly assessed.**

The threshold for this impact is incredibly high – no chance of serious cyber war

Dr. James A. **Lewis**, senior fellow at CSIS where he writes on technology, national security and the international economy, October **2009** “The “Korean” Cyber Attacks and Their Implications for Cyber Conflict”

http://csis.org/files/publication/091023_Korean_Cyber_Attacks_and_Their_Implications_for_Cyber_Conflict.pdf

Only a few nations – Russia, China, Israel, France, the United States, and the United Kingdom, and perhaps a small number of the most sophisticated cyber criminals – **have the advanced capabilities needed to launch a cyber attack that could do serious and long-term damage** equivalent to sabotage or bombing and thus **rise to the level of an act of war**. A sophisticated attack against infrastructure requires planning, reconnaissance, resources and skills that are currently available only to these advanced cyber attackers. As part of their larger military planning, these nations have likely planned to

launch such attacks in the event of a crisis.⁸ Such attacks are not yet within the scope of capabilities possessed by most non-state hackers. **Serious cyber attack independent of some larger conflict is unlikely.** To transpose cyber to the physical world, **there are remarkably few instances of a nation engaging in covert sabotage attacks against another nation** (particularly larger powers) unless they were seeking to provoke or if conflict was imminent. **The political threshold for serious cyber attack** (as opposed to espionage) **by a nation-state is very high, likely as high as the threshold for conventional military action.** At a minimum, this suggests that a serious cyber attack is a precursor, a warning, that some more serious conflict is about to begin. **Absent such larger conflict, however, a nation-state is no more likely to launch a serious cyber attack than they are to shoot a random missile at an opponent.**⁹ **The risk is too great and the benefits of a cyber attack by itself too small for political leaders to authorize the use of this capability in anything short of a situation where they had already decided on military action. Cyber weapons are not decisive; cyber attack by itself will not win a conflict,** particularly against a large and powerful opponent. It is striking that to date; no cyber "attack" that rises above the level of espionage or crime has been launched outside of a military conflict.

It's literally impossible for terrorists to hack into and fire U.S. nuclear weapons because they have no connection to any outside networks

Newman, Slate Reporter, 4-28-14

(Lily Hay, "Why U.S. Nuclear Missile Silos Rely on Decades-Old Technology," accessed 3-14-15, http://www.slate.com/blogs/future_tense/2014/04/28/huge_floppy_disks_and_other_old_tech_is_common_at_air_force_nuclear_missile.html)

You'd probably expect to encounter all sorts of crazy technology in a U.S. Air Force nuclear silo. One you might not expect: **floppy disks.** Leslie Stahl of CBS's 60 Minutes reported from a Wyoming nuclear control center for a segment that aired on Sunday, and the Cold War-era tech she found is pretty amazing. But **it also makes sense.** The government built facilities for the Minuteman missiles in the 1960s and 1970s, and though the missiles have been upgraded numerous times to make them safer and more reliable, the bases themselves haven't changed much. And there isn't a lot of incentive to upgrade them. ICBM forces commander Maj. Gen. Jack Weinstein told Stahl that **the bases have extremely tight IT and cyber security, because they're not Internet-connected and they use such old hardware and software.** While on the base, missileers showed Stahl the 8-inch floppy disks they use as part of launch commands for the missiles. Later, in an interview with Weinstein, Stahl described the disk she was shown as "gigantic," and said she had never seen one that big. Weinstein explained, **"Those older systems provide us some, I will say, huge safety, when it comes to some cyber issues that we currently have in the world."**

A2 Cyber-attack collapses economy

At most \$1 billion in economic damage

Martin **Libicki**, October 2014, A Dangerous World? Threat Perceptions and US National Security, ed. Christopher Peeble & John Mueller, Martin Libicki is a senior management scientist at the RAND Corporation, where his research focuses on the effects of information technology on domestic and national security. He is the author of several books, including Conquest in Cyberspace: National Security and Information Warfare and Information Technology Standards: Quest for the Common Byte. He has also written two cyberwar monographs: Cyberwar and Cyberdeterrence and Crisis and Escalation in Cyberspace. Prior to joining RAND, Libicki was a senior fellow at the National Defense University, page # at end of card

The immediate and direct damage from a major cyberattack can range from zero to tens of billions of dollars (e.g., from a broad outage of electric power). Direct casualties would likely be few, and indirect casualties may have to be inferred from guessing what would have happened if, say, emergency 911 service had not been taken down. In this essay's scenario, total damage would likely be less than \$ 1 billion. Indirect effects may be larger if a cyberattack causes a great loss of confidence— in the banking system, for example, which could trigger a recession. But it is a stretch to argue that even a cyberattack that stopped the banking system completely (much less the sort that merely prevented 24– 7 access to a bank's website) would damage customers' confidence that their bank accounts would maintain their integrity. NASDAQ's three-hour shutdown on August 22, 2013, for example, did not spark a wave of selling. It would require data corruption (e.g., depositors' accounts being zeroed out) rather than temporary disruption, before an attack would likely cause depositors to question whether their deposits are safe.

A2 Grid attacks

No long-term shut-down of the power grid

Martin **Libicki**, October 2014, A Dangerous World? Threat Perceptions and US National Security, ed. Christopher Peeble & John Mueller, Martin Libicki is a senior management scientist at the RAND Corporation, where his research focuses on the effects of information technology on domestic and national security. He is the author of several books, including Conquest in Cyberspace: National Security and Information Warfare and Information Technology Standards: Quest for the Common Byte. He has also written two cyberwar monographs: Cyberwar and Cyberdeterrence and Crisis and Escalation in Cyberspace. Prior to joining RAND, Libicki was a senior fellow at the National Defense University, page # at end of card

Compared with terrorism involving conventional explosives, the ratio of death and destruction from cyberattacks is likely to be several orders of magnitude lower; in that respect, 9/11 was an outlier among terrorist attacks, with the March 11, 2004, Madrid attacks or the July 7, 2005, London attacks being more typical. It is by no means clear what the worst plausible disaster emanating from cyberspace might be (it is far clearer that it would not come from Iran, whose skills at cyberwarfare likely pale in comparison with China's, much less Russia's). Doomsayers argue that a coordinated attack on the national power grid that resulted in the loss of electric power for years would lead to widespread death from disease (absent refrigeration of medications) and starvation (the preelectrified farm sector was far less productive than today's). But even if their characterization of the importance of electricity were not exaggerated (it is), killing electric power for that long requires that equipment with lengthy repair times (e.g., transformers, few of which are made here) be broken. (2014-10-14). A Dangerous World? Threat Perception and U.S. National Security (Kindle Locations 2599-2604). Cato Institute. Kindle Edition.

Grid resilience means no impact and no attempt

Kaplan 07 (Eben-Associated Editor at the Council of Foreign Relations, "America's Vulnerable Energy Grid," 4-27-2007, http://www.cfr.org/publication/13153/americas_vulnerable_energy_grid.html) Attacks on infrastructure are an almost daily fact of life in Iraq. Experts caution the war in that country will produce a whole generation of terrorists who have honed their skills sabotaging infrastructure. In his recent book, The Edge of Disaster, CFR security expert Stephen E. Flynn cautions, "The terrorist skills acquired are being catalogued and shared in Internet chat rooms." But when it comes to Iraq's electrical grid, RAND economist Keith W. Crane says terrorists are not the main cause of disruptions: "Most of the destruction of the control equipment was looting," he says. Either way, Clark W. Gellings, vice president of the Electric Power Research Institute, an industry research organization, thinks the U.S. grid is an unlikely target. "It's not terribly sensational," he explains, "The system could overcome an attack in hours, or at worst, days." That said, attacks on electricity infrastructure could become common in future warfare: The U.S. military has designed an entire class of weapons designed to disable power grids.

AT: Drug D.A

Might be an AFF card Macaulay 08/25/14,

(Brian, Big Brother Is Watching You: Paranoia, Surveillance, and the Drug War

<http://www.thefix.com/content/surveillance-stingray-police-state-Brian-Macaulay2039>),MJ

How will the law ultimately handle the emergence of new technology and the eagerness of police to use it? [The United States Supreme Court has not always shown deference to defendants' constitutional rights where new innovations were concerned, particularly in drug enforcement. In the famous 1928 case of Olmstead v. United States, during the nation's first drug war \(that on alcohol\), the court took on the growing ubiquity of the telephone, and law enforcement's right to tap it.](#) In that case, the court held that wiretapping did not violate bootlegger Roy Olmstead's Fourth Amendment rights because listening to a telephone call involved only hearing, and no entry into a home or office. In effect, a phone call had the constitutional privacy protections of a person's statements shouted out a window. The court didn't change its mind on the issue for nearly 40 years, finally reversing the precedent in 1967. However, a few rulings in recent years may indicate that the current court seeks to put a firm leash on police using the wonders of the digital age. In *Kyllo v. United States* (2001), the justices ruled that the use of warrantless thermal imaging to discover an unusual amount of heat emitting from a suspect's home and thereby discover a cache of indoor marijuana plants violated his right to privacy. In *United States v. Jones* (2012), it was decided that attaching a GPS device to a suspect's car to track his movements also required a warrant. In June, the court went so far as to rule that in an arrest, the police cannot search a suspect's cell phone.

DEA mass surveillance practices and budget recently cut by Congress

Newman, director of media relations at the DPA, and Piper, director of the office of national affairs at the DPA, 6/3/15

(Tony and Bill, "Congress Votes to End DEA's Invasive Bulk Data Collection Program and Slashes Agency's Budget", Drug Policy Alliance (DPA), 6/03/15, <http://www.drugpolicy.org/news/2015/06/congress-votes-end-deas-invasive-bulk-data-collection-program-and-slashes-agencys-budge>, accessed 7/3/15, ZW)

WASHINGTON, D.C.—[Legislators voted by a simple voice vote last night to end the DEA's controversial bulk data collection programs](#), as part of the U.S. House of Representatives' consideration of the Fiscal Year 2016 Commerce, Justice, and Science Appropriations bill. [The House also passed three amendments that cut \\$23 million from the DEA's budget, and shifted it to fighting child abuse, processing rape test kits, reducing the deficit, and paying for body cameras on police officers to reduce law enforcement abuses.](#)

Drug Trafficking increasing now because of heroine and meth.

Miroff, 15 [Nick Miroff is the Washington Post's Latin America correspondent, roaming from the U.S.-Mexico borderlands to South America's southern cone. He has been a staff writer since 2006, reporting on politics, immigration, crime, and development in northern Virginia for the Post's Metro desk until 2009. He earned a Master's degree at the UC Berkeley Graduate School of Journalism (2006), and studied Spanish and Latin American Literature at UC Santa Cruz (2000). Miroff grew up in Albany, New York. From the article "Losing marijuana business, Mexican cartels push heroin and meth". The Washington Post, January 11th, 2015, http://www.washingtonpost.com/world/the_americas/losing-marijuana-business-mexican-cartels-push-heroin-and-meth/2015/01/11/91fe44ce-8532-11e4-abcf-5a3d7b3b20b8_story.html BL]

SAN YSIDRO, Calif. — [Mexican traffickers are sending a flood of cheap heroin and methamphetamine across the U.S. border](#) the latest drug seizure statistics show, in a new sign that America's marijuana decriminalization trend is upending the North American narcotics trade. The amount of cannabis seized by U.S. federal, state and local officers along the boundary with Mexico has fallen 37 percent since 2011, a period during which American marijuana consumers have increasingly turned to the more potent, higher-grade domestic varieties cultivated under legal and quasi-legal protections in more than two dozen U.S. states. [Made-in-the-USA marijuana is quickly displacing the cheap, seedy, hard-packed version](#)

harvested by the bushel in Mexico's Sierra Madre mountains. That has prompted Mexican drug farmers to plant more opium poppies and the sticky brown and black "tar" heroin they produce is channeled by traffickers into the U.S. communities hit hardest by prescription painkiller abuse, off-ering addicts a \$10 alternative to \$80-a-gram cocaine. "Legalization of marijuana for recreational use has given U.S. consumers access to high-quality marijuana, with genetically improved strains, grown in greenhouses," said Raul Benitez-Manaut, a drug-war expert at Mexico's National Autonomous University. "That's why the Mexican cartels are switching to heroin and meth." U.S. law enforcement agents seized 2,181 kilograms of heroin last year coming from Mexico, nearly three times the amount confiscated in 2009. Methamphetamine, too, has surged, mocking the Hollywood image of backwoods bayou labs and "Breaking Bad" chemists. The reality, according to Drug Enforcement Administration figures, is that 90 percent of the meth on U.S. streets is cooked in Mexico, where precursor chemicals are far easier to obtain. "The days of the large-scale U.S. meth labs are pretty much gone, given how much the Mexicans have taken over production south of the border and distribution into the United States," said Lawrence Payne, a DEA spokesman. "Their product is far superior, cheaper and more pure." Last year, 15,803 kilograms of the drug was seized along the border, up from 3,076 kilos in 2009. Criminal organizations are no longer going for bulk marijuana," said Sidney Aki, the U.S. Customs and Border Protection port director here at the agency's busiest crossing for pedestrians and passenger vehicles, just south of San Diego. Hard drugs are the growing trend, and they're profitable in small amounts." Voters in the District of Columbia and 23 U.S. states have approved marijuana for recreational or medical use, with Colorado, Washington state, Alaska and Oregon opting for full legalization.

Estimates of the size of America's marijuana harvest vary widely, and DEA officials say they do not know how quickly it may be increasing as a result of decriminalization. Mexican cartels continue to deploy people as "mules" strapped with 50-pound marijuana backpacks to hike through the Arizona borderlands and send commercial trucks into Texas with bales of shrink-wrapped cannabis so big they need to be taken out on a forklift. But the profitability of the marijuana trade has slumped on falling demand for Mexico's "brick weed," so called because it is crushed into airtight bundles for transport across the border. Drug farmers in the Sierra Madre say that they can barely make money planting mota anymore. The cartels, and consumers, are turning away from cocaine, too. Last year, U.S. agents confiscated 11,917 kilograms of cocaine along the Mexico border, down from 27,444 kilos in 2011.

This reflects lower demand for the drug in the United States, experts say, as well as a cartel business preference for heroin and meth. Those two substances can be cheaply produced in Mexico, unlike cocaine, which is far pricier, and therefore riskier, because it must be smuggled from South America. The Sinaloa cartel, considered Mexico's most powerful drug trafficking organization despite the capture last February of leader Joaquin "El Chapo" Guzman, remains the dominant criminal power along Mexico's Pacific Coast. Its territory spans the entire western half of the U.S.-Mexico boundary, from Ciudad Juarez, opposite El Paso, to Tijuana, on the Pacific Coast. At harvest time, the cartel's middlemen make their rounds to remote Sierra Madre stream valleys in pickup trucks and four-wheelers, armed with guns and cash. They buy sticky bales of raw opium from hardworking farmers and deliver them to crude heroin kitchens that prepare the drug for shipment. The U.S. interstate highway system is less than a day's drive away. Heroin and meth are far easier to transport and conceal than marijuana. Especially worrisome to U.S. officials is a growing trend of more border-crossing pedestrians carrying the drugs strapped under their clothing or hidden in body cavities. "The criminals are trying to blend in among the legitimate travelers, who are 99 percent of the individuals crossing through here," said Aki, the San Ysidro port director. "That's the hard part for us." At the San Ysidro crossing, soon to expand to 35 lanes, U.S. agents with drug-sniffing dogs and foot-long screwdrivers weave among the lines of cars that back up into Mexico. Agents say the screwdrivers, some so old their handles are worn to a nub, are their most valuable investigative tool. Agents knock them against tires and gas tanks for a quick sonic impression. "If you tap a tank with something solid inside, there's a thud," one inspector said. "It's like hitting concrete." Harder to detect are "deep-concealed" drugs buried in fake engine cylinders, dashboard panels, even acid-proof capsules inside car batteries. One vehicle seized here last year carried liquid meth in its windshield-wiper reservoir. Finding small packages in the river of cars and trucks coming across is akin to a game of "Where's Waldo?" for U.S. inspectors. Vehicles that arouse the suspicions of border agents or get their dogs barking and lunging are sent to a secondary inspection station with giant X-ray machines and larger teams of screwdriver-wielding inspectors. If drugs don't appear, the agents may drive the vehicles into garages to open their engines, pry apart interior panels and search for any signs of suspicious alterations. Traffickers will sometimes mist decoy vehicles with marijuana oil or resin to provoke the dogs and draw agents into a fruitless search. "It's like a fish fry," Aki said. "The fish is gone, but the scent is still there." With the dogs and agents tied up inspecting the decoys, the traffickers may try sneaking meth and heroin through. In recent years, Mexican cartels also have begun producing higher-value "white" heroin, typically associated with traffickers from Colombia or Asia, according to DEA officials. "The Mexicans are evolving in their production abilities and getting more sophisticated," said Payne, the DEA spokesman. "It's not just black tar anymore."

Colombian and Caribbean traffickers once controlled heroin distribution east of the Mississippi River, but Mexican criminal groups now dominate the entire North American market, he said. The United States has an estimated 600,000 heroin users, Payne said — a threefold increase in the past five years. But that number is dwarfed by the estimated 10 million Americans who abuse prescription painkillers. Those addicts are the prime target for the booming heroin business. A U.S. crackdown on prescription opiates has driven up the price for drugs such as OxyContin and Percocet, enticing desperate addicts to switch to cheap heroin to fend off withdrawal symptoms. The profile of U.S. heroin addiction is also changing, said Phil Herschman, chief clinical officer with the CRC Health Group, which operates 170 treatment centers in 30 U.S. states. "Now, we're seeing housewives coming in who had been addicted to Vicodin for two or three years before switching to heroin, or adolescents who got hooked by snorting it, thinking it was safe, only to end up injecting themselves," he said. "You can't even begin to measure how it tears families apart," he added. "It's devastating."

The war on drugs is unwinnable- the only way to win is to stop fighting

Winslow, 15 (Don Winslow, "It's Time to Legalize Drugs: An Open Letter to Congress and the President", The Daily Beast, June 28, 2015, <http://www.thedailybeast.com/articles/2015/06/28/it-s-time-to-legalize-drugs-an-open-letter-to-congress-and-the-president.html>) ET

Bestselling author Don Winslow, whose new novel *The Cartel* is now available, on how the only way to win the trillion-dollar War on Drugs is to stop fighting. This piece is also running as a paid ad by Winslow in today's print edition of *The Washington Post*. Let me come right out and say what you won't tell the American people. The War on Drugs is unwinnable. It was unwinnable for Nixon, Ford, Carter, Reagan, Bush, Clinton, Bush, and now Obama. At forty-four years, it's America's longest war and there's no end in sight. The people who benefit most from the War on Drugs are the traffickers. Every dollar we spend on drugs and every dollar we spend trying to interdict them raises the profits of the Mexican cartels and makes them more powerful. So in the very act of fighting this war, we lose it. Cops standing in front of big drug seizures look great on the evening news. But it sells a lie that we're winning, just like George Bush on an aircraft carrier declaring that a war was over that still rages on today. It's not only that we can't win this war, it's that we're destroying ourselves fighting it. We are literally addicted to the War on Drugs. A half-century of failed policy, \$1 trillion, and 45 million arrests has not reduced daily drug use—at all. The U.S. still leads the world in illegal drug consumption, drugs are cheaper, more available, and more potent than ever before. Our justice system is a junkie, demanding its daily fix of arrests, seizures and convictions. It needs drugs. It's as hooked as that guy sticking a needle into his arm even though he knows it's killing him. Towns that used to compete for factories now campaign for penitentiaries because caging our citizens has become big business. Prison privatization—corrections as capitalism—has increased 1600 percent between 1990 and 2010. More African-American men are in prison or in the "system" today than there were slaves in 1850. And you don't just throw an individual behind bars, you throw his or her whole family. Almost 3 million kids have a parent in jail on a drug charge, and they're more likely to be on welfare, drop out of

school, go out on the corner and sell drugs to start the whole tragic cycle all over again. Drugs begin the destruction of families and the justice system finishes them off.

Throughout its history, the War on Drugs has disproportionately impacted minorities—it is a war on people, specifically communities of color. “Right now we have the worst of both worlds. In vast blocks of cities, the only incomes come from the government or from drugs.” That was Bill Clinton in 1992, and 23 years later nothing has changed. The Cato Institute estimates that legalizing all drugs would save the country \$41 billion a year. Taxing drugs at the same rate that we tax alcohol and tobacco... would yield \$46 billion in tax revenues. Police departments have become occupying armies. We can draw a direct line between the War on Drugs and the recent events in Ferguson, Cleveland, Baltimore, and elsewhere. The militarization of our police departments began with the reaction to the crack epidemic of the 1980s. Heavily armed SWAT teams battering down doors in the middle of the night, arresting thousands of young men, have turned American neighborhoods into war zones and spawned a hostile and deadly relationship with our inner-city communities. Proof that this militarization isn’t working is its escalation: In 1972 there were a few hundred paramilitary drug raids; 1980 saw 3,000; 2001 had 40,000; and last year that doubled to 80,000. Of course, if the raids were working, there’d be fewer of them, not more. The War on Drugs isn’t just a failure, it’s a disaster. U.S. drug policy works great—for the Mexican cartels. Your votes have consequences: In 1994 you voted in NAFTA, the North American Free Trade Agreement, which DEA agents on the front line call the North American Free Drug Trade Agreement. So while you were passing severe laws against drug possession at home, you were enabling thousands of trailer trucks of dope to come across the border and flood our cities. Our drug policy toward Mexico has been so bad that former President Clinton apologized to the Mexican people in February of this year, saying, “I wish you had no narco-trafficking, but it’s not really your fault. Basically, we did too good of a job taking the transportation out of the air and water, and so we ran it over land. I apologize for that.” It’s not the “Mexican Drug Problem.” It’s the American Drug Problem. It’s simple: No buyer, no seller. We fund the killing, fuel the killing, and sustain the killing. As a result, 100,000 people in Mexico are dead just since 2006.

More surveillance means less security

Winslow, 15 (Don Winslow, “It’s Time to Legalize Drugs: An Open Letter to Congress and the President”, The Daily Beast, June 28, 2015, <http://www.thedailybeast.com/articles/2015/06/28/it-s-time-to-legalize-drugs-an-open-letter-to-congress-and-the-president.html>) ET

You’re so concerned about terrorists thousands of miles away that you don’t see the terrorists just across our border. The cartels are more sophisticated and wealthier than the jihadists and already have a presence in 230 American cities. The cartels were running the ISIS playbook—decapitations, immolations, videos, social media—ten years ago. Many of you keep talking about building a wall that stretches the entire 2,000-mile land border with Mexico. It doesn’t matter how high a wall you build if the traffickers can tunnel under it. You’ve read about these tunnels, with railroad tracks, air-conditioning, elevators, and dormitories. Now drug traffickers use them, but how long will it be before terrorists figure out that this is a way to get into our country? Those tunnels only exist because drugs are illegal. Your “tough on crime” stance makes us soft on security. We never learn. Since 2005, Congress has spent \$2.5 billion on the Merida Initiative, providing weapons, helicopters, fixed-wing aircraft, surveillance technology, and especially training to Mexican counter-drug agencies. But DEA agents in the field regularly report that these agencies have criminal connections to the cartels, even serving as their armed forces, and have been involved in the massacres of innocent civilians. We are funding our own drug epidemic. Our Mexico strategy is such a complete failure that during Operation Fast and Furious, the ATF violated the very federal laws it was created to enforce, facilitating arms smuggling to drug traffickers in an effort to trace them. The ATF lost track of the automatic rifles that were then used to murder Border Patrol Agent Brian Terry, Mexican ambassador to the U.S. Arturo Sarukhan said, “The thinking that you can let guns walk across the border and maintain operational control of those weapons is really an outstanding lack of understanding of how these criminal organizations are operating on both sides of our common borders.” In Afghanistan, Congress authorized \$108 million to “incentivize” provinces to reduce poppy cultivation. Instead, they built irrigation systems to water the poppies. So far, you’ve spent \$7.6 billion to fight the drug war in Afghanistan, and opium production there has tripled. We should be using our resources to fix our crumbling schools, create jobs, and fund drug treatment. Because interdiction increases supply while education reduces demand. Education is cheaper than incarceration. Keeping someone in a classroom costs one quarter of what it costs to keep him in a cell. But, thanks to the War on Drugs, America is home to the largest prison population in the history of the planet. You know how we got to this point. At the height of the drug war hysteria, and desperate to appear tough on crime, Congress overreacted and passed insanely over-the-top laws

forcing judges to put nonviolent drug offenders into prison for mandatory terms of 15 years to life. The prison population exploded. Now we have 5 percent of the world's people but 25 percent of the world's convicts. That's 2.3 million Americans behind bars, half of them on drug-related offenses. Eric Sterling, a lawyer and one of the architects of the 1986 federal sentencing laws, later wrote that they were a terrible mistake, "among the most reviled Acts of Congress in recent years." U.S. District Judge Mark Bennett says that he feels guilt and sorrow when he has to sentence nonviolent drug offenders to long mandatory terms and tells them, "My hands are tied...I'm sorry. This isn't up to me." We cannot incarcerate our way out of this problem. We've failed. And both sides of the aisle agree: President Obama, April 2015: "I am a very strong believer that the path that we have taken in the United States in the so-called 'war on drugs' has been so heavy in emphasizing incarceration that it has been counterproductive." Governor Chris Christie, June 7, 2015: "I think quite frankly the war on drugs has been a failure." Three-quarters of American voters today agree with them. In a May 2014 drug raid with a "no-knock" warrant, a Georgia SWAT team threw a flash bang grenade into a baby's playpen. That 1-year-old child, Bounkham Phonesavanh, suffered critical burns. David Simon has said, "Probable cause was destroyed by the drug war." We torched our civil rights, and now we burn babies along with them. That's not who we are. At least that's not who we should be. The Cato Institute estimates that legalizing all drugs would save the country \$41 billion a year. Taxing drugs at the same rate that we tax alcohol and tobacco (by far the biggest killers among drugs), would yield \$46 billion in tax revenues. With that kind of money, you could shrink the deficit, grow the economy, create businesses in inner cities, provide treatment for addicts—things that might actually do something about the drug problem. Appearing tough on crime is not the same as being tough on crime. Being tough on crime means making some hard decisions. We need to stop thinking about how to fight this war better, but how not to fight it at all. We need leadership and legislation. We need Congress to have the courage to step up and say not that the system is broken and in need of repair, but that in 1971 we made a colossal trillion-dollar mistake that has destroyed this country, and it has to stop. How much more money do we have to waste, how many more families have to be destroyed, how many more people have to be killed before you summon the courage to tell the truth to the American people? The War on Drugs is not only futile, it is wrong. The answer is legalization. The only way to win is to stop fighting.

The coast guard is successfully stopping drug trafficking now

Edge, 15 (Sami Edge, "Coast Guard Succeeds in Drug-Trafficking Mission", Seattle Times, July 1, 2015, <http://www.military.com/daily-news/2015/07/01/coast-guard-succeeds-in-drug-trafficking-mission.html>) ET

Parents, spouses, children and friends gathered in the midmorning sun Tuesday on Seattle's Pier 36 to greet the return of the Coast Guard cutter Midgett after a 71-day deployment. Signs that read "My sun and my stars, home at last," and "The Mrs. needs a kiss" hailed the 184 guardsmen aboard the ship. The Midgett left Seattle on April 21 to take part in "Operation Martillo," a combined military and international campaign aimed at drug trafficking in the eastern Pacific. In more than two months at sea, law-enforcement officers aboard the Midgett seized more than 12,100 pounds of cocaine and arrested 22 suspected smugglers from seven vessels in international waters. The cocaine was worth an estimated \$180 million wholesale, according to the Coast Guard. "This was significant for the Midgett," Capt. Brendan McPherson, commanding officer of the cutter, said from the pier. McPherson said it was the "most successful" campaign he's seen in his 26 years in the Coast Guard. The crew of the Midgett worked closely with the U.S. Navy, Customs and Border Protection and Coast Guard maritime patrol aircraft to locate drug shipments. They also relied on cooperation from countries throughout Central and South America, like Guatemala, Colombia and Peru. McPherson says these partnerships and resources had a lot to do with the mission's accomplishments, but attributes much of the Midgett's performance to the "extraordinary professionalism and tactical prowess" of the ship's crew. Related Video: McPherson singled out Petty Officer Kira Patino, a pursuit coxswain who drives a 25-foot rigid hull inflatable boat that the cutter deploys to chase down drug runners. Her team of five, including a trained marksman, communicates with the cutter to outmaneuver drug dealer's boats. At times, they've had to shoot out the engines of a vessel to get it to stop. "You brace yourself for the worst, and hope for the best," Patino said. A six-year Coast Guard veteran, Patino was making her last voyage aboard the Midgett after three years. "We set a high bar and we accomplished it," Patino said. "It made my last patrol one of the best." Patino wasn't the only guardsman returning to Pier 36 for the last time. On the dock, Jillian Knoepfel patiently awaited the return of her husband, Reid. In the two months that he's been away, Jillian graduated from the business program at the University of Washington, took care of their two children, Makenlee, 5, and Linden, 3, and packed up their house for an upcoming move. "There were nights I was ready to pull my hair out for school, but also trying to take care of (my kids) who were missing him," Knoepfel said. "It was pretty rough, but we got through it." But she understands. Knoepfel and her husband met in the Coast Guard eight years ago. She left the military to care for the kids shortly before he was relocated from Florida to Seattle. They leave for the next assignment in Virginia on Thursday. "We're very excited," she said about her husband's return.

Non-Unique – we're losing the war on drugs

Gordon, author of *Mainstreaming Torture: Ethical Approaches in the Post-9/11 United States*, 3/23/15

(Rebecca, teacher in the philosophy department at the University of San Francisco and a member of the War Times/Tiempo de Guerras collective, “When the War on Drugs in Mexico Comes Back Home to the U.S.: Like the Islamic State, the Mexican drug cartels’ power has increased as the result of disastrous U.S. policies.”, In These Times, 3/23/15, <http://inthesetimes.com/article/17782/when-the-war-on-drugs-in-mexico-comes-back-home-to-the-u.s>, accessed 7/6/15, ZW)

All in all, the U.S. drug war in Mexico has been an abject failure. In spite of high-profile arrests, including in 2014 Joaquín “El Chapo” Guzmán, who ran the Sinaloa group, and in 2015 Servando “La Tuta” Gómez, head of the Knights Templar Cartel in Michoacán, the cartels seem as strong as ever. They may occasionally split and reassemble, but they are still able to move plenty of product, and reap at least \$20 billion a year in sales in the United States. In fact, this country remains the world’s premier market for illegal drugs. The cartels are responsible for the majority of the methamphetamine sold in the United States today. Since 2006, when a federal law made it much harder to buy ephedrine and pseudoephedrine in this country, the cartels have replaced small-time U.S.-based meth cookers. The meth they produce is purer than the U.S. product, apparently because it’s made with purer precursor chemicals available from China. The other big product is heroin, whose quickly rising consumption seems to be replacing the demand for cocaine in the United States. On the other hand, marijuana legalization appears to be cutting into the cross-border traffic in that drug. The Washington Post reports that almost 9% of Americans “age 12 or older—22.6 million people—are current users of illegal drugs, according to the Substance Abuse and Mental Health Services Administration.” That represents a one-third increase over the 6.2% in 1998. It takes a lot of infrastructure to move that much product. And that’s where U.S.-based gangs come in. Urban gangs in the United States today are not the Sharks and Jets of West Side Story. Certainly, there are still some small local groups formed by young people looking for family and solidarity on the streets. All too often, however, today’s gangs represent the well-run distribution arm of the international drug trade. In Chicago alone, 100,000 people work in illegal drug distribution, selling mostly into that city’s African-American community. Gang membership is skewing older every year, as gangs transform from local associations to organized, powerfully armed criminal enterprises. Well over half of present gang members are adults now. The communities where they operate live in fear, caught between the gangs that offer them employment while threatening their safety and militarized police forces they do not trust. Just like U.S. military adventures in the Middle East and Afghanistan, the U.S.-Mexico war on drugs has only left a larger problem in place, while producing blowback here at home. A particularly nasty example is the cartels’ use of serving U.S. military personnel and veterans as hit men here in the United States. But the effects are far bigger than that. The DEA told the Washington Post that Mexican cartels are operating in more than 1,200 U.S. cities. In all those cities, the failed war on drugs has put in prison 2.3 million people—in vastly disproportionate numbers from communities of color—without cutting demand by one single kilo. And yet, though that war has only visibly increased the drug problem in the same way that the war on terror has generated ever more terror organizations, in both cases there’s no evidence that any other course than war is being considered in Washington.

Non-Unique – drug traffickers circumvent attempts to resolve the war on drugs **Miroff, correspondent in Latin America, 1/11/15**

(Nick, “Losing marijuana business, Mexican cartels push heroin and meth”, The Washington Post, 1/11/15, http://www.washingtonpost.com/world/the_americas/losing-marijuana-business-mexican-cartels-push-heroin-and-meth/2015/01/11/91fe44ce-8532-11e4-abcf-5a3d7b3b20b8_story.html, accessed 7/6/15, ZW)

Mexican traffickers are sending a flood of cheap heroin and methamphetamine across the U.S. border, the latest drug seizure statistics show, in a new sign that America’s marijuana decriminalization trend is upending the North American narcotics trade. The amount of cannabis seized by U.S. federal, state and local officers along the boundary with Mexico has fallen 37 percent since 2011, a period during which American marijuana consumers have increasingly turned to the more potent, higher-grade domestic varieties cultivated under legal and quasi-legal protections in more than two dozen U.S. states. Made-

in-the-USA marijuana is quickly displacing the cheap, seedy, hard-packed version harvested by the bushel in Mexico's Sierra Madre mountains. That has prompted Mexican drug farmers to plant more opium poppies, and the sticky brown and black "tar" heroin they produce is channeled by traffickers into the U.S. communities hit hardest by prescription painkiller abuse, off-ering addicts a \$10 alternative to \$80-a-pill oxycodone.

Not Finished needs underline No Impact – Number of cartels in the US is inflated and uncertain

Higham, reporter, Horwitz, staff writer, AND Rich, database editor for investigations, 08/25/13

(Scott, Sari, AND Steven, "Mexican drug cartel activity in U.S. said to be exaggerated in widely cited federal report", The Washington Post, 8/25/13, http://www.washingtonpost.com/investigations/mexican-drug-cartel-activity-in-us-said-to-be-exaggerated-in-widely-cited-federal-report/2013/08/25/680c1854-f54a-11e2-a2f1-a7acf9bd5d3a_story.html, accessed 7/6/15, ZW)

When Sen. John McCain spoke during an Armed Services Committee hearing last year on security issues in the Western Hemisphere, he relayed a stark warning about the spread of Mexican drug cartels in the United States. "The cartels," the Arizona Republican said, "now maintain a presence in over 1,000 cities." McCain based his remarks on a report by a now-defunct division of the Justice Department, the National Drug Intelligence Center (NDIC), which had concluded in 2011 that Mexican criminal organizations, including seven major drug cartels, were operating in more than 1,000 U.S. cities. But the number, widely reported by news organizations across the country, is misleading at best, according to U.S. law enforcement officials and drug policy analysts interviewed by The Washington Post. They said the number is inflated because it relied heavily on self-reporting by law enforcement agencies, not on documented criminal cases involving Mexican drug-trafficking organizations and cartels. The Post interviewed local police officials in more than a dozen cities who said they were surprised to learn that the federal government had documented cartel-related activity in their communities. "That's news to me," said Randy Sobel, chief of police in Middleton, N.H. "I have no knowledge of that," said David Lancaster, chief of police in Corinth, Miss. NDIC's headquarters in Pennsylvania was closed last year and its personnel folded into the Drug Enforcement Administration. DEA officials declined to release a list of the cities, calling it "law enforcement sensitive." Privately, DEA and Justice Department officials said they have no confidence in the accuracy of the list. "It's not a DEA number," said a DEA official who requested anonymity to speak candidly about the report. "We don't want to be attached to this number at all." The Post was able to identify more than a third of the cities using computer mapping techniques and government documents. The analysis located government claims of Mexican drug activity in numerous cities in unexpected places: 20 in Montana, 25 in Oregon, 25 in Idaho, 30 in Arkansas. There is no disputing that Mexican cartels are operating in the United States. Drug policy analysts estimate that about 90 percent of the cocaine, heroin, marijuana and methamphetamine on U.S. streets came here courtesy of the cartels and their distribution networks in Mexico and along the Southwestern border. DEA officials say they have documented numerous cases of cartel activity in Houston, Los Angeles, Chicago and Atlanta. But analysts who study drug trafficking scoffed at the contention that the violent cartels and other Mexican-based drug organizations are operating in more than 1,000 U.S. cities. "They say there are Mexicans operating here and they must be part of a Mexican drug organization," said

Peter Reuter, who co-directed drug research for the nonprofit Rand think tank and now works as a professor at the University of Maryland. “These numbers are mythical, and they keep getting reinforced by the echo chamber.”

Legalization of drugs as a step to win the drug war, to strengthen law and order, and decrease immigration crisis

Cooper, 2014 (Ryan Cooper, Ryan Cooper is a national correspondent at TheWeek.com. His work has appeared in the Washington Monthly, The New Republic, and the Washington Post. “How the U.S. can solve its immigration crisis: Legalize drugs” <http://theweek.com/articles/445951/how-solve-immigration-crisis-legalize-drugs>) // IL

As Greg Sargent points out, this is a genuinely tricky issue as a matter of immigration law and policy. But if we step back, there is one big step we might take to address the root of the problems in Latin America that are behind the flood of refugees. Namely, we can end the drug war. Where are refugees coming from? Not Mexico as much as one might have thought; rather Honduras, El Salvador, and Guatemala are the main sources of the increase. The refugees are fleeing apocalyptic gang violence. Honduras in particular is now the murder capital of the world. (Just to be clear, Mexico is no success story, either. It isn't showing the same skyrocketing increase in refugees as Honduras, but that means it is still past 12,000 so far this year.) Additionally, some people reportedly have gotten the idea that the U.S. government is now treating immigrant children more leniently. What is driving the violence is a complex question. The best writing I've ever seen on the problem is this Washington Monthly piece by Elizabeth Dickinson. She details how Colombia successfully beat back a leftist insurgency with aggressive use of military force, and then in the mid-2000s exported — with the U.S.'s help — that same strategy throughout Latin America as a way to deal with organized gang violence. But that strategy hasn't worked elsewhere. On the contrary, it sparked more chaos and violence, as upstart drug gangs shoot it out over who will take control over turf and control vacated by toppled kingpins. What Latin America should do about crime is for them to decide. It seems clear to me that their militarized approach has been a disaster, but, frankly, America should stay out of it; we've already done enough damage. However, it is unquestionably the case that a major source of conflict is the struggle over the United States drug market. The U.S. drug market is on the order of \$100 billion in size, making probably the most important source of revenue for most gangs. Though some have diversified into things like iron ore, as Dickinson's piece and other studies make clear, control of U.S. drug trafficking routes is a key strategic asset for criminal gangs, one for which they will fight like mad. Therefore, by taking a more sensible approach to our own drug problem, we can cut out a major source of money and power for the gangs, and reduce the incentive to fight over trafficking routes. In other words, this isn't a matter of trying to micromanage other nations' political systems. Instead, it's about moderating our existing actions to reduce their negative effects — actions that are causing serious problems here at home. Ending the drug war could involve many different policies, but the most important part when it comes to clamping down on gang violence is removing drug supply from the control of criminal gangs. Decades of utterly failed coercive policy shows that it is simply impossible to stop drug trafficking by force. Anything that moved from the drug war model to a more treatment-based, harm reduction model would be a positive step. For a more aggressive policy, we might institute a strict government monopoly on all currently illegal drugs, and say that any addict certified by a doctor can get a supply at cost from the government, with the deliberate intention that enough will leak out to supply current demand. Drugs are easy to make; it would be trivially easy to beat the cartels on price. Another alternative would be to fully legalize all drugs. Personally, I favor mostly full legalization for less harmful drugs like MDMA, psychedelics, and marijuana, with stricter controls on harder stuff like heroin (and alcohol, which could stand much higher taxation). But the idea is to undercut the most important profit center for the drug gangs. It wouldn't solve all crime problems at once, but it's a good idea on the merits, and it would vastly strengthen the relative position of the forces of law and order in Latin America.

Legalization is the most efficient way to reduce drug trafficking – benefits outweigh

Jenner, 2011 (Matthew S. Jenner, associate in the Tax Practice Group of the Washington, DC office. He advises multinational companies on federal tax issues related to cross-border transactions. He also

represents clients in domestic and international tax disputes. "International Drug Trafficking: A Global Problem with a Domestic Solution"

<http://www.repository.law.indiana.edu/cgi/viewcontent.cgi?article=1465&context=ijgls> // IL

IV. LEGALIZATION: A NOVEL APPROACH The past efforts of foreign and domestic governments have proved too feeble to effectively distress global drug trafficking operations, as evidenced by the statistics of persistent violence and the sustained size of the market. However, reflecting on the weaknesses of the previous antidrug programs and assessing them as a whole may elucidate the next step toward a successful drug policy: legalization. A. The Conflict: The Not-So-Giving Tree It may be helpful to analogize the illicit drug industry to a tree. First, the leaves and the branches are the consumers and the local drug dealers, respectively. Early drug policy focused on these groups, and today's criminal laws attempt to eliminate them. In theory, if these programs successfully deterred the consumption and street selling of drugs, the market would collapse with no demand to satiate. However, no matter how many consumers and dealers are penalized or incarcerated, new ones readily replace them or they are not deterred- possibly due to addiction. Second, the trunk represents the traffickers, who bring the drugs to the dealers and consumers. The U.N. Convention Against Illicit Trafficking and the interdiction efforts of the United States attack this group. In theory, if these programs successfully captured the majority of traffickers or simply blocked their trade routes, producers would have no efficient way to get their product to consumers, and the market would fall apart. However, traffickers have proven too abundant and elusive for one axe to chop them down. Third, the roots represent the drug producers, the foundation of the industry. Plan Colombia targeted this aspect of the drug trade, trying to uproot the industry. In theory, if this plan effectively eradicated the bulk of drug-producing crops-and was subsequently instituted in all other major drug-producing nations-then no drugs would ever be produced, the market's supply would disappear, and the market would cease to exist. However, the drug trade is so animate and devious that the moment one root is lifted another has planted itself-illustrating the balloon effect. Each of these previous endeavors targeted a specific player in the industry: the consumer, the distributor, or the producer. They all fail to effectively address the fundamental aspect of the industry that truly holds it all together-the framework that propelled the industry to the astronomical heights it has reached today: the market. To extend the tree analogy, the market is represented by the fertile soil, nourishing the industry and allowing it to grow. The goal of U.S. interdiction efforts is to affect the supply of the market, but these goals misinterpret the market and actually further incentivize drug traffickers by increasing their profits. In order to be effective, the next international drug policy must target the global market. It must erode the soil that perpetuates the global drug trade, bringing the trafficking industry to its knees. B. The Plot : Universal Legalization The most efficient way to affect the global market is to legalize drugs, as prohibition acts as a catalyst in building up the market. It attracts criminals, incentivizes violence, and makes the drug trade one of the most profitable industries in the world. Universal legalization would reverse these trends. It would take the profits out of the industry and put a stop to violent trafficking, possibly ending the drug trade as we know it. When advocates lobby for the legalization or decriminalization of drugs, they often argue from a domestic stance. They see legalization as an opportunity to reallocate police resources, free up prison space, reduce violent crime among drug dealers and consumers, and tax the industry.¹¹⁸ While all of these prospects are inherently part of legalization-and probably bolster this argument even more-this Note focuses on eradicating the global drug trafficking problem. The costs and benefits of legalization should be assessed on the global level, not on the purely domestic level regarding drug problems each nation inevitably faces.¹¹⁹ The concept of legalization entails legalizing every aspect of the drug trade, from production to consumption, worldwide. The immediate benefit of legalization would be a reduction in the violence associated with the drug trafficking aspect of the trade. Prohibition creates the opportunity for self-help violence in the drug trade by driving the market underground.¹²⁰ Legalization would create a legitimate market for drugs, allowing conflicts to be settled in courts of law and attracting commendable market players rather than criminals, much like what happened after the prohibition of alcohol ended in the United States in the 1930s.¹²¹ Skeptics may argue that the violent drug trafficking criminals would not simply become peaceful after legalization occurs. This argument has some merit, but these violent criminals would be sifted out of the industry over time. They would most likely focus their attention on other closely linked illicit trade markets that still offer higher profits, like the arms trade and human trafficking. However, without the enormous income of the drug trade, these other illicit industries would also likely suffer. The long-term effects of legalization are most easily illustrated by an economic analysis of the global market. Although the market structures are complicated-drug cartels create a monopoly-like market with fewer players, called an oligopoly-a simple supply and demand analysis will best demonstrate these effects. Due to the increased costs of the global business resulting from prohibition-such as avoiding authorities and violence-the current supply curve for illicit drugs is relatively steep.¹²² Governments are effectively taxing producers and traffickers by imposing these extra costs; consequently, each unit of drugs is sold at a higher price than it would if drugs were legal. ¹²³ In Figure 4 above, the supply curve of drugs under prohibition is labeled Si. If drugs were legalized, the

supply curve would flatten out, becoming more elastic, because the additional costs and barriers to entry of the illicit industry would no longer exist.¹²⁴ The costs of production and distribution would be lower for each unit of drugs, so a lower price would be charged. In Figure 4, the supply curve of drugs under legalization is labeled S2. The demand for drugs, under any policy, is relatively inelastic. The consumption of drugs stays relatively constant when price fluctuates. This is partly due to the addictive nature of drugs—even when price goes up people still need drugs—and the fact that some people will not consume drugs, regardless of how low the price is. In Figure 4, the demand curve under prohibition is labeled D1. If drugs are legalized, demand is likely to increase because the cost to the consumer is lower. However, this increase is likely to be modest because the legal status of drugs tends to have little effect on whether most people choose to consume drugs.¹²⁵ Evidence of these phenomena can be abstracted from the U.S. experience with the prohibition of alcohol, a similar market. During Prohibition, alcohol consumption did not vary greatly with the change in price, and, after its repeal, consumption did not increase substantially.¹²⁶ In Figure 4, the demand curve under legalization is labeled D2. The net effect of a change in drug policy from prohibition to legalization is a sharp decrease in price and a modest increase in quantity demanded. Figure 4 above provides price and quantity numbers as an example to better understand this economic situation. As seen in Figure 4, equilibrium¹²⁷ price drops from twelve to four, while quantity demanded increases slightly from seven to ten. The difference that most concerns the global drug trade is the net change in revenue. In Figure 4, revenues (the shaded regions) drop drastically from eighty-four under prohibition to forty under legalization, a fifty-two percent reduction. Less revenue in the drug market equates to substantially lower profits for drug traffickers. With lower profits, criminals will likely leave the drug market, abandoning drug production in search of other more profitable, and likely illicit, markets. Additionally, the illicit drug market is closely linked to these other illicit markets, like the arms trade, human trafficking, and terrorism. For instance, illegal investments in the drug trade often fund criminal organizations that procure weapons in the arms trade and train terrorists.¹²⁸ Without the profits from the \$500 billion drug industry, many of these other illicit markets may suffer as well, a substantial benefit to the war on terror. Every last penny of profits from the industry will obviously not just disappear. There will still be a demand for drugs, which will fuel the legalized market. However, if the numbers used in Figure 4 represented reality, about half of the profits, around \$250 billion a year, could evaporate into thin air. New players in the drug market—domestic and international producers and distributors who will resort to judicial process to resolve disputes—will likely recover the other half of the profits. At first, countries with trafficking problems, like Mexico and Colombia, may not see stabilized drug industries until the violent traffickers leave the industry. Over time, however, the drug trade will be akin to other legalized industries. Domestic governments will be able to regulate their drug economies and address consumption issues as they see fit. The biggest critique of the legalization framework is that demand for drugs is more elastic than legalization proponents think. Skeptics worry that the global consumption of drugs will surge to the levels of other legal substances, like alcohol and tobacco.¹²⁹ Nevertheless, these skeptics fail to realize that most people would still not consume drugs even if they were legal.¹³⁰ Alcohol and tobacco are drastically different than illicit drugs like marijuana and cocaine. The dangers of tobacco and alcohol are mostly long term, while drugs like cocaine, marijuana, and other narcotics pose short-term dangers that deter their usage.¹³¹ Other scholars propose decriminalization as the answer.¹³² However, decriminalization would not have the same effect on the market as legalization. In a decriminalized world, production and trafficking would still be illegal, so there would still be the potential for high profits, yielding an incentive for self-help violence, and the drug trade would remain profitable for dangerous criminal organizations. Additionally, under a decriminalization framework, countries would be faced with the same domestic drug problems as legalization.

AT: Money Laundering D.A

AML surveillance is irrational, harms banking services, and lacks tangible effects

Rahn, 2014 (Richard W. Rahn, senior fellow at the Cato Institute and chairman of the Institute for Global Economic Growth. "Anti-Money Laundering Surveillance Hurts Banking Services"
<http://www.cato.org/publications/commentary/anti-money-laundering-surveillance-hurts-banking-services>) // IL

For the last several decades, global liberty-haters have dreamt that all financial privacy would be eliminated. They have sought out a variety of excuses to act as Peeping Toms peering into your bank accounts. In the 1980s, their big push was to enact "anti-money laundering" legislation, with the claim that it would make catching drug dealers and other assorted criminals easier. The United States passed its first anti-money laundering law in 1986 — despite the fact that no one could objectively define money laundering, because it is not an action but an "intent" to act unlawfully. The whole global anti-money laundering regime makes no economic sense, is unworkable, and is morally repugnant." In 1989, at the G-7 summit in Paris (before Russia joined and made it the G-8), it was decided to create an international organization dedicated to combating money laundering — duplicating the efforts of the International Monetary Fund (IMF) and the Organization for Economic Cooperation and Development (OECD) which already had the responsibility. The new organization was called the Financial Action Task Force on Money Laundering (FATF). Over time, the task force expanded its membership to include some corrupt governments such as Russia (which is alleged to engage in money laundering). By the way, a Russian government official, Vladimir Nechaev, is now president of the task force. As a result of all the global anti-money laundering regulations, total compliance costs for financial institutions are now in the hundreds of billions of dollars. Basic banking and other financial services have been reduced and even eliminated for tens of millions of people around the world. Have all of these regulatory costs done any good? In an effort to answer that basic question, the Center for Law and Globalization (a partnership of the University of Illinois College of Law and the American Bar Association) published a report in January, "Global Surveillance of Dirty Money." The authors had the full cooperation of the IMF and FATF, yet the conclusions were damning. One of the authors of the report, Terence Halliday, stated: "We find that the current system is pervasive and highly intrusive but without any evidence of tangible effect." The authors were quoted in The Wall Street Journal as saying the IMF and FATF have built a "Potemkin village" and a "paper reality" based on "a plausible folk theory," rather than data and evidence of what works.

Poor, contemporary use of AML surveillance results in wasteful expenditure and miss significant money laundering activity

Lavine, Giacomini, Messina, Thomas, and Iacono, 2010 (Jeff Lavine, Partner in the Financial Services Regulatory practice of PricewaterhouseCoopers, resident in Washington, D.C. Jeff advises US and international banks, non-bank financial institutions, and regulatory agencies on optimizing controls, compliance, supervision, examination and audit effectiveness, and anti-money laundering matters. Patrick Giacomini, Partner at PricewaterhouseCoopers. Thomas Messina, Compliance Director, Global KYC at Citigroup. Nathan Thomas, sales at PwC. Marco Iacono, associate at PwC. "From source to surveillance: the hidden risk in AML monitoring system optimization"
http://www.pwc.com/en_US/us/anti-money-laundering/publications/assets/aml-monitoring-system-risks.pdf) // IL

As the financial crisis levels off, regulators are now refocusing their efforts on anti-money laundering (AML) and terrorist financing enforcement. This increase in regulatory scrutiny is compelling many financial institutions to take a closer look at their AML operations as they seek innovative ways to meet regulator expectations and reduce costs in an uncooperative economic environment. Considering the regulatory complexity and high costs associated with AML transaction monitoring, institutions often start with improving the effectiveness and efficiency of their automated AML transaction monitoring alert engines. When properly configured, these systems can help institutions detect patterns of

activity that may indicate money-laundering or terrorist-financing activities. Poorly defined alert engine parameters and thresholds, however, may raise flags unnecessarily or even miss significant money laundering activity. PricewaterhouseCoopers (PwC) analysis indicates that 90 percent to 95 percent of all alerts generated by AML alert engines are false positives. These high false-positive rates lead to significant monitoring costs but more disconcerting are the false negatives, or the cases of money laundering that are not detected. Unlike false positives, these are hidden, are harder to quantify, and can have significant negative impact.

Both of these issues can be addressed if institutions refine their rule set thresholds. But tuning without first tackling AML data quality can lead to skewed and misrepresented thresholds. By the time the data is discovered to be inaccurate or incomplete, a threshold change may have already been implemented, leading to costly rework and the potential for a regulator-mandated transaction lookback. Many institutions are caught in a cycle of tuning, rework, lookback, tuning, rework, lookback, etc., because data quality issues are addressed haphazardly instead of systematically. The quality of data clearly affects the quality of the alerts generated by a transaction monitoring system. Active management of monitoring data is paramount to improving data quality. When AML transaction monitoring systems were initially implemented, the accuracy of the transaction code data and rules that determined what qualified as an exception may have been established and vetted. Since the original implementation, however, many institutions have not reassessed and verified whether the transaction codes and data that feed their AML monitoring systems remain at initial quality levels. Despite this, many institutions have still spent time and money tuning monitoring rules using outdated, inaccurate, and incomplete transaction reference data. This reliance on a one-time assessment of data ignores an institution's dynamic fiscal landscape as it introduces new products, consolidates financial entities, and its IT infrastructure evolves.

Anti-money laundering laws impose on privacy and more drastically harms the poor

Mitchell, 2012 (Dan J. Mitchell, Daniel J. Mitchell is a top expert on fiscal policy issues such as tax reform, the economic impact of government spending, and supply-side tax policy. Mitchell is a strong advocate of a flat tax and international tax competition. Prior to joining Cato, Mitchell was a senior fellow with The Heritage Foundation, and an economist for Senator Bob Packwood and the Senate Finance Committee. He also served on the 1988 Bush/Quayle transition team and was Director of Tax and Budget Policy for Citizens for a Sound Economy. His articles can be found in such publications as the Wall Street Journal, New York Times, Investor's Business Daily, and Washington Times. He is a frequent guest on radio and television and a popular speaker on the lecture circuit. Mitchell holds bachelor's and master's degrees in economics from the University of Georgia and a Ph.D. in economics from George Mason University. "World Bank Study Shows How Anti-Money Laundering Rules Hurt the Poor" <https://danieljmitchell.wordpress.com/2012/04/19/world-bank-study-shows-how-anti-money-laundering-rules-hurt-the-poor/>) // IL

I've complained many times about the pointless nature of anti-money laundering laws. They impose very high costs and force banks to spy on their customers, but they are utterly ineffective as a weapon against criminal activity. Yet politicians and bureaucrats keep making a bad system worse, and the latest development is a silly scheme to ban \$100 bills! It also seems that poor people are the main victims of these expensive and intrusive laws. According to a new World Bank study, half of all adults do not have a bank account, with 18 percent of those people (click on nearby chart for more info) citing documentation requirements – generally imposed as part of anti-money laundering rules – as a reason for being unable to participate in the financial system. But this understates the impact on the poor. Of those without bank accounts, 25 percent said cost was a factor, as seen in the chart below. But one of the reasons that costs are high is that banks incur regulatory expenses for every customer, in large part because of anti-money laundering requirements, and then pass those on to consumers. Here are some of the key points in the World Bank report. "The data show that 50 percent of adults worldwide have an account at a formal financial institution... Although half of adults around the world remain unbanked, at least 35 percent of them report barriers to account use that might be addressed by public policy. ...The Global Findex survey, by asking more than 70,000 adults without a formal account why they do not have one, provides insights into where policy makers might begin to make inroads in improving financial inclusion.

...Documentation requirements for opening an account may exclude workers in the rural or informal sector, who are less likely to have wage slips or formal proof of domicile. ...Analysis shows a significant relationship between subjective and objective measures of documentation requirements as a barrier to account use, even after accounting for GDP per capita (figure 1.14). Indeed, the Financial Action Task Force, recognizing that overly cautious Anti-Money Laundering and Terrorist Financing (AML/CFT) safeguards can have the unintended consequence of excluding legitimate businesses and consumers from the financial system, has emphasized the need to ensure that such safeguards also support financial inclusion."

Satisfaction decreases despite increased investment in transaction monitoring systems, the greatest area of AML spending

Anderson and Pesce, 2014 (Jeremy Anderson. Chairman, Global Financial Services. Teresa Pesce, Global Head of Anti-Money Laundering Services. "Global Anti-Money Laundering Survey 2014" <http://www.kpmg.com/Global/en/IssuesAndInsights/ArticlesPublications/global-anti-money-laundering-survey/Documents/global-anti-money-laundering-survey-v6.pdf>) // IL

Despite increased investment in transaction monitoring systems, satisfaction has declined. Although transaction monitoring systems continue to represent the greatest area of AML spending, it appears that regulatory requirements are still outpacing system improvements. Sixty percent of respondents reported transaction monitoring as the largest investment in anti- money laundering controls. Notably, since KPMG's first global AML survey in 2004, transaction monitoring has consistently been ranked the largest AML compliance cost driver. The continued investment in such systems may represent the continual changes in requirements and expectations as well as the advances in technological capabilities over this period of time. Satisfaction with transaction monitoring systems has declined with survey respondents ranking satisfaction an average of 3.42 out of 5, compared to 3.6 in 2011. The reason for the decline in satisfaction seems linked to the increased demands on these systems as the costs have continued to increase, but so too have the requirements and expectations of these systems and the number of staff that use them.

AML laws exclude poor people and are ineffective

Mitchell, 12 (Dan Mitchell, "World Bank Study Shows How Anti-Money Laundering Rules Hurt the Poor", International Liberty, April 19, 2012, <https://danieljmitchell.wordpress.com/2012/04/19/world-bank-study-shows-how-anti-money-laundering-rules-hurt-the-poor/>) E. T.

I've complained many times about the pointless nature of anti-money laundering laws. They impose very high costs and force banks to spy on their customers, but they are utterly ineffective as a weapon against criminal activity. Yet politicians and bureaucrats keep making a bad system worse, and the latest development is a silly scheme to ban \$100 bills! It also seems that poor people are the main victims of these expensive and intrusive laws. According to a new World Bank study, half of all adults do not have a bank account, with 18 percent of those people (click on nearby chart for more info) citing documentation requirements – generally imposed as part of anti-money laundering rules – as a reason for being unable to participate in the financial system. But this understates the impact on the poor. Of those without bank accounts, 25 percent said cost was a factor, as seen in the chart below. But one of the reasons that costs are high is that banks incur regulatory expenses for every customer, in large part because of anti-money laundering requirements, and then pass those on to consumers. Here are some of the key points in the World Bank report. The data show that 50 percent of adults worldwide have an account at a formal financial institution... Although half of adults around the world remain unbanked, at least 35 percent of them report barriers to account use that might be addressed by public policy. ...The Global Findex survey, by asking more than 70,000 adults without a formal account why they do not have one, provides insights into where policy makers might begin to make inroads in improving financial inclusion. ...Documentation requirements for opening an account may exclude workers in the rural or informal sector, who are less

likely to have wage slips or formal proof of domicile. ...Analysis shows a significant relationship between subjective and objective measures of documentation requirements as a barrier to account use, even after accounting for GDP per capita (figure 1.14). Indeed, the Financial Action Task Force, recognizing that overly cautious Anti-Money Laundering and Terrorist Financing (AML/CFT) safeguards can have the unintended consequence of excluding legitimate businesses and consumers from the financial system, has emphasized the need to ensure that such safeguards also support financial inclusion. One would hope honest leftists, who claim to care about the poor, would join with libertarians to roll back absurd anti-money laundering requirements. Heck, one would hope honest conservatives, who claim to be against pointless red tape, would join the fight as well. Here's the video I narrated on the general topic of money laundering laws. I think it makes very good points, but I wish this data had been available when I did the video so I could explain how low-income people are the main victims.

Money Launderers are good for banks

Levi, 91_(Michael Levi, Reader in Criminology, University of Wales, College of Cardiff Wales CFI 3AS, "REGULATING MONEY LAUNDERING The Death of Bank Secrecy in the UK", BJC, Spring 1991, <http://bjc.oxfordjournals.org/content/31/2/109.full.pdf+html>) E. T.

Banks are in business to make money. Undetected money launderers are good business for bankers since, although they do not usually provide long-term deposits or want to borrow money (and thereby generate profitable interest payments for banks), they do assist liquidity and contribute to overheads by paying bank charges. (Sometimes they pay personal transaction charges to bank staff, but this does not directly benefit the bank itself or its shareholders, particularly if the money does not stay in the bank for long.) In competitive national and international markets, bankers can rationalize their moral blindness on the grounds that critical inquisition of potential customers—legitimate and illegitimate—will simply displace them to rival financial institutions. In this respect, it is worth stressing that historically, much of the American concern about money laundering—whether of income from illegal sources by organized crime groups or of income from legal sources by the 'average American'—has been in relation to (1) small banks beneficially owned by organized crime groups, and (2) offshore 'shell' or 'phantom' banks whose principal existence is as a brass plate at the office of a West Indian or South Pacific lawyer. However, during the late 1970s and 1980s, the US Treasury expanded its sphere of operational interest to include all the financial transfer centres, including the UK, and major banks, not just marginal or wholly fraudulent ones.

It would be wrong to see this increased attention to banking information solely as a terrorism/drug money-laundering nexus, aimed solely at normal 'police problem' populations. The Senate Permanent Subcommittee on Investigations observed that the abuse of offshore tax havens was 'not limited to any particular faction of the US population' and 'is continuing to grow at an alarming rate' (PSI 1985: 2-3). Indeed, the consequence of concentrating on drug money is 'to leave virtually untouched many of the so-called "white collar" criminals who may be just as guilty of violating the reporting requirements of the Bank Secrecy Act' (p. 20). Some might argue that this expression of support for international action against US tax evaders is merely a rhetorical device to conceal the underlying interest in suppressing political dissidents, but it is simplistic to view tolerance of tax evasion as being unambiguously supportive of elite interests, however such elite interests are defined (see further Levi 1987).

Alt causes to European cloud computing

Burton 6/15 Graeme Burton is Chief Reporter at Computing. He has 15 years of experience in news and magazine journalism, and has edited such titles as Trade & Forfeiting Review, Inside Knowledge and Managing Information & Documents. "EU's new data protection rules will "kill cloud computing" in Europe, warn Amazon, Cisco, IBM and SAP," Graeme Burton 15 Jun 2015, <http://www.computing.co.uk/ctg/news/2413109/eus-new-data-protection-regulations-will-kill-cloud-computing-warn-amazon-cisco-ibm-and-sap>

New **European Union Data Protection Regulations expected to be finalised today will kill the trading bloc's cloud computing industry and push internet companies out of the continent.** That is the warning of technology giants as diverse as SAP, IBM, Cisco and Amazon. The new regulations, which are expected to be finalised today after a tortuous three-year process will, according to Reuters, enable EU citizens not just to sue companies that hold their personal data, but also organisations that process it on their behalf. On top of that, organisations found to be in contravention of the regulations will face swingeing fines calculated as a percentage of turnover. But the measures, according to Reuters, have been opposed not just by US technology and internet giants, such as Cisco, IBM and Amazon, but also German software giant SAP. They say that the regulations will kill off Europe's cloud computing industry and drive companies out of the trading bloc. The data protection rules are being brought in under the mechanism of a "regulation" rather than a directive in order to make them directly applicable across the EU. Directives, in contrast, have to be translated into member states' own laws, a process that has led to wide variations in interpretation and enforcement across the EU. EU officials claim, however, that the regulations are required to harmonise data protection across Europe as part of plans to create a unified market in digital services. The officials claim that such harmonisation across the 28-country bloc – even if opposed by technology and internet companies – will boost economic growth across the EU. "Under the current, 20-year-old system, cloud providers – companies offering remote storing and processing of data on servers – would classify as 'processors' since they do not collect the data themselves. That means they are not held liable for using the data illegally unless they breach the contract with the company for whom they are processing – the data 'controller'," explains Reuters. Despite opposition from technology giants, EU government ministers are expected to reach agreement on the new regulations today at a meeting in Luxembourg. Technology companies say that the current system is straightforward and works perfectly well as it gives citizens a single point of contact if, for example, a bank breaks data protection rules. By extending responsibility to the bank's suppliers, it risks forcing cloud computing and other services providers outside of the European Union and its associate members.

Squo solves euro—high foreign reserves and confidence—we have a graph

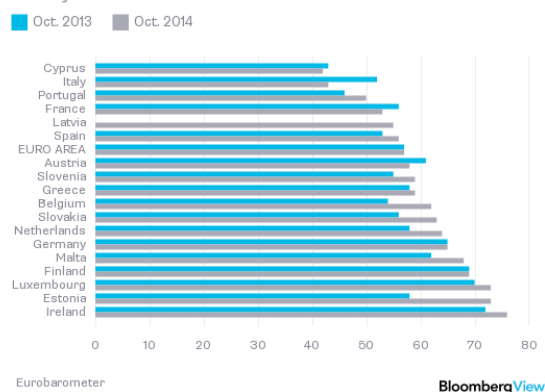

Bloomberg 6/22 Leonid Bershidsky is a Bloomberg View columnist. He is a Berlin-based writer, author of three novels and two nonfiction books. Bershidsky was the founding editor of Russia's top business daily, Vedomosti, a joint project of Financial Times and the Wall Street Journal, and the first publisher of the Russian edition of Forbes, "Don't Worry About the Euro; It'll Be Fine," JUN 22, 2015 <http://www.bloombergview.com/articles/2015-06-22/don-t-worry-about-the-euro-it-ll-be-fine>

To many observers, especially in the U.S. and the U.K., what's happening to Greece is only a symptom of a broader euro crisis. Many people blame the common currency for low economic growth, the excessive debt burdens and high unemployment in the European Union's periphery, and pretty much everything that's wrong with Europe's economy. Yet the euro works, and most people who use it like it, including Greeks. The debt crisis, even if it ends with Greece dropping the euro, may well strengthen, not weaken the common currency. Just 15 years after its introduction, countries and companies are still learning how to use it right, and mistakes made in these early years should be food for thought, not grounds for panic. The euro is now so maligned that U.S. news outlets treated with disbelief and derision Lithuania's decision to adopt it. In a January piece in the Atlantic titled "Why Would Anybody Adopt the Euro in 2015?," Adam Chandler suggested that the Baltic nation became the 19th euro member to protect itself from Russian aggression. Matt O'Brien of the Washington Post made the same point in a post under the heading "Lithuania has officially jumped aboard the Titanic that is the euro," warning Lithuanians: "Don't let the door hit you on your way in." The explanation is somewhat ironic given that Russia itself last year

shifted more of its cash stockpile into euros as it fled the U.S. dollar: At the end of 2014, 46.1 percent of Russia's international reserves was held in euros, a 5.2 percentage point increase in 12 months. And while that's an unusually large share, EUROS make up 22.1 percent of all countries' foreign reserves, significantly more than the combined 15.7 percent share that its predecessors -- the Deutsche mark, the French franc and the Dutch guilder -- had in 1998, their last year as reserve currencies. This is one of the clearest indications that the euro is greater than the sum of its parts. In any case, ordinary Lithuanians didn't get the jokes and Titanic references. Before their country adopted the common currency, 57 percent thought it would be good for Lithuania, and immediately after the change, last January, support rose to 60 percent. Fifty-four percent said the euro was good for them personally -- a sentiment that's hard to explain by fear of Russian invasion. Rather, the euro makes it easier for Lithuanians to travel and order goods online from other European countries. It's no longer necessary to do the annoying currency conversion. (The exchange rate, at the end, was 3.4528 litas per euro.) Of course, Lithuanians might like the euro because they don't have much experience with it. Yet those who do are also mainly fond of it. In fact, the latest Eurobarometer survey on the issue, conducted last fall, showed that in most euro area countries people were happier with it than they had been the year before:

They Like It More Than Ever

Percentage of euro area residents who say the euro is good for their country

Eurolikes In the same survey, Italy and Cyprus were the only countries without a pro-euro majority, and they didn't have an anti-euro majority, either. Apart from making tourism and cross-border trade easier -- especially for individuals and smaller companies, but also for big ones that no longer need to hedge currency risks -- the euro also lowers interest rates. Not long before going over to the common currency, Lithuania issued its first euro-denominated bond at the lowest interest rate in the country's history, 2.1 percent, and it expected borrowing costs to go down noticeably for both government and businesses, because that's what happened in Latvia when it adopted the euro in 2014 and because these costs should be lower when conversion friction and currency risk are removed. Critics argue that peripheral nations' increased ability to borrow is an institutional flaw, not an advantage of the common currency. In a speech earlier this month in Berlin, for instance, Greek Finance Minister Yanis Varoufakis said that, because of trade surpluses in countries such as Germany and the Netherlands, "a tsunami of debt flowed from Frankfurt, from the Netherlands, from Paris -- to Athens, to Dublin, to Madrid, unconcerned by the prospect of a drachma or lira devaluation, as we all share the euro, and lured by the fantasy of riskless risk." He went on: To maintain a nation's trade surpluses within a monetary union the banking system must pile up increasing debts upon the deficit nations. Yes, the Greek state was an irresponsible borrower. But, ladies and gentlemen, for every irresponsible borrower there corresponds an irresponsible lender. Take Ireland or Spain and contrast it with Greece. Their governments, unlike ours, were not irresponsible. But then the Irish and the Spanish private sectors ended up taking up the extra debt that their government did not. Total debt in the Periphery was the reflection of the surpluses of the Northern, surplus nations. This is why there is no profit to be had from thinking about debt in moral terms. We built an asymmetrical monetary union with rules that guaranteed the generation of unsustainable debt. Varoufakis made a valid point about the irresponsibility of lenders, such as German banks, which underestimated the risk of financing governments and companies in other euro area members. The absence of currency risk appears to have

prompted them to throw caution to the wind. They've been taught some harsh lessons, however, by taking big haircuts on Greek, Cypriot, Irish and Spanish assets, and that should make them unlikely to err in the same way again. The debt crisis was caused not by a faulty euro architecture, but by a failure of risk management at financial institutions -- the same kind of failure that precipitated the U.S. mortgage crisis. Even though it might be easier for euro member countries to maintain a pretense of economic growth, and perhaps to lower unemployment, if they could devalue their currencies, they opt -- in line with their public opinion -- to at least try to be fiscally responsible. Finland, in deep trouble because of its shrinking pulp and paper industry and the disappointing performance of its tech sector since Nokia lost its global leadership in mobile phones, doesn't want the markka back, even though a devaluation could help. Its new government's program says: The primary means to handle the financial problems of a euro country are the country's national measures to consolidate the economy and stabilise public finances. If these means are not enough, the secondary means is the implementation of investor liability. If everyone in the euro area adopts that view -- and most governments appear to agree with it -- the euro won't fail, even though some "irresponsible lenders," to borrow Varoufakis's term, may still take hits to their bottom lines. That'll be a problem for them, but not for most Europeans, for whom the benefits of a common currency outweigh the costs, and not for central banks, which need the euro as a counterweight to the too-mighty dollar.

Grexit alt cause to Euro

STUBBINGTON, 6/23, (TOMMY, writes about European financial markets from the Wall Street Journal's London bureau, "Euro Falls to Two-Week Low as Greek Deal Appears Close," Wall Street Journal, Jun 23, 2015, <http://www.wsj.com/articles/european-stocks-rise-further-on-hopes-of-greek-deal-1435046056>)//erg

The euro fell Tuesday as Greece's lenders considered a proposal seen as a potential breakthrough on a bailout deal, while European stocks extended the previous session's rise. The common currency slid around 1.4% against the dollar to \$1.1188, having touched a two-week low earlier in the session. The euro is also down sharply against the British pound and Japanese yen. Many analysts attributed the euro's fall to a ramping up of bets on riskier currencies as tensions appear to ease. Ultra-low interest rates in the eurozone make borrowing euros an attractive way to fund such bets. The euro had been resilient in recent weeks partly because uncertainty over Greece had encouraged investors to scale back on the bets, known as carry trades, buying back euros in the process. "It's all about carry-trade activity," said BNY Mellon currency strategist Neil Mellor. "If a final Greek deal does materialize, the euro could fall quite a bit further." The protracted Greece negotiations have been a distraction for investors looking to bet on a further rise of the dollar against the euro, said Thomas Flury, head of currency strategy at UBS Wealth Management, which oversees \$2 trillion of assets. A deal would allow markets to refocus on a likely interest-rate rise from the Federal Reserve later this year, which should drive the buck higher, according to Mr. Flury. He is looking into going back to the short euro, long dollar trade again, "but first we need some kind of resolution for Greece," he said. In equity markets, the Stoxx Europe 600 closed 1.2% higher, building on Monday's 2.3% gain. Greece's Athex Composite rose 6.1% after rising 9% Monday. The sharp rally has come as Greece's creditors suggested for the first time that a deal to avert the country's bankruptcy was in sight after a last-minute proposal submitted by Athens. European officials hope that eurozone finance ministers can sign off on a policy package agreed to between Greece and the institutions overseeing its bailout program on Wednesday. European stocks and bonds surged on Tuesday morning after Greece's creditors suggested for the first time that a deal to avert the country from defaulting on its international loans was in sight. Photo: Bloomberg
Uncertainty over Greece's future has put stock markets under pressure in recent weeks. The relief continued to spread on Tuesday. Germany's DAX climbed 0.7% after logging its biggest one-day rise in nearly three years on Monday. France's CAC-40 rose 1.2%. "It looks like the brinkmanship is over and they are going to go for a deal," said Jeanne Asseraf-Biton, head of cross-asset research at Lyxor Asset Management in Paris, which manages \$127.9 billion of assets. Fake euro notes on the ground during a pro-Europe demonstration in front of the Greek parliament in Athens on Monday. The common currency has been resilient to the Greek negotiations in recent weeks. ENLARGE
Fake euro notes on the ground during a pro-Europe demonstration in front of the Greek parliament in Athens on Monday. The common currency has been resilient to the Greek negotiations in recent weeks. PHOTO: AGENCE FRANCE-PRESSE/GETTY IMAGES Given the potential of a Greek default to disrupt financial markets, confirmation that an agreement has been struck would likely spark a further relief rally, she added.

Building a separate internet is impossible

EÖRDÖGH 13 FRUZSINA EÖRDÖGH is a freelance digital culture and technology journalist covering various internet phenomena including YouTube, videogames, internet pranksters and activists. She's written for the Guardian, Variety, Slate, ReadWrite, and the Daily Dot among others, and contributes

regularly to LadyBits and Vice's tech and science blog Motherboard, "The World Wants to Break Up with America's Internet," October 16, 2013, <http://motherboard.vice.com/blog/the-world-wants-to-break-up-with-americas-internet>

Can it be done, though? Building an internet without the US, aka data centers and undersea cables, would take a massive amount of time and resources and as Motherboard's Meghan Neal pointed out, it will also require users to stop using sites associated with Google (including YouTube), Apple and Facebook. That isn't to say no country is trying; Germany wants to keep all Internet traffic on local servers so they can't be spied on by the NSA, but that's not really a "German internet" free from the US. Without a feasible alternative on the horizon the released statement by the Internet's core institutions is just a statement of intent, a protest song and dance indicative of a messy break-up that could last for years and years.

No war—even if Euro goes, political structures are resilient

Drezner 6/29/15—Yes that Drezner.

<http://www.washingtonpost.com/posteverything/wp/2015/06/29/can-the-european-union-recover-from-grexit/>

McNamara's analysis raises the most interesting question about the future of the euro and the European Union. Because in some ways this episode is not unusual. The history of EU integration is littered with moments of temporary retreat: Charles De Gaulle's veto of British entry in the 1960s, the failure of the snake in the 1970s or Black Wednesday in the 1990s. In all of these cases, the European Union managed to take two steps forward after its one step back. Is that possible going forward? For that to be true, a post-Grexit eurozone would have to have the institutional capacity to deal with another crisis. McNamara sketches out what that means concretely in her essay: If the euro zone is to work, it needs Europe-level political authority and power in at least four areas: a central bank that can generate market confidence and liquidity; a banking authority that can regulate financial risk and uncertainty across the euro zone; mechanisms for fiscal redistribution and economic adjustment in times of crisis; and a sense of political solidarity to navigate the conflicts that arise in financial crises. Yet it only partially meets these criteria today. As I read it, McNamara's first criteria already exists, and her second one is possible, albeit somewhat difficult. But the latter two now seem like no-go zones. In particular, the "sense of political solidarity" has been trending in the wrong direction for close to a decade now. And without political solidarity, there is no way any national government accedes to greater fiscal constraints. So it would seem as though the euro zone is good and truly screwed. The deeper question is whether that is true of the European Union more generally. It's important to remember that the two groupings are not the same. The former is responsible for the single currency and the European Central Bank; the latter is responsible for some not-so-minor things as well, like a customs union, a political model that was attractive to the European periphery, and helping to prevent war between Germany and its neighbors. The question is whether the bicycle theory applies to the wider EU structures.

1AR—Alt Causes

Lengthy and costly legal disputes

Kennedy 6/15/15 Editor John Kennedy is an award winning technology journalist. “Cloud bust – could EU’s new data protection rules kill Europe’s cloud economy?”

<https://www.siliconrepublic.com/business/2015/06/15/cloud-bust-could-eus-new-data-protection-rules-kill-europes-cloud-economy>

Tech companies like EMC, IBM, Cisco and Amazon fear that new EU data protection rules being agreed today could threaten Europe’s cloud computing industry. They fear that the new rules will allow citizens to sue companies that own data as well as those that process it on their behalf. For countries like Ireland, where many of these companies have substantial data centre and software development hubs, it is a concern worth noting. The new one-stop-shop rules are the cornerstone of the European Commission’s ambitions to create a Single European Market for digital goods and services. The rules will be backed up by heavy fines – as high as €100m – for non-compliance. The new rules will make it easier for consumers to withhold their data and will codify the “right to be forgotten” principle enforced on Google last year by Spanish data regulators. The EU has told Google that it wants to expand the right to be forgotten rule to all websites with a .com suffix and last year the EU voted in favour of Google being split into two entities in Europe, with its search operation being removed from its commercial business over antitrust fears. A right to data portability will make it easier for users to transfer personal data between service providers. No more Safe Harbour? The rules also seek to ensure that data submitted to internet companies – such as Facebook or Google – is not sold on or used for other purposes. Effectively, companies based outside of Europe will have to apply the same rules when offering services in the EU. EU Justice Commissioner Věra Jourová said the aim of the data protection reform will be to enable people to better control their personal data. She said that at the same time modernised rules will allow businesses to make the most of the opportunities of the Digital Single Market by cutting red tape and benefiting from reinforced consumer trust. She said that the single set of rules will save businesses around €2.3bn a year in administrative costs. “Today we take a big step forward in making Europe fit for the digital age. Citizens and businesses deserve modern data protection rules that keep pace with the latest technological changes. “High data protection standards will strengthen consumers’ trust in digital services, and businesses will benefit from a single set of rules across 28 countries. I am convinced that we can reach a final agreement with the European Parliament and the Council by the end of this year,” she said. Blurred lines could lead to lengthy legal disputes However, technology companies like IBM, SAP, Cisco and Amazon and organisations like the Coalition of European Organisations on Data Protection, which includes SAP, Nokia and Ericsson as members, fear lengthy legal battles could ensue. According to Reuters, IBM’s vice president of government and regulatory affairs, Liam Benham, has pointed out that lines could be blurred in data protection disputes. “It is important that consumers and businesses understand who ultimately is responsible for processing their data,” Benham said. “Now the EU’s draft Data Protection Regulation risks blurring these lines of responsibility, setting the stage for lengthy and costly legal disputes, which will be perplexing for consumers and businesses alike.”

Structural limitations make cloud computing a non-viable option in Europe

O’Brien, ’10, (Kevin J, Professor of Asian Studies and Professor of Political Science, Department of Political Science, “Cloud Computing Hits Snag in Europe,” New York Times, SEPT. 19, 2010, [//erg](http://www.nytimes.com/2010/09/20/technology/20cloud.html?_r=0)

BERLIN — In the world of ideas, cloud computing has the potential to revolutionize the way people work. By bundling the processing power of thousands of computer servers, a company, for example, could allow two employees from different countries who speak different languages to communicate directly by phone, using voice recognition software to process what is being said and translation programs to interpret it into another language. The result, ideally, would be a seamless conversation, without struggle and without the limitations of speaking a foreign language. “We’re not quite there yet, but it’s coming,” Eric E. Schmidt, the chief executive of Google, a promoter of the technology, said at a gathering of cellphone industry executives after evoking the image at a convention in Barcelona in February. Continue reading the main story RELATED COVERAGE Spain Is Ripe for Cloud Computing but Slow to Adopt SEPT. 19, 2010 Such cloud-based breakthroughs face a formidable obstacle in Europe, however: strict privacy laws that place rigid limits on

the movement of information beyond the borders of the 27-country European Union. **European governments fear that personal information could fall prey to aggressive marketers and cybercriminals once it leaves the jurisdictions of individual members, a concern that may protect consumers but one that hinders the free flow of data essential to cloud computing.** “There are restrictions on cloud computing in Europe,” said Bob Lindsay, privacy director in Europe for Hewlett-Packard, which makes servers and other equipment for cloud data centers. “This isn’t killing the business, but it is slowing its evolution, compared with what is taking place in the United States.” Cloud computing, which allows companies to tap enormous computing power via the Internet without having to invest in the infrastructure themselves, has grown rapidly in the United States under a legal system that permits the sale and transfer of many forms of private data. For its clients, the lure of cloud computing is the savings made possible by cutting in-house corporate information technology departments and hardware and software purchases. According to the research firm Gartner, global sales of cloud services will rise 17 percent this year, to \$68.3 billion from \$58.6 billion in 2009. About half of what Gartner defines to be cloud services are, in fact, the computing power involved in the display and tracking of Internet ads. The rest is sales of computing services, mostly to large businesses. Global sales of cloud services are poised nearly to double by 2012, to \$102.1 billion, Gartner estimates. But Europe is expected to remain a relatively modest user of cloud services, accounting for only \$18 billion this year, or about 26 percent of the global total. By 2012, Gartner estimates, Europe’s proportion of global cloud sales will rise to 29 percent, even though the bloc’s economy is larger than that of the United States. **Facing legal obstacles in Europe, the U.S. businesses with the greatest stake in cloud computing — primarily Microsoft, Google, H.P. and Oracle — are lobbying lawmakers to loosen restrictions on cross-border data transfers.** Alternatively, some are developing new methods to make cloud computing work within Europe’s complicated legal landscape.

Legal agreements and European business strategy mean cloud won’t work

O’Brien, ’10, (Kevin J, Professor of Asian Studies and Professor of Political Science, Department of Political Science, “Cloud Computing Hits Snag in Europe,” New York Times, SEPT. 19, 2010, [//erg](http://www.nytimes.com/2010/09/20/technology/20cloud.html?_r=0)

In Europe, **the legal definition of what constitutes personal data is much broader** than it is in the United States, extending to information like names, addresses and phone numbers in phone books. **Another obstacle is the European Data Privacy Directive, the main body of European law governing international data transfers, which generally prohibits the movement of E.U. data outside the external borders of the European Union. The European Commission has approved only a handful of other countries to provide cloud computing services — the United States, Argentina and Canada. Israel and Andorra have applied for approval to be designated as computing centers. Companies that want to process E.U. data in countries that have not been approved— India and Malaysia are growing hubs for cloud computing data centers — must negotiate and enter into binding legal agreements with data processors called service level agreements,** which ensure that the personal information of E.U. citizens will be handled in accordance with E.U. regulations. But **such agreements, while increasingly common, are costly, time-consuming to prepare and difficult to enforce,** said Mr. Lindsay, H.P.’s privacy director, who is based in Milton Keynes, England. Backers of cloud computing technology are hoping the European Commission will loosen the rules applying to international data transfers during the review of its data protection directive, which was drafted in 1995, in the early days of the Internet. During the review, which began last year and is not expected to be completed before mid-2011, companies like Microsoft have urged the commission to streamline existing laws on international data transfers. The laws require companies to get the approval of several national data protection regulators for a single data transfer flowing through their jurisdictions. Continue reading the main story Under this framework, a Microsoft affiliate in Bulgaria, for example, seeking to send Bulgarian consumer data to a cloud center in the United States, might have to apply for and receive approval from regulators in a series of countries along the transmission route, which in this case could include Romania, Hungary, Austria, Germany and the Netherlands. In a letter sent in December 2009, John Vassallo, Microsoft’s associate general counsel in Brussels, asked the commission to change the E.U.’s data protection directive to assign varying levels of privacy restrictions to different kinds of data, which could ease the transfer of some personal information, like names and addresses, for commercial marketing purposes if consumers gave their consent. “As the patchwork of **worldwide data protection laws has become increasingly difficult to navigate,**” Mr. Vassallo wrote to the commissioners, “Microsoft has repeatedly called for a comprehensive, workable global privacy framework that is consistent, flexible, transparent and principles-based.” **Should the commission loosen the bloc’s restrictive privacy controls, which is not guaranteed, European businesses,**

with their own multimillion-euro investments in in-house computer systems, employees and procedures, still might not rush to cloud computing. That is because European businesses, in general, are more reluctant than their U.S. counterparts to abandon their own costly investments in computing infrastructure and experiment with emerging technologies like cloud computing, said Ross Anderson, a professor of security engineering at the Computer Lab at Cambridge University in England. “European industry is an awful lot sleepier than industry in the United States,” Mr. Anderson said. “The tech industry has its center of gravity in the U.S.A. You will tend to find that it is high-tech firms there that are the keenest adopters of new technology.”

Cloud computing faces too many legal and privacy issues to be successful in Europe

Lewis, '09, (Shari Claire, lawyer focusing on the intersection of law and technology, “Cloud Computing Brings New Legal Challenges,” New York Times, 2009)//erg

The trend today is toward something different: Whereas companies may still prefer their employees to be in geographic proximity to urban centers of business and government, the cost of prime real estate, and the availability of fast online interconnectedness in many locations that would otherwise be considered remote, make cloud computing a viable and cost effective alternative. Accordingly, data and data applications that are kept in a cloud may be physically located in one or more remote servers but are nevertheless transparently available to company users. Data kept in a cloud often is, or may be, shared among, or usable by, multiple parties. It can include information ranging from word processing documents and business presentations to employee or patient health information and tax or accounting records, to schedules, calendars and contacts. The key to cloud computing is the speed with which the data and applications can be accessed, rather than the capacity and speed of a personal computer's hard drive, as was crucially important in the past. [...] Given the explosive growth of cloud computing, it should be no surprise that it presents numerous legal issues for businesses. Two of the most significant are privacy concerns and the implications of cloud computing for pretrial discovery. As with other forms of “outsourcing,” businesses' duties to protect private or confidential data do not end with their transfer of the data to third-party vendors for storage or processing. For example, although the Gramm-Leach-Bliley Act permits financial institutions to disclose confidential consumer information to a third party such as a cloud computing service provider, the terms of any agreement between the financial institution and the provider must be carefully considered. [...] What undoubtedly can complicate the privacy issues in these and other situations is that the governing law might change depending on the cloud provider's physical location. Different rules can apply if storage is in a European Union country, arguably subject to the EU's Data Protection Directive, in multiple states within the United States, or in multiple locations around the world.

No cloud computing for Europe

MHP, '13, (“European Cloud Computing: Too Big To Fail?” MHP Communications, March 14, 2013, <http://www.mhpc.com/blog/european-cloud-computing-too-big-to-fail/>)//erg

Last week, representatives of the technology industry and European regulators (and this public affairs consultant) met in Brussels for the annual European Cloud Computing Conference. Among the discussion topics were entrepreneurship, digital skills, the internationalisation of the cloud and sustainability. Underpinning it all was a concern for privacy and data protection. This should not come as a surprise: the European Commission released its cloud computing strategy last year, and members of the European Parliament –as well as individual Member States- are debating the breadth and implementation of the long awaited reforms of EU data protection laws, which have not been changed since 1995.

Officials and businesses agreed on the tremendous economic and productivity benefits cloud computing can bring to Europe (some experts have predicted that the diffusion of cloud computing will create up to a million new jobs in the coming years). But **it seems that the EU also has too many barriers to cloud adoption, and needs to make a bigger effort to promote cloud knowledge generally and digital skills in particular.** (The European Commission –having pre-empted these criticisms- launched its Grand Coalition for Digital Jobs three days before the conference) The importance of cloud computing in Europe was summed up by a Dutch panellist: “We all know that some banks are too big to fail. But **are some cloud providers too big to fail?**” **Some participants at the Cloud Conference called for better international standards to regulate the cloud on a broad scale, whilst others argued that Europe needs to model itself on Japan if it wants to become a respected tech market.** With EU-US trade negotiations due to kick off soon, both have been developing parallel policies to strengthen not just the cloud, but also privacy and cybersecurity. The OECD believes that the EU’s data protection legislation will provide impetus to the trade deal (although one can also argue that the reverse is true: that the prospect of a US trade deal will motivate European politicians to quickly revise and adopt the data protection reforms). **For the full potential of cloud computing to be unleashed,** both in Europe and further afield, our knowledge of the cloud and, crucially, **our trust in cloud services needs to increase.** Commission Vice-President Viviane Reding told the conference that **all its efforts would essentially be wasted if current levels of mistrust continue.** Currently, over 70 percent of Europeans are concerned about how companies use their personal information: a sure cause for frustration amongst those in the EU who are advocating for a Digital Single Market.

Cloud computing fails in Europe—too big of a project and empirics prove

Wainwright, '13, (Phil, thought leader in cloud computing as a blogger, analyst and consultant since 1998. He is co-founder of industry advocacy group EuroCloud, “Cloud for Europe: another public IT project built to fail?” Diginomica, October 30, 2013, [//erg](http://diginomica.com/2013/10/30/cloud-europe-public-project-built-fail/#.VZw7fXipX8E)

Perhaps the crowning glory of the EU’s cloud strategy, as conceived by Commissioner for the Digital Agenda Neelie Kroes, is a plan to galvanize public sector procurement of cloud. This beacon project, due for formal launch in mid-November, betrays its ambitions in its name, Cloud for Europe. Unfortunately, I fear its founding principles set it up for inevitable failure, leaving it fatally flawed even before its formal launch. Throughout history, **many public sector IT projects have followed a depressingly predictable trajectory: big projects; massive overspend; late or failed delivery. It seems the European Commission wants to follow the same proven pattern in this forlorn attempt to encourage public sector cloud adoption.** Against the odds **Two misconceptions lie at the heart of Cloud for Europe’s flawed progeniture: That public sector needs are unique and can only be satisfied by custom projects That cloud computing is about how to build digital infrastructure, rather than delivering more effective outcomes for businesses and citizens** **The odds are stacked against success, even before you consider its mission of corralling a consortium of up to two dozen public authorities from up eleven separate European countries into harmonizing their procurement processes.** This is where the project co-ordinator, Linda Strick of ICT research institute Fraunhofer FOKUS, most fears problems, as she explained during a presentation at this month’s EuroCloud Congress: “We have a lot of regulations in each country that might make it difficult to have joint procurement between different procuring entities ... **It’s really a challenging project and it’s unfortunately very political. It’s not a simple project funded by the European Commission.** “It’s very political because it involves member states to participate actively in the role of becoming a procurer and jointly doing this pre-commercial procurement together. “Which means, imagine you have eight ministries and these eight ministries agree in month fourteen — which is next August — on one joint tender for all these nations, having cross-border services. It’s very challenging.”

There are too many issues with cloud computing in Europe

Wainwright, '13, (Phil, thought leader in cloud computing as a blogger, analyst and consultant since 1998. He is co-founder of industry advocacy group EuroCloud, “Cloud for Europe: another public IT project built to fail?” Diginomica, October 30, 2013, [//erg](http://diginomica.com/2013/10/30/cloud-europe-public-project-built-fail/#.VZw7fXipX8E)

Fundamental flaw **Unfortunately the project has locked in failure from the start by copying exactly the same flawed process of requirements definition that has beset every other public sector IT disaster** from the UK's infamous NHS National Programme for IT to this month's failure of the Healthcare.gov website in the US. (I'm conscious these are both Anglo-Saxon examples but no doubt there are many others elsewhere). **The fundamental flaw is that Cloud for Europe has been conceived as a vehicle for 'pre-commercial procurement'**; a model first pioneered in defense procurement. Essentially, the customer predefines an unmet need and the industry creates an innovative solution — the classic example being the Stealth Bomber. As Strick explained: **"It's not that you want to have already existing infrastructures or services. It's really that you go in the direction to have something which is not available at the moment."** Unfortunately, **the classic pre-commercial procurement model for delivering a finished project is the diametric opposite of the kind of iterative assembly and configuration of off-the-shelf components that is best suited to cloud development. Cloud is all about delivering breakthrough business outcomes from rapidly implementing 'good enough' on-demand services and refining results as you go. That's not something you can map out and prespecify in advance, let alone 'pre-commercially procure' it.** In fact you could probably characterize the very essence of cloud as 'post-commercial procurement' — the whole point is to avoid the one-off costs and scale diseconomies of custom-built IT. Three-year timespan Instead of this rapid development model, Cloud for Europe envisages a classic waterfall project plan with a three-year timespan: fourteen months (ending August 2014) to collect requirements and define and issue the tender according to EU rules; four months to evaluate responses; eight months to prototype and a further six months of piloting test versions. By this time it's already February 2015, but as Strick explained in her presentation: "It's not in that phase you will have a product out of that. What you will have is a pilot out of that." After all this, she went on to explain (somewhat optimistically I felt): "If [the pilot] is good enough, you might have the challenge that a lot of public sector organisations will be willing to buy that kind of product because that's what actually is needed." Astonishingly, innovative SMEs are expected to be keen to participate in this three-year process, for which the Commission has set a total budget of €10 million. As Strick explained: "We also want to include a lot of small and medium enterprises because we think there's a huge market as well for the public sector for SMEs to provide cloud services for the public sector. So **it's not only having these big cloud providers providing those services.**" **Good luck with that** (which for non-UK readers I should explain means, **'It ain't gonna happen'**). But it should be no surprise that **the project is such a typical big-company exercise** when the industry representatives on the ECP Steering Board that oversees it includes the like of ATOS, Accenture, Dassault Systèmes, Ericsson and SAP. The only SME representative was recruited belatedly and **none of the members focuses on cloud applications** (unless you count SAP, which has something of a mixed record on that score). Of course Linda Strick and her Fraunhofer FOKUS colleagues have to follow the remit they've been given for Cloud for Europe. They have enormous experience and expertise in co-ordinating distributed IT projects in eGovernment, which they will apply with the utmost professionalism. But if this remit is misguided or ill-conceived, **I fear the outcome cannot be successful.**

The cloud in Europe will fail

Wainwright, '13, (Phil, thought leader in cloud computing as a blogger, analyst and consultant since 1998. He is co-founder of industry advocacy group EuroCloud, "Cloud for Europe: another public IT project built to fail?" Diginomica, October 30, 2013, [//erg](http://diginomica.com/2013/10/30/cloud-europe-public-project-built-fail/#.VZw7fXipX8E)

Cloud-enabled stealth bombers So what are these amazing innovations, these cloud-enabled 'stealth bombers' that Cloud for Europe aspires to deliver for the public sector? The potential examples listed in Strick's presentation came from large-scale cross-border pilots carried out in earlier initiatives for the Commission: Secure Personal Data and Documents Vault Administrative Documents and Files Interoperability Node Educational content (curriculum) creation Probably the most disappointing aspect of this underwhelming list is the knowledge that all of these capabilities are already delivered by cloud services that are commercially available today. So why not just focus on how to empower public sector organizations to procure those services from those existing providers? The inevitable answer that you always hear, of course, is that **the public sector has special requirements that prevent it from buying the same high-volume, low-cost services as everyone else (even though that immediately negates any scale-out benefits of cloud**

sourcing). As Strick explained: "There are a lot of features which are in general necessary for the public sector to make sure that they can go into the cloud. The public sector has very specific requirements." One example she cited was having the freedom to move from one provider to another when that provider changes its pricing policies, which public sector buyers are obliged to do because of regulations that bar them from favoring one vendor over another. "They need to go to another provider, but they need to take out all of the data and put it into [the] other environment. So that is something that public sector is facing even more than industry, because they have to do it." It's not clear to me why private sector buyers would not want the same freedom. However this example was one of a list of characteristics she cited that would likely form part of the requirement: Data and service portability Service and data management support Dependability provisioning services Security provisioning (eID, encryption, signature, data protection) Cloud certification requirements Harmonizing requirements The rationale for spelling all of this out is to arrive at a functional requirement that Cloud for Europe's public sector stakeholders can all agree on. Strick explained: "We want to harmonize requirements to really be able finally to get the potential of out of cloud, saying we have some reusable, identifiable building blocks which can be used by the public sector, and they fulfil those requirements which are harmonized by the public sector ... and then identify those functionalities which can be part of the functional description required for this procurement part." My one hope is that I'm being unfair on Cloud for Europe and that the project will in the end focus on enabling its public sector constituents to develop harmonized procurement processes that allow them to truly benefit from the cloud model. I was struck by an aside from Strick at one point in her presentation that showed an appreciation of how the cloud transcends traditional models: "I personally believe you all know that cloud is not a matter of technology. Cloud is a matter of organization, of philosophy, of acceptance of new models where you will go." Verdict I can't help fearing that Cloud for Europe is more about bending the cloud to fit preconceptions of how the public sector should procure IT. That's not going to deliver its strategic aims, which can only be achieved by adjusting public sector procurement to match what cloud can offer: on-demand assembly and configuration of ready-to-use automated services delivered at scale. If Cloud for Europe's constituents are able to craft specifications that permit the tendered solutions to be built from off-the-shelf cloud services — perhaps supported by add-on services that address specific needs around portability, dependability, certification and the rest — then maybe this project can be saved after all. But all the signs are that this will become yet another classic case of an over-engineered public sector ICT project that fails to live up to its misconceived promise.

1AR—Euro OK

Euro is high—long term stats, trade balance, and China’s holdings prove

Conerly, '14 (Bill, Ph.D. in economics from Duke University, formerly Senior Vice President at First Interstate Bank and held positions in economics and corporate planning at two Fortune 500 corporations. Dr. Conerly was awarded the Chartered Financial Analyst designation in 1999, “Why Is The Euro High On Foreign Exchange Markets In 2014?” Forbes, JUL 17, 2014, <http://www.forbes.com/sites/billconerly/2014/07/17/why-is-the-euro-high-on-foreign-exchange-markets-in-2014//erg>

Arthur asks, “If Europe has a weak economy, why is the Euro so strong compared with the dollar?” That is this week’s FAQ. After answering that, I’ll give the SAQ: Shoulda Asked Question. The Euro is up three percent against the dollar in the past 12 months, which isn’t much. What is surprising to many people is that the Euro has climbed steadily over the past two years despite the Continent’s weak economy. Inflation: For any foreign exchange rate, I begin with comparative inflation rates. The Euro zone consumer price index is rising less rapidly (0.6 percent in the past 12 months) than the United States CPI (up 2.1 percent). That justifies some appreciation, but it’s not the whole story. Trade Balance: A growing trade balance (exports minus imports) typically pushes a currency up, and the Euro-zone trade balance has jumped a good bit, as shown on the right side of the chart. In short, Europe is able to export goods and services to the rest of the world, but its weak economy limits its citizens’ ability to buy imported goods and services. The rising Euro is the market’s way of trying to bring exports and imports into alignment. EuroCrisis: Fundamentals such as inflation and the trade balance are ignored during financial crises. Another thing helping the Euro has been the calming of financial worries about the member countries. (Whether the calming is justified or not, foreign exchange markets reward calm areas.) China: China’s leaders have talked about diversifying their foreign exchange reserves out of dollars and into other currencies. They seem to be adding Euros to their holdings. However, they are not dumping dollars, simply buying Euros when they add reserves.

Euro is re-bounding—growth in the dollar is not sustainable

Jolly, 5/14, (David, has been with The New York Times organization since joining the International Herald Tribune as an editor in 1999. He previously worked for AP-Dow Jones News Service as a correspondent in Tokyo and New York, “Euro, Clawing Its Way Back, Hits 3-Month High,” New York Times, International Business, MAY 14, 2015, http://www.nytimes.com/2015/05/15/business/international/euro-dollar-currency-forex.html?_r=0//erg

As recently as March, the dollar was looking so strong against the euro that the only question seemed to be how soon the eurozone currency would sink to parity. But the euro has been on a rebound, and on Thursday, it reached a three-month high against the American currency, rising above \$1.14. What happened, and what do recent fluctuations say about the American and eurozone economies? “The original argument for the dollar strengthening was one of divergence,” said Alan Ruskin, head of foreign exchange strategy at Deutsche Bank in New York. While things developed largely as expected on the side of the European Central Bank, he noted, the American narrative has not held up as well. The euro, used by 19 countries, began falling in the second half of last year after alarm about deflationary pressures pushed the European Central Bank toward a policy of quantitative easing. The central bank has committed to buying 60 billion euros, or about \$67.6 billion, worth of bonds each month through September 2016. That central bank program, which has the effect of driving down yields on eurozone government bonds, sent investors scurrying to capital markets in the United States in search of higher returns, especially because the Federal Reserve had been expected to begin moving to raise interest rates from near zero. That wave of dollar-buying helped to drive a big rally the American currency, which gained sharply against most of its

counterparts. But the euro, which fell as low as \$1.0458 on March 16, has been clawing its way back. On Thursday it was trading at \$1.1415, up 0.5 percent on the day and the highest level since February.

Even independent of dollar fluctuation, the euro is more attractive

Jolly, 5/14, (David, has been with The New York Times organization since joining the International Herald Tribune as an editor in 1999. He previously worked for AP-Dow Jones News Service as a correspondent in Tokyo and New York, “Euro, Clawing Its Way Back, Hits 3-Month High,” New York Times, International Business, MAY 14, 2015, [//erg](http://www.nytimes.com/2015/05/15/business/international/euro-dollar-currency-forex.html?_r=0)

The euro is not the only currency rising; the dollar has given up ground more broadly, losing about 5 percent of its value against a basket of currencies over the same period. Mr. Ruskin said that the dollar’s rally began to lose steam after officials of the Federal Open Market Committee, the Fed’s policy-making body, pointedly noted at their March meeting that American exporters could be hurt by a strong currency. But even before that, Mr. Ruskin said, weaker-than-expected economic data had begun to undercut the case for the Fed to increase key lending rates. Tourists outside the Louvre in Paris, where the euro was trading at \$1.0567 on Wednesday, making travel cheaper for Americans. Delight or Dread as Euro Falls MARCH 11, 2015 Isaia models at a trade show in Italy, where jackets priced at \$3,000 at Barneys in New York sell for a third of that. Common Sense: Bargain Hunting With a Strong Dollar in Europe, but Finding a Mixed Bag MARCH 26, 2015 Another factor behind the change of direction is that the yields on many European government bonds, which had fallen into negative territory amid fears that deflation would take hold, have begun to spike higher, making short-term European assets more attractive and encouraging capital to flow back into the euro. For example, the yield on the German 10-year bond, a eurozone benchmark, which fell nearly to zero last month, stood at more than 0.7 percent. (Yields move in the opposite direction of prices.) The fall in the euro, which makes it easier for exporters to compete overseas, is one of the factors — along with lower oil prices and lower interest rates — that economists have cited for the eurozone’s relatively strong first-quarter growth. If the euro continues gaining, it might sap some of that energy. Two reports released on Wednesday set off a new round of dollar-selling. First, data from Eurostat, the European statistical agency, showed that the eurozone economy greatly outpaced the United States economy in the first quarter, growing at a 1.6 percent annualized pace. The American economy registered a 0.2 percent gain in the period, but revised figures are expected to show that it actually contracted. Second, a report from the Commerce Department showed that retail sales were flat in April, confounding expectations of a gain. Taken together, the data made it appear unlikely that the Fed would tighten monetary policy before the autumn, at the earliest, economists say. Phyllis Papadavid, a senior foreign exchange strategist at BNP Paribas in London, warned against looking to Europe for an explanation of the dollar’s downturn. Despite some positive signs, she said, the Continent’s economy remains in the doldrums, with high unemployment likely to continue weighing on growth.

The euro is on a long-term growth streak—structural economic factors facilitate long term stability

CNBC, 5/7, (“Rising yields help euro hit 10-week high vs. struggling dollar,” CNBC, Reuters, 7 May 2015, [//erg](http://www.cnbc.com/id/102651993)

The euro hit a ten-week peak on Thursday, tracking European bond yields higher and benefiting from a sell-off in the dollar after weak U.S. jobs data added to speculation that the Federal Reserve will delay raising interest rates. As Britons took to the ballot box to cast their votes in the most uncertain UK parliamentary elections in decades, the euro also hit a three-month high against sterling. Though the pound inched down against the dollar, it remained in the range in which it has traded for the past two weeks. The greenback has skidded almost five percent in the last month on a run of softer-than-expected data that has driven investors to push back bets on when the Fed would start hiking rates, with some now not expecting rises until next year. Figures on Wednesday showed U.S. private sector employers in April hired the fewest workers in over a year, raising a red flag for closely-watched non-farm payrolls numbers due on Friday. That data, as well as a warning from Fed Chair Janet Yellen about the potential dangers of high equity valuations, helped drive the euro to its highest against the greenback since late February, trading up 0.3 percent at \$1.13825 on Thursday. "The dollar lost momentum after the ADP employment report yesterday, so some of the euro move reflects that," said Phyllis Papadavid, senior FX strategist at BNP Paribas in London. "The next 48 hours are going to be quite important, both in terms of the election and the payroll number tomorrow." Traders said the euro's resilience was also due to a surge in German Bund yields, which have jumped nearly 50 basis points in just over a week, outstripping a 34 basis point rise in their U.S. peers. Against the British pound, the single currency powered to 74.71 pence, its highest since Feb. 6. The ruling Conservatives and opposition Labour Party have been neck-and-neck in opinion polls that indicate neither will win an outright majority in the 650-seat parliament. "In terms of short-term sterling response, we see a hung parliament as the worst outcome given that the full degree of uncertainty would remain in place, with markets likely reacting with a knee jerk sterling sell off," wrote Petr Krpata, FX strategist at Dutch bank ING in London. Reflecting a high degree of uncertainty on the shape of the next government, option traders are expecting a volatile trading in sterling. The pound's overnight implied volatility has shot up to above 30 percent from around 12 percent on Wednesday. The Norwegian crown rose around one percent against the dollar after Norway's central bank left interest rates unchanged, trading at 7.3545 crowns, its strongest this year.

Euro is strong—even resilient through Greece crisis and investor favorite

STUBBINGTON, 6/23, (TOMMY, writes about European financial markets from the Wall Street Journal's London bureau, "Why the Euro Is Bucking the Greek Good News Trend," Wall Street Journal, Jun 23, 2015, <http://blogs.wsj.com/moneybeat/2015/06/23/why-the-euro-is-bucking-the-greek-good-news-trend/>///erg

Many investors believe a Greek exit would be a disaster for the currency, at least in the short term, by reawakening questions about a wider eurozone breakup. But the currency's behavior has been remarkably consistent. As the Greece crisis intensified over recent weeks—and stocks tumbled—the euro has actually been rising. Now Athens and its creditors say they're nearing a deal, and the euro has fallen more than 1% against the dollar Tuesday to touch an intraday low of \$1.1218. It's also down against the pound and the yen. The moves suggest that the euro "is unlikely to benefit from any Greek resolution," say currency strategists at BNP Paribas. Many analysts argue that the long-running Greece crisis has had little impact on the euro exchange rate, at least directly. Investors have largely been reluctant to speculate on the outcome of the unpredictable political discussions. But others argue Greece has had a powerful indirect effect, hinging on the euro's role in so-called "carry trades." Currency investors often borrow in a currency with low interest rates to buy another with much higher interest rates, and pocket the difference, known as "carry." The eurozone has some of the lowest interest rates in the world, making the euro a favorite for funding such trades—a role it has gradually wrested away from the dollar over the past two years. The borrowed euros are typically used to fund bets in riskier markets. If risks rise in financial markets (as they did while Greek talks were deadlocked), investors tend to exit these bets. That causes the euro to rise as the borrowed money comes home.

1AR—Greece

Ever country is key – alt causes destroy the internal link

Schäfer 13 (Matthias Schäfer; Head of Team Economic Policy at Konrad-Adenauer-Stiftung, a German political foundation. "PERSPECTIVES FOR A COMMON STABILITY CULTURE IN EUROPE" Konrad-Adenauer-Stiftung; January 2013. http://www.kas.de/wf/doc/kas_33313-544-2-30.pdf?130121114248)

The "euro crisis" has focused attention on the fact, that the eurozone countries are increasingly interdependent concerning macroeconomic developments like economic growth, employment or competitiveness. The crisis has served to emphasise how, more than ever before, it is important to ensure that every national economy can foster its perspectives of growth and wealth in a similar way. The ongoing process of European integration has led to European member states economies becoming more closely interwoven. As a result, decisions or failure to take decisions on economic policy by individual countries no longer simply have an impact on their domestic economies but can also have a significant effect on growth and economic stability in every country in the eurozone. Today eurozone countries all share a common fate. They all benefit from a particular country's economic strength, but as well they are all affected by another country's economic weakness. For this reason, it is essential to intensify the debate on economic growth in the member states. This will promote a mutual understanding of each country's growth and open up a common European perspective that will help the member states to be more competitive and to maintain the stability of the single currency

Grexit destroys everything—shocks prove

Meakin and Ismail, 7/5, (Lucy, and Netty Idayu, "Euro Slides After Greek Voters Reject Austerity; Yen Strengthens," Bloomberg Business, July 5, 2015, [//erg">http://www.bloomberg.com/news/articles/2015-07-05/euro-may-slide-at-open-as-early-polls-suggest-greek-no-vote\)//erg](http://www.bloomberg.com/news/articles/2015-07-05/euro-may-slide-at-open-as-early-polls-suggest-greek-no-vote)

The euro dropped to a one-week low against the dollar as Greeks voted against yielding to further austerity, raising the risk of an exit from the currency union that would call into question the bloc's integrity. Sixty-one percent of Greek voters backed Prime Minister Alexis Tsipras's rejection of further spending cuts and tax increases in a referendum, data on the Interior Ministry website show. Turnout was 62.5 percent. The yen strengthened against all its 16 major counterparts as the Greek crisis spurred demand for haven assets. Australia's dollar fell below 75 U.S. cents. "A 'no' vote in the Greek referendum isn't good news, so the initial reaction to sell the euro is the right one," said Yuji Saito, executive director of foreign exchange at Credit Agricole SA in Tokyo. "Right now it's risk off, and the dollar and yen are in demand. There will probably be a return to bailout negotiations, but the chance of reaching an agreement seems slim." The euro slid 0.5 percent to \$1.1055 at 6:46 a.m. in London after declining as much as 1.3 percent to \$1.0970, the lowest level since June 29. The shared currency tumbled 0.8 percent to 135.31 yen. The yen gained 0.3 percent to 122.38 per dollar. While Greece accounts for less than 2 percent of the euro zone's output, an exit would set a precedent for other nations that membership is reversible. The currency has been resilient amid the ebb and flow of Greek bailout talks, gaining 3.9 percent versus the dollar in the three months through June 30, its best quarter since 2013. The euro pared some of its losses after Finance Minister Yanis Varoufakis said he was leaving the ministry. German Chancellor Angela Merkel will travel to Paris on Monday to meet French President Francois Hollande. The two leaders agreed in a telephone call that the decision of the Greek people in the referendum was "to be respected," the German government press office said in an e-mail. "The risks the Greek referendum pose to the very heart of the European Monetary Union have yet to be fully understood," said Robert Rennie, global head of currency and commodity strategy at Westpac Banking Corp. in Sydney. "Financial markets will be watching very closely for reactions from Hollande, Merkel," and European Central Bank President Mario Draghi, he said. The euro may weaken toward its 12-year low of \$1.0458 set on March 16, Rennie said. Volatility Rises One-month implied volatility, a measure of anticipated price swings in the euro-dollar exchange rate, rose to 13.4 percent, from 12.7 percent at the end of last week. Markets are just wracked with uncertainty, said Ray Attrill, global co-head of currency strategy at National Australia Bank Ltd. in Sydney. "Until we see what the inclination, particularly for the German side, is when they meet tomorrow, that's just making people hesitant to jump in with both feet and sell the euro." The 19-nation shared currency has weakened 8.6 percent against the dollar this year, after a 12 percent decline in 2014, fueled by a divergence in monetary policy between the

U.S. and the euro area. Before the Greek referendum was announced, analysts saw it weakening to \$1.05 by year-end, according to forecasts compiled by Bloomberg.

1AR—Impact D

No war – shared culture

Petty 04 [Gary, UCG, "The World's Superpower Faces Powerful Challenges," <http://www.ucg.org/issues/gn50/superpower.htm>]

Europe's old rivalries are being replaced by nations without borders. Professor Kupchan writes: "The European project has been an unqualified success. Not only has war among Europe's nations become unimaginable, but the borders among them are undefended and already being crossed without passport or customs control ... "Opinion surveys reveal a clear preference among European publics for quickening the speed of integration. Almost half of those polled strongly identified as European, not just as citizens of a national state. And more than 70 percent support a common defense and security policy for the EU" (The End of the American Era, 2002, p. 136). The combined population and economic output of the European Union is greater than the United States, and almost 75 percent of European trade is among member states. This means that the EU can sustain a measure of self-sufficiency that has been the sole privilege of the United States.

Cooperation checks

Ronald **Asmus 03** (Senior Transatlantic Fellow at the German Marshall Fund, Council on Foreign Relations Senior Adjunct Fellow, former Deputy Assistant Secretary of State for European Affairs, Sept/Oct 2003, Foreign Affairs, p. Lexis)

Several factors make the recent collapse in transatlantic cooperation surprising. The crisis came on the heels of the alliance's renaissance in the 1990s. Following deep initial differences over Bosnia at the start of the decade, the United States and Europe came together to stem the bloodshed in the Balkans in 1995 and again in 1999. Led by Washington, NATO expanded to include central and eastern Europe as part of a broader effort to secure a new post-Cold War peace. This initiative was also accompanied by the creation of a new NATO partnership with Russia. As a result, Europe today is more democratic, peaceful, and secure than ever. For the first time in a century, Washington need not worry about a major war on the continent -- a testimony to the success in locking in a post-Cold War peace over the last decade.

Wont escalate

Ullman 97 (Richard Ullman; Professor of International Affairs at Princeton, "The World and Yugoslavia's Wars" January 1997; http://www.cfr.org/publication/109/world_and_yugoslavia_wars.html?excerpt=1)

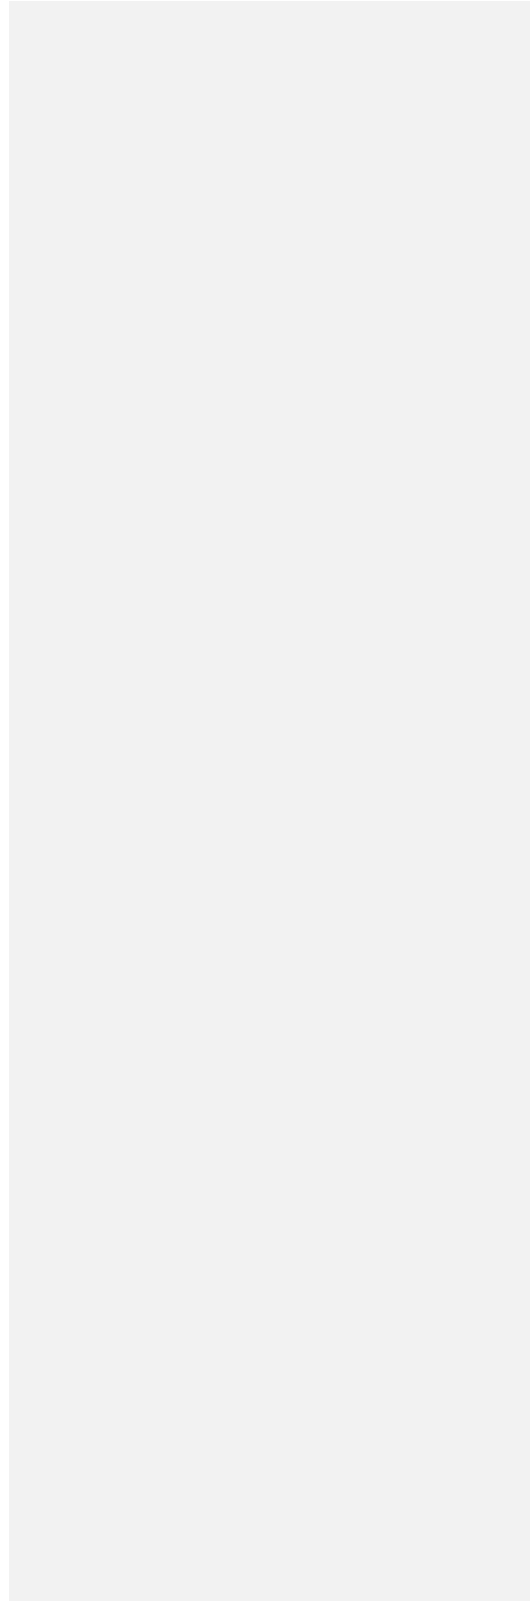

On the contrary, the major powers today perceive their interests in terms sharply different from those that made the Balkans the vortex of earlier great power conflicts. Europe's peace today is a divisible peace: violent conflicts will be sufficiently confined so that they will be very unlikely

to escalate across the threshold of war among the major European powers. There will certainly be quarrels and animosities, more often within states than between them. Their locus will be predominantly in eastern Europe— on the territory of the satellites and republics of the former Soviet Union. The Balkans, obviously, will be a zone of some instability. Some of these quarrels and animosities— a very few of them— will escalate to serious levels of violence. Yet outsiders will have every incentive to remain outside rather than to escalate the level of conflict through competitive interventions. Most Europeans— indeed, an overwhelming majority of them— will live their entire lives without firsthand experience of the flames of war. Given Europe's history of wars that have not been contained, that is a revolutionary development. It is small consolation, however, to the peoples who will be involved in the conflicts that do take place. Indeed, for them its implication is grim. It means that rescue, in the form of an intervention by outside actors that smothers the flames, will be late in coming— if it comes at all.⁵

Passage inevitable and transportation funding thumps the link Cahlink 6-15

George, political commentator, Roll Call, "Congress Weighs Options Before Ex-Im Bank Expires," http://www.rollcall.com/news/congress_weighs_its_options_before_ex_im_bank_expires-242336-1.html

Congress is on course to let the Export-Import Bank expire at the end of this month, but it's unlikely to mean the ultimate demise of the 81-year-old credit financing agency. House and Senate backers of the bank say there are no obvious options for avoiding a lapse in authorization in about two weeks, given limited floor time in both chambers and conservative opposition in the House. But they also say they expect Congress will find a way to move a long-term extension before leaving for the August recess. Supporters expect the business community to continue its heavy push for extending the bank, which provided more than \$20 billion in loans, guarantees and other financing arrangements to U.S. exporters in fiscal 2014. They also note a recent test vote in the Senate on the bank's fate showed 65 votes in favor, a filibuster-proof majority. "Those that want to shut down the bank are in the minority," said Sen. Lindsey Graham, R-S.C., a leading supporter of the financing agency. He expects Congress to attach the bank renewal to must-pass legislation to extend the authorization for highway and transit programs that runs out at the end of July.

It'll be attached to other must pass legislation

Bryan 6-4

Bob, Reporter, Business Insider, "GOLDMAN: Here are 6 things to watch for this summer in Washington," <http://www.businessinsider.com.au/goldman-sachs-summer-politics-forecast-2015-6>

6. But it could mean reauthorizing the Export-Import Bank. Since the short-term infrastructure patch is necessary, Phillips expects that supporters of the Export-Import bank will saddle its reauthorization onto the bill. "Ex-Im supporters are likely to seek to combine renewal of the bank's charter with some other must-pass legislation; the most obvious is the highway bill. If this occurs, it would increase the probability that the Ex-Im charter will be extended, at least temporarily. That said, since the highway program's authority does not expire until July 31, such a strategy would also raise the probability that authority for the Ex-Im Bank to make new export credit loans and guarantees would expire at least temporarily."

Passage inevitable – gets attached to highway legislation in July AP 6-28

Reporter, the Associated Press, "Export-Import bank likely to temporarily expire,"
<http://www.goerie.com/export-import-bank-likely-to-temporarily-expire#>

Republican House Speaker John Boehner of Ohio, a longtime business booster, has pushed his Financial Services Committee Chairman Jeb Hensarling, R-Texas, to come up with a plan to reform the bank or wind it down. Hensarling has responded, instead, by pushing for the bank's charter to expire without a vote June 30. With Congress heading out on recess next week and no prospect of action on the Export-Import Bank before then, Hensarling and fellow tea party conservatives will get their wish. But their victory may be short-lived. Lawmakers of both parties on Capitol Hill expect a reauthorization of the bank could move in the Senate in July. If attached to must-pass legislation extending the federal highway trust fund, it could make it through the House as well. The fate of the Export-Import Bank has become enmeshed in Congress' contentious debate over trade after Washington Democratic Sen. Maria Cantwell withheld her support on a key trade vote last month until she said she got a commitment from McConnell to allow a vote on the bank. What exactly was agreed to is now a matter of dispute on Capitol Hill, and McConnell says he's already fulfilled his commitment by allowing a symbolic vote on the Export-Import Bank earlier this month that allowed supporters to demonstrate they command at least 65 votes in favor. Still, McConnell and other GOP leaders sound open to adding a reauthorization of the bank to the highway bill next month. "The highway bill, of course, will be open for amendment, and it's pretty obvious that that would be a place for this vote to occur," McConnell said Tuesday. Asked about the issue Wednesday, Boehner said: "I think some expectation has been that it'll come over here on some must-pass bill. The only commitment I've made is that if it does, it would be considered under an open process."

Ex-Im gets attached to highway legislation – insider statements prove Fleming 6-23

Matthew, reporter, Roll Call, “Ex-Im Bank Could Hitch a Ride on Highway Bill (Video),” <http://blogs.rollcall.com/wgdb/ex-im-bank-reauthorization-2015-highway-bill/?dcz=>

It looks like **the Export-Import Bank will hitch a ride on the highway bill.** Senate Majority Leader Mitch McConnell said Tuesday **the highway bill would be the “obvious place” for a vote to keep the bank alive.** That’d be over the objections of one Sen. Ted Cruz, R-Texas, who ripped GOP leaders earlier Tuesday and demanded they commit to killing the bank. There’s been some dispute between Ex-Im supporters and Republican leadership over whether or not a deal had been struck on an reauthorization vote prior to the charter’s expiration at month’s end in exchange for a prior vote on TPA. But Tuesday, McConnell said that **senators were given the opportunity for a test vote earlier this month and then floated the highway plan.** “What I’ve said repeatedly going back to our initial discussion on TPA is we would get a vote on an amendable vehicle in June — we’ve had that,” McConnell said. **“That gave the supporters of Ex-Im the opportunity to demonstrate that the votes were there and then the highway bill will be open for amendment.** And it’s pretty obvious that **that would be a place for this vote to occur.** But in connection to TPA, we’ve had no further discussions beyond what I’ve said a month ago.” McConnell had previously stated he did not believe the trade package, which has precarious support, was the appropriate place for an Ex-Im vote.

Passes in both chambers

Wilts and Hughes 6-23

Alex and Krista, Reuters, “U.S. export lender heads for partial shutdown,” <http://www.reuters.com/article/2015/06/23/us-usa-trade-exim-idUSKBNOP327K20150623>

Senate Republican leader Mitch McConnell said a highway bill that is scheduled to come for debate in July was a “pretty obvious” place to attach an extension for Ex-Im. But the Republican chairman of the Senate Environment and Public Works Committee, James Inhofe, said he would oppose his own highway bill if Ex-Im legislation were attached to it. “I’m going to do all I can to keep it from happening,” said Inhofe, one of 31 senators to oppose Ex-Im in a test vote earlier this month. Sixty-five supported it, **suggesting a Senate vote to reauthorize the bank would succeed.** House Democratic whip Steny Hoyer said closing Ex-Im would cost jobs and **noted the House also had enough support to pass an extension of Ex-Im’s charter.**

It get’s attached to the highway bill

Ausick 6-25

Paul, Reporter, 24/7 Wall Street.com, “Boeing 747 Production Will Fall to One a Month,” <http://247wallst.com/aerospace-defense/2015/06/25/boeing-747-production-will-fall-to-one-a-month/>

A report in The Wall Street Journal also noted that 747 buyers are some of the largest customers of **the U.S. Export-Import Bank,** which very likely **will close its doors at the end of June.** **The shutdown may only**

last a month because legislation re-authorizing the Ex-Im bank is likely to be attached to the “must-pass” federal highway bill.

**Highway bill passes because Ex-Im is attached
Hertling 6-22**

Richard, Reporter, Global Policy Watch, “This Week in Congress – June 22, 2015,”
<http://www.globalpolicywatch.com/2015/06/this-week-in-congress-june-22-2015-2/>

The authority for the Export-Import Bank, the federal export credit agency, will expire on June 30 with no prospect for consideration by the Senate of legislation to extend it before the chamber adjourns for the Independence Day holiday. Although the votes exist in the Senate to renew the Bank’s authority, as demonstrated by a test vote during the Senate debate on the defense authorization bill, the Bank’s authority to issue new loans will expire. The plan now among Bank supporters is to aim to include the renewal of the Bank’s charter in the must-pass highway funding bill both chambers will consider in July. Because congressional Republicans have still not found a funding mechanism for a long-term highway bill, including the Bank’s renewal in that vehicle could garner Democratic support for the highway bill, which Democrats have otherwise said they would not support absent a long-term funding mechanism for transportation projects.

2ac no impact/thumper

No impact and highway bill thumps the link Schroeder 6-24

Robert, Fiscal Policy Reporter, Market Watch, "If Export-Import Bank lapses, consequences are 'very modest'," <http://www.marketwatch.com/story/if-export-import-bank-lapses-consequences-are-very-modest-2015-06-24>

The bank makes and guarantees loans to help foreign buyers purchase U.S. goods, including aircraft and industrial equipment. Corporate giants including Boeing Co. BA, -0.38% and General Electric Co. GE, -0.81% benefit from that financing. Critics in Congress say that amounts to corporate welfare and have pushed for the bank's charter to expire on June 30. If that happens, writes Alec Phillips of Goldman Sachs in a research note, the Ex-Im Bank will have to stop extending new loans and guarantees. But he cites two reasons he believes that would have a very modest effect. **First**, he says, the amount of U.S. exports exposed to the bank is fairly modest, at around \$30 billion a year. That's a little more than 1% of exports. And second, Phillips says it looks like the lapse will be temporary. He says he expects the bank's charter to be reinstated in separate highway-related legislation by July 31. The Associated Press, in a report on Wednesday, said lawmakers of both parties expect a reauthorization of the bank could move in the Senate in July. If attached to the must-pass legislation extending the federal highway trust fund, it could make it through the House as well, AP wrote.

2ac link theory

**The colon makes “resolved” meaningless – everything after it is what’s important
Webster’s 2k**

(Guide to Grammar and Writing , <http://ccc.commnet.edu/grammar/marks/colon.htm>)

Use of a colon before a list or an explanation that is preceded by a clause that can stand by itself. Think of the colon as a gate, inviting one to go on... If the introductory phrase preceding the colon is very brief and the clause following the colon represents the real business of the sentence, begin the clause after the colon with a capital letter.

Should expresses desirability

Cambridge Dictionary of American English 7

(http://dictionary.cambridge.org/define.asp?key=should*1+0&dict=A)

should (DUTY)

auxiliary verb

used to express that it is necessary, desirable, advisable, or important to perform the action of the following verb

Should doesn’t mean immediate

Dictionary.com 10

Dictionary.com, <http://dictionary.reference.com/browse/should>

should /ʃʊd/ Show Spelled[shood] Show IPA –auxiliary verb 1. pt. of shall. 2. (used to express condition): Were he to arrive, I should be pleased. 3. must; ought (used to indicate duty, propriety, or expediency): You should not do that. 4. would (used to make a statement less direct or blunt): I should think you would apologize. Use should in a Sentence See images of should Search should on the Web Origin: ME sholde, OE sc (e) olde; see shall —Can be confused: could, should, would (see usage note at this entry). —Synonyms 3. See must 1. —Usage note Rules similar to those for choosing between shall and will have long been advanced for should and would, but again the rules have had little effect on usage. In most constructions, would is the auxiliary chosen regardless of the person of the subject: If our allies would support the move, we would abandon any claim to sovereignty. You would be surprised at the complexity of the directions. Because the main function of should in modern American English is to express duty, necessity, etc. (You should get your flu shot before winter comes), its use for other purposes, as to form a subjunctive, can produce ambiguity, at least initially: I should get my flu shot if I were you. Furthermore, should seems an affectation to many Americans when used in certain constructions quite common in British English: Had I been informed, I should (American would) have called immediately. I should (American would) really prefer a different arrangement. As with shall and will, most educated native speakers of American English do not follow the textbook rule in making a choice between should and would. See also shall. Shall –auxiliary verb, present singular 1st person shall, 2nd shall or (Archaic) shalt, 3rd shall, present plural shall; past singular 1st person should, 2nd should or (Archaic) shouldst or should-est, 3rd should, past plural should; imperative, infinitive, and participles lacking. 1. plan to, intend to, or expect to: I shall go later.

***ex-im good**

2ac growth turn

Passage good – failure to reach a deal hurts small business and U.S. growth Arensmeyer 6-22

John, Reporter, The Hill, “Long-term reauthorization needed for Export-Import Bank,”
<http://thehill.com/blogs/congress-blog/economy-budget/245571-long-term-reauthorization-needed-for-export-import-bank>

Fulton is not alone. If Congress fails to reauthorize the Ex-Im Bank, more than \$34 billion in exports will be lost this year, tens of thousands of workers engaged in the exporting business could be laid off, and several thousand exporters—mostly small business owners—will take a substantial financial loss, as will the suppliers who make or grow the products being exported. Failure to pass a long-term reauthorization of the Ex-Im Bank would be damaging to the economy and place an unfair burden on small business owners like Jenny Fulton and other hard working exporters. It’s time for Congress to find a permanent fix for the Ex-Im Bank so small businesses can have the certainty they need to continue brokering deals with foreign countries that bolster our economy here at home.

Economic collapse causes extinction

Kerpen 8

Phil, National Review Online, October 29, , Don't Turn Panic Into Depression,
<http://www.cbsnews.com/stories/2008/10/29/opinion/main4555821.shtml>

It’s important that we avoid all these policy errors - not just for the sake of our prosperity, but for our survival. The Great Depression, after all, didn’t end until the advent of World War II, the most destructive war in the history of the planet. In a world of nuclear and biological weapons and non-state terrorist organizations that breed on poverty and despair, another global economic breakdown of such extended duration would risk armed conflicts on an even greater scale. To be sure, Washington already has stoked the flames of the financial panic. The president and the Treasury secretary did the policy equivalent of yelling fire in a crowded theater when they insisted that Congress immediately pass a bad bailout bill or face financial Armageddon. Members of Congress splintered and voted against the bill before voting for it several days later, showing a lack of conviction that did nothing to reassure markets. Even Alan Greenspan is questioning free markets today, placing our policy fundamentals in even greater jeopardy. But after the elections, all eyes will turn to the new president and Congress in search of reassurance that the fundamentals of our free economy will be supported. That will require the shelving of any talk of trade protectionism, higher taxes, and more restrictive labor markets. The stakes couldn’t be any higher.

1ar ex-im k2 growth

Key to the economy – businesses and manufacturing jobs

Howard 6-24

James P., Reporter, The Conversation, "Why the Export-Import Bank Should Be Saved," <http://www.thefiscaltimes.com/2015/06/24/Why-Export-Import-Bank-Should-Be-Saved>

Keeping the bank alive. Like other Washington debates, the reality lies between the competing narratives, and the numbers justify continuing the bank's charter. In terms of risk, the Ex-Im Bank has a remarkably low default rate of less 0.2%. Because so few foreign companies have defaulted on their loans, the bank has returned billions of dollars to taxpayers in interest income, \$7 billion since 1992 alone. The bank expects to make another \$14 billion in the next nine years. And the CBO report uses a flawed analysis to show the bank will lose money rather than make a tidy profit. It overweights near-term losses while underweighting long-term gains by using a higher discount rate than it should. The "discount" interest rate is used to figure the net present value of future cash flows. The analysis leaves the outflows, or loans, untouched, yet reduces the value of future payments, so that even if a borrower repays in full, it would show up as a loss in the present. As long as the Ex-Im Bank charges interest rates higher than its own borrowing rate and keeps default rates low, the bank will remain profitable for the government. In sum, the Ex-Im Bank provides a benefit to the US economy by supporting big businesses and small ones alike and bolstering employment, especially endangered manufacturing jobs. By providing investment guarantees, the bank encourages both foreign buyers and domestic manufacturers to work together when private insurance solutions are unavailable. Other industrialized nations provide similar services to support their own manufacturers. Cutting off an essential financial security layer will harm American businesses. This success, at no expense to taxpayers, shows why Congress should keep the bank alive.

It's a lotta jobs!

Harris 6-25

Patrice, Reporter, Talk Radio News Service, "Dem Leaders: Economic Crisis Lurks if Ex-Im Bank is not Renewed," <http://www.talkradionews.com/congress/2015/06/25/dem-leaders-economic-crisis-lurks-if-ex-im-bank-is-not-renewed.html>

(TRNS)- With less than five days before the expiration of the Ex-Im bank, Democratic leaders in the U.S Congress are urging Republicans not to allow the bank to expire. House Minority Leader Nancy Pelosi (D-Calif.) said that the highway bill and renewal of Ex-Im Bank are long overdue. "There are many jobs that depend on Ex-Im bank, 1.5 million jobs and we have a June 30th deadline and no action," Pelosi said. "We are calling upon leadership to pass the highway bill, pass the Ex-Im bank, and bring us to the table to debate a budget that will enable us to be right by the American people." House Minority Whip Steny Hoyer (D-MD) believes there is no excuse to not have the Ex-Im bank legislation passed as yet. Hoyer is assuring that the Ex-Im bank renewal has had majority of the votes for the last six months. "Not funding a highway bill and funding for highways has left governors, mayors, county executives, county commissioners all at risk and with doubt as to what funding will be available. I would urge republican leadership to bring Ex-Im bank to the floor as soon as we return and have in July a product for us to

consider," Hoyer said. According to the Democratic leadership, as many as 160,00 jobs would be lost across America by the closure of the Ex-Im bank.

1ar ex-im k2 growth/heg

Failure to reauthorize Ex-Im kills heg and the economy

Stanley, 6/29

(Kevin, CEO of Ventech Engineers International, "Export-Import Bank Critical to American Strength, 29 June 2015, <http://www.washingtonexaminer.com/export-import-bank-critical-to-american-strength/article/2567131>)

Most of the discussion of the Ex-Im Bank deals with economic issues like the **150,000 American jobs** that **are attributed to the bank each year** and its impact on America's GDP. Critics focus on ideological slogans like "crony capitalism" or the true but irrelevant point that government shouldn't "pick winners and losers" in the market. (Ex-Im does no such thing.) But here's a far more relevant fact — if Ex-Im shuts down at the end of June, we will not be able to build a critically-needed \$300 million facility to supply fuels required for the fight against ISIS. In the longer term, America's central role in the rebuilding of Iraq and the development of the entire region will be put at risk as foreign firms — fiercely backed by their own big-spending governments — rush in to seize business that right now is going to American companies backstopped by the Export-Import Bank. And the loss of those projects will also represent lost future business to support and maintain those American-supplied facilities for decades. **That loss will have painful economic consequences, as export-oriented businesses pull back and American export workers lose their jobs by the tens of thousands. It will put in motion a costly "brain drain" as key export fields like aerospace, oil services and precision machinery all shift overseas. Last year, Ex-Im supported nearly \$30 billion in U.S. exports, all of which would be lost to U.S. business** if the bank's attackers have their way. But **the stakes are higher still.** We learned during the Cold War how **the spread of U.S. culture, products and businesses around the globe enhances our global strength. Anyone who sees America's free and open economic system at work ends up wanting to join with us, to take our side.** **Withdrawing from global economic engagement as the bank's critics would have us do would dangerously undermine this vital outreach tool.**

Ex-Im bank boosts small businesses, treasury revenue, and allows the US to remain competitive in the global economy

Wright, 6/28/15

(Lincoln, "Loss of Ex-Im Bank Could Affect Local Manufacturers," http://www.southbendtribune.com/news/business/loss-of-ex-im-bank-could-affect-local-manufacturers/article_e33cd133-5081-524a-a8af-e795af67126b.html)

On Thursday, the 20 percent of Sullivan-Palatek's business that foreign sales make up will start to dissolve, McFee said. The Ex-Im Bank will continue to provide assistance for deals it's already committed to fund, but it will not be able to offer new aid. A large portion of its deals also don't extend more than a year. Soon it will be impossible, McFee said, to get new foreign business, which is typically the company's largest orders. **Though about 90 percent of the bank's transactions — including the transactions handled for Sullivan-Palatek — are aimed at supporting smaller businesses,** opponents argue the bank is largely welfare for big corporations. Though the bank does work with large companies like Boeing and General Electric, **a majority of the about \$20.5 billion the bank authorized for more than 3,700 transactions in fiscal year 2014 were for small companies, according to the bank.** **This contributed to more than 164,000 U.S. jobs,** the bank says. U.S. Reps. Fred Upton, R-St. Joseph, and Jackie Walorski, R-Jimtown, did not return requests for comments by Friday's deadline. However, Republican opposition to the bank has grown only in recent years. In fact, since its creation about 81 years ago, the Ex-Im Bank has seen overwhelming bipartisan support. Discussing the importance of the bank with the South Bend Tribune, U.S. Sen. Joe Donnelly, D-Ind., quoted Republican

President Ronald Reagan. Reagan, known partly for his supply-side economic policies, said, **“Exports create and sustain jobs for millions of American workers and contribute to the growth and strength of the United States economy. The Export-Import Bank contributes in a significant way to our nation’s export sales.”**, Donnelly, though, said he had no confidence in the House taking up a vote in a timely manner since all opposing lawmakers have to do is ignore the issue to stop the bank’s charter. Donnelly, who serves on the Senate Banking Committee, has continuously advocated for the reauthorization of the Ex-Im Bank and called the arguments against the bank “ideological thinking.” He said **the Ex-Im Bank has directly helped more than 100 companies in Indiana export more than \$3 billion in goods and services since 2010. And although the bank does benefit some large companies, Donnelly said it can’t be argued that it’s hurting the U.S. Since 1992, the bank has returned more than \$7 billion in profits to the Treasury Department**, the senator said, with \$675 million of that coming from the 2014 fiscal year. And according to the bank, with its less than 2 percent default rate, **it has also not cost taxpayers any money since a bailout in the 1980s.** ¶ **“Unilaterally eliminating our export credit agency hurts only the U.S. and handcuffs our job creators while allowing competitors in foreign countries to capitalize and seize business.”** Donnelly said speaking before the full Senate this past week. “Even our neighbor Canada is providing far more export financing than the U.S., even though Canada’s economy is one-tenth the size of the U.S. economy and their Ex-Im Bank provides for more financing than ours. Clearly, **the Ex-Im Bank is a tool that helps American companies compete in the global economy.**” ¶ Letting the bank’s charter expire, though, may be a short-lived victory for its opposition. Congressional members in both parties are expecting the issue to be brought back in the Senate later in July. If attached to a bill extending the federal high trust fund, seen as must-past legislation, the Ex-Im Bank’s reauthorization stands a chance of making it past the House. “What seems odd is it works so well,” McFee said. “I don’t know who will be harmed by this.”

Export-Import bank is key to the economy and overall diplomacy

Kirk, 6/29

(Ron, co-chair of the Clean and Safe Energy Coalition & former US trade representative, “A Critical Deadline,” US News, 29 June 2015, <http://www.usnews.com/news/the-report/articles/2015/06/29/the-export-import-bank-is-critical-to-national-security-and-the-economy>)

America achieves its diplomatic goals. Some believe that a strong military and open dialogue are the solution to all our problems. Of course, **diplomacy with world leaders has immense strategic value, but as equally important to maintaining our influence is economics. We are the largest economy in the world, and that’s one of our biggest selling points.** But being big isn’t always enough. Foreign businesses want to transact with us and have a means to do so. Often the global marketplace is efficient enough where American businesses can win deals just by virtue of the value they provide. But the marketplace isn’t level, and we can lose business by no fault of our own. That’s why **more than 7,300 companies rely on the Ex-Im Bank.** ¶ **Enough cannot be said of the role the Ex-Im Bank plays in securing American jobs simply by giving businesses an edge to win a piece of the huge overseas market.** The Bank’s function is relatively simple: foreign buyers need access to financing to purchase American goods, but sometimes can’t get it from private sector lenders. This can happen for a number of reasons, which are rarely related to how much risk the borrower carries. **There could be regulatory obstacles, or political factors, or the borrower needs official export credit guaranteed by a government. In these cases, the Ex-Im Bank is able to step in.** But helping small and mid-sized businesses grow and expand is not the only value of the Ex-Im Bank. **As important is the kind of influence we can have when our trading partners are making strategic decisions.** ¶ We see this happen in several ways. First, **the Ex-Im Bank is often involved in politically sensitive industries where goods and services have national security implications. When we export a nuclear reactor or a satellite or a power plant, we are integrating not just American products, but also American standards and protocols** into the infrastructure of trading partners. ¶ **Then there’s good old-**

fashioned economic diplomacy, where our trading partners understand their economic prosperity is at stake in choosing to align against U.S. interests. This has been an important tool in international affairs for millennia, and is no less true today. **The Ex-Im Bank plays no small part in preserving these interests** and I've witnessed its influence, such as when Indian suppliers cut sales to Iran fearing consequences to Ex-Im Bank deals. ¶ **The end of the Ex-Im Bank poses such severe consequences to U.S. interests abroad,** 12 former national security officials, including myself, wrote to Congress urging them to reauthorize the Bank. The letter, with no exaggeration, concludes, "**Our national security and economic interest depend upon it.**" Susan Rice, U.S. National Security Advisor, echoed our comments in April, adding, "when President Obama meets with foreign leaders, **Ex-Im is an important part of our diplomacy.**"

2ac heg turn

Ex-Im is key to reduce the trade deficit – failure to extend the bank hastens hegemonic decline

Thompson 6-12

Loren, national security and business writer for Forbes, “Crazy Crusade To Kill Ex-Im Bank Hurts America, Helps China,” <http://www.forbes.com/sites/lorenthompson/2015/06/12/crazy-crusade-to-kill-ex-im-bank-hurts-america-helps-china/2/>

If you want to understand why economic recovery from the recent recession has been so anemic, don't look at Obamacare or ozone rules — look at the trade deficit. Last year the huge imbalance between America's imports and exports shaved a full percentage point off economic growth; if trade had been balanced, the growth rate would have been 3.6% rather than 2.6%. The impact was even worse in the first quarter of this year, enough to transform what would have been moderate expansion into a negative growth rate. With last year's non-petroleum trade deficit ranked as the worst ever recorded after adjusting for inflation, you'd think Congress would be moving decisively to help U.S. exporters. Well, guess again. Right-wing Republicans are actually trying to kill off the Export-Import Bank (“Ex-Im”), which would make America the only major trading nation in the world without an export credit agency. If that ill-conceived campaign succeeds, it will accelerate China's rise as a global economic power and hasten America's decline. When Ex-Im critics cite their bill of particulars for why abolishing America's only export credit agency makes sense, you get the feeling they've never heard of China. China is the biggest reason for America's yawning trade gap, and its use of state funds to push exports around the globe dwarfs anything Ex-Im is doing. At the moment, Ex-Im has a loan portfolio worth about \$110 billion. Over the last two years alone, China has passed out \$670 billion in loans and other financial assistance to its exporters. And unlike Ex-Im programs, Beijing's export assistance often takes the form of subsidies. Ex-Im is required by law to be self-sustaining, so it has to charge fees whenever it provides a loan guarantee or any other type of financial assistance. In fact, it generates a profit for taxpayers by charging foreign buyers for what amounts to insurance that their deals will be consummated. China's export credit agencies (it has several) supposedly are required to be self-sustaining too under World Trade Organization rules, but their operations are as opaque as everything else in official China. So it shouldn't come as a surprise that Beijing has provided export assistance to one favored telecom company — Huawei — greater in value than Ex-Im's entire loan portfolio. Huawei now routinely beats U.S. rivals for telecom contracts in places like Brazil, even though it is rumored to have used proprietary technology developed by those rivals in its own offerings. This is standard operating procedure for Chinese exporters in the developing world, where they typically show up with inferior products but irresistible financing courtesy of the Beijing government. Over the long haul, China's push to replace U.S. companies in foreign markets may prove more injurious to American power and prosperity than the huge gap in bilateral trade of goods between the two countries (the U.S. deficit in China trade was \$343 billion last year — nearly a billion dollars per day). An intelligence assessment produced early in the Obama Administration warned that the transfer in wealth from West to East currently under way is without precedent in modern history. But the distracted, divided U.S. political system is ill-equipped to cope with the challenge China's mercantilist trade policies present. The absurd effort to abolish Ex-Im Bank is emblematic of how intellectually unprepared some lawmakers are to respond to America's waning economic influence. The complaints of Ex-Im critics about “crony capitalism” and “corporate

welfare” sound more like the rants of left-wing liberals in the pre-Reagan era than the reasoning of people who understand current economic realities. The critics contend that if Ex-Im disappeared, private lenders would fill the resulting vacuum — even though private lenders keep saying they can’t or won’t. Private lenders often don’t like the risk profile of countries seeking export assistance, or they don’t like to do business with small companies (who account for 90% of Ex-Im transactions).^a Besides, it is usually commercial lenders who bring Ex-Im into transactions in the first place, because they want the kind of protections available to lenders who finance the exports of other countries. In fact, they’re willing to pay a fee for that protection, and Ex-Im has proven it can provide assistance that levels the playing field without incurring significant risk. The default rate on its loans currently stands at less than one fifth of one-percent; Wells Fargo wishes its loan portfolio looked that good. No private lender has ever complained about competition from Ex-Im, because its services are crucial to making deals work. So when Ex-Im’s authority to extend credit lapses at the end of this month, there probably will be a quiet celebration in Beijing that some lawmakers in America are so misguided. Washington is the only capital in the world where a debate is going on about whether an export credit agency is needed. The debate in Beijing, and Seoul, and New Delhi, is about how much more money should be spent on export financing, not whether to do it. The good news is that there are majorities in both chambers of Congress ready to reauthorize the Export-Import Bank; the bad news is that critics are working hard to prevent a floor vote that would permit the triumph of common sense over mindless ideology.

Hegemony solves every conflict imaginable **Brookes 6 – senior fellow @ Heritage**

Peter, senior fellow at The Heritage Foundation. Why they need us: Imagine a world without America. 7/4/6. <http://www.heritage.org/Press/Commentary/ed070406a.cfm>.

The picture isn't pretty. Absent U.S. leadership, diplomatic influence, military might, economic power and unprecedented generosity, life aboard planet earth would likely be pretty grim, indeed. Set aside the differences America made last century - just imagine a world where this country had vanished on Jan. 1, 2001. On security, the United States is the global balance of power. While it's not our preference, we are the world's "cop on the beat," providing critical stability in some of the planet's toughest neighborhoods. Without the U.S. "Globo-cop," rivals India and Pakistan might well find cause to unleash the dogs of war in South Asia - undoubtedly leading to history's first nuclear (weapons) exchange. Talk about Fourth of July fireworks . . . In Afghanistan, al Qaeda would still be an honored guest, scheming over a global caliphate stretching from Spain to Indonesia. It wouldn't be sending fighters to Iraq; instead, Osama's gang would be fighting them tooth and nail from Saudi Arabia to "Eurabia." In Asia, China would be the "Middle Kingdom," gobbling up democratic Taiwan and compelling pacifist Japan (reluctantly) to join the nuclear weapons club. The Koreas might fight another horrific war, resulting in millions of deaths. A resurgent Russia, meanwhile, would be breathing down the neck of its "near abroad" neighbors. Forget the democratic revolutions in Ukraine and Georgia, Comrade! In Europe, they'd be taking orders from Paris or Berlin - if those rivals weren't at each other's throats again. In Africa, Liberia would still be under Charles Taylor's sway, and Sudan would have no peace agreement. And what other nation could or would provide freedom of the seas for commerce, including the shipment of oil and gas - all free of charge? Weapons of Mass Destruction would be everywhere. North Korea would be brandishing a solid nuclear arsenal. Libya would not have given up its weapons, and Pakistan's prodigious proliferator, A.Q. Khan, would still be going door to door, hawking his nuclear wares. Also missing would be other gifts from "Uncle

Sugar" - starting with 22 percent of the U.N. budget. That includes half the operations of the World Food Program, which feeds over 100 million in 81 countries. Gone would be 17 percent of UNICEF's costs to feed, vaccinate, educate and protect children in 157 countries - and 31 percent of the budget of the U.N. High Commissioner for Refugees, which assists more than 19 million refugees across the globe. In 2005, Washington dispensed \$28 billion in foreign aid, more than double the amount of the next highest donor (Japan), contributing nearly 26 percent of all official development assistance from the large industrialized countries. Moreover, President Bush's five-year \$15 billion commitment under the Emergency Plan for AIDS Relief is the largest commitment by a single nation toward an international health initiative - ever - working in over 100 (mostly African) countries. The United States is the world's economic engine. We not only have the largest economy, we spend 40 percent of the world's budget on R&D, driving mind-boggling innovation in areas like information technology, defense and medicine. We're the world's ATM, too, providing 17 percent of the International Monetary Fund's resources for nations in fiscal crisis, and funding 13 percent of World Bank programs that dole out billions in development assistance to needy countries. And what does Uncle Sam get in return? Mostly grief, especially from all the ungrateful freeloaders who benefit tremendously from the global "public goods" we so selflessly provide with our time, effort, blood and treasure. How easily - and conveniently - they forget . . . unless they need help, of course.

2ac competitiveness

Nations don't compete like corporations.

Krugman, 2011

Paul Krugman, Nobel prize winning economist, January 22,
<http://krugman.blogs.nytimes.com/2011/01/22/competitiveness/>)

Sigh. So it appears that President Obama is going to make "competitiveness" his main economic theme. To be fair, he could (and may well) do worse. But this is hackneyed stuff, and involves a fundamental misconception about the nature of our economic problems. It's OK to talk about competitiveness when you're specifically asking whether a country's exports and import-competing industries have low enough costs to sell stuff in competition with rivals in other countries; measures of relative costs and prices are, in fact, commonly — and unobjectionably — referred to as competitiveness indicators. But the idea that broader economic performance is about being better than other countries at something or other — that a company/country is like a corporation — is just wrong. I wrote about this at length a long time ago, and everything I said then still holds true.* The hopeful interpretation of Obama's embrace of the idea that he's the CEO of America Inc. is that it might help fend off right-wing attacks on government action as a whole, helping him sell the need for public investment of various kinds. On the other hand, as Robert Reich says, this could all too easily turn into a validation of the claim that what's good for corporations is good for America, which is even less true now than it used to be.

Competitiveness theory is false.

Kakaes, 2012

Konstantin Kakaes, January 9,
http://www.slate.com/articles/technology/future_tense/2012/01/u_s_scientists_are_not_competing_with_china_or_any_other_country_.html

But the truth is that jobs were lost in the U.S. for many reasons: technological change, corporate consolidation, and a sluggish economy. The jobs that were created abroad are, by and large, different jobs than the jobs lost in the United States. As Paul Krugman wrote in an essay for Foreign Affairs in 1994, "it is simply not the case that the world's leading nations are to any important degree in economic competition with each other, or that any of their major economic problems can be attributed to failures to compete on world markets." It's easy to blame today's bleak economic outlook on a failure to compete. But doing so is just finding a scapegoat for domestic shortcomings.

1ar competitiveness

Ignore their authors- they misdiagnosed the economy.

Krugman, 2011

Paul Krugman, Nobel prize winning economist, New York Times, “The Competition Myth” January 23, <http://www.nytimes.com/2011/01/24/opinion/24krugman.html>

But let's not kid ourselves: talking about “competitiveness” as a goal is fundamentally misleading. At best, it's a misdiagnosis of our problems. At worst, it could lead to policies based on the false idea that what's good for corporations is good for America. About that misdiagnosis: What sense does it make to view our current woes as stemming from lack of competitiveness? It's true that we'd have more jobs if we exported more and imported less. But the same is true of Europe and Japan, which also have depressed economies. And we can't all export more while importing less, unless we can find another planet to sell to. Yes, we could demand that China shrink its trade surplus — but if confronting China is what Mr. Obama is proposing, he should say that plainly. Furthermore, while America is running a trade deficit, this deficit is smaller than it was before the Great Recession began. It would help if we could make it smaller still. But ultimately, we're in a mess because we had a financial crisis, **not** because American companies have lost their ability to compete with foreign rivals.

2ac growth

No econ impact

Jervis 11 – Professor of Political Science @ Columbia

Robert, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University, December 2011, "Force in Our Times," *Survival*, Vol. 25, No. 4, p. 403-425

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

1ar growth

Economic decline doesn't cause war

Daniel W. **Drezner 12**, Professor, The Fletcher School of Law and Diplomacy, Tufts University, October 2012, "The Irony of Global Economic Governance: The System Worked," http://www.globaleconomicgovernance.org/wp-content/uploads/IR-Colloquium-MT12-Week-5_The-Irony-of-Global-Economic-Governance.pdf

The final outcome addresses a dog that hasn't barked: the effect of the Great Recession on cross-border conflict and violence. During the initial stages of the crisis, multiple analysts asserted that the financial crisis would lead states to increase their use of force as a tool for staying in power.³⁷ Whether through greater internal repression, diversionary wars, arms races, or a ratcheting up of great power conflict, there were genuine concerns that the global economic downturn would lead to an increase in conflict. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fuel impressions of surge in global public disorder. ¶ The aggregate data suggests otherwise, however. The Institute for Economics and Peace has constructed a "Global Peace Index" annually since 2007. A key conclusion they draw from the 2012 report is that "The average level of peacefulness in 2012 is approximately the same as it was in 2007."³⁸ Interstate violence in particular has declined since the start of the financial crisis - as have military expenditures in most sampled countries. Other studies confirm that the Great Recession has not triggered any increase in violent conflict; the secular decline in violence that started with the end of the Cold War has not been reversed.³⁹ Rogers Brubaker concludes, "the crisis has not to date generated the surge in protectionist nationalism or ethnic exclusion that might have been expected."⁴⁰ ¶ None of these data suggest that the global economy is operating swimmingly. Growth remains unbalanced and fragile, and has clearly slowed in 2012. Transnational capital flows remain depressed compared to pre-crisis levels, primarily due to a drying up of cross-border interbank lending in Europe. Currency volatility remains an ongoing concern. Compared to the aftermath of other postwar recessions, growth in output, investment, and employment in the developed world have all lagged behind. But the Great Recession is not like other postwar recessions in either scope or kind; expecting a standard "V"-shaped recovery was unreasonable. One financial analyst characterized the post-2008 global economy as in a state of "contained depression."⁴¹ The key word is "contained," however. Given the severity, reach and depth of the 2008 financial crisis, the proper comparison is with Great Depression. And by that standard, the outcome variables look impressive. As Carmen Reinhart and Kenneth Rogoff concluded in *This Time is Different*: "that its macroeconomic outcome has been only the most severe global recession since World War II - and not even worse - must be regarded as fortunate."⁴²

Empirical studies show no causal relationship between economic decline and war **Miller 1 – prof of economics**

Morris Miller 2001, Professor of Economics, *Poverty: A Cause of War?*, <http://archive.peacemagazine.org/v17n1p08.htm>

Library shelves are heavy with studies focused on the correlates and causes of war. Some of the leading scholars in that field suggest that we drop the concept of causality, since it can rarely be demonstrated. Nevertheless, it may be helpful to look at the motives of war-prone political leaders and the ways they have gained and maintained power, even to the point of leading their nations to war. Poverty: The Prime Causal Factor? Poverty is most often named as the prime causal factor. Therefore we approach the question by asking whether poverty is characteristic of the nations or groups that have engaged in wars. As we shall see, poverty has never been as significant a factor as one would imagine. Largely this is because of the traits of the poor as a group - particularly their tendency to tolerate their suffering in silence and/or be deterred by the force of repressive regimes. Their voicelessness and powerlessness translate into passivity. Also, because of their illiteracy and ignorance of worldly affairs, the poor become susceptible to the messages of war-bent demagogues and often willing to become cannon fodder. The situations conducive to war involve political repression of dissidents, tight control over media that stir up chauvinism and ethnic prejudices, religious fervor, and sentiments of revenge. The poor succumb to leaders who have the power to create such conditions for their own self-serving purposes. Desperately poor people in poor nations cannot organize wars, which are exceptionally costly. The statistics speak eloquently on this point. In the last 40 years the global arms trade has been about \$1500 billion, of which two-thirds were the purchases of developing countries. That is an amount roughly equal to the foreign capital they obtained through official development aid (ODA). Since ODA does not finance arms purchases (except insofar as money that is not spent by a government on aid-financed roads is available for other purposes such as military procurement) financing is also required to control the media and communicate with the populace to convince them to support the war. Large-scale armed conflict is so expensive that governments must resort to exceptional sources, such as drug dealing, diamond smuggling, brigandry, or deal-making with other countries. The reliance on illicit operations is well documented in a recent World Bank report that studied 47 civil wars that took place between 1960 and 1999, the main conclusion of which is that the key factor is the availability of commodities to plunder. For greed to yield war, there must be financial opportunities. Only affluent political leaders and elites can amass such weaponry, diverting funds to the military even when this runs contrary to the interests of the population. In most inter-state wars the antagonists were wealthy enough to build up their armaments and

propagandize or repress to gain acceptance for their policies. Economic Crises? Some scholars have argued that it is not poverty, as such, that contributes to the support for armed conflict, but rather some catalyst, such as an economic crisis. However, a study by Minxin Pei and Ariel Adesnik shows that this hypothesis lacks merit. After studying 93 episodes of economic crisis in 22 countries in Latin American and Asia since World War II, they concluded that much of the conventional thinking about the political impact of economic crisis is wrong: "The severity of economic crisis - as measured in terms of inflation and negative growth - bore no relationship to the collapse of regimes ... or (in democratic states, rarely) to an outbreak of violence... In the cases of dictatorships and semi-democracies, the ruling elites responded to crises by increasing repression (thereby using one form of violence to abort another)."

2ac won't pass

Won't pass --- at the very least, delayed vote means thumpers intervene before passage

Reuters 7/28 ["Congress embraces highway bill," July 28, 2015, <http://triblive.com/usworld/nation/8821619-74/bank-senate-republican#axzz3hF6lZz60>] //khirn

WASHINGTON — In a rapidly shifting battle, Republican leaders in Congress prepared to pass a three-month highway funding extension Tuesday while leaving the idled Export-Import Bank's fate hanging at least into September.

With the House of Representatives and Senate rushing toward a five-week summer recess, Republican leaders in both chambers embraced the newest version of a bill to temporarily fund road and mass transit construction projects.

Failure by Congress to act by Friday would lead to a cutoff of federal transport funds, disrupting projects nationwide. The lifeline until Oct. 29 is expected to pass the House on Wednesday followed by quick action in the Senate.

Senate Majority Leader Mitch McConnell, a Republican, vowed to pass a highway trust fund extension with three years of funding in the hope the House would follow suit in coming months.

Late Monday, the Senate demonstrated strong support for renewing the Ex-Im Bank, whose charter expired June 30, by attaching a renewal to its longer-term transportation bill.

But House Republican leaders effectively blocked that measure by arranging to pass the three-month highway extension and leave Washington on Wednesday.

That would leave the Ex-Im Bank unable to make or guarantee loans until September or October, when its backers in Congress will have another chance to revive it.

"The hard right is running the Republican Party," said Sen. Chuck Schumer, the chamber's third-ranking Democrat. **Republicans are leaving Ex-Im shuttered** for the summer."

Won't pass: Republicans want McConnell to fight the senate

Howell 7/15

[Tom, "Ted Cruz and tea partyers: Let the Ex-Im Bank stay dead," *Washington Times*, 7/15/15, <http://www.washingtontimes.com/news/2015/jul/15/ted-cruz-and-tea-partyers-let-ex-im-bank-stay-dead/>]/shrek

Sen. Ted Cruz and other conservatives told GOP leaders Wednesday not to let Congress revive the federal Export-Import Bank, an agency that financed the sale of U.S. goods overseas for decades but is creeping toward a slow death after lawmakers failed to renew its charter by the June 30 deadline. conservatives want the bank to stay dead, arguing the product of the New Deal handed out "corporate welfare" and should fade away once it meets its existing obligations. "After 81 years, Congress finally, finally, finally decided to let a wasteful spending program expire," said Mr. Cruz, Texas Republican, who is running for president. "You'll notice the sky hasn't fallen," he later added, peering up to the heavens outside the Capitol. The 2016 contender rallied with likeminded Republicans, conservative groups and the Tea Party Patriots

because supporters of the bank say they have the votes to resuscitate it in the coming weeks. They're hoping to amend a highway bill in the Senate and send it to the House as must-pass legislation. Senate Majority Leader Mitch McConnell, Kentucky Republican, is committed to an open amendment process in the upper chamber and has acknowledged that the bank's supporters want to use the highway bill as their vehicle. The leader is trying to assemble a long-term bill before the highway fund lapses July 31, meaning the federal government would no longer be able to reimburse state and local governments for their road projects. The House, however, is making the first move, passing Wednesday afternoon a bill that extends the highway fund through the end of the year. That would buy enough time for lawmakers to devise an international tax overhaul that could cobble together the \$90 billion needed to fill the gap between projected costs and expected revenues from the federal gas tax over the next six years. Known in Capitol-speak as "Ex-Im," the bank's supporters say it bolsters more than 160,000 jobs and helps U.S. goods compete overseas. In a joint statement, the Texas Association of Business and Texas Association of Manufacturers said their members "rely on a host of tools to continue growing and hiring, including the Export-Import Bank." "Senator Ted Cruz has failed to understand that and chooses, again and again, to put politics ahead of economic progress and payrolls for his constituents," the groups said. Rep. Bill Flores, Texas Republican and chairman of the Republican Study Committee, said Wednesday it is unclear whether the GOP would move to block a legislative rule that would bring a Senate version with Ex-Im attached to the House floor. Conservatives said it is up to Mr. McConnell and Speaker John A. Boehner to stand against Ex-Im, which they said benefits corporations with lobbyists at the expense of taxpayers. They even praised GOP leaders for letting the bank expire, saying no one had to lift a finger to let the bank wind down its existing lines of credit. "If there's one thing Congress is good at," Mr. Cruz said, "it's doing nothing." Former Virginia Attorney General Ken Cuccinelli said it's time for Mr. McConnell to play hardball in the Senate and block any Democratic amendment to revive Ex-Im.

Ex-im controversial - conservatives hate it

Quinn 7/15 (Melissa Quinn is a news reporter for The Daily Signal. *The Daily Signal*: "Ted Cruz Willing to Use 'Any and All' Tools to Stop Export-Import Bank Reauthorization" published July 15th, 2015. Accessed July 16th, 2015. <http://dailysignal.com/2015/07/15/ted-cruz-willing-to-use-any-and-all-tools-to-stop-export-import-bank-reauthorization-even-the-filibuster/>)KaIM

With talk of the Export-Import Bank's reauthorization continuing on Capitol Hill, Sen. Ted Cruz said today he plans to use "any and all" tools possible to stop the 81-year-old agency from coming back to life. Speaking to reporters in front of the U.S. Capitol today, Cruz, R-Texas, raised the prospect of filibustering a highway funding bill that could be used as a vehicle for Ex-Im's reauthorization. "I am willing to use any and all procedural tools to stop this corporate welfare, this corruption from being propagated," Cruz said when asked if he would attempt to stop the advancement of the highway legislation if it included Ex-Im reauthorization. Sen. Mike Lee, R-Utah, who joined Cruz, agreed. "I think those of us who oppose it will continue to use any and all procedural tools at our disposal in order to oppose it," he said. The two senators were joined by Republican Study Committee Chairman Rep. Bill Flores, R-Texas, and House Freedom Caucus Chairman Rep. Jim Jordan, R-Ohio, as well as leaders of the Club for Growth, Senate Conservatives Fund, Heritage Action for America and Tea Party Patriots. Ex-Im's charter expired June 30, and conservatives in the House and Senate are working to ensure the bank is not reauthorized. However, Senate Democrats are working to attach an amendment reauthorizing Ex-Im to the highway funding bill.

Conservative backlash prevents Export Import Bank renewal

Werner 6/30 [Erica, Associated Press Congressional Reporter, "What is the federal Export-Import Bank and why won't Congress renew it?" *UpNorthLive*, 6/30/15, <<http://www.upnorthlive.com/news/story.aspx?id=1224404#.VZ7fkRNViko>>]//eugchen

Conservatives cheered the demise of the federal Export-Import Bank Tuesday and vowed to beat back efforts to revive it, even as business leaders issued dire warnings that letting the agency expire at midnight would hurt U.S. competitiveness globally. "Ding Dong, the Ex-Im Bank is dead!" declared FreedomWorks, one of the outside groups responsible for transforming the bank from an obscure government lending institution into a conservative rallying cry. "This is a critical blow to manufacturers," countered Aric Newhouse, a senior vice president at the National Association of Manufacturers, arguing that the bank plays a necessary role in underwriting loans to help foreign customers purchase U.S. goods. The charter of the 81-year-old

government agency expires at midnight Tuesday without congressional action, and with the House and Senate on recess for the July 4 holiday there was no chance of a last-minute reprieve. Supporters warn that billions of dollars in pending deals are at risk because of the failure to renew the bank's charter, something that's been done numerous times over the years with little to no controversy. But although the Export-Import Bank will be unable to make new loans as of midnight, it will stay in business for the time being to service more than \$100 billion in outstanding loans and guarantees, and no immediate lay-offs or changes are planned, bank officials said. The bank is funded through Sept. 30. Supporters are making plans to revive the bank in the coming weeks by attaching it to must-pass legislation to extend the highway trust fund.

Senate Majority Leader Mitch McConnell, R-Ky., told The Associated Press this week that supporters of the bank have the votes to pass it and he will give them the opportunity to do so. Whether it could then get through the House is less certain, and conservative groups pledged to redouble their efforts to oppose it. "It is up to Republican leaders to accept and preserve this major policy victory," said Michael A. Needham, chief executive of Heritage Action for America. Under pressure from tea party-backed conservatives, GOP congressional leaders and presidential candidates have lined up against the bank, defying their traditional allies in the business community who support it. That's led to bitter grumbling from some business leaders. Two business officials on a conference call Tuesday organized by the Exporters for Ex-Im Coalition, a group backed by the National Association of Manufacturers and others, attacked House Majority Leader Kevin McCarthy, R-Calif., in unusually personal terms for turning against the bank. One of them, Don Nelson, president of California-based ProGauge Technologies, said he'd met with McCarthy personally to explain that his company that makes oil industry equipment will have to stop exporting if the Export-Import Bank is dissolved. "Truth be told, he has zero experience or knowledge on the topic and yet he and other misguided congressmen portray they're experts on this topic and say the private sector can take over," Nelson said. "They really don't have a clue what they're doing or the damage they're going to inflict on small businesses in America by closing the Ex-Im bank." McCarthy's office did not immediately offer a response.

House conservatives will prevent Ex-Im from passing

Livingston 7/16 [Abby, political writer, "Ghost of Export-Import Bank Haunts Highway Bill," *The Texas Tribune* <<https://www.texastribune.org/2015/07/16/texans-ex-im-highway-bill/>>]//eugchen

WASHINGTON – Two weeks after it was supposedly killed, the ghost of the Export-Import Bank continues to haunt Capitol Hill. Advocates of the bank, a federal agency that supports companies doing business abroad, are busy trying to resuscitate it by attaching reauthorization to a so-called must-pass bill that will help fund the nation's highway system. But the bank has fierce adversaries on the Hill, including several from the Texas delegation. One, U.S. Sen. and Republican presidential aspirant Ted Cruz, essentially threatened to bring down the entire highway bill if needed to finish off the Ex-Im Bank, which officially expired on June 30, though it continues to operate finishing out its pending business. "I am willing to use any and all procedural tools to stop this corporate welfare, this corruption from being propagated," Cruz said at a news conference in front of the U.S. Capitol on Wednesday. But by tucking the bank's renewal into a highway funding bill that most lawmakers support, the bank's backers hope to overcome the conservative blockade that has stymied efforts to keep it alive. Though it occupies a small niche in the federal government, it has become a lightning rod in conservative politics, serving as the current battleground between limited-government groups and business interests like the U.S. Chamber of Commerce. The bank uses loan guarantees, insurance and other support to help American companies do business abroad. The House passed the highway funding measure Wednesday without the Ex-Im provision, but many Capitol Hill sources expect it to be added when the Senate takes up the bill in the coming days or weeks, setting up a showdown between the chambers. More than almost any other federal government program, constituents feel the effects of Highway Trust Fund from the moment they leave their houses each day and drive to work. In Texas alone, the federal government subsidized \$3.3 billion worth of road construction and repairs in 2014. Now that other major issues — the controversial Pacific Rim trade deal and a nuclear treaty with Iran — are in holding patterns until the fall, the most pressing issue for Congress is this reauthorization of the Highway Trust Fund, now set to expire on July 31. But thanks to continual congressional gridlock and the ghost of Ex-Im, the legislation that will replenish the fund is creeping from "must-pass" to "might-pass." If the highway bill returns from the Senate with the bank authorization included, House conservatives who oppose the bank, led by House Financial Services Chairman Jeb Hensarling of Dallas, are expected to pull out all the stops to take it back out again. U.S. Rep. Bill Flores, R-Bryan, is another vocal critic of Ex-Im and appeared with Cruz at the morning press conference. He promised to "try to make sure that this never comes to the floor again, ever." Bank advocates say that a majority of the House — Democrats and Republicans combined — would probably back the bank if given the chance to vote on it. And not all Texas Republicans despise it. "I'm for reforming the process," said U.S. Rep. Pete Sessions, R-Dallas. "Not killing it." Cruz entered the fray on Wednesday morning with his filibuster threat, which like many of Cruz's tactics startled operatives and members. But most on Capitol Hill shrugged off the threat, pointing to an early June vote when 65 senators voted in favor of the bank — more than enough to break a filibuster. Other Republicans scoffed at Cruz, speculating that his news conference had more to do with presidential campaign

fundraising than Senate procedure. And Ex-Im advocates blasted out press releases questioning the credibility of many of Cruz's charges against the bank. "Texas exports more than any other state for a reason: We have the best workers and businesses. And our businesses rely on a host of tools to continue growing and hiring, including the Export-Import Bank," the Texas Association of Businesses and the Texas Association of Manufacturers responded in a statement. "Senator Ted Cruz has failed to understand that and chooses, again and again, to put politics ahead of economic progress and payrolls for his constituents." Still, there are mixed opinions whether Ex-Im will survive, or whether it could blow up the highway bill. A Republican leadership source prognosticated a grim stretch ahead for the bank, while multiple Democratic sources in both chambers insisted the highway bill will return to the House with Ex-Im, and it will arrive on the president's desk. "We'll see when it gets to here. I've heard this," Sessions said of the Senate speculation on Ex-Im. "I do recognize that the Senate is more fired up than some of our House people have been, but they have to pass it first."

at: econ impact

Ex-Im is not key to the economy Flynn 7/16

[Mike, "Senate GOP plants to resurrect ex-im bank," *Breitbart*, 7/16/15, <<http://www.breitbart.com/big-government/2015/07/16/senate-gop-plans-to-resurrect-ex-im-bank/>>]//shrek

Humans may be mortal, but the government programs they create tend to live on forever. Just weeks after the New Deal-era Export-Import Bank finally expired, Senate Republicans are planning to resurrect the corporate welfare arm through a highway funding bill. Conservatives may well ask what was the point of Republicans winning the Senate. The Export-Import Bank was created by FDR to provide taxpayer-backed loans to foreign companies to purchase American products. Perhaps the idea made some sense in the depths of the worldwide Great Depression, but any rationale for the program has long since been confined to the history books. Today, less than 2 percent of America's exports are financed by the Ex-Im Bank. In a world of very cheap money, it isn't clear that the taxpayer-backed loans are necessary for even this small amount of sales. This is especially true because over 60 percent of the loans backed by the bank go to a small handful of American corporations, with giants like Caterpillar and Boeing reaping the overwhelming majority of the benefits. The federal lending agency is really just another financing arm for a few well-connected companies. The Export-Import Bank is simply a poster child of federal corporate welfare. Its benefits are concentrated on a few companies that donate considerable funds to politicians and its costs are spread, in minuscule amounts, across all taxpayers. Its only real economic benefits are confined to those who can navigate the agency for their own ends. There is no real benefit to the overall economy. If this federal welfare agency can't be allowed to expire, then nothing the government does will ever come to an end. Thankfully, the bank's charter expired on June 30, so it legally no longer exists. This being Washington, however, dead isn't quite dead. Next week, the Senate is expected to take up a short-term spending "fix" for the federal highway trust fund. The "fix" is a "must-pass" piece of legislation to shore up funding for infrastructure spending. The Senate GOP is likely to attach an amendment reauthorizing the Bank, forcing the House to accept its resurrection in order to maintain highway spending. Sens. Sen. Ted Cruz (R-TX)96% and Sen. Mike Lee (R-UT)100% have threatened to filibuster the spending patch if such an amendment is added to the spending bill. "I am willing to use any and all procedural tools to stop this corporate welfare, this corruption, from being propagated," Cruz said. As admirable as this sentiment is, the effort is likely to fail. The principled point will be lost in a sea of news stories about threatened infrastructure spending. Senators will posture about the critical needs of our nation's highways and bridges, cheered on by Washington's donor class. And, yet again, an antiquated relic of corporate welfare will rise again on the banks of the Potomac. The new Republican majority will again prove that adage that the more things change, the more they remain the same.

Export Import bank bad – funds the wealthy, tanks jobs, and takes money out of consumer's pockets

Bob 7/15 [Adelmann, graduate of an Ivy League school and a former investment advisor, "Pressure Increasing to Reopen Export-Import Bank," *The New American*, 7/15/15, <<http://www.thenewamerican.com/economy/commentary/item/21258-pressure-increasing-to-reopen-export-import-bank>>]//eugchen

It's been just two weeks since the Export-Import Bank's charter lapsed — that "fund of corporate welfare" as criticized by presidential candidate Barack Obama in 2008 before reality set in — and two predictable things have occurred: The world continues to turn without it, and K-Street lobbyists are busy trying to resurrect it. With massive radio advertising and extensive help from the media publishing op-eds in its favor, the chances are increasing that the zombie will come back to life. The deceased bank, touted as offering loan guarantees to small businesses wanting to do business overseas but unable to obtain financing in the regular way, WAS turned into a slush fund of free money to the country's largest corporations: Boeing, General Electric,

Bechtel, and Caterpillar. It was rife not only with low interest loans and guarantees to companies that didn't need them (but took them because they could), but with corruption as well. The bank's own internal Office of Inspector General (OIG) remains active, continuing to work on dozens of cases involving special deals and fraudulent documents and rules violations in approving loans. And it was not just corporate giants that were getting special dispensation, either. China, Russia, Saudi Arabia, and the United Arab Emirates were also taking advantage of low-interest-rate loans guaranteed by the U.S. taxpayer, saving them millions while costing companies that didn't have special access to the trough opportunities and lost labor forces. As Veronique de Rugy, a fellow at the Mercatus Center, so eloquently noted, jobs that were gained in companies enjoying special Ex-Im treatment were lost elsewhere. And Wall Street banks also enjoyed the party while the punch bowl was full. In a private conversation, an official with JPMorgan — the bank that most took advantage of being able to offer lower-than-market rate loans thanks to the Ex-Im slush fund — said, "It's free money." Delta Airlines CEO Richard Anderson, one of the bosses of the companies penalized by the Ex-Im Bank, stated in testimony before the House Financial Services Committee in June 2014 that by the Ex-Im Bank giving his competitors special advantages through low interest rate loans, more than 7,500 domestic airline jobs have disappeared. He explained: Many of those airlines [favored with low interest rate loans by the Ex-Im Bank] are themselves heavily owned or heavily subsidized by foreign governments. Emirates Airlines, for example, is owned by Dubai and receives benefits from that ownership that make it an extraordinarily strong competitor ... [because of that special treatment domestic customers must pay] fees and taxes that make up over 20 percent of the average ticket price. Put another way, every time someone flies domestically, his ticket is 20 percent higher than it would be without that subsidized foreign competition, aided and abetted by largesse from the Ex-Im Bank. In his testimony, Anderson presented an analysis of the cost advantage given to Emirates Airlines "that illustrated how the [Ex-Im Bank's] loan guarantees save Emirates as much as \$20 million in financing costs per plane.... Emirates is essentially getting a free additional widebody plane for every eight new planes it buys. That kind of deal is simply not available to airlines that must rely on market financing," explained Anderson. He added that if all Emirates Airlines' Boeing widebody aircraft were financed with Ex-Im Bank below-market interest rate loans, "Emirates may be receiving a total subsidy [thanks to the Ex-Im Bank] of up to \$188.7 million per year." And then there's Pemex, the Mexican state-owned petroleum company, with a market capitalization of half a trillion dollars, which nevertheless was able to secure more than \$7 billion in U.S. taxpayer financing to help fund deals with American companies. If those K-Street lobbyists have their way, the Ex-Im Bank will be resurrected and will continue to inflict itself on the hapless U.S. taxpayer once again, providing benefits to crony capitalists such as Boeing and JPMorgan, while allowed the culture of corruption inside to flourish unabated.

AT: Google EMRs D.A

EMRs are Inefficient/Expensive

EMRs are inefficient and hurt health care systems

Hensley 14 — Scott Hensley, Assistant Professor at the Wistar Institute, holds a PhD in biology from UPenn, 2014 (“Electronic Medical Records, Built For Efficiency, Often Backfire,” National Public Radio, November 7, Available Online at <http://www.npr.org/sections/health-shots/2014/11/07/361148976/electronic-medical-records-built-for-efficiency-often-backfire>, Accessed 7/26/15)

Electronic medical records were supposed to usher in the future of medicine.

Prescriptions would be beamed to the pharmacy. A doctor could call up patients' medical histories anywhere, anytime. Nurses and doctors could easily find patients' old lab results or last X-rays to see what how they're doing. The computer system could warn doctors about dangerous drug combinations before it was too late.

Many of those things are an everyday reality in doctors' offices and hospitals across the country. But a survey of more than 400 internists with experience using electronic medical records, or EMRs, documents what doctors have complained about for years: **computerized records chew up a lot of time.**

Writing up a patient's visit on the computer can take more time than you might expect. More than 60 percent of the doctors surveyed said that **note writing took longer using computerized records** than before they were implemented.

One reason: There are all kinds of boxes to check that have more to do with the billing department than the patient.

Overall, the survey found that attending physicians, the doctors in charge of care, lost an average of 48 minutes a day because of EMRs. Doctors in training lost 18 minutes a day.

EMR implementation is time consuming, ineffective, and wasteful spending

Denning 13 — Steve Denning, Program Director of Knowledge Management at the World Bank, studied law and psychology at Sydney University, worked as a lawyer in Sydney for several years, holds a postgraduate degree in law at Oxford, 2013 (“Why Is Your Doctor Typing? Electronic Medical Records Run Amok,” Forbes, April 25, Available Online at [Why Is Your Doctor Typing? Electronic Medical Records Run Amok](http://www.forbes.com/2013/04/25/why-is-your-doctor-typing-electronic-medical-records-run-amok/), Accessed 7/26/15)

In the last year or two, there's been a shift. **Much of my time with doctors has been spent watching them type.** In one case, the doctor tapped away on his laptop, occasionally looking up to ask questions before returning to the main focus of his attention: his computer. In another case, the doctor intermittently tapped on an iPad while we spoke. In a third instance, the doctor had a conversation with me and then apologized that he would be spending the next half of our session typing up the results of

our conversation. All this typing was required, he said, if he was ever going to be reimbursed for his services. It was getting in the way of being a doctor.

Surely, I said, computerized medical records generate benefits. They are easily retrievable. They can be transferred from one practice to another and accessible to the many different service providers—hospitals, laboratories, specialists, radiology and so on—that might be involved in any one patient.

“In theory, perhaps,” he replied. “But in practice, it’s a horrible and costly bureaucracy that is being imposed on doctors. I spend less time with patients, and more time filling out multiple boxes on forms that don’t fit the way I work. Often I am filling out the same information over and over again. A lot of it is checking boxes, rather than understanding what this patient really needs.”

What about retrieving information? Isn’t that easier?

“Again, in theory, retrieval should be easy and quick,” he said, “But you can’t flip through these records the way you do with a paper file and easily find what you want. The other day, for instance, I inherited a new patient along with her electronic records. Her previous care-givers had checked forty-five boxes of problems. There’s no way that I can deal with a patient with forty-five problems. She and I talked for some time and eventually we figured out that she had six real health problems: then we could begin to discuss what to do. And then I had to input that discussion into the computer. The electronic record didn’t save time. It made everything take longer.”

But at least now you can get the records electronically?

“Sometimes,” he said. “But each network has its own system and often the systems are incompatible. The systems don’t talk to each other. So transferring records from one system to another becomes another nightmare.”

But why do you type while the patient is there?

“Filling out these forms and checking all the boxes takes me a lot of time,” he said, “If I don’t do it now, I will spend half the night trying to remember the discussion and typing up the results of the day’s visits. The outcome is that I have less time to spend with patients. Instead of making the system better, it’s making everything more costly.”

What we are seeing here is the implementation of Obamacare—the Affordable Care Act—which has provided reimbursement incentives and an electronic medical records deadline for those who adopt electronic medical records (EMR). However, for those who don’t meet the electronic medical records deadline for implementation, the government has laid out a series of penalties. The message to doctors is clear: implement electronic records or pay a price.

“The government already is wasting billions on the medical EMR,” my doctor told me. “They are committed to giving each health care system \$17,000 per doctor who is successfully using electronic medical records to help them cover their software investment. This money goes to the health care system and not the docs. So it’s basically a very lucrative pass through to the software people for generating an inadequate and burdensome system.”

Survey: most doctors lose money with electronic records

My doctor is not alone in seeing problems with the way that electronic medical records are being implemented.

A recent survey published in Health Affairs by Julia Adler-Milstein, Carol Green and David W. Bates, estimates that **doctors who install electronic medical records systems should expect an initial loss of around \$44,000 on their investment.** Almost two-thirds of the practices using electronic records would lose money even with government subsidies, the researchers said.

Having electronic records is in principle a good idea, but only if one imagines implementation as quick and intuitive so that it's easier for doctors to input and retrieve information rather than from scribbling notes on paper. Reformers imagine some kind of well-tuned iPhone or iPad with lots of cool gadgets and apps that make life easier.

But in practice, **implementation of electronic health records today is anything but quick and intuitive or easy to use.** It's mostly like old-style form-filling software that is an aggravating pain to use. It takes forever, involves continuous repetition, is counter-intuitive to use and offers few benefits in return. Along with upfront costs, doctors said they have to work longer hours because of the software. Smaller offices, those with five doctors or fewer, struggled the most.

The study shows that 27 percent of practices are projected to gain by seeing more patients or getting more claims approved by insurers, though there is no indication what happened to the quality of care in such accelerated throughput.

Implementing electronic records is expensive and difficult to use

Denning 13 — Steve Denning, Program Director of Knowledge Management at the World Bank, studied law and psychology at Sydney University, worked as a lawyer in Sydney for several years, holds a postgraduate degree in law at Oxford, 2013 (“Why Is Your Doctor Typing? Electronic Medical Records Run Amok,” Forbes, April 25, Available Online at Why Is Your Doctor Typing? Electronic Medical Records Run Amok, Accessed 7/26/15)

Despite the theoretical potential for quality improvement from computerized records, they found that few physician practices use electronic records. Miller and Sim argue that “the path to quality improvement and financial benefits lies in getting the greatest number of physicians to use the electronic medical records [EMR] (and not paper) for as many of their daily tasks as possible. **The key obstacle in this path to quality is the extra time it takes physicians to learn to use the EMR effectively for their daily tasks.**”

Miller and Sim report:

“Interviewees reported that most physicians using EMRs spent more time per patient for a period of months or even years after EMR implementation. **The increased time costs resulted in longer workdays or fewer patients seen, or both,** during that initial period... Even highly regarded, industry-leading EMRs to be challenging to use because of the multiplicity of screens, options, and navigational aids... Although vendors are slowly improving EMR usability, most vendor interviewees doubted that any “silver bullet”

technology (for example, voice recognition, tablet computers, or mobile computing) will dramatically simplify EMR usage. Designing easy-to-use software for knowledge workers is a challenge that spans the software industry beyond health care.”

Miller and Sim suggest policy interventions to overcome these barriers, including providing work/practice support systems, improving electronic clinical data exchange, and providing financial incentives for quality improvement.

This thinking is fanciful. Paying people to work unintelligently doesn't work and ultimately will be ineffective. What is needed are systems that actually help doctors do their work.

The world didn't need incentives or support systems to get people to adopt iPhones or iPads. We embraced the iPhones and iPads because they are easy to use and they made our lives better.

When the software embedded in electronic records isn't adapted to the doctor's needs and the way they work, **hopes of major productivity gains through policy fixes like incentives or training are doomed.**

EMRs Don't Work

EMRs don't improve data sharing

Creswell 14 — Julie Creswell, reporter at the New York Times, JD from University of Iowa, 2014 (“Doctors Find Barriers to Sharing Digital Medical Records,” New York Times, September 30, Available Online at http://www.nytimes.com/2014/10/01/business/digital-medical-records-become-common-but-sharing-remains-challenging.html?_r=0, Accessed 7/26/15)

Regardless of who is at fault, doctors and hospital executives across the country say they are **distressed** that the expensive electronic health record systems they installed in the hopes of reducing costs and improving the coordination of patient care — a major goal of the Affordable Care Act — **simply do not share information with competing systems.**

The issue is especially critical now as many hospitals and doctors scramble to install the latest versions of their digital record systems to demonstrate to regulators starting Wednesday that they can share some patient data. Those who cannot will face reductions in Medicare reimbursements down the road.

On top of that, leading companies in the industry are preparing to bid on a Defense Department contract valued at an estimated \$11 billion. A primary requirement is that the winning vendor must be able to share information, allowing the department to digitally track the medical care of 9.6 million beneficiaries around the globe.

The contract is the latest boon to an industry that taxpayers have heavily subsidized in recent years with over \$24 billion in incentive payments to help install electronic health records in hospitals and physicians' offices.

While most providers have installed some kind of electronic record system, two recent studies have found that fewer than half of the nation's hospitals can transmit a patient care document, while **only 14 percent of physicians can exchange patient data with outside hospitals or other providers.**

“We've spent half a million dollars on an electronic health record system about three years ago, and I'm faxing all day long. **I can't send anything electronically over it,**” said Dr. William L. Rich III, a member of a nine-person ophthalmology practice in Northern Virginia and medical director of health policy for the American Academy of Ophthalmology.

Alt Cause

Alt cause to healthcare industry — bureaucratization and bad management

Denning 13 — Steve Denning, Program Director of Knowledge Management at the World Bank, studied law and psychology at Sydney University, worked as a lawyer in Sydney for several years, holds a postgraduate degree in law at Oxford, 2013 (“Why Is Your Doctor Typing? Electronic Medical Records Run Amok,” Forbes, April 25, Available Online at Why Is Your Doctor Typing? Electronic Medical Records Run Amok, Accessed 7/26/15)

As Brown points out, the biggest challenge in enterprise software delivery lies not in these software practices themselves, but rather in the overall management culture. If the organization remains in a vertical, hierarchical mode, with an approach of “here’s the system—implement it”, none of the advantages of computerization will accrue. In fact, costs will increase.

The problem is that hierarchical bureaucracy is still pervasive in the health sector. Producing easy-to-use software or the agility to make continuous adjustments from experience lies beyond the performance envelope of this type of management.

A radically different kind of management is needed. It needs to begin, not with a goal of “introducing electronic medical records”, but rather with the goal of “improving the working lives of doctors through better technology”.

Instead of producing outputs in the form of electronic records, the goal needs to be generating positive outcomes for doctors. Once outcomes for doctors are positive, the need for incentives vanishes: doctors will want to improve their working lives. There will be stampede to use the new technology.

But this entails a revolution in management thinking. Instead of seeing electronic records as merely a shift in technology from paper to IT, it involves a transformation in the way the health sector thinks about and manages work. It means new goals, new roles for managers, new ways of coordinating work, new values and new ways of communicating.

Fortunately, there is a vast experience in thousands of organizations around the world for over a decade to show the way. It’s still the best kept secret in the management world.

We need to stop torturing doctors with systems that make work more difficult and generate systems that are better—better for doctors, better for patients and better for the health system overall. And for that to happen, we need a different kind of management.

AT: Insider Threats D.A

2AC Frontline—Insider Threats

1. Bulk collection makes NSA systems more vulnerable to insider hacks—multiple structural weaknesses

Bellovin 8 [Steven M. Bellovin (Columbia University), Matthew A. Blaze (University of Pennsylvania), "Risking Communications Security: Potential Hazards of the Protect America Act," IEEE Society, 1-1-2008] AZ

The US has also experienced difficulties with communications surveillance systems. Under the Communications Assistance for Law Enforcement Act (P.L. 100-667), the US Federal Bureau of Investigation (FBI) was responsible for determining technical specifications for wiretapping built into switches of digital telephone networks. DCS 3000, an FBI suite of systems for collecting and managing data from wiretaps for criminal investigations, was designed to meet those requirements. Recently released FBI documents reveal serious problems in the system's implementation.²² Its auditing system was primitive, surprising for a system intended for evidence collection. The system has no unprivileged user IDs, relying on passwords rather than token-based or biometric authentication, and even uses an outdated hashing algorithm (MD5 appears in a 2007 "system security plan,"²³ several years after Chinese researchers found serious problems with this already weak hashing algorithm). Most seriously, the system relied on a single shared login, rather than a login per authorized user. The system's ability to audit user behavior depended entirely on following proper processes, including using a manual log sheet to show who was using the system at a given time. Remote access—in an insecure fashion—is permitted from other DCS 3000 nodes, making the system vulnerable to insider attacks. These are a real risk: recall that the most damaging spy in FBI history, Robert Hanssen, abused his authorized access to internal FBI computer systems to steal information and track progress of the investigation aimed at him. The problems in the DCS 3000 implementation illustrate the risks in building a communications surveillance system. We do not know whether DCS 3000 was merely poorly implemented or whether it was poorly specified. What were the requirements on the FBI system? Did they include full auditing and full user identity? What were the project's goals? Were the designers required to meet all requirements or goals? These are questions that should have been asked of the DCS 3000 designers—and should be asked of any builder of a communications surveillance system. Although the NSA has extensive experience in building surveillance systems, that does not mean things cannot go wrong. When you build a system to spy on yourself, you entail an awesome risk. In designing a system to satisfy the needs of the Protect America Act, the risk is made worse by four phenomena: cation carriers in all previous interception programs within the US communication system. This protective role was the result of the specificity required in wiretap warrants. placing the system properly within the US rather than at US borders; likelihood that the system will be built out of pieces previously used abroad, which runs the risk that opponents are already familiar with the equipment via intelligence-sharing agreements or capture of equipment; and use of CDRs, originally built for network development purposes, in an entirely new way involving "customers" outside the phone company. These architectural decisions facilitate three distinct types of problems: system capture to enable spying on US traffic; system defeat by using information learned from foreign examples to defeat selection and filtering strategies; and system spoofing by similar means. All of these can be used not only to make the surveillance system less effective, but also to turn it into a tool for capturing communications that are not implicated in any

illegal activity—**endangering both security and privacy**. We see several specific risks as a result. **Risk of exploitation by opponents**. A **system that accesses domestic communications necessarily poses a greater direct risk** to the communications of Americans than a surveillance system fielded overseas. To avoid foreign familiarity with its operation, communication security equipment is not often shared with allies. However, engineering economy reuses systems previously fielded abroad; thus, both **allies and opponents are likely to be familiar with US surveillance equipment**. Is there a risk that knowledge of the surveillance system acquired by studying equipment outside the US will be applied to defeating or subverting similar equipment deployed within the US? Is the NSA designing sufficiently robust mechanisms to assure complete control of the filtering and selection mechanisms? Even prior to the Protect America Act, US communications were vulnerable to surveillance, but building signals intelligence systems is expensive. The system designed as a result of the Protect America Act must not reduce foreign powers' difficulty in gaining access to US communications. Can the communications of US persons be tapped without increasing the risk that these communications will be exploited by others without authorization to do so?

2. Econ decline turns the DA—triggers the impact

Hall 14 [Caitlin Squire Hall (Strategic Intelligence Graduate, Officer in the United States Air Force, Combat Intelligence analyst), "The Trusted Shadow and Trojan Horse of the United States Government: Human Behavior and the Insider Threat," Small Wars Journal, 3/20/2014, <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>] AZ

Due to the impact, monetarily, strategically, and tactically, in which an insider can cause damage to the United States, steps must be taken in order to prevent, mitigate, and attempt to eliminate. **With the poor economy and current government shutdown, this threat only has the potential to grow as American citizen's fight against financial complications and anger towards the government**. The issue is that **there is no easy way to prevent the insider**, rather mitigate or minimize the impact. There are several programs that could be implemented to not only draw awareness to the insider threat but call for periodic review boards and background checks. However, **the insider is still a trusted shadow of the government and with the technological advancements** in today's society, numerous programs, if poor in nature, could be implemented and **the threat would remain alive and kicking**.

3. We're already losing the spy war and it's too late to alter our status—even if we could, the timeframe is decades

Schindler, '15 (John R., security consultant and a former National Security Agency counterintelligence officer, "China's Spies Hit the Blackmail Jackpot With Data on 4 Million Federal Workers", "The Daily Beast", 06/11, <http://www.thedailybeast.com/articles/2015/06/11/china-s-spies-hit-the-blackmail-jackpot-with-every-data-on-federal-worker.html>) JL

With each passing day the U.S. government's big hacking scandal gets worse. Just what did hackers steal from the Office of Personnel Management? Having initially assured the public that the loss was not all that serious, OPM's data breach now looks very grave. The lack of database encryption appears foolhardy, while OPM ignoring repeated warnings about its cyber vulnerabilities implies severe

dysfunction in Washington. To say nothing of the news that hackers were scouring OPM systems for over a year before they were detected. It's alarming that intruders got hold of information about every federal worker, particularly because OPM previously conceded that "only" 4 million employees, past and present, had been compromised, including 2.1 million current ones. Each day brings worse details about what stands as the biggest data compromise since Edward Snowden stole 1.7 million classified documents and fled to Russia. Then there's the worrisome matter of what OPM actually does. A somewhat obscure agency, it's the federal government's HR hub and, most important, it's responsible for conducting 90 percent of federal background investigations, adjudicating some 2 million security clearances every year. If you've ever held a clearance with Uncle Sam, there's a good chance you're in OPM files somewhere. Here's where things start to get scary. Whoever has OPM's records knows an astonishing amount about millions of federal workers, members of the military, and security clearance holders. They can now target those Americans for recruitment or influence. After all, they know their vices, every last one—the gambling habit, the inability to pay bills on time, the spats with former spouses, the taste for something sexual on the side—since all that is recorded in security clearance paperwork. (To get an idea of how detailed this gets, you can see the form, called an SF86, here.) Speaking as a former counterintelligence officer, it really doesn't get much worse than this. Do you have friends in foreign countries, perhaps lovers past and present? The hackers know all about them. That embarrassing dispute with your neighbor over hedges that nearly got you arrested? They know about that, too. Your college drug habit? Yes, that too. Even what your friends and neighbors said about you to investigators, highly personal and revealing stuff, that's in the other side's possession now. Perhaps the most damaging aspect of this is not merely that millions of people are vulnerable to compromise, through no fault of their own, but that whoever has the documents now so dominates the information battlespace that they can halt actions against them. If they get word that an American counterintelligence officer, in some agency, is on the trail of one of their agents, they can pull out the stops and create mayhem for him or her: Run up debts falsely (they have all the relevant data), perhaps plant dirty money in bank accounts (they have all the financials, too), and thereby cause any curious officials to lose their security clearances. Since that is what would happen. This disaster was decades in the making and will take decades to set right. Then there's the troubling matter of who's behind this mega-hack. U.S. intelligence sources haven't been particularly shy about pointing the finger at China, particularly at hacker groups that serve as cut-outs for Chinese intelligence and who are the suspected culprits behind several major online data breaches of the U.S. economy, including the health-care industry. What they're particularly looking for is information about Chinese nationals who have ties to Americans working in sensitive positions. Why Beijing wants that information isn't difficult to determine. Armed with lists of Chinese citizens worldwide who are in "close and continuing contact" (to cite security clearance lingo) with American officials, Beijing can now seek to exploit those ties for espionage purposes. And it will. While many intelligence services exploit ethnic linkages to further their espionage against the United States—Russians, Cubans, Israelis, even the Greeks—none of the major counterintelligence threats to America exploit ethnic ties as consistently as Beijing does. The OPM compromise, however it came about, represents a genuine debacle for Washington, one that will take many years to repair. Our intelligence community already faces serious and long-standing problems with counterintelligence, the Beltway's perennial redheaded stepchild, and this setback promises to make things exponentially worse. This is a new kind of threat, the melding of ancient counterespionage techniques with 21st-century technology, and we're playing catchup. The OPM hack, which is unprecedented in its scope, offers our adversaries the opportunity to penetrate our government and

use that information to deceive it at a strategic level. **This is the essence of SpyWar**, the secret struggle between the West and adversaries like China, Russia, and Iran, a clandestine battle that never ceases, yet which the public seldom gets wind of, except when something goes wrong. The extent of the damage here appears so vast that all the counterintelligence awareness in the world may not be able to offset the advantage in the SpyWar that Beijing has won with this data theft. If you are or have been employed with the federal government and have listed Chinese nationals on your SF86, it's time to be vigilant, while anybody who's worked for the feds since the mid-1980s ought to be watching their credit reports for anomalies. Then there's the matter of the lives possibly ruined by this. Simply put, there has long been a tacit agreement: You keep the U.S. government's secrets safe, it will do the same for yours. That important promise, the bedrock upon which the security clearance process is based, has been violated, with serious consequences for millions of Americans—and for Washington. Counterintelligence hands warned of the threat posed by putting all sorts of sensitive information in such databases, but they were ignored. **It's too late to undo the damage**, but we must finally get serious about preventing the next big compromise, while mitigating the pain of this loss. This disaster was decades in the making and will take decades to set right. There's no time for back-biting. Honest assessment is what's required. There's a SpyWar on that needs to be won.

4. Underreporting—97% chance that insiders bypass monitoring and surveillance checks

Bunn 14 [Matthew Bunn (American nuclear and energy policy analyst, currently a professor of practice at the Harvard Kennedy School at Harvard University) and Scott Sagan, "A Worst Practices Guide to Insider Threats: Lessons from Past Mistakes," the American Academy of Arts and Sciences, 2014, <https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>] AZ

Nuclear managers may assume that their systems for detecting red flags are much better—that they would surely catch someone like Hasan. But the case of Sharif Mobley suggests that this may not always be the case. In March 2010, Mobley was arrested in Yemen for alleged involvement in al-Qaeda and for shooting a guard in an attempt to escape. Yet between 2002 and 2008, prior to traveling to Yemen, **Mobley worked at five U.S. nuclear power plants (Salem-Hope Creek, Peach Bottom, Limerick, Calvert Cliffs, and Three Mile Island), where he was given unescorted access** inside the plant (though not in the vital areas) to perform maintenance and carry supplies. According to a Nuclear Regulatory Commission (NRC) report, Mobley voiced his militant views during his work, referring to non-Muslim coworkers as "infidels" and remarking to some in his labor union: "We are brothers in the union, but if a holy war comes, look out."²⁴ Though the rules in place at the time required individual workers to report any suspicious behavior on the part of coworkers, **none of Mobley's fellow union members** apparently **reported these statements**. The red flags were again invisible. Cases of ignoring red flags as extreme as Hasan's, or even Mobley's, do not happen often. But the **issues raised—failing to report problems because of the headaches involved, passing troublesome employees off to someone else—** arise in smaller ways in almost every organization. Indeed, research suggests that indicators of insider security problems are **systematically underreported**.²⁵ One study of several cases of **insider information-technology sabotage** in critical infrastructure found that **97 percent of the insiders involved** in the cases **"came to the attention of supervisors or coworkers for concerning behavior prior to the attack," but the **observed behavioral precursors were "ignored by the organization."****²⁶ All managers of nuclear organizations should be asking themselves: how are the incentives for reporting such issues really

aligned in my organization? How could I test how well such issues are reported? How could I improve my organization's ability to detect and act on a potential problem before it occurs?

Privacy Violation

Counterintelligence programs engage in civil rights abuses even worse than NSA mass surveillance.

Gage, '13 (a Yale history professor, is the author of *The Day Wall Street Exploded*, "Somewhere, J. Edgar Hoover Is Smiling", "Slate", 06/07, http://www.slate.com/articles/news_and_politics/history/2013/06/prism_j_edgar_hoover_would_have_loved_the_nsa_s_surveillance_program_topic.html) JL

On March 8, 1971, a handful of activists broke into the FBI's field office in Media, Penn., and made off with a stack of incriminating documents. Over the next several months, they began to publish what they had learned. In the pre-Internet age, this often meant reprinting the FBI records in the alternative press, though papers such as the Washington Post and New York Times also picked them up. Like Glenn Greenwald's recent revelations about the NSA, the discoveries from the Media break-in sparked widespread public outrage—and turned out to be one of the biggest scoops in intelligence history. The program they exposed was called COINTELPRO (short for "counterintelligence program"), known today as the most notorious of the many notorious secret operations authorized by former FBI director J. Edgar Hoover. Under COINTELPRO, federal agents engaged in a jaw-dropping array of abuses—not only widespread surveillance of law-abiding American citizens, but also active "disruption" efforts against political organizations and activist leaders. The most famous is perhaps the FBI's bugging of Martin Luther King's hotel rooms, an effort that captured King in a variety of sexually compromising situations. When the press refused to peddle the sex stories (yes, the press used to refuse to peddle sex stories), the FBI sent King an anonymous note urging him to drop out of politics, and potentially to commit suicide. "You are done," the letter declared. "There is but one way out for you." There can be no question that COINTELPRO was more intrusive—if also more targeted—than today's apparent efforts at mass technological surveillance by the National Security Agency. But there is at least one important distinction that makes today's scandal far more disturbing. When the FBI launched COINTELPRO, it was acting alone, outside of the boundaries of established law. Today, what the NSA is doing appears to be legal—and nearly every branch of the government is complicit. Unlike Hoover's activities, the NSA's programs come to us with the seal of congressional and judicial approval. It didn't take J. Edgar Hoover to engineer this scandal. We did it to ourselves. * * * From his earliest days as FBI director, Hoover had shown a talent for skirting the law. When Franklin Roosevelt encouraged him to look into domestic fascist and communist movements in the late 1930s, Hoover took this as a secret mandate to launch mass intelligence operations. When Congress outlawed wiretapping that same decade, Hoover interpreted the new statute to mean that he should not disclose wiretap evidence in court—then continued to wiretap as part of his ongoing intelligence operations. For Hoover, the sanctity and secrecy of FBI records was always the top concern; if it seemed that a secret program might be exposed, he often tried to shut it down. In at least one case, he allowed a known Soviet spy to walk free rather than take the risk that he would be forced to produce raw FBI reports in front of a jury of citizens. Advertisement Such secrecy was arguably easier to maintain in the 1950s and 1960s for a simple reason: Outside of appropriations hearings, intelligence agencies were not subject to much congressional oversight. Theoretically, Hoover worked for the attorney general, who worked for the president, and FBI policies were approved up the chain of command. In reality, he worked for himself and did mostly what he wanted. This is not to say that Hoover was a rogue actor, engaged in activities that would have horrified his Washington contemporaries. Rather, most politicians understood the deal: The FBI might

be up to no good, but it was in the interests of national security, and it was best not to ask too many questions. As a result, most efforts to expose the FBI's operations came from outside of Washington, and from outside the mainstream press. 1960s activists had been complaining for years that the FBI was bugging their meetings, planting informers, disrupting their relationships and organizations. But until the Media break-in they had little by way of hard proof. In that sense, the Media revelations—like the ongoing NSA scandal—were less about shock and surprise than about confirmation: The government was in fact doing everything you already sort of knew it was doing. After the Media burglary, COINTELPRO entered the popular lexicon as the shorthand designation for an entire universe of government surveillance, lies, and betrayal. PRISM may now take on a similar life, a one-word reminder that the government may, in fact, be watching your keystrokes. The FBI responded to the Media break-in by circling the wagons. Hoover cut back on counterintelligence activities, punished the local office chiefs, and set about trying to catch the burglars. But he had little luck. The Media burglary—“Medburg,” in the FBI's lexicon—still ranks as one of the Bureau's great unsolved cases. The political consequences were severe, however, and took several years to play out. In October 1971, a group of prominent civil liberties activists gathered at Princeton University for a conference to pressure the government into enacting intelligence oversight and reform. But it was not until 1975, in the wake of Watergate, that Congress itself took action. That year Idaho Sen. Frank Church led a sweeping congressional investigation into intelligence abuses, one the most expansive such efforts in American history. What he found confirmed the revelations from Media and then some, exposing COINTELPRO as a program that swept in groups from the Weathermen to the Ku Klux Klan. Hoover himself had died by that point, and he made an easy scapegoat, a larger-than-life figure who had amassed more power than any single man deserved, and who had used it to make a mockery of American democratic tradition. The discoveries went well beyond Hoover, though, and well beyond the FBI. According to the Church Committee reports, every federal intelligence agency had engaged in widespread civil liberties abuses over the previous 30 years, beginning with mass surveillance of domestic political groups and moving on up through the assassination of foreign leaders. The result was a new system of oversight—institutions like the Senate Select Committee on Intelligence and the FISA courts that govern intelligence activities today. When they were created, these new mechanisms were supposed to stop the kinds of abuses that men like Hoover had engineered. Instead, it now looks as if they have come to function as rubber stamps for the expansive ambitions of the intelligence community. J. Edgar Hoover no longer rules Washington, but it turns out we didn't need him anyway.

The FBI Chasing Spies program trample on civil liberties.

Haynes, 03 (John Earl, an American historian who worked as a specialist in 20th-century political history in the Manuscript Division of the Library of Congress. He is known for his books on the subject of the American Communist and anti-Communist movements, and on Soviet espionage in America (many written jointly with Harvey Klehr, “Chasing Spies: How the FBI Failed in Counterintelligence but Promoted the Politics of McCarthyism in the Cold War Years (review)”, “Project Muse”, *Journal of Cold War Studies* Volume 5, Number 2, Spring 2003 pp. 117-119, <http://muse.jhu.edu/journals/cws/summary/v005/5.2haynes.html>) JL

In lieu of an abstract, here is a brief excerpt of the content: *Journal of Cold War Studies* 5.2 (2003) 117-119 Athan G. Theoharis, Chasing Spies: How the FBI Failed in Counterintelligence but Promoted the Politics of McCarthyism in the Cold War Years. Chicago: Ivan R. Dee, 2002. 307 pp. \$27.50. The heart of this volume repeats the theme Athan Theoharis has pursued through numerous books and articles: In the name of internal security the Federal Bureau of Investigation (FBI) oppressed innocent people and trampled on civil liberties in its eagerness to suppress criticism of the status quo. In particular, his earlier works depicted the FBI's investigations of the American Communist Party (CPUSA) and other radicals as having lacked any legitimate basis. The bulk of Chasing Spies continues this theme, focusing on cases of

the FBI's use of warrantless wiretaps and buggings; warrantless, surreptitious entries to photograph evidence ("black-bag" jobs); close surveillance; informants inside the CPUSA; and cooperation with congressional committees investigating domestic Communism.

Theoharis describes all of this in detail and in scandalized tones. Nevertheless, in light of the declassification of the decrypted Venona materials and the documents that have emerged from Soviet archives, it is no longer possible to ignore Soviet espionage and the CPUSA's role in it. Consequently, Theoharis surrounds his recapitulation of FBI investigatory abuses with a discussion of the new evidence. He writes that Venona and KGB records confirm that leaders of the American Communist party had served either as couriers or had recruited individuals to steal U.S. secrets for the Soviet Union.... The fact that the Soviets spied on the United States ... is in itself not a startling revelation. (p.237) If one's knowledge of Soviet espionage had been based on Theoharis's earlier writings, the disclosure of CPUSA involvement would have been very "startling" indeed. He deprecated claims of significant Soviet spying and CPUSA assistance, and he steadfastly attacked the credibility of defectors from Soviet espionage such as Elizabeth Bentley, whose testimony has now been overwhelmingly vindicated. His glossing over of Soviet espionage was key to his criticism of the FBI's internal security activities as unjustified.

HUMINT Link Turn

Insider threat programs need people, not technology.

Shea, '15 (Sharon, manages special projects for TechTarget Security Media's websites, including SearchSecurity and SearchCloudSecurity, "Insider threat programs need people, not technology", "Search Security", 04/28, <http://searchsecurity.techtarget.com/news/4500245207/Insider-threat-programs-need-people-not-technology>) JL

SAN FRANCISCO -- **Developing insider threat programs is more about people, policies and planning than**

technology -- this according to an RSA Conference panel Thursday. The discussion among Dawn Cappelli, Rockwell Automation Inc.'s insider risk management director, Geoff Hancock, Advanced Security Group CEO, and Pat Reidy, CSC's vice president of cybersecurity focused on five tenets to help enterprises build effective threat-management programs. Know what you're fighting for When it comes to insider threat management, Reidy said, it is critical to understand the first responsibility of the job is to protect both the privacy of employees and confidential corporate data. After this, Reidy continued, the "sexy" part of the job -- catching the bad guys -- comes into play. This mindset can also establish an insider threat program as more "palatable" to leadership and employees alike. Putting together an effective team All three panelists agreed **having the right people involved in insider threat programs is**

essential. Reidy said stakeholders, human resources members, legal representatives and the security team were all crucial to include in a strategy. Cappelli recommended forming a "virtual team" -- a specialized taskforce from different areas of a company -- a strategy she employed when creating an internal threat program at Rockwell. However, she added that a dedicated insider threat management team is not always necessary; in many enterprise scenarios, integrating the task into existing team members' daily responsibilities is sufficient. Along with creating the team, the panelists emphasized it's important to assign the right tasks to the right people. Insider threat detection is often "chucked at the geeks," Reidy said; but the threats often are 90% nontechnical. Knowing when to contact HR, the legal team or even law enforcement is key.

Squo Solves

Companies can form their own insider threat programs without any or a huge investment.

Shea, '15 (Sharon, manages special projects for TechTarget Security Media's websites, including SearchSecurity and SearchCloudSecurity, "Insider threat programs need people, not technology", "Search Security", 04/28, <http://searchsecurity.techtarget.com/news/4500245207/Insider-threat-programs-need-people-not-technology>) JL

A people problem doesn't always have a technology solution **Adopting an insider threat program doesn't always require a huge -- or any -- monetary investment**, Reidy said. Before purchasing the next hot product touting insider threat detection capabilities, Reidy continued, evaluate what your organization has in house; the products enterprises are already employing often contain necessary insider threat detection features. Start with developing baseline data, Hancock added. Detail what needs protection, who has access to what and so forth. Cappelli suggested that nontechnical controls -- including limiting USB and cloud service usage -- may also prevent a number of insider attacks. Selling the idea to management While getting executives on board sounds simple enough, getting insider threat program buy-in can be a lot of work, Cappelli continued. Insider threat programs are often seen as just another expense. But, Hancock noted, 55% of breaches start with insiders; if the threat can be nipped in the bud, it's a good investment. Additionally, Hancock went on to say, building a strong business case for insider threat programs can help executives justify the investment. While it's important to tell enterprise leaders the dangers of insider threats, Reidy asserted, scare tactics aren't the best method and likely won't work. Instead, Reidy suggested selling insider threat programs by touting their benefits: protecting the people, intellectual property and viability of the company. Never base insider threat suspicions on personal opinions of employees, Cappelli added; monitoring should spare no one. "Not all employees [who are insider threats] are 'disgruntled,'" Cappelli said. "A lot of very nice people try to walk out with information." Proactive insider threat detection A daunting aspect of insider threats, Hancock said, is there's no way to stop them.

Enterprises can, however, take proactive measures to detect the threats before they become a major

issue. Creating a baseline measurement of network behavior, Hancock continued, would help companies detect and investigate suspicious anomalies. Locking common methods used by inside attackers can also prevent attacks, Cappelli noted. Prohibiting USB use and cloud file sharing should be foremost considered, as they are two of the most common ways employees exfiltrate data. If enterprises cannot feasibly control all users by such methods, enforcing controls on select departments and individuals would help reduce the attack surface. Another part of being proactive, suggested Hancock, involved keeping an ongoing playbook, to which the other panelists agreed writing down all potential insider threats and solutions was critical. Though new, never-before-experienced events will inevitably occur, **cataloging these events and learning from them is a huge part of any insider threat program.**

Non-UQ: Losing Spy War

We are losing the Spy War. It's too late to undo the damage

Schindler, '15 (John R., security consultant and a former National Security Agency counterintelligence officer, "China's Spies Hit the Blackmail Jackpot With Data on 4 Million Federal Workers", "The Daily Beast", 06/11, <http://www.thedailybeast.com/articles/2015/06/11/china-s-spies-hit-the-blackmail-jackpot-with-every-data-on-federal-worker.html>) JL

With each passing day the U.S. government's big hacking scandal gets worse. Just what did hackers steal from the Office of Personnel Management? Having initially assured the public that the loss was not all that serious, OPM's data breach now looks very grave. The lack of database encryption appears foolhardy, while OPM ignoring repeated warnings about its cyber vulnerabilities implies severe dysfunction in Washington. To say nothing of the news that hackers were scouring OPM systems for over a year before they were detected. It's alarming that intruders got hold of information about every federal worker, particularly because OPM previously conceded that "only" 4 million employees, past and present, had been compromised, including 2.1 million current ones. Each day brings worse details about what stands as the biggest data compromise since Edward Snowden stole 1.7 million classified documents and fled to Russia. Then there's the worrisome matter of what OPM actually does. A somewhat obscure agency, it's the federal government's HR hub and, most important, it's responsible for conducting 90 percent of federal background investigations, adjudicating some 2 million security clearances every year. If you've ever held a clearance with Uncle Sam, there's a good chance you're in OPM files somewhere. Here's where things start to get scary. Whoever has OPM's records knows an astonishing amount about millions of federal workers, members of the military, and security clearance holders. They can now target those Americans for recruitment or influence. After all, they know their vices, every last one—the gambling habit, the inability to pay bills on time, the spats with former spouses, the taste for something sexual on the side—since all that is recorded in security clearance paperwork. (To get an idea of how detailed this gets, you can see the form, called an SF86, [here](#).) Speaking as a former counterintelligence officer, it really doesn't get much worse than this. Do you have friends in foreign countries, perhaps lovers past and present? The hackers know all about them. That embarrassing dispute with your neighbor over hedges that nearly got you arrested? They know about that, too. Your college drug habit? Yes, that too. Even what your friends and neighbors said about you to investigators, highly personal and revealing stuff, that's in the other side's possession now. Perhaps the most damaging aspect of this is not merely that millions of people are vulnerable to compromise, through no fault of their own, but that whoever has the documents now so dominates the information battlespace that they can halt actions against them. If they get word that an American counterintelligence officer, in some agency, is on the trail of one of their agents, they can pull out the stops and create mayhem for him or her: Run up debts falsely (they have all the relevant data), perhaps plant dirty money in bank accounts (they have all the financials, too), and thereby cause any curious officials to lose their security clearances. Since that is what would happen. This disaster was decades in the making and will take decades to set right. Then there's the troubling matter of who's behind this mega-hack. U.S. intelligence sources haven't been particularly shy about pointing the finger at China, particularly at hacker groups that serve as cut-outs for Chinese intelligence and who are the suspected culprits behind several major online data breaches of the U.S. economy, including the health-care industry. What they're particularly looking for is information about Chinese nationals who have ties to

Americans working in sensitive positions. Why Beijing wants that information isn't difficult to determine. Armed with lists of Chinese citizens worldwide who are in "close and continuing contact" (to cite security clearance lingo) with American officials, Beijing can now seek to exploit those ties for espionage purposes. And it will. While many intelligence services exploit ethnic linkages to further their espionage against the United States—Russians, Cubans, Israelis, even the Greeks—none of the major counterintelligence threats to America exploit ethnic ties as consistently as Beijing does. The OPM compromise, however it came about, represents a genuine debacle for Washington, one that will take many years to repair. **Our intelligence community already faces serious and long-standing problems with counterintelligence**, the Beltway's perennial redheaded stepchild, and this setback promises to make things exponentially worse. This is a new kind of threat, the melding of ancient counterespionage techniques with 21st-century technology, and we're playing catchup. The OPM hack, which is unprecedented in its scope, offers our adversaries the opportunity to penetrate our government and use that information to deceive it at a strategic level. **This is the essence of SpyWar**, the secret struggle between the West and adversaries like China, Russia, and Iran, a clandestine battle that never ceases, yet which the public seldom gets wind of, except when something goes wrong. The extent of the damage here appears so vast that all the counterintelligence awareness in the world may not be able to offset the advantage in the SpyWar that Beijing has won with this data theft. If you are or have been employed with the federal government and have listed Chinese nationals on your SF86, it's time to be vigilant, while anybody who's worked for the feds since the mid-1980s ought to be watching their credit reports for anomalies. Then there's the matter of the lives possibly ruined by this. Simply put, there has long been a tacit agreement: You keep the U.S. government's secrets safe, it will do the same for yours. That important promise, the bedrock upon which the security clearance process is based, has been violated, with serious consequences for millions of Americans—and for Washington. Counterintelligence hands warned of the threat posed by putting all sorts of sensitive information in such databases, but they were ignored. **It's too late to undo the damage**, but we must finally get serious about preventing the next big compromise, while mitigating the pain of this loss. This disaster was decades in the making and will take decades to set right. There's no time for back-biting. Honest assessment is what's required. There's a SpyWar on that needs to be won.

The US is losing the Spy War.

Greenfield, '13 (Rebecca, "Why America Is Losing the War Against China's Hacker Spies", "The Wire", 02/14, <http://www.thewire.com/technology/2013/02/america-losing-war-against-chinas-hacker-spies/62135/>) JL

Forget The New York Times and The Wall Street Journal. **Chinese hackers are on a digital espionage campaign targeting a vast array of pretty much any major American organization "with intellectual property to protect,"** and now that there's a rare human side to combatting the malware attacks, we know there's not enough being done to stop the hackers yet. In a new cover story, Bloomberg Businessweek's Dune Lawrence and Michael Riley follow one of the American malware experts attempting to fight the war on hackers, and he reveals a long — even impossible — battle ahead. Since he began tracking Chinese hackers in 2004 at Dell SecureWorks, Joe Stewart has had two big successes in spy hunting, as he unveiled the identities of the hackers "Zhang" and "Cyb3rsleuth."* And he doesn't exactly deny Lawrence and Riley's assertion that the ongoing Chinese malware spying goes straight to the top: Investigators at dozens of commercial security companies suspect many if not most of those hackers either are military or take their orders from some of China's many intelligence or surveillance organizations. Indeed, the Businessweek story builds on growing fears that Chinese hackers might be targeting a whole lot more than just a couple of newspapers in the United States. A secret intelligence estimate described by The Washington Post this week "describes a wide range of sectors that have been the focus of hacking over the past five years, including energy, finance, information technology, aerospace and automobiles." That's a lot of trade secrets, and it appears to be the impetus behind an executive order issued on Tuesday by President Obama for government and the private sector to collaborate on cybersecurity threats. Congress is also taking up the Cyber Intelligence Sharing and Protection Act in an effort to shore up what security hawks see as holes in Obama's order. At the State of the Union on Tuesday, the president devoted a surprisingly large part of his address to hacking: Now, we know hackers steal people's identities and infiltrate private e-mails. We know foreign countries and companies swipe our corporate secrets. Now our enemies are also seeking the ability to sabotage our power grid, our financial institutions, our air traffic control systems. We cannot look back years from now and wonder

why we did nothing in the face of real threats to our security and our economy. Unfortunately, it may also take years before the full extent of the threat from China can be addressed head-on. As the U.S. government and those major, say, financial institutions start to connect on security issues, our private malware defenders can't even add up their success stories to anything that will actually stop the hacks from growing — or that will actually get China to admit what's going on. From Businessweek: Outing one person involved in the hacking teams won't stop computer intrusions from China. Zhang's a cog in a much larger machine and, given how large China's operations have become, finding more Zhangs may get easier. Show enough of this evidence, Stewart figures, and eventually the Chinese government can't deny its role. It might take several more years of piling on reports like that to make that weight of evidence so strong that it's laughable, and they say, 'Oh, it was us,' says Stewart. "I don't know that they'll stop, but I would like to make it a lot harder for them to get away with it." That's right, it will take years longer for China to even pay attention to the American counter-offensive. As the Bloomberg piece explains, these hacks are a "continuous invasion," and America is totally outnumbered. In the last 10 months, Chinese hackers have doubled their forces, with 10 teams deploying 300 malware groups. "There is a tremendous amount of manpower being thrown at this from their side," Stewart, the face of our anti-malware campaign, told Businessweek. Meanwhile, most American businesses and agencies are "outmatched by an enemy with vast resources and a long head-start," Lawrence and Riley write. There is one slightly encouraging tid-bit in the Bloomberg piece, however. At least some of our important national security organizations have enough resources to combat the hackers. Lawrence and Riley list the Pentagon and a "handful of three letter organizations" as "possibly" having enough manpower to combat the vast Chinese effort. So, there's that, and that's why Obama is doubling down.

A2 Russia Spies

Soviet spies actually helped US interests, by deterring Soviet aggressive negotiation.

Haynes, 03 (John Earl, an American historian who worked as a specialist in 20th-century political history in the Manuscript Division of the Library of Congress. He is known for his books on the subject of the American Communist and anti-Communist movements, and on Soviet espionage in America (many written jointly with Harvey Klehr, "Chasing Spies: How the FBI Failed in Counterintelligence but Promoted the Politics of McCarthyism in the Cold War Years (review)", "Project Muse", Journal of Cold War Studies Volume 5, Number 2, Spring 2003 pp. 117-119, <http://muse.jhu.edu/journals/cws/summary/v005/5.2haynes.html>) JL

Furthermore, Theoharis claims that **Soviet spies not only did not harm U.S. interests, but actually helped: "the information about U.S. industrial productivity and military strength provided by the Silvermaster group—the numbers being overwhelming—might have deterred Soviet officials from pursuing an aggressive negotiating strategy"** (pp.16-17). We have only limited knowledge of the influence of espionage on Stalin's foreign policy decisions. The notion that information from Soviet spies scared Stalin into moderation is at best highly speculative. To downplay Soviet espionage, Theoharis emphasizes that KGB and Venona records document ... political intelligence operations: reports on the plans and objectives of Democratic and Republican officials; operations directed against Communist political adversaries—Trotskyites, Russian Monarchists, Social Democrats, Russian Orthodox, prelates, and anti-Russian Polish Americans. (p.236) Theoharis dismisses these Soviet political intelligence activities as "silly" (p.16). In reality, Soviet intelligence organs, with the assistance of American Communists, reached into the United States to track exiled Russians, Poles, and Ukrainians, monitored Eastern Orthodox clergy for anti-Soviet sermons, infiltrated American Jewish organizations, kidnapped Soviet seamen...

Russia spies are not a threat.

Peritz, '14 (Aki, "What The Americans gets wrong about Russian spies", "The Week", 04/19,

<http://theweek.com/articles/447808/what-americans-gets-wrong-about-russian-spies>) JL

So what were these Soviet illegals actually doing in the suburbs? Probably not too much, according to retired KGB Maj. Gen. Oleg Kalugin, who wrote in his memoirs that the deep cover agents were the "least productive" of the KGB's branches working in the U.S. capital. **The most recent batch of busted Russian deep-cover agents apparently only managed to collect open-source material during their stay in America — information that could have been discovered by anyone with internet access. In fact, the U.S. Justice Department didn't charge any of them with espionage because they never actually sent any classified information back to Moscow.** It wasn't exactly the stuff of a Robert Ludlum thriller.

Non-UQ: Monitoring Fails

Even close monitoring doesn't check nuclear threats—bureaucracy and empirics prove

Bunn 14 [Matthew Bunn (American nuclear and energy policy analyst, currently a professor of practice at the Harvard Kennedy School at Harvard University) and Scott Sagan, "A Worst Practices Guide to Insider Threats: Lessons from Past Mistakes," the American Academy of Arts and Sciences, 2014, <https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>]
] AZ

High-security facilities typically have programs to monitor the behavior of employees for changes that might suggest a security issue, and to encourage other employees to report such changes. Effective personnel screening, training, and monitoring systems are designed to pick up subtle signs that personnel reliability has been or is about to be compromised by disgruntlement, mental health problems, drug abuse, or personal life difficulties, or that security reliability has been or is about to be compromised by shifting political allegiances, corruption, recruitment, or self-radicalization. While picking up subtle signs of danger is difficult, security managers often assume that severe red flags warning of problems will not go unnoticed. But if individual incentive systems and information-sharing procedures encourage people not to report, even the reddest of red flags can be ignored. The shooting incident at Fort Hood, Texas, is an extreme version of this problem. On November 5, 2009, U.S. Army Major Nidal Hasan opened fire on a group of soldiers preparing to deploy to Afghanistan, killing thirteen and wounding twenty-nine.¹⁹ Major Hasan had made no secret of his radicalized, violent beliefs, voicing his justification of suicide bombers, defense of Osama bin Laden, and devotion to Sharia law over the U.S. Constitution to peers and supervisors over a period of years before the attack. The San Diego Joint Terrorism Task Force (JTTF), an interagency group managed by the FBI, had also obtained multiple email communications between Hasan and a "foreign terrorist" reported in the press to be Anwar al-Awlaki.²⁰ As Amy Zegart has argued, stopping "a radicalized American Army officer who was publicly espousing his beliefs and was known to be communicating with one of the world's most dangerous and inspirational terrorists in the post-9/11 era was not asking the impossible."²¹ Why did multiple U.S. government processes fail to act on the obvious red flags raised by Hasan? There were several reasons. First, the process for review and removal of an officer on security reliability grounds was time-consuming and cumbersome, posing an immense set of headaches to anyone who tried to act. Combined with the incentive to keep someone with Hasan's psychiatry specialty in the service, no officer at Walter Reed decided to start proceedings against Hasan. Second, the Army's system for reviewing officers' performance

Underreporting—97% chance that insiders bypass monitoring and surveillance checks

Bunn 14 [Matthew Bunn (American nuclear and energy policy analyst, currently a professor of practice at the Harvard Kennedy School at Harvard University) and Scott Sagan, "A Worst Practices Guide to Insider Threats: Lessons from Past Mistakes," the American Academy of Arts and Sciences, 2014, <https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>]
] AZ

Nuclear managers may assume that their systems for detecting red flags are much better—that they would surely catch someone like Hasan. But the case of Sharif Mobley suggests that this may not always

be the case. In March 2010, Mobley was arrested in Yemen for alleged involvement in al-Qaeda and for shooting a guard in an attempt to escape. Yet between 2002 and 2008, prior to traveling to Yemen, Mobley worked at five U.S. nuclear power plants (Salem-Hope Creek, Peach Bottom, Limerick, Calvert Cliffs, and Three Mile Island), where he was given unescorted access inside the plant (though not in the vital areas) to perform maintenance and carry supplies. According to a Nuclear Regulatory Commission (NRC) report, Mobley voiced his militant views during his work, referring to non-Muslim coworkers as “infidels” and remarking to some in his labor union: “We are brothers in the union, but if a holy war comes, look out.”²⁴ Though the rules in place at the time required individual workers to report any suspicious behavior on the part of coworkers, none of Mobley’s fellow union members apparently reported these statements. The red flags were again invisible. Cases of ignoring red flags as extreme as Hasan’s, or even Mobley’s, do not happen often. But the issues raised—failing to report problems because of the headaches involved, passing troublesome employees off to someone else— arise in smaller ways in almost every organization. Indeed, research suggests that indicators of insider security problems are **systematically underreported**.²⁵ One study of several cases of insider information-technology sabotage in critical infrastructure found that 97 percent of the insiders involved in the cases “came to the attention of supervisors or coworkers for concerning behavior prior to the attack,” but the observed behavioral precursors were “ignored by the organization.”²⁶ All managers of nuclear organizations should be asking themselves: how are the incentives for reporting such issues really aligned in my organization? How could I test how well such issues are reported? How could I improve my organization’s ability to detect and act on a potential problem before it occurs?²⁷

Internal politics and nepotism hamper counterintelligence services, causing monitoring failure.

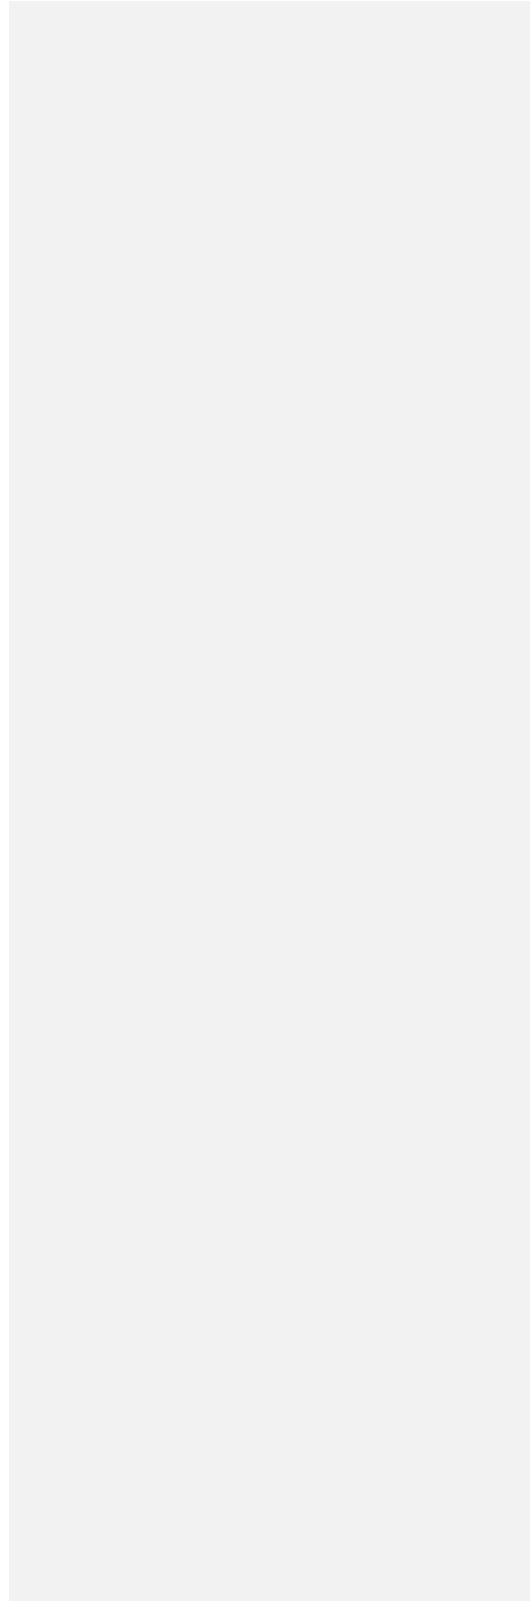

Riddell, '15 (Kelly, investigative reporter for The Washington Times, “FBI surveillance teams frustrated by nepotism and internal politics”, “The Washington Times”, 03/02, <http://www.washingtontimes.com/news/2015/mar/2/fbi-surveillance-teams-frustrated-by-nepotism-and-/?page=all>,) JL

Members of the **FBI surveillance teams that secretly track terrorists, spies and mobsters on U.S. soil are increasingly frustrated their mission is being hampered by internal politics and nepotism**, according to interviews and documents. FBI memos reviewed by The Washington Times show at least **three younger relatives of high-ranking bureau supervisors have landed jobs on the elite surveillance teams in recent years**, with two fast-tracked to full special agent status. In addition, some FBI local offices that ranked high on a threat and needs matrix for surveillance were passed over for new teams last year in favor of more politically connected offices that ranked lower, the records show. The worries have grown so widespread that one longtime decorated surveillance team member has sought whistleblower protection, taking his colleagues’ concerns to both the Justice Department’s inspector general and the Senate Committee on the Judiciary. The whistleblower told The Times he initially went to supervisors, who dismissed the problems and then gave him a poor personnel review. So **he then went to Congress because he fears current practices are jeopardizing the war on terror and the bureau’s counterintelligence operations**. “Who gets what surveillance teams — it’s now all about bias and favoritism and the good ol’ boy system,” the whistleblower said in an interview with The Times, speaking only on condition of anonymity because his identity is supposed to remain secret during surveillance. “My division — although we had the statistics to prove we needed more personnel — got skipped over because executive management had an ax to grind.” FBI officials readily acknowledge a

handful of top managers' children or relatives landed jobs on the surveillance teams, but they insist the hirings were governed by the bureau's strongly worded policy that outlaws favoritism in hiring. "All applicants go through a rigorous selection process, including structured interviews and security background investigations," the bureau said. "Personnel matters that have the potential of being viewed as an act of nepotism are subject to appropriate administrative action." The FBI also confirmed that some offices that scored high for surveillance needs were skipped over in favor of lower-ranked offices. Officials said that while the matrix evaluation was carefully conducted, it also allowed for some discretion by managers to change rankings. "Due to limited resources, not all field offices that qualified for an additional surveillance team were provided one. Both the selection process and the final determinations were subjected to an extensive review process and approved by executive management," the bureau said in its statement to The Times. The whistleblower disclosures come at a sensitive time for the bureau, which still faces questions as to why it had not more aggressively tracked the Tsarnaev brothers, who are suspected in the 2013 Boston Marathon bombing, after Russian authorities had tipped the agency about the pair.

AT: Intelligence D.A- UTNIF

AT NSA Morale

Link Turn

Morale crashing because of RULEBREAKING

Friedersdorf 12/10/13 Conor Friedersdorf is a staff writer at The Atlantic, where he focuses on politics and national affairs. He lives in Venice, California, and is the founding editor of The Best of Journalism, a newsletter devoted to exceptional nonfiction.

<http://www.theatlantic.com/politics/archive/2013/12/do-you-trust-em-the-washington-post-em-sources-on-morale-at-the-nsa/282184/>

After reading what these former officials had to say, Marcy Wheeler points out that NSA employees have a reason for low morale that has nothing to do with Obama's support:¶ Most of the NSA's employees have not been read into many of these programs ... That raises the distinct possibility that NSA morale is low not because the President hasn't given them a pep talk, but because they're uncomfortable working for an Agency that violates its own claimed rules so often. Most of the men and women at NSA have been led to believe they don't spy on their fellow citizens. Those claims are crumbling, now matter how often the NSA repeats the word "target."

Morale Low – NU

Morale low – Obama ignoring

Circa News 8/7/14 <http://circanews.com/news/nsa-employee-morale-drops-after-snowden-leaks>

Former NSA officials say the agency's workers are feeling low due to the fact that Pres. Obama hasn't paid them a visit since the Snowden leaks began. Pres. Obama hasn't visited NSA headquarters at Fort Meade since the first leaks from Edward Snowden surfaced, causing a plunge in morale among employees, former NSA officials tell the Washington Post. NSA workers "are feeling bad, beaten down," an unnamed official said. The agency, from top to bottom, leadership to rank and file, feels that it is had no support from the White House even though it's been carrying out publicly approved intelligence missions. They feel they've been hung out to dry, and they're right. – Joel Brenner, former NSA inspector general, Former Pres. George W. Bush visited the agency in 2006 shortly after the New York Times published revelations that the agency has engaged in warrantless wiretapping. The visit had a "tremendous" affect on morale, Brenner said.

Morale Low – Security Breach

NSA morale killed by mass intelligence breach

McGough 13 (Michael, Michael McGough is the Los Angeles Times' senior editorial writer, based in Washington, D.C. He has been writing editorials for The Times since 2006. Before that, McGough worked for 30 years for the Pittsburgh Post-Gazette as a reporter, editorial writer, editorial page editor and Washington correspondent. He writes about law, national security, politics, foreign policy and religion. McGough is a graduate of Allegheny College and also attended the University of Kent at Canterbury in England and Yale Law School, where he received a master of studies in law degree. 12/20/13, "Obama throws the NSA under the bus" <http://www.latimes.com/opinion/opinion-la/la-ol-obama-nsa-snowden-20131220-story.html>)

President Obama's end-of-the-year news conference Friday, he was given the opportunity to second-guess two bureaucracies that report to him: the intelligence community and the Department of Justice. He threw only the first one under the bus by implying strongly that he was open to ending the National Security Agency's bulk collection of telephone records. He did this in two ways. First, he said that the metadata program — in which the NSA hoovers up information about the source, destination and duration of phone calls — might not be the only way of "skinning the cat." He suggested that, given public concerns about potential abuse of metadata, maybe it would be a good idea to follow a task force recommendation and have telephone companies store the information, with access by investigators on a more limited basis. But equally important was the way Obama evaded a question about whether the metadata program had actually prevented terrorist plots. Skeptics about that proposition include both the task force and the federal judge who this week ruled that the program was probably unconstitutional. Obama could have responded: "I disagree. I know that the metadata program was essential in the prevention of plots." But he offered no such defense. You might read some endorsement of the program's effectiveness into Obama's comment that the government might be able to "accomplish the same goals" in a different way. But that's different from saying that the goals actually have been accomplished. Obama went easier on the Department of Justice. Asked about the possibility of amnesty for Edward Snowden, Obama noted that "I've got to be careful" because Snowden was under indictment and that the disposition of the charges against him was the province of the attorney general and a judge and a jury. But that was more than a little misleading. As Obama seemed to acknowledge in response to a follow-up question, the White House likely would be consulted by Justice about major decisions in the case. And, of course, the president has the power to pardon Snowden — even before a trial. Yet it seems pretty clear there won't be a pardon in Snowden's Christmas stocking. And why not? Because the self-styled whistle-blower, in Obama's words, had caused "unnecessary damage to U.S. intelligence capabilities and U.S. diplomacy." On that point, Obama doesn't seem open to fresh thinking

AT NSA Recruiting

Non-unique – Recruiting low

Students are skeptical of the NSA – number of recruited diminishes

Brumfiel 3/31/15 (Geoff Brumfiel, science correspondent for NPR, After Snowden, "The NSA Faces Recruitment Challenge," www.npr.org/2015/03/31/395829446/after-snowden-the-nsa-faces-recruitment-challenge)

Matthew Green, a professor of computer science at Hopkins, says the number of such students the school turns out each year can vary. "Sometimes it's a half-a-dozen," he says. "Sometimes it's just one or two." Green says the Snowden leaks have changed academia's views of the agency. "Before the Snowden leaks we looked at the NSA as being a spy agency, and they did what they were supposed to do," he says. "But we've learned that they're been collecting this incredible amount of information. And they're not shy about doing whatever they have to do to get access to that information." Green says he doesn't feel as friendly toward the NSA as he once did. It's important that people learn about the Snowden documents, he says, and he teaches about them to students like Swann. Swann says Green's class helped shape his thinking on whether to work for the NSA. The lawsuit by Wikimedia and other plaintiffs challenges the National Security Agency's use of upstream surveillance, which collects the content of communications, instead of just the metadata. NATIONAL SECURITY An 'Upstream' Battle As Wikimedia Challenges NSA Surveillance Someone like Daniel Swann is a fairly rare commodity. Hopkins is a big university, but its Information Security Institute will produce just 31 master's this year. Of those, only five are U.S. citizens — a requirement to work at the NSA. With similarly small numbers at other schools, how many Daniel Swanns are rejecting the agency because of the Snowden leaks?

"Well that's kind of a tricky question," says Ziring, the NSA computer scientist. Ziring also helps lead academic outreach for the agency. "When I've been out on campuses and talking to students," he says, "there are some of them ... that puts them off or they have doubts." On the other hand, Ziring says, the Snowden leaks have sparked other students' interest. "[They say], 'I actually know some of what you do now, and that's really cool and I want to come do that,'" he says.

NSA is struggling for recruits to hire and compete with other sectors

Zakaria '11 (Tabassum Zakaria, Staff writer for Washington Post, "NSA is looking for a few good hackers," www.washingtonpost.com/politics/nsa-is-looking-for-a-few-good-hackers/2011/08/02/gIQAXZAbql_story.html)

The NSA is hiring about 1,500 people in the fiscal year, which ends Sept. 30, and another 1,500 next year, most of them cybersecurity experts. With a workforce of about 30,000, the Fort Meade-based NSA dwarfs other intelligence agencies, including the CIA. It also engages in cyber-spying and other offensive operations, something it rarely, if ever, discusses publicly. But at Defcon, the NSA and other "Feds" will be competing with corporations looking for hacking talent. The NSA needs cybersecurity experts to harden networks, defend them with updates, do "penetration testing" to find security holes and watch for signs of cyberattacks. The NSA is expanding its fold of hackers, but George said there is a shortage of those skills. "We are straining to hire the people that we need."

NSA fights an uphill battle with recruitment against other corporations

Hatamoto 4/2/15 (Michael Hatamoto, West Coast reporter, "NSA finding it harder to recruit specialists following Snowden leaks," www.tweaktown.com/news/44398/nsa-finding-harder-recruit-specialists-following-snowden-leaks/index.html)

The NSA has around 35,000 employees across the country, and trying to compete against tech companies to recruit employees from leading universities is proving difficult. A lack of trust is a major issue that is making some people think-twice before trying to land a job with a security clearance.

"Before the Snowden leaks we looked at the NSA as being a spy agency, and they did what they were supposed to do," said Matthew Green, assistant research professor at the Johns Hopkins Information Security Institute, in a statement to NPR. "But we've learned that they've been collecting this incredible amount of information. And they're not shy about doing whatever they have to do to get access to that information." Trying to compete against Facebook, Google, and other appealing tech companies is difficult, with the private sector providing higher salaries and better perks - but the NSA and other federal branches try to promote work-life balance and continuing education as benefits of government positions.

Non-unique – Snowden kills recruiting

Snowden's revelations still devastates recruitment and questions much of the ethics of the NSA

Brumfiel 3/31/15 (Geoff Brumfiel, science correspondent for NPR, After Snowden, "The NSA Faces Recruitment Challenge," www.npr.org/2015/03/31/395829446/after-snowden-the-nsa-faces-recruitment-challenge)

After Snowden's revelations, Swann's thinking changed. The NSA's tactics, which include retaining data from American citizens, raise too many questions in his mind: "I can't see myself working there," he says, "partially because of these moral reasons." This year, the NSA needs to find 1,600 recruits. Hundreds of them must come from highly specialized fields like computer science and mathematics. So far, it says, the agency has been successful. But with its popularity down, and pay from wealthy Silicon Valley companies way up, agency officials concede that recruitment is a worry. If enough students follow Daniel Swann, then one of the world's most powerful spy agencies could lose its edge.

AT NSA Retention

Non-unique – privatization

Attacking the NSA only leads to privatization

Markon and Nakashima '14 (Jerry and Ellen, Reporters for Washington Post, "Top-level turnover makes it harder for DHS to stay on top of evolving threats,"

http://www.washingtonpost.com/politics/top-level-turnover-makes-it-harder-for-dhs-to-stay-on-top-of-evolving-threats/2014/09/21/ca7919a6-39d7-11e4-9c9f-ebb47272e40e_story.html)

In one nine-month period between June 2011 and March 2012, for example, four senior DHS cybersecurity officials quit and one retired — all headed to the private sector. The departures came as the department battled the Pentagon and the National Security Agency over who should have responsibility for protecting critical private-sector networks and for responding to industry requests for assistance. DHS was pressing to enshrine its authority in law. "It became so hard to advocate for DHS to be placed in charge and given more responsibility because people were constantly leaving," recalled Jacob Olcott, a former House Homeland Security Committee aide. The cybersecurity bill died, a victim of strong opposition from industry and its backers on the Hill. The continuing stream of departures has at times hampered the department's ability to combat cyberattacks aimed at civilian federal networks and to serve as the federal point of contact for critical industries, such as energy and transportation, and for state and local governments. The high turnover has meant that at times the National Cybersecurity and Communications Integration Center struggles to carry out its mission of analyzing attacks on federal and private computer systems and responding to them.

Not even government aid can keep NSA employees from staying

Moore 4/14/15 (Jack Moore, staff writer for NextGov, "IN FIERCE BATTLE FOR CYBER TALENT, EVEN NSA STRUGGLES TO KEEP ELITES ON STAFF," www.nextgov.com/cybersecurity/2015/04/fierce-battle-cyber-talent-even-nsa-struggles-keep-elites-staff/110158/)

The National Security Agency is probably among the best-equipped parts of the federal government at recruiting, training and staffing an elite team of cybersecurity professionals. Thanks to Congress, the agency has been granted significant leeway in bypassing the sluggish federal hiring process to onboard staff quicker and greater latitude to pay new recruits retention bonuses and provide other perks. But even that's not enough to stop some top-level technical talent from jumping ship. "We're throwing the kitchen sink at them from our standpoint," said NSA's human resources technical director, John Yelnosky. "And they're writing in to us, as they leave NSA, in their exit interviews, 'I'm leaving to double my salary.'" Yelnosky spoke Tuesday during a panel discussion hosted by the Partnership for Public Service on the shortage of skilled cybersecurity professionals in government. A recent report from the partnership and consultancy Booz Allen Hamilton called attention to the most pressing challenges the government faces in hiring cyber talent: the arcane federal hiring process, a rigid pay scale not keeping pace with the private sector and the lack of a governmentwide "master strategy" for boosting the cyber workforce. NSA, along with other parts of the intelligence community and the Defense Department, has been granted flexibility to bypass traditional hurdles in the hiring process and adjust salary rates to be more competitive. The report called on the Obama administration to allow all agencies to fast-track

cyber hiring, as well as stand up a governmentwide cyber training center and create a version of the military ROTC program for cyber recruits. "NSA is really the poster child for many of the reforms we've advocated here," said Ron Sanders, former chief human capital officer for the intelligence community and a vice president at Booz Allen Hamilton, who co-authored the report. But NSA's experiences point to the lack of a silver bullet. "We lose more technical people at much higher rates to resignations early on in their careers than we do people in other skill sets," Yelnosky said of the churn in NSA's cyber personnel. It stings all the more as most depart after they've undergone extensive, specialized NSA training. "The competition out there is really fierce and particularly for these folks that we make a big investment in, and we feel those losses very keenly," Yelnosky said. According to the report, 2014 marked the second year in a row in which the number of civilian federal cyber employees streaming for the exits outpaced the number of new hires. (That figure, which excludes military members and intelligence community employees followed a three-year period between 2009-2012, when the number of new hires outpaced separations by much larger margins, however.) The overall attrition rate isn't necessarily raising eyebrows.

Intel Impact Answers

AT K2 Foreign Policy

Intelligence is irrelevant to FP

Pilar 1/3/12

<http://www.foreignpolicy.com/articles/2012/01/03/intelligence>

Paul R. Pillar is an academic and 28-year veteran of the Central Intelligence Agency (CIA), serving from 1977 to 2005.[1] He is now a non-resident senior fellow at Georgetown University's Center for Security Studies,[2] as well as a nonresident senior fellow in the Brookings Institution's Center for 21st Century Security and Intelligence.[1] He was a visiting professor at Georgetown University from 2005 to 2012.[1] He is a contributor to The National Interest.[1][3]

"Presidents Make Decisions Based on Intelligence."

Not the big ones. From George W. Bush trumpeting WMD reports about Iraq to this year's Republican presidential candidates vowing to set policy in Afghanistan based on the dictates of the intelligence community, Americans often get the sense that their leaders' hands are guided abroad by their all-knowing spying apparatus. After all, the United States spends about \$80 billion on intelligence each year, which provides a flood of important guidance every week on matters ranging from hunting terrorists to countering China's growing military capabilities. This analysis informs policymakers' day-to-day decision-making and sometimes gets them to look more closely at problems, such as the rising threat from al Qaeda in the late 1990s, than they otherwise would.¶On major foreign-policy decisions, however, whether going to war or broadly rethinking U.S. strategy in the Arab world (as President Barack Obama is likely doing now), **intelligence is not the decisive factor.** The influences that really matter are the ones that leaders bring with them into office: their own strategic sense, the lessons they have drawn from history or personal experience, the imperatives of domestic politics, and their own neuroses. A memo or briefing emanating from some unfamiliar corner of the bureaucracy hardly stands a chance.¶ Besides, one should never underestimate the influence of conventional wisdom. President Lyndon B. Johnson and his inner circle received the intelligence community's gloomy assessments of South Vietnam's ability to stand on its own feet, as well as comparably pessimistic reports from U.S. military leaders on the likely cost and time commitment of a U.S. military effort there. But they lost out to the domino theory -- the idea that if South Vietnam fell to communism, a succession of other countries in the developing world would as well. President Harry Truman decided to intervene in Korea based on the lessons of the past: the Allies' failure to stand up to the Axis powers before World War II and the West's postwar success in firmly responding to communist aggression in Greece and Berlin. President Richard Nixon's historic opening to China was shaped by his brooding in the political wilderness about great-power strategy and his place in it. The Obama administration's recent drumbeating about Iran is largely a function of domestic politics. Advice from Langley, for better or worse, had little to do with any of this.¶ No, bad leadership did. Intelligence may have figured prominently in Bush's selling of the invasion of Iraq, but it played almost no role in the decision itself. If

the intelligence community's assessments pointed to any course of action, it was avoiding a war, not launching one.

Iraq proves intel doesn't impact policymaking

Pilar 1/3/12 <http://www.foreignpolicy.com/articles/2012/01/03/intelligence> Paul R. Pillar is an academic and 28-year veteran of the Central Intelligence Agency (CIA), serving from 1977 to 2005.[1] He is now a non-resident senior fellow at Georgetown University's Center for Security Studies,[2] as well as a nonresident senior fellow in the Brookings Institution's Center for 21st Century Security and Intelligence.[1] He was a visiting professor at Georgetown University from 2005 to 2012.[1] He is a contributor to The National Interest.[1][3]

When U.S. Secretary of State Colin Powell went before the United Nations in February 2003 to make the case for an invasion of Iraq, he argued, "Saddam Hussein and his regime are concealing their efforts to produce more weapons of mass destruction," an observation he said was "based on solid intelligence." But in a candid interview four months later, Deputy Defense Secretary Paul Wolfowitz acknowledged that weapons of mass destruction were simply "the one issue that everyone could agree on." The intelligence community was raising no alarms about the subject when the Bush administration came into office; indeed, the 2001 edition of the community's comprehensive statement on worldwide threats did not even mention the possibility of Iraqi nuclear weapons or any stockpiles of chemical or biological weapons. The administration did not request the (ultimately flawed) October 2002 intelligence estimate on Iraqi unconventional weapons programs that was central to the official case for invasion -- Democrats in Congress did, and only six senators and a handful of representatives bothered to look at it before voting on the war, according to staff members who kept custody of the copies. Neither Bush nor Condoleezza Rice, then his national security advisor, read the entire estimate at the time, and in any case the public relations rollout of the war was already under way before the document was written.¶ Had Bush read the intelligence community's report, he would have seen his administration's case for invasion stood on its head. The intelligence officials concluded that Saddam was unlikely to use any weapons of mass destruction against the United States or give them to terrorists -- unless the United States invaded Iraq and tried to overthrow his regime. The intelligence community did not believe, as the president claimed, that the Iraqi regime was an ally of al Qaeda, and it correctly foresaw any attempt to establish democracy in a post-Saddam Iraq as a hard, messy slog.¶ In a separate prewar assessment, the intelligence community judged that trying to build a new political system in Iraq would be "long, difficult and probably turbulent," adding that any post-Saddam authority would face a "deeply divided society with a significant chance that domestic groups would engage in violent conflict with each other unless an occupying force prevented them from doing so." Mentions of Iraqis welcoming U.S. soldiers with flowers, or the war paying for itself, were notably absent. Needless to say, none of that made any difference to the White House.

No foreign policy connection to intel

Pilar 1/3/12

<http://www.foreignpolicy.com/articles/2012/01/03/intelligence>

Paul R. Pillar is an academic and 28-year veteran of the Central Intelligence Agency (CIA), serving from 1977 to 2005.[1] He is now a non-resident senior fellow at Georgetown University's Center for Security Studies,[2] as well as a nonresident senior fellow in the Brookings Institution's Center for 21st Century Security and Intelligence.[1] He was a visiting professor at Georgetown University from 2005 to 2012.[1] He is a contributor to The National Interest.[1][3]

"Intelligence Failures Have Screwed Up U.S. Foreign Policy."¶ Hardly. The record of 20th-century U.S. intelligence failures is a familiar one, and mostly indisputable. But whether these failures -- or the successes -- mattered in the big picture is another question.¶ The CIA predicted both the outbreak and the outcome of the 1967 Six-Day War between Israel and neighboring Arab states, a feat impressive enough that it reportedly won intelligence chief Richard Helms a seat at President Johnson's Tuesday lunch table. Still, top-notch intelligence couldn't help Johnson prevent the war, which produced the basic contours of today's intractable Israeli-Palestinian conflict, and U.S. intelligence completely failed to predict Egypt's surprise attack on Israel six years later. Yet Egypt's nasty surprise in 1973 didn't stop Nixon and Secretary of State Henry Kissinger from then achieving a diplomatic triumph, exploiting the conflict to cement relations with Israel while expanding them with Egypt and the other Arab states -- all at the Soviets' expense.¶ U.S. intelligence also famously failed to foresee the 1979 Iranian revolution. But it was policymakers' inattention to Iran and sharp disagreements within President Jimmy Carter's administration, not bad intelligence, that kept the United States from making tough decisions before the shah's regime was at death's door. Even after months of disturbances in Iranian cities, the Carter administration -- preoccupied as it was with the Egypt-Israel peace negotiations and the Sandinistas' revolution in Nicaragua -- still had not convened any high-level policy meetings on Iran. "Our decision-making circuits were heavily overloaded," Zbigniew Brzezinski, Carter's national security advisor, later recalled.¶ Imperfect intelligence analysis about another coming political upheaval -- the collapse of the Soviet Union -- did not matter; the overriding influence on U.S. policy toward the USSR in the 1980s was Ronald Reagan's instincts. From the earliest days of his presidency, the notion that the Soviet Union was doomed to fail -- and soon -- was an article of faith for the 40th president. "The Russians could never win the arms race," he later wrote. "We could outspend them forever."

Aff overestimates predictive capacity

Pilar 1/3/12

<http://www.foreignpolicy.com/articles/2012/01/03/intelligence>

Paul R. Pillar is an academic and 28-year veteran of the Central Intelligence Agency (CIA), serving from 1977 to 2005.[1] He is now a non-resident senior fellow at Georgetown University's Center for Security Studies,[2] as well as a nonresident senior fellow in the Brookings Institution's Center for 21st Century Security and Intelligence.[1] He was a visiting professor at Georgetown University from 2005 to 2012.[1] He is a contributor to The National Interest.[1][3]

"Good Intelligence Can Save Us From Bad Surprises." ¶ We wish. Early last February, barely a week before the Arab Spring ended the three-decade presidency of Egypt's Hosni Mubarak, Sen. Dianne Feinstein, chair of the Senate Intelligence Committee, grilled a CIA official in a Capitol Hill hearing room. "The president, the secretary of state, and the Congress are making policy decisions on Egypt, and those policymakers deserve timely intelligence analysis," Feinstein told Stephanie O'Sullivan, then the CIA's associate deputy director. "I have doubts whether the intelligence community lived up to its obligations in this area." ¶ Feinstein was hardly the only one to criticize U.S. intelligence agencies' inability to predict the speed at which the fire lit by Tunisian fruit vendor Mohamed Bouazizi, who immolated himself on Dec. 17, 2010, would spread throughout the Arab world. But all the bureaucratic overhauls and investigative commissions in the world can't change one incontrovertible fact: Many things we would like our intelligence services to know are too complex to model or predict. What the community should be expected to provide -- and, based on the limited publicly available evidence, apparently did provide -- is a strategic understanding of conditions and attitudes that, given the right spark, could ignite into a full-blown revolution. ¶ The most recent recriminations and inquiries are only the latest in a long line dating back to the 1941 surprise attack on Pearl Harbor. The resources devoted to intelligence have increased substantially over the past seven decades, and intelligence agencies are continually looking for ways to improve how they do their business. But no amount of moving around boxes on a flowchart can eliminate unpleasant surprises, and there will always be new challenges -- especially in an age of endlessly proliferating information. ¶ Intelligence can help manage uncertainty, defining its scope and specifying what is known and what is likely to stay unknown. It can distinguish true uncertainty from simple ignorance by systematically assembling all available information, but it cannot eliminate uncertainty and it cannot prevent all surprises, including some big ones. Leaders must accept this reality; they must expect -- and prepare -- to be surprised. ¶ With due acknowledgment to Donald Rumsfeld, it also means expecting unknown unknowns. Not only will we not know all the right answers -- we will not even be asking all the right questions.

AT Terrorism

NSA doesn't solve terrorism—their statistics are overblown

Cahall et al. 14 (Bailey, David Sterman, Emily Schneider, Peter Bergen, Cahall is a Policy Analyst at New America Foundation. Sterman is a program associate at New America and holds a master's degree from Georgetown's Center for Security Studies. His work focuses on homegrown extremism and the maintenance of New America's datasets on terrorism inside the United States and the relative roles of NSA surveillance and traditional investigative tools in preventing such terrorism, Schneider is a senior program associate for the International Security Program at New America. Her research focuses on the use of drones for military and civilian purposes, comparative cyber security issues, and national security law and policy, Bergen is a print, television and web journalist, documentary producer and the author or editor of five books, three of which were New York Times bestsellers and three of which were named among the best non-fiction books of the year by The Washington Post, 1/13/14, Do NSA's Bulk Surveillance Programs Stop Terrorists?, <https://www.newamerica.org/international-security/don-sas-bulk-surveillance-programs-stop-terrorists/>) DHH

However, our review of the government's claims about the role that NSA "bulk" surveillance of phone and email communications records has had in keeping the United States safe from terrorism shows that these claims are overblown and even misleading. An in-depth analysis of 225 individuals recruited by al-Qaeda or a like-minded group or inspired by al-Qaeda's ideology, and charged in the United States with an act of terrorism since 9/11, demonstrates that traditional investigative methods, such as the use of informants, tips from local communities, and targeted intelligence operations, provided the initial impetus for investigations in the majority of cases, while the contribution of NSA's bulk surveillance programs to these cases was minimal. Indeed, the controversial bulk collection of American telephone metadata, which includes the telephone numbers that originate and receive calls, as well as the time and date of those calls but not their content, under Section 215 of the USA PATRIOT Act, appears to have played an identifiable role in initiating, at most, 1.8 percent of these cases. NSA programs involving the surveillance of non-U.S. persons outside of the United States under Section 702 of the FISA Amendments Act played a role in 4.4 percent of the terrorism cases we examined, and NSA surveillance under an unidentified authority played a role in 1.3 percent of the cases we examined.

No impact to metadata

NSA metadata is not necessary for useful intelligence – Claims that this method has prevented over 50 attacks is discredited and likely false

Rory Carroll 4/22/15 (US West Coast Correspondent for the Guardian in Los Angeles.

<http://www.theguardian.com/us-news/2015/apr/22/mass-surveillance-needed-isis-attack-mike-rogers>)

Mass surveillance should be retained because of the prospect of Islamic State attacks within the United States, a key Republican ally of the National Security Agency has claimed. Mike Rogers, the former chairman of the House intelligence committee, said the NSA needed to preserve its wide powers in case Isis used its bases in Syria and Iraq to unleash atrocities on the US homeland. "Now you have a very real face on what the threat is," Rogers told the Guardian on Tuesday. "Somebody calling back from Syria to Minnesota, either recruiting somebody or giving the operational OK to do something. That's real and it's serious. Before it seemed all hypothetical. Now you can see it." He added: "Think about how many people are in Syria with western passports or even American passports. I want to know if they pick up the phone. If they're calling back to the States, I don't know about you, but I want to know who they're talking to and what they're talking about." Rogers gave the warning as negotiators in the House of Representatives wrangled over a revamp of the USA Freedom Act, a bill that aimed to stop the NSA from its daily collection of US phone records in bulk which failed in the Senate in 2014, and is now returning to Congress. **A coalition of civil**

libertarian groups on the left and right wants a landmark law to reform the intelligence services in the wake of revelations to the Guardian by Edward Snowden, the NSA whistleblower. Part of the Patriot Act known as section 215, which the NSA uses to justify domestic mass surveillance, expires on 1 June. Reformers hope that deadline will give them the leverage to make sure the Freedom Act only reauthorises those provisions on condition of much greater privacy protections. Republicans, however, are signalling possible resistance. Senator Charles Grassley, the powerful chair of the Senate judiciary committee, whose support is crucial, told reporters on Tuesday he had concerns about "finding a balance between national security and privacy" in the bill. The National Journal reported that the Senate majority leader, Mitch McConnell, may try to thwart reformers by introducing a bill that would reauthorise section 215 until 2020. Rogers, speaking in a brief interview after addressing the Rand Corporation thinktank in Los Angeles, sought to persuade Democrats and his fellow Republicans of the need to keep extensive surveillance, and expressed hope that "cooler heads" in Congress will renew section 215 without ceding big concessions to reformers. **Nadia Kayyali, an activist with the digital rights group Electronic Frontier**

Foundation, said reauthorising the provision without comprehensive reform would be against the constitution. "Ending the bulk collection of phone records under section 215 is the first step in reforming the NSA. The time for Congress to take that step is now." She said **NSA defenders would**

falsely claim that it was necessary to keep the mass surveillance. "But the Privacy and Civil Liberties Oversight Board, the President's Review Group, and senators who are familiar with how bulk phone records collection works have all said we don't need the program." **Kayyali accused reform opponents of peddling fear and discredited claims, such as mass**

surveillance having stopped 54 terrorist attacks. "We hope at least Congress has some frank, truthful discussion about NSA spying as we head towards the 1 June deadline." In his address to the Rand Corporation audience Rogers, a former FBI agent, painted a dark picture of terrorists and other enemies exploiting the naivety and complacency of certain Americans – including Barack Obama – who did not grasp the urgency of nurturing and projecting US power. He lamented that the uproar over Snowden's leaks gave the public a "completely wrong" impression about NSA collection of metadata, which he compared to a postman noting an envelope's addressee and sender. "It got so distorted, as if the government was collecting everything and hoarding it in the basement and couldn't wait to find out about Aunt May's bunions. The political narrative got ahead of the facts. It was very frustrating." Rogers, a close ally of John Boehner, the House majority leader, expressed confidence Congress would strike an acceptable balance. "I'm hoping cooler heads will prevail knowing what we have now. I mean, Isis is a mess. And this interconnected world we live in, with these folks having the ability to get back to the United States, is really troubling. We better have some mechanism to protect ourselves and still protect our civil rights."

Drones

Too much money makes CBP violent and corrupt

McMahon 10/31/14 <http://reason.com/blog/2014/10/31/unsafe-at-any-border-us-border-patrol-co>
Lucian McMahon is the fall 2014 Burton C. Gray Memorial Intern at Reason.

Politico Magazine has a lengthy expose by Garrett M. Graff of the financially bloated, systemically corrupt, often violent U.S. Customs and Border Protection (CBP). Earlier manifestations of the CBP, such as the Immigration and Naturalization service, have historically been understaffed, underfunded, and largely ignored. But the post-9/11 hysteria heightened fears about border security, leading to the creation of the CBP under the Department of Homeland Security. It also ensured that the new border protection agency would get a generous share of the national security cash pie. The CBP during the Bush years morphed into a goliath lumbering along America's borders. Tom Ridge, Bush's post-9/11 homeland security czar, recalled that "people just wanted to give me unlimited amounts of money." The agency would eventually grow into "the nation's largest law enforcement agency, with its 46,000 gun-carrying customs officers and border patrol agents and massive \$12.4 billion annual budget". Customs and Border Protection not only employs some 60,000 total personnel—everything from desert agents on horseback to insect inspectors at airports—but also operates a fleet of some 250 planes, helicopters and unmanned aerial vehicles like the Predator drones the military sent to Iraq and Afghanistan, making CBP both the largest law enforcement air force in the world and equivalent roughly to the size of Brazil's entire combat air force. The Border Patrol wing of this vast apparatus has experienced particularly dramatic growth: By the time the Bush administration left Washington, the fiercely independent agency—part police force, part occupying army, part frontier cavalry—had gone from being a comparatively tiny, undermanned backwater of the Justice Department to a 21,000-person arm of the largest federal law enforcement agency in the country. The Bush administration had been keen on increasing the capabilities of the agency as quickly as possible. This urgency came with its own human price tag—one the Obama administration has been unwilling to address: Corruption and excessive force have also skyrocketed along with the massive hiring surge. In fact, between 2005 and 2012, nearly one CBP officer was arrested for misconduct every single day—part of a pattern that Ronald Hosko, former assistant director of the FBI's criminal investigation division, calls "shocking." During Obama's first term, the sheer number of allegations was so glaring that, according to two CBP officials, DHS under Secretary Janet Napolitano ordered Customs and Border Protection to change its definition of corruption to downplay to Congress the breadth of the problem. That redefinition differentiated between two supposedly distinct types of corruption: The agency began to differentiate between "mission-compromising corruption"—bribery, narcotics-smuggling or human-smuggling allegations—and "non-mission-compromising corruption," a "lesser" category of cases that included things like employees' sexually assaulting detainees or workplace theft. Only the "mission-compromising" problems, the agency now decreed, would be reported to Congress...The distinction helped them wipe nearly a third of the corruption cases out of statistics. Graff lists some examples: There was the Miami CBP officer who used his law enforcement status to bypass airport security and personally smuggle cocaine and heroin into Miami. There was the green-uniformed agent in Yuma,

Arizona, who was caught smuggling 700 pounds of marijuana across the border in his green-and-white Border Patrol truck; the brand-new 26-year-old Border Patrol agent who joined a drug-smuggling operation to distribute more than 1,000 kilograms of marijuana in Del Rio, Texas.¶ Not to mention the excessive force complaints, the victims of CBP assault, and those killed by trigger-happy border agents.¶ The expansion of the CBP into one of the most dangerous government agencies in America should be deeply unsettling to everyone—particularly now, when roughly two-thirds of Americans live in a "border" zone where the government claims the right to conduct stops and searches without warrant or cause.

Drones waste money

Winston 1/12/15 <https://www.revealnews.org/article-legacy/scathing-audit-on-border-agency-drones-comes-as-police-interest-rises/> Ali Winston can be reached at awinston@cironline.org. Follow him on Twitter: @awinston.

Funding for drone purchases has come through state and federal homeland security grants, continuing a pattern of military-grade equipment getting into the hands of local law enforcement. The Center for Investigative Reporting first reported on the federal government's role in facilitating the flow of such technology to police departments in 2012.¶ One argument law enforcement agencies have made for using drones is that the unmanned vehicles will improve their operational ability and save money that would instead be spent on costly helicopters. But Customs and Border Protection's experience over the past eight years presents a cautionary tale: The inspector general's audit found that the Predator B flights had minimal impact on migrant apprehensions and drug interdictions. Furthermore, the drones did not respond to ground sensors triggered by passing people or vehicles in heavy crossing areas, and the advanced radar system mounted on the drones was not used efficiently, nor did the border agency have adequate metrics to evaluate the use of such technology.

No internal link - cybersecurity will be a good funding magnet for CBP

Magnuson 12

<http://www.nationaldefensemagazine.org/archive/2012/september/Pages/FirmsThatHelpDHSSaveMoneyWillMakeMoney,AnalystsSay.aspx> STEW MAGNUSON, AWARD-WINNING AUTHOR, JOURNALIST. Welcome to my website! I'm a Washington, D.C.-based writer and the author of several books,

John Hernandez, senior aerospace and defense analyst at Frost & Sullivan, said, "Most talk about sequestration has been about DoD, but DHS is not immune. It's also an election year, which always seems to slow down government spending, and companies are somewhat apprehensive about the future."¶ But there are ongoing initiatives in the information technology realm within the department, insiders said. It's not glamorous, but there will be business opportunities, especially for firms that can show the department how to save money."¶ It's a little bit boring. It's not as cool as drones over the border, but on the flipside ... this is not risky business. We know we can save money. We know we can help," said Paul Christman, president and CEO of Quest Software's public sector subsidiary.¶ The department has embarked on behind-the-scenes projects to put its cybersecurity, interoperability and computing houses in order. Seamlessly integrating its workforce so a Coast Guard officer, for example,

can communicate effortlessly with a CBP agent, and have access to his or her data when needed is one of the goals. It also wants an identity management system in place so these personnel, along with outsiders in the public safety sector, can access public or classified data wherever they are and when they need it — but only if they are authorized.

AT Politics for NSA restrictions

Public hates NSA – the anti-terrorism concern's declined

Drezner 12/16/13 <http://foreignpolicy.com/2013/12/16/tone-deaf-at-the-listening-post/> Daniel W. Drezner is professor of international politics at the Fletcher School of Law and Diplomacy at Tufts University.

It might be an occupational hazard, but NSA officials continue to talk about the threat environment as if they've been frozen in amber since 2002. To them, the world looks increasingly unsafe. Syria is the next Pakistan, China is augmenting its capabilities to launch a financial war on the United States, and the next terrorist attack on American soil is right around the corner. They could very well be correct — except that the American public has become inured to such warnings over the past decade, and their response has been to tell politicians to focus on things at home and leave the rest of the world alone. A strategy of "trust us, the world is an unsafe place" won't resonate now the way it did in the immediate wake of the Sept. 11 attacks.

AT: FBI/CIA Cooperation DA- NU

No Cooperation

The FBI and CIA don't and shouldn't cooperate

Franklin '2, Reporter

Daniel, "Spooks vs. Suits: Why the FBI and CIA don't cooperate, and why they shouldn't.", http://www.slate.com/articles/news_and_politics/the_best_policy/2002/10/spooks_vs_suits.html

After investigating the intelligence snafus that preceded Sept. 11, 2001, the members of Congress' Joint Intelligence Committee are offering some homespun wisdom to the FBI and CIA: Learn to share. ¶ The demand for greater cooperation between spooks and G-men is compellingly simple, but it dangerously misunderstands the lessons of the 9/11 intelligence failures. It's true that the FBI and CIA don't communicate well. It's also true that an intelligence operation that crosses international borders as seamlessly as the terrorists do will be a key to preventing future attacks. But if Congress and the Bush administration are going to create an effective response to al-Qaida, they must realize that the communication breakdowns between the FBI and CIA are not evidence of the agencies falling short of their individual missions. In fact, they show just how successful the two sibling rivals are. ¶ While geography represents an obvious difference between the FBI and the CIA—the Bureau takes the homeland, the Agency the rest—it is far from the most important. The FBI is a law enforcement organization that was designed to track down and arrest the crooks that local cops can't. The CIA is an intelligence agency that was designed to tell policy-makers what's really going on in the world. One measures its accomplishment by successful convictions, the other by successful predictions. Both use intelligence to do their jobs, but catching the kidnapper of the Lindbergh baby and determining whether Gen. Badenov still has influence with Khrushchev are two very different goals. And because the work is so different, the two agencies differ in how they collect, analyze, act upon, and share intelligence. ¶ Take, for instance, a piece of information that was shared but not acted upon. In 1998, congressional investigators discovered, the CIA told the FBI that a group of Arab terrorists was planning to fly a plane filled with explosives into the World Trade Center. The FBI dropped the report in its bombing file and forgot about it. And why shouldn't they have? What investigation would it support? Like most CIA intelligence products, it didn't include the sources or the methods used to acquire the information because that might jeopardize the Agency's ability to continue collecting intelligence. For the FBI, a vague prediction without names, sources, or methods is useless. CIA analysts are trained to paint the big picture. "The FBI," says former CIA analyst Larry Johnson, "wants to know about a target: Who are his immediate associates, who is his family, who does he call, where does he eat? Most of that is never disseminated ... because it would compromise sources." ¶ The FBI complains that intelligence officers are too untrusting, but the Bureau has earned its reputation for burning sources. In 1985, for instance, the FBI rushed to arrest ex-National Security Agency staffer Ronald Pelton, who was suspected of spying for the Soviets. As the investigation began, then-NSA Director Lt. Gen. William Odom gave explicit instructions to watch Pelton until the case against him was rock solid and investigators learned if others were working for the Soviets. Such patience is a classic intelligence investigation technique that the FBI didn't appreciate. Odom was expecting to wait a year or more, but the Bureau arrested Pelton after only a month of surveillance. The only reason the FBI eventually gained enough evidence for a conviction was that Pelton offered to work for the Bureau as a double agent. The FBI thanked Pelton for his confession, and he was sentenced to life in prison. But, Odom says, "There's no reason he couldn't have just walked. Now, if you've had that experience, would you give the FBI any information?" ¶ FBI agents are similarly

skeptical toward the CIA agents who always seem to be getting in the way of their arrests. As Mark Riebling details in *Wedge: The Secret War Between the FBI and CIA*, the CIA in 1979 told the FBI that fugitive financier Robert Vesco had sought sanctuary in the Bahamas, where he gained protection by bribing Bahaman officials. Just before the FBI arrested Vesco, the CIA station chief objected on the grounds that busting Vesco might scuttle the Agency's attempts to work with those same corrupt officials to find a new home for the recently deposed Shah of Iran. While the FBI and CIA were going back and forth, Vesco figured the decidedly un-Rasta-like men following him for FBI agents and fled for communist Nicaragua and eventually Cuba. Seen through each agency's lens of experience, the mistakes leading up to Sept. 11 begin to make slightly more sense. One can perhaps understand why the CIA might have failed to tell the FBI that two suspected al-Qaida operatives who would eventually become hijackers had entered the United States. Why risk the FBI arresting two guys who may eventually lead them to Bin Laden's cave? So, too, can one understand why the FBI failed to give the CIA the names of al-Qaida informants who were helping the investigation of the 1998 Nairobi Embassy bombing. Why risk the prosecution by involving an agency that knows little and cares even less about law enforcement? Had either been more forthcoming, the other might have been able to do more to prevent the attacks. But had either done so, it wouldn't have been doing its job, at least not in a strict sense. That's why the reformers' calls for intelligence-sharing, personnel exchange, and token increases at the Joint Counterterrorism Center at Langley are, in the end, so empty. Ultimately, the people of each agency are going to abide by the goals of the very different organizations for which they work. They have done so for more than 50 years, despite every director of the FBI and CIA's well-meaning promises to improve coordination. And as much as Congress tries, rhetorical whippings or budgetary enticements will not fix what is essentially a problem of structure.

There's structural antagonisms

Graff '12, Editor

Garrett, "FBI-CIA Tensions Linger a Decade After CIA Warned of "Problems",
<http://www.washingtonian.com/blogs/capitalcomment/fbi/fbi-cia-tensions-linger-a-decade-after-cia-warned-of-problems.php>

The French say it like "Plus ça change, plus c'est la même chose." The more things change, the more they stay the same. This week unfortunately has brought a fresh reminder—two, in fact—that the FBI and the CIA continue to struggle to get along, more than a decade after the 9/11 attacks exposed a glaring—and deadly—lack of communication between the two cornerstones of the US national security apparatus. A Washington Post story this week reports that the office of director of national intelligence, a post created after the September 11 attacks, has handed the FBI an "expanded role in coordinating the domestic intelligence-gathering activities of the CIA." Coincidentally, the National Security Archive at George Washington University released a trove of decade-old CIA documents dealing with the hunt for Osama bin Laden. While much of the media's attention today has focused on the Counterterrorism Center's budget woes before 9/11, one of the most striking documents is the CIA's inspection report of its Counterterrorism Center from the summer of 2001 (PDF). Conducted while, unbeknownst to the agency, Mohamed Atta and the 9/11 hijackers were finalizing their plans to attack Washington and New York, the CIA inspector general's routine investigation discussed the overall effectiveness of CTC. After generally giving the center good marks—despite its budget and staffing shortfalls—deep into the report, the IG raises the agency's working relationship with the FBI, listed on an earlier page as one of its key

relationships. “CTC described cooperative relations with the FBI,” the report said. “The growth in joint activities and cross assignments suggests that the relationship is now more institutionalized and less personality dependent.” Yet, the report continues, “concerns still remain in both organizations about access to the counterpart’s mission critical information.” Indeed, the most glaring example of the two agencies’ breakdown in communication was even at that point unknown: At a June 2001 meeting, CIA agents had lied to FBI agents regarding their knowledge of the whereabouts of two of the men who were to become 9/11 hijackers, Khalid al-Mihdhar and Nawaf al-Hazmi. That breakdown—one of the best chances, if not the only one, that the US government had to stop or interdict the 9/11 plot—was a point of much teeth-gnashing afterwards. Along with all too many other examples, it catalyzed years of close coordination between the FBI and the CIA at the upper levels and more cross assignments between the two. Afterward, then-CIA director George Tenet and FBI director Robert Mueller made very public efforts to show how they were on the same team. Much has changed since 2001. It’s clear to most observers that the FBI and the CIA do have the best working relationship the two agencies ever have had. Since 9/11, more and more FBI agents and CIA officers have been detailed to the other agency; there’s more information sharing and more overall cooperation. CIA and FBI personnel work together on more task forces and share more information than ever before, according to dozens of interviews I’ve done over the past four years. And yet tensions and rivalries persist. Some of the tensions between the agencies is inherent—the two have different territories and different approaches. The FBI is supposed to be a domestic law enforcement agency, focused on federal criminal infractions leading to prosecutable court cases. The CIA is an international intelligence agency, focused on gathering actionable information to guide political and military decision-making. There’s a lingering unease both at Langley and at the Hoover Building that the other’s standards just aren’t good enough. FBI agents think the CIA isn’t discerning enough in its information gathering, too willing to accept assumptions and “what’s likely true.” And CIA officers, likewise, think FBI agents are too focused on “guilty beyond a reasonable doubt.” Plus there’s the big one: The FBI is supposed to be domestic, the CIA international. The reality, again, is much more clouded than that. The FBI has hundreds of agents posted in some 70 countries overseas in varying levels of operational capability. Likewise, the CIA has a broad domestic network, focused on helping the agency gather information overseas. As the Post explains, “The National Resources Division, as this group is known, routinely debriefs executives, university officials, and other Americans who volunteer to share information gathered on their trips out of the country. The CIA is also allowed to approach foreign nationals in the United States and try to recruit them as spies upon their return to their home countries.” Those overlapping responsibilities helped lead to the ODNI’s new directive. This week’s Post article includes an example of how the new ODNI is already stirring up trouble: “One former US official said senior FBI agents recently used a meeting with executives from major manufacturing companies on the West Coast to instruct them to cut off contact with the CIA. The FBI’s message was that ‘they were now in charge of relationships with the corporate sector, so the folks there should feel no need to deal with the agency,’ said the former official, who spoke on the condition of anonymity because of the sensitivity of the topic. The FBI agents apparently were not aware that a former CIA officer was among the executives in attendance.” On page 47, the 2001 report says, “Problems persist and probably will never be fully overcome. A natural tension exists between the two organizations, deriving from their different missions, which can be negotiated but never eliminated.” Sadly, more than a decade of history has proven that observation all too applicable.

Cooperation's impossible

Shane 3-26-15, Journalist specializing in intelligence

Scott, "C.I.A. Officers and F.B.I. Agents, Meet Your New Partner: The Analyst",
http://www.nytimes.com/2015/03/27/us/cia-officers-and-fbi-agents-meet-your-new-partner-the-analyst.html?_r=0

Call it the revenge of the nerds, Washington-style. The gun-toting F.B.I. agent and the swashbuckling C.I.A. undercover officer are being increasingly called upon to share their clout, their budgets and even their Hollywood glamour with the humble, deskbound intelligence analyst. As the two agencies confront an evolving terrorist threat, cyberattacks and other challenges, both are reorganizing in ways intended to empower analysts. That involves the delicate job of meshing the very different cultures of the streetwise agent and the brainy analyst, who reads secret dispatches, pores over intercepted communications, absorbs news media accounts and digests it all. The biggest challenge remains at the F.B.I., a traditional law enforcement organization that has struggled since the 2001 terrorist attacks to remake itself as an intelligence agency that can prevent attacks and not just investigate crimes. A report on the F.B.I.'s progress, released on Wednesday, concluded that despite great strides, the bureau needs to step up the role of analysts and the respect and resources they get. While bureau officials have long extolled the importance of intelligence analysts, the report, by the F.B.I. 9/11 Review Commission, found that the bureau "still does not sufficiently recognize them as a professionalized work force with distinct requirements for investment in training and education." The F.B.I. director, James B. Comey, acknowledged the problem and said that empowering analysts was one of his main goals. At the C.I.A., where analysts have had a central role since its founding, they long worked largely apart from the "operators," who work in the field overseas recruiting agents. This month, John O. Brennan, the C.I.A. director, announced that analysts and operators would be combined in 10 new "mission centers," following the model of the agency's Counterterrorism Center. That may give the analysts greater day-to-day influence on operations. The latest moves continue the steady enhancement of the role of intelligence analysts. Even popular culture has caught on, with analysts becoming the stars of recent movies and television shows. In "Zero Dark Thirty," the 2012 movie account of the hunt for Osama bin Laden, the central character is a C.I.A. analyst called Maya, played by Jessica Chastain. Addressing the beefy, heavily armed members of the Navy SEALs who are about to fly into Pakistan, the petite Maya is no wallflower. "Bin Laden is there," she confidently tells the SEALs. "And you're going to kill him for me." The failure to prevent the Sept. 11 attacks and the subsequent focus on terrorist threats have helped drive the new stature of analysts. The National Counterterrorism Center — not to be confused with the C.I.A.'s Counterterrorism Center — was created after Sept. 11 as an analytical hub to make sure that every scrap of threat information was combined with other data to detect plots. Another factor is the explosion of data in an era of smartphones and the Internet, as the National Security Agency documents leaked by Edward J. Snowden have underscored. While the N.S.A. has always been a data-driven operation, other agencies now need their own skilled people to make sense of the flood of information, or it will overwhelm them. "These days when you have an intelligence lapse, it's usually because the crucial information is lost in an avalanche of data," said John E. McLaughlin, a former deputy director and acting director of the C.I.A. He said that while analysts had always been valued at the agency, they were long segregated in the Directorate of Intelligence, separate from the Directorate of Operations, which did the spying. For many years, a turnstile and a security checkpoint at the C.I.A.'s headquarters in Langley, Va., separated the analysts from the operations officers, he said. A career

analyst himself, Mr. McLaughlin said that some operations veterans “may feel angst” about the reorganization that will group them with analysts, but that it made sense. “The role of the analyst who puts all the pieces together has become more critical, because there are just more pieces,” he said.¶ After Sept. 11, the C.I.A. lent the F.B.I. some 40 analysts to try to jump-start the bureau’s reorientation, Mr. McLaughlin said. Before 2001, according to the national 9/11 commission, 66 percent of F.B.I. analysts were “not qualified to perform analytical duties.” Secretaries were sometimes rewarded with a promotion to analyst, with duties that included emptying the trash.¶ Proud special agents did not always see the value of analysts who did not necessarily build criminal cases — the traditional measure of success at the F.B.I. “At the end of my career, there was low-level tension between the agents and the analysts,” said Jack Cloonan, an F.B.I. agent from 1976 to 2002. “Who was running the case?”¶ Mr. Cloonan said the analysts did not always share the “camaraderie and esprit de corps” that agents had with one another. “Street agents are street agents,” he said, adding that he still heard grumbling from former bureau colleagues about some analysts who earn more than they do.¶ Philip Mudd, a career C.I.A. analyst who moved to a top counterterrorism job at the F.B.I. in 2005, said the difference in cultures was striking, and predictable. He recalled the case of David C. Headley, an American affiliated with Lashkar-e-Taiba, a Pakistani extremist group, who admitted to scouting targets for the 2008 terrorist attacks in Mumbai, India. Mr. Headley was arrested, prosecuted and sentenced to 35 years. The more difficult and novel task that the F.B.I. faced, and one for which analysts were critical, was determining whether Lashkar-e-Taiba had other operatives in the United States.¶ “It’s exploring the world of the unknown,” Mr. Mudd said.¶ By empowering analysts, “You’re telling agents, ‘You’re going to have to give up some turf,’ ” he said. “Someone’s going to say, ‘O.K., how many child molesters do you want me not to prosecute so you can do your analysis?’ ”¶ Mr. Comey, the F.B.I. director, has used the analogy of an arranged marriage to describe the relationship between agents and analysts, who have often been quickly paired together, with little say in the matter. Sometimes arranged marriages end up with the couple living happily ever after. Other times, they end up sleeping in different beds.¶ Mr. Comey is trying to get agents and analysts to “date” at the F.B.I. Academy, where they are now required to train and practice working together. Mr. Comey has said his hope is for a career intelligence analyst to rise to the F.B.I.’s most senior ranks before he retires.¶ Some people who study intelligence and counterterrorism are concerned that the pendulum could swing too far. Intelligence analysts, said Amy Zegart, a Stanford scholar who studies intelligence, could become too consumed by daily operations and neglect strategic thinking about threats that could be years away.¶ At the C.I.A., she said, counterterrorism analysts are already “too tactical,” focused on the next drone target. If the same model is applied to the rest of the agency’s work, other analysts, too, could be caught up in short-term demands, she said. “Who in the U.S. government,” she asked, “is going to be thinking about longer-term threats?”

No Prolif

No risk of prolif- the spread is slow and there's no motive or resources for it

Keck '13, Associate Editor of The Diplomat

Zachary, "Why Nuclear Weapons Don't Spread (Quickly)", <http://thediplomat.com/2013/12/why-nuclear-weapons-dont-spread-quickly/>

Over at Foreign Policy, David Kenner has an interesting piece on how President Barack Obama's views on nuclear weapons are shaping his approach to the Middle East (Kenner also includes other so-called weapons of mass destruction, although nuclear weapons are the primary focus). Kenner's main thesis is that "non-proliferation has emerged as the centerpiece of Obama's agenda in the Middle East." He cites a number of examples to support this argument, from Syria's chemical weapons stockpiles to Iran's nuclear program. The piece is well worth the read, although I'm not sure I agree with the central premise. Additionally, while Kenner attributes America's focus on WMD issues in the Middle East to Obama's personal interest and passion for these subjects, I would argue it has more to do with external events like the advanced stage of Iran's nuclear program and the Syrian civil war. Regardless, I was more drawn to a comment that James Cartwright, Obama and (presumably) David Sanger's favorite general, makes in the article. As summarized by Kenner, Cartwright believes "Obama has also come to grips with the fact that the proliferation of knowledge about nuclear technology has permanently altered America's options in combatting the spread of these weapons. Since you can't bomb knowledge, he says, military force can only delay, not stop, proliferation risks." Or, in Cartwright's own words: "[If] a country wants these weapons, they can get them ... So you have to start to think of alternatives to the threats of: 'I'm going to attack you.'" Cartwright is hardly alone in holding these views. Indeed, the general consensus when it comes to nuclear weapons has long been "when there's a will there's a way." And yet, the spread of nuclear weapons has always been surprisingly slow. Moreover, despite the diffusion of nuclear technology, nuclear weapons have actually been spreading much more slowly than they did during the first few decades of the nuclear era. Consider that, in the three decades following the atomic bombings of Hiroshima and Nagasaki, no less than seven countries developed at least a nascent nuclear weapon capability. In the nearly four decades since, only three countries — Pakistan, South Africa, and North Korea — have developed a nuclear weapons capability, and one of these states — South Africa — voluntarily dismantled its arsenal. So what explains this great nuclear slowdown? Two converging trends seem to be at work. First, there has been an undeniable decline in the number of states interested in acquiring nuclear weapons. Harald Muller and Andreas Schmidt have documented this well. In their comprehensive study of states with nuclear weapons activities between 1945 and 2005, they find that "states with nuclear weapons activities were always a minority, and today they are the smallest minority since 1945." Specifically, in 2005 they identified 10 states as having nuclear weapons activities (including those with nuclear weapons), which constituted less than six percent of UN members. Today the only non-nuclear weapon state (NNWS) that might be interested in an atomic weapon is Iran. The fact that states have by and large been uninterested in nuclear weapons is somewhat perplexing from a historic perspective. After all, what other revolutionary military technology hasn't elicited strong interest from most states competing in the international system? At the same time, when one examines the properties of nuclear weapons more closely, the lack of interest is easier to understand. Nuclear weapons have basically served one purpose for states possessing them; namely, they have deterred others from challenging that state's survival and other fundamental interests. But

the nuclear era has also been characterized by a sharp decline in warfare and today fewer states face fundamental external threats to their existence. Given the high costs of building and maintaining a nuclear arsenal, it makes little sense to acquire nuclear weapons without such an existential threat.¶ While lack of interest explains why some states have renounced nuclear weapons despite possessing the capability to build them, the difficulty in building them has prevented others states that seek nuclear weapons from acquiring them. Despite the view that “where there is a will there’s a way,” and a strong sense that globalization has exacerbated this, the historical record tells a very different story.¶ As Jacques Hymans has pointed out, before 1970 seven countries launched dedicated nuclear weapon programs and all seven succeeded in an average of seven years. Since 1970, ten states have launched dedicated nuclear weapons programs and only three have succeeded (the jury’s still out on Iran). These three have taken an average of 17 years to succeed and Iran under the Islamic Republic has been working towards a nuclear weapon capability for some three decades.¶ Just as pundits have routinely underestimated the difficulty of building nuclear weapons, so too do they grossly overstate the number of states who are technically capable of building them. Both journalists and scholars regularly cite 40 as the number of non-nuclear weapon states who are technically capable of building them. This figure is often attributed to the former head of the International Atomic Energy Agency (IAEA), Mohamed ElBaradei, who said in 2004:¶ “Some estimates indicate that 40 countries or more now have the know-how to produce nuclear weapons, which means if they have the required fissile material — high enriched uranium or plutonium — we are relying primarily on the continued good intentions of these countries.”¶ As Scott Sagan has pointed out, most of those citing ElBaradei omit the latter part of his statement about having the required fissile material. But this statement is crucial as only a handful of NNWS are capable of producing or otherwise procuring fissile material, which is necessary for a nuclear bomb.¶ Moreover, thanks in no small part to President Obama’s focus on nuclear security, the global availability of fissile material has been declining as the U.S. and its allies help remove fissile material from some states while downsizing the stockpiles in many others. Furthermore, compared with the Cold War era and even the 1990s, nuclear weapon holding and nuclear capable states are much less willing to sell NNWS crucial dual use technology that can be used to indigenously produce fissile material.¶ Thus, contrary to common perception, there is no impending nuclear domino about to fall.

Doesn't Solve Terror

FBI can't support intelligence- culture

Nectaria Krokidis **Gelardi 15**, former CIA analyst and currently a Senior Intelligence Analyst at a New York area Police Department and also an adjunct instructor in the Homeland and Corporate Security Program at St. John's University, Special Agent v. Analyst: Clashing Cultures At the FBI, 4/1/15, <http://www.overtaction.org/2015/04/special-agent-v-analyst-clashing-cultures-at-the-fbi/>

The Federal Bureau of Investigation's 9/11 Review Commission released a tough report last month, indicating that even a decade and a half after 9/11, the Bureau still has difficulty transitioning from a law-enforcement agency to an integrated intelligence-focused one. While giving credit for making institutional changes over the last decade, the report noted the gulf between Special Agents and analysts remains wide, noting, "This imbalance needs urgently to be addressed to meet growing and increasingly complex national security threats, from adaptive and increasingly tech-savvy terrorists, more brazen computer hackers and more technically capable, global cyber syndicates." For over a hundred years, the FBI worked like this: a crime is committed, agents investigate the case, and the case is closed, hopefully, with an arrest. "Job well done," a supervisor might say, slapping his Special Agent on the back, "...now on to the next case." But after 9/11, the FBI was told to incorporate intelligence into their law enforcement world so the organization could better prevent another attack on the homeland. The FBI's Directorate of Intelligence was established in 2005, and after a decade, there remains ample room for major improvement. The FBI's report criticized the Bureau's lack of progress on this front, noting it "has made progress in building the framework to support its intelligence function but continues to lag in capability." In addition to budgetary concerns, a cause behind the slow progress of the FBI's analytic shop is that most law enforcement agencies — the FBI especially — are resistant to change, particularly systemic cultural change. And this is a major cultural shift.

Fundamental distinction in disciplines

Nectaria Krokidis **Gelardi 15**, former CIA analyst and currently a Senior Intelligence Analyst at a New York area Police Department and also an adjunct instructor in the Homeland and Corporate Security Program at St. John's University, Special Agent v. Analyst: Clashing Cultures At the FBI, 4/1/15, <http://www.overtaction.org/2015/04/special-agent-v-analyst-clashing-cultures-at-the-fbi/>

The core problem is that analysis and law enforcement are fundamentally different disciplines. The root cause may be generally explained as a conflict of the strategic objective of the analyst versus the tactical objective of the law enforcement official. Yes, there are some similarities between intelligence and law enforcement; for example, handling human assets is basically the same as running confidential informants for information gathering. However, there are deep conceptual differences. Intelligence is typically part of a cycle while law enforcement is traditionally linear. Generally, an analyst's main objective is to provide warning and strategic insights, which is essentially a proactive effort, while an agent's job is reactive by nature. Agents are considered successful based on the number of cases they close while measuring analytic "success" can be far murkier and more complex. Sometimes there is follow up in a criminal investigation, while sometimes there is not. Continuous examination and assessment of information is the basis of intelligence analysis while information in law enforcement is not always shared, and sometimes the choice to share relies on trust, not institutional mandates. Even the CIA, the nation's premier intelligence agency, continues to struggle with similar issues of distrust. At

its conception, critics opposed to a civilian intelligence agency argued it would be too academic. For decades, CIA analysts and case officers have struggled to communicate with each other, which has been one of the drivers that has led to establishing fusion centers to better foster information sharing. Recently, CIA Director – and former analyst – John Brennan announced the Agency is moving towards further integrating operational, analytic, and other agency elements by establishing ‘mission centers’ in an effort to better confront the threats of the 21st century.

Doesn't solve- not integrated

DEVLIN **BARRETT 15**, reporter for the Wall Street Journal, Panel Urges FBI to Expand Intelligence Work, Global Footprint, 3/25/15, <http://www.wsj.com/articles/panel-urges-fbi-to-expand-intelligence-work-global-footprint-1427294845>

The commissioners—Mr. Roemer, who also served on the earlier 9/11 commission, former U.S. Attorney General Ed Meese and Georgetown University professor Bruce Hoffman, who studies terrorism—said the FBI needs to focus on areas including criminal investigation, counterintelligence, intelligence collection and analysis, and technological know-how. After the 2001 attacks, one of the chief findings of the 9/11 commission was that the FBI and other organizations such as the Central Intelligence Agency didn't sufficiently share information that could have uncovered the plot and prevented the attack. As a result, sweeping changes were made inside government agencies, but Wednesday's report found that the FBI still "is not sufficiently integrated" into the network of U.S. intelligence bodies. The commission urged a greater emphasis on the development of intelligence analysts within the bureau and of stronger relationships with other intelligence agencies. The commission also found that the U.S. government's broader mission to counter radicalization at home can't be addressed solely by the FBI as a law-enforcement body. The panel recommended that social-outreach efforts to prevent violent extremism should be transferred from the FBI to the Department of Homeland Security.

AT: Drone DA- NU

Nonunique- No Drones Now

Drone momentum is already dead – FAA regulations

Donfro 1-15 [writer for business insider “The FAA's New Drone Proposal Would Be Bad News For Amazon And Google” <http://www.businessinsider.com/faa-new-drone-rules-2014-11>]

At the same time, some companies are grumbling that the playing field is being gamed by the powerful. And that even when federal regulators allow more drone flights, the restrictions will be so onerous that it could cripple innovation. “They are frozen. They are in analysis paralysis. And in the meantime, it's easier to say no,” Dan Ganousis, CEO of Iron Ridge UAS in Longmont, said of federal regulators. Much of the blame, he added, lies not with the technology — which is largely there — but with the slow pace of the Federal Aviation Administration and its effort to draw up rules for the drone business that balances innovation with privacy and safety concerns.

No Solve Terror

Drones don't solve terror

Dilanian 15 [July 3, 2015 AP Intelligence Writer<http://www.vnews.com/news/nation/world/17592169-95/us-counterterrorism-policy-faces-mounting-skepticism> "U.S. Counterterrorism Policy Faces Mounting Skepticism"] (Vaibhav)

Administration officials had once signaled they would cut back on signature strikes, which pose a higher risk of killing the wrong people, including civilians. But the evacuation of the embassy in Yemen and the CIA's absence in Syria mean such strikes will be more common, the U.S. officials said. **Even when they succeed, they are insufficient, experts say. Drone strikes "do not defeat terrorist organizations,"** said Seth Jones, a **counterterrorism analyst at the Rand Corp.** think tank.

No Link

Drones are effective counter terrorism- the aff doesn't trade off with that

Dilanian 15 [July 3, 2015 AP Intelligence Writer<http://www.vnews.com/news/nation/world/17592169-95/us-counterterrorism-policy-faces-mounting-skepticism> "U.S. Counterterrorism Policy Faces Mounting Skepticism"] (Vaibhav)

Drone strikes have clearly made it harder for terrorists to plan complex attacks, he said. While the strikes create international backlash, he added, **there is no evidence they are a driving force in the growth of terror networks**. A task force at the Henry L. Stimson Center took a different view in April, raising questions about the long-term effects of killing terrorists with drones.

Link Turn

Drones create more terrorism because of revenge

Abbas 13 [Hassan Abbas is a senior advisor at Asia Society and the author of the forthcoming book *The Taliban Revival*. August 6, 2013

<http://www.theatlantic.com/international/archive/2013/08/how-drones-create-more-terrorists/278743/> "**How Drones Create More Terrorists**" (Vaibhav)

Drone strikes may create more jihadi militants. (Ibraheem Abu Mustafa/Reuters) Recently, **strong evidence has begun to suggest that terrorists use drone strikes as a recruitment tool.** Of course, the value of drones in the arena of intelligence-gathering and secret surveillance of foes (and even friends) is unmistakable. In warzones too, it can support ground operations in significant and even decisive ways. None of this is controversial, though the ones on the receiving end will certainly not like it. What is debatable is its use as a counter-terrorism instrument in theaters that are not declared war zones, or in cases where a sovereign state is not fully and publicly on board with this policy. Lack of transparency in regulations that govern this new type of warfare, the unverifiable nature of targets, and questions over the credibility of intelligence only complicates the matter. Mark Bowden's important contribution to the drone debate raises critical questions that policy makers will be wise to consider for the future use of this new tool of war. One of the important arguments mentioned in the piece revolves around the notion that drone strikes might be less provocative than ground assaults for terrorists, meaning that standard warfare might create more terrorists than drones do. Let's first accept what is obvious: more civilians are killed in standard warfare, and the history of warfare in the 20th century sufficiently proves the point. When it comes to drone strikes, the ratio of civilian deaths is certainly lower, but the issue is not about the number of civilian casualties alone. **The inherently secret nature of the weapon creates a persistent feeling of fear in the areas where drones hover in the sky, and the hopelessness of communities that are on the receiving end of strikes causes severe backlash -- both in terms of anti-U.S. opinion and violence.** Response to drone strikes comes in many varieties. **First, revenge is targeted at those within the easy range of the insurgents and militants.** The victims of those revenge terrorist attacks also consider the drone strikes responsible for all the mayhem. **Consequently, terrorists and ordinary people are drawn closer to each other out of sympathy, whereas a critical function of any successful counter-terrorism policy is to win over public confidence so that they join in the campaign against the perpetrators of terror. Poor public awareness -- which is often a function of inadequate education -- about terrorist organizations indeed plays a role in building this perspective. Public outrage against drone strikes circuitously empowers terrorists.** It allows them space to survive, move around, and maneuver. Pakistan is a perfect example of this phenomenon. **Many in Pakistan now believe that drone strikes tend to motivate Al Qaeda and the Pakistani Taliban to conduct terrorist attacks that target Pakistan's security forces as well as civilians.** The duplicity of Pakistan's political and military elite in giving a green light to the U.S. drone policy proved to be counterproductive. The sponsors and supporters of drone strikes in U.S. policy circles apparently ignored the wider socio-political impact and indirect costs when evaluating its efficacy.

Drones cause terrorism by implementing the mentality of revenge

Mothana 12 [Ibrahim Mothana, a writer and activist, is a co-founder of the Watan Party June 13, 2012

<http://www.nytimes.com/2012/06/14/opinion/how-drones-help-al-qaeda.html> "How drones help Al-Qaeda" (Vaibhav)

"DEAR OBAMA, when a U.S. drone missile kills a child in Yemen, the father will go to war with you, guaranteed. Nothing to do with Al Qaeda." a Yemeni lawyer warned on Twitter last month. **President Obama should keep this message in mind before ordering more drone strikes** like Wednesday's, which local officials say **killed 27 people, or the May 15 strike that killed at least eight Yemeni civilians. Drone strikes are causing more and more Yemenis to hate America and join radical militants; they are not driven by ideology but rather by a sense of revenge and despair.** Robert Grenier, the former head of the C.I.A.'s counterterrorism center, has warned that the American drone program in Yemen risks turning the country into a safe haven for Al Qaeda like the tribal areas of Pakistan — "the Arabian equivalent of Waziristan." **Anti-Americanism is far less prevalent in Yemen than in Pakistan. But rather than winning the hearts and minds of Yemeni civilians, America is alienating them by killing their relatives and friends.** Indeed, the drone program is leading to the Talibanization of vast tribal areas and the

radicalization of people who could otherwise be America's allies in the fight against terrorism in Yemen.

The first known drone strike in Yemen to be authorized by Mr. Obama, in late 2009, left 14 women and 21 children dead in the southern town of al-Majala, according to a parliamentary report. Only one of the dozens killed was identified as having strong Qaeda connections.

Impact Inevitable

Only takes one accident to wreck confidence

Cathain 14 [writer for the guardian "Just one 'disastrous accident' could set drone industry back, warn Lords" <http://www.theguardian.com/technology/2015/mar/05/just-one-disastrous-accident-could-set-drone-industry-back-warn-lords>]

The drone industry could create 150,000 jobs across the European Union by 2050, **but it would take "just one disastrous accident" to destroy public confidence and set the sector back, a group of peers has warned**. A report from the Lords EU select committee has concluded that there is huge potential for growth in the sector, but that this potential can only be realised if the safety of drone operations is demonstrated to the public. **The report comes after a near miss between a passenger jet and a civilian drone near Heathrow airport in December sparked debate about how best to regulate the consumer drones market.** Mark Stevens predicts the days of people being able to do a short course, buy an inexpensive drone, then start charging \$100 to \$600 an hour to shoot stills or videos of landscapes, buildings and events may soon be coming to an end. "It's inevitable that UAVs [unmanned aerial vehicles] will become commoditised," he says. "In the market serviced by small UAVs, most of the work is small-scale engagements that can be measured in hours; it's aerial filming for real estate, weddings, sports events, maintenance inspections and local surveying and it's ripe for integration. This is an immature industry where low barriers to entry have led to lots of drone operators entering the market. Inevitably, there will be a consolidation process with a handful of larger companies emerging." Nick Smith: specialisation is a smart move. Nick Smith: specialisation is a smart move. Stevens is not a disinterested observer. In 2009, betting that drones were going to take off and that most businesses would want to outsource their drone work, the former Australian Army officer launched UAVs Australia with his son, Aonghus. Last year, he joined forces with the US-based, globe-spanning, drone-sourced data company Measure in a joint venture called Measure Australia. "Certainly, Measure Australia plans to benefit from the consolidation of the local industry when it comes," he says. "We're expecting the industry to experience strong growth over the next decade, especially as the technological advances made in military drones cross over into non-military drones. This is an industry that the Association for Unmanned Vehicle Systems International estimates will be worth US\$82 billion (\$104 billion) and employing 100,000 people globally by 2025. "And as the market evolves, we expect operators will be required to meet higher standards in terms of certification, insurance, experience and risk management, something that will benefit larger businesses."

AT: Terror DA- NU

Uniqueness

CT Fails

Counter terrorism is ineffective now- their evidence is hype

Brooks 15 [June 24, 2015 Rosa Brooks is a law professor at Georgetown University and a Schwartz senior fellow at the New America Foundation. She served as a counselor to the U.S. defense undersecretary for policy from 2009 to 2011 and previously served as a senior advisor at the U.S. State Department. <http://foreignpolicy.com/2015/06/24/u-s-counterterrorism-strategy-is-the-definition-of-insanity/> "U.S. Counterterrorism Strategy Is the Definition of Insanity"] (Vaibhav)

Loyalty to your employer is a fine thing, especially in a press spokesman, but outside the ranks of officials in President Barack Obama's administration, experts are far more dubious about the heavy U.S. reliance on air power and targeted strikes. "The tactical, whack-a-mole approach is not having the desired effect," my Foreign Policy colleague Michah Zenko told the New York Times. "Not having the desired effect" was a polite circumlocution: As Zenko recently noted for FP, State Department figures show a substantial recent uptick in global terrorism. In 2014, terrorist attacks increased 39 percent over the previous year, while the number of fatalities caused by terrorist attacks went up 83 percent. In Yemen, which the administration inexplicably continues to tout as a counterterrorism "success," U.S. policy in in shambles. "If you're looking for logic here, you're not going to find much," Stephen Seche, a former U.S. ambassador to Yemen, told the New York Times. In mid-June, the Washington Post reported that "[al]-Qaeda affiliates are significantly expanding their footholds" in both Yemen and Syria. And the Islamic State also continues to gain ground in both countries. Meanwhile, in Libya, it's "utter chaos," former U.N. advisor Dirk Vandewalle told the Times: The Islamic State and al Qaeda-linked groups are vying for power, and a recent U.S. drone strike against al Qaeda operative Mokhtar Belmokhtar "shows that we're still relying on ad hoc measures." In Iraq, Somalia, and Afghanistan, it's the same story. The United States continues to rely heavily on airstrikes and targeted killings, while terrorist groups continue to cause mayhem and gain adherents. Even some of those who do get paid by Uncle Sam have grown more openly skeptical of U.S. counterterrorism policy. Capt. Robert Newson, a Navy SEAL who served as director of the Joint Interagency Task Force-Counter Terrorism, told an interviewer at West Point's Combating Terrorism Center that "drone strikes, manned airstrikes, and special operations raids ... buy space and time. But by themselves they are only a delaying action, and everywhere I have been, in Iraq, Afghanistan, Yemen, every military person up and down the chain of command acknowledges this. This 'CT concept' — the solution that some people champion where the main or whole effort is drone strikes and special operations raids — is a fantasy." Like Newson, I haven't encountered many defenders of U.S. counterterrorism strikes. Last year, I co-chaired a Stimson Center commission on U.S. drone policy with retired Gen. John Abizaid. The commission, which included former senior military and intelligence officials from both Obama's and George W. Bush's administrations, concluded in June 2014 that "the Obama administration's heavy reliance on targeted killings as a pillar of US counterterrorism strategy rests on questionable assumptions, and risks increasing instability and escalating conflicts. While tactical strikes may have helped keep the homeland free of major terrorist attacks, existing evidence indicates that both Sunni and Shia Islamic extremist groups have grown in scope, lethality and influence in the broader area of operations in the Middle East, Africa and South Asia." In dozens of interviews and conversations with national security experts since June 2014, I have yet to find anyone who won't admit, off the record, that U.S. counterterrorism policy is flailing badly.

AT: Data Link

Mathematic Analysis proves- Data collection is widely ineffective at stopping terrorism.

Leonard 14 (<http://www.computing.co.uk/ctg/news/2355787/nsa-data-collection-ineffective-against-terrorism-and-dangerous-for-democracy-say-mathematicians>, John Leonard is responsible for the setting up and running qualitative and quantitative surveys for Computing Research's clients in order to assess the opinions and experiences of IT professionals on issues important to the industry, such as cloud computing, bring-your-own-device (BYOD) and the IT decision making process as a whole.)

Two American **mathematicians have spoken** of their concern that the **mass data collection** undertaken by the NSA with the aim of 'preventing terrorism' **is both ineffective in achieving the stated goal and dangerous for democracy.** Writing in **Notices of the AMS June/July 2014** (PDF), **Keith Devlin**, a mathematician at Stanford University who **spent five years researching** the area of extracting actionable information from vast amounts of **data' funded by the US** Department of Defense, claimed that mass data collection is an ineffective way of preventing terrorism, and that resources would be **better deployed elsewhere.** "I concentrate on whether indiscriminate 'vacuuming up' of personal information that, according to the documents Edward Snowden has released, the NSA has routinely engaged in for several years, can effectively predict terrorist attacks," Devlin writes. "I'll say up front that, **based on everything I learned in those five years, blanket surveillance is highly unlikely to prevent a terrorist attack** and is a dangerous misuse of resources that, if used in other ways, possibly could prevent attacks such as the 2013 Boston Marathon bombing. **Anyone with a reasonable sense of large numbers could surmise a similar conclusion.** When the goal is to identify a very small number of key signals in a large ocean of noise, indiscriminately increasing the size of the ocean is self-evidently not the way to go."¶

It is statistically impossible for Surveillance to be an effective tool for catching terrorists

Corrigan 15

[Ray Corrigan is a senior lecturer in mathematics, computing, and technology at the Open University, U.K. http://www.slate.com/articles/health_and_science/new_scientist/2015/01/mass_surveillance_against_terrorism_gathering_intelligence_on_all_is_statistically.html]

It is statistically impossible for total population surveillance to be an effective tool for catching terrorists.¶ **Even if your magic terrorist-catching machine has a false positive rate of 1 in 1,000—and no security technology comes anywhere near this—every time you asked it for suspects in the U.K. it would flag 60,000 innocent people.** Law enforcement and security services need to be able to move with the times, using modern digital technologies intelligently and through targeted data preservation—not a mass surveillance regime—to engage in court-supervised technological surveillance of individuals whom they have reasonable cause to suspect. That is not, however, the same as building an infrastructure of mass surveillance. **Mass surveillance makes the job of the security services more difficult and the rest of us less secure.**

Turn- there is bulk data failure preventing surveillance agencies from effectively using data.

Whittaker 4/15 (http://www.zdnet.com/article/nsa-whistleblower-overwhelmed-with-data-ineffective/?tag=nl.e539&s_cid=e539&ttag=e539&ftag=TRE17cfd61, Zack Whittaker is a writer-editor for ZDNet, and sister sites CNET and CBS News. He is based in the New York newsroom.)

In a lunch meeting hosted by Contrast Security founder Jeff Williams on Wednesday, William Binney, a former NSA official who spent more than three decades at the agency, said the US government's mass surveillance programs have become so engorged with data that they are no longer effective, losing vital intelligence in the fray. That, he said, can -- and has -- led to terrorist attacks succeeding. Binney said that an analyst today can run one simple query across the NSA's various databases, only to become immediately overloaded with information. With about four billion people -- around two-thirds of the world's population -- under the NSA and partner agencies' watchful eyes, according to his estimates, there is too much data being collected. "That's why they couldn't stop the Boston bombing, or the Paris shootings, because the data was all there," said Binney. Because the agency isn't carefully and methodically setting its tools up for smart data collection, that leaves analysts to search for a needle in a haystack. "The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that," he said. "But that doesn't stop it." Binney called this a "bulk data failure" -- in that the NSA programs, leaked by Edward Snowden, are collecting too much for the agency to process. He said the problem runs deeper across law enforcement and other federal agencies, like the FBI, the CIA, and the Drug Enforcement Administration (DEA), which all have access to NSA intelligence.

Terrorists deterrence is impossible and only leads to unique forms of terrorist circumvention

Frey 2007 (Bruno Frey, Prof. emer. of Economics, University of Zurich and Basel Research Director, CREMA - Center for Research in Economics, Management and the Arts, Switzerland, http://www.tampereclub.org/e-publications/vol2_frey.pdf)

The second type of costs produced by deterrence policy relate to its effects on terrorists. It is generally agreed that full deterrence is impossible. No country, not even one having extensive surveillance and punishing power is able to thwart all conceivable future terrorist activity. Experience has shown that terrorists are capable of innovative responses to deterrence policy. They do not only seek new ways of achieving their aims but they quickly substitute to those targets impossible or too costly to protect. The costs are further raised if the terrorists move their attention away from less to more harmful objectives, resulting in more casualties and damage. A coercive response tends to reinforce terrorists' cohesiveness and influence. At the same time it exacerbates nationalism and xenophobia in the countries more or less associated with the terrorists. There are, thirdly, more general costs involved with fighting terrorism by deterrence. Deterrence is based on a negative approach: terrorists are

threatened with punishment if they continue their activities. Coercive action is answered by coercive action. Such interaction tends to degenerate into a negative sum game between the parties involved making each one of them worse off (see George and Simon 1994, Baldwin 1999): both the country engaging in the coercive response, and also the terrorists lose. Any war, including the proclaimed “war against terrorism” is a “dramatically non-zero sum activity” (Schelling 1984, 269). This consequence may be the most important argument against exclusively or even mainly relying on force to fight terrorism. It is argued here that there is an alternative anti-terrorism policy available based on a positive approach (see also Bernauer and Ruloff 1999 for positive incentives in non-proliferation policies). Such anti-terrorist policies tend to evolve into positive sum games: As a result, both parties will be better off.

AT: Deterrence

Terrorists are either willing to sacrifice or have planned mechanisms of escape

Loren 14 (I focus on the strategic, economic and business implications of defense spending as the Chief Operating Officer of the non-profit Lexington Institute and Chief Executive Officer of Source Associates. I have also taught at Harvard University's Kennedy School of Government. I hold doctoral and masters degrees in government from Georgetown University and a bachelor of science degree in political science from Northeastern University. <http://www.forbes.com/sites/lorenthompson/>)

Elusive adversaries are hard to hold at risk. Deterrence is all about retaliation, or at least the threat of retaliation. It's the fear of horrible consequences that dissuades a potential aggressor from acting in the first place. But when it takes ten years to find the mastermind of the 9-11 conspiracy, accountability becomes tenuous. Many of the non-traditional adversaries who threaten America today lack a fixed address that can be targeted in retribution. That doesn't just apply to terrorists and insurgents who "move amongst the people as a fish swims in the sea" (to quote Mao Zedong), it also applies to hackers who invade our networks and traffickers in technologies of mass destruction. The most sophisticated hacks may originate in places like China, but if they arrive via the Chicago municipal healthcare system's information network and we can't identify their ultimate authors, how can we deter them?

Impact Work

Impact Framing

No risk of nuclear terror- prefer our evidence because it provides a framework by which to evaluate good public policy

Walt '13, Robert and Renée Belfer professor of international relations at Harvard University

Stephen M., "Why We Don't Need to Worry About a 'Nuclear Handoff'",
<http://foreignpolicy.com/2013/07/25/why-we-dont-need-to-worry-about-a-nuclear-handoff/>

After the 9/11 attacks, the U.S. national security establishment started focusing on the various ways that "international terrorism" might pose a threat to U.S. interests or the United States itself. Unsurprisingly, experts began to dream up all sorts of frightening scenarios and worry about all sorts of far-fetched scenarios. I remember this period well, and I recall sitting through seminars and workshops at which lots of very smart and creative people were imagining various nasty things that groups like al Qaeda might try to do. Hijack gas trucks and blow up the Lincoln Tunnel? Take over the Mall of America and create carnage on a big shopping day? Commandeer a supertanker and smash it into the Verrazano-Narrows Bridge? Wait until summer and then set forest fires all over the American West? The list of conceivable dangers was infinitely long, but if you sat in enough of those seminars, you could easily become convinced that it was only a matter of time before somebody did something really nasty to you or your loved ones.¶Imagination is one thing, but disciplined risk assessment is another. It's easy to dream up bad things that could conceivably happen, but intelligent public policy should rest on a more careful and sustained appraisal of how likely those various scary things are. And that's why I suggest you read Keir Lieber and Daryl Press's recent article in the journal *International Security* on "Why States Won't Give Nuclear Weapons to Terrorists."¶The fear that nuclear-armed states would hand weapons to terrorists has been a staple of U.S. threat-mongering ever since 9/11. It was a key part of the justification for invading Iraq in 2003, and it forms part of the constant drumbeat for military action against Iran. But it never made much sense for two reasons. First, a nuclear-armed state has little incentive to give up control over weapons it has labored long and hard to acquire, for what could the state possibly gain from doing so? Second, a state giving nuclear weapons to terrorists could never be sure that those weapons would not be traced back to it and thereby invite devastating retaliation.¶Lieber and Press examine the historical record and show that it is almost impossible to conduct a major terrorist operation and not be blamed for it. Here's the abstract for their article:¶Many experts consider nuclear terrorism the single greatest threat to U.S. security. The fear that a state might transfer nuclear materials to terrorists was a core justification for the invasion of Iraq in 2003 and, more recently, for a strike against Iran's nuclear program. The logical basis for this concern is sound: if a state could orchestrate an anonymous nuclear terror attack, it could destroy an enemy yet avoid retaliation. But how likely is it that the perpetrators of nuclear terrorism could remain anonymous?¶Data culled from a decade of terrorist incidents reveal that attribution is very likely after high-casualty terror attacks. Attribution rates are even higher for attacks on the U.S. homeland or the territory of a major U.S. ally — 97 percent for incidents in which ten or more people were killed. Moreover, tracing a terrorist group that used a nuclear weapon to its state sponsor would not be difficult, because few countries sponsor terror; few terror groups have multiple sponsors; and only one country that sponsors terrorism, Pakistan, has nuclear weapons or enough material to manufacture them. If leaders understand these facts, they will be as reluctant to give weapons to terrorists as they are to use them directly; both actions would invite devastating retaliation.¶I might add that this is the kind of important, nonpartisan,

policy-relevant work that more social scientists ought to be doing. It is also important to disseminate these findings widely, so that 1) U.S. policymakers won't keep chasing phantom dangers, 2) the leaders of nuclear-armed states understand that their arsenals are good for deterrence and not much else, and 3) said leaders also understand the need to keep whatever weapons they might have under very reliable control.

No Impact

No risk of nuclear terror- retaliation threats prove

Lieber and Press '13, Associate Professor in the Edmund A. Walsh School of Foreign Service and the Department of Government at Georgetown University, and Associate Professor of Government at Dartmouth College

Kier A. and Daryl G., "Why States Won't Give Nuclear Weapons to Terrorists",
http://www.mitpressjournals.org/doi/pdf/10.1162/ISEC_a_00127

The concern that a nuclear-armed state might transfer weapons to terrorists is part of the foundation of U.S. nonproliferation policy. Nonproliferation is pursued for a variety of reasons, including the fear that new nuclear states will use their weapons directly against adversaries, even in the face of a clear risk of retaliation; lose control of their nuclear weapons or materials through regime incompetence, corruption, or instability; trigger regional proliferation cascades among nervous neighbors; or be emboldened to use nuclear weapons as a "shield" for undertaking aggressive diplomatic and military actions, confident that other states could thus be deterred from responding forcefully.⁵ The concern that a state might transfer nuclear weapons to terrorists, however, is among the greatest of these worries, and to many analysts it is the most compelling justification for costly actions—including the use of military force—aimed at preventing proliferation. Despite the issue's importance, the danger of deliberate nuclear weapons transfer to terrorists remains understudied.⁶ Scholars have scrutinized many other proliferation concerns more extensively. Analysts have investigated the deductive and empirical bases for claims that new nuclear states would be deterrable;⁷ the likelihood that Iran, in particular, would behave rationally and avoid using nuclear weapons recklessly;⁸ and the risks of proliferation cascades,⁹ "loose nukes,"¹⁰ and nuclear-armed states using their weapons as a shield for aggression or blackmail.¹¹ To the extent that analysts have debated the possibility of covert state sponsorship of nuclear terrorism, however, the arguments have consisted mostly of competing deductive logics—with little empirical analysis. This article assesses the risk that states would give nuclear weapons to terrorists. We examine the logical and empirical basis of the core proposition: that a state could surreptitiously transfer a nuclear weapon to a like-minded terrorist group, thus providing the means for a devastating attack on a common enemy, while remaining anonymous and avoiding retaliation. The strategy of nuclear attack by proxy hinges on one key question: What is the likelihood that a country could sponsor a nuclear terror attack and remain anonymous? We examine this question in two ways. First, having no data on the aftermath of nuclear terrorist incidents, we use the ample data on conventional terrorism to discover attribution rates. We examine the fraction of terrorist incidents attributed to the perpetrating terrorist organization and the patterns in the rates of attribution. Second, we explore the challenge of tracing culpability for a nuclear terror event from the guilty terrorist group back to its state sponsor. We ask: How many suspects would there be in the wake of a nuclear detonation? How many foreign terrorist organizations have state sponsors? Of those that do, how many state sponsors do they typically have? And how many state sponsors of terrorism have nuclear weapons or sufficient stockpiles of nuclear materials on which to base such a concern? We conclude that neither a terror group nor a state sponsor would remain anonymous after a nuclear terror attack. We draw this conclusion on the basis of four main findings. First, data on a decade of terrorist incidents reveal a strong positive relationship between the number of fatalities caused in a terror attack and the likelihood of attribution. Roughly three-quarters of the attacks that kill 100 people

or more are traced back to the perpetrators. Second, attribution rates are far higher for attacks on the U.S. homeland or the territory of a major U.S. ally—97 percent (thirty-six of thirty-seven) for incidents that killed ten or more people. Third, tracing culpability from a guilty terrorist group back to its state sponsor is not likely to be difficult: few countries sponsor terrorism; few terrorist groups have state sponsors; each sponsored terror group has few sponsors (typically one); and only one country that sponsors terrorism, Pakistan, has nuclear weapons or enough missile material to manufacture a weapon. In sum, attribution of nuclear terror incidents would be easier than is typically suggested, and passing weapons to terrorists would not offer countries an escape from the constraints of deterrence.¹² This analysis has two important implications for U.S. foreign policy. First, the fear of terrorist transfer seems greatly exaggerated and does not—in itself—seem to justify costly measures to prevent proliferation. Nuclear proliferation poses risks, so working to prevent it should remain a U.S. foreign policy goal, but the dangers of a state giving nuclear weapons to terrorists have been overstated, and thus arguments for taking costly steps to prevent proliferation on those grounds—as used to justify the invasion of Iraq and fuel the debate over attacking Iran—rest on a shaky foundation. Second, analysts and policymakers should stop understating the ability of the United States to attribute terrorist attacks to their sponsoring states. Such rhetoric not only is untrue, but it also undermines deterrence. States sometimes exaggerate their capabilities to deter an enemy's attacks;¹³ but U.S. analysts and leaders, by understating U.S. attribution capabilities, inadvertently increase the odds of catastrophic terrorist attacks on the United States and its allies.

Their impact lacks rationality and is empirically denied- logical dilemmas and threats of being caught

Lieber and Press '13, Associate Professor in the Edmund A. Walsh School of Foreign Service and the Department of Government at Georgetown University, and Associate Professor of Government at Dartmouth College

Kier A. and Daryl G., "Why States Won't Give Nuclear Weapons to Terrorists", http://www.mitpressjournals.org/doi/pdf/10.1162/ISEC_a_00127

Conclusion President Obama has identified nuclear terrorism as "the single biggest threat to U.S. security," describing it as "something that could change the security landscape of this country and around the world for years to come."⁵⁴ The prospect of an adversary state covertly giving a nuclear weapon or nuclear materials to a terrorist organization has been the animating force in U.S. grand strategy for more than a decade. The scenario was used to justify the invasion of Iraq and toppling of the Iraqi regime in 2003; and in 2012 and 2013, proponents of a preventive military strike on Iran's nuclear facilities frequently argued that such attacks are necessary to eliminate the possibility of Iran trying a nuclear attack by proxy against Israel or the United States. We demonstrate here that such fears are overblown. The rationale for state sponsorship of nuclear terrorism lacks sound deductive logic and is empirically unsupported by the most relevant available evidence. The United States and its allies should be able to deter nuclear-armed states from passing their weapons to terrorists, because a terrorist nuclear strike would not remain anonymous for long and would soon be traced back to the originating state. This conclusion is based on two empirical findings. First, among the relevant past cases of conventional terrorist attacks—those targeting the homelands of powerful states and causing significant casualties—almost all were successfully attributed to the perpetrating terrorist organization. Second, linking the attributed terrorist organization to a state sponsor would not be difficult. Few

foreign terrorist organizations have state sponsors; those that do typically have only one; and only one suspected state sponsor of terrorism (Pakistan) has nuclear weapons or sufficient stockpiles of nuclear materials. Furthermore, potential sponsors of nuclear terror face a wicked dilemma: to maintain distance by passing the weapon to a terrorist group they do not know well or trust, or to maintain control by giving it to a group they have cooperated with repeatedly. The former strategy is mind-bogglingly dangerous; the latter option makes attribution from terror group to sponsor simple. Our findings have two important policy implications. First, the fear of nuclear attack by proxy by itself does not justify costly military steps to prevent nuclear proliferation. Nuclear proliferation may pose a variety of other risks, and the appropriate level of U.S. efforts to stop proliferation should depend on the cumulative effect of these risks, but the dangers of a nuclear handoff to terrorists have been overstated. For example, Iranian leaders would have to be crazy or suicidal to think that they could give a nuclear weapon to one of their terrorist collaborators and face no repercussions. If leaders were that irrational, the bigger problem would be direct nuclear attack without concern for the retaliatory consequences, not the alleged problem of a nuclear handoff. A second implication is that instead of publicly stressing the dangers of nuclear attack by proxy and lamenting the limits of U.S. nuclear forensic capabilities (and thus potentially misleading enemies to overestimate the feasibility of an anonymous attack against America), the United States should be advertising its impressive record of attributing highly lethal terrorist attacks. Understating one's own capabilities is a reasonable strategy for luring an enemy into making an unwise attack, but it is a disastrous policy if the goal is deterrence. The most effective way to deter countries from passing weapons to terrorists is to demonstrate the ease of nuclear attribution and the devastating consequences of such attribution to the sponsoring state.

A2 Terror Now

Terrorism is getting lower and lower

The Nation 15 [April 27, 2015 <http://nation.com.pk/national/27-Apr-2015/terrorism-incidents-witness-a-decline-in-2015> "Terrorism incidents witness a decline in 2015"] (Vaibhav)

Terrorism incidents throughout the country witnessed a substantial decline as compared to previous years. According to official documents, around 252 incidents of terror occurred since January 1, 2015 till date in which 139 citizens and 51 security men were martyred. The documents revealed that in the past 5 years, a total of 8520 terror incidents occurred in which 28779 people were killed. In 2010, 2061 incidents of terror occurred in which 502 security men were killed and 1454 civilians lost their lives. In 2011, 1680 incidents of terror occurred in which 948 civilians and 408 security men were killed. In 2012, 1316 incidents occurred in which 347 security men and 816 civilians were killed. In 2013, 1571 incidents claimed lives of 555 security men and 1239 civilians. According to the report in 2014, 1640 incidents of terror occurred in which 434 security men and 672 civilians were martyred.

A2 Loose Nukes

No risk of loose nukes- countries don't want the blame and there's none with major security issues

Lieber and Press '13, Associate Professor in the Edmund A. Walsh School of Foreign Service and the Department of Government at Georgetown University, and Associate Professor of Government at Dartmouth College

Kier A. and Daryl G., "Why States Won't Give Nuclear Weapons to Terrorists", http://www.mitpressjournals.org/doi/pdf/10.1162/ISEC_a_00127

counterargument #1: capitalizing on "loose nukes" In the wake of a nuclear detonation, investigators would need to consider the possibility that the nuclear device or missile materials were obtained without the consent of any state. The attack might not have resulted from a state's attack-by-proxy strategy, but rather from the problem of "loose nukes"—poorly secured nuclear weapons or materials falling into the wrong hands through illicit means. Knowing that a victim would need to at least consider the possibility of nuclear theft, a state sponsor might hope to succeed with its nuclear handoff under one of two logics. First, a state might give nuclear weapons or materials to a terrorist organization with full awareness that it would be identified as the source, but then try to avoid responsibility by claiming that the weapons or materials had been stolen from its stockpiles. Second, a state might give nuclear weapons or materials to a terrorist organization and try to avoid responsibility by claiming that the weapons or materials were stolen from a different foreign stockpile. The first strategy—giving nuclear weapons to terrorists and then pleading guilty to the lesser charge of maintaining inadequate stockpile security—is highly dubious. Any state rational enough to seek to avoid retaliation for a nuclear attack would recognize the incredible risk that this strategy entails. In the wake of an act of nuclear terrorism, facing an enraged and vindictive victim, would the state sponsor step forward to admit that its weapons or materials were used to attack a staunch enemy, with the hope that the victim would believe a story about theft and grant clemency on those grounds? If that logic does not appear implausible enough, recall that no state would be likely to give its nuclear weapons or materials to a terrorist organization with which it did not have a long record of cooperation and trust. Thus, a state sponsor acknowledging that it was the source of materials used in a nuclear attack would be doing so in light of its enemies' knowledge that the terrorists who allegedly stole the materials happened to have been its close collaborators in prior acts of terrorism. This strategy would be nearly as suicidal as launching a direct nuclear attack.³⁷ The second strategy—giving nuclear weapons to terrorists and then hiding behind the possibility that they were stolen from some unspecified insecure foreign source—deserves greater scrutiny. The list of potential global sources of missile material seems long. Nine countries possess nuclear weapons, and eleven more have enough missile material to fashion a crude fission device.³⁸ In 2011 the world's stockpile of highly enriched uranium (HEU), the missile material most likely to be sought by terrorists,³⁹ was about 1.3 million kilograms, meaning that the material needed for a single crude weapon could be found within the rounding error of the rounding error of global stocks. Perhaps, therefore, nearly all twenty countries with sufficient stocks of missile material would need to join the lineup of suspects after a terrorist nuclear attack, not as possible sponsors but as potential victims of theft. And if enough missile material to make a nuclear weapon could be purloined from any of these countries, then perhaps the victim would be unable to rule out all possible sources and thus be unable to punish the real culprit. This gloomy picture

overstates the difficulty of determining the source of stolen material after a nuclear terrorist attack. In the wake of a detonation, the possibility of stolen fissile material complicates the task of attribution—but only marginally. At the end of the Cold War, several countries—particularly in the former Soviet Union—confronted major nuclear security problems, but great progress has been made since then.⁴⁰ Although no country has perfect nuclear security, today the greatest concerns surround just a few countries: Belarus, Japan, Pakistan, Russia, and South Africa.⁴¹ In addition, not all of those states are equally worrisome as potential sources of nuclear theft. Substantial concerns exist about the security of fissile materials in Pakistan and Russia (the latter if simply because of the large size of its stockpile), but Belarus, Japan, and South Africa would likely be quickly and easily ruled out as the source of stolen fissile material. Belarus has a relatively small stockpile of fissile material—approximately 100 kilograms of HEU⁴²—so in the wake of a nuclear terrorist attack, it would be easy for Belarus to show that its stockpile remained intact.⁴³ Similarly, Japan (one of the United States’ closest allies) and South Africa as posing the greatest dangers, as summarized in Bunn, *Securing the Bomb 2010*, table 3.5. Bunn’s list of top concerns includes Kazakhstan, but that country has subsequently eliminated almost all of its highly enriched uranium, and its remaining stock—mostly in the range of 22 to 36 percent enrichment—would be inordinately difficult for a terror group to process into material for a nuclear bomb. Bunn’s discussion also includes Ukraine, but Ukraine has subsequently removed all HEU from its territory. On Ukraine, see Office of the Press Secretary, “Fact Sheet: Ukraine Highly Enriched Uranium Removal.”⁴⁴ Fissile Materials Working Group, “Nuclear Security’s Top Priority.”⁴⁵ As discussed above, a crude, gun-type HEU bomb—the type that terrorists might be able to steal—South Africa would be keen to allow the United States to verify the integrity of their full stocks of materials. (In the wake of a nuclear terror attack, a lack of full cooperation in showing all materials accounted for would be highly revealing.) Iran is not believed to have any weapons-usable nuclear material to steal,⁴⁶ although that could change. In short, a nuclear handoff strategy disguised as a loose nukes problem would be very precarious.⁴⁵

A2 US Retaliation

That's offense for us- proves terrorists wouldn't strike in the first place

Lieber and Press '13, Associate Professor in the Edmund A. Walsh School of Foreign Service and the Department of Government at Georgetown University, and Associate Professor of Government at Dartmouth College

Kier A. and Daryl G., "Why States Won't Give Nuclear Weapons to Terrorists",
http://www.mitpressjournals.org/doi/pdf/10.1162/ISEC_a_00127

There are two problems with this counterargument. First, while attribution uncertainty might restrain a state from responding to an act of nuclear terror with a major nuclear retaliatory strike, that option is not the only devastating response available to a country such as the United States or one of its allies. Indeed, regardless of the level of attribution certainty, a nuclear strike might not be the preferred response. For example, in the wake of a nuclear terror attack against the United States thought to be sponsored by Pakistan, Iran, or North Korea, U.S. leaders might not feel compelled to determine those countries' guilt "beyond a reasonable doubt" or to narrow down the suspect list further; Washington might simply decide that the era in which "rogue states" possessed nuclear weapons must end, and threaten to conquer any country that refused to disarm or that was less than forthcoming about the terror attack.⁵² Second, this counterargument would be unlikely to carry much weight with a leader contemplating nuclear attack by proxy. A leader tempted to attack because of the prospect of residual attribution uncertainty and the hope that such uncertainty would restrain his victim from lashing out in retaliation would need enormous confidence in the humaneness of his enemy, even at a time when that enemy would be boiling over with rage. For example, could one really imagine an Iranian aide convincing the supreme leader that if Iran gave a nuclear bomb to Hezbollah, knowing that Israel would strongly suspect Iran as the source, Israel's leaders would be too restrained by their deep humanity and lingering doubts about sponsorship to retaliate harshly against Tehran? In fact, the U.S. response to the September 11 attacks, including the invasions of Afghanistan and Iraq, indicates a willingness to retaliate strongly against those directly culpable (al-Qaida), their associates (the Taliban), and others simply deemed to be troublemakers in the neighborhood (Iraq). There was debate in the United States over the strategic wisdom of invading Iraq, but none of Saddam Hussein's crimes—either known, suspected, or fabricated—were held to an evidentiary standard even close to certainty.⁵³ States that consider giving nuclear weapons to terrorists cannot be certain how the victim will react, but basing one's hope for survival on a victim's reluctance to act on partial evidence of culpability would be a tremendous gamble.

AT: Internet BAD stuff

Innovation Addon

Internet K2 Innovation

Internet freedom is key to innovation – China proves

Hoffman 14 - Professor of Communication and Political Science, University of Delaware

Lindsay Hoffman, 2/5/2014, The Huffington Post, "Internet Censorship: A Threat to Economic Progress in China?", http://www.huffingtonpost.com/lindsay-hoffman/internet-censorship-a-thr_b_4395167.html, 7/18/2015, \\BD

Social media platforms such as Twitter and Facebook have helped to ignite an information revolution by allowing individuals around the world to use the Internet for communicating, learning, teaching, and protesting. However, these endless possibilities pose a threat to oppressive governments, and as a result, technology use has been severely limited in some nations. The Chinese government's strict regulation of Internet exemplifies these limitations within the context of an increasingly powerful nation. While the incredible economic progress of China over the past several decades suggests it is a threat to the status of the United States as the world's superpower, censorship may stop upward progress in its tracks. The expansion of the Internet in recent years has rendered this technology necessary to the day-to-day lives of people throughout China and the world, and that dependence has become a significant tool of power for oppressive governments. Beyond establishing a great firewall to block thousands of sites from being accessed within China, the government also works to prevent opposition on social media websites and blogs. The government listens to what citizens are saying online, thereby enabling officials "to address issues and problems before they get out of control" (see Rebecca MacKinnon's book, "Consent of the Networked"). In early September, a Chinese judge re-interpreted Internet restrictions so that any individual spreading "slanderous rumors" on the Internet that are seen by 5,000 people or shared by 500 people could face up to 10 years in prison. This stricter interpretation of Internet limitations indicates that an open Internet China is not on the immediate horizon. Google Chairman Eric Schmidt recently made headlines when he visited Hong Kong and suggested that China's prevention of free expression online may pose a threat to continuing economic progress for the country. Although many people may not connect the Internet to economic success, Schmidt suggests that the limitations placed on online speech by Chinese officials will prevent the country from overcoming the "middle-income trap." This occurs when countries move up from a place of poverty but are unable to further progress, leaving them trapped on a plateau below higher-income nations. Schmidt seems to be a celebrant, as his words echo the notion that the Internet "has the power to determine outcomes" for people, countries, and the entire world, although McChesney argues that this perspective is "ultimately unsatisfactory" in a complex reality (see McChesney's "Digital Disconnect"). Schmidt criticized the 500-repost rule as well as other restrictions placed on citizens' words and behavior on the Internet by the Chinese government. He suggested that in order to solve economic problems such as unemployment, nations require the "entrepreneurs" and "innovation" that an open Internet encourages. As the Chairman for such an economically successful company as Google understands, individuals must be allowed to think of fresh ideas when they use their technology. Extensive firewalls and harsh punishments for certain forms of expression prevent citizens from being able to make creative and helpful economic contributions through the Internet. Schmidt's warning to the Chinese government seems intended to persuade the Chinese government that there may be negative consequences of a closed and restrictive Internet that they had not previously considered. The tireless attempts to maintain power over citizens through Internet regulation and censorship may

actually be threatening the economic power of the nation in an increasingly technological world. The Chinese government may soon discover that when you hold on to something too tightly, it is far more likely to slip right out of your hands.

AT: Internet Bad K

State action key

Policy change is the only method to achieve internet freedom – their author

Power and Jablonski 2015 (Shawn M [Assistant Professor of Communication at Georgia State University] and Michael [attorney and presidential fellow in communication at Georgia State University]; *The Real Cyber War*; University of Illinois Press; p. 198; kdf)

Despite the fury, the private sector and technologists still depend on state actions for long-term solutions to privacy online. While AOL, Apple, Facebook, Google, LinkedIn, Microsoft, Twitter, Yahoo! and others condemn undue surveillance activities, their solution is to call for policy reform.⁶⁰ Technologists have promised to try and beat the government's invasive techniques, but even the best cryptographers in the world agree that it will take a tremendous amount of human effort, and years of work, to combat the NSA's surveillance programs. As Twitter's former head of cybersecurity Moxie Marlinspike explains, "We all have a long ways to go," adding, "[and] it's going to take all of us."⁶¹ Outraged governments—fueled by their outraged publics—are calling for greater control over the international information flows, not less. While it is easy for many in the United States and in parts of Europe to decry such perspectives as government censorship, or a power grab by international institutions (see chapters 4 and 5), the reality is that accepting some level of shared internet regulation is a far superior option to an internet splintered along geographical and national boundaries. This is exactly what will happen if current policies remain unchanged. Amid an onslaught of rhetoric that highlights how new technologies are changing societies and institutions around the world, it may be helpful to look back to how states navigated similar technological revolutions in the past, assess if and how those approaches worked, and determine their relevance to the challenges today's ICTs present. The history of interstate cooperation and rulemaking is, actually, neatly intertwined with developments in international communication. The first two intergovernmental organizations were created in order to coordinate the rules by which information flowed across national borders. The International Telegraph Convention established the first organization in 1865. After the invention and widespread adoption of radio technology, it was renamed the International Telecommunications Union (ITU) to encompass all types of transnational telecommunication issues.

Perm Solves

The permutation solves

Fish 2014 (Adam; Beyond surveillance fridges and socialized power drills: social media and the financialization of everyday life; Mar 29; savageminds.org/2014/03/29/beyond-surveillance-fridges-and-socialized-power-drills-social-media-and-the-financialization-of-everyday-life/; kdf)

Meanwhile, Jeremy Rifkin sees Morozov's "Internet of Things" not as a horror of surveillance and ever-sharper financial practices, but as the birth of a maker movement. When the net cost of production not just of digitized information like music and movies but of physical objects approaches zero, he claims, capitalism faces a fundamental challenge, one in which the winners will be found in the nonprofit sector. All those networked fridges and 3D printers, he says, are enabling a second economy to grow up alongside capitalist production, an economy based on sharing of goods and information, where we live "partly beyond markets," in "an increasingly interdependent global commons." Well, which will it be, dental espionage or ride-sharing our way into a global village? We've gone out into the field to try to find out, by examining new companies who're trying to combine big data and the sharing economy, and asking hard questions of their managers and of the people who're turning to them as alternatives to old-school consumerist products and services. In our project, "Third Party Dematerialization and Rematerialization of Capital," funded by the Engineering and Physical Sciences Research Council's "Digital Economy Research In The Wild" initiative, we are researching Zopa Limited, the sort of financial innovator Morozov has in mind when he speaks of Silicon Valley's ability to "disrupt" Wall Street with "better data and better engineers." Zopa is a "non-bank" – as regulation designed to discourage upstarts and protect the market share of slow-to-innovate and too-big-to-fail firms limits the use of the value-laden term "bank" – a "peer-to-peer lender." Zopa uses a proprietary algorithm to evaluate credit risk, and then matches individual borrowers of relatively small sums with potential investors of a bit of spare cash. Zopa claims that their highly stringent credit-evaluating algorithm, their lack of legacy infrastructure, both buildings and IT, and their individual evaluation of potential borrowers – rather than trusting entirely to automated processes – enable them to offer better rates to borrowers and lenders than high street banks can bother with. Zopa is a successful financial firm with only one top executive from the financial industry – their risk analyst. With Big Data experts and social marketing managers, Zopa explicitly applies Silicon Valley logics to a segment of what once was a UK high street banking monopoly – short to medium-term unsecured consumer lending and borrowing. Yet Zopa neither deploys fleets of drones or the latest gimmicks of "gamification" – the techniques developed from the realization that we'll do nearly anything for the quick hit of an endorphin rush from "rewards" as ephemeral as points or levels in a colorful game interface. While gamification is often claimed as the missing link between financialization and social mediatization – we'll do anything for rewards, and we want all our friends to see our status, so we'll click to create the data for others to profit from – today's reality is remarkably more old-fashioned. The twin challenges of social financialization are managing and marketing trust and risk. Once solely the province of banks, who used neoclassical architecture, three-piece suits, and free toasters to convey social messages of high trust and low risk, the largely dematerialized companies of social financialization necessarily use social media and internet user interfaces to do the same job. The trend-surfers and hipsters of the world aren't Zopa's clients: rather Zopa works to appeal to the newly financialized: older people with a bit of extra money who are neither wealthy nor connected enough to be worth the time of innovation-challenged, blue-blooded UK banks, and young families yet to see the "recovery" talked up on the newly-ubiquitous financial media. Zopa designers see their job as creating an online presence that looks enough like a bank to convey messages of trustworthiness and low risk, while simultaneously appealing to a demographic that feels abandoned by banks in their oscillations between high risk/high return algorithm-driven trading and "credit crunch" unwillingness to lend to anyone who might actually have a need for funds. It is in these everyday, slightly dowdy design choices that social financialization is being built, in a process of connecting the dots between a lost age of bricks-and-mortar rhetorics of trustworthiness – a trustworthiness coupled with incentives against too much financial literacy, too much desire to look behind the neoclassical facades to interrogate actual banking practices – and Morozov's all too likely future of trying to level up our gamified toothbrushes to lower our dental insurance premiums. We need the cautionary tales of the dystopias we're building and the utopian visions of data power to the people, but more, we need to know if our gateway drugs of social financialization really are harmless hits and performance enhancements, or whether they will lead inevitably to refrigerator madness. One thing we suspect is true: we can't "Just Say No."

Yes – Internet-> Democracy

The thesis of the K is wrong—Free Internet helps promote democracy movements—it is key to tackling authoritarian government—studies Prove

OSU 12—Ohio State University ("Internet use promotes democracy best in countries that are already partially free" April 4, 2012 <http://www.sciencedaily.com/releases/2012/04/120404152004.htm>)//JLee

Although use of the internet has been credited with helping spur democratic revolutions in the Arab world and elsewhere, a new multinational study suggests the internet is most likely to play a role only in specific situations. Researchers at Ohio State University found that the internet spurs pro-democratic attitudes most in countries that already have introduced some reforms in that direction. "Instead of the internet promoting fundamental political change, it seems to reinforce political change in countries that already have at least some level of democratic freedoms," said Erik Nisbet, lead author of the study and assistant professor of communication at Ohio State University. "Internet use is a less effective means to mobilize citizens for democracy in extremely authoritarian countries." In addition, demand for democracy is highest in a country when more people are connected to the internet and, most importantly, when they spend more time online. "Internet penetration in a country matters in terms of how much people want democratic reforms, but it is even more important that people are spending greater amounts of time on the internet and that they are connected to other people in their community," said Elizabeth Stoycheff, a co-author of the study and doctoral student in communication at Ohio State. Nisbet and Stoycheff conducted the study with Katy Pearce of the University of Washington. Their study appears in the April 2012 issue of the Journal of Communication, a special issue dedicated to social media and political change. The researchers analyzed previously collected data on 28 countries in sub-Saharan Africa and Asia. This included surveys of 37,549 people who participated in the 2008 Afrobarometer and 2006-2008 Asian Barometer surveys. Included were questions that evaluated how much the citizens in each country demanded democracy and their frequency of internet use. In addition, the researchers looked at country-level data that measured how democratic each country was, and their levels of internet penetration, international bandwidth per internet user and other sociodemographic factors. The results suggest that the internet is most likely to play a role in democratization in countries that have a moderate to high internet penetration and that have at least a partly democratic political regime. In countries ruled by authoritarian regimes, people may have access to the internet, but the rulers may control the content available, how users may interact with each other, and whether they may get information from outside their own country, Stoycheff said. "The internet's effect on citizen demand for democracy is somewhat contingent on both the technological context and the political context," Stoycheff said. Based on the results of the study, Nisbet said there are some countries that currently appear to have the right political and technological mix for the internet to play a role in social and political change. Those countries include Kenya, Senegal, Uganda, Singapore and Zambia. But countries in the survey that are run by highly authoritarian regimes, such as Vietnam and Zimbabwe, are not likely to see democracy flourishing anytime soon, regardless of use of the internet, the findings suggest. Other countries, like Mozambique and Tanzania, are partly free but have a low citizen demand for democracy and little internet penetration, Nisbet said. But if internet use grows in these countries, it has the potential to encourage people there to challenge their autocratic regimes. "Our results suggest that the internet can't plant the seed of democracy in a country," Nisbet said. "However, the internet may help democracy flourish if it has already started to grow."

Internet Capitalism Good

Internet makes capitalism good—creates low cost revenue and is easier to trade
Rifkin 14—Jeremy is the author of The Zero Marginal Cost Society: The Internet of Things, The Collaborative Commons, and The Eclipse of Capitalism. He is an adviser to the European Union and to heads of state around the world, and president of the Foundation on Economic Trends in Washington, DC ("Capitalism is making way for the age of free" March 31, 2014
[//JLee](http://www.theguardian.com/commentisfree/2014/mar/31/capitalism-age-of-free-internet-of-things-economic-shift)

In a capitalist market, governed by the invisible hand of supply and demand, sellers are constantly searching for new technologies to increase productivity, allowing them to reduce the costs of producing their goods and services so they can sell them cheaper than their competitors, win over consumers and secure sufficient profit for their investors. Marx never asked what might happen if intense global competition some time in the future forced entrepreneurs to introduce ever more efficient technologies, accelerating productivity to the point where the marginal cost of production approached zero, making goods and services "priceless" and potentially free, putting an end to profit and rendering the market exchange economy obsolete. But that's now beginning to happen. Over the past decade millions of consumers have become prosumers, producing and sharing music, videos, news, and knowledge at near-zero marginal cost and nearly for free, shrinking revenues in the music, newspaper and book-publishing industries. Some of the US's leading economists are waking up to the paradox. Lawrence Summers, former US treasury secretary, and J Bradford DeLong, professor of economics at the University of California, Berkeley, addressed this in August 2001, in a speech delivered before the Federal Reserve Bank of Kansas City. Summers and DeLong focused their presentation on the new communication technologies that were already reducing the marginal (per-unit) cost of producing and sending information goods to near zero. They began by acknowledging that "the most basic condition for economic efficiency: [is] that price equal marginal cost", and further conceded that "with information goods the social marginal cost of distribution is close to zero". They then went to the crux of the problem. "If information goods are to be distributed at their marginal cost of production – zero – they cannot be created and produced by entrepreneurial firms that use revenues obtained from sales to consumers to cover their [fixed set-up] costs ... [companies] must be able to anticipate selling their products at a profit to someone." Summers and DeLong opposed government subsidies to cover up-front costs, arguing that they destroy the entrepreneurial spirit. Instead they supported short-term monopolies to ensure profits, declaring that this is "the reward needed to spur private enterprise to engage in such innovation". They realised the trap this put them in, recognising that "natural monopoly does not meet the most basic condition for economic efficiency: that price equal marginal cost" but nonetheless concluded that in the new economic era, this might be the only practical way to proceed. The pair had come up against the catch-22 of capitalism that was already freeing a growing amount of economic activity from the market, and threw up their hands, favouring monopolies to artificially keep prices above marginal cost, thwarting the ultimate triumph of the invisible hand. This final victory, if allowed, would signal not only capitalism's greatest accomplishment but also its death knell. While the notion of near-zero marginal cost raised a small flurry of attention 12 years ago, as its effects began to be felt in the music and entertainment industry and newspaper and publishing fields, the consensus was that it would likely be restricted to information goods, with limited effects on the rest of the economy. This is no longer the case. Now the zero-marginal cost revolution is beginning to affect other commercial sectors. The precipitating agent is an emerging general-purpose technology platform – the internet of things. The convergence of the communications internet with the fledgling renewable energy internet and automated logistics internet in a smart, inter-operable internet-of-things system is giving rise to a third industrial revolution. Siemens, IBM, Cisco and General Electric are among the firms

erecting an internet-of-things infrastructure, connecting the world in a global neural network. There are now 11 billion sensors connecting devices to the internet of things. by 2030, 100 trillion sensors will be attached to natural resources, production lines, warehouses, transportation networks, the electricity grid and recycling flows, and be implanted in homes, offices, stores, and vehicles – continually sending big data to the communications, energy and logistics internets. Anyone will be able to access the internet of things and use big data and analytics to develop predictive algorithms that can speed efficiency, dramatically increase productivity and lower the marginal cost of producing and distributing physical things, including energy, products and services, to near zero, just as we now do with information goods. Summers and DeLong glimpsed that as marginal costs approach zero, "the competitive paradigm cannot be fully appropriate" for organising commercial life, but admitted "we do not yet know what the right replacement paradigm will be". Now we know. A new economic paradigm – the collaborative commons – has leaped onto the world stage as a powerful challenger to the capitalist market. A growing legion of prosumers is producing and sharing information, not only knowledge, news and entertainment, but also renewable energy, 3D printed products and online college courses at near-zero marginal cost on the collaborative commons. They are even sharing cars, homes, clothes and tools, entirely bypassing the conventional capitalist market. An increasingly streamlined and savvy capitalist system will continue to operate at the edges of the new economy, finding sufficient vulnerabilities to exploit, primarily as an aggregator of network services and solutions, allowing it to flourish as a powerful niche player. But it will no longer reign. Hundreds of millions of people are already transferring bits and pieces of their lives from capitalist markets to the emerging global collaborative commons, operating on a ubiquitous internet-of-things platform. The great economic paradigm shift has begun.

The alt fails—its attempt to block the internet’s economic progress will fail due to new businesses

Rifkin 14—Jeremy is the author of *The Zero Marginal Cost Society: The Internet of Things, The Collaborative Commons, and The Eclipse of Capitalism*. He is an adviser to the European Union and to heads of state around the world, and president of the Foundation on Economic Trends in Washington, DC ("THE ZERO MARGINAL COST SOCIETY THE INTERNET OF THINGS, THE COLLABORATIVE COMMONS, AND THE ECLIPSE OF CAPITALISM" 2014 <http://digamo.free.fr/rifkin14.pdf> pg. 11)//JLee

Edited for Gendered Language

Attempts to block economic progress invariably fail because new entrepreneurs are continually roaming the edges of the system in search of innovations that increase productivity and reduce costs, allowing them to win over consumers with cheaper prices than those of their competitors. The race Lange outlines is relentless over the long run, with productivity continually pushing costs and prices down, forcing profit margins to shrink. While most economists today would look at an era of nearly free goods and services with a sense of foreboding, a few earlier economists expressed a guarded enthusiasm over the prospect. Keynes, the venerable twentieth-century economist whose economic theories still hold considerable weight, penned a small essay in 1930 entitled "Economic Possibilities for Our Grandchildren," which appeared as millions of Americans were beginning to sense that the sudden economic downturn of 1929 was in fact the beginning of a long plunge to the bottom. Keynes observed that new technologies were advancing productivity and reducing the cost of goods and services at an unprecedented rate. They were also dramatically reducing the amount of human labor needed to produce goods and services. Keynes even introduced a new term, which he told his readers, you "will hear a great deal in the years to come—namely, technological unemployment. This means unemployment due to our discovery of means of economising the use of labour outrunning the pace at which we can

find new uses for labour." Keynes hastened to add that technological unemployment, while vexing in the short run, is a great boon in the long run because it means "that mankind [Society] is solving its economic problem."⁷

Internet Capitalism Good -- Environment

The internet is able to help the environment, detect Natural Disasters, and farmers
Rifkin 14—Jeremy is the author of The Zero Marginal Cost Society: The Internet of Things, The Collaborative Commons, and The Eclipse of Capitalism. He is an adviser to the European Union and to heads of state around the world, and president of the Foundation on Economic Trends in Washington, DC (“THE ZERO MARGINAL COST SOCIETY THE INTERNET OF THINGS, THE COLLABORATIVE COMMONS, AND THE ECLIPSE OF CAPITALISM” 2014 <http://digamo.free.fr/rifkin14.pdf> pg. 16-17)//JLee

The Internet of Things is quickly being applied in the natural environment to better steward the Earth’s ecosystems. Sensors are being used in forests to alert firefighters of dangerous conditions that could precipitate fires. Scientists are installing sensors across cities, suburbs, and rural communities to measure pollution levels and warn the public of toxic conditions so they can minimize exposure by remaining indoors. In 2013, sensors placed atop the U.S. Embassy in Beijing reported hour to hour changes in carbon emissions across the Chinese capital. The data was instantaneously posted on the Internet, warning inhabitants of dangerous pollution levels. The information pushed the Chinese government into implementing drastic measures to reduce carbon emissions in nearby coal-powered plants and even restrict automobile traffic and production in energy-intensive factories in the region to protect public health. Sensors are being placed in soil to detect subtle changes in vibrations and earth density to provide an early warning system for avalanches, sink holes, volcanic eruptions, and earthquakes. IBM is placing sensors in the air and in the ground in Rio de Janeiro to predict heavy rains and mudslides up to two days in advance to enable city authorities to evacuate local populations.²¹ Researchers are implanting sensors in wild animals and placing sensors along migratory trails to assess environmental and behavioral changes that might affect their well-being so that preventative actions can be taken to restore ecosystem dynamics. Sensors are also being installed in rivers, lakes, and oceans to detect changes in the quality of water and measure the impact on flora and fauna in these ecosystems for potential remediation. In a pilot program in Dubuque, Iowa, digital water meters and accompanying software have been installed in homes to monitor water use patterns to inform homeowners of likely leaks as well as ways to reduce water consumption.²² The IoT is also transforming the way we produce and deliver food. Farmers are using sensors to monitor weather conditions, changes in soil moisture, the spread of pollen, and other factors that 16 affect yields, and automated response mechanisms are being installed to ensure proper growing conditions. Sensors are being attached to vegetable and fruit cartons in transit to both track their whereabouts and sniff the produce to warn of imminent spoilage so shipments can be rerouted to closer vendors.²

Internet Inevitable

The expansion of the internet is coming—makes Capitalism inevitable—alt cannot do anything about it

Rifkin 14—Jeremy is the author of *The Zero Marginal Cost Society: The Internet of Things, The Collaborative Commons, and The Eclipse of Capitalism*. He is an adviser to the European Union and to heads of state around the world, and president of the Foundation on Economic Trends in Washington, DC (“THE ZERO MARGINAL COST SOCIETY THE INTERNET OF THINGS, THE COLLABORATIVE COMMONS, AND THE ECLIPSE OF CAPITALISM” 2014 <http://digamo.free.fr/rifkin14.pdf> pg. 62-63)//JLee

The enormous leap in productivity is possible because the emerging Internet of Things is the first smart-infrastructure revolution in history: one that will connect every machine, business, residence, and vehicle in an intelligent network comprised of a Communications Internet, Energy Internet, and Logistics Internet, all embedded in a single operating system. In the United States alone, 37 million digital smart meters are now providing real-time information on electricity use.⁹ Within ten years, every building in America and Europe, as well as other countries around the world, will be equipped with smart meters. And every device—thermostats, assembly lines, warehouse equipment, TVs, washing machines, and computers—will have sensors connected to the smart meter and the Internet of Things platform. In 2007, there were 10 million sensors connecting every type of human contrivance to the Internet of Things. In 2013, that number was set to exceed 3.5 billion, and even more impressive, by 2030 it is projected that 100 trillion sensors will connect to the IoT.¹⁰ Other sensing devices, including aerial sensory technologies, software logs, radio frequency identification readers, and wireless sensor networks, will assist in collecting Big Data on a wide range of subjects from the changing price of electricity on the grid, to logistics traffic across supply chains, production flows on the assembly line, services in the back and front office, as well as up-to-the-moment tracking of consumer activities.¹¹ As mentioned in chapter 1, the intelligent infrastructure, in turn, will feed a continuous stream of Big Data to every business connected to the network, which they can then process with advanced analytics to create predictive algorithms and automated systems to improve their thermodynamic efficiency, dramatically increase their productivity, and reduce their marginal costs across the value chain to near zero. Cisco systems forecasts that by 2022, the Internet of Everything will generate \$14.4 trillion in cost savings and revenue.¹² A General Electric study published in November 2012 concludes that the efficiency gains and productivity advances made possible by a smart industrial Internet could resound across virtually every economic sector by 2025, impacting “approximately one half of the global economy.” It’s when we look at each industry, however, that we begin to understand the productive potential of establishing the first intelligent infrastructure in history. For example, in just the aviation industry alone, a mere 1 percent improvement in fuel efficiency, brought about by using Big Data analytics to more successfully route traffic, monitor equipment, and make repairs, would generate savings of \$30 billion over 15 years.¹³ The health-care field is still another poignant example of the productive potential that comes with being embedded in an Internet of Things. Health care accounted for 10 percent of global GDP, or \$7.1 trillion in 2011, and 10 percent of the expenditures in the sector “are wasted from inefficiencies in the system,” amounting to at least \$731 billion per year. Moreover, according to the GE study, 59 percent of the health-care inefficiencies, or \$429 billion, could be directly impacted by the deployment of an industrial Internet. Big Data feedback, advanced analytics, predictive algorithms, and automation 62 systems could cut the cost in the global health-care sector by 25 percent according to the GE study, for a savings of \$100 billion per year. Just a 1 percent reduction in cost would result in a savings of \$4.2 billion per year, or \$63 billion over a 15-year period.¹⁴ Push these gains in efficiency from 1 percent, to 2 percent, to 5 percent, to 10 percent, in the aviation and health-care sectors and across every other sector, and the magnitude of the economic change becomes readily apparent. The term Internet of Things was coined by Kevin Ashton, one of the founders of the MIT Auto ID Center, back in 1995. In the years that followed, the IoT languished, in part, because the cost of sensors and actuators embedded in “things” was still relatively expensive. In an 18 month period between 2012 and 2013, however, the cost of radio-frequency identification (RFID) chips, which are used to monitor and track things, plummeted by 40 percent. These tags now cost less than ten cents each.¹⁵ Moreover, the tags don’t require a power source because they are able to transmit their data using the energy from the radio signals that are probing them. The price of micro-electromechanical systems (MEMS), including gyroscopes,

accelerometers, and pressure sensors, has also dropped by 80 to 90 percent in the past five years.¹⁶ The other obstacle that slowed the deployment of the IoT has been the Internet protocol, IPv4 which allows only 4.3 billion unique addresses on the Internet (every device on the Internet must be assigned an Internet protocol address). With most of the IP addresses already gobbled up by the more than 2 billion people now connected to the Internet, few addresses remain available to connect millions and eventually trillions of things to the Internet. Now, a new Internet protocol version, IPv6, has been developed by the Internet Engineering Task Force; it will expand the number of available addresses to a staggering 340 trillion trillion trillion—more than enough to accommodate the projected 2 trillion devices expected to be connected to the Internet in the next ten years

Indict – Morozov

Morozov's idea is wrong—he fails to recognize technology have biases

Davis 13—Ron is the CEO of Tenacity, a health technology startup using cutting-edge behavioral science to improve people's lives and save employers money. . He holds degrees from Harvard Law School, The University of Oregon and George Fox University. As an employee of Fidelity National Financial, he drove several successful strategic initiatives, was widely known for his consulting and coaching program, and broke all local sales records. ("Morozov Is Wrong: Smart Technology Enhances Choice" May 18, 2013 http://www.huffingtonpost.com/ron-davis/morozov-is-wrong-smart-te_b_2891165.html)/JLee

Morozov's rational actor famously performed center stage in classical economic theory, which assumed that people maximize their own well-being when making purchases. Ironically, though, he scolds engineers for curtailing choice by offering consumers the choices they crave. Rather than follow his own advice and provide unbiased information about smart products, he imports his idiosyncratic ideas about choice, and labels these products "bad," and suggests they make us dumb. They appeal to "base instincts," as if Runkeeper users are baboons. By his own confused standards, his words "fall somewhere between good smart and bad smart." Even Morozov's modest suggestion that BinCam should benchmark customer's recycling habits is a known tactic for creating comparison and appealing to "base" instincts like people's pride and their desire to keep up with others. Perhaps Morozov fails to recognize that all technologies have biases, as Rushkoff has argued. Guns and pillows can kill, but their bias toward doing so differs exponentially. We can pick any kind of car to get to work - gas, diesel, electric--and among hundreds of models, but "this sense of choice blinds us to the fundamental bias of the automobile toward distance, commuting, suburbs, and energy consumption." Morozov has strangely singled out smart technology for criticism, though bias is common to all products and at least smart technologies make many of their nudges explicit. People buy them because they want to change their behavior. It's hard to say the same for the biases that come with products like ramen and chips and fast food. People don't purchase these with chronic disease and early death in mind, though unfortunately that's often part of the package. Morozov misses the forest and then cuts down the wrong tress. This doesn't mean all products are evil. But it seems that bias and base instincts are unavoidable. Technologies frame our decisions. Marketers influence our choices by bombarding us with messages that appeal to impulses like pride, fear, sex, exclusivity and security. Animal urges - like starvation avoidance, push us to overeat. City planning, or the lack thereof, constrains our choices about where we live and how we travel. In other words, we are up against all kind of intentional and unintentional forces that we didn't ask for, all of which conspire to curtail our autonomy. And, in rarer cases, we should circumscribe choice. Even libertarians have long acknowledged that freedom should be limited when our actions harm others. This is why we have a criminal code. Breathalyzers that keep drunks from driving should limit their liberty to injure innocents, just as the threat of prison or an officer's pistol strongly encourages people to avoid violent altercations. Appropriate autonomy is more than mere license. Morozov raises more serious concerns, like privacy and the possibility of people getting forced to turn over information or engage with coercive technology. But he offers nothing new here: these worries are widely shared and decent legislation can protect citizens from overzealous technocrats and rapacious businesses. More important, Morozov's rubric for "good" and "bad" relies on discredited ideas about human autonomy and choice, causing him to so wildly miss the mark that he criticizes smart technology as autonomy-limiting, when it actually offers us the chance to play a greater role in choosing our own destinies.

Morozov advocates a critique without a coherent understanding of IT, falls prey to his own critique, fails to undertake analysis of the state, all the while moving debate away from central questions of internet freedom with smoke and mirrors

Muller 11, (Milton, Professor at the Syracuse University School of Information Studies, “WHAT IS EVGENY MOROZOV TRYING TO PROVE? A REVIEW OF “THE NET DELUSION” , <http://www.internetgovernance.org/2011/01/13/what-is-evgeny-morozov-trying-to-prove-a-review-of-the-net-delusion/>)

Flirting with “the dark side”^a The subtitle suggests that Morozov wants to position himself on the authoritarian side of the political spectrum. But he doesn’t really. That is, I don’t think he does. He seems to oppose censorship and authoritarianism and doesn’t want to join the copyright holders, the cyber-spooks, the Chinese Communist Party, the Islamic fundamentalists and the Christian morality-in-media types in singling out freedom online for destroying the fabric of civilization. What he does is remind us that there is a dark side to human nature which often manifests itself on the Internet. To attribute this dark side to the Internet itself, however – which Morozov sometimes does – is to fall prey to the Internet-centrism he tries to attack. Moreover, some of his most vivid stories are not about the “dark side of Internet freedom” but rather about how unfree networks can be controlled and manipulated by authoritarian states in unfree societies.^a When it comes to deflating cyber-utopianism related to the Internet, I don’t think anyone has done it better, and with more detail and empirical knowledge of Internet developments around the world. At some level, however, his basic point is trivial. Any sentient user of the internet knows by now that creating a gigantic, globalized sphere for social interaction means that the activity there will exhibit all the classical problems of human society: bullying, fads and follies, propaganda, political domination, rumor-mongering, theft, fraud, and inter-group conflicts ranging from nationalism to racism. We have been accepting and responding to that reality for the past decade, instituting various technical, legal and behavioral controls on Internet use while seeking to preserve the freedom and openness that made the Internet such a valuable resource. That is why we are having dialogue about internet governance and security at the global, national and local levels.^d Yes, it’s wrong to assume that open information will necessarily and automatically topple dictatorships and advance democracy. But you don’t advance that dialogue very much by wallowing in colorful horror stories of bad Internet-enabled activities and peddling them as a byproduct of “Internet freedom.” That’s what the copyright interests do to carve their pound of flesh out of our freedom; that’s what the cyber-security interests (elsewhere, so ably attacked and satirized by Morozov himself) have done and are doing; that’s what the content regulation and web site blocking hawks have done and are doing. Is Morozov intent on feeding this frenzy?^a In his zeal to deflate utopian notions that “networking is always good” Morozov sometimes embraces the other idea he wants to attack, Internet centrism. The Internet is to be blamed, he implies, for gang wars in Cuernavaca, the illegal trade in endangered species, and many other things – because the practitioners “use the Internet.” “Text messaging has been used to spread hate in Africa,” he writes (apparently oblivious to the fact that SMS technology is not the Internet) – implying both that communication-information technology itself created the problem of tribal warfare, and that we can make it go away if we regulate or control the way the technology is used. He writes approvingly of China’s decision to shut down the internet in Xinjiang province in the summer of 2009 as tensions flared between Uighurs and Han Chinese.^a But Morozov never articulates a consistent position on what Internet freedom means and how and when it should be

supported. All in all, one comes away with the conclusion that he doesn't really know where to go with his critique. The two "Internet freedoms" That is because a fundamental confusion lies at the very core of this book. His subtitle and much of his material identifies "Internet freedom" as its object. But careful readers (and of course, most readers will not be) soon notice that this term means two distinct things. Most of the time, especially in the earlier pages, Morozov's notion of "Internet freedom" can be accurately defined as "the support of Internet freedom by the US government as a way of meeting US foreign policy and public diplomacy goals of promoting democracy and human rights overseas." When the book is narrowly focused on this topic, it is excellent. I say this not because I completely agree with the critique, but because it raises the right questions and calls attention to many possible unintended side effects. On the other hand, Internet freedom can – and usually does – refer to a normative political position on how much or how little the people using the internet should be controlled by states, or some other hierarchical authority. This notion of Internet freedom recognizes that the U.S. government, like any other state, can adopt policies and practices hostile to freedom. More broadly, it denotes the debate over what is the proper role of freedom of expression, freedom of association online, and the free flow of information in society. Although it is usually universalistic, this notion does not commit its proponents to any tactical belief that freeing the Internet is inherently transformative of repressive societies. Although at times Morozov does manage to separate analytically these two approaches to "Internet freedom," just as often he conflates them. Worse, he repeatedly equates support for Internet freedom in the normative sense with cyber-utopianism, which is both incorrect and irresponsible. Networks and states? Insofar as he tried to weigh in on the deeper issues of Internet freedom, Morozov is unsuccessful. He makes (in passing) a vague argument that freedom requires "the state." But M's discussion of "the state" is abstract, ahistorical and tautological; it confuses "the state" with "order." The definition of the state he relies on refers broadly to the way society institutionalizes the capacity to produce and enforce order. With such a definition, the assertion that "the state" is needed to secure freedom is nothing more than a tautology. It describes an idealized outcome of having the right kind of state but tells us nothing about what states should do to the internet now. And it begs the question of what kind of a state should act, whether it should be the nation-state or some other form, and how globalized communication infrastructure alters the way states function. Any concrete, historically specific instantiation of the capacity for supplying order may, in fact, generate as much disorder and chaos as its absence in specific situations. Morozov claims that there has been no engagement with this issue. He is wrong. There is a robust dialogue going on about the degree to which the Internet does or does not require new forms of global governance. Entire books have been written about it [wink]. The many faces of Morozov's Contributing to the overall sense of inconsistency, Morozov adopts differing identities or perspectives, as long as they can be used to score points. He writes: "internet freedom may make policymakers overlook their own [political and strategic] interests." Here he postures as jaded realpolitik advisor to powerful decision makers in existing governments. They have to look after their interests, and not worry about ideals. Elsewhere, we find a different Morozov – one who rips into the hypocrisy of the US government for promoting Internet freedom on the one hand and supporting dictators, surveillance of Internet users both domestic and foreign, and other policies designed to advance and promote US state's power. This critique, unlike the first one, presumes that freedom is a higher value that should not be subordinated to national interests and realpolitik. In yet other places, Morozov positions himself as earnest giver of advice about how we [NGOs, govts] need to promote civil society, democracy and liberalism in the rest of the world and how

Internet policy may help us do that. Typically, his style is to take long, detailed and rhetorically convincing excursions into narrative alleys that link Internet technology to social problems, and then cover his ass by issuing two or three concluding sentences as a more nuanced escape valve: e.g., “Networks can be good or bad. Promoting internet freedom must include measures to mitigate the negative side effects of increased interconnectedness.” Most readers emerging from this tunnel are simply going to come away with the conclusion that the internet is responsible for a lot of problems and should be regulated more in order to avoid them. Regulated how? By whom? How to ensure that the cures aren’t worse than the diseases? Those are the real issues.

Even if Morozov is right, his critique ultimately devolves into pessimism and hopefulness – vote aff for at least a chance to reform the inter

Chatfield 11, (Tom, doctorate from and professor at St John's College, Oxford, author and technology theorist, <http://www.theguardian.com/books/2011/jan/09/net-delusion-morozov-review>)

In this sense, all of Morozov’s arguments boil down to the same thing: a war against complacency. The masses are mired in dross – but the echo chambers of the elite are equally pernicious, as intellectuals travel the world from conference to book signing, chatting to each other about freedom while their native countries clamp down. There’s an anguish here that emerges most clearly when Morozov talks about his native Belarus, where “no angry tweets or text messages, no matter how eloquent, have been able to rekindle the democratic spirit of the masses, who, to a large extent, have drowned in a bottomless reservoir of spin and hedonism, created by a government that has read its Huxley.” Is this really what our brave new world amounts to? Morozov longs for the sacred light of reason to shine into the web’s dark corners. But, as his own diagnosis suggests, politics has always been a matter for the passions. And if it’s naive to think that the internet can save us, it’s naive to think that it can damn us too. Here, his avowedly realist programme runs into idealistic trouble: for if the twinned, venal natures of man and media are to blame for our ills, there’s not much we can do. This helps no one, and runs counter to his incisive anatomy of the issues at stake. For better and for worse, the world has arrived online – and duly busied itself looking at cute pictures of cats, building encyclopedias and distributing classified diplomatic cables. If there is hope, it lies exactly where Morozov himself seems most hopeless: in acknowledging and building on what it is that people actually fear, desire and believe in.

Morozov fails to undertake statistical analysis and cherry-picks empirics to support his arguments

Thierer 11, (Adam, senior research fellow at the Mercatus Center at George Mason University, “Book Review: The Net Delusion by Evgeny Morozov” , <http://techliberation.com/2011/01/04/book-review-the-net-delusion-by-evgeny-morozov/>)

Morozov thinks that the “ridiculously easy group-forming” that his leading nemesis Clay Shirky described in his recent book Cognitive Surplus is, in reality, leading largely to cognitive crap, at least as it pertains to civic action and political activism. Indeed, at one point in Chapter 7 (the creatively-titled, “Why Kierkegaard Hates Slacktivism”), Morozov speaks of the development of what we might think of as a “tragedy of the civic commons” (my term, not his). He argues that: “When everyone in the group performs the same mundane tasks, it’s impossible to evaluate individual contributions, and people

inevitably begin slacking off... Increasing the number of participants diminishes the relative social pressure on each and often results in inferior outputs. (p 193) It's an interesting theory, as far as it goes, but Morozov doesn't muster much more than a handful of anecdotes in support of it. He notes, for example, that even back in the Berlin Wall era, young East German students were more likely to know intimate facts about popular American dramas like Dallas and Dynasty than current political affairs. And, echoing the recent laments of Andrew Keen (Cult of the Amateur) and Lee Siegel (Against the Machine), Morozov worries about the "narcissism" and "attention seeking" of social networking denizens. "There's nothing wrong with the self-promotion per se, but it seems quite unlikely that such narcissistic campaigners would be able to develop true feelings of empathy or be prepared to make sacrifices that political life, especially political life in authoritarian states, requires." (p 187) But this ignores many legitimate forms of social organization / protesting that have been facilitated by the Net and digital technologies. Despite what Morozov suggests, we haven't all become lethargic, asocial, apolitical cave-dwelling Baywatch-rerun-watching junkies. If all Netizens are just hooked on a cyber-sedative that saps their civic virtue, what are we to make of the millions of progressives who so successfully used the Net and digital technologies to organize and elect President Obama? (Believe me, I wish they wouldn't have been so civic-minded and rushed to the polls in record numbers to elect that guy!)

Morozov fails to understand the internet as a way of disseminating information and instead dismisses it without subjecting it to any analysis.

Thierer 11, (Adam, senior research fellow at the Mercatus Center at George Mason University, "Book Review: The Net Delusion by Evgeny Morozov" , <http://techliberation.com/2011/01/04/book-review-the-net-delusion-by-evgeny-morozov/>)

Yet, in his zeal to counter those who have placed too great an emphasis on the role of information technology, Morozov himself has gone too far in the opposite extreme in The Net Delusion by suggesting that technology's role in transforming States or politics is either mostly irrelevant or even, at times, counter-productive. I'm just not buying it. I think you'll find a more nuanced and balanced set of conclusions in this new white paper, "Political Change in the Digital Age: The Fragility and Promise of Online Organizing," by Bruce Etling, Robert Faris and John Palfrey. In it, they conclude: The Internet has an important role in increasing information sharing, access to alternative platforms, and allowing new voices to join political debates. The Internet will continue to serve these functions, even with state pushback, as activists devise ways around state online restrictions. Conditions that contribute to success are likely determined not by the given technological tool, but by human skill and facility in using the networks that are being mobilized. ... It is less clear how far online organizing and digital communities will be allowed to push states toward drastic political change and greater democratization, especially in states where offline restrictions to civic and political organization are severe. As scholars, we ought to focus our attention on the people involved and their competencies in using digitally-mediated tools to organize themselves and their fellow citizens, whether as flash mobs or through sustained social movements or organizations, rather than the flow of information as such. In other words, we should view information as one of many means to the end and not the end in and of itself. But we also shouldn't discount its importance too lightly.

Morozov fails to clarify an alternative to his critique and promotes the same internet authoritarianism he critiques – only the perm is able to overcome this solvency defect

Thierer 11, (Adam, senior research fellow at the Mercatus Center at George Mason University, “Book Review: The Net Delusion by Evgeny Morozov” , <http://techliberation.com/2011/01/04/book-review-the-net-delusion-by-evgeny-morozov/>)

There’s a more profound problem with Morozov’s thesis. If he is correct that the Net poses such risks, or undermines the cause of democracy-promotion, isn’t the logical recommendation that flows from it technology control or entertainment repression? If, as Morozov implies, Netizens are spending too much time viewing Lolcats and not enough in the streets protesting or running down to the Peace Corps to sign up for a tour of duty, then what would he have us do about it? Shall we restrict access to the growing abundance of technological / entertainment choices that he laments? Amazingly, he never really clarifies his views on this important point. Like so many other cultural critics before him, Morozov finds it easy to use caustic wit to tear apart inflated arguments and egos on the other side while also conveniently ignoring the logical consequences of their critiques or bothering to set forth a constructive alternative. About the closest he comes is to detailing his views in Chapter 9, which focuses on the danger of the Net and modern digital technology being used to spread extremist views. Even though he refuses to get more specific about potential responses, what, exactly, are we to conclude when we hear Morozov speak of the need for “measures to mitigate the negative side effects of increased interconnectedness.” (p. 261) And what are we to make of his claim that “More and cheaper tools in the wrong hands can result in less, not more, democracy.” (p. 264) Or, his argument that: The danger is that the colorful banner of Internet freedom may further conceal the fact that the Internet is much more than a megaphone for democratic speech, that is other uses can be extremely antidemocratic in nature, and the without addressing those uses the very project of democracy promotion might be in great danger.” (p. 265-6) Or, finally, his conclusion in that chapter that: If the sad experience of the 1990s has taught us anything, it’s that successful (democratic) transitions require a strong state and a relatively orderly public life. The Internet, so far, has posed something of a threat to both. (p. 274) Reading those passages — especially the words I’ve highlighted — it’s hard not to conclude that Morozov would like to put the information genie back in the bottle. To be clear, he never says that directly since he simply refuses to be nailed down on specifics. But, again, his tone seems to suggest that some form of technological control or information repression may be necessary. I hope that in coming essays Evgeny will be willing to clarify his views on this issue since The Net Delusion leaves us scratching our heads and wondering just how far he would go to counter the supposed “danger” or “threat” posed by digital technology.

Morozov fails to understand the historical context of the internet and doesn't undertake cost benefit analysis of the internet – on balance it has improved quality of life and government accountability.

Thierer 11, (Adam, senior research fellow at the Mercatus Center at George Mason University, “Book Review: The Net Delusion by Evgeny Morozov” , <http://techliberation.com/2011/01/04/book-review-the-net-delusion-by-evgeny-morozov/>)

Moreover, Morozov once again overplays his hand here. He spends so much time arguing that digital technologies have made our lives more transparent to the State that he underplays the myriad ways it has simultaneously made government activities more visible than at any point in history. It is extraordinarily difficult for even the most repressive of States today to completely bottle up all its secrets and actions. Morozov says modern China, Putin's Russia and Hugo Chavez are embracing new digital technologies in an attempt to better control them or learn how to use them to better spy on their citizens, and he implies that this is just another way they will dupe the citizenry and seduce them into a slumber so they will avert their eyes and ears to the truth of the repression that surrounds them. Sorry, but once again, I'm not buying it. Repressive regimes really do face a tension when they embrace modern information and communications technologies. It does force them to make certain trade-offs as they look to modernize their economies. Morozov thinks this so-called “dictator's dilemma” hypothesis is largely bunk, but he seems to expect this process to unfold overnight once new technology moves in. In reality, these things take more time. The general progression of things in most states is toward somewhat greater transparency and openness, even if it does not magically spawn regime change overnight. Importantly, he never really offers a credible cost-benefit analysis of the life of citizens in those regimes today relative to the past. Are we seriously supposed to believe that information-deprived Chinese peasants of the Mao era were somehow better positioned to influence positive regime change than the more empowered modern Chinese citizen? It's a tough sell. Are their downsides associated with those new technologies (especially the potential for citizen surveillance)? Yes, of course. But let's not use that as an excuse for marching backwards, technologically-speaking.

Morozov concludes affirmative – policy action is a necessary prerequisite to challenging internet delusion – this link turns the kritik

Thierer 11, (Adam, senior research fellow at the Mercatus Center at George Mason University, “Book Review: The Net Delusion by Evgeny Morozov” , <http://techliberation.com/2011/01/04/book-review-the-net-delusion-by-evgeny-morozov/>)

Chapter 8 of the book focuses on what Morozov describes as the “Cultural Contradictions of Internet Freedom.” He again scores some points for rightly pointing to the hypocrisy at play in the United States today — by both government and corporations — when it comes to the promotion of Net freedom globally. He correctly notes that “while American diplomats are preaching the virtues of a free and open Internet abroad, an Internet unburdened by police, court orders, and censorship, their counterparts in domestic law enforcement, security, and military agencies are preaching — and some are already pursuing — policies informed by a completely different assessment of those virtues.” (p. 218) Similarly, Morozov castigates many of America's leading high-tech companies — Facebook,

Google, Microsoft, Apple, Twitter, etc. – for preaching the values of Net freedom but then all too willingly handed over information about dissidents to repressive State actors, or playing ball with foreign thugs in other ways. Morozov is right; American leaders in both government and business need to better align their actions with their rhetoric when it comes to the interaction of government and technology. Too often, both groups are guilty of talking a big game about the Internet and freedom, only to later take steps to undermine that cause. As Morozov asks in a recent New York Post column, “Shouldn’ t America’ s fight for Internet freedom start at home for it to be taken seriously by the rest of the world?” Yes, it should.

No Bubble

No such thing as a tech bubble—tons of stats prove

Harris 7/16—Melissa joined the Chicago Tribune as a business columnist in 2009 after nearly five years as an award-winning metro reporter at The Baltimore Sun. Prior to joining the Sun, she was a metro reporter at The Orlando Sentinel. She is a graduate of Northwestern and Johns Hopkins universities (Bachelor of Science in journalism and Master of Arts in government), and a two-time finalist for the Livingston Award, honoring outstanding reporting by journalists younger than 35. (“Hate to burst your bubble, but tech investment is healthy” July 16, 2015
<http://www.chicagotribune.com/business/columnists/ct-harris-tech-bubble-0717-biz-20150716-column.html>)/JLee

The tech bubble doesn't exist. That's the point of a 53-slide presentation last month in which three partners from the Silicon Valley venture capital firm Andreessen Horowitz supplied evidence that the tech market is nowhere near the mania levels of 1999 and 2000. Andreessen Horowitz's data show that private and public funding for tech companies remains at about 40 percent of what it was in 1999. There's been no surge in venture capital fundraising. It's rising but still below 2006 levels. And venture capital funding as a percentage of the gross domestic product created by the sector is down by half since 1980. There's also a real market for these businesses now. The number of Internet users has increased from 738 million in 2000 to 3.2 billion in 2015, according to a new report from the International Telecommunication Union. Venture funding per person online has been flat since the bubble, while people are spending more on it. Yes, the S&P 500 Information Technology Index is approaching 1999 levels but this time, Andreessen Horowitz argues, profits are driving these returns with price-to-earnings multiples at early 1990s levels. (A price-to-earnings ratio is the current price of a share of stock divided by its earnings per share. A large multiple can signal that the market's perception of the company is inflated.) The price-to-earnings ratio of the tech component of the S&P is in fact lower than for the index as a whole, Bloomberg reported. Instead, almost all of the returns are being had in private markets, meaning without a company going public. In other words, you have to know someone or be a large institutional investor to be able to buy equity in privately held companies like Uber even though its estimated worth is some \$40 billion. Overall dollars raised by technology companies are being dominated by such deals. The good news is that mom-and-pops can't bet their retirement funds on Uber. The bad news is that there was at least \$32.97 billion in venture capital sitting out there for 4,378 venture deals in 2014. That first number comes from Dow Jones VentureSource and represents a 62 percent increase from 2013 and the highest total since 2007. The deal number comes from PricewaterhouseCoopers' MoneyTree, a quarterly study of venture capital activity in the United States, and represents a 4 percent increase from 2013. Why is that bad? Keep reading. The way to look at the tech sector is to think of it like an hourglass, explained Waverly Deutsch, a clinical professor of entrepreneurship at the University of Chicago Booth School of Business. (Disclaimer: I attend Booth. Deutsch previously coached a startup I founded.) There is an increasing number of companies being created at the bottom, and about 60 highly valued startups worth \$1 billion or more, known as unicorns, at the top. In the middle is a big squeeze. The base at the bottom of the hourglass is widening. The number of companies raising capital has doubled since 2009, and the number of funding rounds has grown by 150 percent. But the size of those rounds has fallen by a third since 2004. The collapse of the cost of creating tech companies in the last two decades means many more are being created, Andreessen Horowitz's Morgan Bender, Benedict Evans and Scott Kupor wrote. With each one needing less money to get started, there are a lot more small rounds. That is, there is a surge in seed-stage funding. There has been a seven-times increase over 10 years in the amount of money raised in \$1 million to \$2 million funding rounds, although that totals to only \$1.1 billion, or about 5 percent of all funding going into deals of less than \$40 million, according to Andreessen Horowitz. At the other end of the hourglass, all unicorns combined equal the value of about one Facebook. Still, these private funding rounds of \$40 million or more dominate fundraising. The headlines are ominous," Bender, Evans and Kupor acknowledge. Seventy-five percent of the

largest VC investments have been raised in the last five years. ... Many companies that would have in the past done an IPO are now doing late-stage rounds (effectively quasi-IPOs). ... Thus, traditional public market investors and buyout funds, who would not typically invest in companies at this stage, have moved into the private markets." Sixteen of the Top 20 tech deals last year had participation from "non-traditional investors," according to Andreessen Horowitz. More large investors want access to these fast-growing, scalable tech companies than there are fast-growing, scalable tech companies. Comparatively few exist because right before that comes the squeeze. Funding to get to proof of concept — a company has a product and a few customers — is plentiful and cheap. Heck, many companies can get that far without raising any outside funding at all. But scaling that product to reach millions of customers is very expensive. There are so few ideas that can make that leap, even with stellar leadership. That's reflected in the venture data. Total funding for deals in the \$10 million to \$25 million range has fallen in half since 1999, according to Andreessen Horowitz. And total money going into deals under \$40 million is back to 2001, post-bubble-burst levels. "You get terms in the valley, like the cockroaches, companies that are just kind of crawling along, self-funding with small streams of revenue, but not enough to pay founders legitimate salaries, not enough to grow and not enough to invest in marketing," Deutsch said. "You've got tens of thousands of companies getting money from angels, graduating from accelerators all thinking the way they're going to grow their business is through venture capital, and there are 2,365 seed and early-stage deals being done. "The early-stage venture capitalists whittle this giant pool of tens of thousands of companies down to 2,365 companies, then they can overpay for the growth of those companies," Deutsch continued. "The pipeline is kind of broken in the middle. ... But if you squeeze through this neck, you've got this massive amount of venture capital that's waiting. The valuations are crazy because there's competition among the big funds to get their billions of dollars placed." The funnel is frustrating for entrepreneurs, but that squeeze is the only thing preventing a bubble. The unicorn euphoria can't be allowed to cascade down, and the Andreessen Horowitz presentation makes a persuasive case that it hasn't. Yet.

The tech bubble does not exist—Unicorn start-ups do not exist

Smith 7/6—Noah is an assistant professor of finance at Stony Brook University and a freelance writer for a number of finance and business publications. He maintains a personal blog, called Noahpinion. ("There Is No Tech Bubble. Still, Be Worried." July 6, 2015
<http://www.bloombergview.com/articles/2015-07-06/there-is-no-tech-bubble-still-be-worried-///JLee>

Andreessen Horowitz, the most innovative and outspoken of Silicon Valley's big venture capital firms, recently came out with a presentation intended to kill the idea that there's a new tech bubble under way. The 53-slide presentation, by Morgan Bender, Benedict Evans and Scott Kupor, takes on the idea that too much money is flowing into private technology companies, especially in the highly valued startups called "unicorns." First, a little background. Bubbles, by definition, pop, and if tech crashed it would hurt a lot of investors. People making the case for a bubble often focus on unicorn startups (those with a valuation of greater than \$1 billion) such as Uber, which is now valued at \$40 billion without having gone public. They claim that large private financing by late-stage venture capital, backed up by large asset managers like Fidelity or Tiger Global Management, have replaced initial public offerings as the driver of overvaluation. This is known as the "private IPO." The pro-bubble case is that these private financing rounds have inflated the value of the unicorns without spilling over into the public markets. Andreessen Horowitz's team attacks this idea from a number of directions. First, they show that overall funding for tech startups — both private financing and IPOs — is still nowhere near the dizzying heights it reached in 1999 and 2000, especially when measured as a share of the economy. The same is true of venture capital fundraising. They also present various arguments that long-term earning potential for tech startups is much stronger this time around. (Bloomberg LP, the parent company of Bloomberg News, is an investor in Andreessen Horowitz.) The Andreessen Horowitz presentation makes a very convincing case. We should not be drawing a parallel between the boom in private late-stage funding of unicorn startups and the late-'90s IPO boom. They just don't look like the same phenomenon. So there's probably not a unicorn bubble. How about a tech bubble more generally? The Andreessen Horowitz team points out that the tech sector isn't taking over the

Standard & Poor's 500 stock index the way it did in the late-'90s tech bubble: The share of tech in the index has been flat for about 12 years now. And, as Sam Altman pointed out on Twitter, stock valuations for technology companies don't look any higher than other stock valuations; the price-to-earnings ratio of the tech component of the S&P is in fact lower than for the index as a whole. So we're probably not in a tech bubble of any kind. That said, there was one Andreessen Horowitz slide that's ominous. It shows that all the unicorns together are valued at slightly less than Facebook. That reminded me of an e-mail debate between financial economists Eugene Fama and Ivo Welch, on the question of whether the '90s tech bubble was really an episode of market irrationality. In that debate, Fama said the following: During 1999-2000 there [were] 803 IPOs with an average market cap of \$1.46 billion ... 576 of the IPOs are tech and internet-related ... [thus] their total market cap [was] about \$840 billion, or about twice Microsoft's valuation at that time. Given expectations at that time about high tech and the business revolution to be generated by the internet, is it unreasonable that the equivalent of two Microsofts would eventually emerge from the tech and internet-related IPOs?

AT ISIS Turns

No Link – Internet Not Key

The internet is not the main point of ISIS recruitment—even if they do recruit through the internet the recruitment is small

Franz, 6/2- (Barbara Franz teaches political science at Rider University, Lawrenceville and Princeton, New Jersey.) “Popjihadism: Why Young European Muslims Are Joining the Islamic State” Mediterranean Quarterly Volume 26, Number 2, June 2015, Dunke University press, Project Muse.//droneofark

Jihadism has become a media phenomenon. Videos distributed by IS and other radical groups, with their own YouTube accounts, flourish on the Internet. The films appeal to Muslim youth with messages of martyrdom and loyalty packaged in rock and rap video formats.¹⁶ A Viennese social worker states, “All like Jihadism. It has a pull.”¹⁷ Some have dubbed the new genre popjihadism.¹⁸ However, one German study found that only 18 percent of jihadists were radicalized through online resources. By far the most important variable for the radicalization of German youth is contact with imams [End Page 9] and mosques (23 percent) and with friends who have gone off to fight in the jihad before them (30 percent).¹⁹ What these popjihadists express in blogs is crucial and highly influential for their friends at home. For example, the young woman behind the Umm Layth blog presents herself as a British immigrant to the caliphate. She asks, while posting photos of herself and her “sisters” clothed in black burqas, “How can you not want to produce offspring who may be, God willing, part of the great Islamic revival?”²⁰ Just as curious are the ventures of Samra Kesinovic and Sabina Selimovic, two Austrian teenagers of Bosnian background ages fifteen and sixteen, whose story has circulated throughout the local media scene.²¹ The two young women left Vienna in April 2014, and in August Selimovic appeared in a selfie on Instagram wearing a hijab. The woman is a jihadi now — the picture depicts her wearing a burqa and holding a gun. A number of Austrian teenage women, including some recent converts and one thirteen-year-old girl, have formed a Whatsapp group and are planning to sojourn to Syria as well.²² Other IS fighters, such as the nineteen-year-old Firas Abdullah, an Austrian with Tunisian roots, currently stationed in ar-Raqqa, Syria, use online platforms like ask.fm to blog about their experiences.²³ Through Twitter, Facebook, Instagram, and Tumblr, IS easily spreads its message to a Western audience. Yilmaz, a smiling Dutch jihadist with Turkish roots, has become a social media sensation with his Tumblr account Chechclear.Tumblr.com glorifying his stint in Syria as the ultimate adventure by posting photos of warfare alongside children and kittens.²⁴ Although YouTube videos, Instagram, Twitter, and Tumblr accounts often initiate interest in the jihad, recruitment is a more complex issue and does usually not occur via electronic means. The sympathizer group is usually small and concise. In Vienna, for example, only a dozen or so people really know how recruitment actually happens. The recruitment of individuals occurs not only in the virtual world but also in public places. There are a [End Page 10] number of known meeting areas for possible recruits in Vienna, according to two anonymous informants of the weekly paper Der Falter. They are, for example, on the Danube Island, at the Handelskai, and the Jägerstraße, all working-class locales close to public transportation frequented daily by crowds of commuters.²⁵ Some youth might have been recruited by Salafite imams. Recently, some radical voices in Vienna apparently have begun to call for volunteers for the holy war, including a Bosnian imam in a mosque in Vienna’s second district, Leopoldstadt, who incited hatred against Jews, Christians, atheists, and women. His followers supposedly have engaged in military exercises in the woods around Vienna.²⁶ An Egyptian preacher in Styria’s capital Graz labeled Christian Austrians as successors of “apes and pigs,” and a preacher from Gaza called Western women whores and argued that the pope is a fool and not worth the “nail in the sandals of the prophet.”²⁷ While this might distress good Austrian Christians, whether this language is enough to entice individuals to become jihadists is questionable. It is, however, part of a rhetorical strategy to divide the world into the good and the bad in general, the believers and the infidels, and good and bad Muslims.²⁸ In the mosque, nationality does not matter; Bosnians, Chechens, Turks, Kurds, and Austrians pray side by side. In a society in which discrimination and marginalization of ethnic minorities remains a key feature, the mosque provides something new for young Muslims. For many young converts who feel they have no career prospects and no economic opportunities, these are spaces where they are given self-worth because they are given a choice: if they chose the “right” side, Salafite jihadism, they are promised that they will become heroes. [End Page 11]

No internal link—governments use the internet to discredit ISIS as much as they use it as a persuasion tactic.

Farwell, 14- (holds a B.A. from Tulane University, a J.D. in Law from Tulane University, and a D.C.L.S. in Comparative Law from the University of Cambridge (Trinity College). In addition, he is a Senior Research Scholar in Strategic Studies at the Canada Centre for Global Security Studies, Munk School of Global Affairs, University of Toronto) “The Media Strategy of ISIS” From “Survival: Global Politics and Strategy”, Routledge Publishing vol. 56 no. 6 | December 2014–January 2015 | pp. 49–55, pdf, //droneofark

Yet there is a strategic downside to ISIS's approach. The ubiquity of smartphones has empowered individual fighters to spread messages and images of their own, including videos of atrocities, such as the chopping off of a man's hand in Raqqa, whose filming ISIS leaders had banned to avoid sparking a backlash. ISIS fighters may take pride in tweeting and bragging about their experiences, but such material provides fodder for the group's opponents, who can use it to discredit the militants' narrative while mobilising opposition.¹⁷ The US State Department, for example, has created a video mocking ISIS recruitment efforts by showing, in graphic detail, the group's ugly brutality and suggesting that the group's adventure trail ends in an inglorious death.¹⁸ During an earlier phase of conflict in Iraq, al-Qaeda realised that images of Muslims killing Muslims were counterproductive, and became critical of ISIS for carrying out such actions. Likewise, Egyptian cleric Yusuf alQaradawi and the Association of Muslim Scholars in Iraq have spoken out against ISIS beheadings.¹⁹ Releasing warm and fuzzy images of ISIS murderers hugging pets was a good gambit, but the emotional impact of images depicting ISIS militants drenched in the blood of Muslims and other innocents is likely to backfire. That doesn't mean the road ahead will be easy for ISIS's opponents. The Iraqi government has tried to shut down Internet access in regions where ISIS has gained a physical foothold, and has cut Internet traffic across Iraq by one-third.²⁰ But the government in Baghdad lacks centralised control over the country's telecommunications infrastructure, limiting its ability to get its own messages out. ISIS has proven more adroit, leveraging the capabilities of providers in Turkey and Iran for its own purposes. It will be interesting to see how Ankara and Tehran respond. ISIS leaders seem to recognise that social media is a double-edged sword. The group tries to protect the identity and location of its leadership by minimising electronic communications among top cadres and using couriers to deliver command-and-control messages by hand. Social media is reserved for propaganda. Still, advances in technology may eventually leave the group vulnerable to cyber attacks, similar to those reportedly urged by US intelligence sources to intercept and seize funds controlled by Mexican drug cartels.²¹ Ultimately, defeating ISIS will require focused efforts aimed at discrediting and delegitimising the group among Muslims, while working towards the only long-term solution for the evil the group has brought to the world: eradication. One hopes the policymakers building coalitions and launching strikes against ISIS have these aims in mind, and will calibrate their narratives, themes and messages accordingly.

No Link – Fill in solves

Even if the aff curtails surveillance, other countries solve the impact

Dodd 6/21 – writer for The Guardian

Vikram Dodd, 6/21/2015, The Guardian, “Europol web unit to hunt extremists behind Isis social media propaganda”, <http://www.theguardian.com/world/2015/jun/21/europol-internet-unit-track-down-extremists-isis-social-media-propaganda>, 7/17/2015, \\BD

A new Europe-wide police unit is being set up to scour the internet for the ring leaders behind Islamic State’s social media propaganda campaign, which it has used to recruit foreign fighters and jihadi brides. The police team will seek to track down the key figures behind the estimated 100,000 tweets a day pumped out from 45,000 to 50,000 accounts linked to the Islamist terror group, which controls parts of Iraq and Syria. Run by the European police agency Europol, it will start work on 1 July, with a remit to take down Isis accounts within two hours of them being detected. Europol’s director, Rob Wainwright, told the Guardian that the new internet referral unit would monitor social media output to identify people who might be vulnerable and those preying on them. He said: “Who is it reaching out to young people, in particular, by social media, to get them to come, in the first place? It’s very difficult because of the dynamic nature of social media.” The director added that the police team would be working with social media companies to identify the most important accounts operating in a range of languages that are “underpinning what Isis are doing”. Europol said it would not name the social media firms who have agreed to help the police. It will use network analytics to identify the most active accounts, such as those pumping out the most messages and those part of an established online community. Wainwright said the new unit would aim to “identify the ringleaders online”, but even then counter-terrorism investigators could not go through every one of the estimated 50,000 targeted accounts, as there were too many and new ones could easily be set up. Last week, Isis’s ability to reach into British communities to gain recruits was demonstrated once again. One Briton, Talha Asmal, a 17-year-old from Dewsbury, West Yorkshire, is believed to have killed himself in a suicide bombing in Iraq, while three Bradford sisters are feared to have fled to Syria with their nine children in the hope of joining a brother who has been fighting the Assad regime. A total of 700 Britons have travelled to territory controlled by Isis in Syria and Iraq – a problem shared with other European countries. Europol’s database tracking suspected foreign fighters in the two countries has 6,000 names. Some of those may be facilitators, or their associates. Wainwright said up to 5,000 were believed to have travelled to Isis-held territory from countries including Holland, France and Belgium, as well as from the UK. He said some were “disaffected” youths migrating from teenage gangs in their own countries seeing Isis as a “bigger gang in Syria”. But he added that others being attracted are those who had bright futures in their home countries. The new European initiative is in part based on Scotland Yard’s counter-terrorism internet-referral unit. The hope is the new unit will boost efforts across European countries, with results passed back to nations to take action against the individuals running the accounts. The unit is part of European governments’ response to the terrorist attacks on the office of satirical magazine Charlie Hebdo in Paris in January. Wainwright said money used to fund Isis activities will also be hunted down. He added: “Where you follow the money trail, it helps find who they are, what they are doing and who their associates are.” The home secretary, Theresa May, stressed in a speech this week the need to tackle the cross-border threat of Isis. She said: “The threat ... that we face is a common one shared by many of your countries. And if we are to defeat it, we need to work together. We have also supported the EU

in setting up an internet-referral unit at Europol to address the increasing amount of terrorist and extremist propaganda available on the internet, and I am pleased to say the UK will be seconding a police officer to this unit."

Link Turn -- Internet Solves ISIS

The Internet allows us to monitor information about their location

Starr 5/12 – writer for CNN

Barbara Starr, 5/12/2015, CNN, "Pentagon hunts for ISIS on the secret Internet",
<http://www.cnn.com/2015/05/12/politics/pentagon-isis-dark-web-google-internet/>, 7/17/2015, \\BD

Though a tough space to shed light on, now the Pentagon is developing a way to pry the doors open and chase ISIS and others down. "We need a technology to discover where that content is and make it available for analysis," said Chris White of the Defense Advanced Research Projects Agency, or DARPA. DARPA has a new military technology known as MEMEX that acts as a unique search engine -- seeing patterns of activity on the Dark Web and websites not available via traditional routes like Google or Bing. "MEMEX allows you to characterize how many websites there are and what kind of content is on them," White said. "It was actually first developed to track down human trafficking on the web -- it's an idea that works for an illicit activity users try to keep hidden." It all starts, White said, by being able to track down locations where activity is happening.

Increased marketing allows us to combat ISIS

AFP 2/20

AGENCE FRANCE-PRESSE, 2/20/2015, Raw Story, "Winning the Internet war is key in ISIS fight: experts",
<http://www.rawstory.com/2015/02/winning-the-internet-war-is-key-in-isis-fight-experts/>, 7/17/2015, \\BD

The Internet has become a crucial battleground in the fight against jihadist propaganda and Western nations need to step up their game, according to participants in a Washington meeting on countering radical groups. Experts say governments must engage in corporate-style marketing if they are to combat the Islamic State, which is using slick videos to lure foreign nationals to the battlefields of Iraq and Syria. "If ISIS has a branding and marketing department, where is ours?" said Sasha Havlicek, the founding chief executive officer of the London-based Institute for Strategic Dialogue (ISD). The think tank has carried out several experiments using Google Ideas, Twitter and Facebook to try to directly engage with potential recruits — and dissuade them from joining the brutal jihadist movement. In one campaign, ISD released several videos of Abdullah X — a fictional character who tries to convince young Muslims that following the Islamic State is not the way forward. "We were able to 'hypercharge' that content — inserting him in the very spaces the extremists were using (...) anchoring this content to extremist Twitter accounts, posting it on extremist pages, having it pop out whenever you search for jihad in Syria," said Havlicek. "And within a few months, this went from reaching 50 people to 100,000 people of our target group of individuals searching to go to Syria for jihad," she said. The best indicator of success was that ISIS responded by running five pages of "urgent refutation" of the arguments of Abdullah X, she added. The ISD think tank also launched a pilot project using Facebook to "walk back people from the edge" of extremism by proposing a one on-one chat with people expressing interest in violent jihad. "Right now, only extremist groups and intelligence services are really engaging with this constituency online," Havlicek said. The next step is to see "if see if that outreach can be automated," she added. For that to happen, private companies with well-developed online marketing strategies can offer that knowledge to associations and activists working against the IS message, Havlicek said. —

Counter 'brainwashing' → The US government is already working to weaken extremist groups online — a digital blitz involving a State Department team that posts opinion pieces on radical Islam, cartoons and graphic photos.

Unmasking online profiles allows us to gain info about ISIS

Matthews 2/24 – writer for Open Canada

Kyle Matthews, 2/24/2015, "Five ways to fight ISIS online", <http://opencanada.org/features/five-ways-to-fight-isis-online/>, 7/17/2015, \\BD

4. Unmask online profiles It is essential that action is taken to expose, disrupt and make public ISIS members on social media, as well as their cheerleaders. Last year a business executive in India was exposed as the person behind the country's most prolific ISIS Twitter account. He was arrested and then apologized, with no proof that he has since urged others to wage holy war. Recently, the hacker group known as Anonymous, following the murder of the journalists at Charlie Hebdo in Paris, declared a social media war against jihadist groups online and recently shut down over one hundred such Twitter and Facebook accounts.

--xt Internet Segregation Turn

The Internet is key to solve ISIS

Dettmer 6/2 – journalist for The Daily Beast

Jamie Dettmer, 6/2/2015, The Daily Beast, “Can the West Beat ISIS on the Web?”,
<http://www.thedailybeast.com/articles/2015/03/10/can-the-west-beat-isis-on-the-web.html>,
7/17/2015, \\BD

But that could result in a tremendous loss of useful information in the fight against the Islamic State. “If every single ISIS supporter disappeared from Twitter tomorrow, it would represent a staggering loss of intelligence—assuming that intelligence is in fact being mined effectively by someone somewhere,” argue analysts J.M. Berger and Jonatho Morgan in a study published Friday for Brookings, a U.S. think tank, called “The ISIS Twitter Census.”³ The report garnered media coverage at the weekend for its estimate that last autumn the followers of the terror group had over 46,000 and possibly as many as 90,000 accounts on Twitter, which has become the main social media hub for ISIS, allowing it to disseminate links to digital content hosted on other online platforms.⁴ The authors argued, “By virtue of its large number of supporters and highly organized tactics, ISIS has been able to exert an outsized impact on how the world perceives it, by disseminating images of graphic violence (including the beheading of Western journalists and aid workers, and more recently, the immolation of a Jordanian air force pilot), while using social media to attract new recruits and inspire lone actor attacks.”⁵ But the authors maintain that Twitter’s aggressive suspension of jihadist accounts in recent weeks—a policy that has earned the threat of retaliation against the company’s executives by the terror group—could well be counter-productive. A total suspension, they say, could have unintended consequences. Not only would it deny intelligence agencies useful operational and tactical information, they fear, it could speed up radicalization by channeling potential recruits and lone wolves like Cornell into segregated ISIS Internet channels.⁶ That, they maintain, would reduce any possibility of moderating influences being brought to bear by the intelligence services and de-radicalizing experts on potential recruits. But such sophisticated efforts seem a long way from being applied.

Iraq Solves

Iraq solves propaganda – ISIS can't post their memes online

Harris 14 – senior staff writer at Foreign Policy, four times been named a finalist for the Livingston Awards for Young Journalists

Shane Harris, 6/17/2014, Foreign Policy, "Iraqi Government Takes Its Fight With ISIS Online", <http://foreignpolicy.com/2014/06/17/iraqi-government-takes-its-fight-with-isis-online/>, 7/17/2015, \\BD

Iraqi soldiers may have dropped their weapons, stripped off their uniforms, and fled the Islamist jihadists who have conquered a growing list of cities as they move closer to Baghdad. On the battlefields of cyberspace, by contrast, the Iraqi government is putting up a fierce fight against the forces of the Islamic State of Iraq and al-Sham (ISIS). In the past week, government ministries have blocked Internet access in regions where ISIS has a physical foothold in an attempt to stop the group from spreading propaganda and recruiting followers among Iraq's repressed Sunni minority. The government has also ordered Internet service providers across the country to block all access to certain social media sites, including Facebook, YouTube, and Twitter, which are ISIS's favorite tools for spreading propaganda and posting photos and videos of their victories over the Iraqi military and their wholesale slaughter of unarmed Shiites — both sources of tremendous embarrassment for the government of Prime Minister Nouri al-Maliki, a Shiite. Baghdad's online offensive appears to be having some effect. As of Tuesday, June 17, daily Internet traffic across Iraq had dropped by roughly a third, said David Belson, editor of the State of the Internet Report, published by web services company Akamai Technologies, which monitors Internet access around the world.

Europol Solves

Europol solves – ending data localization is key

Chorley 7/1 – writer for Daily Mail

Matt Chorley, 7/1/2015, Daily Mail, “100,000 terror web posts removed since 2010 as Europol sets up dedicated unit to stem tide of ISIS propaganda”, <http://www.dailymail.co.uk/news/article-3145689/Europe-wide-police-team-launches-wipe-ISIS-web-aim-terrorist-accounts-taken-two-hours.html>, 7/17/2015, \\BD

Almost 100,000 pieces of terrorist or extremist web posts have been removed from the internet by the British authorities in the last five years, it emerged today. The government says it is proof that it takes 'seriously the threat from online terrorist and extremist propaganda'. But with some 46,000 accounts linked to the terror group operating in Iraq and Syria, there are fears it could be an impossible task to halt its sophisticated internet publicity machine. In a sign of an escalation in the problem, Europol today set up a Europe-wide police unit begins work today to tackle the tide of ISIS propaganda online being used to radicalise and recruit extremists around the world. Officers say they aim to have new accounts on Twitter, Facebook and other social media sites closed down within two hours to protect the 'the safety and liberty of the internet'. It follows the revelation that Tunisian gunman Seifeddine Rezgui, who killed 38 tourists including up to 30 Britons, posted increasingly extreme messages on Facebook after becoming radicalised. A Home Office spokesman said today: 'This Government takes seriously the threat from online terrorist and extremist propaganda, which can directly influence people who are vulnerable to radicalisation.' 'We are working with the internet industry to remove terrorist material hosted in the UK or overseas and since 2010 we have successfully removed more than 95,000 pieces of terrorist-related content.' Building on this, the UK worked with Europol and other EU Member States to establish the new EU Internet Referral Unit, which will be able to remove a wider range of sources and in a wider range of languages. 'We also support the work of civil society groups to challenge those who promote extremist ideologies online, and we are working on projects in local areas that increase the awareness, confidence and capability of parents and teaching staff by building an understanding of how the internet is used to radicalise young people.' 'Social media companies have come under increased pressure from the UK government to take 'stronger, faster and further action' to stop ISIS and other terror groups from recruiting fighters and spreading propaganda online.' Police and intelligence agencies claim their ability to track the work of extremists is hampered by web firms protecting users' privacy.

Memes Solve

Government trolling solves ISIS – memes are key

Branstetter 2/3 – writer for The Daily Dot

Ben Branstetter, 2/3/2015, The Daily Dot, "To fight ISIS, government spies are trolling you on the Internet", <http://www.dailydot.com/opinion/government-agents-online-trolling/>, 7/17/2015, \\BD

Once again, it's time to admit the conspiracy theorists were right: Government agents are distributing misinformation online as a massive propaganda campaign. While much has been made of the social media campaigns of ISIS and other nefarious groups, it's also becoming more clear how much governments—both Western and not—are spreading their message online. The Israeli Defense Force has long had an active online propaganda campaign, even offering scholarships to college students for circulating pro-IDF messages online. The Daily Dot's own James Neimeister explored how Russian operatives spread rumors to the press through Twitter to assist pro-Russian rebels in the fight against Ukraine. Just this week, Great Britain unveiled their own troop of "Facebook warriors" for the information age. The 77th Brigade—so named after a legendary and controversial group of British-Burmese guerrilla fighters—will practice "non-lethal warfare" by creating "dynamic narratives" on social media. In short, these 1,500 British troops will be scouring Facebook and Twitter to promote pro-Western narratives to combat the storyline ISIS uses to recruit young people across the planet. If you aren't a government agent or a terrorist operative, however, this still affects your life. The Internet, for all of its ability to bring the world's libraries to your fingertips, is also a hotbed of misinformation, deceit, and plain old lies. While such campaigns have been waged by corporations, special interest groups, and trolling pranksters, this evolution of world governments participating—especially clandestinely—deserves the attention of even the most discerning consumer. On many levels, this British force is a necessary part of combatting groups like ISIS or the misinformation campaigns of Putin's Russia. ISIS has created one of the most effective recruiting campaigns of any terrorist group in history, convincing thousands of Westerners to join their fight in Syria. Such a nefarious use of social media needs the truth to combat against it, such as this French campaign that promises future ISIS fighters "you will discover Hell on Earth and die alone and far from home."

Memes are the only effective method to stop ISIS

RT 5/8 – Russian Times

Russian Times, 5/8/2015, Russian Times, "Meme's the word: US lawmakers want to 'blow ISIS out of the water' with...the internet", <http://www.rt.com/usa/256717-senators-isis-recruitment-internet-memes/>, 7/17/2015, \\BD

While the US is fighting ISIS intensively on the ground, some lawmakers also want Washington to take the battle online. One even proposed using internet memes, noting that the terrorist group has successfully used them to further its mission. During a 'Jihad 2.0' hearing on social media and terrorism, the Senate Homeland Securities and Government Affairs Committee discovered that the Islamic State (IS, formerly ISIS/ISIL) has managed to attract the interest of 62 people in the US through social media. The interested online parties either tried to join IS (some successfully) or supported others in doing so. Of the 62 people, 53 were very active on social media, downloading jihadist propaganda. Some of them directly communicated with IS. But Sen. Ron Johnson (R-Wisc.) had just the answer to the problem –

and it didn't involve deadly weapons or military troops. "Let's face it: We invented the Internet. We invented the social network sites. We've got Hollywood. We've got the capabilities...to blow these guys out of the water from the standpoint of communications," he said. "He was supported by Sen. Cory Booker (D-N.J.), who had an unconventional trick up his sleeve: internet memes. "Look at their fancy memes compared to what we're not doing," Booker said while clutching print-outs of ISIS memes. "He said the Islamic State is busying making "slick, fancy and attractive" videos, while the US is spending "millions and millions on old school forms of media." "A prolific user of Twitter, Booker said he knows "something about memes." He became a viral sensation himself after rescuing his neighbor from a burning building in 2012. "The heroic move inspired his own Twitter hashtag, with social media users sharing their own (false) superhero encounters with Booker. One user tweeted that when he needed a kidney, Booker "instantly ripped out his own, handed it to me & flew away." "The hearing, titled 'Jihad 2.0: Social Media in the Next Evolution of Terrorist Recruitment,' is part of an ongoing attempt by Congress to identify ways to thwart efforts by overseas terrorists to lure foreign fighters or incite jihadists to commit attacks inside the US.

Literally, government meming solves

Donoghue 3/12 – witer for ABC News

Paul Donoghue, 3/12/2015, ABC News, "Twitter wars: How the US is fighting Islamic State propaganda through internet memes", <http://www.abc.net.au/news/2015-03-12/state-department-counter-radicalisation-twitter/6290436>, 7/18/2015, \\BD

The Islamic State group's widespread use of social media to recruit fighters is well publicised, and this week prompted a Sydney Muslim community leader to call for Australia to immediately launch a social media campaign to halt the grooming of jihadists. But what might such a campaign look like? "The US State Department already runs three Twitter accounts - @DOTArabic, @DSDOTAR, and @DigitalOutreach - that fire off dozens of tweets a day in Arabic and often directly reply to people who espouse radical views." The aim, it says, is to "counter terrorist propaganda and misinformation about the United States across a wide variety of interactive digital environments that had previously been ceded to extremists". "Many of the tweets poke fun at IS beliefs and use images that resemble internet memes to target the group's hypocrisy. Here are 12 such memes, with translations into English.

Epist Indict

Be skeptical – overestimating the threat legitimizes jihadists

Gander 7/7 – writer for The Independent

Kashmira Gander, 7/7/2015, The Independent, "Isis: Threat posed by extremist group should not be amplified, urges Australian politician Malcolm Turnbull",
<http://www.independent.co.uk/news/world/politics/isis-threat-posed-by-extremist-group-should-not-be-amplified-urges-australian-politician-malcolm-turnball-10373544.html>, 7/18/2015, \\BD

Politicians must be careful not to over-hype the threat that Isis poses, so as not to legitimise the "delusions" held by jihadists, an Australian politician has urged. Communications minister Malcolm Turnbull has called for the debate on terrorism to remain calm, civil and proportional. His comments come after Prime Minister Tony Abbott warned the country that Isis is "coming after us", Australia's ABC reported. In a speech to the Sydney Institute, Turnbull urged Australia to avoid inadvertently aiding Isis by making them appear more dangerous than they are, or else risk becoming "amplifiers of their wickedness and significance", The Guardian. He told the audience that while the security threat Isis poses should not be underestimated, politicians must maintain a sense of perspective. "We should be careful not to say or do things which can be seen to add credibility to those delusions," he said, arguing that Isis' leaders "dream" of sweeping across the Middle East and into Europe like medieval Arab armies.

ISIS Impact D

ISIS not a threat – comparative evidence citing the Air Force General

Klimas 7/14 – writer for The Washington Post, citing the Air Force General

Jacqueline Klimas, 7/14/2015, The Washington Post, “Islamic State no threat to U.S. homeland: Air Force general”, <http://www.washingtontimes.com/news/2015/jul/14/isis-no-threat-us-homeland-air-force-general-says/>, 7/18/2015, \\BD

Air Force Gen. Paul Selva on Tuesday ranked the Islamic State the least-threatening group to the U.S., saying that the terrorists do not pose a threat to the homeland. At a Senate Armed Services Committee hearing on his nomination to be the vice chairman of the joint chiefs of staff, Sen. John McCain, Arizona Republican, asked Gen. Selva to rank the threats the U.S. is facing today. “I would put the threats to this nation in the following order: Russia, China, Iran, North Korea, and all of the organizations that have grown around ideology that was articulated by al Qaeda,” he said, mirroring the list gave by Marine Corps Gen. Joseph Dunford last week in his nomination to be chairman of the joint chiefs of staff. Gen. Selva, pressed by Mr. McCain on why he would put terrorists groups such as the Islamic State last, said that the group **does not threaten** Americans or its allies at home. “Right now [the Islamic State] does not present a clear and presence threat to our homeland and to our nation,” he said. “It is a threat we must deal with ... but it does not threaten us at home.”

AT ISIS Bioweapons

ISIS Ebola threat is all hype

Evans 14 – writer for Slate

Nicholas G. Evans, 10/10/2014, Slate, “Ebola Is Not a Weapon”,
http://www.slate.com/articles/health_and_science/science/2014/10/ebola_and_bioterrorism_the_virus_is_not_a_bioweapon_despite_media_myths.html, 7/18/2015, \\BD

Stop it. Just stop it. Ebola isn't a potential weapon for terrorists. It isn't, as reported by Forbes and the Daily Mail, a low-tech weapon of bioterror for ISIS. It isn't the final refuge of a lone wolf on a suicide mission, in the words of Fox News. It isn't a U.S.-built race-targeting bioweapon, as the leader of the Nation of Islam declared. Ebola is very real, and very scary. But this outbreak isn't a recipe for a bioweapon. Not unless you want to be the most incompetent bioterrorist in history. First, the virus isn't a viable bioweapon candidate. It doesn't spread quickly—its R0, a measure of how infectious a virus is, is about 2. That means that, in a population where everyone is at risk, each infected person will, on average, infect two more people. But because someone with Ebola is infectious only when she shows symptoms, we've got plenty of chances to clamp down on an outbreak in a country with a developed public health system. And unlike some bioweapons, such as anthrax, Ebola's transmission mechanism makes it really hard to weaponize. Anthrax spores can be dried and milled so they form little particles that can float on the air and be inhaled. Ebola requires the transmission of bodily fluids, and those don't make efficient or stealthy weapons. (And no—even though you may have heard this—Ebola is not “airborne.” The one study everyone talks about showed that pigs could transmit Ebola to macaques through an unknown mechanism that may have involved respiratory droplets. The researchers noted, however, that they couldn't get macaques to transmit it to each other. The take-home from the study is really that pigs can spread Ebola.) This alone pretty much rules it out as a bioweapon. A terrorist organization would have to go door to door with bags of blood and vomit to infect even a handful of people—and you'd probably notice it. What about “suicide sneezers,” you may ask? Someone who deliberately infects herself with Ebola and then proceeds to pass it on to others? That's a losing game for the terrorist. Someone with Ebola isn't infectious until she has symptoms, and even then, there is often only a small window for action before the disease takes hold. Many people who contract Ebola do so while caring for someone who is crippled by the affliction. A terrorist who wants to infect others isn't likely to be functional enough to run around spreading the disease for very long—and even then, will find it hard to transmit the virus. As for conspiracies about engineered Ebola, we know the virus appeared in 1976. The 1970s was also a time when genetic engineering was in its infancy—no one could've engineered a virus, even if he'd wanted to. Short of a time-traveling bioterrorist, that particular theory isn't tenable. What about now, though? Could a bioterrorist group—or, more likely, a secret national bioweapons program, like the one run by the Soviet Union during the Cold War—take Ebola and modify it to be airborne or more contagious? It isn't likely. Why? One, because it is really difficult—we just don't know enough about viruses to spontaneously engineer new traits. There is also a whole host of other nasty bugs that are already better designed to be weapons. Bugs like smallpox. If terrorists are going to go to all the trouble of engineering a bioweapon, they are likely to pick a much, much better starting point than Ebola. Finally, even if one of these unlikely scenarios came to pass, what enemy is going to be able to claim to have weaponized Ebola and have anyone believe them? ISIS and other militant groups rely on carefully managed reputations to achieve their goals. Executions and explosions

work for terrorists because there is something to be gained in doing so: fear, and credit for causing fear. There's nothing to be gained in using a disease like Ebola during an outbreak because it is difficult prove it was deliberate, and thus you can't brag about it. The fear that an emerging infectious disease could in fact be a weapon is not new. In 1918, Lt. Col. Philip S. Doane voiced a suspicion that the pandemic "Spanish flu" strain was in fact a germ weapon wielded by German forces. More recently, an Australian professor of epidemiology argued that Middle Eastern respiratory syndrome could be a bioterror agent. People love to craft theories that provide malevolent agency to disease outbreaks. Yet while bioterrorism is possible—advances in technology are making that easier—for now, nature is almost always the culprit. Ebola isn't a weapon; it's the collision between humans and their environment. It's about the failure of public health in Guinea, Liberia, and Sierra Leone. And it's a failure, on our parts, to act and assist the people of these countries. That's a failure of trust. In developed countries, the biggest threat is not the terrorist, but fear. That fear is causing lawmakers to campaign for stepping up screening, even though it is unlikely to work—it is too hard to track people in air travel, and it isn't effective at detecting cases. That fear is causing politicians to claim that we should seal the border to Mexico, or ban all flights out of West Africa. That fear is a powerful weapon that can be used against us. Terror leading us to make bad decisions is much more effective against rich, developed nations than Ebola could be. If we want to beat the latter, we have to beat the former. To beat Ebola, we have to worry less about terrorists, and more about helping others.

New Democracy ! Cards

Democracy decreases the likelihood of conflicts – assumes non-democracy wars

Desposato and Gartzke 4/4 – Associate Professor at UC San Diego in Political Science, Associate Professor at UC San Diego in Political Science

Scott Desposato and Erik Gartzke, 4/4/2015, “How ‘Democratic’ is the Democratic Peace?”, <http://www.democracy.uci.edu/files/docs/conferences/suong.pdf>, 7/20/2015, \\BD

Discussion: This study provides evidence of democracy’s pacifist effect among publics of all regime types. Not only are citizens of Brazil, a democracy, hesitant to go to war against another democracy, but citizens of China, a non-democratic country, are also more reluctant to strike a democratic country. Our results imply that the reluctance to fight a democracy is more widespread than many may have thought. Put slightly differently, rather than possessing uniquely pacifistic publics, democracies appear to benefit from a “halo effect,” in which citizens of other countries are generally reluctant to initiate military aggression against them. Empirically, the effect of democracy is substantially and consistently larger in Brazil than in China; in most comparisons, the effect of democracy is twice as big in Brazil as in China. These patterns, while intriguing, are also not statistically significant. However, they suggest a critical next step. We now know that democracies enjoy a peace surplus of opinion both in democracies and in non-democracies—but are there systematic differences in the magnitude of this affect across countries? Future work involving larger data collection efforts will clarify whether there are cross-national differences in affect toward democracies. Our study has other limitations. Like other scholars working in this area (Tomz and Weeks, 2013b), we used an internet based survey drawn from a commercial panel, not random samples.¹² Although Brazilian and Chinese respondents seem to share a reluctance to strike at a democratic target without UN approval, observed differences or non-differences may reflect different sampling frames instead of different or similar attitudes. The effect of democracy is consistently smaller in China than Brazil by a small margin. A bigger sample size may allow us to propose an alternative hypothesis about the differing effect of regime type in Brazil and China. At present we cannot reject the null hypothesis of no difference between Brazil and China.

Internet K2 Democracy Camp Cards

Data localization will end internet freedom – that's key to freedom of expression

Hill 14 – Internet Policy at U.S. Department of Commerce (Jonah, “The Growth of Data Localization Post-Snowden: Analysis and Recommendations for U.S. Policymakers and Business Leaders”, The Hague Institute for Global Justice, Conference on the Future of Cyber Governance, 2014, May 1, 2014, SSRN)//TT

Free Expression and Internet Freedoms Are Not Well Served. Most troubling of all the potential harms of data localization is its effect on free expression and Internet freedom. This is ironic, in that to many of its advocates, data localization is a remedy to the threat posed by the NSA to free expression and Internet freedom. I suggest that the opposite is actually true, that the “remedy” only serves to make the danger greater. The Internet and other online media have become indispensable tools for individuals to communicate globally and have furthered individual participation in the political process, increased transparency of governmental activities, and promoted fundamental rights. Data localization, by centralizing control over digital infrastructure, can diminish this capacity in a number of ways. As was discussed above, data localization as a local server or local data storage requirement can limit freedom by permitting countries more easily to collect information on their citizens (through domestic surveillance). It allows a government more quickly and effectively to shut down Internet services (usually via legal threats to local Internet service providers) that the government believes is abetting unwanted political opposition. ¹¹⁵ Data localization mandates also can obstruct Internet freedom in other, indirect ways. Restricted routing, in particular, is problematic, because it is not technically possible as the existing Internet is designed or organized. Unlike the telephone network, the Internet operates under a model known as “best effort delivery,” where data is delivered to its destination in the most efficient manner possible, without predetermined routes. For instance, data sent from the United States to Botswana will attempt to travel along the shortest and most direct route possible. However, if there is a bottleneck along the shortest route, a packet may find a longer but more expeditious route. This is a core feature of the Internet that makes network congestion easy to navigate around. In order to restrict data routing to specific geographies as governments are advocating, all Internet routers that are currently programmed to follow this “best effort” routing model would have to be reconfigured to prohibit data from one country from moving through the territory of “prohibited” countries. Moreover, since Internet addresses are not always assigned according to a specific geography, the Internet’s addressing system currently would have to be dramatically altered as well. Thus, the Border Gateway Protocol (one of the core Internet networking protocols), the Internet’s routing tables (the address books by which routers send data), and the process by which IP addresses are allocated, would all have to be modified. Such an undertaking would require a fundamental overhaul not only of the Internet’s operating structures, but also of the governance structures by which those structures are implemented and standardized. These are not just arcane concerns of those involved in Internet governance, although they surely are matters that greatly trouble those who favor an efficient and interoperable Internet. These alterations in the way the Internet works will, I believe, materially restrict the power of the Internet to support free expression. These modifications to these core characteristic of the current Internet – modifications that localization would require – may result in intelligence agencies acquiring a previously unavailable capacity to assess where data had originated and where it was heading, because the origin and destination information would be included in the data packet.¹¹⁶ A centralized governance process, further, which would be required to change the routing protocols and IP allocation system, would give authoritarian countries significantly more influence over how information on the Internet is regulated. In fact, this is one of the main reasons why China, Russia, many Arab states (among others) have pushed for tracked routing protocols in the past,¹¹⁷ just as they have lobbied for a handover of the global Internet governance system to the U.N.’s International Telecommunications Union.¹¹⁸ In short, localization would require dramatic changes to the current structure of the Internet, changes that would have adverse consequences for those who see it as a principal – if not the principal – means of global democratization. For some, those adverse consequences would be unintended; more chillingly, there are those who intend precisely those consequences. This would be an enormous price to pay, particularly since the other objectives that are promoted as justifications for localization – namely, security for communications and economic development – are illusory.

Other countries will use US Internet surveillance as an excuse to oppress their citizens

Solash '13 – contributor to SG News, (Richard S., “US Internet surveillance could backfire,”

<http://sgnews.ca/2013/07/22/us-internet-surveillance-could-backfire/0->) VD

The University of Toronto’s Deibert says the NSA affair could also lead to renewed calls for an international agreement on cyberspace governance — calls that Internet freedom advocates and Western governments have found problematic in the past. He recalls a “code of conduct” for cyberspace proposed by China, Russia, Tajikistan, and Uzbekistan at the UN General Assembly in 2011 that favored state controls. “The proposals that were made by Russia and other countries at the UN were more or less fumbles politically and were scuttled for that reason,” Deibert says. “But in the wake of the NSA revelation, I am sure those types of proposals will be resurrected and find much greater traction among a wide range of swing countries which no doubt are now looking with a great deal of skepticism towards the United States-led Internet freedom agenda.” Some have also expressed concern that

the US government's explanation for its surveillance program — legitimate or not — could be manipulated by repressive governments: Washington has defended the program as a legally authorized method of helping to guard the country against terrorist attacks. Countries ranging from China to Belarus to Uzbekistan have previously rationalized pervasive online censorship under the banner of national security. ¶ Rebecca MacKinnon, an expert on internet freedom at the New America Foundation in Washington, says the United States can still work against the misuse of the NSA revelations by foreign governments. ¶ Implementing reforms and ensuring accountability is the way to do so, she says. ¶ "The United States needs to absolutely bring its system of surveillance and national security into line with constitutional checks and balances and if it fails to do so, I think then rest of the world will use our failure to do so as an excuse to be unaccountable themselves," MacKinnon says. "Unless and until we begin to lead by example, unfortunately, things are not going to be pretty."

***Internet freedom facilitates democratic transitions—extensive scholarship proves Nisbet 12**

et al 12 – PhD in communication, assistant professor at the School of Communication at The Ohio State University, research on public diplomacy, foreign policy, comparative democratization, and communication (Erik, "Internet Use and Democratic Demands: A Multinational, Multilevel Model of Internet Use and Citizen Attitudes About Democracy", Journal of Communication, April 2012, <http://onlinelibrary.wiley.com/doi/10.1111/j.1460-2466.2012.01627.x/epdf//DBI>

Moving from institutions to citizens, an open question is whether greater Internet penetration and use influence individual attitudes about democracy? Though not empirically tested, Howard (2009) answers this question in the affirmative, theorizing that Internet use plays an important role in shaping and mobilizing citizen attitudes about democracy in transitioning or emerging democracies. Howard asserts that traditional media in nondemocratic states "constrains" public opinion to those of ruling elites, creating a passive public incapable of challenging autocratic institutions and power-relations. Leslie (2002) and Howard view the Internet as distinct from the one-way communication of radio, television, and print media that provide information to an audience, but are incapable of soliciting immediate feedback. The Internet is lauded as having great democratic potential because it does allow for feedback and encourages the development of "participant" citizens, as described by Almond and Verba (1963). Rather than acting as passive receptors of political information, participant citizens are more sophisticated and engage with political information provided to them and subsequently respond or make "demands" from it (Almond & Verba, 1963). For example, as Lei (2011) observes in the case of China, the "Internet has contributed to a more critical and politicized citizenry" with "citizens no longer merely compliant receivers of official discourse" (p. 311). In this sense, Howard sees the potential of the Internet, especially when paired with organizations such as political parties or movements, to promote the formation of "mass" public opinion that demands political change within authoritarian or democratizing states. Other scholars also embrace the Internet's capacity to promote political change by serving as a pluralistic media platform (Bratton et al., 2005; Groshek, 2009; Lei, 2011). Bratton and colleagues (2005) argue that media use in transitioning or emerging democracies "expands the range of considerations that people bear in forming their political and economic attitudes," which promotes democratic citizenship and greater demand for democratic processes and reform (Bratton et al., 2005, p. 209). Media that enjoys low government regulation and high plurality of content have "the greatest impact in inducing an audience to reject authoritarian rule, especially one-party rule," compared to other forms of media use (p. 210). In this context, Groshek (2009) draws upon media dependency theory (Ball-Rokeach & DeFleur, 1976) to argue that Internet use influences the democratic orientations of audiences—which in turn promotes (democratic) change in sociopolitical systems in which audiences are embedded. Internet penetration, in other words, allows citizens to access more pluralistic content that increases citizen demand for democracy. Increased demand promotes "bottom-up" democratization by increasing the likelihood of democratic transitions in nondemocratic states or strengthening democratic institutions in young democracies. Lei (2011) asserts this bottom-up democratization has emerged in China, with "netizens" constituting "an important social force that imposes much pressure on the authoritarian state" (p. 311). Moreover, this theoretical perspective is

consistent with scholarship examining the role of citizen attitudes in processes of democratization (Inglehart & Welzel, 2005; Mattes & Bratton, 2007; Welzel, 2007).

The Internet is vital to the emergence of global publics – that's key to democracy

Keane 11 – Professor of Politics at the University of Sydney (John, "Democracy in the Age of Google, Facebook and WikiLeaks" <http://sydney.edu.au/arts/downloads/news/ALR.pdf>)

o **Communicative abundance enables one other trend that is of life-and-death importance to the future of democracy: the growth of cross-border publics whose footprint is potentially or actually global** in scope. o The Canadian Scholar

Harold Innis famously showed that communications media like the wheel and the printing press and the telegraph had distance-shrinking effects, but genuinely globalised communication only began (during the nineteenth century) with overland and underwater telegraphy and the early development of international news agencies like Reuters. The process is currently undergoing an evolutionary jump, thanks to the development of a combination of forces:

wide-footprint geo-stationary satellites, **weblogs and other specialist computer-networked media, the growth of global**

journalism and the expanding and merging flows of international news, **electronic data exchange**, entertainment and education materials controlled by giant firms like Thorn-EMI,

AOL/Time-Warner, News Corporation International, the BBC, Al Jazeera, Disney, Bertelsmann, Microsoft, Sony and CNN. o **Global media linkages certainly have downsides**

for democracy. Global media integration has encouraged loose talk of the abolition of barriers to communication (John Perry Barlow). It is said to be synonymous with the rise of a 'McWorld' (Benjamin Barber)

dominated by consumers who dance to the music of logos, advertising slogans, sponsorship, trademarks and jingles. In the most media-saturated societies, such as the United States, global media integration nurtures pockets of parochialism; citizens who read local 'content engine' newspapers like The Desert Sun in Palm Springs or Cheyenne's Wyoming Tribune-Eagle are fed a starvation diet of global stories, which typically occupy no more than about 2% of column space. And not to be overlooked is the way governments distort global information flows. Protected by what in Washington are called 'flack packs' and dissimulation experts, governments cultivate links with trusted or

'embedded' journalists, organise press briefings and advertising campaigns, so framing - and wilfully distorting and censoring - global events to suit current government policies. o All **these fickle counter-**

trends are sobering, but they are not the whole story. For in the age of communicative abundance there

are signs that the spell of parochialism upon citizens is not absolute because global media integration is

having an unanticipated political effect: by nurturing a world stage or theatrum mundi, global journalism and other

acts of communication are slowly but surely cultivating public spheres in which many millions of people scattered

across the earth witness mediated controversies about who gets what, when, and how, on a world

scale. o Not all global media events - sporting fixtures, blockbuster movies, media awards, for instance - sustain global publics, which is to say that audiences are not publics and public spheres are not simply domains of entertainment or play. Strictly speaking, global publics are scenes of the political. Within global publics, people at various points on the earth witness the powers of governmental and non-governmental organisations being publicly named, monitored, praised, challenged, and condemned, in defiance of the old tyrannies of time and space and publicly unaccountable power. It is true that global publics are neither strongly institutionalised nor effectively linked to mechanisms of representative government. This lack is a great challenge for democratic thinking and democratic politics. Global publics are voices without a coherent body politic; it is as if they try to show the world that it resembles a chrysalis capable of hatching the butterfly of cross-border democracy - despite the fact that we currently have no good account of what 'regional' or 'global' or 'cross border' democratic representation might mean in

practice. o Still, in spite of everything, **global publics have marked political effects**, for instance **On** the suit-and-tie worlds of **diplomacy, global**

business, inter-governmental meetings and independent non-governmental organizations. Every great

global issue since 1945 - human rights, the dangers of nuclear war, continuing discrimination against

women, the greening of politics - every one of these issues **first crystallised within these publics** Global publics sometimes have 'meta-political'

effects, in the sense that they help create citizens of a new global order. The speech addressed to 'global citizens' by Barack Obama at the Siegestaule in the Tiergarten in July 2008 is a powerful case in point, a harbinger of a remarkable trend in which those who are caught up within global publics learn that the boundaries between native and foreigner are blurred. They consequently become footloose. They live here and there; they discover the

'foreigner' within themselves. o Global publics centred on ground-breaking media events like Live-Aid (in 1985 it attracted an estimated one billion viewers) can be spaces of fun, in which millions taste something of the joy of acting publicly with and against others for some defined common purpose. When by contrast they come in the form of televised world news of the suffering of distant strangers, global publics highlight cruelty; they make possible what Hannah Arendt once called the 'politics of pity'. And especially during dramatic media events - like the nuclear meltdown at Chernobyl, the Tiananmen massacre, the 1989 revolutions in central-eastern Europe, the overthrow and arrest of Slobodan Milosevic, the 9/11 terrorist attacks and the recent struggles for dignity in Tunisia and Egypt - public spheres intensify audiences' shared sense of living their lives contingently, on a knife edge, in the subjective

tense. o **The witnesses of such events** (contrary to McLuhan) do not experience uninterrupted togetherness. They do not enter a 'global village' dressed in the skins of humankind and thinking in

the terms of a primordial 'village or tribal outlook'. They instead **come to feel the pinch of the world's power relations; in consequence,**

they put matters like representation, accountability and legitimacy on the global political agenda, in

effect by asking whether new democratic measures could inch our little blue and white planet towards greater

openness and humility, potentially to the point where power, wherever it is exercised within and across

borders, would come to feel more 'biodegradable', a bit more responsive to those whose lives it

currently shapes and reshapes, secures or wrecks

Data localization leads to authoritarian information control – collapses democracy

Chandler and Le 15 – Professor of Law, B.A. from UC Davis, J.D. from Harvard; B.A. from Yale, J.D. from US Davis

- * Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; A.B., Harvard College; J.D., Yale Law School AND **Free Speech and Technology Fellow, California International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law (Anupam and Uyen, "DATA NATIONALISM" 64 Emory L.J. 677, lexis)

E. Freedom Information control is central to the survival of authoritarian regimes. Such regimes require the suppression of adverse information in order to maintain their semblance of authority. This is because "even authoritarian governments allege a public mandate to govern and assert that the government is acting in the best interests of the people." n280 Information that disturbs the claim of a popular mandate and a beneficent government is thus to be eliminated at all costs. Opposition newspapers or television is routinely targeted, with licenses revoked or printing presses confiscated. The Internet has made this process of information control far more difficult by giving many dissidents the ability to use services based outside the country to share information. The Internet has made it harder, though not impossible, for authoritarian regimes to suppress their citizens from both sharing and learning information. n281 Data localization will erode that liberty-enhancing feature of the Internet. The end result of data localization is to bring information increasingly under the control of the local authorities, regardless of whether that was originally intended. The dangers inherent in this are plain. Take the following cases. The official motivation for the Iranian Internet, as set forth by Iran's [*736] head of economic affairs Ali Aghamohammadi, was to create an Internet that is "a genuinely halal network, aimed at Muslims on an ethical and moral level," which is also safe from cyberattacks (like Stuxnet) and dangers posed by using foreign networks. n282 However, human rights activists believe that "based on [the country's] track record, obscenity is just a mask to cover the government's real desire: to stifle dissent and prevent international communication." n283 An Iranian journalist agreed, "this is a ploy by the regime," which will "only allow[] [Iranians] to visit permitted websites." n284 More recently, even Iran's Culture Minister Ali Janati acknowledged this underlying motivation: "We cannot restrict the advance of [such technology] under the pretext of protecting Islamic values." n285 Well aware of this possibility, Internet companies have sought at times to place their servers outside the country in order to avoid the information held therein being used to target dissidents. Consider one example: when it began offering services in Vietnam, Yahoo! made the decision to use servers outside the country, perhaps to avoid becoming complicit in that country's surveillance regime. n286 This provides important context for the new Vietnamese decree mandating local accessibility of data. While the head of the Ministry of Information's Online Information Section defends Decree 72 as "misunderstood" and consistent with "human rights commitments," n287 the Committee to Protect Journalists worries that this decree will require "both local and foreign companies that provide Internet services ... to reveal the identities of users who violate numerous vague prohibitions against certain speech in Vietnamese law." n288 As Phil Robertson of Human Rights Watch argues, "This is a law that has been established for selective persecution. This [*737] is a law that will be used against certain people who have become a thorn in the side of the authorities in Hanoi." n289 Data localization efforts in liberal societies thus offer cover for more pernicious efforts by authoritarian states. When Brazil's government proposed a data localization mandate, a civil society organization focused on cultural policies compared the measure to the goals of China and Iran: [SEE FIGURE IN ORIGINAL] Translated, this reads as follows: "Understand this: storing data in-country is the Internet dream of China, Iran, and other totalitarian countries, but it is IMPOSSIBLE #MarcoCivil." n290 Thus, perhaps the most pernicious and long-lasting effect of data localization regulations is the template and precedent they offer to continue and enlarge such controls. When liberal nations decry efforts to control information by authoritarian regimes, the authoritarian states will cite our own efforts to bring data within national control. If liberal states can cite security, privacy, law enforcement, and social economic reasons to justify data controls, so can authoritarian states. Of course, the Snowden revelations of widespread U.S. surveillance will themselves justify surveillance efforts by other states. For example, Russia has begun to use NSA surveillance to justify increasing control over companies such as Facebook and Google. n291 Such rules have led critics to worry about increasing surveillance powers of the Russian state. n292 Critics caution, "In the future, Russia may even succeed in splintering the web, [*738] breaking off from the global Internet a Russian intranet that's easier for it to control." n293 Even though officials describe such rules as being antiterrorist, others see a more sinister motive. The editor of Agentura.ru, Andrei Soldatov, believes that Zheleznyak's proposal is motivated by the government's desire to control internal dissent. n294 Ivan Begtin, the director of the group Information Culture, echoes this, arguing that Zheleznyak's surveillance power "will be yet another tool for controlling the Internet." n295 Begtin warns, "In fact, we are moving very fast down the Chinese path." n296 Finally, creating a poor precedent for more authoritarian countries to emulate is not the only impact on liberty of data localization by liberal states. Even liberal states have used surveillance to undermine the civil rights of their citizens and residents. n297 The proposal for a German "Internetz" has drawn worries that national routing would require deep packet inspection, raising fears of extensive surveillance. n298 The newspaper Frankfurter Allgemeine argues that not only would a state-sanctioned network provide "no help against spying," it would lead to "a centralization of surveillance capabilities" for German spy agencies. n299 India's proposed localization measures in combination with the various surveillance systems in play - including Aadhaar, CMS, National Intelligence Grid (Natgrid), and Netra - have raised concerns for human rights, including freedom of expression. n300 [*739] In addition to concerns regarding human rights violations based on surveillance and censorship, data localization measures also interfere with the freedom of expression - particular the "freedom to seek, receive and impart information and ideas of all kinds, regardless of frontier[]." n301 Preventing citizens from using foreign political forums because such use might cause personal data to be stored or processed abroad might interfere with an individuals' right to knowledge. n302 Armed with the ability to block information from going out and to filter the information coming in, data location consolidates power in governments by making available an infrastructure for surveillance and censorship.

That will collapse the global internet

Chandler and Le 15 – Professor of Law, B.A. from UC Davis, J.D. from Harvard; B.A. from Yale, J.D. from US Davis

- * Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; A.B., Harvard College; J.D., Yale Law School AND **Free Speech and Technology Fellow, California International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law (Anupam and Uyen, "DATA NATIONALISM" 64 Emory L.J. 677, lexis)

The era of a global Internet may be passing. Governments across the world are putting up barriers to the free flow of information across borders. Driven by concerns over privacy, security, surveillance, and law enforcement, governments are erecting borders in cyberspace, breaking apart the World Wide Web. The first generation of Internet border controls sought to keep information out of a country - from Nazi paraphernalia to copyright infringing material. n1 The new generation of Internet border controls seeks not to keep information out but rather to keep data in. Where the first generation was relatively narrow in the information excluded, the new generation seeks to keep all data about individuals within a country. a Efforts to keep data within national borders have gained traction in the wake of revelations of widespread electronic spying by United States intelligence agencies. n2 Governments across the world, indignant at the recent disclosures, have cited foreign surveillance as an argument to prevent data from leaving their borders, allegedly into foreign hands. n3 As the argument [*680] goes, placing data in other nations jeopardizes the security and privacy of such information. We define "data localization" measures as those that specifically encumber the transfer of data across national borders. These measures take a wide variety of forms - including rules preventing information from being sent outside the country, rules requiring prior consent of the data subject before information is transmitted across national borders, rules requiring copies of information to be stored domestically, and even a tax on the export of data. We argue here that data localization will backfire and that it in fact undermines privacy and security, while still leaving data vulnerable to foreign surveillance. Even more importantly, data localization increases the ability of governments to surveil and even oppress their own populations. a Imagine an Internet where data must stop at national borders, examined to see whether it is allowed to leave the country and possibly taxed when it does. While this may sound fanciful, this is precisely the impact of various measures undertaken or planned by many nations to curtail the flow of data outside their borders. Countries around the world are in the process of creating Checkpoint Charlies - not just for highly secret national security data but for ordinary data about citizens. The very nature of the World Wide Web is at stake. We will show how countries across the world have implemented or have planned dramatic steps to curtail the flow of information outside their borders. By creating national barriers to data, data localization measures break up the World Wide Web, which was designed to share information across the globe. n4 The Internet is a global network based on a protocol for interconnecting computers without regard for national borders. Information is routed across this network through decisions made autonomously and automatically at local routers, which choose paths based largely on efficiency, unaware of political borders. n5 Thus, the services built on the Internet, from email to the World [*681] Wide Web, pay little heed to national borders. Services such as cloud computing exemplify this, making the physical locations for the storage and processing of their data largely invisible to users. Data localization would dramatically alter this fundamental architecture of the Internet. a Such a change poses a mortal threat to the new kind of international trade made possible by the Internet - information services such as those supplied by Bangalore or Silicon Valley. n6 Barriers of distance or immigration restrictions had long kept such services confined within national borders. But the new services of the Electronic Silk Road often depend on processing information about the user, information that crosses borders from the user's country to the service provider's country. Data localization would thus require the information service provider to build out a physical, local infrastructure in every jurisdiction in which it operates, increasing costs and other burdens enormously for both providers and consumers and rendering many of such global services impossible. a While others have observed some of the hazards of data localization, especially for American companies, n7 this Article offers three major advances over earlier work in the area. First, while the earlier analyses have referred to a data localization measure in a country in the most general of terms, our Article provides a detailed legal description of localization measures. Second, by examining a variety of key countries around the world, the study allows us to see the forms in which data localization is emerging and the justifications offered for such measures in both liberal and illiberal states. Third, the Article works to comprehensively refute the various arguments for data localization offered around the world, showing that data localization measures are in fact likely to undermine security, privacy, economic development, and innovation where adopted. a [*682] Our paper proceeds as follows. Part I describes the particular data localization measures in place or proposed in different countries around the world, as well as in the European Union. Part II then discusses the justifications commonly offered for these measures - such as avoiding foreign surveillance, enhancing security and privacy, promoting economic development, and facilitating domestic law enforcement. We appraise these arguments, concluding that, in fact, such measures are likely to backfire on all fronts. Data localization will erode privacy and security without rendering information free of foreign surveillance, while at the same time increasing the risks of domestic surveillance.

Mandatory data localization wrecks US internet company competitiveness and US internet freedom – also threatens the functioning of the internet itself

Kehl, 14 – Policy Analyst at New America’s Open Technology Institute (Danielle, “Surveillance Costs: The NSA’s Impact on the Economy, Internet Freedom & Cybersecurity” July, <https://www.newamerica.org/oti/surveillance-costs-the-nsas-impact-on-the-economy-internet-freedom-cybersecurity/>)

Some analysts have questioned whether data localization and protection proposals are politically motivated and if they would actually enhance privacy and security for ordinary individuals living in foreign countries,¹⁶⁰ especially given the existence of similar laws in a number of countries and Mutual Legal Assistance Treaties (MLATs) between nations that provide cross-border access to data stored for lawful investigations.¹⁶¹ Yet there is no doubt that American companies will pay a steep price if these policies move forward. Mandatory data localization laws could lead to soaring costs for major Internet companies such as Google, Facebook, and Twitter, who would be faced with the choice of investing in additional, duplicative infrastructure and data centers in order to comply with new regulations or pulling their business out of the market altogether.¹⁶² In testimony before Congress last November, for example, Google’s Director of Law Enforcement and Information Security suggested that requirements being discussed in Brazil could be so onerous that they would effectively bar Google from doing business in the country.¹⁶³ The penalties that companies face for violating these new rules are also significant. In some cases, unless U.S. policy changes, it may be virtually impossible for American companies to avoid violating either domestic or foreign laws when operating overseas.¹⁶⁴ The costs and legal challenges could easily prevent firms from expanding in the first place or cause them to leave existing markets because they are no longer profitable.¹⁶⁵ ITIF’s Daniel Castro has suggested that data privacy rules and other restrictions could slow the growth of the U.S. technology-services industry by as much as four percent.¹⁶⁶ Data localization proposals also threaten to undermine the functioning of the Internet, which was built on protocols that send packets over the fastest and most efficient route possible, regardless of physical location. If actually implemented, policies like those suggested by India and Brazil would subvert those protocols by altering the way Internet traffic is routed in order to exert more national control over data.¹⁶⁷ The localization of Internet traffic may also have significant ancillary impacts on privacy and human rights by making it easier for countries to engage in national surveillance, censorship, and persecution of online dissidents, particularly where countries have a history of violating human rights and ignoring rule of law.¹⁶⁸ Ironically, data localization policies will likely degrade – rather than improve – data security for the countries considering them, making surveillance, protection from which is the ostensible reason for localization, easier for domestic governments, if not foreign powers, to achieve.” writes Jonah Force Hill.¹⁶⁹ The rise in data localization and data protection proposals in response to NSA surveillance threatens not only U.S. economic interests, but also Internet Freedom around the world.

The last tech bubble caused premiums to go sky high – natural bubbles ruin the economy

Tabb 04 [Tabb, William K.. *Economic Governance in the Age of Globalization*. New York, NY, USA: Columbia University Press, 2004. ProQuest eLibrary. Web. 19 July 2015.].//kmc

If war and terrorism are to frame the world’s prospects a number of costly consequences follow for important sectors such as the travel industry, airlines and hotels, and more widely in such aspects as the cost of insurance coverage for buildings, ships, and factories for which premiums jumped in a number of locations in the wake of military activity in the Persian Gulf. Security concerns add to the cost of transporting goods and can have an impact on industries whose products are considered strategic. William Archey, president of the American Electronics Association, fearing more restrictions on sales, spoke for the thousands of companies he represented of the impact of export controls. Two years after the high tech bubble had peaked, the sector had lost over half a million jobs, and fear of a security state augured to make matters worse. Archey’s

members, he said, “are worried that politicians will take a short sighted approach to national security that will not make us more secure but will harm our economy” (Foremski, 2003: 1). U.S.-based producers were losing out to overseas competitors who were profiting from those restrictions. The group was also alarmed at massive cutbacks to education from squeezed state budgets. “We need well-educated people; it is what feeds the high tech sector,” he said adding that loss of a skilled workforce would push firms to go abroad. His was not the only industry which expressed such concerns.

The tech bubble isn't real – venture capital, demand

Harris 7/16 [Melissa, 2015. Hate to burst your bubble, but tech investment is healthy.

<http://www.chicagotribune.com/business/columnists/ct-harris-tech-bubble-0717-biz-20150716-column.html> 7/19)//kmc

The tech bubble doesn't exist.^a That's the point of a 53-slide presentation last month in which three partners from the Silicon Valley venture capital firm Andreessen Horowitz supplied evidence that the tech market is nowhere near the mania levels of 1999 and 2000.^a Andreessen Horowitz's data show that private and public funding for tech companies remains at about 40 percent of what it was in 1999. There's been no surge in venture capital fundraising. It's rising but still below 2006 levels. And venture capital funding as a percentage of the gross domestic product created by the sector is down by half since 1980.^a **There's also a real market for these businesses now. The number of Internet users has increased from 738 million in 2000 to 3.2 billion in 2015, according to a new report from the International Telecommunication Union. Venture funding per person online has been flat since the bubble, while people are spending more on it.**^a Yes, the S&P 500 Information Technology Index is approaching 1999 levels but this time, Andreessen Horowitz argues, profits are driving these returns with price-to-earnings multiples at early 1990s levels.^a (A price-to-earnings ratio is the current price of a share of stock divided by its earnings per share. A large multiple can signal that the market's perception of the company is inflated.)^a “The price-to-earnings ratio of the tech component of the S&P is in fact lower than for the index as a whole,” Bloomberg reported.^a Instead, almost all of the returns are being had in private markets, meaning without a company going public. In other words, you have to know someone or be a large institutional investor to be able to buy equity in privately held companies like Uber even though its estimated worth is some \$40 billion.^a **Overall dollars raised by technology companies are being dominated by such deals.**^a The good news is that mom-and-pops can't bet their retirement funds on Uber.

Censorship Bad -> Localization

Censorship creates inconsistencies within internet localization that spurs innovation to bypass them.

Deibert, 15- (Ron Deibert is director of the Citizen Lab at the Munk School of Global Affairs, University of Toronto. He is the author of *Black Code: Surveillance, Privacy, and the Dark Side of the Internet* (2013). He was a co-founder and principal investigator of the OpenNet Initiative (2003–14).) “Cyberspace Under Siege” *Journal of Democracy* Volume 26, Number 3, July 2015, Project Muse, //droneofark

First-generation controls tend to be “defensive,” and involve erecting national cyberborders that limit citizens’ access to information from abroad. The archetypal example is the Great Firewall of China, a system for filtering keywords and URLs to control what computer users within the country can see on the Internet. Although few countries have matched the Great Firewall (Iran, Pakistan, Saudi Arabia, Bahrain, Yemen, and Vietnam have come the closest), first-generation controls are common. Indeed, Internet filtering of one sort or another is now normal even in democracies. Where countries vary is in terms of the content targeted for blocking and the transparency of filtering practices. Some countries, including Canada, the United Kingdom, and the United States, block content [End Page 65] related to the sexual exploitation of children as well as content that infringes copyrights. Other countries focus primarily on guarding religious sensitivities. Since September 2012, Pakistan has

been blocking all of YouTube over a video, titled “Innocence of Muslims,” that Pakistani authorities deem blasphemous.⁴ A growing number of countries are blocking access to political and security-related content, especially content posted by opposition and human-rights groups, insurgents, “extremists,” or “terrorists.” Those last two terms are in quotation marks because in some places, such as the Gulf states, they are defined so broadly that content is blocked which in most other countries would fall within the bounds of legitimate expression. National-level Internet filtering is notoriously crude.

Errors and inconsistencies are common. One Citizen Lab study found that Blue Coat (a U.S. software widely used to automate national filtering systems) mistakenly blocked hundreds of nonpornographic websites.⁵ Another Citizen Lab study found that Oman residents were blocked from a Bollywood-related website not because it was banned in Oman, but because of upstream filtering in India, the pass-through country for a portion of Oman’s Internet traffic.⁶ In Indonesia, Internet-censorship rules are applied at the level of Internet Service Providers (ISPs). The country has more than three-hundred of these; what you can see online has much to do with which one you use.⁷ As

censorship extends into social media and applications, inconsistencies bloom, as is famously the case in China. In some countries, a user cannot see the filtering, which displays as a “network error.” Although relatively easy to bypass and document,⁸ first-generation controls have won enough acceptance to have opened the door to more expansive measures. Second-generation controls are best thought of as deepening and extending information controls into society through laws, regulations, or requirements that force the private sector to do the state’s bidding by policing privately owned and operated networks according to the state’s demands. Second-generation controls can now be found in every region of the world, and their number is growing. Turkey is passing new laws, on the pretext of protecting national security and fighting cybercrime, that will expand wiretapping and other surveillance and detention powers while allowing the state to censor websites without a court order. Ethiopia charged six bloggers from the Zone 9 group and three independent journalists with terrorism and treason after they covered political issues. Thailand is considering new cybercrime laws that would grant authorities the right to access emails, telephone records, computers, and postal mail without needing prior court approval. Under reimposed martial [End Page 66] law, Egypt has tightened regulations on demonstrations and arrested prominent bloggers, including Arab Spring icon Alaa Abd El Fattah. Saudi blogger Raif Badawi is looking at ten years in jail and 950 remaining lashes (he received the first fifty lashes in January 2015) for criticizing Saudi clerics online. Tunisia passed broad reforms after the Arab Spring, but even there a blogger has been arrested under an obscure older law for “defaming the military” and “insulting military commanders” on Facebook. Between 2008 and March 2015 (when the Supreme Court struck it down), India had a law that banned “menacing” or “offensive” social-media posts. In 2012, Renu Srinivasan of Mumbai found herself arrested merely for hitting the “like” button below a friend’s Facebook post. In Singapore, blogger and LGBT activist Alex Au was fined in March 2015 for criticizing how a pair of court cases was handled. Second-generation controls also include various forms of “baked-in” surveillance, censorship, and “backdoor” functionalities that governments, wielding their licensing authority, require manufacturers and service providers to build into their products. Under new antiterrorism laws, Beijing recently announced that it would require companies offering services in China to turn over encryption keys for state inspection and build into all systems backdoors open to police and security agencies. Existing regulations already require social-media companies to survey and censor their own networks. Citizen Lab has documented that many chat applications popular in China come preconfigured with censorship and surveillance capabilities.⁹ For many years, the Russian government has required telecommunications companies and ISPs to be “SORM-

compliant”—SORM is the Russian acronym for the surveillance system that directs copies of all electronic communications to local security offices for archiving and inspection. In like fashion, India’s Central Monitoring System gives the government direct access to the country’s telecommunications networks. Agents can listen in on broadband phone calls, SMS messages, and email traffic, while all call-data records are archived and analyzed. In Indonesia, where BlackBerry smartphones remain popular, the government has repeatedly pressured Canada-based BlackBerry Limited to comply with “lawful-access” demands, even threatening to ban the company’s services unless BlackBerry agreed to host data on servers in the country. Similar demands have come from India, Saudi Arabia, and the United Arab Emirates. The company has even agreed to bring Indian technicians to Canada for special surveillance training.¹⁰ Also spreading are new laws that ban security and anonymizing tools, including software that permits users to bypass first-generation blocks. Iran has arrested those who distribute circumvention tools, and it has throttled Internet traffic to frustrate users trying to connect to popular circumvention and anonymizer tools such as Psiphon and Tor. Belarus and Russia have both recently proposed making Tor and similar tools illegal. China has banned virtual private networks (VPNs) nationwide—the [End Page 67] latest in a long line of such bans—despite the difficulties that this causes for business. Pakistan has banned encryption since 2011, although its widespread use in financial and other communications inside the country suggests that enforcement is lax. The United Arab Emirates has banned VPNs, and police there have stressed that individuals caught using them may be charged with violating the country’s harsh cybercrime laws. Second-generation controls include finer-grained registration and identification requirements that tie people to specific accounts or devices, or even require citizens to obtain government permission before using the Internet. Pakistan has outlawed the sale of prepaid SIM cards and demands that all citizens register their SIM cards using biometric identification technology. The Thai military junta has extended such registration rules to cover free WiFi accounts as well. China has imposed real-name registration policies on Internet and social-media accounts, and companies have dutifully deleted tens of thousands of accounts that could not be authenticated. Chinese users must also commit to respect the seven “baselines,” including “laws and regulations, the Socialist system, the national interest, citizens’ lawful rights and interests public order, morals, and the veracity of information.”¹¹ By expanding the reach of laws and broad regulations, second-generation controls narrow the space left free for civil society, and subject the once “wild frontier” of the Internet to growing regulation. While enforcement may be uneven, in country after country these laws hang like dark clouds over civil society, creating a climate of uncertainty and fear.

Aff solves Democracy

The aff is an example of providing greater accountability and HR reliance to solve back for anti-democratic rhetoric—sill solves for democracy.

Deibert, 15- (Ron Deibert is director of the Citizen Lab at the Munk School of Global Affairs, University of Toronto. He is the author of Black Code: Surveillance, Privacy, and the Dark Side of the Internet (2013). He was a co-founder and principal investigator of the OpenNet Initiative (2003–14).) "Cyberspace Under Siege" Journal of Democracy Volume 26, Number 3, July 2015, Project Muse, //droneofark

Since June 2013, barely a month has gone by without new revelations concerning U.S. and allied spying—revelations that flow from the disclosures made by former NSA contractor Edward Snowden. The disclosures fill in the picture of a remarkable effort to marshal extraordinary capacities for information control across the entire spectrum of cyberspace. The Snowden revelations will continue to fuel an important public debate about the proper balance to be struck between liberty and security. While the value of Snowden's disclosures in helping to start a long-needed discussion is undeniable, the revelations have also had unintended [End Page 74] consequences for resurgent authoritarianism and cyberspace. First, they have served to deflect attention away from authoritarian-regime cyberespionage campaigns such as China's. Before Snowden fled to Hong Kong, U.S. diplomacy was taking an aggressive stand against cyberespionage. Individuals in the pay of the Chinese military and allegedly linked to Chinese cyberespionage were finding themselves under indictment. Since Snowden, the pressure on China has eased. Beijing, Moscow, and others have found it easy to complain loudly about a double standard supposedly favoring the United States while they rationalize their own actions as "normal" great-power behavior and congratulate themselves for correcting the imbalance that they say has beset cyberspace for too long. Second, the disclosures have created an atmosphere of suspicion around Western governments' intentions and raised questions about the legitimacy of the "Internet Freedom" agenda backed by the United States and its allies. Since the Snowden disclosures—revealing top-secret exploitation and disruption programs that in some respects are indistinguishable from those that Washington and its allies have routinely condemned—the rhetoric of the Internet Freedom coalition has rung rather hollow. In February 2015, it even came out that British, Canadian, and U.S. signals-intelligence agencies had been "piggybacking" on China-based cyberespionage campaigns—stealing data from Chinese hackers who had not properly secured their own command-and-control networks. Third, the disclosures have opened up foreign investment opportunities for IT companies that used to run afoul of national-security concerns. Before Snowden, rumors of hidden "backdoors" in Chinese-made technology such as Huawei routers put a damper on that company's sales. Then it came out that the United States and allied governments had been compelling (legally or otherwise) U.S.-based tech companies to do precisely what many had feared China was doing—namely, installing secret backdoors. So now Western companies have a "Huawei" problem of their own, and Huawei no longer looks so bad. In the longer term, the Snowden disclosures may have the salutary effect of educating a large number of citizens about mass surveillance. In the nearer term, however, the revelations have handed countries other than the United States and its allies an opportunity for the self-interested promotion of local IT wares under the convenient rhetorical guise of striking a blow for "technological sovereignty" and bypassing U.S. information controls. There was a time when authoritarian regimes seemed like slow-footed, technologically challenged dinosaurs whom the Information Age was sure to put on a path toward ultimate extinction. That time is no more—these regimes have proven themselves surprisingly (and dismayingly) light-footed and adaptable. National-level information controls are now deeply entrenched and growing. Authoritarian regimes are becoming more active and assertive, sharing norms, technologies, and "best" practices with one [End Page 75] another as they look to shape cyberspace in ways that legitimize their national interests and domestic goals. Sadly, prospects for halting these trends anytime soon look bleak. As resurgent authoritarianism in cyberspace increases, civil society will struggle: A web of ever more fine-grained information controls tightens the grip of unaccountable elites. Given the comprehensive range of information controls outlined here, and their interlocking sources deep within societies, economies, and political systems, it is clear that an equally comprehensive approach to the problem is required. Those who seek to promote human rights and democracy through cyberspace will err gravely if they stick to high-profile "Internet Freedom" conferences or investments in "secure apps" and digital training. No amount

of rhetoric or technological development alone will solve a problem whose roots run this deep and cut across the borders of so many regions and countries. What we need is a patient, multipronged, and well-grounded approach across numerous spheres, with engagement in a variety of venues. Researchers, investigative journalists, and others must learn to pay more attention to developments in regional security settings and obscure trade fairs. The long-term goal should be to open these venues to greater civil society participation and public accountability so that considerations of human rights and privacy are at least raised, even if not immediately respected. The private sector now gathers and retains staggering mountains of data about countless millions of people. It is no longer enough for states to conduct themselves according to the principles of transparency, accountability, and oversight that democracy prizes; the companies that own and operate cyberspace—and that often come under tremendous pressure from states—must do so as well. Export controls and “smart sanctions” that target rights-offending technologies without infringing on academic freedom can play a role. A highly distributed, independent, and powerful system of cyberspace verification should be built on a global scale that monitors for rights violations, dual-use technologies, targeted malware attacks, and privacy breaches. A model for such a system might be found in traditional arms-control verification regimes such as the one administered by the Organization for the Prohibition of Chemical Weapons. Or it might come from the research of academic groups such as Citizen Lab, or the setup of national computer emergency-response teams (CERTs) once these are freed from their current subordination to parochial national-security concerns.²⁹ However it is ultimately constituted, there needs to be a system for monitoring cyberspace rights and freedoms that is globally distributed and independent of governments and the private sector. Finally, we need models of cyberspace security that can show us how to prevent disruptions or threats to life and property without sacrificing liberties and rights. Internet-freedom advocates must reckon with [End Page 76] the realization that a free, open, and secure cyberspace will materialize only within a framework of democratic oversight, public accountability, transparent checks and balances, and the rule of law. For individuals living under authoritarianism’s heavy hand, achieving such lofty goals must sound like a distant dream. Yet for those who reside in affluent countries, especially ones where these principles have lost ground to antiterror measures and mass-surveillance programs, fighting for them should loom as an urgent priority and a practically achievable first step on the road to remediation.

AT: Cloud computing Bad

Cloud Computing solves Warming

Green cloud computing solves the warming impact

Zhang et al. 11, (Yanwei, University of Tennessee-Knoxville, Master of Science, “GreenWare: Greening Cloud-Scale Data Centers to Maximize the Use of Renewable Energy” <http://www2.ece.ohio-state.edu/~xwang/papers/middleware11.pdf>)

In this paper, we propose GreenWare, a novel middleware system that conducts dynamic request dispatching to maximize the percentage of renewable energy used to power a network of distributed data centers, subject to the desired cost budgets of Internet service operators. We first model the intermittent generation of renewable energy, i.e., wind power and solar power, with respect to the varying weather conditions in the geographical location of each data center. For example, the available wind power generated from wind turbines is modeled based on the ambient wind speed [35,9], while the available solar power from solar plants is estimated by modeling the maximum power point on irradiance (i.e., solar energy per unit area of the solar panel’s face) and temperature [31,41]. Based on the models, we formulate the core objective of GreenWare as a constrained optimization problem, in which the constraints capture the Quality of Service (QoS, e.g., response time) requirements from customers, the intermittent availabilities of renewable energy in different locations, the peak power limit of each data center, and the monthly cost budget of the Internet service operator. We then transfer the optimization problem into a linear-fractional programming (LFP) formulation for an efficient request dispatching solution with a polynomial time average complexity. Specifically, this paper makes the following major contributions: – We propose a novel GreenWare middleware system in operating geographically distributed cloud-scale data centers. GreenWare dynamically dispatches incoming service requests among different data centers, based on the timevarying electricity prices and availabilities of renewable energy in their geographical locations, to maximize the use of renewable energy, while enforcing the monthly budget determined by the Internet service operator. – We explicitly model renewable energy generation, i.e., wind turbines and solar panels, with respect to the varying weather conditions in the geographical location of each data center. As a result, our solution can effectively handle the intermittent supplies of renewable energy. – We formulate the core objective of GreenWare as a constrained optimization problem and propose an efficient request dispatching solution based on LFP. – We evaluate GreenWare with real-world weather, electricity price, and workload traces. Our experimental results show that GreenWare can significantly reduce the dependence of cloud-scale data centers on fossil-fuel-based energy without violating the desired cost budget, despite the intermittent supplies of renewable energy and time-varying electricity prices and workloads.

Cloud Computing Solves Environment

Cloud computing is good for the environment – prefer actual studies with comparative analysis to the squo rather than their uncontextual evidence

Matthews 13, (Richard, The Green Market Group President, Owner/President Small Business Consulting, “How Environmentally Sustainable is Cloud Computing and Storage?” , <http://globalwarmingisreal.com/2013/09/12/sustainable-cloud-computing/>)

The case for the cloud being environmentally sustainable Many see the cloud as a key feature of IT environmental sustainability. Cloud infrastructure addresses two critical elements of a green IT approach: energy efficiency and resource efficiency. As explained by BSR, “Cloud services make a positive contribution to sustainability: The cloud encourages important clean-tech applications like smart grids and it also encourages consumers to use virtual services such as video streaming to replace resource-heavy physical products. The cloud also draws resources to where they are used most efficiently and its jobs tend to be cleaner and safer than those of more traditional industries.” Saving energy, money, time, hardware and waste The cloud saves energy and provides more efficient supplier management. Another of the cloud’s green attributes take the form of “dematerializing” the economy which involves reducing the number of physical materials. The cloud’s efficiency and scalability help reduce energy usage and trash. By reducing the need for hardware, companies can reduce costs and eliminate the need for maintenance and upgrades. The cloud offers cheaper running costs and more flexibility for businesses hoping to expand. The cloud is ideal for businesses with time sensitive data, and it significantly reduces computing time and expenses. The cloud also increases productivity through its ability to accommodate online collaboration that reduces the need for face to face meetings. Many of the firms interviewed by Verdantix reported cost savings as a primary motivator for adopting the cloud, with anticipated cost reductions as high as 40 to 50 percent. According to a report by the Carbon Disclosure Project (CDP) titled Cloud Computing: The IT Solution for the 21st Century, cloud computing can save U.S. Companies \$12 billion. A 2011 Pike Research report titled “Cloud Computing Energy Efficiency,” said data center energy consumption will drop by 31 percent from 2010 to 2020 due to the continued adoption of cloud computing and other virtualized data options. The technological reason for these energy savings is that the cloud uses energy in a more streamlined and efficient way than traditional, in-house data centers. Cloud computing uses multi-tenant architecture and this tends to be more efficient than the typical, single-tenant, statically-allocated data centers. Carbon reduction The cloud reduces carbon emissions through minimized energy requirements. According to the CDP report, offsite servers have the potential to prevent 85.7 million metric tons of annual carbon emissions by 2020. Research carried out by Google suggested that businesses could save around 60-85 percent on their energy costs simply by switching to a cloud facility. The environmental impact of these substantial reductions in energy are significant. One study surveying the clients of Salesforce, a fast-growing cloud computing giant, suggested carbon reductions of 95 percent compared to companies with servers on their premises. “The Salesforce community saved an estimated 170,900 tons of carbon in 2010—the equivalent of taking 37,000 cars off the road, or avoiding the consumption of 19.5 million gallons of gas.” said Marc Benioff, Salesforce’s chairman and CEO. A 2010 study from Accenture, Microsoft and WSP Environment and Energy reported a huge impact of the cloud on CO2 emissions. They

found out that businesses with systems and applications on the cloud could reduce per-user carbon footprint by 30 percent for large companies and 90 percent for small businesses. Cloud providers are getting even more efficient with companies like Cheeky Munkey further diminishing environmental impacts by using servers designed to use hardware as efficiently as possible, driving down energy resource and also keeping costs low.

We will link turn this bad impact with our even worse advantage scenario (seriously is advantage is a joke) – even if they win squo computing is bad innovations solve – there’ s only a risk we improve the market

Foster 11, (Pete, Pete Foster is a writer, researcher and consultant on sustainable information and communications technologies, "Cloud computing – a green opportunity or climate change risk?" , <http://www.theguardian.com/sustainable-business/cloud-computing-climate-change>)

Cloud computing enables users to share resources and carry out tasks remotely. Rather than using your own local PCs or servers to do the work, you connect to a remote data centre, often provided by an IT services or software company. It means more computing is migrating to purpose-built data centres. From a low carbon perspective it's no bad thing. Data centres tend to be more energy efficient than individual servers distributed around an organisation and, while there is still vast room for improvement, many companies are working to make their computing facilities more energy efficient. Software and IT services suppliers, for example, have been vying to be seen as the greenest provider – apart from the PR value there is a great deal of money to be saved in greater energy efficiency. There is also growing evidence of the extent of energy and emissions that can be saved from cloud computing. A report from cleantech market intelligence firm Pike Research found that the adoption of cloud computing will lead to a 38% reduction in worldwide data centre energy expenditure by 2020, compared to what would otherwise be used. The Carbon Disclosure Project (CDP) reached a similar conclusion, finding that large US companies that use cloud computing will be able to save \$12.3bn in energy costs and 85.7 million metric tons of CO2 emissions annually by 2020. The energy savings are equivalent to 200 million barrels of oil – enough to power 5.7 million cars for one year.

AT: China Liberalization D.A

Non-ug

China will curtail the firewall now- WTO pressure

Holden 14, Kevin Holden is a freelance journalist based in Asia. **Internally cites the co-directors of the European Centre for International Political Economy and Andrew Nathan, an expert on Chinese Censorship Policies at Columbia University. "Breaking through China's Great Firewall", 6/30/14, < <http://thediplomat.com/2014/07/breaking-through-chinas-great-firewall/>>

This new American resolve to publicly confront Chinese hackers could also portend a growing willingness in Washington to challenge the Great Firewall in the WTO. Yet Andrew Nathan, an expert on Chinese Internet censorship policies at Columbia University, suggests that Beijing might balk at a WTO ruling that strikes down its barriers to American newspapers, British news sites and Google's provision of access to information across the World Wide Web. "I believe that information control is too important for the Chinese government to sacrifice it," says Nathan, who also heads Columbia's Center for the Study of Human Rights. But the co-directors of the European Centre for International Political Economy say the chances of China's refusing to comply with a WTO decision against its cyber-blockades are virtually zero. China's reputation as a member in good standing of the global group is too important, they say, to jeopardize in any way. The WTO is the leading guardian of China's expansion into a trading superpower, they add, with the People's Republic's worldwide trade surpassing \$4 trillion last year. With the stakes so high, China cannot afford to risk being seen as resisting the group's rules and rulings.

No L

Self-censorship checks rebellion- and even if, citizens criticize the local government not Beijing

Zhang 15 Yuxin Zhang is a Congressional aide. Previously, he was a research fellow at Asia Policy Point, a think tank in Washington, D.C. He is the executive director of the Heisei Sedai Association of Future Leaders of East Asia. He is a member of the National Committee on US-China Relations as well as Young Professionals in Foreign Policy. "China: Self-Censorship Displaces Western Threats", 3/3/15, <<http://thediplomat.com/2015/03/china-self-censorship-displaces-western-threats/>>

But we have entered a new millennium. If one doesn't see harsh criticisms about the Chinese central government on Weibo or WeChat, one would assume they are being removed by the Internet "supervisors" (wang-luo-guan-li-yuan) under the leaders' instructions (ling-dao-zhi-shi). They are not. They don't appear because most Chinese people don't post them. Chinese society has moved into an era of self-censorship where people themselves automatically "purify" the Internet environment. There are too many interests at stake to attack the CCP online. You could lose your job. You would be "invited" to "drink a cup of tea" (qing-he-cha, meaning you'll be asked to have a talk with some officials in the government). You may be held in detention. You might go to prison. Your life could be at risk. By the end of 2014, more than 500 million Chinese were online. Western academics are optimistic about this number, believing advances in digital communications will revolutionize China, even though Facebook, YouTube, and Google are all blocked. Their pivotal argument is that technology makes information flow and collective action easier, citing the Arab Spring as evidence. Transnational quantitative research suggests an association between exposure to the Internet and demands for democracy in the Middle East. Yet China is different. Like Egyptians or Tunisians, Chinese people harbor anger. The difference between China and the Middle East is that general disaffection in China is more likely to be directed at local government, instead of Beijing. Unlike people in the Middle East, Chinese use the Internet in a way that helps to consolidate the CCP's rule. Rather than criticizing the CCP or the central government, Chinese nationals choose to vent their anger at local government. Additionally, the majority has successfully been convinced that there is such a thing as a "foreign force" harming China's national interests. Chinese people are accustomed to what I call "patricocracy," leadership inherited from one's predecessor or the past. As a consequence they are not highly motivated to overthrow the central government. As long as the mechanisms of self-censorship and propaganda continue to work effectively to stabilize Chinese society, the education minister need not worry.

Alt causes—intellectual property and a culture of innovation

Bao 13 Beibei Bao is a China analyst at the Rhodium Group. "How Internet Censorship Is Curbing Innovation in China", 4/22/13, <<http://www.theatlantic.com/china/archive/2013/04/how-internet-censorship-is-curbing-innovation-in-china/275188/>>

The hindering effect of Internet control on homegrown innovation, as Meng sees it, is far-reaching yet less explicit than causing efficiency loss or service instability. When he studied at the prestigious Peking University in Beijing, the school charged (and still charges) students \$1.50 a month for unlimited domestic Internet use, but \$14.50 for unlimited access to the World Wide Web. Meng sensibly chose the lower rate. "I didn't need to visit foreign websites," he explained. "Nobody talked about them, and I didn't feel curious about them at all. It wasn't until I came to Wandou Labs that I felt like the world was flat." Meng's experience wasn't at all unusual, and it reflects something deeper in China's Internet policy. Bishop believes the Great Firewall is simply a symptom, not the cause, of much broader issues that are actually hampering creativity and innovation across the economy. "If people say 'if only we didn't have the Great Firewall, we would have innovation and creativity', I think that's actually not true," said Bishop. "I think the fact the Great Firewall exists is indicative of a much broader approach to how you educate people and how you manage the economy." Bishop's point of view resonates with that of a few other sophisticated China observers, including Wang Haiyan, the China-born and U.S.-educated managing partner of the China India Institute, a Maryland-based consultancy. Wang said that China lacks the right mix of conditions that feed real innovation, including free flow of information from across society, strong intellectual property rights, and an education

and culture that encourages people to think creatively and speak up for themselves. Web censorship, she said, is only part of the government's efforts to control information flow.

CCP decline will be peaceful—spurs needed social and economic reform

Lee 15 Peter Lee writes on East and South Asian affairs and their intersection with US foreign policy. Peter Lee blogs at China Matters and his columns appear in Asia Times Online and elsewhere. “Twilight of the CCP and Shambaughism”, 3/14/15, <<http://www.internationalpolicydigest.org/2015/03/14/twilight-of-the-ccp-and-shambaughism/>> //ak

But his objective, I believe, will be to leave a party/state/economic structure that cannot easily be screwed up even by a Chinese Gorbachev. If the CCP regime collapses, I believe the regime will degrade relatively gracefully—and the longer Xi is in power and can effectively advance his agenda, the more graceful that decline will be. In particular, I believe a failure of governance at the Center will be answered by the devolution of actual power to the coastal provinces: Guangdong, Shanghai etc. Without a strong Center to restrain them and by shedding the incubus of the poorer provinces, provincial heavyweights will pursue their own paths to political power and economic advantage—that may or may not involve appeasing the urban well-to-do with political liberalization or even the hollowing-out or sidelining of the CCP, locally and eventually at the national level. But my prediction is that in the near, medium, and long term, China will be run by jerks in suits...just like the rest of the world. It is also a process that has little to do with the central shibboleth of Shambaughism: the need for political as well as economic reform to rescue the PRC from its looming national cul-de-sac. Or as he put it in his op-ed: “Until and unless China relaxes its draconian political controls, it will never become an innovative society and a ‘knowledge economy’—a main goal of the Third Plenum reforms. The political system has become the primary impediment to China’s needed social and economic reforms. If Mr. Xi and party leaders don’t relax their grip, they may be summoning precisely the fate they hope to avoid.” But using political reform as a diagnosis of China’s ills, and its panacea, isn’t quite a logical and evidentiary slam dunk, in my opinion. Letting 100 flowers bloom may not be the only or even the most practical way of handling the big challenges and risks that China is facing.

No CCP collapse – economic strength and lack of dissent among students

Liu 11, Yao Liu is a PhD candidate at Stanford University, specializing in political science, China, and economic studies. He was formerly a junior policy analyst for the Federal Government of Canada and received a Masters of Arts from the University of Toronto. “Governing the Restless and Young in Contemporary China: in Search for the Chinese Communist Party’s Ruling Logic”, 1/10/11<https://tspace.library.utoronto.ca/bitstream/1807/25769/5/Liu_Yao_201011_MA_thesis.pdf> //ak

Chen Yun’s “bird cage” logic has survived and thrived in the realm of post-Tiananmen university governance: the party-state simultaneously strengthened its control measures and expanded the zone of political opportunity and tolerance.¹³⁹ For example, the reestablishment of control institutions on campus is accompanied by the creation of new outlets such as the USVO program for political participation, and heightened internet monitoring is parallel with greater toleration of subtle anti-hegemonic political expressions. Furthermore, unprecedented economic development since 1989 has allowed the party-state to be ever more responsive to, and effective in managing, potential crises which could trigger student unrest. The CCP is also, to use the word of many students, “fortunate” to have such leaders as Hu and Wen, who are capable of utilizing the media to mediate psychologically between the party’s not-so-desirable control measures and an increasingly informed and self-centered generation of university students. More than twenty years of relative tranquility in Chinese universities, with several instantaneous but well-managed bursts of nationalistic sentiments, might well suggest that the party’s cage—both institutional and ideational—is well and alive. And it really seems to be so, according to some university students themselves. The four-city, seven-university survey shows that the majority of the student respondents believe that the party’s institutions are still playing significant roles in campus governance and student life. It also unequivocally suggests that “big political ideas” promoted by the party are perhaps genuinely endorsed by the majority of the student respondents (with political fear being ruled out through statistical test). Of course, as stated at the very outset, this thesis examines only one particular aspect in contemporary state-society relationship in China, which contains a patchwork of numerous, variegated aspects and elements. Yet, I hope, by examining the state-student relationship in relative detail, that I have shed a provocative new light on the ways of looking at the overall state-society relationship. In 2007, Yu Keping—one of President Hu’s key advisors, at least allegedly—wrote his famous article “Democracy is a Good Thing”, in which he argues that the party must achieve “dynamic stability” rather than “static stability” of the society, the former of which refers to channelling people’s desires and dissents, and the latter constraining them.¹⁴⁰ In the case of governing university students, the CCP has undoubtedly experimented with both constraining and channelling. And this

might become increasingly manifest in the party's overall approach to governing Chinese society—an approach that combines both “static control” and “dynamic control”, and an approach that increasingly resembles an ever growing “bird cage”.

Econ Turn

Internet freedom key to innovation and government austerity

Bao 13 Beibei Bao is a China analyst at the Rhodium Group. "How Internet Censorship Is Curbing Innovation in China", 4/22/13, <
<http://www.theatlantic.com/china/archive/2013/04/how-internet-censorship-is-curbing-innovation-in-china/275188/>>

In the eyes of Michael Li, founder and CEO of Chuangtouquan, this inefficiency costs China dearly, especially in the area of indigenous innovation. China's lack of innovation derives partially from entrepreneurs not knowing enough about the latest trends, something attributable to the closed nature of the country's Internet. Slow traffic – even with tools to hop over the Great Firewall – also hinders creativity. For example, if people are unable to watch videos without frequent buffering on YouTube, they may get frustrated in the process of seeking inspiration. "I didn't need to visit foreign websites. Nobody talked about them, and I didn't feel curious about them at all." "In this Internet era, we invested so much money and effort to build an Intranet. This is very distressing," Li said. *** The Chinese government has invested heavily to build the Great Firewall, part of what the Ministry of Public Security called the "Golden Shield Project" that kicked off in May 2001. The project is a complex system that monitors all levels of information flow within the state and across China's borders. Its total cost remains a state secret, but the state-run China Central Television (CCTV) was quoted by one of the participating developers, Guangdong Hong'an Group, as saying that the investment had already reached 6.4 billion RMB, or \$770 million, in 2002.

CCP Turn

Internet freedom bolsters CCP rule

MacKinnon 10 Rebecca MacKinnon is the Director of the Ranking Digital Rights project at the New America Foundation, author of "Consent of the Networked: The Worldwide Struggle for Internet Freedom", and an adjunct lecturer at the University of Pennsylvania Law School and visiting affiliate at the Center for Global Communication Studies at UPenn's Annenberg School. She received her AB in government from Harvard University. "Networked Authoritarianism in China and Beyond: Implications for global Internet freedom" 10/11/10< http://iis-db.stanford.edu/evnts/6349/MacKinnon_Libtech.pdf>

In his book *Technological Empowerment: The Internet, State, and Society in China*, Yongnian Zheng points out that the success or failure of online activism in China depends on its scope and focus, and that some online activism – particularly at the local level, or targeting specific policy issues over which there are divisions or turf-wars between different parts of the government – can actually serve to bolster regime legitimacy.¹⁷ The most spectacularly unsuccessful online movements (and the ones leading to the most brutal crackdowns both online and offline) tend to be those that advocate various forms of political "exit," including calls for an end of one-party rule by the Chinese Communist Party, and greater political autonomy or independence for particular ethnic or religious groups. When a movement or group challenges the regime's overall legitimacy, the people involved with it can expect to be silenced – either through censorship, intimidation, or arrest depending on the situation – because all power-holders in the system have a common interest in doing so. "When the regime is threatened by challengers," Zheng writes. "The soft-liners and hard-liners are likely to stand on the same side and fight the challengers."¹⁸ On the other hand, successful online movements in China are usually characterized by what Zheng calls the 'voice' option, or what other¹⁶ *Ibid.*, p. 243¹⁷ Yongnian Zheng, *Technological Empowerment: The Internet, State, and Society in China*, (Stanford University Press, 2008) 18 *Ibid.*, p. 164¹⁰ political scientists call the "cooperation option." Such online insurgencies actually provide ammunition to reformist leaders or liberal local bureaucrats in their power struggles against hard-line conservative colleagues. "Voice" activism helps reduce political risks to reformist officials, who can point to online sentiment and argue that without action or policy change there will be more unrest and public unhappiness. Zheng writes: "The voice does not aim to undermine or overthrow the state. Instead, through a voice mechanism, the state can receive feedback from social groups to respond to state decline and improve its legitimacy."¹⁹ Thus, rising levels of online activism in China cannot automatically be interpreted as a sign of regime instability or vulnerability. Nor do rising levels of online activism necessarily signal impending democratization. One must examine what kind of online activism is succeeding and what kind of online activism is failing. If "voice" activism is for the most part succeeding while "exit" activism is systematically being stifled and crushed – thanks to high levels of systematic censorship and surveillance, in addition to the lack of an independent or impartial judiciary – one can in fact conclude that the Chinese Communist Party has adapted to the Internet much more successfully than most Western observers realize. The "Iron Curtain 2.0" mentality criticized by Tsui may indeed have blinded many Western policymakers, human rights activists, and journalists to what is really happening in China. In 2005 New York Times columnist Nicholas Kristof wrote breathlessly: "it's the Chinese leadership itself that is digging the Communist Party's grave, by giving the Chinese people broadband."²⁰ Zheng's analysis, however, supports the opposite conclusion: that the Internet is a subtle and effective tool through which the CCP is actually prolonging its rule, bolstering its domestic power and legitimacy, while enacting no meaningful political or legal reforms.

AT:Presidential Powers MSDI

2AC – Pres Powers Weak

USA Freedom Act decked presidential powers

Saudi Gazette, 6-3-2015, President Obama signs bill curbing NSA powers into law," No Publication, <http://www.saudigazette.com.sa/index.cfm?method=home.regcon&contentid=20150604246156>, Accessed: 6-25-2015, /Bingham-MB

The changes were rejected, with at least 11 **Republicans** opposing McConnell to vote against the amendments. McConnell **decried the reform bill as "a step backward."** **"This is going to diminish our ability to respond to the myriad threats we have today,"** he said in a provocative floor speech in which he accused the Obama administration of withdrawing from leadership **in the battle against extremism.** **"It is also a resounding victory for those who continually plot against our homeland,"** McConnell said. The vote occurred against a backdrop of Republican infighting and tension about the bill. House leaders had warned that any change to the bill could delay its final passage or even kill it, which would have meant several national security authorizations expiring for good. Many major Internet firms declared victory with the congressional approval. "The USA Freedom Act realizes hard-fought and much-needed wins for Internet users everywhere, including prohibiting the bulk collection of user data," Yahoo said in a statement. But Republican presidential candidate Marco Rubio, a Florida senator who voted against the act, slammed it as result of "weak presidential leadership." **"The USA Freedom Act weakens US national security by outlawing the very programs our intelligence community and the FBI have used to protect us time and time again,"** Rubio said. **"Unfortunately, weak presidential leadership combined with a politically motivated misinformation campaign have now left the American people less safe than we've been at any point since the 9/11 attacks,"** he added. Hawkish Republican Senator John **McCain**, who also voted against it, **added that a diverse array of possible threats meant the "intelligence community must have access to the vital authorities and capabilities they need to stop another terrorist attack before it happens."** — AFP

NSA was a significant cut back against government powers

Kristina **Peterson** and Damian **Paletta**, **6-2-2015**, Congress Reins In NSA's Spying Powers," WSJ, <http://www.wsj.com/articles/senate-passes-house-bill-overhauling-nsa-surveillance-program-1433277227>, Accessed: 6-25-2015, /Bingham-MB

WASHINGTON—**A long-running congressional battle over privacy and surveillance ended Tuesday when the Senate voted to curb the collection of millions of Americans' phone records, the first significant retrenchment of government spying powers since the 9/11 attacks. The measure,** which was signed Tuesday night by President Barack Obama, will reauthorize and reboot the provisions of the USA Patriot Act that lapsed Sunday at midnight, but it **will phase out the National Security Agency's bulk phone-records program.** The bill, passed by the Senate Tuesday in a 67-32 vote, will shift storage of the phone records to telecommunications companies over six months. Supporters said the legislation marked a victory for civil liberties diminished by laws put in place in the wake of the September 2001 terror attacks. "Today the American people are now safe from the federal government's collection of their personal data," said Sen. Mike Lee of Utah, the bill's chief GOP proponent in the Senate. The House approved the bill, known as the USA Freedom Act, in May. The bill will require the NSA and Federal Bureau of Investigation to obtain phone records for most counterterror investigations and other probes on a case-by-case basis from telecommunications companies. **This would end the nine-year-old practice**

underpinned by Section 215 of the Patriot Act, which allowed the NSA to hold the telephone records of millions of Americans, regardless of any person's background or behavior. The bulk data collection didn't include the content of the calls themselves.

2AC – Not Zero Sum

Legislative-Executive power isn't zero-sum – it's a rubber band – it can be exercised without changing the structure

Rottinghaus, Assistant Prof of Poli Sci at the University of Houston, 11 [Brandon Rottinghaus, "The Presidency and Congress", from *New Directions in the American Presidency*, ed. Lori Cox Han] page 96-97

Conclusion: "Rubber Band" Relations

Alexander Hamilton's edict for "energy" in the executive can creatively contradict the constitutional authority given to the legislative branch. A visible and powerful president necessarily detracts from a legislature whose job it is (at least on paper) to be the engine of legislative ingenuity. The Constitution sought to buttress 'parchment barriers' by pitting ambition against ambition; and the principle means of doing that was the election of public officials at different times, by different people and for somewhat different reasons." 107 **Although the powers of the president have grown** immeasurably beyond **what the framers envisioned and have surpassed Congress in terms of the ability to lead in the American system, the function of shared powers continues to shape the political process in America.**

To consider this relationship a pendulum (an analogy some have used¹⁰⁸ to suggest the power balance swings from one branch to another) **may overstate the zero-sum game of Washington politics—the truth is that legislative powers are shared, even if certain powers are exercised** at certain times by specific institutions **that** perhaps **encroach** on the power of another branch. **A pendulum analogy implies that the power shifts** between the branches (potentially at regular, predictable intervals). **This arrangement is false since, even during times when one branch appears to have more power** than another, **the truth is that the branches still rely on one another for shared policy-making power.** In reality, **the executive-legislative relationship is more like a rubber band**, where **it retains a fundamental shape but can be stretched** to change as legislative and executive tools change and political events occur. **So, for instance, in utilizing unilateral powers, presidents can stretch that part of the rubber band, even while members of Congress assert themselves** on matters of foreign policy or the appointments process.

Indeed, perpetuating **the rubber band analogy**, jointly understanding presidency- centered and Congress-centered variables **is also shown to better account for variations in policy making.**¹⁰⁹ For instance, **recent evidence suggests a resurgent Congress** in the creation of foreign policy, a fact that seems at odds with the "two presidencies" thesis ¹¹⁰ **or other literature that claims that Congress always defers** to the president in foreign policy matters. ¹¹¹ **This supports the literature that Congress may not be involved** in the formal aspects of foreign policy making **but does play a role** in the informal aspects.¹¹² The evidence presented here also reveals that **Congress has more say on when and how the president uses his unilateral powers and whom the president recommends** for nomination and confirmation **than was previously assumed.**

2AC – No Impact

Less powerful executive won't hurt US foreign policy

Paul, Professor at University of Connecticut School of Law, 98

[Joel Paul, July 1998. "The Geopolitical Constitution: Executive Expediency and Executive Agreements," California Law Review, 86 Calif. L. Rev. 671, Lexis.]

A less powerful executive would not weaken U.S. foreign policy. Public scrutiny of the deliberative process and an independent judiciary have been a source of political stability and vitality in our system of government. The advantages of the President acting with the support of a strong consensus are evident. A congressional authorization to use force overseas sends a serious message to a foreign adversary that the nation is united. Congressional debate can educate the public about the nature of a foreign situation and consolidate public support for foreign assistance. Compelling members of Congress to take a public position in favor of a policy makes it less likely that they will abandon the policy when the going gets tough. For a generation the executive has told us how to imagine the world beyond our borders. Our collective fear displaced reason as we deferred to the President's greater wisdom. As a consequence, the people no longer hold Congress accountable for the failures and excesses of U.S. [*773] foreign policy. We cannot afford to ignore global forces that are reshaping our economy and our politics. Foreign and domestic issues have converged. Accordingly, we must reassert some measure of democracy in the formulation of foreign policy. Holding our government accountable for foreign policy requires the vigilance of the courts no less than Congress.

2AC – AT: Rogue Nations

The United States has no way to stop rogue nations, the public and the president have given up

David Francis, 13, 8-23-2013, "A War-Weary America Gives Rogue Nations a Free Pass," Fiscal Times, ([//EG">http://www.thefiscaltimes.com/Articles/2013/08/23/A-War-Weary-America-Gives-Rogue-Nations-a-Free-Pass">//EG](http://www.thefiscaltimes.com/Articles/2013/08/23/A-War-Weary-America-Gives-Rogue-Nations-a-Free-Pass))

Badran added that the lack of follow through on steps to stop Assad also makes the United States look weak. "Assad thinks the word of the United States is meaningless. He can deploy whatever weapon he wants and the United States will convene the Security Council, which is pointless because Russia will upset it every time," he said. "Obama has been more concerned about staying out than articulating what's important. If you declared that the Assad regime has to go, which is a strategic priority, you have to develop a possibility that follows though on that," he added. Badran said Washington's failure to act on Syria, as well as its inability to shape events in Egypt, sends the wrong message to the real problem in the Middle East: Iran. "What does this mean for the deterrence policy of the United States for others in the region, mainly Iran?" he asked. "The fact that he did declare it, watch it get crossed and did absolutely nothing is abhorrent for a superpower." But it's not just the Middle East where the United States has failed to follow through on threats. Consider these other incidents: North Korean leader Kim Jong-un defied the United States and its allies by continuing to test its missile program while threatening the West with nuclear annihilation. Despite U.S. protests, Afghan President Harmid Karzai is now backing a former terrorist as the next leader of the country. Moscow ignored harsh U.S. rhetoric over Edward Snowden and granted the NSA leaker asylum in Russia. Russian President Vladimir Putin has made it his job to be a professional thorn in Barack Obama's side on nearly every important international issue. Violence in Iraq continues unabated despite U.S. pleas to stop. The lack of bite behind U.S. threats might simply be a byproduct of Obama's withdrawal from the world stage. And the U.S. public has tired of overseas military adventures. But the failure of rivals to even acknowledge a U.S. request is troubling. Simply put, America, which caused nations to tremble during the Cold War, can bark but has no bite.

2AC – AT: Cred Impact

No risk of losing international credibility- significant chance of the US gaining credibility
Ganesh, **Sitarman, 2014**, Assistant Professor of Law at Vanderbilt Law School and a Senior Fellow at the Center for American Progress, “Harvard Law review forum: “Credibility and Powers”

The leading alternative to the past actions and reputation theories of credibility is the *current calculus* theory.¹⁶ Current calculus theory holds that credibility is not a function of past actions or reputation, but rather a function of a country’s present capabilities and interests in a particular situation. On this theory, an adversary assesses credibility based on the country’s ability to effectuate its threat and the costs and benefits to that country in enforcing its threat. Two other theories are worth noting. The *ingrained lessons* theory holds that decisionmakers do not look to the threatening country’s history, but instead to their own history. For example, they will expect today’s adversary to back down if their previous adversaries also backed down. The *never again* theory holds that breaking a commitment actually increases credibility of future threats because decisionmakers will understand that backing down a second time is too costly. In the context of military threats and the use of force, credibility arguments suffer from some important limitations. First, because both past actions and reputation are based on audience interpretations, a country can have multiple reputations and a single action can create different reputations among different audiences.¹⁷ To some, following through on a threat demonstrates resolve; to others, foolishness. Second, action in one context might not migrate into reputation in another.¹⁸ If the United States sets a “red line on a fishing issue for Micronesia and then backs down, it is unlikely to send a signal to Iran that all American “red lines are bluffs. The Iranians may ignore the Micronesian case because it is fundamentally different from their own.

2AC – No Impact Failed States

No impact to failed states

Patrick, senior fellow, director – program on international institutions and global governance @ CFR, 4/15/'11

(Stewart M, “Why Failed States Shouldn’t Be Our Biggest National Security Fear,” <http://www.cfr.org/international-peace-and-security/why-failed-states-shouldnt-our-biggest-national-security-fear/p24689>)

In truth, while **failed states** may be worthy of America's attention on humanitarian and development grounds, most of them **are irrelevant to U.S. national security**. The **risks they pose are mainly to their own inhabitants. Sweeping claims to the contrary are not only inaccurate but distracting and unhelpful, providing little guidance to policymakers** seeking to prioritize scarce attention and resources. In 2008, I collaborated with Brookings Institution senior fellow Susan E. Rice, now President Obama's permanent representative to the United Nations, on **an index of state weakness** in developing countries. The study **ranked all 141 developing nations on 20 indicators of state strength**, such as the government's ability to provide basic services. More recently, **I've examined whether these rankings reveal anything about each nation's role in major global threats: transnational terrorism, proliferation of weapons of mass destruction, international crime and infectious disease. The findings are** startlingly **clear**. Only a handful of the world's failed states pose security concerns to the United States. Far **greater dangers emerge from stronger developing countries** that may suffer from corruption and lack of government accountability but come **nowhere near** qualifying as **failed states. The link between failed states and transnational terrorism**, for instance, **is tenuous. Al-Qaeda franchises are** concentrated in South Asia, North Africa, the Middle East and Southeast Asia but are markedly **absent in most failed states**, including in sub-Saharan Africa. Why? From a terrorist's perspective, **the notion of finding haven in a failed state is an oxymoron. Al-Qaeda discovered this in the 1990s** when seeking a foothold in anarchic **Somalia**. In intercepted cables, **operatives bemoaned** the insuperable **difficulties of working under chaos, given their need for security and for access to the global financial and communications infrastructure**. Al-Qaeda has generally found it easier to maneuver in corrupt but functional states, such as Kenya, where sovereignty provides some protection from outside interdiction. **Pakistan and Yemen became sanctuaries for terrorism not only because they are weak but because their governments lack the will to launch** sustained counterterrorism **operations** against militants whom they value for other purposes. Terrorists also need support from local power brokers and populations. Along the Afghanistan-Pakistan border, al-Qaeda finds succor in the Pashtun code of pashtunwali, which requires hospitality to strangers, and in the severe brand of Sunni Islam practiced locally. Likewise in Yemen, al-Qaeda in the Arabian Peninsula has found sympathetic tribal hosts who have long welcomed mujaheddin back from jihadist struggles. Al-Qaeda has met less success in northern Africa's Sahel region, where a moderate, Sufi version of Islam dominates. But **as the organization evolves** from a centrally directed network **to a diffuse movement** with autonomous cells in dozens of countries, **it is as likely to find haven in** the banlieues of **Paris** or high-rises of Minneapolis **as in remote Pakistani valleys**. What about **failed states and weapons of mass destruction**? Many U.S. analysts worry that poorly governed countries will pursue nuclear, biological, chemical or radiological weapons; be unable to control existing weapons; or decide to share WMD materials. These **fears are misplaced**. With two notable exceptions — North Korea and Pakistan — **the world's weakest states pose minimal proliferation risks, since they have limited stocks of fissile or other WMD material and are unlikely to pursue them. Far more threatening are capable countries** (say, Iran and Syria) intent on pursuing WMD, **corrupt nations** (such as Russia) that possess loosely secured nuclear arsenals **and poorly policed nations** (try Georgia) through which proliferators can smuggle illicit materials or weapons. When it comes to crime, the story is more complex. Failed states do dominate production of some narcotics: Afghanistan cultivates the lion's share of global opium, and war-torn Colombia rules coca production. The tiny African failed state of Guinea-Bissau has become a transshipment point for cocaine bound for Europe. (At one point, the contraband transiting through the country each month was equal to the nation's gross domestic product.) And Somalia, of

course, has seen an explosion of maritime piracy. Yet **failed states have little or no connection with** other categories of **transnational crime, from human trafficking to money laundering**, intellectual **property theft, cyber-crime or counterfeiting** of manufactured goods. **Criminal networks** typically **prefer** operating in **functional countries that provide baseline political order as well as opportunities to corrupt authorities. They** also **accept higher risks to work in nations straddling major commercial routes.** Thus narco-trafficking has exploded in Mexico, which has far stronger institutions than many developing nations but borders the United States. **South Africa presents** its own **advantages.** It is a country where “the first and the developing worlds exist side by side,” author Misha Glenn writes. “The first world provides good roads, 728 airports . . . the largest cargo port in Africa, and an efficient banking system. . . . **The developing world accounts for the low tax revenue, overstretched social services, high levels of corruption** throughout the administration, **and** 7,600 kilometers of **land and sea borders** that have more holes than a second-hand dartboard.” Weak and **failing African states**, such as Niger, simply **cannot compete.** Nor do failed states pose the greatest threats of pandemic disease. Over the past decade, outbreaks of SARS, avian influenza and swine flu have raised the specter that fast-moving pandemics could kill tens of millions worldwide. Failed states, in this regard, might seem easy incubators of deadly viruses. In fact, recent fast-onset pandemics have bypassed most failed states, which are relatively isolated from the global trade and transportation links needed to spread disease rapidly. Certainly, the world’s **weakest states** — particularly in sub-Saharan Africa — suffer disproportionately from disease, with infection rates higher than in the rest of the world. But their principal **health challenges are endemic diseases with local effects, such as malaria, measles and tuberculosis. While** U.S. national security **officials** and Hollywood screenwriters **obsess over** the gruesome **Ebola and Marburg** viruses, **outbreaks** of these hemorrhagic fevers **are rare and self-contained.** I do not counsel complacency. The world’s richest nations have a moral obligation to bolster health systems in Africa, as the Obama administration is doing through its Global Health Initiative. And they have a duty to ameliorate the challenges posed by HIV/AIDS, which continues to ravage many of the world’s weakest states. But **poor performance** by developing countries **in preventing**, detecting and responding to infectious **disease is** often **shaped less by budgetary and infrastructure constraints than** by conscious **decisions by unaccountable** or unresponsive **regimes. Such** deliberate **inaction has occurred** not only in the world’s weakest states but also **in stronger developing countries, even in** promising **democracies.** The list is long. It includes **Nigeria’s** feckless **response to** a 2003-05 **polio** epidemic, **China’s lack of candor about** the 2003 **SARS** outbreak, **Indonesia’s** obstructionist **attitude to** addressing **bird flu** in 2008 and South Africa’s denial for many years about the causes of HIV/AIDS. Unfortunately, **misperceptions about** the **dangers of failed states have transformed budgets and bureaucracies.** U.S. intelligence agencies are mapping the world’s “ungoverned spaces.” The Pentagon has turned its regional Combatant Commands into platforms to head off state failure and address its spillover effects. The new Quadrennial Diplomacy and Development Review completed by the State Department and the U.S. Agency for International Development depicts fragile and conflict-riddled states as epicenters of terrorism, proliferation, crime and disease. Yet such **preoccupations reflect more hype than analysis.** U.S. national **security officials would be better served** — and would serve all of us better — **if they turned their strategic lens** toward stronger developing countries, from which transnational threats are more likely to emanate.

2AC – Turn – Dictatorship

Presidential power leads to a dictatorship, this allows all thinkable impacts.

Rozeff 14'

Professor at state university of New York, PhD, University of Rochester MS, University of Illinois MBA, University of Illinois MAT, Harvard Graduate School of Education BA, Harvard College

*We do not agree with the authors use of sexist language.

U.S. presidents have dictatorial powers Many have already been exercised and become precedents, **Many more and worse are potential powers, to be invoked when a president feels like it. If a president can get away with some new exercise of power**, which he can **if it doesn't create too much resistance in the rest of the government**, his party, the media and the people, then that's the end of the matter. **He then has augmented the dictatorship, which is both his and that of "enough" of the nation to leave the power in place. Over time, the dictatorship grows. It is already so large that a list of presidential powers is both amazing and frightening. President Roosevelt interned Japanese-Americans in camps by Executive Order 9066.** If this were done today and applied to Texas and Hawaii, it would mean that 7 relatives of mine would be separated from their families and be removed to camps. One of these powers is to prevent Americans from trading with non-Americans. **Obama used this power by an executive order on December 19, 2014 that "prohibits the export of goods, technology, or services to Crimea and prohibits the import of goods, technology, or services from Crimea, as well as new investments in Crimea. The E.O. also authorizes** the Secretary of the Treasury to impose sanctions on individuals and entities operating in Crimea." The president can relax trading with Cuba and tighten trading with Crimea. This is a dictatorial power, a ruling by his edict alone. **Obama is actively extending this kind of dictatorial power whenever he can** . Obama and any president also claims and has the power to speak and act for all Americans on foreign relations. He can say things like this: "...the United States will not accept Russia's occupation and attempted annexation of Crimea." **A U.S. president can steer the nation into conflicts, hostilities, and wars. These can last for decades. This is a seriously dictatorial power,** moderated only by resistance in other parts of the government and people but supported also by elements of both. Whenever I think about the state and the powers that it has, I can always find reason after reason why **these powers are harmful** and only very weak arguments why these powers are supposed to be helpful or right. I will listen if someone can provide convincing arguments as to why Americans are now forbidden to trade in Crimea and why Obama says that the "United States will not accept Russia's occupation and attempted annexation of Crimea." There are no such reasons, as far as I can see, anymore than there were reasons to isolate Cuba or for President Kennedy to authorize the Bay of Pigs invasion, another dictatorial action.

Letting the president harness such powers leads to tyranny

Michiko **Kakutani 7**, 7-6-2007, Kakutani is an American Pulitzer Prize-winning critic for The New York Times. "Unchecked and Unbalanced: Presidential Power in a Time of Terror," New York Times, (http://www.nytimes.com/2007/07/06/books/06book.html?pagewanted&_r=0)/EG

"Making the executive supreme makes the nation no safer -- either from its enemies or its own worse impulses," the authors conclude. "Indeed, the abiding genius of the Founding Generation was its rejection of the idea that unchecked unilateral power is ever properly vested in any one branch of government. Our government was framed 'to control itself,' as James Madison wrote in the Federalist Papers. 'Ambition must be made to counteract ambition.' **Dividing powers between three branches, the Founders harnessed human passions in the cause of limited government.** Madison, again writing in the Federalist Papers, provided the enduring explanation for this division of government: **The accumulation of all power, legislative, executive, and judiciary, in the same hands, whether of one, a few, or many, and whether hereditary, self-appointed, or elective, may justly be pronounced the very definition of tyranny.'** "

Most uses of presidential power are unconstitutional

George, **Weiner**, Assistant Professor of Political Science at Assumption College and the author of *Madison's Metronome: The Constitution, Majority Rule, and the Tempo of American Politics*, **2013**, "Terrorism: Presidential power and the war on terror"
<http://www.theimaginativeconservative.org/2013/02/terrorismpresidential-power-and-the-war-on-terror-whence-congress.html>

This is, in the age of terrorism, non-controversial stuff. But it is also, constitutionally speaking, pabulum. To begin with, the president, whose actual authority under Article II is remarkably sparse, has no blanket power to "protect the country"; if he did, it is difficult to see what authority would not fall under it, which also explains why presidents would prefer to believe they did indeed possess it: again, power. The United States does have an "inherent right of self defense," but note the sleight-of-hand in the presumed concentration of that right and its attendant powers in the person of the president.

2AC – No Link

No long term threat exists that legitimizes the presidential authorization of surveillance
Richard Henry **Seamen**, 2007, "Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits" 452

The President's power to authorize surveillance outside FISA in a genuine national security emergency does not justify the TSP's continuance beyond the weeks immediately after 9/11. Indeed, the program's very status as an ongoing, broad "program" prevents it from falling within the President's "genuine emergency" power. The genuine emergency power is limited in scope and duration when it is exercised in contravention of legislation, such as FISA, that is a generally valid regulation of the President's power to conduct domestic surveillance for national security purposes. For example, the President may well have had broad power to conduct surveillance outside FISA in the days and weeks immediately after the terrorist attacks on September 11, 2001. That power subsided, however, as time and a still-functioning civil government permitted the President to consult Congress on the appropriate scope of surveillance powers. Thus, the President's "genuine emergency" power cannot support a broad surveillance program that violates a generally valid Act of Congress. By the same token, by recently amending FISA so as to avoid a conflict between that statute and certain features of the TSP, Congress's enactment of the Protect America Act of 2007 supports the validity of those same features.¹ Congressional ratification of the President's conduct both reinforces the President's power to engage in that conduct and supports its reasonableness for Fourth Amendment purposes.

Presidential powers fall short when used on domestic surveillance policies

Richard Henry **Seamen**, 2007, "Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits" 452

The President's power to authorize surveillance outside FISA in a genuine national security emergency does not justify the TSP's continuance beyond the weeks immediately after 9/11. Indeed, the program's very status as an ongoing, broad "program" prevents it from falling within the President's "genuine emergency" power. The genuine emergency power is limited in scope and duration when it is exercised in contravention of legislation, such as FISA, that is a generally valid regulation of the President's power to conduct domestic surveillance for national security purposes. For example, the President may well have had broad power to conduct surveillance outside FISA in the days and weeks immediately after the terrorist attacks on September 11, 2001. That power subsided, however, as time and a still-functioning civil government permitted the President to consult Congress on the appropriate scope of surveillance powers. Thus, the President's "genuine emergency" power cannot support a broad surveillance program that violates a generally valid Act of Congress. By the same token, by recently amending FISA so as to avoid a conflict between that statute and certain features of

the TSP, Congress's enactment of the Protect America Act of 2007 supports the validity of those same features.' Congressional ratification of the President's conduct both reinforces the President's power to engage in that conduct and supports its reasonableness for Fourth Amendment purposes.

No risk of plan reducing presidential powers

Richard Henry **Seamen**, 2007, "Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits" 477

More recently, two Justices in *Hamdi v. Rumsfeld* recognized a similar, but broader, emergency power to respond to threats to national security.⁹⁴ In *Hamdi*, Justice Souter (joined by Justice Ginsburg) dissented from a decision upholding the detention of an asserted enemy combatant who is also a U.S. citizen.⁹⁵ Justice Souter concluded that an Act of Congress barred the detention.⁹⁶ He suggested, however, that the executive branch might be able to detain a citizen, even in violation of the statute, "in a moment of genuine emergency, when the Government must act with no time for deliberation." The plurality did not address this issue because it held—contrary to Justice Souter's dissent (but in basic agreement with Justice Thomas' dissent)—that the detention in that case was authorized by federal statute. The *Hamdi* dissent implies that the President's power to take action "incompatible with the expressed or implied will of Congress" (the third situation identified by Justice Jackson's *Youngstown* concurrence) may include the power to take immediate action to respond to a "genuine emergency" threatening national security. Furthermore, the *Hamdi* dissent did not limit its implication of presidential power to situations involving an actual attack. Indeed, even before *Hamdi* many commentators believed that the President's power encompasses taking defensive measures necessary to thwart imminent attacks. The position staked out here does, however, reject the view that "there is no constitutional impediment to Congress restricting the President's ability to conduct electronic surveillance within the United States and targeted at United States persons."¹²³ That view would apparently preclude the President's violation of statutory surveillance restrictions even if the President reasonably concluded that violation of those restrictions was necessary to respond to a national security emergency.

2AC – No Spillover

Even if the US were to lose credibility in one scenario, this won't influence our overall credibility

Ganesh, **Sitarman, 2014**, Assistant Professor of Law at Vanderbilt Law School and a Senior Fellow at the Center for American Progress, "Harvard Law review forum: "Credibility and Powers"

The leading alternative to the past actions and reputation theories of credibility is the *current calculus* theory.¹⁶ Current calculus theory holds that credibility is not a function of past actions or reputation, but rather a function of a country's present capabilities and interests in a particular situation. On this theory, an adversary assesses credibility based on the country's ability to effectuate its threat and the costs and benefits to that country in enforcing its threat. Two other theories are worth noting. The *ingrained lessons* theory holds that decisionmakers do not look to the threatening country's history, but instead to their own history. For example, they will expect today's adversary to back down if their previous adversaries also backed down. The *never again* theory holds that breaking a commitment actually *increases* credibility of future threats because decisionmakers will understand that backing down a second time is too costly. **In the context of military threats and the use of force, credibility arguments suffer from some important limitations.** First, because both past actions and reputation are based on audience interpretations, a country can have multiple reputations and a single action can create different reputations among different audiences.¹⁷ **To some, following through on a threat demonstrates resolve; to others, foolishness.** Second, **action in one context might not migrate into reputation in another.**¹⁸ **If the United States sets a "red line on a fishing issue for Micronesia and then backs down, it is unlikely to send a signal to Iran that all American "red lines are bluffs. The Iranians may ignore the Micronesian case because it is fundamentally different from their own.**

There's no spillover

Jack **Balkin**, The Atlantic, 9/3/13, What Congressional Approval Won't Do: Trim Obama's Power or Make War Legal, www.theatlantic.com/politics/archive/2013/09/what-congressional-approval-wont-do-trim-obamas-power-or-make-war-legal/279298/

Wouldn't congressional refusal make the United States look weak, as critics including Senator John McCain warn loudly? **Hardly. The next dictator who acts rashly will face a different situation and a different calculus.** The UN Security Council or NATO may feel differently about the need to act. **There may be a new threat to American interests that lets Obama or the next president offer a different justification for acting. It just won't matter very much what Obama said about red lines in the past. World leaders say provocative things all the time and then ignore them. Their motto is: That was then, and this is now.**

If Congress turns him down, won't Obama be undermined at home, as other critics claim? **In what sense? It is hard to see how the Republicans could be less cooperative than they already are.** And it's not in the interest of Democrats to fault a president of their own party for acceding to what Congress wants instead of acting unilaterally.

Some commentators argue (or hope) that whatever happens, Obama's request for military authorization will be an important precedent that will begin to restore the constitutional balance between the president and Congress in the area of war powers. Don't bet on it. By asking for congressional authorization in this case, Obama has not ceded any authority that he or any other president has previously asserted in war powers.

It is naive to think that the next time a president wants to send forces abroad without congressional approval, **he or she will be deterred by the fact that Barack Obama once sought congressional permission** to bomb Syria. If a president can plausibly assert that any of the previous justifications apply -including those offered in the Libya intervention -the case of Syria is easily distinguishable.

Perhaps more to the point, **Congress still cannot go to the courts to stop the president, given existing legal precedents. Congress may respond by refusing to appropriate funds, but that is a remedy that they have always had -and have rarely had the political will to exercise.**

The most important **limit on presidential adventurism is political, not legal. It will turn less on the precedent of Syria than on whether the last adventure turned out well or badly.**

2AC – Thumpers

Presidential powers have no power- History shows active judicial and congressional vetoes

Richard Henry **Seamen**, 2007, "Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits" 466-469

As noted above, the President seemingly admits that after 9/11 he authorized "electronic surveillance" within the meaning of FISA without following FISA's requirements. As also noted above, -this surveillance outside FISA is not authorized by the later-enacted AUMF (or any other statute). Because neither the AUMF nor any other statute authorizes the surveillance, only the President's "inherent powers" can do so, and they can do so only to the extent that those inherent powers cannot validly be restricted by FISA. To say that FISA invalidly restricts the President's inherent powers reflects a conclusion that FISA violates the separation of powers doctrine. I join other commentators in believing that analysis of this separation of powers issue is guided by *Youngstown Sheet and Tube Co. v. Sawyer*. In *Youngstown*, the Court invalidated President Truman's attempt to take over the nation's steel mills. Truman attempted the takeover to ensure that, despite labor unrest, the mills would continue to produce materiel for the Korean War.⁷¹ Truman argued that "his action was necessary to avert a national catastrophe" which would inevitably result from a stoppage of steel production, and that in meeting this grave emergency [he] was acting within the aggregate of his constitutional powers as the Nation's Chief Executive and the Commander in Chief of the Armed Forces.⁷² The Court rejected that argument. It held that Truman's action was not authorized by any statute or any extra-statutory power that the President has under the Constitution.⁷³ The most authoritative opinion from *Youngstown* has come to be, not the majority's opinion, but Justice Jackson's concurrence.⁷⁴ In his concurrence, Justice Jackson set out a three-part framework for analyzing the President's power.⁷⁵ The framework reflects the interdependence of the President and Congress in certain matters, including war.⁷⁶ Under the first part of the framework, the President's power is "at its maximum" when he or she acts with the express or implied authorization of Congress.⁷⁷ In this first situation, the President has "all [of the power] that he [or she] possesses in his [or her] own right plus all that Congress can delegate."⁷⁸ The second part of the framework applies when the President acts with neither congressional approval nor congressional denial of his or her authority. In this second situation, the President "can only rely upon his [or her] own independent powers."⁷⁹ The third part of the framework applies when the President takes action "incompatible with the expressed or implied will of Congress."⁸⁰ In this third situation, the President's power "is at its lowest ebb, for then he [or she] can rely only upon his [or her] own constitutional powers minus any constitutional powers of Congress over the matter. Courts can sustain exclusive presidential control" in such a case⁸¹

only by disabling Congress from acting upon the subject., Justice Jackson's framework makes it important to determine whether the TSP is authorized by-or is instead inconsistent with-the express or implied will of Congress. The President argues that the TSP was authorized at its inception by the AUMF, but this argument lacks merit.⁸² Without the AUMF to support it, the TSP violates FISA and so presents Justice Jackson's third situation. Accordingly, the surveillance can fall within the President's power, despite violating FISA, only to the extent that Congress is constitutionally "disabl[ed]" from curbing the President's power.⁸³ The question becomes to what extent Congress can regulate the President's conduct of domestic electronic surveillance for national security purposes.

2NC – Checks Key

Congressional checks on presidential power only way to solve 4th amendment violations
Richard Henry **Seamen**, 2007, “Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits” 452

The President's power to authorize surveillance outside FISA in a genuine national security emergency does not justify the TSP's continuance beyond the weeks immediately after 9/11. Indeed, the program's very status as an ongoing, broad "program" prevents it from falling within the President's "genuine emergency" power. The genuine emergency power is limited in scope and duration when it is exercised in contravention of legislation, such as FISA, that is a generally valid regulation of the President's power to conduct domestic surveillance for national security purposes. For example, the President may well have had broad power to conduct surveillance outside FISA in the days and weeks immediately after the terrorist attacks on September 11, 2001. That power subsided, however, as time and a still-functioning civil government permitted the President to consult Congress on the appropriate scope of surveillance powers. Thus, the President's "genuine emergency" power cannot support a broad surveillance program that violates a generally valid Act of Congress. By the same token, by recently amending FISA so as to avoid a conflict between that statute and certain features of the TSP, Congress's enactment of the Protect America Act of 2007 supports the validity of those same features. Congressional ratification of the President's conduct both reinforces the President's power to engage in that conduct and supports its reasonableness for Fourth Amendment purposes.

Congressional power is key to minimizing both domestic and international threats—
Presidential power will offset

Richard Henry **Seamen**, 2007, “Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits” 469-470

Precedent establishes that Congress has some regulatory power in this matter, but the precedent leaves the scope of that power unclear. The relevant precedent includes FISA itself, which was supported by Presidents Carter and Ford as a legitimate regulation of the President's power. Unfortunately, this legislative precedent has no direct analog in Supreme Court precedent. The Supreme Court has said that Congress can regulate electronic surveillance in the United States to investigate national security threats posed by *domestic* organizations. The Court has not addressed congressional regulation of surveillance of threats to national security posed by *foreign* agents and powers. Though not addressing that specific issue, the Court has recognized that Congress has significant power over foreign relations—power that stems from, among other places, its power over foreign commerce and certain national defense matters. On the other hand, the Court has recognized that the President, too, has significant power over foreign affairs, including matters of foreign intelligence, which exists independently of

Congress's power. Precedent does not establish to what extent the President's power is not only independent but also "plenary"--meaning not reducible **by** Congress.

Congressional powers are critical in retaliation measures

Richard Henry **Seaman**, 2007, "Domestic Surveillance for International terrorists: presidential powers and 4th amendment limits" 474-477

This reliance on the unitary executive concept is deliberately narrow. It does not embrace broader claims that have been asserted under the unitary executive theory. Unitary executive extremists assert Presidential power to ignore congressional restrictions on removal of executive branch officials and congressional enactments vesting exclusive power to administer statutory programs in officials other than the President.¹²¹ In particular, recognition of congressionally irreducible presidential power in national security emergencies does not imply that the President has a greater role than Congress in the prosecution of war.¹²² The position staked out here does, however, reject the view that "there is no constitutional impediment to Congress restricting the President's ability to conduct electronic surveillance within the United States and targeted at United States persons."¹²³ That view would apparently preclude the President's violation of statutory surveillance restrictions even if the President reasonably concluded that violation of those restrictions was necessary to respond to a national security emergency.

AT: theory Politics DA Michigan 7

2ac PC Fails

Presidential influence is wildly exaggerated --- their ev just quotes political pundits

Nyhan, assistant professor of government at Dartmouth, 14 (Brendan, "Obama and the Myth of Presidential Control," http://www.nytimes.com/2014/07/25/upshot/obama-and-the-myth-of-presidential-control.html?_r=0&abt=0002&abg=1, JMP)

ONE OF THE MOST COMMON CRITICISMS OF PRESIDENTS — especially struggling ones during their second term — IS THAT THEY HAVE LOST CONTROL OF EVENTS.

This charge, which has been leveled at chief executives such as Ronald Reagan and George W. Bush, has become a mantra lately in coverage of President Obama, who faces a stalled legislative agenda and crises in Ukraine, Gaza and at the border with Mexico.

What happened? ONE FREQUENT EXPLANATION FROM PUNDITS AND JOURNALISTS IS THAT Mr. OBAMA HAS "LITTLE CONTROL" AND IS INSTEAD BEING "DRIVEN" OR "BUFFETED" BY EVENTS.

This notion pervades commentary and debate on the presidency. WE WANT TO BELIEVE THAT THE PRESIDENT IS (OR SHOULD BE) IN CONTROL. It's the impulse behind holding the president responsible for a bad economy and giving him credit for a good one (the most important factor in presidential approval and election outcomes). THE REASSURING NATURE OF PRESIDENTIAL CONTROL IS ALSO WHY NEWS MEDIA COVERAGE OF FOREIGN POLICY CRISES AND OTHER EVENTS THAT RALLY THE COUNTRY TENDS TO USE LANGUAGE THAT DEPICTS THE PRESIDENT AS BEING IN COMMAND.

The flip side of the demand for presidential control is disappointment when he can't magically work his will. ADVOCATES OF what I've called THE GREEN LANTERN THEORY OF THE PRESIDENCY SUGGEST that Mr. OBAMA'S FAILURE TO ACHIEVE HIS GOALS IN CONGRESS REFLECTS A LACK OF EFFORT OR WILLPOWER. If he only tried harder or were tougher, they suggest, he could control events rather than being controlled by them.

THESE ANALYSES GET THE DIRECTION OF CAUSALITY BACKWARD, however. **Under favorable circumstances, presidents seem to be in command of events, but that's largely a reflection of the context they face.** It's not hard to seem in control when the economy is booming, the president's party has a large majority in Congress or the nation is rallying around the president after a national tragedy.

Once unfavorable circumstances arise, though, even the most accomplished chief executives seem to lose control. My research has found, for example, that scandals are not simply about misconduct. They are more likely to arise when presidents are unpopular with self-identified members of the opposition party or when there are few competing stories in the news.

Obviously, the modern presidency is a powerful office with enormous influence, especially in foreign policy. Iraq and Afghanistan, for instance, might look very different today if Mr. Bush had made different decisions. Even in the domestic realm, the president can have success with a supportive Congress, as Mr. Obama's success in passing the Affordable Care Act demonstrates.

At the same time, THE POWERS OF THE PRESIDENCY ARE OUTSTRIPPED BY THE UNREALISTIC EXPECTATIONS PLACED ON THE CHIEF EXECUTIVE IN THE MODERN ERA. When problems arise, it's only natural that people want the most powerful person in the country to fix them, but these demands often lack a plausible account of how the problem could be solved. And even when the president has a proposal that he thinks would provide a solution, he's likely to struggle to persuade Congress or the public to support it, as Mr. Reagan discovered despite his reputation as the "Great Communicator."

The limits of the president's power can be scary — as human beings, we find a lack of control threatening — but **the idea that they can control events is a comforting fiction, NOT AN EXPLANATION FOR THEIR SUCCESS OR FAILURE**. AS Abraham LINCOLN (perhaps our greatest president) WROTE, "I CLAIM NOT TO HAVE CONTROLLED EVENTS, BUT CONFESS PLAINLY THAT EVENTS CONTROLLED ME." IMAGINE WHAT THE PUNDITS WOULD DO WITH THAT ADMISSION TODAY!

2ac AT: Losers-Lose Link

Obama's recent wins won't spillover --- no chance for cooperation on other issues

Drezner, 6/30/15 --- professor of international politics at the Fletcher School of Law and Diplomacy at Tufts University (Daniel W., "What can Obama really do in his fourth quarter? He had a good week last week. What does that mean for his presidency going forward?" <http://www.washingtonpost.com/posteverything/wp/2015/06/30/what-can-obama-really-do-in-his-fourth-quarter/>, JMP)

So the consensus among the political cognoscenti was that last week was the best week of Barack Obama's presidency. I guess that includes me. Last week I tweeted:

[image omitted]

And this was all before the Supreme Court eliminated all restrictions on same-sex marriage and Obama gave the speech of his presidency in eulogizing the Rev. Clementa Pinckney:

So, naturally, THE SUNDAY MORNING SHOWS WERE ALL ABOUT OBAMA REBORN AND THE POLITICAL PRESS WAS WRITING ALL ABOUT "AFTER MOMENTOUS WEEK, OBAMA'S PRESIDENCY IS REBORN," AND I THINK IT'S TIME TO JUST TAKE A STEP BACK AND THINK REAL HARD ABOUT THIS MEME A BIT.

THIS KIND OF ANALYSIS IS AKIN TO SPORTS-WRITING ABOUT MOMENTUM: THE NOTION THAT A PLAYER IS ON A HOT STREAK IMPLIES THAT HE WILL CONTINUE TO GO ON HIS HOT STREAK, when in point of fact, regression to the mean is the far more likely outcome. To be fair, IN POLITICS, THERE'S THE "POLITICAL CAPITAL" ARGUMENT THAT PRIOR SUCCESSES BURNISHES A PRESIDENT'S POPULARITY, WHICH IN TURN GIVES HIM SOME FORM OF POLITICAL CAPITAL TO SEEK OUT EVEN MORE SUCCESSES. And Obama's popularity is rising in some (but not all) polls.

Still, a dose of realism seems useful here. A president can advance his agenda through a number of means: acts of legislation, executive actions in domestic policy, foreign affairs accomplishments and burnishing his political legacy. Let's think about these in turn.

The president could reel off 10 consecutive speeches like he did in Charleston, but that's not going to make this Congress any more amenable to his policies. THE GOP LEADERSHIP HAS JUST COOPERATED WITH OBAMA ON THE ONE POLICY INITIATIVE THAT THEY AGREE ON — there isn't anything left in the hopper. And buried within Politico's "Obama reborn!" story is this little nugget:

Meanwhile, progressives on the Hill, especially those still burning over how hard he steamrolled them on trade, are rolling their eyes at the lionizing. Remember, they point out, that many of the big things Obama gets the credit for didn't originate with him — people like Nancy Pelosi were pushing him further on health care than the White House wanted to go, or out in favor of a gay marriage plank in the 2012 convention platform when he was still deciding what to say.

So the congressional route is pretty much stymied.

Then there's executive action, a route that this administration has been super-keen on since last year, particularly with respect to climate change (see also: new overtime rules). But lost among all the "huzzahs!" and "WTFs!!" about King vs. Burwell was the fact that Chief Justice John Roberts's ruling actually constricted the executive branch's ability to do that very thing. Roberts's opinion placed significant limits on the "Chevron deference" that the courts have bestowed to the executive branch in the past, as Chris Walker explains:

[T]he Chief went the extra step of reasserting the judiciary's primary role of interpreting statutes that raise questions of "deep economic and political significance." This is a major blow to a bright-line rule-based approach to Chevron deference....

One could say that King v. Burwell—while a critical win for the Obama Administration—is a judicial power grab over the Executive in the modern administrative state....

It will also be interesting to see how this amplified major questions doctrine affects other judicial challenges to executive action. Especially in light of the King Court's citation to UARG, one context that immediately comes to mind is the EPA's Clean Power Plan.

So while the health-care ruling was a substantive victory for the Obama administration, it was a process loss, and could make it difficult for the president to implement parts of his agenda through executive action.

Then there's foreign policy, his most promising avenue. Obama has the ability to rack up some significant accomplishments over the next 18 months: the Trans-Pacific Partnership, the Transatlantic Trade and Investment Partnership, an opening to Cuba, an Iran nuclear deal and a climate change deal in Paris at the end of this year.

I think it says something, however, that of the five things listed above, the Cuba opening is likely the least controversial. TPP and T-TIP are important but will not build him political capital since his own domestic allies hate it. The Iran deal and climate change negotiations are significant but will run into considerable

opposition. And, connected with the point above, political polarization will make it harder for Obama to make credible commitments in Paris. More significantly, I think foreign policy is an area where the president has lost the broader debate about how the United States should approach the world.

Finally, there's his political legacy. If Hillary Clinton wins the presidency in 2016, then Obama can legitimately compare himself to Ronald Reagan as the only postwar presidents who managed to bequeath his party the presidency after his two terms were up. But as Jonathan Martin noted over the weekend in the New York Times, the paradoxical effect of last week is that it clears the deck for GOP candidates:

[E]ven as conservatives appear under siege, some Republicans predict that this moment will be remembered as an effective wiping of the slate before the nation begins focusing in earnest on the presidential race.

As important as some of these issues may be to the most conservative elements of the party's base and in the primaries ahead, few Republican leaders want to contest the 2016 elections on social or cultural grounds, where polls suggest that they are sharply out of step with the American public.

"Every once in a while, we bring down the curtain on the politics of a prior era," said David Frum, the conservative writer. "The stage is now cleared for the next generation of issues. And Republicans can say, 'Whether you're gay, black or a recent migrant to our country, we are going to welcome you as a fully cherished member of our coalition.'"

So WILL OBAMA BE ABLE TO BUILD ON HIS GREAT WEEK TO HAVE A SUCCESSFUL FOURTH QUARTER? COLOR ME SOMEWHAT SKEPTICAL. ON THE DOMESTIC POLICY FRONT, the president is likely to find his political options more restricted rather than less restricted after last week. There are significant but polarizing opportunities on foreign policy. And his political legacy rests on Clinton's ability to fend off Bernie Sanders and a Republican who will be battle-tested from the most competitive party primary I've ever seen.

He's got decent chances on the latter two fronts — but let's put last week into perspective. It was a great week for the president. It does not mean that his presidency is reborn.

Link isn't unique --- Congress forcing Obama's hand now Lemieux 7/8

Scott Lemieux, is a professor of political science at the College of Saint Rose in Albany and frequently contributes to American Prospect, "How Congress learned to stop bowing to President Obama on national security," July 8, 2014, *The Week*, <http://theweek.com/articles/558953/how-congress-learned-stop-bowing-president-obama-national-security/NV>

FOR A BRIEF PERIOD OF TIME LAST WEEK, THE POST-9/11 NATIONAL SECURITY AGENCY TELEPHONE SURVEILLANCE PROGRAM WAS NO LONGER FULLY IN FORCE. IN AN ALL TOO RARE CASE OF SENATE PROCEDURES ACTUALLY PROTECTING CIVIL LIBERTIES, SEN. RAND PAUL WON A BATTLE WITH Majority Leader (and fellow Kentuckian) Mitch MCCONNELL in preventing the relevant sections of the USA Patriot Act from being re-authorized.

PAUL'S "VICTORY" WAS TEMPORARY, AND ULTIMATELY RESULTED IN ONLY MODEST CHANGES TO THE SURVEILLANCE STATE, in the form of the USA Freedom Act. But the new restrictions on the N.S.A.'s surveillance program can be a basis for cautious optimism going forward, not only on the topic of surveillance but on other issues related to civil liberties and national security. It appears Congress has finally recovered some of its clout.

The machinations in the Senate were an outgrowth of the political firestorm created by Edward Snowden, who revealed the N.S.A.'s secret surveillance program. A majority of the American public, which tends to be highly supportive of antiterrorism measures, opposes the collection of metadata revealed by Snowden. Whatever one thinks of Snowden's means, his whistleblowing has had a significant effect on American political culture, creating more skepticism about the NSA's antiterrorism efforts among both political elites and ordinary people.

As a result, CONGRESS FINALLY ACTED TO RESTRICT THE NSA'S POWERS. THE USA FREEDOM ACT, signed into law by President OBAMA, CONTAINS TWO SIGNIFICANT REFORMS. First of all, the NSA will not be permitted to collect bulk telephone and internet records. And second, at least some decisions of the FISA court that oversees NSA surveillance will be made transparent to the public, rather than be classified.

It is important not to overstate the significance of these changes. While the NSA will not be able to store data in bulk, private telecommunication companies will, and the government will be able to access that data with an order from the FISA court, which has generally been extremely deferential to government requests. And while it's good that the process will become more transparent, it's hard to imagine that making such information available will have a transformative effect. The new law is an improvement over the status quo ante, but not a major one.

Does the passage of the legislation at least signal the arrival of a new civil liberties hero in the Republican Party, who also happens to be running for president? Not really. Paul's procedural obstructions were more about bringing attention to himself than getting a better bill. After all, McConnell brought up the USA Freedom Act

for a vote that same day — it almost certainly could have passed had Paul supported it. Indeed, if not for Paul the bill could have passed the Senate last November — the cloture vote fell two votes short, and Paul was one of those votes.

Even though Paul was theoretically opposed to the bill because he (correctly) believed that it didn't go far enough, his obstructionism did not actually cause Congress to pass a better statute. As Russell Berman observes in *The Atlantic*, Paul is, in a sense, as much a political loser in this as McConnell.

The new restrictions on the NSA aren't about Rand Paul per se. But they do suggest the existence of a new civil libertarian coalition in Congress, consisting of most of the Democratic caucus and a handful of Republicans. This group of legislators might be able to make modest headway not only in pruning the surveillance state, but on other important issues, such as mass incarceration. I wouldn't hope for too much yet — the political headwinds are likely to be stronger against other kinds of reform, and Paul's presidential run is likely to expose the fact that even watered-down civil libertarianism has little constituency within his party. But supporters of NSA reform should consider whether bipartisan reform is possible on other civil liberties issues as well.

In addition to the policy changes, then, THE USA FREEDOM ACT IS ALSO POLITICALLY SIGNIFICANT. THE FACT THAT A SENATE SUPERMAJORITY WAS ABLE TO PASS A BILL OVER THE DEFIANCE OF THE SENATE MAJORITY LEADER SUGGESTS THAT **the days when Congress gave maximal deference to the executive branch might finally be over.** (Congress, of course, has shown little deference to the president when it comes to him trying do more to protect civil liberties, such as his attempt to stop imprisoning people at Guantanamo Bay.)

As we get further away from 9/11, hopefully a majority in Congress will finally begin to recognize that we do not need to diminish the civil liberties of American citizens to effectively fight terrorism.

Losers-lose is wrong --- won't impact rest of agenda

Sargent, 13 (Greg, 9/10/2013, Washington Post.com, "No, a loss on Syria would not destroy the Obama presidency," Factiva, JMP)

Get ready for a lot more of this sort of thing, should Congress vote No on Syria strikes:

The fate of President Obama's second term hangs on his Tuesday speech to the nation about Syria.

This is a particularly cartoonish version of what much of the punditry will be like if Obama doesn't get his way from Congress, but make no mistake, the roar of such punditry will be deafening. Jonathan Bernstein offers a much needed corrective:

There's one permutation that absolutely, no question about it, would destroy the rest of Barack Obama's presidency is: a disastrous war. Ask Lyndon Johnson or George W. Bush. Or Harry Truman. Unending, seemingly pointless wars are the one sure way to ruin a presidency.

Now, I'm not saying that's in the cards; in fact, I don't think it is. I'm just saying: that's the kind of thing that really does matter a lot to presidencies. And if you do believe that the administration is going down a path that winds up there, or a path that has a high risk of winding up there, then you should be very worried about the health of this presidency.

If not? None of the other permutations here are anywhere close to that kind of threat to the Obama presidency. PRESIDENTS lose key votes WHICH ARE THEN mostly forgotten all the time. THEY PURSUE POLICIES WHICH POLL BADLY, BUT ARE THEN MOSTLY FORGOTTEN, ALL THE TIME.

Look, there is no question that IF OBAMA LOSES SYRIA VOTE, the coverage will be absolutely merciless. But let's bring some perspective. The public will probably be relieved, and EVENTUALLY ALL THE "OBAMA IS A LOSER" TALK WILL sink out of the headlines AND BE REPLACED BY OTHER BIG STORIES with potentially serious ramifications for the country.

It's key to distinguish between two things here. One question is: How would a loss impact the credibility of the President and the United States with regard to upcoming foreign policy crises and confrontations? That's not the same as asking: How would a loss impact Obama's relations with Congress in upcoming domestic battles?

And on that latter score, there's a simple way to think about it: Look at what's ahead on the calendar. The two looming items are THE GOVERNMENT SHUTDOWN AND DEBT CEILING BATTLES, and when it comes down to it, THERE'S NO REASON TO BELIEVE A LOSS ON SYRIA WOULD SUBSTANTIALLY ALTER THE DYNAMICS ON EITHER. Both are ultimately about whether House Republicans can resolve their own internal differences.

Will a Syria loss weaken Obama to the point where Republicans would be even more reluctant than they are now to reach a deal to continue funding the government? Maybe, but even if a shutdown did result, would a loss on Syria make it any easier for the GOP to dodge blame for it? It's hard to see how that work in the eyes of the public. Same with the debt limit. IS THE ARGUMENT REALLY GOING TO BE, SEE, OBAMA LOST ON SYRIA, SO WE'RE GOING TO GO EVEN FURTHER IN THREATENING TO UNLEASH ECONOMIC HAVOC IN ORDER

TO DEFUND OBAMACARE AND/OR FORCE CUTS TO POPULAR ENTITLEMENTS? THERE'S JUST NO REASON WHY A CONGRESSIONAL VOTE AGAINST SYRIA STRIKES WOULD MAKE THE "BLAME GAME" ON THESE MATTERS ANY EASIER FOR REPUBLICANS.

IS IT POSSIBLE THAT A LOSS ON SYRIA WILL MAKE CONGRESSIONAL DEMS LESS WILLING TO DRAW A HARD LINE ALONG WITH THE PRESIDENT IN THESE TALKS, MAKING A CAVE TO THE GOP MORE LIKELY? I

DOUBT IT. It will still be in the interests of Congressional Dems to stand firm, because the bottom line remains the same: House Republicans face potentially unbridgeable differences over how far to push these confrontations, and a united Dem front exploits those divisions. Syria doesn't change any of that. If a short term deal on funding the government is reached, the prospects for a longer term deal to replace the sequester will be bleak, but they've been bleak for a long time. Syria will fade from public memory, leaving us stuck in the same stalemate -- the same war of attrition -- as before.

What about immigration? The chances of comprehensive reform passing the House have always been slim. Could a Syria loss make House Republicans even less likely to reach a deal? Maybe, but so what? Does anyone really imagine Latinos would see an Obama loss on Syria as a reason to somehow become less inclined to blame the GOP for killing reform? The House GOP's predicament on immigration will be unchanged.

WHATEVER HAPPENS ON SYRIA, AND **no matter how much "Obama is weak" punditry that results from it,** ALL OF THE REMAINING BATTLES WILL BE JUST AS PERILOUS FOR THE GOP AS THEY APPEARED BEFORE THE SYRIA DEBATE HEATED UP. FOLKS MAKING THE CASE THAT A SYRIA LOSS THROWS OBAMA'S SECOND TERM AGENDA INTO SERIOUS DOUBT -- AS IF CONGRESSIONAL INTRANSIGENCE WERE NOT ALREADY ABOUT AS BAD AS IT COULD POSSIBLY GET -- NEED TO EXPLAIN WHAT THEY REALLY MEAN WHEN THEY SAY THAT. **It's not clear even they know.**

--- 1ar Current Momentum Won't Spillover

Recent political momentum won't break GOP opposition on future issues Pace 6/25

Julia Pace, White House Correspondent for Associated Press, "Obama's Legacy Takes Shape With The Help Of Unlikely Allies," June 25, 2015, Associated Press, http://www.huffingtonpost.com/2015/06/25/obama-legacy-scotus-trade_n_7667946.html/NV

WASHINGTON (AP) -- Long past the prime of his presidency, Barack OBAMA IS DEFYING THE LAME-DUCK LABEL AND SOLIDIFYING THE CONTOURS OF HIS LEGACY WITH THE HELP OF UNLIKELY ALLIES IN CONGRESS AND THE SUPREME COURT.

Led by Chief Justice John Roberts, the high court preserved Obama's signature health care law Thursday, hours before a Republican-controlled Congress paved the way for an Asia-Pacific trade pact at the center of the president's international agenda. The Supreme Court also handed Obama a surprise win by upholding a key tool used to fight housing discrimination.

"This was a good day for America," Obama said, speaking from the White House Rose Garden shortly after the court rulings.

FOR A PRESIDENT DEEP INTO HIS SECOND TERM, THE LEGAL AND LEGISLATIVE VICTORIES WERE A VINDICATION OF POLICY PRIORITIES THAT HAVE SAPPED HIS POLITICAL CAPITAL AND EXPOSED RIFTS WITH HIS OWN DEMOCRATIC PARTY. THE BACK-TO-BACK SUCCESSSES also **ENERGIZED A WEARY WHITE HOUSE**, with senior officials and longtime advisers making little effort to hide their glee.

"I don't think that a lot of people expected that a lame-duck president could still very actively lead on every major issue being debated today," said Bill Burton, a former White House and campaign adviser to Obama.

The coming days could bring further clarity to president's legacy, as U.S. negotiators work feverishly to finalize a nuclear deal with Iran ahead of a June 30 deadline. While securing an elusive agreement would mark a major foreign policy breakthrough for Obama, it could be months or even years before it's known if a deal successfully prevents Iran from building a bomb.

Against the backdrop of his recent successes, Obama will also confront the stark limitations of his presidency when he travels to Charleston, South Carolina, Friday to deliver a eulogy for victims of last week's massacre at a black church. Obama has failed to make any progress on gun control legislation, and even against the backdrop of the tragedy in South Carolina, he made clear he had given up hope of pursuing such measures again during his remaining 19 months in office.

Despite the unfinished business Obama will leave behind, Thursday's health care ruling largely answered what has long been one of the biggest questions looming over his White House: Would the sweeping health care overhaul that has fueled so much Republican hostility toward Obama survive his presidency?

Now, that answer is all but guaranteed to be yes.

The Supreme Court ruling marked the second time the justices have saved the health care law, with Roberts writing the majority opinion both times. In an ironic twist, Obama as a senator voted against Roberts when he was nominated by former Republican President George W. Bush.

While House Republicans may still hold votes to repeal the health care measure, as they have already done more than 50 times, the Senate and Obama's veto power prevent such efforts from going any further. And even if Obama is succeeded by a Republican president, fully repealing the law could become less politically palatable given the millions of Americans who have gained health care coverage through its mandates.

"The 6-3 decision is strong validation of the constitutionality of the law," White House senior adviser Valerie Jarrett said of the court's ruling. "Coupled with over 16 million people who currently have health care who didn't have it before, that makes it very difficult to unwind."

Still, some Republican presidential candidates insisted that remained their goal.

"This decision is not the end of the fight against Obamacare," said Jeb Bush, the former Florida governor. "I will work with Congress to repeal and replace this flawed law with conservative reforms that empower consumers with more choices and control over their health care decisions."

Obama had to flip Washington's standard political scorecard in order to get support for the Asia-Pacific trade pact. While Republicans are largely supportive of free trade, many of Obama's fellow Democrats fear such agreements put American workers at a disadvantage and have weak environmental protections.

Just two weeks ago, Democrats dealt Obama an embarrassing defeat on trade, leaving him searching for a solution with many of the same Republicans lawmakers who decry the health care law.

The unusual coalition succeeded. On Wednesday, Obama secured the authority to get fast approval for a final Trans-Pacific Partnership deal, and on Thursday, Congress sent a workers' assistance package to his desk.

White House officials cast Obama's successful dealings with Republicans as evidence of what they had hoped would be another piece of the president's legacy: an ability to work with his political opponents and curb Washington's intense partisanship.

BUT few in the White House or elsewhere in the nation's capital expect this brief detente between Obama and the GOP to last for long, especially as they stare down deadlines this fall on taxes and spending - ISSUES THAT HAVE RIVALED HEALTH CARE IN DRIVING DEEP DIVISIONS BETWEEN THE DEMOCRATIC WHITE HOUSE AND REPUBLICAN LAWMAKERS.

"IT'S GOING TO GIVE THE WHITE HOUSE SOME MOMENTUM GOING INTO THE FALL," SAID Jim MANLEY, A FORMER ADVISER TO Senate Minority Leader Harry REID, D-Nev. "BUT I DON'T THINK ANYONE CAN EXPECT THE EFFORTS TO WORK WITH REPUBLICANS ON TRADE TO TRANSLATE INTO HELP ON THESE TAX AND SPENDING ISSUES."

2ac Winners-Win

Winners-win --- gives Obama critical momentum

Hirsh, 13 --- Chief correspondent (2/7/2013, Michael, "There's No Such Thing as Political Capital; The idea of political capital—or mandates, or momentum—is so poorly defined that presidents and pundits often get it wrong," <http://www.nationaljournal.com/magazine/there-s-no-such-thing-as-political-capital-20130207>)

Naturally, ANY PRESIDENT HAS PRACTICAL AND ELECTORAL LIMITS. DOES HE HAVE A MAJORITY IN BOTH CHAMBERS OF CONGRESS AND A COHESIVE COALITION BEHIND HIM? OBAMA HAS NEITHER AT PRESENT. AND UNLESS a surge in the economy—at the moment, still stuck—or SOME other GREAT victory gives him more momentum, IT IS INEVITABLE THAT THE CLOSER OBAMA GETS TO THE 2014 ELECTION, THE LESS HE WILL BE ABLE TO GET DONE. Going into the midterms, Republicans will increasingly avoid any concessions that make him (and the Democrats) stronger.

But the abrupt emergence of the immigration and gun-control issues illustrates how suddenly shifts in mood can occur and how political interests can align in new ways just as suddenly. Indeed, the pseudo-concept of political capital masks a larger truth about Washington that is kindergarten simple: You just don't know what you can do until you try. Or as ORNSTEIN himself ONCE WROTE years ago, "WINNING WINS." IN THEORY, AND IN PRACTICE, DEPENDING ON OBAMA'S HANDLING OF ANY PARTICULAR ISSUE, EVEN IN A POLARIZED TIME, HE COULD STILL DELIVER ON A LOT OF HIS SECOND-TERM GOALS, DEPENDING ON HIS SKILL AND THE BREAKS. Unforeseen catalysts can appear, like Newtown. Epiphanies can dawn, such as when many Republican Party leaders suddenly woke up in panic to the huge disparity in the Hispanic vote.

Some political scientists who study the elusive calculus of how to pass legislation and run successful presidencies say that political capital is, at best, an empty concept, and that almost nothing in the academic literature successfully quantifies or even defines it. "It can refer to a very abstract thing, like a president's popularity, but there's no mechanism there. That makes it kind of useless," says Richard Bense, a government professor at Cornell University. Even Ornstein concedes that the calculus is far more complex than the term suggests. WINNING ON ONE ISSUE OFTEN CHANGES THE CALCULATION FOR THE NEXT ISSUE; there is never any known amount of capital. "The idea here is, IF AN ISSUE COMES UP WHERE THE CONVENTIONAL WISDOM IS THAT PRESIDENT IS NOT GOING TO GET WHAT HE WANTS, AND HE GETS IT, THEN each time that happens, it changes the calculus of the other actors" ORNSTEIN SAYS. "IF THEY THINK HE'S GOING TO WIN, THEY MAY CHANGE POSITIONS TO GET ON THE WINNING SIDE. It's a bandwagon effect."

ALL THE WAY WITH LBJ

SOMETIMES, A CLEVER PRACTITIONER OF POWER can get more done just because he's aggressive AND KNOWS THE HALLWAYS OF CONGRESS WELL. Texas A&M's Edwards is right to say that the OUTCOME OF THE 1964 ELECTION, Lyndon JOHNSON'S LANDSLIDE VICTORY over Barry Goldwater, WAS ONE OF THE FEW THAT CONVEYED A MANDATE. BUT ONE OF THE MAIN REASONS FOR THAT MANDATE (in addition to Goldwater's ineptitude as a candidate) WAS President JOHNSON'S masterful use of power leading up to that election, and his ABILITY TO GET FAR MORE DONE THAN ANYONE THOUGHT POSSIBLE, GIVEN HIS LIMITED POLITICAL CAPITAL. In the newest volume in his exhaustive study of LBJ, The Passage of Power, historian Robert Caro recalls Johnson getting cautionary advice after he assumed the presidency from the assassinated John F. Kennedy in late 1963. Don't focus on a long-stalled civil-rights bill, advisers told him, because it might jeopardize Southern lawmakers' support for a tax cut and appropriations bills the president needed. "ONE OF THE WISE, PRACTICAL PEOPLE AROUND THE TABLE [SAID THAT] THE PRESIDENCY HAS ONLY A CERTAIN AMOUNT OF COINAGE TO EXPEND, AND YOU OUGHTN'T TO EXPEND IT ON THIS," CARO WRITES. (COINAGE, of course, WAS WHAT POLITICAL CAPITAL WAS CALLED in those days.) JOHNSON REPLIED, "WELL, WHAT THE HELL'S THE PRESIDENCY FOR?"

JOHNSON DIDN'T WORRY ABOUT COINAGE, AND HE GOT THE CIVIL RIGHTS ACT ENACTED, ALONG WITH MUCH ELSE: Medicare, a tax cut, antipoverty programs. HE APPEARED TO UNDERSTAND not just the ways of Congress but also THE WAY TO maximize the momentum he possessed in the lingering mood of national grief and determination by picking the right issues, as Caro

records. "Momentum is not a mysterious mistress," LBJ said. "It is a controllable fact of political life." JOHNSON HAD THE SKILL AND WHEREWITHAL TO REALIZE THAT, AT THAT MOMENT OF HISTORY, HE could have unlimited coinage if he handled the politics right. He did. (At least until Vietnam, that is.)

And then there are the presidents who get the politics, and the issues, wrong. It was the last president before Obama who was just starting a second term, George W. Bush, who really revived the claim of political capital, which he was very fond of wielding. Then Bush promptly demonstrated that he didn't fully understand the concept either.

Last month proves winners-win is true

Siddiqui, 7/1/15 (Sabrina, The Guardian, "Barack Obama basks in public approval after 'best week of his presidency'; President's approval ratings at 50% for first time in two years Obama vows to 'squeeze every last ounce of progress' from rest of term," Lexis, JMP)

Barack **OBAMA PLEDGED** on Tuesday **TO "SQUEEZE EVERY LAST OUNCE OF PROGRESS" OUT OF HIS REMAINING TIME IN THE WHITE HOUSE**, as his poll ratings reached a two-year high following what political commentators said was the best week of his presidency.

Asked to describe **A WEEK MARKED BY several victories for his administration**, including the passage by Congress of so-called "fast-track" authority for the president to negotiate trade deals and landmark supreme court rulings on gay marriage and his healthcare reforms, **OBAMA SAID** it **WAS GRATIFYING**.

The president also won acclaim for a stirring eulogy, during which he sang Amazing Grace, delivered on Friday in Charleston, South Carolina, after the racially motivated shooting of nine people at a historically black church there.

During a joint press conference with the Brazilian president, Dilma Rousseff, on Tuesday, Obama said the legislative and judicial achievements were "simply a culmination" of the work of his administration since he first came into office.

But **HE EXPRESSED** his **SATISFACTION AT BEING ABLE TO SECURE THE TRADE POWERS IN CONGRESS despite opposition from his own party**, and said the results of the supreme court decision to uphold a key component of his healthcare law "speak for themselves".

Obama's remarks coincided with the release of a new poll that found his approval ratings at 50% for the first time in more than two years. The CNN/ORC survey found that support for how Obama was handling the presidency had shot up five points since a similar poll in May, when just 45% approved of Obama's job performance and more than half of Americans disapproved.

Last week's news, as well as an improving economy, contributed to the climb in Obama's approval ratings, the poll found.

It also included higher marks for the way the president had handled race relations in the United States. According to the survey, 55% of Americans said they approved of Obama's handling of issues pertaining to race, while just 42% said they disapproved.

The subject has risen in prominence following a series of high-profile killings of unarmed black men by white police officers and the mass shooting in Charleston this month in which a white male gunned down nine African American churchgoers. The suspect seems to have been a white supremacist.

"My remarks in Charleston were heartfelt," Obama said on Tuesday of his eulogy for one of the victims, the pastor and state senator Clementa Pinckney. "It wasn't a celebration. It was, I think, a reflection on the consistent challenge of race in this country and how we can find a path towards a better way.

ASKED WHAT HE PLANNED TO DO WITH the political capital he appeared to gain from last week, OBAMA SAID: "THE LIST IS LONG."

"WE ARE GOING TO SQUEEZE EVERY LAST OUNCE OF PROGRESS THAT WE CAN MAKE ... as long as I have the privilege of holding this office," he said, before identifying issues such as infrastructure spending, criminal justice reform, and expanding free community college as potential opportunities.

--- 1ar Winners Win True Now

Winners-win is true in the current political climate

Nelson 6/30

Colleen McCain Nelson, is a Washington D.C. Reporter for the Wall Street Journal, "Obama Sees Recent Wins as 'Culmination' of Hard Work," June 30, 2015, Wall Street Journal, <http://blogs.wsj.com/washwire/2015/06/30/obama-sees-past-week-as-culmination-of-hard-work/NV>

AFTER CELEBRATING VICTORIES in the last several days ON TRADE, HEALTH CARE AND GAY MARRIAGE, President Barack OBAMA DEEMED IT A GRATIFYING WEEK AND PLEDGED TO KEEP PUSHING ON HIS AGENDA.

"In many ways, LAST WEEK WAS SIMPLY A CULMINATION OF A LOT OF WORK THAT WE'VE BEEN DOING SINCE I CAME INTO OFFICE," MR. OBAMA SAID Tuesday in a joint press conference with Brazilian President Dilma Rousseff. "HOW AM I GOING TO SPEND WHATEVER POLITICAL CAPITAL THAT I'VE BUILT UP? YOU KNOW, THE LIST IS LONG AND my instructions to my team and my instructions to myself have always been that WE ARE GOING TO SQUEEZE EVERY LAST OUNCE OF PROGRESS THAT WE CAN MAKE ...as long as I have the privilege of holding this office."

Congress last week gave the president broad authority to negotiate trade deals, and the Supreme Court upheld a key provision of the Affordable Care Act, preserving Mr. Obama's signature domestic achievement. The Supreme Court also ruled that same-sex marriage is a nationwide right, a decision that Mr. Obama lauded as a "thunderbolt" of justice.

The White House claimed another victory when the Supreme Court ruled that minorities could continue using a civil-rights era statute in housing discrimination lawsuits. And Mr. Obama closed last week by delivering an emotional eulogy for the pastor of the black church where nine people were slain, calling for gun-control measures and action to address racial disparities.

The string of wins and the president's compelling address in Charleston, S.C., prompted pronouncements that this had been Mr. Obama's best week in office. On Tuesday, the president brushed aside such commentary, suggesting that other life events trump a good week in politics.

Winners win is true now --- momentum from TPP proves

Nakamura 6/24

David Nakamura, reporter on the White House for the Washington Post, "Obama scores a major trade win, burnishing his foreign policy legacy," June 24, 2015, The Washington Post, http://www.washingtonpost.com/politics/obama-poised-for-a-major-trade-win-burnishing-his-foreign-policy-legacy/2015/06/24/e940c6fa-1a77-11e5-93b7-5eddc056ad8a_story.html/NV

President OBAMA WON NEW POWERS FROM CONGRESS on Wednesday, TO BRING HOME AN EXPANSIVE PACIFIC RIM FREE-TRADE DEAL THAT analysts said COULD BOOST U.S. ECONOMIC STANDING IN ASIA AND ULTIMATELY BURNISH HIS FOREIGN POLICY LEGACY.

Obama's victory on Capitol Hill, coming 12 days after House Democrats nearly scuttled his bid for "fast-track" trade authority, sets the stage for his administration to complete the multi-nation Trans-Pacific Partnership, or TPP, by year's end.

It represents a hard-won payoff for a president WHO WAS WILLING TO PARTNER WITH HIS REPUBLICAN RIVALS AND DEFY A MAJORITY OF HIS PARTY in pursuit of an accord that aides have said will ensure that the United States maintains an economic edge over a rising China.

"This looks like a big, strategic piece," said Ian Bremmer, president of the Eurasia Group, a global risk analysis firm. "It's a global strategy doctrine that will move the world in a direction that, in the long term, is useful for the investments of America."

The intensive legislative fight — WAGED FOR MONTHS BY A WHITE HOUSE EAGER TO SCORE A RARE, BIPARTISAN LEGISLATIVE VICTORY LATE IN OBAMA'S TENURE — APPEARED TO BE COMING TO A CLOSE AFTER THE SENATE VOTED 60-38 to grant final approval to the fast-track bill. Also Wednesday, key House Democrats signaled that they would

concede defeat and support related legislation — which they had blocked two weeks ago to stall the trade agenda — that provides retraining assistance for displaced workers.

"Within reach is an opportunity to shape tomorrow's global economy so that it reflects both our values and our interests," U.S. Trade Representative Michael Froman said.

[Earlier: Trade war heating up among Democrats]

The trade-promotion bill now heads to Obama's desk for his signature. It gives the executive branch additional powers for six years and authorizes the president, and his successor, to present trade deals to Congress for a vote on a specified timeline without lawmakers being able to amend the terms.

Although **the outcome is a full-fledged victory for Obama**, the acrimony along the way has raised questions about the Democratic Party's cohesion heading into the 2016 election cycle. Democratic front-runner Hillary Rodham Clinton, who supported the TPP as Obama's secretary of state, sought to distance herself from the pact more recently.

Most Democrats have dismissed the strategic foreign policy benefits of the trade deal, warning instead that the TPP will cost U.S. workers jobs in traditional manufacturing industries and exacerbate the nation's widening income gap.

"The foreign policy establishment of the executive branch has divorced itself from the domestic policy," said Rep. Marcy Kaptur (D-Ohio), who opposed the legislation.

U.S. officials expect the new authority to jump-start the final rounds of talks. Negotiators still must hammer out deals on a number of thorny issues, including new rules on access to Japanese auto and agriculture markets. In addition to lowering tariffs, the trade pact also aims to expand copyright and intellectual property protections and regulate the flow of information on the Internet.

ONCE NEGOTIATIONS ARE COMPLETE, THE ADMINISTRATION WILL HAVE TO GET A FINAL DEAL THROUGH ANOTHER VOTE IN CONGRESS, during which labor unions are certain to renew their opposition efforts. The whole process could take six months or more and plunge the Democratic Party into further political turmoil in the middle of a presidential campaign.

The passage of the fast-track bill "does not end our fight for working families," said House Minority Leader Nancy Pelosi (D-Calif.), who opposed the legislation.

--- AT: Plan is not a Win – It's Unpopular

Passing even controversial policies boosts Obama's political capital

Singer, 9 – Juris Doctorate candidate at Berkeley Law (Jonathon, "By Expending Capital, Obama Grows His Capital," 3/3/2009, <http://www.mydd.com/story/2009/3/3/191825/0428>)

Despite the country's struggling economy and vocal opposition to some of his policies, President Obama's favorability rating is at an all-time high. Two-thirds feel hopeful about his leadership and six in 10 approve of the job he's doing in the White House.

"What is amazing here is how much political capital Obama has spent in the first six weeks," said Democratic pollster Peter D. Hart, who conducted this survey with Republican pollster Bill McInturff. "And against that, he stands at the end of this six weeks with as much or more capital in the bank."

Peter Hart gets at a key point. Some believe that political capital is finite, that it can be used up. To an extent that's true. But it's important to note, too, that political capital can be regenerated -- and, specifically, that when a President expends a great deal of capital on a measure that was difficult to enact and then succeeds, he can build up more capital. Indeed, that appears to be what is happening with Barack Obama, who went to the mat to pass the stimulus package out of the gate, got it passed despite near-unanimous opposition of the Republicans on Capitol Hill, and is being rewarded by the American public as a result.

Take a look at the numbers. President Obama now has a 68 percent favorable rating in the NBC-WSJ poll, his highest ever showing in the survey. Nearly half of those surveyed (47 percent) view him very positively. Obama's Democratic Party earns a respectable 49 percent favorable rating. The Republican Party, however, is in the toilet, with its worst ever showing in the history of the NBC-WSJ poll, 26 percent favorable. On the question of blame for the partisanship in Washington, 56 percent place the onus on the Bush administration and another 41 percent place it on Congressional Republicans. Yet just 24 percent blame Congressional Democrats, and a mere 11 percent blame the Obama administration.

So at this point, with President Obama seemingly benefiting from his ambitious actions and the Republicans sinking further and further as a result of their knee-jerked opposition to that agenda, there appears to be no reason not to push forward on anything from universal healthcare to energy reform to ending the war in Iraq.

2ac Iran + Laundry List Thumper

Number of other priorities, including Iran thump

Lee 7/2 (Carol E. Lee, 7/2/15, "White House Gears Up for Domestic Policy Offensive", Wall Street Journal, <http://blogs.wsj.com/washwire/2015/07/02/white-house-gears-up-for-domestic-policy-offensive/>)/jmoney

While President Barack Obama's top foreign-policy initiatives—particularly on Cuba, trade and Iran—have dominated the headlines lately, the White House is gearing up for a domestic policy push that's largely been under the radar.

The effort is designed both to burnish Mr. Obama's domestic-policy legacy and to try to make headway on issues where progress has lagged.

Mr. Obama has already begun to showcase the strategy. The White House announced this week A PROPOSAL TO EXPAND OVERTIME PAY TO ABOUT FIVE MILLION MORE AMERICANS, and on Wednesday Mr. Obama traveled to Tennessee to highlight his health-care law in the wake of last week's Supreme Court ruling that upheld federal subsidies to millions of low-income

In coming weeks, the White House is expected to roll out more executive orders, perhaps on gun safety. And top White House officials are hoping to capitalize on their successful collaboration with congressional Republicans on trade to advance a business-tax overhaul and transportation initiatives targeted at shoring up the country's infrastructure.

Changes to the criminal justice system are also at the top of the president's domestic wish list.

He telegraphed his renewed domestic focus this week during a news conference with Brazilian President Dilma Rousseff.

"The list is long," Mr. Obama said. "What we're going to do is just keep on hammering away at all the issues that I think are going to have an impact on the American people. Some of them will be left undone. But we're going to try to make progress on every single one of them."

The renewed domestic offensive, coupled with an aggressive front on foreign-policy issues, are a reflection of a president who is, as former senior White House adviser David Axelrod recently told The Wall Street Journal, "feeling the pressures of time."

The challenge for Mr. Obama will be in the places where his domestic and foreign policy agendas intersect.

The president has limited political capital in Congress. AND HE NEEDS LAWMAKERS TO BACK—OR AT LEAST NOT AMASS A VETO-PROOF MAJORITY OPPOSITION TO—A NUCLEAR DEAL WITH IRAN if one is finalized in coming days. He'll also need to generate enough support among Republican and Democratic lawmakers for lifting the embargo on Cuba, which on Wednesday he again called on Congress to do as he announced finalized plans to open an American embassy in Havana.

It's unclear if Mr. Obama will also be able to persuade Congress to act on issues such as infrastructure, business taxes and the criminal JUSTICE SYSTEM. BUT White House officials have been instructed to make a strong effort.

"We are going to squeeze every last ounce of progress that we can make when I have the privilege—as long as I have the privilege of holding this office," Mr. Obama said Tuesday.

--- 1ar Iran Thumper

The Iran deal thumps the disad – will burn up PC AND failure will stall Obama’s political momentum

Fabian 7/7

Jordan Fabian, is a reporter who covers the White House for the Hill, “Nuclear deal with Iran appears elusive,” July 7, 2015, The Hill, <http://thehill.com/homenews/administration/247156-nuclear-deal-with-iran-appears-elusive/NV>

WHITE HOUSE HOPES FOR A NUCLEAR DEAL WITH IRAN —A TOP FOREIGN POLICY ACHIEVEMENT FOR PRESIDENT OBAMA — seemed in danger of crumbling on Tuesday.

Negotiators extended their talks again in Geneva, as Iran made new hard-line demands, including that the United Nations lifts its arms embargo on the country.

It was the second time the parties blew through a deadline since the original June 30 cutoff, and it raised fresh questions on whether Obama’s push to use diplomacy to cut off Tehran’s path to a nuclear weapon can succeed.

THE WHITE HOUSE ACKNOWLEDGED A NUMBER OF DIFFICULT ISSUES STAND IN THE WAY OF A DEAL BUT SAID THE COUNTRIES INVOLVED HAVE “NEVER BEEN CLOSER TO REACHING A FINAL AGREEMENT THAN WE ARE NOW.”

“THAT’S AN INDICATION THAT THESE TALKS, AT LEAST FOR NOW, ARE WORTH CONTINUING,” White House spokesman Josh EARNEST TOLD REPORTERS.

At the same time, Earnest declined to put odds on reaching a deal. “I’m not feeling like a betting man today,” he said.

The parties extended an interim agreement to July 10, allowing the talks to last into Friday. But Iran is warning it won’t sit at the negotiating table indefinitely.

“We’ve come to the end,” an Iranian official told Reuters on Tuesday. “Either it happens in the next 48 hours or not.”

THE STAKES ARE HIGH FOR OBAMA. ALONG WITH HIS BID TO RE-ESTABLISH TIES WITH CUBA, THE IRAN DEAL IS A MAJOR TEST OF THE PRESIDENT’S DOCTRINE OF ENGAGING WITH THE U.S.’S TRADITIONAL ADVERSARIES TO ADDRESS COMMON INTERESTS.

IF THE TALKS FALTER, IT WOULD WIPE AWAY AN ELUSIVE LEGACY-DEFINING FOREIGN POLICY ACHIEVEMENT FOR OBAMA, who has grappled with instability in the Middle East and the rise of the Islamic State in Iraq and Syria.

While Obama is riding the momentum from a series of successes on the domestic front, on trade, same-sex marriage and healthcare, failure on Iran could blunt his gains.

“He had secured his domestic legacy in a pretty dramatic fashion in the last two weeks. THAT’S ALWAYS BEEN HIS NO. 1 PRIORITY,” SAID JAMES JEFFREY, a distinguished fellow at the Washington Institute for Near East Policy and a former ambassador to Iraq under Obama. “He realizes his international legacy is a mess.”

Obama has spent a tremendous amount of political capital in pursuit of the deal — both with Democrats in Congress and the U.S.’s traditional allies in Persian Gulf states and Israel, who fear the deal could embolden Iran in its pursuit of dominance in the Middle East.

Deputy national security adviser Ben Rhodes acknowledged last week the president is “taking on some sacred cows” in dealing with hostile regimes.

But HE SAID THE AIM OF DEALING WITH IRAN IS TO AVOID BEING PULLED INTO ANOTHER CONFLICT IN THE MIDDLE EAST WHILE PREVENTING IT FROM BECOMING A NUCLEAR POWER.

Administration officials told The Wall Street Journal Monday that they hope a successful Iran deal could open the door to resolving lingering conflicts in Syria and Yemen, where Iran is involved.

But OBAMA IS COMING UNDER PRESSURE FROM LAWMAKERS IN BOTH PARTIES NOT TO AGREE TO A DEAL AT ALL COSTS.

ON TUESDAY EVENING, THE PRESIDENT MET WITH SENATE DEMOCRATS AT THE WHITE HOUSE, WHERE HE WAS EXPECTED TO SOOTH MEMBERS OF HIS PARTY WHO ARE WORRIED ABOUT THE TALKS.

Influential Democrats, including Senate Foreign Relations Committee ranking member Ben Cardin (Md.), have demanded “anytime, anywhere” inspections of Iranian nuclear facilities.

But those conditions are unlikely to be met, making it tougher for the administration to prevent a veto-proof majority from voting to disapprove of a deal, if one is reached.

COMPLICATING THAT EFFORT FURTHER IS THE FACT THAT A DEAL IS UNLIKELY TO BE REACHED BY THURSDAY, WHEN THE CONGRESSIONAL REVIEW PERIOD DOUBLES FROM 30 DAYS TO 60 DAYS. THAT COULD ALLOW OPPOSITION TO BUILD.

REPUBLICANS WERE EMBOLDENED IN THEIR CALLS FOR OBAMA TO WALK AWAY FROM THE TALKS following Tuesday’s extension.

“THE STAKES ARE TOO HIGH FOR THIS DIPLOMATIC CHARADE TO CONTINUE,” Sen. Marco RUBIO (R-Fla.), a 2016 presidential candidate, SAID in a statement. “Iranian leaders continue to walk back previous commitments, even as they actively sponsor terrorism, pursue regional domination and hold American citizens hostage.”

AT THE SAME TIME, OBAMA SEEMS TO UNDERSTAND THE RISKS FAILURE COULD POSE TO HIS LEGACY.

“Look, 20 years from now, I’m still going to be around, God willing. If Iran has a nuclear weapon, it’s my name on this,” he told The Atlantic in May.

Obama is closely following the talks, receiving updates from national security adviser Susan Rice and other aides multiple times daily, Earnest said.

There are major risks for Iran too. The regime in Tehran desperately wants relief from international sanctions related to its nuclear program, which have crippled the country’s economy.

Sanctions caused its gross domestic product to shrink by 5 percent in 2013, and its economy has recovered only slightly since an interim agreement was reached that year.

Despite the delay, JEFFREY believes Obama is in a strong position heading into the final stretch of the talks.

He PREDICTED THE PRESIDENT’S LEGACY WOULD NOT BE HURT IF, AT THIS POINT, A DEAL FALLS THROUGH BECAUSE IRANIAN INTRANSIGENCE.

“By taking a tough position at the talks to the point where we’ll walk out or the Iranians will have to walk out — we’re basically making it clear to the Iranians that we can’t be pushed around,” he said. “That we are deadly serious in this process.”

--- 1ar Laundry List Thumpers

Multiple issues thump the link, including infrastructure, overtime, criminal justice, and education

Balan 6/30 --- news analyst at Media Research Center, Bachelor's in political science and history at University of Delaware (Matthew Balan, 6/30/15, "CNN's Acosta Tosses Softball to Obama Over his 'Best Week Ever'", <http://newsbusters.org/blogs/matthew-balan/2015/06/30/cnns-acosta-tosses-softball-obama-over-his-best-week-ever>)//Jmoney

CNN's Jim Acosta quoted colleague John King at a Tuesday press conference at the White House by asking President Obama about "what some people are calling 'your best week ever.'" Acosta played up that "you had two Supreme Court decisions supportive of the Affordable Care Act and of gay rights. You also delivered a speech down in Charleston that was pretty warmly received."

The correspondent then underlined that 'it seems that you've built up some political capital for the remaining months of your presidency.' He asked, "I'm curious, how you want to use it? What hard things do you want to tackle at this point?" [video below]

The President led his answer with the obvious personal answer to the question – that the real "best weeks" in his life were the weeks where he married his wife, Michelle, and where his daughters were born. The CNN correspondent gushingly replied, "Good thing you remembered those." He then spotlighted something Acosta didn't mention: Congress passing his fast-track trade legislation. He continued by cheering the Supreme Court's ObamaCare decision, before touching on his remarks at the Charleston funeral of Rev. Clementa Pinckney, who was killed days earlier in a mass shooting. Interestingly, the President didn't mention the Court's decision on same-sex "marriage."

Near the end of his extended answer (altogether, Obama spoke for ten-plus minutes answering Acosta's "multi-part" question), the chief executive outlined that he planned to use his "political capital" to press for the passage of overtime rules, infrastructure spending, reforming the criminal justice system, education, and generally making "a difference in the lives of ordinary Americans."

When the President cracked that wanted to "see if we can make next week even better," Acosta wondered if there would be "another press conference." The Democrat replied by joking, "I love press conferences. It's my press team that's always holding me back. I want to talk to you guys everyday."

Congress's agenda is also filled with a number of must pass bills this month

Mimms 7/5 --- Staff Correspondent for the National Journal (Sarah Mimms, 7/5/15, "Must-Pass Highway Bill Dominates Jammed July", <http://www.nationaljournal.com/congress/must-pass-highway-bill-dominates-jammed-july-20150705>)//Jmoney

With a month-long recess looming in August, Congress is going to try to pack as much as possible into July.

In the next three weeks, members will have to contend with several pieces of must-pass legislation, meet a July 31 deadline to fill the nation's Highway Trust Fund, and lay the groundwork for even more critical legislation due in the early fall.

The House plans to take up two appropriations bills during its remaining summer stint in D.C., funding the Department of the Interior and filling the coffers for financial services, the White House, and a handful of other related agencies. Passing those two bills will get the House a third of the way through its appropriations process before the August recess, giving the lower chamber just three weeks to deal with eight additional bills—and coordinate passage through the Senate—before the government's funding runs out on Sept. 30.

The Senate is much further behind and has not passed a single appropriations bill yet this year. Whether the upper chamber will attempt to pass any of the 12 spending bills in July is unclear, given the current stalemate between the two parties. Democrats have not backed off their vow to block each of them until Republicans agree to raise the coming sequestration on nondefense programs. Given that each of the 12 appropriations bills takes about a

week in the Senate, the upper chamber is already running short on time, raising the likelihood of a last-minute omnibus spending bill to prevent a government shutdown this fall.

In the meantime, the Senate will take up education legislation revising No Child Left Behind as its first act of the July session.

The bipartisan bill, coauthored by Republican Lamar Alexander and Democrat Patty Murray, looks likely to pass. But the House will revive its own, much more conservative version of the education legislation during this session as well, likely leading both chambers to conference.

The only true deadline this session is July 31, when the nation's Highway Trust Fund—which gives federal funding to states to build and maintain roads and other infrastructure projects—runs dry.

With just three weeks to find a solution, neither chamber seems to have made much progress. Many in the Senate are pushing for a multi-year solution, with bipartisan legislation out of the Environment and Public Works Committee calling for a six-year extension, but the Senate's Finance Committee has yet to announce how it would be paid for. The House, meanwhile, appears to be moving toward another short-term patch, the third in the last year.

Complicating matters further, Democrats and some Republicans in the Senate plan to attach a bill reauthorizing the Export-Import Bank's charter as an amendment to the highway bill, or perhaps some other legislation. That won't go over well with House conservatives, who have been pushing to wind down the bank for years and praised its expiration on July 1. Senate Majority Leader Mitch McConnell has promised his members a vote to reopen the bank's doors sometime this month, and it's clear that there are enough votes in the upper chamber to pass it.

But it's unclear what House Speaker John Boehner, who opposed letting the bank expire abruptly, will do. Boehner has kept mum, telling reporters last month that the House would wait on the Senate before deciding what to do. The bank was not mentioned in House Majority Leader Kevin McCarthy's list of upcoming legislation for the July session.

The Senate could also see action on a forthcoming U.S. nuclear deal with Iran, which is set to be released to Congress by July 9, setting off a 30-day review period in the Senate on one of the most contentious issues the upper chamber has handled this year. If the administration misses that deadline, however—which is a possibility, given that negotiators this week announced they'll have to extend talks through July 7—senators will have 60 days to review the final accord whenever it comes through.

Both chambers will also begin conferences to resolve their differences on the National Defense Authorization Act as well as a customs-enforcement bill.

2ac Infrastructure Thumper

Infrastructure bill thumps --- it's a priority for Obama

Laing 6/30 --- Reporter at The Hill (Keith Lang, 6/30/15, "Obama: Road funding could be late-term achievement", The Hill, <http://thehill.com/policy/transportation/246554-obama-boosting-road-funding-a-possible-late-term-achievement//money>)

President Obama on Tuesday listed boosting the nation's infrastructure funding as an area where progress is possible before he leaves office in 2017.

Asked during a joint press conference with Brazilian President Dilma Rousseff about legislation he plans to pursue during his final months in the White House, **Obama identified a long-term transportation bill as a priority.**

"I want to see if we can get bipartisan work done with Congress around rebuilding our infrastructure," he said. "Brazil just talked about their rebuilding of highways and roads and ports and bridges. You know what? We've got the same work to do and **we need to put people back to work there.**"

Lawmakers face a July 31 deadline for the expiration of the current infrastructure measure, and are struggling to come up with a way to pay for even an extension that would keep the spending levels flat past this summer.

Obama has proposed a \$478 billion transportation bill that he says would cover six years worth of infrastructure projects. The administration has proposed paying for the measure by taxing corporate profits that are stored overseas through a process that is known as "repatriation."

The proposal is an effort to address a transportation funding shortfall that is estimated to be about \$16 billion per year.

The federal government typically spends about \$50 billion per year on transportation projects, but the gas tax only brings in approximately \$34 billion annually.

Congress has been grappling with the deficit for a decade, but they have not passed a transportation bill that lasts longer than two years in that span.

--- XT: Infrastructure Thumper

Infrastructure thumps the link --- there will be a fight over how to fund it

Bolton 6/28 --- News Reporter for The Hill (Alexander Bolton, 6/28/15, "Looming highway debate stirs tax fight", The Hill, [//Jmoney](http://thehill.com/homenews/senate/246354-looming-highway-debate-stirs-tax-fight)

A fight over raising taxes has bloomed as the chief obstacle to passing a desperately needed multi-year transportation bill by the end of next month, raising the specter of a possible shutdown of highway programs.

Senate Finance Committee Orrin Hatch (R-Utah), who is tasked with finding a way to pay for a multi-year deal, has ruled out the prospect of raising taxes, putting him on a collision course with Democrats.

Senate Democratic leaders have called for a six-year, \$478 billion transportation bill paid largely by taxing overseas corporate profits.

They warn it would be "very hard" for them to accept another short-term extension of highway funds after having done so 33 times.

A bipartisan group of senators, including Senate Environment and Public Works Committee Chairman Jim Inhofe (R-Okla.), and Sen. Barbara Boxer (Calif.), the ranking Democrat on the panel, have proposed a less ambitious six-year, \$275 billion highway bill.

But Inhofe and Boxer are leaving it up to the Finance Committee to find a way to pay for a \$90 billion funding shortfall not covered by federal gasoline and diesel taxes.

Lawmakers will have four weeks to solve the impasse before the Highway Trust Fund runs out of money on July 31.

The battle over tax increases will return to the forefront when lawmakers get back from the Fourth of July recess, now that the trade debate — which consumed May and June — is finally over.

"We hope we can get the highway bill done before the end of July," Hatch told reporters but he identified the funding shortfall as a major obstacle.

He says a three- or four-year transportation bill is more realistic than the six-year proposals put forth by the president and Senate colleagues.

"I know one thing. It's pretty tough to go six years. Six years is \$92 to \$94 billion," he said.

"I hope it's a multi-year, that's all I can say, and I'm going to make it as long as we can," he added.

Senate Democratic leaders are pushing the six-year transportation plan included in President Obama's budget, which calls for \$317 billion in spending on roads and \$143 billion on federal transit projects.

They want to pay for it by requiring U.S. corporations to repatriate overseas profits at a 14 percent tax rate, which would raise \$238 billion in revenue, and tax future foreign earnings at 19 percent.

"We're asking them for their proposal. Here's ours, what's yours? Let's not wait to get to that deadline again and do a short-term funding plan number 34," said New York Sen. Charles Schumer, who is leading the Democratic messaging strategy in the transportation fight.

Senate Democratic leaders say the six-year, \$275 billion bill sponsored by Inhofe and Boxer, which the Environment and Public Works Committee passed last week, does not go far enough.

"It's a step in the right direction because it's long term and it does increase funding, but not by enough to meet our needs and what Democrats would prefer," said a Democratic leadership aide.

Sens. David Vitter (R-La.) and Tom Carper (D-Del.) are cosponsors of the measure.

Republicans want to pass a multi-year transportation bill, but a schism has emerged within their conference over the thorny question of whether they should raise some taxes to pay for it.

Republican Sen. Bob Corker (Tenn.) has called for increasing federal taxes on gasoline and diesel by 12 cents over two years and indexing it to inflation.

The gas tax now stands at 18.4 cents per gallon while the tax on diesel is 24.4 cents per gallon.

Inhofe and Senate Commerce Committee Chairman John Thune (R-S.D.) have not ruled out increasing the gas tax.

"John Thune made the statement that 'nothing is off the table,' and I agree with his statement," Inhofe told reporters earlier this year.

The Commerce panel is responsible for about \$1 billion a year of the infrastructure budget, according to a Senate aide.

But any proposal to raise taxes would pick a fight with the conservative base led by Grover Norquist, the president of Americans for Tax Reform.

Norquist said Congress would have more funding for highway construction projects if it wipes out the federal requirement established by the Davis-Bacon Act to pay local prevailing wages.

"There is zero chance the Republican House and Senate will increase taxes. Highway spending is 25% above what is needed due to Davis-Bacon prevailing wage law.... eliminate that and your funding problem disappears," he said in a statement to The Hill.

"No need to raise taxes. This was tried in Michigan and Massachusetts and defeated by a vote of the people," he added.

So far, Hatch is siding with Norquist and other anti-tax conservatives.

"We're not willing to raise taxes," he said. "I'm willing to look at everything but we're not going to raise taxes to get there."

Democrats believe, however, that House Ways and Means Committee Chairman Paul Ryan (R-Wis.) has signaled interest in paying for a multi-year transportation bill with corporate tax reform.

"LOTS of other Republicans, including Paul Ryan, think international tax reforms that raise revenues are a good way to go. Democrats agree," said a senior Democratic aide.

Ryan has opposed paying for increased transportation funding by taxing overseas profits because he wants to use the reservoir of funding for a broader tax reform initiative.

Earlier this month he downplayed the likelihood of a major tax reform package passing Congress this year.

House Majority Leader Kevin McCarthy (R-Calif.) said last month he is exploring options to pay for a multiyear infrastructure bill and acknowledged it would need to be partly funded with revenue increases.

There will be a fight over infrastructure funding

Laing 6/19 --- News reporter for The Hill (Keith Lang, 6/19/15, "Feds warn of highway funding cutoff", The Hill, <http://thehill.com/policy/transportation/245591-feds-warn-of-highway-funding-cutoff//1money>)

The Obama administration is warning state transportation departments that it will have to stop authorizing payments for construction projects on July 31 unless Congress reaches a deal to extend federal infrastructure funding.

The current transportation funding measure is scheduled to expire on that date, and lawmakers are struggling to come up with a way to pay for an extension.

The Department of Transportation said Friday its Highway Trust Fund will dip below \$4 billion, which is the level that triggers "cash management procedures," on the day of the looming infrastructure deadline.

The agency revived a Highway Trust Fund ticker Friday that it has used in the past to warn lawmakers of the consequences of allowing the infrastructure funding measure to expire.

"With a shortfall in the Highway Trust Fund approaching, cash management steps are not far away," the transportation department said in a blog post on its website.

"Because the HTF supports critical roadwork by State DOTs, these cash management procedures will slow improvements and basic repairs on roads across the U.S," the blog post continued. "To keep Americans informed, we've posted on our website the projected cash flows for the HTF's Highway Account and Mass Transit Account."

Lawmakers are grappling with a shortfall in transportation spending that is estimated to be about \$16 billion per year, and they have not passed an infrastructure package that lasted longer than two years since 2005.

The current transportation funding legislation includes about \$50 billion in annual spending on road and transit projects.

The traditional source for transportation funding is revenue collected from the 18.4 cents per gallon federal gas tax. But the tax, which has not been increased since 1993, only brings in about \$34 billion per year.

Lawmakers have turned to other parts of the federal budget to fill the gap in recent years, but transportation advocates have complained the resulting temporary patches prevent states from completing long-term construction projects.

The Congressional Budget Office has estimated it will take about \$100 billion to close the gap long enough to pay for a six-year transportation funding bill, as requested by the Obama administration.

Transportation supporters have pushed for a gas tax increase. They say it would be about 30 cents per gallon now if it had been indexed to inflation in 1993.

Lawmakers have been reluctant to ask drivers to pay more at the pump, and Republicans have called an increase a nonstarter.

The OBAMA administration, meanwhile, has suggested lawmakers approve a six-year, \$478 billion transportation funding bill that it says can be paid for largely with taxes that could be collected on corporate profits that are stored overseas.

Republicans have said they are open to the idea, known as repatriation, but the parties have squabbled about how much to tax those corporate funds and whether it should be mandatory or voluntary.

2ac Cuba Thumper

Cuba thumps the link --- he is prioritizing and spending capital

Milbank 7/5 (Dana Milbank, 7/5/15, ["Obama spending his windfall of political capital on Cuba"](http://www.heraldnet.com/article/20150705/OPINION04/150709675//1/money), HeraldNet, <http://www.heraldnet.com/article/20150705/OPINION04/150709675//1/money>)

"This," President **OBAMA** said in the Rose Garden on Wednesday as he [ANNOUNCED THE RESTORATION OF DIPLOMATIC RELATIONS WITH CUBA](#). "is what change looks like."

This echo of his 2008 campaign theme was self-congratulatory but deserved, coming at a time of unexpected hope late in his presidency. [In the space of just over a week, Obama's tired tenure came back to life](#). He bested congressional Democrats and got trade legislation on his desk. The Supreme Court upheld the signature achievement of his presidency — Obamacare — and thereby cemented his legacy.

The high court also made same-sex marriage legal across the land following a tidal change in public opinion that Obama's own conversion accelerated. Had the court's decisions not dominated the nation's attention, Obama's eulogy Friday for those slain in a South Carolina church, and his extraordinary rendition of "Amazing Grace," would have itself been one of the most powerful moments of his presidency.

It is little surprise, then, that this lame duck's job approval rating hit a respectable 50 percent this week for the first time in two years in a CNN poll, and his disapproval rating dropped to 47.

The good tidings of the past week have been arguably more luck than achievement for Obama, but he deserves credit for his effort to use the momentum of his victories to revive what had been a moribund presidency. [When you earn political capital, as George W. Bush liked to say, you spend it. This is why it was shrewd of the surging Obama to demand new action from Congress on Cuba.](#)

"Americans and Cubans alike are ready to move forward; I believe it's time for Congress to do the same," he said, renewing his call to lift the travel and trade embargo. "Yes, there are those who want to turn back the clock and double down on a policy of isolation, but it's long past time for us to realize that this approach doesn't work. It hasn't worked for 50 years. ... [So I'd ask Congress to listen to the Cuban people, listen to the American people, listen to the words of a proud Cuban American](#) [former Bush commerce secretary] Carlos Gutierrez, who recently came out against the policy of the past."

[Fifteen minutes later, Obama lifted off](#) from the South Lawn in Marine One on his way [to Nashville](#), where he tried to use the momentum generated by the Supreme Court Obamacare victory [to spread the program to states where Republican governors have resisted](#).

"What I'm hoping is that with the Supreme Court case now behind us, what we can do is ... now focus on how we can make it even better," he said, adding, "My hope is that on a bipartisan basis, in places like Tennessee but all across the country, we can now focus on ... what have we learned? What's working? What's not working?"

He said that "because of politics, not all states have taken advantage of the options that are out there. Our hope is, is that more of them do." He urged people to "think about this in a practical American way instead of a partisan, political way."

This probably won't happen, but it's refreshing to see [Obama](#), too often passive, [regaining vigor as he approaches the final 18 months of his presidency](#). The energy had, at least for the moment, returned to the White House, where no fewer than six network correspondents were doing live stand-ups before Obama's appearance Wednesday morning. There was a spring in the president's step, if not a swagger, as he emerged from the Oval Office trailed by Vice President Biden.

[REPUBLICAN PRESIDENTIAL CANDIDATES WERE NEARLY UNANIMOUS IN DENOUNCING THE PLAN TO OPEN A U.S. EMBASSY IN HAVANA. BUT Obama](#), squinting in the sunlight as he read from his teleprompters, [welcomed the fight](#).

"The progress that we mark today is yet another demonstration that we don't have to be imprisoned by the past," he said. Quoting a Cuban-American's view that "you can't hold the future of Cuba hostage to what happened in the past," Obama added, "That's what this is about: a choice between the future and the past."

Obama turned to go back inside, ignoring the question shouted by Bloomberg's Margaret Talev: "How will you get an ambassador confirmed?"

That will indeed be tricky. But momentum is everything in politics — and for the moment, Obama has it again.

Prison Reform Thumper

Prison reform is Obama's biggest priority

Berman 7/10 --- (Russell Berman, 7/10/15, "Is this Obama's moment for criminal justice reform?", Government executive, <http://www.govexec.com/management/2015/07/obamas-moment-criminal-justice-reform/117481//>)//money

The U.S. locks up more of its citizens than any nation in the world, and far too many of them are African American and Hispanic men imprisoned for non-violent drug crimes. THE SAD STATE OF THE CRIMINAL-JUSTICE SYSTEM HAS BECOME, over the last decade, A CRISIS lamented with nearly equal measure of sorrow by Democrats and Republicans alike. To hear the politicians tell it, mass incarceration is both a financial drain on the government at all levels, and a moral stain that consigns families and entire communities to a cycle of poverty.

Yet despite no shortage of proposals for reform in recent years, Congress has done virtually nothing. That may, finally, be about to change, as an emboldened ^{President} Obama eyes what might be the last major addition to his domestic legacy in the White House.

Speaking at a press conference last week, the president was asked how he might follow the remarkable string of victories he earned in late June, which included a congressional win on trade, a pair of legacy-setting Supreme Court decisions, and a widely-praised eulogy in Charleston. He ticked off several unchecked boxes on his economic agenda, including a major infrastructure bill and enactment of his proposals to boost job training and access to community college. But the big-ticket item Obama mentioned that actually holds the most promise in the Republican Congress is a long-awaited overhaul of the nation's criminal-justice system. "We've seen some really interesting leadership from some unlikely Republican legislators very sincerely concerned about making progress there," the president observed.

He's right. The bipartisan coalition pushing to reduce incarceration rates in the world's most crowded prison system has been building for years, bringing together ardent foes like the Koch Brothers and the ACLU, and Rand Paul and Cory Booker, among others. Various proposals to eliminate mandatory minimum sentences for certain drug crimes, and to keep young, nonviolent offenders from receiving long, crippling prison sentences have circulated for a while without going anywhere. Yet that movement is cresting now, providing what lawmakers and advocates say is a genuine opportunity to enact legislation before the end of the year. "I am very optimistic that we will get something done. If you had told me a couple years ago, I would not have believed it," said Representative Elijah Cummings, a Maryland Democrat who is not known as a congressional Pollyanna.

As usual, however, Cummings's rosy view comes with a key caveat repeated by other advocates I interviewed: the looming presidential election. "I think the stars have aligned," Cummings said. "I do believe, however, that if we don't get it done now, I don't know that the stars will align like this again." Obama talked up the prospect of criminal-justice reform just a few days after lawmakers in the House unveiled the most ambitious and comprehensive proposal to modernize the system to date. Over the weekend, The New York Times reported that Obama was soon likely to commute the sentences of dozens of nonviolent drug offenders—an act of presidential clemency unprecedented in scope that would seek to galvanize the push for reform in Congress.

Obama pushing Prison Reform

Italiano and Boniello 7/12 --- (Laura Italiano and Kathianne Boniello, 7/12/15, "Obama, Democrats and republicans push for prison reform", nypost, <http://nypost.com/2015/07/12/obama-democrats-and-republicans-push-for-prison-reform//>)//money

An alliance of Republicans and Democrats led by ^{President} Obama is pushing to reform federal laws that have packed prisons with legions of aging, nonviolent drug dealers.

MANDATORY-MINIMUM- sentencing laws and guidelines, along with so-called "three strikes, you're out" statutes, a legacy of the crack epidemic of the 1980s and 1990s, have helped fill US prisons with drug offenders.

But warehousing them costs the government big money — up to a million dollars each in the case of teens locked up for life.

They are the legislative legacy of the crack epidemic that raged in the '80s and '90s — mandatory minimum and so-called “Three-Strikes, You’re Out” federal sentencing statutes meant to clear the streets of rampant crime.

Trouble is, those laws have left American prisons packed with aging drug dealers, many of them non-violent and costing up to a million dollars each to warehouse, in the case of teens locked up for life.

Now, a strange-bedfellows alliance of Republicans and Democrats — led by President Obama — is on board to reform those laws and start clearing prison space for violent convicts.

Proponents of reform include lawmakers from both parties, and even staunchly conservative billionaires Charles and David Koch.

This week, Obama is expected to call for a comprehensive federal sentencing package that includes reduced sentences and greater judicial sentencing discretion for nonviolent drug offenders.

He will likely make his pitch Tuesday, when he addresses the NAACP conference in Philadelphia.

On Thursday, he will become the first sitting president to visit a prison.

Obama will meet with prison officials and inmates inside the federal penitentiary in El Reno, Okla., to “underscore the administration’s focus on the need to reform and improve America’s criminal-justice system.” White House press secretary Josh Earnest said Friday.

And as early as Monday, the president may announce his latest round of clemencies of non-violent offenders.

In March, he shortened the sentences of nearly two dozen drug inmates, including eight who were doing life.

With prisons overcrowded by almost 40 percent, and more people behind bars — 2.3 million — than in any other country of the world, sentencing reform simply makes good fiscal and humanitarian sense, said Mike Riggs of Families Against Mandatory Minimums.

“The Bureau of Prisons is spending 25 percent of the DOJ budget — much of it on nonviolent drug offenders,” Riggs said. “Do we really need to do that, when we’re trying to fight cyberterrorism and ISIS?”

Sentencing reform would benefit New York state, said veteran defense lawyer George Goltzer.

“We deal with these guidelines every day, and the catalog of human tragedy is amazing,” he said. “These are not major drug dealers; these are not the leaders of a cartel.”

Obama committed to Prison Reform

Fabian 7/10 — (Jordan Fabian, 7/10/15, “Obama to visit federal prison in push for criminal justice reform”, The Hill, [//money](http://thehill.com/homenews/administration/247533-obama-to-visit-federal-prison-in-push-for-criminal-justice-reform)

President Obama will visit a federal prison in Oklahoma next Thursday as part of his push to overhaul the country’s criminal-justice system.

Obama will travel to the El Reno Correctional Institution outside of Oklahoma City, becoming the first sitting president to visit a federal prison, White House press secretary Josh Earnest announced Friday.

While at the prison, the president is likely to commute the sentences of dozens of non-violent drug offenders, The Washington Post reported.

Obama's trip to the prison will be recorded for a "Vice" documentary on America's prison system that will air on HBO. The president will speak with Vice founder Shane Smith and meet with prisoners, prison staff and law enforcement officials, according to Vice.

The White House has close ties to Vice. The media company hired former Obama deputy chief of staff Alyssa Mastromonaco last November as a senior executive. Reggie Love, the president's former body man and Duke University basketball player, was hired this week to cover sports.

The president's prison visit will come two days after he delivers a speech to the NAACP's national conference in Philadelphia. He is expected to call for lower sentences for non-violent offenders, according to reports.

Obama will "outline the unfairness in much of our criminal-justice system," Earnest said.

The president is stepping up his effort to push Congress to reform the nation's sentencing laws, an effort that has attracted support from members in both political parties.

In February, the White House threw its backing behind a bipartisan bill that would slash mandatory minimum sentences for many non-violent drug offenders.

Obama commuted the sentences of 22 drug offenders in March, the most aggressive use of his executive power to date to address the issue.

He has spoken out more frequently about the adverse effect current sentencing guidelines have on communities of color.

During a March interview with David Simon, the creator of HBO's "The Wire," Obama decried "the massive trend towards incarceration, even of non-violent drug offenders."

"The challenge, which you depict in your show, is folks going in at great expense to the state, many times trained to become more hardened criminals while in prison, come out and are basically unemployable," he said.

Obama is pushing prison legislation

Sink 7/10 --- (Justin Sink, 7/10/15, "Obama to push U.S. sentencing change backed by Koch brothers", Bloomberg Politics, [//money">http://www.bloomberg.com/politics/articles/2015-07-10/cost-of-vast-u-s-prison-population-allies-obama-and-republicans">//money](http://www.bloomberg.com/politics/articles/2015-07-10/cost-of-vast-u-s-prison-population-allies-obama-and-republicans)

The White House is preparing to seize advantage of bipartisan concern over the burgeoning U.S. prison population and push for legislation that would reduce federal sentences for nonviolent crimes.

President Barack Obama will champion sweeping reform of the criminal justice system during a speech to the NAACP annual convention on Tuesday in Philadelphia, press secretary Josh Earnest said Friday. Obama will present ideas to make the system "safer, fairer and more effective," Earnest said.

Later in the week, Obama will become the first sitting U.S. president to visit a federal prison when he goes to a medium-security facility in El Reno, Oklahoma. He'll also sit for an interview with Vice News for an HBO documentary on the criminal justice system, Earnest said.

"So it has more momentum than anybody realizes."

Representative Jason Chaffetz

Obama came to office promising to reduce the number of Americans imprisoned for nonviolent drug offenses, and in 2010 he signed a law reducing disparities in sentences for possession of crack and powder cocaine. Some Republicans and police organizations criticized the moves as too lenient, but now a bipartisan coalition that includes Obama's chief political antagonists, billionaires Charles and David Koch, have joined him to support relaxing federal sentencing guidelines.

Key lawmakers from both parties have been invited to the White House next week to discuss strategy.

And Obama is expected to soon issue a spate of commutations for nonviolent drug offenders identified by a Justice Department program launched last year.

Top officials from the department, including Deputy Attorney General Sally Yates, have recently met with members of Congress to express support for sentencing-reform legislation.

"Engagement with the president has been lacking for the past six years, but this is one topic where it has been refreshingly bipartisan," Representative Jason Chaffetz, the Utah Republican who heads the House Oversight Committee, said in a telephone interview.

AT: Cuba Scenario --- No Normalization / Lifting of Embargo

Congress will never normalize

Nachemson 7/1

Andrew Nachemson, staff writer for the Washington Times, "Embargo remains major hurdle in U.S.-Cuba thaw," July 1, 2015, The Washington Times, <http://www.washingtontimes.com/news/2015/jul/1/cuba-embargo-remains-hurdle-in-us-cuba-thaw/?page=all/NV>

THE EMBASSIES MAY BE REOPENING, BUT the embargo will take a lot longer to come down.

President OBAMA PAIRED THE ANNOUNCEMENT OF RENEWED DIPLOMATIC TIES WITH HAVANA AT THE WHITE HOUSE WEDNESDAY WITH A CALL FOR CONGRESS TO END THE ECONOMIC EMBARGO, but U.S. business groups anxious to crack the Cuban market say it's already clear the economic track will lag behind the political one for the president. Cuban President Raul Castro underscored the point himself Wednesday.

"There could be no normal relations between Cuba and the United States as long as the economic, commercial and financial blockade continues to be fully implemented," Mr. Castro said.

BUT, WITHOUT THE APPROVAL OF CONGRESS, OBAMA CANNOT LIFT THE ECONOMIC EMBARGO CURRENTLY LEVIED AGAINST CUBA. Many in Congress, both Republican and Democrat, are opposed to restoring diplomatic ties with the Communist island nation.

THE DISSENTERS CITE THE CUBAN GOVERNMENT'S HUMAN RIGHTS VIOLATIONS, HARBORING OF AMERICAN FUGITIVES, AND SEIZURE OF AMERICAN-OWNED PROPERTY WITHOUT COMPENSATION. Even the president's embassy move is in jeopardy, AS CONGRESS MUST APPROVE ANY PUBLIC SPENDING ON THE AMERICAN EMBASSY IN HAVANA.

Public opinion, on the other hand, seems to be embracing the changes. According to a survey conducted by the Chicago Council on Global Affairs, two in three Americans support ending the trade embargo.

Won't normalize – not enough funds

Snell 7/6

Snell, 7/6/15 (Kelsey, Washington Post.com, "How Republicans want to defund Obama's legacy ; Republicans want to use the appropriations process to prevent the White House from moving forward on a long list of policy priorities," Factiva/NV)

REPUBLICANS ARE PLANNING TO USE THE ANNUAL SPENDING BILLS TO CHALLENGE SOME OF President OBAMA'S BEST-LOVED POLICIES, ADDING ANOTHER LAYER TO A BUDGET BATTLE THAT ALREADY PROMISES TO BE MESSY as the two parties fight over how much money to spend on domestic programs.

The fiscal 2016 spending bills moving through THE HOUSE AND SENATE ARE FILLED WITH ATTEMPTS TO BLOCK OR DEFUND A SLEW OF OBAMA ADMINISTRATION INITIATIVES, INCLUDING environmental rules, THE EFFORT TO RENEW DIPLOMATIC TIES WITH CUBA and a Labor Department proposal to crackdown on the retirement savings industry.

While using so-called policy riders on appropriations bills is a time-honored tradition on Capitol Hill, REPUBLICANS HAVE SIGNALLED THEY PLAN TO BE EXTRA AGGRESSIVE THIS YEAR NOW THAT THEY CONTROL BOTH CHAMBERS OF CONGRESS AND OBAMA'S SECOND TERM IS RUNNING OUT.

When the fight over these policy-riders will come to a head is unclear. THE FIRST ORDER OF BUSINESS IS FIGURING OUT AN END TO THE STALEMATE OVER THE TOP-LINE SPENDING LEVEL FOR THE FISCAL 2016 APPROPRIATIONS BILLS, SOMETHING THAT COULD TAKE UNTIL THE END OF THE CALENDAR YEAR. Obama is threatening to veto any bill that

conforms to the Republican budget plan approved by Congress earlier this year. Senate Democrats are also threatening to filibuster any appropriations bill until a broader deal is reached allowing for more spending on domestic programs.

As negotiations over the broader funding battle progress, at some point in the coming months the policy-riders will likely lead to a showdown between Republicans and Obama.

What follows is a list of which ones could prove most contentious.

CUBA. THE COLD WAR MAY BE LONG OVER, BUT LAST WEEK'S ANNOUNCEMENT THAT THE UNITED STATES AND CUBA WILL OPEN EMBASSIES later this month after more than a half-century of diplomatic isolation FUELED ANGER AMONG MANY REPUBLICANS, WHO ARE ALREADY UPSET OVER THE ADMINISTRATION'S ANNOUNCEMENT IN DECEMBER THAT IT PLANNED TO RENEW DIPLOMATIC TIES WITH THE COMMUNIST COUNTRY.

THE GOP IS SEEKING TO THWART THE ADMINISTRATION'S CUBA AGENDA BY DENYING FUNDING FOR KEY PROGRAMS.

For instance, the House State and Foreign Operations spending bill includes language banning funds for a new embassy and its operations.

AND DENYING MONEY FOR OPENING AN EMBASSY IN CUBA ISN'T THE ONLY WAY REPUBLICANS ARE TARGETING OBAMA'S ASPIRATIONS IN CUBA. Rep. Mario-Diaz BALART (R-Fla.), the son of Cuban immigrants, ADDED LANGUAGE TO THE COMMERCE, JUSTICE AND SCIENCE SPENDING BILL THAT WOULD PREVENT THE UNITED STATES FROM PROVIDING MILITARY ASSISTANCE TO CUBA AND TO THE TRANSPORTATION, HOUSING AND URBAN DEVELOPMENT BILL THAT WOULD BLOCK U.S. AIRLINES AND CRUISE SHIPS FROM TRAVELLING TO THE ISLAND.

"We must not permit the exploitation of properties stolen by the Castro regime, which is expressly prohibited in U.S. law," Diaz-Balart said in a statement.

REPUBLICANS IN THE SENATE ARE EXPECTED TO INCLUDE SIMILAR PROVISIONS IN THEIR SPENDING BILLS.

"I WILL DO ALL IN MY POWER TO BLOCK THE USE OF FUNDS TO OPEN AN EMBASSY IN CUBA." Appropriations Committee member Sen. Lindsey O. GRAHAM (R-S.C.) WROTE in a tweet in December. "Normalizing relations with Cuba is bad idea at a bad time."

Congress really hate the idea of lifting the embargo

Maloy 7/2

Simon Maloy, the Salon's political writer, "GOP's dead-end Cuba gamble: Republicans' Cold War-era tough talk won't come to anything," July 2, 2015, Salon, http://www.salon.com/2015/07/02/gops_dead_end_cuba_gamble_republicans_cold_war_era_tough_talk_wont_come_to_anything/NV

After winning a great victory for communism with the Supreme Court decision upholding the Affordable Care Act's subsidies, Barack Obama went for broke this week and surrendered to Cuba, thus ending the Cold War in a crippling defeat for global capitalism. ¡Que viva la gran revolución! ¡Venceremos!

Okay, maybe that's not precisely what happened. But what did happen is that THE WHITE HOUSE FOLLOWED THROUGH ON A KEY PORTION OF THE PRESIDENT'S PLAN TO NORMALIZE RELATIONS WITH our tiny communist island neighbor. In a Rose Garden ceremony yesterday, Obama officially announced that the United States and CUBA would open embassies in Havana and Washington, DC. THAT ANNOUNCEMENT CAME JUST OVER A MONTH AFTER CUBA WAS REMOVED FROM THE STATE DEPARTMENT'S LIST OF STATE SPONSORS OF TERRORISM.

THAT'S TWO BIG CHANGES TO THE UNITED STATES' CUBA POLICY, WHICH HAD REMAINED ESSENTIALLY UNCHANGED FOR 50 YEARS and made precisely zero progress towards its goal of dislodging the Castro regime. BUT REPUBLICANS IN CONGRESS AND THE 2016 PRESIDENTIAL FIELD ARE, AS IS THEIR WONT, PUSHING BACK ON THE PRESIDENT AND INSISTING THAT WE STICK WITH WHAT HASN'T BEEN WORKING. The two Cuban-American

Republican presidential candidates, Marco RUBIO AND Ted CRUZ, VOWED TO BLOCK SENATE CONFIRMATION OF ANY AMBASSADOR TO CUBA. House Speaker John Boehner said “relations with the Castro regime should not be revisited, let alone normalized, until Cubans enjoy freedom – and not one second sooner.” 2016 hopeful Carly Fiorina outdid everyone, promising to Hugh Hewitt that as president she would close the U.S. embassy in Cuba.

I guess IT’S NOT ENTIRELY SURPRISING THAT THE GOP WOULD STILL BE SO GUNG-HO ABOUT FIGHTING THE COLD WAR MORE THAN TWO DECADES AFTER IT ENDED. But there’s no real reason to think that all this tough talk and posturing on Cuba will amount to anything, even if a Republican wins the White House in 2016.

The reason is simple: corporate America very strongly approves of Obama’s plans to open up Cuba, and Republicans try very hard to not piss off the business community too much. For half a century the island has just been sitting there off the Florida coast, a market completely shut off from thorough exploitation by American business interests. Those same business interests would love nothing more than to see the 50-year trade embargo come crashing down, but OBAMA CAN’T UNILATERALLY END IT BECAUSE BILL CLINTON stupidly GAVE UP THE EXECUTIVE BRANCH’S AUTHORITY OVER THE EMBARGO BACK IN 1996. THE ONLY WAY TO END THE CUBA EMBARGO IS FOR CONGRESS TO VOTE TO KILL IT, AND STATEMENTS LIKE THE ONE FROM THE HOUSE SPEAKER QUOTED ABOVE DON’T LEAD ONE TO BELIEVE THAT THAT WILL HAPPEN ANY TIME SOON. But America’s corporate masters are apparently massing their armies of lobbyists to try and convince enough Republicans in Congress to give up on this obsolete relic from the Kennedy administration.

Too many roadblocks to lifting the embargo Marple 7/7

Marple, 7/7/15 --- Research Associate at the Council on Hemispheric Affairs (Olivia, ForeignAffairs.co.nz, “Roadblocks Remain in US-Cuba Rapprochement,” Factiva/NV)

Diplomatic relations between the United States and Cuba will finally be restored ON JULY 20, when WASHINGTON REOPENS ITS EMBASSY IN HAVANA AFTER MORE THAN 50 YEARS of political turmoil between the two countries. Cuba will also open its embassy in Washington that day, and John Kerry will visit Havana, making him the first U.S. secretary of state to go to Cuba in 70 years. [1]

This is a step in the right direction in regard to US-Cuban policy since the U.S. embargo, which was enacted in the early 1960s, has not been successful in bringing about regime change or some version of the Washington Consensus in Cuba. [2] “It hasn’t worked for 50 years,” Obama said in his announcement from the Rose Garden last week. “It shuts America out of Cuba’s future, and it only makes life worse for the Cuban people.” [3]

Instead of naming an ambassador right away, the Obama Administration announced it would make Jeffery DeLaurentis its charge d’affaires. DeLaurentis has led the U.S. diplomatic mission in Cuba beginning last year. SENATORS AND PRESIDENTIAL CANDIDATES Marco Rubio (R-FL) and Ted Cruz (R-TX) HAVE DECLARED THEY WILL OPPOSE ANY AMBASSADOR THAT OBAMA NOMINATES. [4]

These REPUBLICANS AND OTHER CRITICS OF THE NORMALIZATION PROCESS BETWEEN THE TWO COUNTRIES ARGUE THAT OBAMA IS LEGITIMIZING THE GOVERNMENT OF RAÚL CASTRO without attempting to seek guarantees of improvement in human rights on the island. RUBIO HAS BEEN ESPECIALLY INDIGNANT ABOUT THE EASING IN RELATIONS, insisting that it is “important that pro-democracy activities not be sacrificed in the name of ‘diplomacy’ just so that we can change the name of a building from ‘Interest Section’ to ‘Embassy.’” [5]

While this condemnation on Rubio’s part certainly makes him appear tough on governments that do not share Washington’s values, it does not offer any real solution to the problems dissenting Cubans face and ignores the valuable cultural exchange that can take place through increased levels of tourism and bilateral economic transaction.

The number of Americans who visited Cuba between January 1 and May 9 this year increased 36 percent compared to the same period in 2014. [6] Although the result of this influx of American tourists remains to be seen, it appears that if critics like Rubio want Cuba to inherit American ideals, contact between the countries would be a good start.

As part of the agreement between the United States and Cuba, Cuba has agreed to relax restrictions on Internet access, and, in fact, the American media streaming site Netflix announced Cubans can now stream its content. [7] Although independent Cuban websites are still blocked, this increase in Internet freedoms will most likely snowball into greater access. [8]

It should be noted that this exchange of ideas will not only be one way, and it should not be assumed that Cuban citizens will be the only ones learning from American tourists and companies. For example, Cuba provides healthcare for “all segments of the population” and still manages to boast a medical system with

"results similar to those of the most developed nations." [9] Its education system enjoys success as well; its literacy rate is 99.8 percent, far above many of its Caribbean neighbors. [10]

IN ADDITION TO THE REPUBLICANS' OPPOSITION TO APPOINTING AN AMBASSADOR, ANOTHER ROADBLOCK TO COMPLETE NORMALIZATION IS THE FACT THAT **the embargo can only be completely lifted by Congress, which is currently Republican-controlled.** [11] OBAMA CANNOT LIFT THESE SANCTIONS AGAINST CUBA HIMSELF BECAUSE IN 1996 former President Bill CLINTON SIGNED THE HELMS-BURTON LAW, WHICH DECLARED THE EMBARGO COULD ONLY BE LIFTED BY A MAJORITY OF VOTES IN CONGRESS. [12]

This illustrates that, DESPITE THE PROGRESS MADE ON OBAMA'S PART, BARRIERS REMAIN. **Rubio and other critics of this rapprochement are only gumming up a process** that could actually result in some of the increased human rights and democratic changes they have been calling for.

Won't pass LaFranchi 15

HOWARD LAFRANCHI, A REPORTER IN THE MONITOR'S WASHINGTON BUREAU, "US FLAG TO FLY OVER HAVANA AGAIN, BUT THAT WON'T END AMERICA'S CUBA DEBATE (+VIDEO)" JULY 1, 2015, THE CHRISTIAN MONITOR, [HTTP://WWW.CSMONITOR.COM/USA/FOREIGN-POLICY/2015/0701/US-FLAG-TO-FLY-OVER-HAVANA-AGAIN-BUT-THAT-WON-T-END-AMERICA-S-CUBA-DEBATE-VIDEO/NV](http://www.csmonitor.com/usa/foreign-policy/2015/0701/us-flag-to-fly-over-havana-again-but-that-won-t-end-america-s-cuba-debate-video/nv)

WASHINGTON – THE UNITED STATES AND CUBA MAY HAVE AGREED WEDNESDAY TO OPEN EMBASSIES IN EACH OTHER'S CAPITAL FOR THE FIRST TIME IN HALF A CENTURY, BUT **that doesn't mean it will be all salsa music and humdrum diplomacy between the two longtime adversaries anytime soon.**

President Obama emphasized that "very serious differences" remain between the two neighboring countries, particularly on human rights and democracy, as he announced a long-awaited accord between the two governments Wednesday. The agreement will allow each country's existing diplomatic offices in Washington and Havana to reopen as full-fledged embassies as of July 20.

"I believe that American engagement – through our embassy, our businesses, and most of all, through our people – is the best way to advance our interests and support for democracy and human rights," Mr. Obama said Wednesday in a Rose Garden speech.

Cuba is one of a number of key foreign-policy issues – Iran and Iraq also come to mind – in which Obama has sought to get beyond what he has seen as mistaken policies of the past. Such a foreign policy emphasizes trying diplomacy where, to the president's thinking, isolation and unilateral action have not worked. And in each instance, WHETHER CUBA OR IRAN, IT IS STILL BEING HOTLY DEBATED, WITH SOME VAUNTING AND OTHERS VILIFYING THE APPROACH.

THAT DEBATE PROMISES TO FIGURE PROMINENTLY IN THE 2016 PRESIDENTIAL ELECTION, AND THE EMOTIONAL TOPIC OF CUBA IS SURE TO STAND OUT.

On Wednesday, SEVERAL REPUBLICAN PRESIDENTIAL HOPEFULS – most notably two from Florida, with its politically crucial Cuban-American population – WERE QUICK TO BLAST THE REESTABLISHMENT OF DIPLOMATIC RELATIONS WITH CUBA AS A GIFT TO A REPRESSIVE REGIME.

Former Florida Gov. Jeb BUSH SAID DIPLOMATIC TIES "WILL LEGITIMIZE REPRESSION IN CUBA, NOT PROMOTE THE CAUSE OF FREEDOM AND DEMOCRACY."

Florida GOP Sen. Marco RUBIO CRITICIZED THE OBAMA ADMINISTRATION for being so eager to open an embassy in Havana that it has "continued to look the other way and offer concession after concession" as the Cuban government "has stepped up its repression of the Cuban people."

Insisting the US got nothing from the Cubans in the six months of negotiations since Obama announced his intention to renew diplomatic relations, Senator RUBIO SAID, "IT IS TIME FOR OUR UNILATERAL CONCESSIONS TO THIS ODIOUS REGIME TO END."

That theme of the US giving up much to an adversary for little or nothing in return can also be heard in reference to Iran and the negotiations to limit its nuclear program.

Most Democrats, on the other hand, hailed the reopening of the Havana and Washington embassies by echoing Obama's foreign-policy conviction that America's isolation of adversaries does little to resolve differences with them – while causing problems with allies who oppose unilateral steps like the 50-year-old US trade embargo on Cuba.

"Embargo and isolation failed to bring fundamental change to Cuba and have instead become a source of friction between the United States and our partners in the Western Hemisphere and across the globe," said Sen. Christopher Murphy (D) of Connecticut in a statement.

Preserving America's global stature, Senator Murphy added, "depends on strong diplomatic relationships and a willingness to learn from both our successes and our ... missteps in particular – from the failed isolation of Cuba to the disastrous occupation of Iraq."

WHAT CONGRESS IS EXPECTED TO DO

EVEN AS THE POLITICAL DEBATE OVER CUBA CONTINUES, THE REPUBLICAN-CONTROLLED CONGRESS IS EXPECTED TO TRY TO THWART OBAMA'S OPENING TO CUBA AS BEST IT CAN – LARGELY THROUGH ITS CONTROL OF GOVERNMENT PURSE STRINGS.

CONGRESS CAN'T STOP THE REESTABLISHING OF FULL DIPLOMATIC TIES WITH CUBA. On Wednesday, in fact, Secretary of State John Kerry said he will travel to Havana "later this summer" to mark both "the raising of the Stars and Stripes" over the embassy and "the beginning of a new era of a new relationship with the Cuban people."

It will be the first time since 1945 that a secretary of State has visited Havana, Mr. Kerry noted.

STILL, Congress can continue to place roadblocks on the way to a deeper US diplomatic presence in Cuba.

A NUMBER OF FUNDING BILLS FOR US GOVERNMENT DEPARTMENTS HAVE BEEN AMENDED IN THE HOUSE TO LIMIT ANY EXPANSION OF OPERATIONS IN CUBA. Most critically, State Department funding for US diplomats operating in Cuba has been frozen – even though the State Department won Havana's OK to boost the number of US diplomats in Cuba as part of the transition to a full-fledged embassy.

"It would be a shame if Congress impeded implementation of some of the very things we all agree we want to do," says a senior State Department official, referring to the ability to "reach out all over the island" with a beefed-up embassy staff.

AT: CUBA SCENARIO --- APPEASEMENT TURN

Lifting the embargo makes the US look weak internationally Campbell 15

Greg Campbell, contributor for tpnn, "Ten GREAT Reasons the U.S. Should NOT Lift the Embargo on Cuba," January 16, 2015, tpnn, <http://www.tpnn.com/2015/01/16/ten-great-reasons-the-u-s-should-not-lift-the-embargo-on-cuba/NV>

AS President OBAMA CONTINUES TO DISMANTLE WHAT HAS STOOD AS DIPLOMATIC BEDROCK FOR each and every president for the last FIFTY-PLUS YEARS, CUBAN LEADERS WAIT WITH HUSHED ANTICIPATION OF THE DAY WHEN THE U.S. WILL FINALLY LIFT THE ECONOMIC EMBARGO on the island that remains a bastion of Communist government just 90 miles off our shores.

To be clear, the citizens of Cuba are not to blame for this system of government. WHILE IT IS UNFORTUNATE THAT SO MANY MUST REMAIN IMPRISONED ON THIS ISLAND, stuck under the oppressive rule of this despotic Castro regime, THE SUREST HOPE FOR THEIR ULTIMATE FREEDOM IS FOR THE BREAKING OF THE COMMUNIST STRANGLEHOLD on Cuban citizens, NOT TO FACILITATE THE SURVIVAL of this method of tyrannous government.

Though President Obama and his assorted band of "yes men" and other diplomatic weaklings head towards lifting the Cuban embargo, Jim Meyers at Newsmax.com compiled a list of compelling reasons why those on the right and left ought to be in favor of maintaining the embargo:

1. Lifting the embargo would benefit the Cuban people far less than the Castro regime. Most of the Cuban economy is owned by the government and all foreign trade is channeled through its agencies. Companies pay wages in hard currency, including dollars and euros, but the government pays workers in Cuban pesos — 500 pesos is worth around \$21 USD — and then pockets about 90 percent of the wages.

2. Decades of trade between Cuba and market economies in Europe, Canada, and Latin America have not produced the political and economic benefits to the people that embargo opponents say a lifting of the sanctions would produce. What they have done is line the pockets of the Castro government. Corruption, not the embargo, denies people the benefits of trade.

3. OPENING UP TRADE WITH CUBA WOULD LEAD THE UNITED STATES INTO DEALINGS WITH A "DEADBEAT" NATION THAT REFUSES TO HONOR ITS COMMITMENTS. CUBA HAS DEFAULTED ON ITS ESTIMATED \$37 BILLION DEBT TO THE PARIS CLUB OF NATIONS. RUSSIA HAS BEEN FORCED TO WRITE OFF CUBA'S \$32 BILLION DEBT, and Mexico wrote off \$340 million of Cuba's debt.

4. CUBA HAS NOT RELEASED ALL THE POLITICAL PRISONERS OBAMA SAID THE REGIME HAD PROMISED TO FREE DURING RECENT CUBAN-AMERICAN DISCUSSIONS. ESTIMATES ARE THAT THERE ARE MORE THAN 6,000 POLITICAL DETAINEES IN CUBA, among the world's highest per capital, and some 65,000 prison inmates altogether.

5. ENDING THE EMBARGO WOULD BE A BLOW TO AMERICAN VALUES, Americans want free trade with free people and NOT RELATIONS THAT STRENGTHEN AN AUTHORITARIAN REGIME'S OPPRESSION OF ITS PEOPLE.

6. Lifting the embargo without getting concessions from Cuba would make the United States appear weak. ACCORDING TO U.S. LAW, CUBA MUST LEGALIZE ALL POLITICAL ACTIVITY, RELEASE POLITICAL PRISONERS, COMMIT TO FREE AND FAIR ELECTIONS, grant freedom of the press, and allow labor unions. Cuba has not met these conditions. Lifting the sanctions unilaterally would send the message that America is willing to appease an oppressive regime. MOREOVER, the embargo enables the United States to continue to pressure the Cuban government to improve human rights.

7. The embargo does not prevent Americans from providing assistance to the Cuban people. American policy allows people to visit family members and send money to relatives in Cuba. Over \$3.5 billion in remittances are sent to Cuban families each year.

8. Cuba remains on the U.S. "State Sponsors of Terrorism" list. Cuba has provided sanctuary for terrorists from other nations and harbored American fugitives. Black Panther activist and convicted murderer JoAnne Chesimard is among the 90 or more criminals who fled America and received political asylum in Cuba.

9. THE UNITED STATES SHOULD NOT LIFT THE EMBARGO UNTIL A NEW LEADER IS IN PLACE IN CUBA, Fidel Castro turned over control to his brother Raul, but Raul is over 80 years old and it is unclear who would succeed him. THE EMBARGO COULD BE USED AS A BARGAINING CHIP WHEN A NEW LEADER TAKES POWER.

10. The American people oppose lifting the embargo. A poll last year found that a slight majority still want the sanctions to remain in place. More importantly, an even larger majority of Cuban-Americans, those who understand the situation best, favor keeping the embargo in place.

{Insert the Russia Scenario here}

AT: CUBA SCENARIO --- HUMAN RIGHTS TURN

Turn – the embargo is key to stop human rights violations

Campbell 15

Greg Campbell, contributor for tpnn, "Ten GREAT Reasons the U.S. Should NOT Lift the Embargo on Cuba," January 16, 2015, tpnn, <http://www.tpnn.com/2015/01/16/ten-great-reasons-the-u-s-should-not-lift-the-embargo-on-cuba/NV>

AS President OBAMA CONTINUES TO DISMANTLE WHAT HAS STOOD AS DIPLOMATIC BEDROCK FOR each and every president for the last FIFTY-PLUS YEARS, CUBAN LEADERS WAIT WITH HUSHED ANTICIPATION OF THE DAY WHEN THE U.S. WILL FINALLY LIFT THE ECONOMIC EMBARGO on the island that remains a bastion of Communist government just 90 miles off our shores.

To be clear, the citizens of Cuba are not to blame for this system of government. WHILE IT IS UNFORTUNATE THAT SO MANY MUST REMAIN IMPRISONED ON THIS ISLAND, stuck under the oppressive rule of this despotic Castro regime, THE SUREST HOPE FOR THEIR ULTIMATE FREEDOM IS FOR THE BREAKING OF THE COMMUNIST STRANGLEHOLD on Cuban citizens, NOT TO FACILITATE THE SURVIVAL of this method of tyrannous government.

Though President Obama and his assorted band of "yes men" and other diplomatic weaklings head towards lifting the Cuban embargo, Jim Meyers at Newsmax.com compiled a list of compelling reasons why those on the right and left ought to be in favor of maintaining the embargo:

1. Lifting the embargo would benefit the Cuban people far less than the Castro regime. Most of the Cuban economy is owned by the government and all foreign trade is channeled through its agencies. Companies pay wages in hard currency, including dollars and euros, but the government pays workers in Cuban pesos — 500 pesos is worth around \$21 USD — and then pockets about 90 percent of the wages.
2. Decades of trade between Cuba and market economies in Europe, Canada, and Latin America have not produced the political and economic benefits to the people that embargo opponents say a lifting of the sanctions would produce. What they have done is line the pockets of the Castro government. Corruption, not the embargo, denies people the benefits of trade.
3. Opening up trade with Cuba would lead the United States into dealings with a "deadbeat" nation that refuses to honor its commitments. Cuba has defaulted on its estimated \$37 billion debt to the Paris Club of nations. Russia has been forced to write off Cuba's \$32 billion debt, and Mexico wrote off \$340 million of Cuba's debt.
4. CUBA HAS NOT RELEASED ALL THE POLITICAL PRISONERS OBAMA SAID THE REGIME HAD PROMISED TO FREE DURING RECENT CUBAN-AMERICAN DISCUSSIONS. ESTIMATES ARE THAT THERE ARE MORE THAN 6,000 POLITICAL DETAINEES IN CUBA, among the world's highest per capital, and some 65,000 prison inmates altogether.
5. ENDING THE EMBARGO WOULD BE A BLOW TO AMERICAN VALUES, Americans want free trade with free people and NOT RELATIONS THAT STRENGTHEN AN AUTHORITARIAN REGIME'S OPPRESSION OF ITS PEOPLE.
6. Lifting the embargo without getting concessions from Cuba would make the United States appear weak. ACCORDING TO U.S. LAW, CUBA MUST LEGALIZE ALL POLITICAL ACTIVITY, RELEASE POLITICAL PRISONERS, COMMIT TO FREE AND FAIR ELECTIONS, GRANT FREEDOM OF THE PRESS, AND ALLOW LABOR UNIONS. CUBA has not met these conditions. Lifting the sanctions unilaterally would send the message that America is willing to appease an oppressive regime. MOREOVER, the embargo enables the United States to continue to pressure the Cuban government to improve human rights.
7. The embargo does not prevent Americans from providing assistance to the Cuban people. American policy allows people to visit family members and send money to relatives in Cuba. Over \$3.5 billion in remittances are sent to Cuban families each year.
8. Cuba remains on the U.S. "State Sponsors of Terrorism" list. Cuba has provided sanctuary for terrorists from other nations and harbored American fugitives. Black Panther activist and convicted murderer JoAnne Chesimard is among the 90 or more criminals who fled America and received political asylum in Cuba.
9. THE UNITED STATES SHOULD NOT LIFT THE EMBARGO UNTIL A NEW LEADER IS IN PLACE IN CUBA, Fidel Castro turned over control to his brother Raul, but Raul is over 80 years old and it is unclear who would succeed him. THE EMBARGO COULD BE USED AS A BARGAINING CHIP WHEN A NEW LEADER TAKES POWER.

10. The American people oppose lifting the embargo. A poll last year found that a slight majority still want the sanctions to remain in place. More importantly, an even larger majority of Cuban-Americans, those who understand the situation best, favor keeping the embargo in place.

Lifting it just leads to more oppression – last 7 months prove Gonzalez 7/7

Mike Gonzalez, writer for Newsweek, "Cuban Rights Protestors Bloodily Beaten in Havana," July 7, 2015, Newsweek, <http://www.newsweek.com/cuban-rights-protesters-bloodily-beaten-havana-351091/NV>

When President OBAMA CONFIDENTLY ASSERTED, "THIS IS WHAT CHANGE LOOKS LIKE," DURING HIS CUBA EMBASSY ANNOUNCEMENT ON JULY 1, HE COULDN'T POSSIBLY HAVE HAD IN MIND THE PICTURE OF A BLOODIED AND BANDAGED ANTONIO RODILES.

AND YET, THE DISSIDENT LEADER WARNED OBAMA THAT VERY DAY IN A TWEET that appeasement meant more repression of dissidents.

RODILES HAD TO BE OPERATED ON OVERNIGHT TO REPAIR HIS NOSE AFTER RECEIVING A BEATING AT THE HANDS OF STATE SECURITY AGENTS. HE WAS ARRESTED ON JULY 5 ALONG WITH 20 OTHER PEOPLE WHO HAD THE TEMERITY TO MARCH TO MASS DEMANDING that HUMAN RIGHTS and individual freedom be respected in Castro's Caribbean island Gulag.

His prophetic tweet to Obama and U.N. Ambassador Samantha Power the day of the announcement simply asked, "HOW TO TALK ABOUT ENGAGEMENT AFTER 11 SUNDAYS OF STRONG REPRESSION."

Rodiles was responding to Obama's statement, "I strongly believe that the best way for America to support our values is through engagement," which the White House tweeted out and Power retweeted.

My retweet of Rodiles said, "@AmbassadorPower @BarackObama Pls listen to this dissident. He risks his life every day in #Cuba. Do u know better?"

And that's just it: Apparently they think they do.

It's either THIS HUBRISTIC BELIEF THAT OBAMA AND THE PEOPLE AROUND HIM KNOW BETTER ABOUT HOW TO ADVANCE DEMOCRACY AND HUMAN RIGHTS THAN THE CUBANS ACTUALLY FIGHTING FOR IT, OR THEY THINK THAT DISSIDENTS LIKE RODILES ARE A NUISANCE THAT GET IN THE WAY OF THE STATE-TO-STATE EXCHANGES BETWEEN THE GROWNUPS.

THERE IS SADLY A HISTORY OF SUCH DISMISSAL OF DEMOCRATIC FORCES FOR THIS ADMINISTRATION. Its very first on the world stage was to stand by as pro-democracy demonstrators took to the streets of Tehran.

THE WHITE HOUSE WAS NOT EVEN SWAYED BY THE GRUESOME MURDER OF DISSIDENT NEDA AGHA SOLTAN. SO WHY WOULD IT HAVE A MOMENT OF CONTRITION OVER RODILES'S BROKEN NOSE?

For THIS ARROGANT BELIEF IN THEIR OWN INTRINSIC KNOWLEDGE OF HOW TO BRING DEMOCRACY TO CUBA—OR THE WORSE DISMISSAL OF THOSE SUFFERING FOR SPEAKING THEIR MINDS—Obama has broken the law by attempting to open an embassy in Havana.

The Cuban Liberty and Democratic Solidarity (Libertad) Act of 1996 requires the fulfillment of two conditions before the restoration of diplomatic relations. The first is that the president must determine that "a transition to a democratically elected government in Cuba has begun." Not even Secretary of State John Kerry in his worst moments of euphoria could make this claim.

The second condition is "the satisfactory resolution of property claims by a Cuban Government recognized by the United States." The Castro regime's seizure of some \$8 billion in U.S. assets remains the largest theft in U.S. history.

THE 12TH SUNDAY OF REPRESSION IN CUBA IS UNLIKELY TO STOP OBAMA'S LEGITIMIZATION OF THE CASTROS, JUST LIKE SKULLDUGGERY ON THE PART OF THE MULLAHS WILL NOT SLOW DOWN THE RUSH "TO GET AN AGREEMENT" WITH IRAN.

Congress, on the other hand, has a responsibility to make sure that the president acts within the law and does not “fundamentally transform” America’s history of supporting democracy and freedom.

Removing embargo won’t change anything Washington Post 7/1

Washington Post, “Despite Mr. Obama’s ‘engagement,’ Cuba continues its repression,” July 1, 2015, Washington Post, http://www.washingtonpost.com.proxy.lib.umich.edu/opinions/the-reality-in-cuba/2015/07/01/5b891ba2-1b6a-11e5-bd7f-4611a60dd8e5_story.html/NV

IN ANNOUNCING THE REOPENING OF THE U.S. EMBASSY IN HAVANA, PRESIDENT OBAMA SAID “NOBODY EXPECTS CUBA TO BE TRANSFORMED OVERNIGHT” BY HIS POLICY OF “ENGAGEMENT.” That’s just as well because IN THE FIRST SIX MONTHS OF MR. OBAMA’S NORMALIZATION OF RELATIONS with the Communist regime, MOST INDICATORS OF HUMAN RIGHTS ON THE ISLAND HAVE MOVED IN THE WRONG DIRECTION.

SINCE DECEMBER, THERE HAVE BEEN MORE THAN 3,000 POLITICAL DETENTIONS IN CUBA, INCLUDING 641 IN MAY AND 220 ON SUNDAY ALONE, according to dissident sources. MOST WERE ACCOMPANIED BY BEATINGS; AT LEAST 20 DETAINEES REQUIRED MEDICAL TREATMENT IN MAY. After Cuba was invited for the first time to the Summit of the Americas in Panama, regime thugs attacked the civil society activists who also showed up.

“SOME OF US HAD HOPED . . . THAT THERE WOULD BE A STOP TO — OR AT LEAST A LESSENING OF — THE BEATINGS” OF PEACEFUL DEMONSTRATORS, WROTE ACTIVIST MARIO LLEONART RECENTLY, “BUT WE NOW KNOW THAT WHAT IS HAPPENING IS PRECISELY THE OPPOSITE.”

Visits by Americans to Cuba are reportedly up by a third, including plenty of political delegations. But IN THE MONTHS AFTER MR. OBAMA ANNOUNCED THE DIPLOMATIC OPENING IN DECEMBER, THERE WAS ALSO A 120 PERCENT INCREASE IN CUBANS SEEKING TO FLEE TO THE UNITED STATES. MANY WORRY THAT ONCE RELATIONS ARE NORMALIZED, THE UNITED STATES WILL STOP ACCEPTING REFUGEES; according to recent polling, MORE THAN HALF OF CUBANS WOULD LIKE TO LEAVE THE COUNTRY.

Mr. Obama eased regulations on U.S. food sales, but imports of American food to the island, controlled by the state, dropped by half in the first three months of 2015, compared with last year. Netflix announced that Cubans could stream its service — but the charge for an hour of access to one of the few government-controlled Internet hotspots equals 10 percent of a typical government worker’s monthly salary, and independent Cuban Web sites are blocked.

WE DON’T OPPOSE DIPLOMATIC CONTACTS OR U.S. EMBASSIES IN COUNTRIES SUCH AS CUBA, IN PRINCIPLE. BUT THE RESULTS OF MR. OBAMA’S INITIATIVE SO FAR UNDERLINE THE OPPORTUNITY HE MISSED IN NOT REQUIRING EVEN MODEST ALLEVIATION OF THE DICTATORSHIP’S REPRESSION IN EXCHANGE FOR WHAT AMOUNTS TO A POLITICAL AND ECONOMIC BAILOUT OF A FAILING REGIME. Mr.

Obama could have sought a guarantee, for example, that the Ladies in White, formed by the families of political prisoners, be allowed to carry out their peaceful weekly marches without arrests or beatings; as it is, attacks on the group have increased sharply.

THE STATE DEPARTMENT ALSO COULD HAVE INSISTED THAT U.S. DIPLOMATS HAVE UNRESTRICTED ACCESS TO AVERAGE CUBANS AND COULD HAVE REJECTED THE REGIME’S DEMANDS THAT ONGOING DEMOCRACY PROGRAMS BE CANCELED. Instead, a senior U.S. official said that, while access would improve, the State Department had accepted “constraints” on personnel in Cuba similar to those in other “restrictive environments.”

Thanks to congressional opposition, no U.S. ambassador to Cuba may be confirmed anytime soon. But Mr. Obama himself, according to his spokesman, is eager to visit Havana. We’d like to hope that the president will restrain himself until the Castro regime shows some sign of delivering the improvements in human rights he says are the goal of his outreach. SO FAR, U.S.-CUBA RAPPROCHEMENT IS LOOKING ENTIRELY ONE-SIDED.

AT: Cuba Scenario --- Lifting Embargo Increases Structural Violence

Lifting in the embargo only increases structural violence

Jacoby 7/8

Jeff Jacoby, columnist for the Boston Globe, "Cubans pay the price for Obama's 'engagement' with the Castros," July 8, 2015, Boston Globe, <http://www.therealcuba.com/NV>

ON JULY 1, President OBAMA ANNOUNCED THE FORMAL RESUMPTION OF DIPLOMATIC RELATIONS WITH CUBA, ASSERTING CONFIDENTLY THAT "American ENGAGEMENT . . . IS THE BEST WAY TO ADVANCE our interests and support for DEMOCRACY AND HUMAN rights."

ON JULY 5, the Communist regime in HAVANA DELIVERED ITS CUSTOMARY RESPONSE. IT ARRESTED MORE THAN 80 DEMOCRATIC DISSIDENTS, INCLUDING AT LEAST 60 MEMBERS OF LADIES IN WHITE, a peaceful group of brave women who march weekly in support of husbands, fathers, and other relatives imprisoned in the Castros' jails. MANY OF THOSE DETAINED WERE HURT, SOME SEVERELY. One prominent human rights activist, ANTONIO RODILES, WAS SENT TO THE HOSPITAL WITH A SHATTERED NOSE; HE had reportedly BEEN handcuffed by security forces, then BEATEN FOR SHOUTING "LONG LIVE FREEDOM" AND "LONG LIVE HUMAN RIGHTS."

THERE HAD BEEN EVEN MORE ARRESTS AND BEATINGS IN THE DAYS LEADING UP TO OBAMA'S ROSE GARDEN STATEMENT. SOME 225 CUBAN DISSIDENTS ACROSS THE ISLAND WERE ARRESTED THE PREVIOUS SUNDAY, with Ladies in White again prominent among those targeted. In fact, there have been police actions against Cuban democrats for 12 Sundays in a row — THE GOVERNMENT MAKES A POINT OF GOING AFTER DISSIDENTS AS THEY WALK TO MASS or emerge from church holding photos of imprisoned loved ones.

Like most US advocates of normalizing relations with the only all-out dictatorship in the Western Hemisphere, Obama claims that warming up to the Castro regime is the most effective way to promote freedom and liberal reform in Cuba. When he announced LAST DECEMBER that ties between Havana and Washington were going to be restored, THE PRESIDENT DECLARED THAT "WE CAN DO MORE TO SUPPORT THE CUBAN PEOPLE and promote our values through engagement." NOW, NEARLY SEVEN MONTHS LATER, HE REITERATES "AMERICA'S ENDURING SUPPORT FOR UNIVERSAL VALUES, like freedom of speech and assembly," AND he INSISTS THAT HIS ADMINISTRATION "WILL NOT HESITATE TO SPEAK OUT WHEN WE SEE ACTIONS THAT CONTRADICT THOSE VALUES."

NO? OVER THE PAST SEVEN MONTHS, LIFE FOR CUBA'S PEOPLE HAS GROWN EVEN MORE UNFREE. YET FAR FROM FORTHRIGHTLY CONDEMNING THE REPRESSION, OBAMA SERENELY COUNSELS PATIENCE: "Nobody expects Cuba to be transformed overnight," he says.

THERE HAVE BEEN MORE THAN 3,000 POLITICAL DETENTIONS ON THE ISLAND SINCE LAST DECEMBER, according to The Washington Post. The paper quotes Mario Felix Leonart, a Cuban Baptist pastor who laments that he, like many, "had hoped, following the announcement about normalizing relations between the US and Cuba, that there would be a stop to — or at least a lessening of — the beatings" of dissidents. "We now know that what is happening is precisely the opposite."

The policy that Obama now embraces is also "precisely the opposite" of the one he feigned to uphold as a candidate for president.

ONCE UPON A TIME, OBAMA MAINTAINED THAT THERE WOULD BE NO AMERICAN EMBASSY IN HAVANA UNTIL ALL OF CUBA'S POLITICAL PRISONERS WERE FREE. Now he trumpets John Kerry's forthcoming trip to Havana "to proudly raise the American flag over our embassy once more," even as Cuba continues to lock up men and women for daring to seek the democratic liberties Americans take for granted.

THE OBAMA ADMINISTRATION IS BESTOWING TREMENDOUS GIFTS ON CUBA'S RULERS: diplomatic legitimation, a public-relations triumph, an influx of hard currency, and expanded influence in Washington. ALL THIS THE CASTROS ARE GETTING IN

EXCHANGE FOR NOTHING: NO ELECTIONS, NO FREE PRESS, NO END TO BEATING PEACEFUL
PROTESTERS, NO JUSTICE FOR THE MANY VICTIMS OF CUBAN TOTALITARIANISM.

"CASTROISM HAS WON," MOURNED THE CUBAN DISSIDENT YOANI SÁNCHEZ last winter, when Obama announced an end to America's principled policy on Cuba. If it wasn't obvious then, it is now.

AT: Russia Impact

No Russia war – five warrants Margossian 14

Maral Margossian, a columnist for Massachusetts Daily Collegian, "Five reasons why Russia won't start World War III," March 27, 2014, The Massachusetts Daily Collegian, <http://dailycollegian.com/2014/03/27/five-reasons-why-russia-wont-start-world-war-iii/NV>

THE recent EVENTS IN EASTERN EUROPE INVOLVING RUSSIA AND UKRAINE HAVE SPAWNED, AT THEIR MOST EXTREME, APOCALYPTIC CLAIMS. HERE ARE FIVE REASONS WHY RUSSIA WON'T START WORLD WAR III, or any other war for that matter:

1. THE WORLD IS MAD. THE END OF WORLD WAR II USHERED THE WORLD INTO A precarious ATOMIC AGE that characterized the international atmosphere DURING THE COLD WAR. LUCKILY, THE COLD WAR NEVER ESCALATED TO NUCLEAR WAR. WHY? BECAUSE OF MUTUALLY ASSURED DESTRUCTION (or MAD). RUSSIA KNOWS THAT IF IT PUSHES THAT BIG RED BUTTON, WE HAVE OUR OWN EVEN BIGGER, REDDER BUTTON TO PUSH in retaliation. THE ODDS OF A NUCLEAR WAR WITH RUSSIA ARE EXTREMELY UNLIKELY.

2. THE IMPACT OF ECONOMIC SANCTIONS ON THE RUSSIAN ECONOMY IS FAR TOO CRIPPLING FOR RUSSIA TO FUND A war. As a part of a globalized world, economic sanctions are more than mere slaps on the wrist. ALREADY THE SANCTIONS IMPOSED ON RUSSIA HAVE BEGUN TO TAKE THEIR TOLL. The West has yet to attack Russia's strongest economic assets, but THE DECLINING STRENGTH OF THE RUSSIAN ECONOMY PUTS PUTIN FAR FROM A POSITION TO WAGE A WORLD WAR.

3. PUTIN'S ACTIONS DEMONSTRATE HIS LONGING FOR RUSSIA'S GLORY DAYS BEFORE THE FALL OF THE SOVIET UNION. HIS ANNEXATION OF CRIMEA IS MORE OUT OF FEAR THAN STRENGTH. Putin feels threatened by Russia's changing role in world affairs and is using Crimea to tell the world that Russia still matters.

4. RUSSIA IS ALREADY SEEN AS THE "BIG BAD WOLF" OF EUROPE. Though Putin may have been nominated for the Nobel Peace Prize for his involvement in the Syrian chemical weapons deal, RUSSIA'S POPULARITY AMONG MANY WESTERN COUNTRIES IS NOT VERY HIGH. THE RECENT SUSPENSION OF RUSSIA FROM THE G8 GROUP IS A SYMBOLIC ACTION THAT DEMONSTRATES THAT RUSSIA WILL HAVE TO FACE A UNITED FRONT OF WORLD POWERS IF IT CHOOSES TO START A WAR.

5. THERE IS JUST TOO MUCH AT STAKE. WAR BETWEEN UKRAINE AND RUSSIA IS ONE THING; Russia's military is large enough and strong enough to easily defeat Ukraine. HOWEVER, IF RUSSIA DECIDES TO TAKE FURTHER AGGRESSIVE ACTION, IT MUST ALSO CONTEND WITH SURROUNDING EUROPEAN UNION MEMBER NATIONS and their potential involvement in the war. Moreover, Russia's involvement in other international affairs will be affected. For example, the ongoing effort to normalize relations between Iran and the rest of the world will be jeopardized, considering Russia is involved in those efforts. CRIMEA MAY HAVE SYMBOLIC MEANING CLOSE TO THE HEARTS OF RUSSIANS, BUT IT ISN'T WORTH RISKING THE DOMINO EFFECT OF EVENTS THAT CAN POTENTIALLY OCCUR.

So, those of you who feel abnormally unsettled by the recent turn of events can rest easy. WHILE RUSSIA'S ACTIONS CAN'T BE BRUSHED ASIDE AND SHOULD BE TAKEN SERIOUSLY, THE CHANCES OF THIS CONFRONTATION ESCALATING TO A GREAT WAR ARE SLIM — assuming these countries act rationally.

AT: Iran Politics Samford

Iran Answers (Front-Line)

(--) Surveillance is issue-specific and won't spill over:

Jared **Metzker**, (staff writer), July 27, 2013. Retrieved Apr. 29, 2015 from <http://original.antiwar.com/jared-metzker/2013/07/26/poll-shows-voter-bi-partisan-split-mirrors-house-vote-on-nsa/>

By a ratio of about two-to-one, 60 to 29 percent, young respondents said they were more concerned about the government doing too much to weaken civil liberties than they were about it doing too little to defend the nation from terror. In terms of gender, 51 percent of men agreed with this statement, as opposed to only 29 percent of women. In the report, Pew concludes that the views of U.S. citizens on this issue are "complex", a conclusion based in part on the relative lack of correlation with party leanings. Spill Over **Ornstein believes that the cross-cutting divide splitting both major parties is "issue-specific" and unlikely to spill over into other major controversies,** for example on social issues such as spending on health care.

(--) The NSA director, not Obama, will lobby against the plan:

George **Zornick**, (staff writer) THE NATION, July 25, 2013. Retrieved Apr. 29, 2015 from <http://www.thenation.com/blog/175427/historic-bipartisan-vote-narrowly-fails-derail-nsa-spying>

Representatives Justin Amash and John Conyers created an amendment to a big defense appropriations bill, which used targeted language to defund the bulk collection of data by the National Security Agency. This was the practice disclosed by Edward Snowden and The Guardian in early June. Amash managed to get the amendment to the House floor. Politico suggests House leadership allowed a vote because they were sure it couldn't pass—though that seems like a contestable assumption. **The administration seemed quite worried that it would: NSA director Keith Alexander was immediately dispatched to the Hill to lobby members against the amendment.** The White House also released a veto threat on the same day, a somewhat unusual move for a single amendment that supposedly had no chance of passing. The White House declared, "This blunt approach is not the product of an informed, open, or deliberative process."

(--) The Iran deal will fail now:

David Ignatius, (staff writer), HUFFINGTON POST, FEB. 9, 2015. Retrieved Apr. 30, 2015 from http://www.washingtonpost.com/opinions/proceed-with-caution-on-iran-diplomacy/2015/02/09/35a601e4-b0a7-11e4-854b-a38d13486ba1_story.html

Pessimism about the negotiations is growing because the two sides seem far apart on key issues. Take the question of sanctions relief: Iranian Foreign Minister Mohammad Javad Zarif said Sunday that sanctions are a "liability" that should be removed quickly if there's a deal. But American negotiators have insisted that sanctions would be removed gradually, in a phased process, as Iran shows that it is abiding by the terms of the overall agreement. When the two sides are so far apart on this basic issue, it's hard to see how they will get to yes.

Deal will fail and Democrats will be forced to vote for sanctions:

Jennifer **Rubin, 2/9/2015** (staff writer, "Iran deals, loopholes and sanctions,"

<http://www.washingtonpost.com/blogs/right-turn/wp/2015/02/09/iran-deals-loopholes-and-sanctions/>, Accessed 2/19/2015, rwg)

Mr. Khamenei seems to oppose a procedure already agreed to by the two sides, which is to conclude an understanding of general principles by March 24 and to finalize details of a deal by the end of June. "If an agreement is reached," he said, "it must be concluded in one go and must encompass both general principles and details." Agreement on only principles would allow the Americans to raise "one objection after another" over details, he said, describing this as usual practice by the U.S." **If there is to be no interim "political framework" in March then Democrats' feet will be put to the fire and, according to the letter ten Democrats sent to the president, would then vote for additional sanctions conditioned on no final deal.**

Winners win- key to momentum and public approval.

Parnes, 12-27 – The Hill senior White House correspondent

[Amie, "'Liberated' Obama builds momentum," The Hill, 12-27-14, thehill.com/homenews/administration/228017-liberated-obama-builds-momentum, accessed 12-29-14]

President **Obama is responding to a drubbing in the midterm elections with action. So far, it's paying off. Obama's poll numbers — which had previously slid into the low 40's — are up, and the president has enjoyed a streak of good headlines.** Those factors, coupled with a rising economy, are making the White House optimistic about his final two years in office. White House allies say the president feels an increased sense of liberation with the elections over. They predict that he will continue to be proactive in the face of the Republican Congress that will take power early next year. After a mostly lackluster 2014, **Obama was able to score a series of wins in the last six weeks by going on the offensive with a string of executive actions,** a hitherto-secret plan to normalize relations with Cuba and a satisfying compromise on the omnibus. "He doesn't feel constrained anymore," said Steve Elmendorf, the prominent Democratic lobbyist and veteran of Capitol Hill. "I think he felt constrained before the election, a little too constrained, to protect vulnerable senators. Now he has a little more breathing room." A former senior administration official said that a more confident Obama has emerged since the midterm dustup: the one who hates to lose. While political pundits and others in the Beltway have been portraying him as a lame duck, Obama has fought back against that notion, the official said. "The most remarkable trait of Barack Obama is that he's always had a confidence about him regardless of political wins or what pundits are saying," the former official said. "Throughout his presidency, even in the lowest moments when everyone was piling on, he's always had this sense that ultimately he's going to be vindicated and I think these events certainly helped." Obama's winning streak was extended on Tuesday when new data from the Commerce Department showed that the economy grew at a 5 percent rate from July to September, the fastest pace in 11 years. The news will surely add to Obama's swagger on the economy. White House aide say he'll continue to tout the recovery – and remind people of just how dire the situation was when he first took office — as part of an effort to define his legacy. **But as the president continues to play in the "fourth quarter,"** as he put it at his year-end press conference last week, **even some of his most loyal allies are wondering how can he keep the momentum going.** Political observers caution that **Obama will face significant roadblocks in the months ahead,** especially **now that** all of **Capitol Hill is Republican-controlled territory** "**it will be much, much harder.**" said Julian Zelizer, a professor of history and public affairs at Princeton University.

No arms race or war

Layne 9 – Int'l Affairs Prof, Texas A&M, Visiting Fellow in Foreign Policy Studies, Cato Institute (Christopher, America's Middle East grand strategy after Iraq, Review of International Studies 35, Cambridge Journals)

Of course, hard-line US neoconservatives reject this approach and argue that a nuclear-armed Iran would have three bad consequences: there could be a nuclear arms race in the Middle East; Iran might supply nuclear weapons to terrorists; and Tehran could use its nuclear weapons to blackmail other

Commented [ME1]:

states in the region, or to engage in aggression. Each of these scenarios, however, is improbable.²⁴ A **nuclear Iran will not** touch off a proliferation **snowball** in the Middle East. Israel, of course, already is a nuclear power. The other three states that might be tempted to go for a nuclear weapons capability are **Egypt, Saudi Arabia, and Turkey**. However, each of these states **would be under** strong **pressure not to** do so, **and Saudi Arabia lacks** the industrial and engineering **capabilities** to develop nuclear weapons indigenously. Notwithstanding the Bush administration's hyperbolic rhetoric, **Iran is not going to give** nuclear **weapons to terrorists**. This is not to deny Tehran's close links to groups like Hezbollah and Hamas. However, there are good reasons that states – even those that have ties to terrorists – draw the line at giving them nuclear weapons (or other WMD): if the terrorists were to use these weapons against the US or its allies, the **weapons could be traced back** to the donor state, **which would** be at **risk of annihilation** by an American retaliatory strike.²⁵ **Iran's leaders** have too much at stake to run this risk. Even if one believes the administration's claims that rogue state leaders are indifferent to the fate of their populations, they do **care** very much **about** the **survival** of their regimes, which means that they can be deterred. For the same reason, Iran's possession of nuclear weapons will not invest Tehran with options to attack, or intimidate its neighbours. Israel's security with respect to Iran is guaranteed by its own formidable nuclear deterrent capabilities. By the same token, just as it did in Europe during the Cold War, the US can extend its own deterrence umbrella to protect its clients in the region – Saudi Arabia, the Gulf states, and Turkey. **American security guarantees** not only will **dissuade Iran from acting recklessly**, but also restrain proliferation by negating the incentives for states like Saudi Arabia and Turkey to acquire their own nuclear weapons. Given the overwhelming US advantage in both nuclear and conventional military capabilities, **Iran is not going to risk** national **suicide by challenging America's** security commitments in the region. In short, while a nuclear-armed Iran hardly is desirable, neither is it 'intolerable', because it could be contained and deterred successfully by the US.

Commented [ME2]:

Winners Win 1ar

Extend our Parnes evidence: Winners Win for Obama and it assumes this term and right now—prefer that to generic old evidence.

Keeping the streak going is key- Obama needs a new win to prevent conservative reprieve

Yong, 12-27 -- Strait Times

[Jermei Au, "US President Obama gets his groove back," 12-27-14, news.asiaone.com/news/world/us-president-obama-gets-his-groove-back, accessed 1-4-15]

He gave a clear hint of the sort of thinking that will drive his interactions with a Republican-controlled Congress next year: He still has veto power and is not about to be bullied. "In order for their initiatives to become law, I'm going to have to sign off and that means they have to take into account the issues I care about, just as I'm going to take into account the issues they care about." The **turnaround has come almost entirely off the back of actions Mr Obama has taken** on his own. After his shellacking by the Republicans at the mid-term elections, it is almost as if a switch went off. In a few short weeks, he has signed a landmark emissions deal with China, taken significant executive action on immigration reform, managed to get a comprehensive budget passed and started the process of normalising relations with Cuba. **That rapid-fire string of achievements has now given Mr Obama the sort of momentum he struggled to achieve all year.** Throughout 2014, he seemed to be lurching from crisis to crisis, whether it was Russia invading Ukraine, China towing an oil rig into disputed waters in the South China Sea, the Ebola outbreak in West Africa or the threat of the Islamic State in Iraq and Syria militant group. His favourability among Hispanic voters has shot up, he has fired up his liberal political base and sent Republicans scrambling for a response. In pushing ahead with immigration reform despite a multitude of threats, he has also shown renewed political nous, gambling that the Republicans would not risk a mutually destructive government shutdown to punish him. Add to that a compressed time frame and the fact that the GOP had yet to take over the Senate, the Republicans indeed duly passed a US\$1.1 trillion (\$\$1.3 trillion) spending Bill with only a token symbol of their objection to his immigration action attached. But the **conservatives**, too, **will be looking forward to the new year because**, at some point, **the President is going to run out of things he can do** on his own.

Deal Failing Now: 1ar

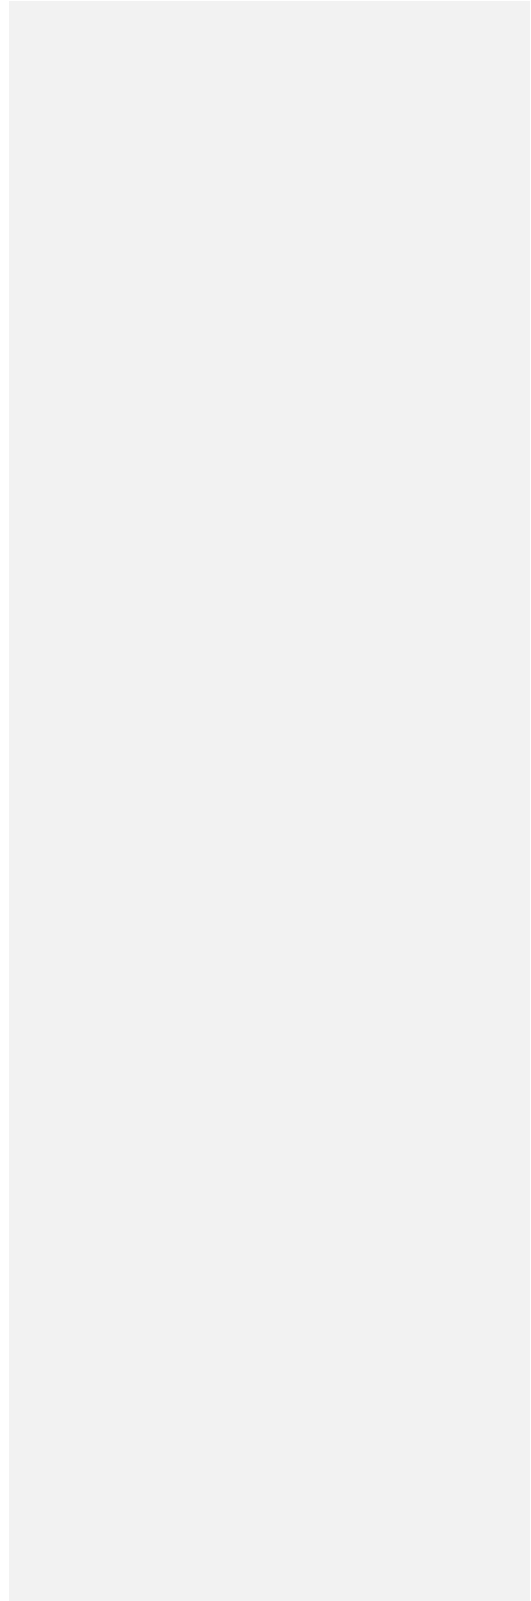

Deal is failing now:

David Ignatius, 2/9/2015 ("Proceed with caution on Iran diplomacy,"

UQ

UQ—Overwhelms the Link

Uniqueness overwhelms the link, Congress and Republicans can't do anything about the deal – Iran deal passing regardless whether the plan is done or not

Beauchamp 7/21 (<http://www.vox.com/2015/7/21/9007211/iran-nuclear-deal-republicans>, The GOP has no good options for killing the Iran deal, Zack Beauchamp, staff writer for the Vox and ThinkProgress. 7/21/2015)

Republican presidential candidates are climbing over one another to denounce the Iran nuclear deal. Jeb Bush called it a "terrible deal." Marco Rubio labeled it "a dangerous and destabilizing failure." Ted Cruz warned it "will result in the United States government becoming one of the leading funders of international terrorism." Rick Perry pledged to kill it as "one of my first official acts" as president; Scott Walker said he would "very possibly" order airstrikes on Iran on his first day in office. This all makes political sense. But don't take it too seriously as actual policy. The truth is that Republicans are in no real position to kill the Iran deal — probably not in Congress, and probably not even if they take the White House in 2016. Nor, really, should they want to: At this point, even if you are an Iran hawk who hates the deal, unilaterally torpedoing it would hurt your goals rather than advance them. Republicans have an Iran problem: They are politically wedding themselves to something that is, in practice, going to be very difficult or impossible for them to do. Unless something substantial changes on the ground — maybe Iran is caught in a major violation and refuses to fix it — American opponents of the Iran deal are probably not going to be able to kill it. Congressional Republicans are in a very weak position to kill the deal. The 2015 Iran Nuclear Agreement Review Act gives Congress 60 days to review the deal before Obama can begin lifting sanctions. In theory, they could vote to block US sanctions relief, which would violate the terms of the deal — effectively killing it. But that almost certainly won't happen. Congress is "effectively powerless to stop the Iran deal," writes Jack Goldsmith, the Henry L. Shattuck Professor at Harvard Law School. The simple explanation is numbers. Republicans would have to overcome a presidential veto. For that, they need every single Republican, plus 13 Senate Democrats and 44 House Democrats to vote in their favor — which, as Andrew Prokop points out, is a full fifth of the Democrats in each chamber. That's a huge hurdle. Even if you remove the actual foreign policy considerations, it would be politically bizarre for Democrats to so hurt their own party. This is President Obama's signature foreign policy achievement; over the course of 2015, supporting an Iran deal has increasingly become identified with supporting the president's foreign policy. Hillary Clinton, Democratic heir apparent, is on board with the deal — as is House Minority Leader Nancy Pelosi, who wields tremendous influence over House Democrats. Democratic voters support it by a whopping 69-25 margin, according to a Washington Post poll. The margin is pretty large among the general public, as well: 56 to 37. On foreign policy terms, killing the deal now is what you might call a tough sell. The most likely outcome, if the US Congress kills the deal, is that the international sanctions coalition against Iran would collapse. Keep in mind that the US signed this agreement not just with Iran but also with the UK, France, Russia, China, and Germany — all of whom would blame the US for breaking its word. Iran would suddenly be free from its obligations under the deal to dismantle its nuclear program. We would go from severe restrictions on Iran's nuclear program to effectively no restrictions, and we would go from a crippling sanctions regime to a very weak one. Even if you hate the Iran deal, that scenario is a lot worse. So in order to even have a chance of killing the Iran deal, Republicans will have to convince a large number of Democrats to abandon their president on his biggest foreign policy initiative, in defiance of the party's voters and top leaders — to support a bill that would be likely to end up accomplishing the opposite of what it's supposed to. That's a tough sell. Republicans' Iran problem only gets harder after Obama leaves office. As the years drag on, it will become harder for Republicans to unilaterally kill the deal — even if the Republicans take back the White House. By the time President Scott Walker or President Marco Rubio would be inaugurated, most of the international sanctions will already be gone. The whole point of killing the deal right now is to keep sanctions in place. Meanwhile, the international community will have a bunch of inspections and monitoring in place that the US would jeopardize by killing the deal. "The next president can start from scratch," Bob Corker, chairman of the Senate Foreign Relations Committee, told Reuters. "What would have happened, though, is the international sanctions process would have been totally dismantled." Merely withdrawing from the deal, in other words, isn't enough: A new Republican president would need to figure out some way to convince the world to put sanctions back in place. But it's really, really hard to imagine how the US could convince Russia and China and Europe to go back on a nuclear deal they so clearly see as a good thing. The entire point of the sanctions regime was to get Iran to agree to limits on its nuclear program. From the world's perspective, Iran has just agreed to put limits on its nuclear program. No major power would go along with a new American president who wants to kill the deal and roll the clock back to 2013. Destroying the deal would both 1) give Iran sanctions relief and 2) remove the strict limits the deal puts on Iran's nuclear program. That's the best of both worlds for Tehran — and the worst for Washington. Some of the more forthright hawks

recognize this. "If the next president is to have any hope of putting Iran back into the sanctions box, he or she will have to do some heroic diplomatic work to convince our allies to go along or else risk open economic warfare with our closest allies," Max Boot, a leading Iran hawk at the Council on Foreign Relations, writes in Commentary. Boot counsels a future Republican president "to keep the accord in place" while "building the case, both at home and abroad, for re-imposing sanctions and even using force if necessary to stop the Iranian nuclear program." It's hard to imagine the world powers deciding that it should join a President Walker or Rubio in renegeing on the deal and punishing Iran for its compliance (if Iran cheats, the deal has mechanisms for reimposing sanctions). The fact that this is where the anti-Iran-deal policy conversation is — super long-shot schemes premised on convincing all the world powers to betray a deal they just signed — tells you a lot about the likelihood of actually killing it. The deal is likely sealed. There are other imaginable avenues to killing the deal, but they're not much more attractive. A Republican president could simply launch a war out of thin air, as Walker suggested, but that'd be a disaster; the rest of the world would correctly see it as America betraying its commitments to the nuclear deal. The backlash would be even worse than it was to the 2003 Iraq invasion. And if a Democrat wins the White House, congressional Republicans will be in a worse place than they are now. It is certainly possible that the deal could fall apart in some other way: Maybe Iran will stonewall inspectors on verifying that it's complied with the terms, for example. But it is just very difficult to imagine any plausibly functional way in which Republicans can now unilaterally kill the deal. The Iran deal is almost certainly here to stay. Republican presidential candidates will likely say all sorts of things about rolling it back. The party's hawks are a critical constituency in the upcoming primary battle, and saying that you hate the deal and want to kill it helps convince those folks that you share their priorities. But don't confuse those pledges with, y'know, actual policy commitments. A Republican president will have little choice, like it or not, but to see the deal through.

Deal will pass—consensus of insiders

Foster 7/14 (Peter Foster; July 14, 2015; Correspondent for the Telegraph; "Iran deal: what happens next in Washington?" ; The Telegraph; <http://www.telegraph.co.uk/news/worldnews/middleeast/iran/11730368/Iran-deal-what-happens-next-in-Washington.html>) jskullz

So CONGRESS COULD still SCUPPER THE DEAL? ¶ IN THEORY yes - ALTHOUGH IN PRACTICE THIS IS VERY UNLIKELY. ¶ Republicans have majorities in both houses of Congress so they can pass a motion rejecting the deal, but Mr Obama will then veto that motion. ¶ This is where the Congressional mathematics get very tough for opponents of an agreement. REPUBLICANS CAN OVERRIDE THE PRESIDENT'S VETO BUT ONLY IF THEY CAN RALLY TWO-THIRDS OF THE VOTE in both the Senate and the House. ¶ IN THE SENATE THAT MEANS THAT AT LEAST 13 DEMOCRATS MUST VOTE AGAINST MR OBAMA to derail the deal. GIVEN THAT THE DEAL IS OBAMA'S DEFINING FOREIGN POLICY ACHIEVEMENT, THE INFORMED CONSENSUS IS THAT THAT IS VERY UNLIKELY TO HAPPEN. ¶ In short, THERE ARE DEMOCRATS WHO DON'T LIKE THIS DEAL BUT NOT ENOUGH TO TORPEDO THEIR PRESIDENT'S FLAGSHIP FOREIGN POLICY ACHIEVEMENT.

No override—strong democratic support

Davis 7/14 (Susan Davis; July 14, 2015; Chief Washington correspondent for USA Today; "Congress unlikely to block Iran deal"; USA Today; <http://www.usatoday.com/story/news/politics/2015/07/14/congress-iran-deal/30125885/>) jskullz

IF CONGRESS WERE TO PASS A RESOLUTION seeking to block the deal, President OBAMA SAID TUESDAY HE WOULD VETO IT. OPponents WOULD then NEED A VETO-PROOF, TWO-THIRDS MAJORITY IN BOTH CHAMBERS TO OVERRIDE — A SCENARIO THAT SEEMS UNLIKELY TODAY AS TOP DEMOCRATS ISSUED EARLY STATEMENTS OF SUPPORT. ¶ "THE HISTORIC NUCLEAR AGREEMENT ANNOUNCED today IS THE

PRODUCT OF YEARS OF TOUGH, BOLD AND CLEAR-EYED LEADERSHIP from President Obama," SAID House Minority Leader Nancy PELOSI, D-Calif. "I commend the president for his strength throughout the historic negotiations that have led to this point."

No override—Democratic letter

Sargent 5/7 (Greg Sargent; May 7th 2015; Writer for the Washington Post's Plum Line political column; "The odds of an Iran nuclear deal just got better"; Washington Post; <http://www.washingtonpost.com/blogs/plum-line/wp/2015/05/07/the-odds-of-an-iran-nuclear-deal-just-got-higher/>) jskullz

ONE HUNDRED AND FIFTY HOUSE DEMOCRATS HAVE now SIGNED A LETTER EXPRESSING STRONG SUPPORT FOR PRESIDENT OBAMA'S ongoing NEGOTIATIONS WITH IRAN over its nuclear program, I've learned, IMPROVING THE CHANCES THAT AN EVENTUAL NUCLEAR DEAL COULD SURVIVE THE CONGRESSIONAL OVERSIGHT PROCESS.¶ The 150 DEMOCRATIC SIGNATORIES — WHICH INCLUDE DEM LEADERS LIKE NANCY PELOSI AND Chris VAN HOLLEN — are significant. Here's why: IF A DEAL IS REACHED that looks like the recently-announced framework, and THE GOP-CONTROLLED CONGRESS VOTES TO DISAPPROVE OF IT, IT'S NOW MORE LIKELY THAT THERE WILL BE ENOUGH HOUSE DEMOCRATS TO SUSTAIN OBAMA'S VETO of that disapproval legislation, allowing the deal to move forward.

Veto override's overwhelmingly slated to pass—house democrats won't abandon Obama.

Feeherey 7/14 (John Feeherey; July 14, 2015; staff writer for the Wall Street Journal; "Republicans Oppose the Iran Deal—but Can They Override a Veto?"; Wall Street Journal; <http://blogs.wsj.com/washwire/2015/07/14/republicans-oppose-the-iran-deal-but-can-they-override-a-veto/>) jskullz

Congress can pass either a resolution of approval or disapproval regarding the agreement. A TWO-THIRDS VOTE IN BOTH CHAMBERS IS NEEDED TO ASSERT CONGRESSIONAL DOMINANCE OVER THE PRESIDENT, and to reach that threshold, REPUBLICANS WILL MOST LIKELY NEED THE SUPPORT OF the incoming Democratic leader of the Senate, Chuck SCHUMER.¶¶ Senate Majority Leader Mitch McConnell will need Mr. Schumer, ALL OF THE OTHER JEWISH DEMOCRATS IN THE SENATE, AND THREE OTHER DEMOCRATS TO JOIN HIM in overcoming the veto that President Obama promised Tuesday in the face of congressional opposition. Sen. Robert MENENDEZ IS A LIKELY SUSPECT; Bill NELSON AND Kirsten GILLIBRAND ARE ALSO STRONG POSSIBILITIES.¶¶ IN THE HOUSE, GETTING ENOUGH VOTES WOULD BE AN EVEN TOUGHER SLOG. Iran is the one issue that unifies House Republicans. Indeed, when Speaker John Boehner invited the Israeli prime minister to address a joint session of Congress, it sent his stock sky-high among his most recalcitrant conservative colleagues. But THE ODDS OF GETTING ENOUGH BIPARTISAN SUPPORT FOR AN OVERRIDE ARE DICEY AT BEST.¶¶ There are 247 Republicans in the House. THEY NEED 290 MEMBERS TO OVERRIDE A VETO, WHICH MEANS THEY WOULD NEED 43 DEMOCRATS TO ABANDON MR. OBAMA.¶¶ IT'S HARD TO SEE WHERE THEY GET THAT MANY VOTES. THERE ARE 18 JEWISH DEMOCRATS IN THE HOUSE, AND MANY OF THEM WILL probably STICK WITH THE PRESIDENT.

NEITHER THE BLACK CAUCUS NOR THE HISPANIC CAUCUS IS LIKELY TO ABANDON MR. OBAMA, AND IT IS HIGHLY UNLIKELY THAT House Democratic leader Nancy PELOSI WILL either.

Iran deal will pass

Richter 7/12/2015 (Paul Richter, writer for the L.A. times, "Iran nuclear deal appears close, deal may come Monday, <http://www.latimes.com/world/middleeast/la-fg-iran-talks-20150712-story.html#page=1, 7/12/15>)

Diplomats from Iran and six world powers completed what may be their final

negotiating session after two years of talks Sunday amid signs that a comprehensive deal to keep Iran from building a nuclear bomb for at least a decade will be announced Monday. After 16 days of bargaining, top officials from the United States and five other world powers that have been negotiating with Iran met Sunday evening for a working dinner that lasted just over three hours. Before the meeting, diplomats said the foreign ministers were aiming to nail down the precise language of the agreement and of the United Nations Security Council resolution that will lay out its terms. The head of Iran's nuclear agency, Ali Akbar Salehi, was quoted by an Iranian news agency as saying

that **technical discussions are almost over**, and the text regarding the technical issues with their annexes is almost finished." Earlier in the day, diplomats said that if negotiators completed their work here, the lengthy final text of the deal would be sent to Washington and Tehran for a final review, with the expectation that the terms would be publicly revealed Monday, unless the talks hit a snag. "We are working hard, but a deal tonight is simply logistically impossible," said Alireza Miryousefi, a senior Iranian official at the talks. "This is a 100-page document, after all." But although the comments from all sides were optimistic throughout the day, the nuclear negotiations have hit last-minute roadblocks in the past, and officials from the U.S. and Iran cautioned that a deal was not yet certain. Secretary of State John F. Kerry and French Foreign Minister Laurent Fabius emphasized in public comments earlier Sunday that difficult decisions remained. Fabius described Sunday's meetings as the "final stage" of talks. Negotiators have failed to meet two deadlines in this round of talks and are facing a third deadline Monday night. If a deal is not reached, Kerry would be under strong political pressure to call at least a temporary halt in the negotiations. If a deal is reached, Congress would have 60 days to review it. **The Republican majorities in both**

houses virtually guarantee that a resolution disapproving **the deal will pass**, probably in September. President Obama would be certain to veto any such move, and vote counters currently do not think that Congress would have the votes to override a veto. That means the deal would take effect and probably become a significant issue in the 2016 elections, with nearly all the Republican presidential hopefuls pledging to overturn it if elected. Iran, the United States, France, Britain, Germany, Russia and China have spent almost two years trying to work out a deal that would lift sanctions on Iran if it agrees to restrictions intended to prevent it from obtaining a nuclear bomb for 10 to 15 years. Such a deal could resolve, at least for the next decade or more, one of the world's most worrisome security issues and could bring far-reaching changes in the Middle

East. In April, the negotiators, meeting in Lausanne, Switzerland, reached a preliminary agreement. Under it, Iran would mothball two-thirds of its newer high-speed centrifuges that enrich uranium, going from 19,000 devices to 6,104 older machines. It would reduce its stockpile of low-enriched uranium from 7,154 kilograms to 300 kilograms and not build any new facilities for enrichment for 15 years. Those limits, plus inspections to prevent Iran from using new, covert nuclear sites, would greatly restrain its ability to complete a bomb for at least a decade, U.S. and European officials said. Iran would be allowed to continue to enrich fuel, but only to a level useful for a commercial nuclear reactor producing electricity. It would be required to convert a reactor in Arak that was designed to produce plutonium, which can be used to fuel a nuclear bomb. In return, the U.S. and the other world powers would lift many of the economic sanctions that have strangled Iran's economy. With those issues largely resolved, the final round of negotiations has focused on a few of the most difficult issues — what access international inspectors would have to Iran's suspected nuclear sites, how quickly sanctions would be lifted and what procedures would be used to "snap back" sanctions if the U.S. and other countries decided Iran was cheating. Iran also insisted that the international embargo on its arms purchases be lifted. Even as they hashed out those issues, however, each side accused the other of trying to reopen issues that had been agreed upon earlier. The negotiators are believed to have settled on a process under which international inspectors will be able to obtain rapid, although not immediate, access to Iranian nuclear sites if they believe cheating has taken place. With those difficult issues under discussion, the process has often seemed close to a successful conclusion — and often close to collapse — in the last week. There were many indications Sunday that the process had swung back toward obtaining a deal. Russian Foreign Minister Sergei Lavrov, who has preferred to keep a distance from the laborious negotiations until decisions were needed, arrived in Vienna on Sunday afternoon. In Iran, Saeed Matazerulmahdi, chief of

the Tehran police, announced that officers would provide security if Iranians wanted to celebrate. In Jerusalem, Israeli Prime Minister Benjamin Netanyahu, long an opponent of the negotiations, warned again that the deal was a bad one. To illustrate the risk, he showed Israeli officials a video of President Clinton's promises about the 1994 nuclear agreement with North Korea. Clinton promised at the time that the agreement was a "good deal" that would lead to the dismantling of Pyongyang's nuclear infrastructure. Instead, North Korea soon began violating the agreement and ejected international inspectors. U.S. officials say that the North Korea deal was completed with few safeguards, in part because American officials at the time thought the North Korean government was on the verge of collapse. In the Iran negotiations, by contrast, months have been spent on the verification and enforcement procedures. In Washington, Senate Majority Leader Mitch McConnell (R-Ky.) said that the nuclear agreement would be a "hard sell" for the administration and that the Senate probably would pass a resolution to disapprove it. Sen. Bob Corker (R-Tenn.), chairman of the Foreign Relations Committee, said his main concern was that Iran would "cheat by inches," avoiding any violations that would trigger renewed economic sanctions, but still progressing toward a nuclear weapon.

UQ—Won't pass

Won't pass—democratic skepticism

RTT 7/13 (RTT News; July 13th 2015; online newswire; "McConnell: Iran Deal Going To Be A Very Hard Sell In Congress"; RTT News; <http://www.rttnews.com/2521995/mcconnell-iran-deal-going-to-be-a-very-hard-sell-in-congress.aspx?type=cong>) jskullz

We don't endorse ableist language

While international negotiators continue to work on a deal to address Iran's nuclear program, Senate Majority Leader Mitch MCCONNELL, R-Ken., ARGUED THE AGREEMENT WILL HAVE A HARD TIME MAKING IT THROUGH CONGRESS. ¶ In an appearance on "Fox News Sunday," McConnell claimed the agreement currently being negotiated will leave Iran as a threshold nuclear state. ¶ "It appears as if the administration's approach to this was to reach whatever agreement the Iranians are willing to enter into," McConnell said. ¶ "So I think IT'S GOING TO BE A VERY HARD SELL -- if it's completed -- in Congress." ¶ McConnell suggested CONGRESS WOULD LIKELY APPROVE A RESOLUTION OF DISAPPROVAL AFTER REVIEWING THE AGREEMENT AND NOTED PRESIDENT BARACK OBAMA WOULD NEED THE SUPPORT OF 34 SENATORS TO UPHOLD A VETO. ¶ "They'll have to get at least 34 votes assuming a resolution of disapproval passes," McConnell said. ¶ THE PRESIDENT VETOES IT, HE'LL HAVE TO GET AT LEAST 34 SENATORS TO GO FORWARD. ¶ A NUMBER OF DEMOCRATS, such as Sen. Robert Menendez, D-N.J., HAVE ALSO EXPRESSED SKEPTICISM ABOUT THE DEAL, which would limit Iran's nuclear program in exchange for lifting crippling economic sanctions. ¶

Arms embargo is a dealbreaker—ensures controversy

Rogers and Roubein 7/13 (Alex Rogers and Rebecca Roubein; July 13, 2015; staff correspondent for National Journal, writer for National Journal; "Last-Minute Iran Deal Details Make Democrats Nervous"; National Journal; <http://www.nationaljournal.com/congress/last-minute-iran-deal-details-make-democrats-nervous-20150713>) jskullz

On the eve of a landmark nuclear deal with Iran, President OBAMA'S DEMOCRATIC ALLIES IN CONGRESS ARE WORRYING OVER A PERIPHERAL ISSUE THAT, if included, COULD HAMPER SUPPORT FOR IT. ¶ DEMOCRATS ARE GRAPPLING WITH A REPORTED PHASED LIFTING OF A UNITED NATIONS ARMS EMBARGO, which the Iranians have demanded as the international community looks to lift sanctions worth some \$150 billion. In exchange, Iran would reduce its centrifuges, convert a once-secret, underground mountain facility to one used only for peaceful purposes, and increase access for international inspectors to all of its nuclear facilities, among other points described in the White House's framework struck in April. ¶ "MY CONCERNS would be the same that anybody would have, which IS a concern of a PROLIFERATION of weapons in that region by the Iranians," SAID Sen. Michael BENNET of Colorado, adding that the embargo concerning conventional arms "is not what this negotiation is about." ¶ On Monday, Sen. Robert CASEY of Pennsylvania SAID THE ISSUE WAS "OF GREAT CONCERN" to him, Sen. Christopher COONS of Delaware REITERATED HIS OPPOSITION, AND Sen. Richard BLUMENTHAL of Connecticut SAID IT "PROBABLY" WOULD BE A LINE HE COULDN'T CROSS. ¶ And Sen. Robert MENENDEZ of New Jersey, among the Democrats most skeptical of the talks, SAID HE COULDN'T SUPPORT THE DEAL if it relaxed the embargo as it would allow Russia, a negotiating partner, to sell Iran an advanced air-defense system. ¶ "Listen, the last thing we need to do is give Iran the ability to have the wherewithal to have arms going throughout the region," he said. "They're already involved in Yemen, in Syria, in Lebanon, in Iraq. ... What is lost here is that if we lift the arms embargo, then the Russians freely can sell the S-300 [missile] to them, and that makes it a lot more difficult in the future—

should Iran violate the agreement and move towards their nuclear capability for a nuclear weapon—of trying to strike them with the S-300 as a defense missile system. For all of those reasons, IT SHOULD BE A REDLINE. And the intercontinental missile issue should also be a redline."¶ DEMOCRATS' OPPOSITION FOLLOWS IN THE FOOTSTEPS OF TOP MEMBERS OF THE ADMINISTRATION, INCLUDING outgoing JOINT CHIEFS CHAIRMAN Martin DEMPSEY AND DEFENSE SECRETARY Ashton CARTER, who explained their views last week in a Senate Armed Services hearing. "The reason that we want to stop Iran from having an ICBM program is that the I in ICBM stands for intercontinental, which means having the capability from flying from Iran to the United States," said Carter. "And we don't want that."¶ "UNDER NO CIRCUMSTANCES SHOULD WE RELIEVE PRESSURE ON IRAN RELATIVE TO BALLISTIC CAPABILITIES AND ARMS TRAFFICKING," added Dempsey.¶ Republicans, who have criticized the administration's Iran strategy since before the Joint Plan of Action interim agreement of November 2013, have added it to their litany of concerns.¶ "There was a huge shift when under JPOA we went from dismantling their program to acknowledging enrichment," Senate Foreign Relations Committee Chairman Bob Corker said. "That was a pretty big shock to folks. And then from then on it's gotten—you know the anytime, anywhere inspections—where's that going to end up? They're saying military sites are off. Now the arms embargo seems to be coming in. I don't think anybody can say it's been going in a more positive way, OK?¶ "I mean, so MANY REDLINES HAVE BEEN CROSSED," he added.

Bipartisan disapproval of the deal

AP 7/14 (Associated Press; July 14, 2015; One of the premier international news bureaus; "Democrats skeptical of Iran nuclear deal, GOP mostly hostile"; Boston Herald; http://www.bostonherald.com/news_opinion/us_politics/2015/07/democrats_skeptical_of_iran_nuclear_deal_gop_mostly_hostile) jskullz

WASHINGTON — SOME OF PRESIDENT BARACK OBAMA'S FELLOW DEMOCRATS EXPRESSED SKEPTICISM AND REPUBLICANS VOICED OUTRIGHT HOSTILITY Tuesday TO THE landmark IRANIAN nuclear DEAL.¶ Under the historic accord, Iran's nuclear program would be curtailed in exchange for billions of dollars in relief from international sanctions. The agreement aims to avert the threat of a nuclear-armed Iran and another U.S. military intervention in the Middle East.¶ "I was skeptical at the beginning of this process, and I REMAIN SKEPTICAL of the Iranians," SAID Rep. Steve ISRAEL, THE HIGHEST RANKING JEWISH DEMOCRAT in the House. "In the fall, there will be a vote on this deal, and my obligation is to review every word, sentence and paragraph of the deal to ensure it satisfies my continued concerns."¶ "IF IT'S as BAD a deal as I think it is," SAID Republican House Speaker John BOEHNER of Ohio, "WE'RE GOING TO DO EVERYTHING WE CAN TO STOP IT."¶ Sen. Bob MENENDEZ, formerly a RANKING member of the Foreign Relations Committee, SAID HE WAS CONCERNED THAT THE DEAL "ultimately LEGITIMIZES IRAN AS A threshold NUCLEAR STATE."¶ "I'm concerned the red lines we drew have turned into green lights: that Iran will be required only to limit rather than eliminate its nuclear program, while the international community will be required to lift the sanctions," said Menendez, D-New Jersey.¶ After receiving a copy of the agreement, lawmakers will have 60 days to read the fine print, vote yea or nay — or take no action.¶ If Congress votes to disapprove it, Obama reiterated Tuesday that he would veto it. A two-thirds majority in both the House and Senate would be needed to override a veto.¶ Many Republicans, as expected, are vehemently opposed to the agreement. That's not surprising since the GOP-led House invited Israeli Prime Minister Benjamin Netanyahu to speak before a joint meeting of Congress earlier this year. Netanyahu assailed the negotiations with Iran, which has threatened to destroy Israel.¶ "It's like giving an alligator more teeth and thinking now they may be nice to you," said Rep. Ted Yoho, R-Florida.¶ Senate Majority Leader Mitch McConnell of Kentucky said the agreement was flawed. "Given what we do know so far it appears that Republicans and Democrats were right to be deeply worried about the direction of these talks," he said on the Senate floor.¶ Even if Congress votes to disapprove the deal, it doesn't scuttle the agreement.¶ The only way Congress can thwart the Iran deal is by passing new sanctions legislation or stripping away the authority Obama currently has to waive those sanctions that were imposed earlier by Congress. Moreover, even if Congress rejects the deal with Tehran, Obama could use his executive pen to offer a hefty portion of sanctions relief on his own. He could take unilateral actions that — when coupled with European and U.N. sanctions relief — would allow him to implement the deal. Obama can't lift the congressionally mandated sanctions; only Congress can do that.¶ "If this agreement is what the administration says it is, it is a major, historic diplomatic breakthrough," said Sen. Barbara Boxer, D-California.¶ The foreign relations committees in both chambers — and possibly other panels on intelligence and the armed services — are expected to quickly schedule hearings. It appears unlikely, though, that Congress will take any formal action before the August recess, when

they most certainly will hear from constituents on the issue.¶ When it comes to a vote, all eyes will be on Democrats to figure out whether they will back the deal brokered by the administration or turn their back on the president, as many of his fellow Democrats did in a recent battle involving trade negotiating authority for presidents.¶ KEY SENATORS to watch: New York Sen. Chuck SCHUMER, THE NO. 3 DEMOCRAT in the chamber; MENENDEZ, who has bucked the White House by voicing skepticism that Iran can be trusted to abide by terms of any deal; AND Maryland Sen. Ben CARDIN, THE RANKING DEMOCRAT ON THE SENATE FOREIGN RELATIONS COMMITTEE.

Iran deal won't pass – Senate Republicans have a strategy

Moran 7/15 (GOP strategy to defeat Iran deal: Convince Schumer to oppose it, http://www.americanthinker.com/blog/2015/07/gop_strategy_to_defeat_iran_deal_convince_schumer_to_oppose_it.html, Rick Moran, writer/editor for the American Thinker, blogger, 7/15/2015)

REPUBLICAN SENATORS ARE DEVELOPING A STRATEGY TO OVERRIDE AN EXPECTED PRESIDENTIAL VETO OF A RESOLUTION OF DISAPPROVAL OF THE IRAN NUCLEAR AGREEMENT. AND WHILE THEY WILL BE WORKING ON GETTING 13 DEMOCRATIC SENATORS TO GO AGAINST PRESIDENT OBAMA AND SUPPORT KILLING THE DEAL, ONE DEMOCRAT IS ABSOLUTELY KEY TO THEIR PLAN. NEW YORK SENATOR CHUCK SCHUMER, A STRONG FRIEND OF ISRAEL, IS GENUINELY TORN OVER SUPPORTING HIS PARTY LEADER OR VOTING AGAINST A DEAL HE KNOWS IS BAD FOR ISRAEL. IF REPUBLICANS CAN CONVINCE HIM TO SUPPORT THE DISAPPROVAL RESOLUTION, THAT WILL PRETTY MUCH BE THE BALL GAME. THERE ARE 7 OR 8 OTHER DEMOCRATIC SENATORS, STRONG FRIENDS OF ISRAEL ALL, WHO WOULD BE LIKELY TO FOLLOW SCHUMER IN OPPOSING THE AGREEMENT. Meanwhile, the GOP is crafting a PR strategy to get maximum effect from exposing a divided Democratic party unsure of supporting a bad deal. The Hill: Only one Senate Democrat, Sen. Bob Menendez (N.J.), announced opposition to the deal on Tuesday. But Republicans believe they will win the public relations battle on the deal, which largely unites the GOP and threatens to divide the Democratic Party. Some Senate Republicans are thinking about moving a motion of approval of the deal, believing it would put Democrats in a tough spot ahead of next year's elections. Such a move in the upper chamber could lead to less than half of the Senate backing the president, allowing for more favorable headlines for the GOP. The House, however, is more likely to pass a resolution of disapproval. A third option is to move legislation sponsored by Menendez and Sen. Mark Kirk (R-Ill.) placing new sanctions on Iran, which the Banking Committee passed earlier this year and has Democratic support. "All options are on the table," said a Republican member of the Senate Foreign Relations panel who requested anonymity. "I wouldn't take anything off." Republicans will likely use the Iran votes as ammunition on the campaign trail in 2016. But Democrats have the bully pulpit, and the Obama administration has initiated a huge campaign to sway the public. New York Sen. Charles Schumer, the third-ranking member of the Senate Democratic leadership, is emerging as a critical vote. Senate Republicans need to hold their ranks and persuade 13 Democrats to vote with them to override President Obama's threatened veto of a resolution of disapproval. "IF SCHUMER COMES OUT AND SAYS, 'I LOOKED AT THE BILL AND STUDIED ITS DETAILS AND THINK IT'S A GOOD DEAL AND WILL STOP IRAN FROM GETTING WEAPONS,' THERE WILL BE ZERO HOPE OF OVERRIDING AN OBAMA VETO," SAID NOAH POLLAK, EXECUTIVE DIRECTOR OF THE EMERGENCY COMMITTEE FOR ISRAEL, WHICH FUNDED A SIX-FIGURE WEB CAMPAIGN TARGETING SCHUMER EARLIER THIS YEAR. "IF SCHUMER SAYS THIS DOESN'T DO IT, IT LIFTS THE ARMS EMBARGO AND DOESN'T HAVE ANYTIME, ANYWHERE INSPECTIONS, THEN WE HAVE A FIGHT ON OUR HANDS. HE'S A LINCHPIN OR A BELLWETHER," HE ADDED. Both sides are confident they can win, given the circumstances. Realistically, Republicans have a tougher hill to climb given Obama's position as leader of the party. and his ability to appeal to Democrats to support one of

his singular achievements. But this deal is so bad, all bets are off. With pro-Israeli groups set to mount a massive lobbying campaign against the agreement, anything at this point can happen.

Iran deal won't pass – Jewish alt cause

Feehery 7/14 (<http://www.csmonitor.com/USA/Politics/Politics-Voices/2015/0714/Iran-deal-Can-it-pass-muster-in-Congress>, Iran deal: Can it pass muster in Congress?, John Feehery, policy analyst for Christian Science Monitor 7/14/2015)

I have a theory about this Iran nuclear deal. It's not about the bomb. It's about the sanctions. THE OBAMA ADMINISTRATION, BY RELAXING THE TOUGH SANCTIONS ON THE PERSIAN REGIME, IS BASICALLY DECLARING PEACE WITH THE IRANIANS. FOR THE ISRAELIS AND THE SAUDIS, WHO ARE FIGHTING PROXY WARS ON SEVERAL DIFFERENT FRONTS THROUGHOUT THE MIDEAST AGAINST IRAN, THIS IS TANTAMOUNT TO A MASS BETRAYAL. We are avoiding war but our allies can't. The sanctions have hurt the Iranian people. They have stunted the growth of their economy. They made it more difficult for the Iranian armed forces to get cash to buy conventional weapons. They delegitimized the government in the eyes of the people. In other words, the sanctions worked as a weapon in this shadow war between the Jews, the Sunni, and the Shia. The problem for the Obama administration is that the sanctions only worked as long as there was a grand coalition that was willing to enforce it. And that coalition was fraying. Sanctions are hard to enforce over the long term because the free market is hard to control. People want to do business. Iran has a lot of oil, which is attractive to the Europeans. Think of Cuba. It's a relatively small country and yet the pressure to lift the embargo that came from the American business sector was intense – intense enough that Republicans joined with Democrats to approve some limited business interaction as long as a decade ago. Of course, THE ISRAELIS DON'T HAVE ANY INTEREST IN THE AMERICANS BECOMING BASICALLY NEUTRAL IN THEIR PROXY WAR WITH IRAN. AND THEY HAVE CONSIDERABLE POLITICAL POWER IN THE UNITED STATES, MUCH MORE POLITICAL POWER THAN THE SAUDIS, WHO ARE FORMIDABLE IN THEIR OWN RIGHT. THE OBAMA ADMINISTRATION HAS BEEN PRETTY HOSTILE TO ISRAEL AND BENJAMIN NETANYAHU, MUCH MORE HOSTILE THAN I THOUGHT WAS POSSIBLE. THAT HOSTILITY HAS LED SEVERAL LEADING JEWISH BILLIONAIRES TO ACTIVELY AND AGGRESSIVELY SUPPORT REPUBLICANS IN THE CONGRESS AND IN THE PRESIDENTIAL FIELD. THE JEWISH VOTE IN AMERICA ISN'T VERY BIG BUT IT IS VERY INFLUENTIAL. AND IT HAS USUALLY BEEN RELIABLY DEMOCRATIC IN ITS LEANINGS, SOCIALLY PROGRESSIVE, AND USUALLY OPPOSED TO THE CHRISTIAN CONSERVATIVES WHO MAKE UP THE BULK OF THE REPUBLICAN PARTY. BUT THE MORE ORTHODOX JEWISH DEMOCRATS HAVE STEADILY MIGRATED TO THE GOP, NOT ONLY WITH THEIR VOTES, BUT ALSO WITH THEIR CAMPAIGN CONTRIBUTIONS. And big money men like Sheldon Adelson have become hugely influential in the Republican presidential primary. The Sheldon primary seems to be every bit as important in a presidential campaign as the Iowa straw poll. America's support of Israel used to be a thoroughly bipartisan affair, but as we saw with John Boehner's invitation to Netanyahu to address a joint meeting of the Congress, that bipartisanship is fraying. President Obama sees the deal with Iran as an important achievement for his legacy, as does John Kerry. But it's hard to see how this deal passes muster with the Congress. Much will be said about how Iran will soon get access to nuclear weapons because of this deal. That may or may not be the case. I don't know. But what I do know is that this deal relaxes sanctions against the Iranian regime. That is what concerns Netanyahu the most. No matter what deal John Kerry came up with, it was not going to be good enough for the Israeli prime minister, because he didn't want any kind of deal. He wants help in his proxy war with the Iranians. Relaxing the sanctions makes his situation worse not better. IT WOULD HAVE BEEN

FAR BETTER HAD MR. OBAMA TRIED TO REACH A GENERAL PEACE AGREEMENT THAT INCLUDED BOTH THE ISRAELIS AND THE SAUDIS, BUT HE DECIDED TO GO DOWN A DIFFERENT PATH, BASICALLY EXCLUDING THEM FOR THE DELIBERATIONS. AND SO, THEY WILL DO THEIR BEST TO GET CONGRESS TO KILL IT. And they might be successful.

Won't pass—bipartisan skepticism and tons of concerns

DeBonis and Mufson, writers for the Washington Post, **7/14/2015**

(Mike and Steven, "On Capitol Hill, deep skepticism persists as lawmakers react to Iran deal," http://www.washingtonpost.com/business/economy/on-capitol-hill-deep-skepticism-persists-as-lawmakers-react-to-iran-deal/2015/07/14/90190bfe-2a27-11e5-a5ea-cf74396e59ec_story.html)

THE DEBATE OVER THE FUTURE OF THE IRANIAN NUCLEAR PROGRAM quickly MOVED from the negotiating tables of Vienna TO THE HALLS OF THE U.S. CAPITOL on Tuesday, AS skeptical lawmakers BEGAN TAKING STOCK OF A DEAL THEY WILL HAVE ROUGHLY TWO MONTHS TO REVIEW AND possibly reject.

Initial reaction to the 159-page agreement ran largely along political lines that had been sketched out for months beforehand. But THE RELEASE OF SPECIFIC TERMS PROMPTED A new upheaval in Congress and the universe of think tanks, lobbyists and nongovernmental organizations, especially over the parts of the agreement that would lift many of the sanctions imposed over the past three decades.

MOST REPUBLICANS HAVE BEEN deeply skeptical OF THE TALKS and the prospect of relieving economic sanctions while leaving any Iranian nuclear capability intact. DEMOCRATS HAVE cautiously WELCOMED PROGRESS in the talks, and most have sought to lend support to President Obama as he pursues a cornerstone of his foreign policy.

House Speaker John A. Boehner (R-Ohio) accused Obama of abandoning his own objectives for the negotiations and called the agreement "unacceptable."

"It's going to hand a dangerous regime billions of dollars in sanctions relief while paving the way for a nuclear Iran," he said. "If it's as bad a deal as I think it is at this point, we'll do everything we can to stop it."

Senate Majority Leader Mitch McConnell (R-Ky.) said the deal announced Tuesday "appears to further the flawed elements" of a preliminary framework announced in April, criticizing the Obama administration for "reaching the best deal acceptable to Iran, rather than actually advancing our national goal of ending Iran's nuclear program."

Senate Minority Leader Harry M. Reid (D-Nev.) called the agreement "historic," while House Minority Leader Nancy Pelosi (D-Calif.) called it "the product of years of tough, bold and clear-eyed leadership from President Obama."

"The world community agrees that a nuclear-armed Iran is unacceptable and a threat to our national security, the safety of Israel and the stability of the Middle East," Reid said. "Now it is incumbent on Congress to review this agreement with the thoughtful, level-headed process an agreement of this magnitude deserves."

NOT SINCE George W. BUSH SOUGHT the approval of Congress TO GO TO WAR HAS A PRESIDENT TURNED TO LAWMAKERS FOR THEIR SUPPORT ON A MATTER OF SUCH INTERNATIONAL IMPORTANCE.

The congressional review of the deal will proceed according to A FRAMEWORK PASSED BY CONGRESS in May and signed into law by Obama. It PROVIDES, in this case, FOR A 60-DAY REVIEW PERIOD, DURING WHICH LAWMAKERS CAN VOTE THEIR DISAPPROVAL OF THE DEAL BY VOTING TO BLOCK SANCTIONS RELIEF.

While SUCH A VOTE would not directly reject the deal reached Tuesday, it WOULD REPRESENT A SERIOUS BREACH OF TERMS THAT WOULD LIKELY scuttle the agreement negotiated over the course of months by diplomats not only from the United States and Iran, but also five other world powers.

Passing A DISAPPROVAL MEASURE, however, WOULD HAVE TO SURVIVE A PRESIDENTIAL VETO, which Obama promised Tuesday he would deliver should Congress send one to his desk.

Sen. Bob CORKER (R-Tenn.), chairman of the Senate Foreign Relations Committee, SAID Monday that IT WAS LIKELY THAT VOTES WOULD BE HELD IN SEPTEMBER, AFTER THE congressional SUMMER RECESS and after a probable series of public hearings on the agreement.

Under the review law, the 60-day clock does not begin until the agreement is officially certified and submitted to Congress, but it begins no later than five days after the deal is reached.

LAWMAKERS HAVE LAID OUT A WIDE ARRAY OF CONCERNS, ranging from the terms under which international inspectors will be given access to Iranian facilities, to the pace of sanctions relief, to the extent that Iranians will be able to maintain a peaceful nuclear energy capability that includes equipment that might be converted to military use, to the Iranian regime's ongoing support for terrorist activities in the Middle East and beyond.

"The Senate must now weigh why a nuclear agreement should result in reduced pressure on the world's leading state sponsor of terror," McConnell said in his statement. "The test of the agreement should be whether it leaves our country and our allies safer."

UQ—PC Low

Obama Political Capital low now – Cuba

Milbank, 7/5/15 (Dana, writer at Herald Net, “Obama spending his windfall of political capital on Cuba”, [//BW">http://www.heraldnet.com/article/20150705/OPINION04/150709675">//BW](http://www.heraldnet.com/article/20150705/OPINION04/150709675)

The good tidings of the past week have been arguably more luck than achievement for OBAMA, BUT HE DESERVES CREDIT FOR HIS EFFORT TO USE THE MOMENTUM OF HIS VICTORIES TO REVIVE WHAT HAD BEEN A MORIBUND PRESIDENCY. WHEN YOU EARN POLITICAL CAPITAL, AS GEORGE W. BUSH LIKED TO SAY, YOU SPEND IT. This is why it was shrewd of the surging Obama to demand new action from Congress on Cuba. “Americans and Cubans alike are ready to move forward; I believe it's time for Congress to do the same,” he said, renewing his call to lift the travel and trade embargo. “YES, THERE ARE THOSE WHO WANT TO TURN BACK THE CLOCK AND DOUBLE DOWN ON A POLICY OF ISOLATION, BUT IT'S LONG PAST TIME FOR US TO REALIZE THAT THIS APPROACH DOESN'T WORK. IT HASN'T WORKED FOR 50 YEARS. ... So I'd ask Congress to listen to the Cuban people, listen to the American people, listen to the words of a proud Cuban American, [former Bush commerce secretary] Carlos Gutierrez, who recently came out against the policy of the past.”

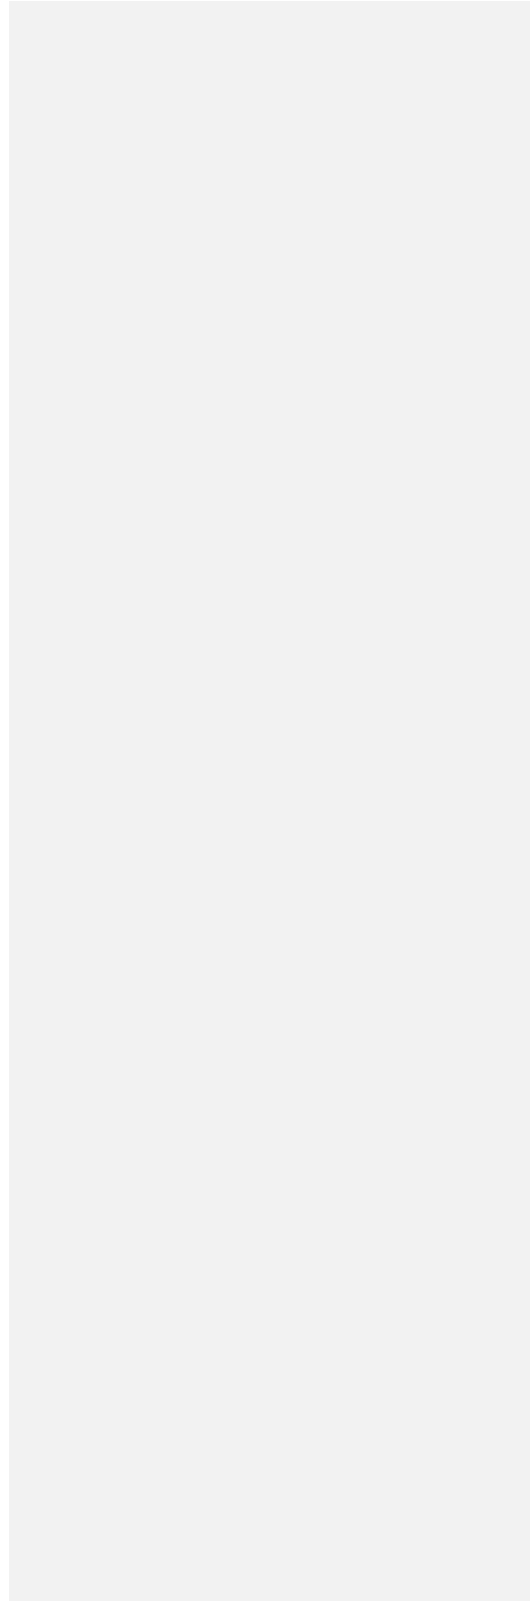

Thumper—Ads

Public opinion and ads thump

Mimms 7/13 (Sarah Mimms; July 13, 2015; staff correspondent for National Journal Daily, covering Congress; "For Iran Deal, Longer Review Means More Time for Political Attacks"; National Journal; http://www.nationaljournal.com/congress/for-iran-deal-longer-review-means-more-time-for-political-attacks-20150713?utm_content=buffer292b7&utm_medium=social&utm_source=twitter.com&utm_campaign=buffer) jskullz

From the White House Tuesday morning, Obama announced the nuclear agreement with Iran -- threatening to veto any move that would scuttle the deal. IT WAS AN EARLY START IN WHAT WILL BE A HOT SUMMER OF DEBATE that will officially kick off when the final text is delivered to Congress for review later this week or early next. THAT WILL START THE CLOCK THAT GIVES LAWMAKERS 60 DAYS TO DISAPPROVE OF THE DEAL, rubber-stamp it, or ignore it altogether and allow it to go through without congressional input. Democrats had pushed for just a 30-day review period, but in a compromise with Republicans agreed to extend it for 60 days if negotiators failed to meet a July 9 deadline. As negotiations continued, MEMBERS ARE NOW LEFT WITH TWO MONTHS TO THINK OVER THE DEAL, ABOUT HALF OF WHICH WILL BE SPENT AT HOME IN THEIR DISTRICTS HEARING FROM CONSTITUENTS CONCERNED ABOUT A NUCLEAR IRAN AND SEEING THEIR OWN FACES ON TELEVISION IN A BARRAGE OF ADS FROM OUTSIDE GROUPS. It all adds up to a headache for vote-counters on both sides of the issue. THE AD WAR HAS ALREADY BEGUN, AND IT ONLY PROMISES TO GROW MORE INTENSE WITH A DEAL ON THE TABLE AND MEMBERS OF CONGRESS FAR AWAY FROM THEIR PEERS IN WASHINGTON DURING THE AUGUST RECESS. And THE ISSUE IS ALREADY BUBBLING UP AMONG THE PUBLIC, Republican pollster David Winston said. Although Iran remains far behind jobs and the economy as driving issues for voters, he said, "IN A LOT OF POLLS IT'S RIGHT AROUND DOUBLE DIGITS," MUCH HIGHER THAN IS TYPICAL FOR A FOREIGN POLICY ISSUE. But along with the issue of ISIS, Winston said, "THERE ARE VERY CLEAR POTENTIAL OUTCOMES THAT ARE VERY CLEAR SIGNIFICANT THREATS" AND THE AMERICAN PUBLIC IS PAYING ATTENTION. "THE BIGGER CHALLENGE AND THE BIGGER QUESTION IS GOING TO BE, AND IT DEPENDS ON HOW THIS [DEAL] GETS SHAPED: ... Is this a deal that people believe will allow Iran to create this weapon or not?" Winston said. HOW THAT MESSAGE IS SHAPED WILL, in part, BE UP TO AD-MAKERS WHO ARE ALREADY RUNNING TELEVISION SPOTS ENCOURAGING MEMBERS TO OPPOSE THE (as-yet-unannounced) DEAL WITH IRAN. The ads have largely targeted Democrats, who will be swing votes on the biggest foreign policy deal of President Obama's tenure.

I/L

No deal block

Mechanics of bill prevent deal block

Culhane 7/13 (Patty Culhane; July 13th 2015; Analyst for Al Jazeera; "The reality of the Iran deal: Congress can't 'kill' it"; Yahoo News; <https://en-maktoob.news.yahoo.com/reality-iran-deal-congress-cant-kill-214921511--spt.html>) jskullz

HERE IS WHAT THE LAW actually DOES. IT GIVES CONGRESS THE POWER TO STOP THE US PRESIDENT FROM LIFTING US SANCTIONS ON Iran.¶ If you look at the numbers, IT'S PRETTY CERTAIN THAT THEY WILL ONLY BE ABLE TO STOP HIM FOR A SHORT TIME. ¶ IT DOESN'T STOP President Barack OBAMA FROM MAKING THE AGREEMENT OR GOING TO THE UN AND LIFTING INTERNATIONAL SANCTIONS.¶ So I've been trying to figure out how that could "kill" any potential agreement.¶ The only thing I can think of is the mentality that the US is the centre of the world is behind the assumption.¶ Let's ASSUME for the sake of argument that CONGRESS WILL OVERRIDE A PRESIDENTIAL VETO AND FORBID HIM FROM WAIVING MOST US SANCTIONS on Iran.¶ I can only guess that THESE PEOPLE ARE ASSUMING THAT WITHOUT US SANCTIONS RELIEF IRAN WOULD WALK AWAY from their side of the bargain.¶ WHY WOULD THEY DO THAT? THEY WOULD BASICALLY BE SAYING "I CAN NOW DO BUSINESS WITH THE ENTIRE GLOBE EXCEPT AMERICA, BUT THAT IS JUST NOT GOOD ENOUGH."¶ The White House doesn't believe Congress can now say yes or no to a deal. This is what White House Press Secretary Josh Earnest said as the bill was making its way through Congress:¶ "The bill that has passed by the Senate Foreign Relations Committee with bipartisan support essentially is a vote to vote later on congressional sanctions and not the decision about whether or not to enter into the agreement, that would certainly resolve some of the concerns we've expressed about the authority that is exercised by the president of the United States to conduct foreign policy."¶ The president would never give up his right to act as the sole "decider" on foreign policy.¶ He doesn't need congressional approval to do whatever he feels like at the UN. He was smart enough to not frame this as an official treaty.¶ The Senate would have had to weigh in on that and with the lobbying that is taking place, it never would have passed.¶ I have to think the reason behind this mischaracterisation is coming from some members of Congress. They can tell their constituents that they are "being tough".¶ They can vote their disapproval knowing, in the end, it won't change a thing.¶ I don't know if the negotiators will actually get a deal, but I'm certain about this CONGRESS CAN'T KILL IT IF THEY DO. ¶ THEY CAN TRY TO FORCE IRAN TO WALK AWAY. THEY CAN EMBARRASS THEIR PRESIDENT ON THE WORLD STAGE. THEY CAN KEEP AMERICAN COMPANIES FROM BENEFITING FROM ANY SANCTIONS RELIEF IN IRAN.

AT: Compartmentalization

No compartmentalization—republicans fighting Obama at every level

Sargent 7/14 (Greg Sargent; July 14, 2015; writer for the Washington Post’s Morning Plum Column; “Morning Plum: Don’t fear the Iran debate, Democrats”; Washington Post; <http://www.washingtonpost.com/blogs/plum-line/wp/2015/07/14/morning-plum-dont-fear-the-iran-debate-democrats/>) jskullz

Thus, THE ARGUMENT THAT DEVELOPS AROUND THE AGREEMENT MAY ALSO TAKE SHAPE AROUND THE VIRTUES AND RISKS OF INTERNATIONAL ENGAGEMENT. And THIS COULD JOIN OTHER ISSUES TO FEED INTO A BROADER CONTRAST, IN WHICH REPUBLICANS ARE OPPOSING INTERNATIONAL ENGAGEMENT ON MULTIPLE FRONTS — INCLUDING CUBA AND CLIMATE CHANGE (on which we may have an accord later this year). Meanwhile, CLINTON MAY WELL EMBRACE INTERNATIONAL ENGAGEMENT ON MULTIPLE FRONTS, AND USE THIS CONTRAST TO CAST THE GOP AS TOO INWARD LOOKING AND TRAPPED IN THE PAST TO CONFRONT THE CHALLENGES OF THE FUTURE.¶

Republican president will kill Iran deal

Toosi 7/14 (How a Republican president could kill the Iran deal, <http://www.politico.com/story/2015/07/gop-president-iran-deal-kill-120077.html>, Nahal Toosi, Nahal Toosi is a foreign affairs correspondent at POLITICO, 7/14/2015)

IF THE NEXT PRESIDENT HATES THE NUCLEAR DEAL WITH IRAN, HE (OR SHE) CAN UNDO IT AFTER TAKING OFFICE. The dilemma: Use blunt force? Or go for a soft kill? Story Continued Below The accord reached this week in Vienna promises broad sanctions relief to Iran in exchange for significant curbs on its nuclear program. The agreement has taken years to negotiate, involves seven countries as well as the European Union and the United Nations, and relies upon the expertise of scientists as well as diplomats. But at the end of the day, the “deal” is at most a political arrangement — not a treaty or other form of signed legal document. That means that the pRESIDENTIAL CANDIDATES WHO HAVE THREATENED TO CANCEL THE DEAL — SO FAR ALL OF THEM REPUBLICANS — CAN KEEP THEIR PROMISE BY USING THE PRESIDENCY’S EXECUTIVE AUTHORITY TO REIMPOSE SUSPENDED U.S. SANCTIONS ON IRAN AND WITHDRAWING FROM PANELS INVOLVED IN IMPLEMENTING THE ACCORD. That abrupt approach may be quick, but it also carries risks. For one thing, a sudden U.S. withdrawal could anger the European and Asian countries also involved in the deal, making them less inclined to reimpose their own sanctions on a country they consider an alluring trading partner. The international business community may resist efforts to once again seal off a youthful, well-educated nation with vast energy reserves. And Iran could respond to the U.S. move by resuming elements of its nuclear program, which the West has long suspected is aimed at making weapons. “If we try to reimpose sanctions on Iran and no one follows, then we have the worst of all worlds,” said Robert Einhorn, a former Iran nuclear negotiator at the State Department. Instead, even the deal’s most ardent critics say, a new president might be better off taking a more subtle, longer-term approach, one that involves laying the groundwork to ultimately convince the world that Iran — through perceived violations, intransigence, foot-dragging or whatever a president chooses to highlight — has left the U.S. no choice but to quit the deal. “You say it’s a bad deal, but you don’t just rip up the deal,” said Mark Dubowitz, executive director of the Foundation for Defense of Democracies. THE FIRST STEP FOR A NEWLY INAUGURATED PRESIDENT WOULD BE TO ORDER A REVIEW OF THE ACCORD, WHICH WILL ALREADY HAVE BEEN IN EFFECT FOR ROUGHLY A YEAR AND A HALF. IT’S POSSIBLE THE IRANIANS WILL HAVE BEEN ACCUSED OF VIOLATING THE DEAL BY THE TIME A NEW PRESIDENT TAKES OFFICE, SO A REVIEW COULD TALLY THOSE TRANSGRESSIONS TO SOW DOUBTS IN THE MINDS OF THE AMERICAN PUBLIC ABOUT THE SOUNDNESS OF THE AGREEMENT. DEPENDING ON HOW MAJOR THE VIOLATIONS ARE, THE U.S. MIGHT ALSO BE ABLE TO CONVINC OTHER NATIONS THAT THE DEAL ISN’T WORKING. EVEN IF THE IRANIANS HAVEN’T COMMITTED ANY OR MANY NOTABLE VIOLATIONS, THERE ARE OTHER FACTORS A PRESIDENT COULD POINT TO. Take the regional situation: If Iran, either directly or through proxies, has escalated its interference in other countries in the Middle East, a president could blame the nuclear deal by saying it has given Tehran economic leverage to pursue mischief outside its borders. America’s Arab allies, who have watched Iran make inroads everywhere from Syria to Lebanon to Iraq, have long argued that the Iranian government will take advantage of sanctions relief to funnel more money toward its regional aggression. Here, a U.S. president — and a hawkish Congress — also has the option of leveling new sanctions on Iran that aren’t necessarily tied to its nuclear program but rather to its support for terrorist groups. (Existing sanctions that target Iran over its support for terrorism and its abuses of human rights won’t be lifted under the

nuclear deal.) At the very least, the new sanctions will increase the tension between the U.S. and Iran, possibly even leading to a backlash from Tehran that boosts the U.S. president's standing. Dubowitz said it's critical that the U.S. sanctions target in particular the Iranian Revolutionary Guard Corps, the powerful military unit that controls a large chunk of the Iranian economy and is behind much of the country's interference in other states. At the same time that the U.S. is adding sanctions, it should remind the international business community of the riskiness of doing business in Iran, Dubowitz added. How U.S. allies in the region — especially Israel — feel about the deal in 2017 and beyond could also affect a U.S. president's ability to make a case against the Islamic Republic. If Israel's leaders insist that the accord is not working and can point to intelligence or other evidence that backs up their claim that gives added credence to the president's decision to walk away from the agreement. (Already on Tuesday, Prime Minister Benjamin Netanyahu ripped the deal as "a historic mistake.") Not that any of this is simple or predictable. A president determined to get rid of the deal, but unwilling to do so through an abrupt withdrawal, could find that it will take longer than one term, or even two, to make his case to the world. He might even find it hard to get his own administration on board. "Even if you get a total nut job in the Oval Office, you're going to have a policy fight internally," arms control expert Jeffrey Lewis said. "Regardless of what Republicans say, they tend to do things that are much more moderate because it's hard to move the government." At least one Republican presidential candidate appears to be taking this reality into account. New Jersey Gov. Chris Christie said earlier this month that although he was disturbed by President Barack Obama's efforts to strike a deal with Iran, he wouldn't promise to undo it if elected. His stance was far more cautious than that of other GOP White House contenders such as Florida Sen. Marco Rubio and Wisconsin Gov. Scott Walker, who have said they'd revoke the deal unless it meets their more stringent requirements. "I'm not one of those guys who's going to say to you, 'On Day One, I will abrogate the agreement,'" CHRISTIE TOLD A GROUP OF REPUBLICANS IN NEW HAMPSHIRE. "ON DAY ONE, I WILL LOOK INTO AND TRY TO DECIDE WHAT TO DO WITH THE AGREEMENT, DEPENDING ON WHERE WE ARE AT THAT MOMENT. Because, by the way, it's not just us involved anymore. WE HAVE A NUMBER OF OUR ALLIES AROUND THE WORLD WHO'RE AT THAT TABLE AS WELL, AND SANCTIONS ARE MOST EFFECTIVE WHEN NOT ONLY WE DO IT, BUT THE OTHER ALLIES DO IT." Still, it's not unprecedented for an administration to abandon an agreement signed by a predecessor. EVEN IF THE AGREEMENT ROSE TO THE LEVEL OF A TREATY, A U.S. PRESIDENT HAS SO MUCH POWER IN THE REALM OF FOREIGN POLICY THAT HE COULD WITHDRAW FROM IT, the way George W. Bush left the 1972 Anti-Ballistic Missile Treaty with Russia. America's 1994 nuclear deal with North Korea, meanwhile, died a slow and painful death after years of alleged violations by both sides. AP Photo One potential wild card in the Iran case is whether the U.N. Security Council will pass a resolution that gives the deal some binding status under international law, said Tyler Cullis, a legal fellow with the National Iranian American Council, a group that supports the talks. Although a president could in theory simply disregard such a resolution, he would be taking the risk of putting the U.S. in violation of international law if he unilaterally withdraws without a lawful justification. Dubowitz, one of the most vocal skeptics of the Iran talks, insisted that if he were president his goal wouldn't be to outright destroy a deal but to try to ensure that Iran never achieves nuclear weapons capability. He doubts the current deal does that because, he says, Iran will be able to expand its economic might as sanctions fade, making it even easier for it to resume nuclear activity once restrictions on its program start to drop off after the first 10 years of the agreement. So he envisions a 10-year timeline to strengthen America's hand against Iran, one that would involve a U.S. president laying the groundwork for his successor and making some new demands from Iran. The president could insist, for instance, that if within five years

U.N. inspectors cannot verify that Iran's nuclear program is entirely peaceful, then the restrictions on Iran's nuclear activities that would have dropped off after year 10 would stay on. It might not make for an easy soundbite on the 2016 campaign trail, but this longer-term approach could ultimately yield a less-dangerous Iran without undermining America's international standing. "There's always a quicker way, but the question is, 'Is there a smarter way to accomplish your objective?'" Dubowitz said. "I hope all our candidates are thoughtful in how they deal with what I think is increasingly an incredibly difficult situation for the next president to handle. This deal is going to leave the next president with an excruciatingly difficult decision: either to accept an Iranian bomb or to bomb Iran."

XT Next Prez

This is a unique double bind. Either the Iran deal won't pass now or the Iran deal will be so unpopular with the public that they will end up blaming Obama, and instead elect a Republican president for the coming 2016 election causing the Iran deal to die of anyways.

PC Not Key/Fails

Pelosi key—doesn't get tied to Obama

Lake and Rogin 7/13 (Eli Lake and Josh Rogin; July 13th 2015; Bloomberg View columnists who write about politics and foreign affairs, "Obama Counting on Pelosi to Defend Iran Deal"; <http://www.bloombergview.com/articles/2015-07-13/obama-counting-on-pelosi-to-defend-iran-deal>) jskullz

With the deal over Iran's nuclear program announced, the White House will turn its attention to selling it to Congress -- and IT WILL BE DEPENDING ON ONE LAWMAKER TO SAVE President Barack OBAMA'S FOREIGN-POLICY LEGACY: House Minority Leader Nancy PELOSI. ¶ While the former House speaker has yet to publicly support any Iran deal, her behind-the-scenes campaign to whip votes to protect it has already begun. SHE HAS URGED HER DEMOCRATIC COLLEAGUES TO BACK THE PRESIDENT. SHE HAS HOSTED INFORMAL MEETINGS WITH EXPERTS WHO SUPPORT THE NEGOTIATIONS TO EDUCATE HER CAUCUS. SHE EVEN HELPED GATHER LAWMAKERS' SIGNATURES for a May 7 letter to President Barack Obama EXPRESSING SUPPORT FOR DIPLOMACY with Iran, though reserving judgment on a final deal.¶ Now PELOSI IS EXPECTED TO BE THE FIREWALL THE WHITE HOUSE WILL NEED TO PREVENT A TWO-THIRDS, VETO-PROOF MAJORITY IN THE HOUSE TO DISAPPROVE OF THE FINAL IRAN DEAL, staving off political humiliation for the lame-duck president.

PC Not key—activist lobbying

Brown and Mimms 7/15 (Alex Brown and Sarah Mimms; Mimms is a staff correspondent for National Journal Daily, Alex Brown Technology reporter for National Journal; "Congressional Democrats Don't Trust Iran, But Do They Trust Obama?"; Government Executive; <http://www.govexec.com/oversight/2015/07/congressional-democrats-dont-trust-iran-do-they-trust-obama/117805/>) jskullz

Ultimately, though, SOME THINK DEMOCRATS WILL HAVE LITTLE CHOICE BUT TO BACK THE DEAL. "[Vice President Joe] BIDEN'S COMING OVER TOMORROW to sway us in one direction," Rep. Brad Sherman said. "It will be hard to sway us in the other direction, because YOU'VE GOT OBAMA AND HILLARY AND DEMOCRATIC ACTIVISTS AROUND THE COUNTRY ALL ON ONE SIDE. ... The two PROBLEMS IN OVERRIDING A VETO ARE EVERY DEMOCRATIC INSTITUTION IS SAYING NOT TO and there's no crisp answer to 'and then what?' "

Iran deal won't pass – PC not key

Everett and French 7/16/15 (Burgess and Lauren, writers for politico, "Congress balks at Obama's UN move on Iran deal", <http://www.politico.com/story/2015/07/congress-responds-to-obamas-un-move-on-iran-deal-120257.html>)/BW

President Barack Obama has a new hurdle to selling his Iran deal on Capitol Hill: BIPARTISAN OPPOSITION TO HIS DECISION TO SUBMIT THE NUCLEAR ACCORD TO THE UNITED NATIONS BEFORE CONGRESS VOTES ON THE AGREEMENT. Sens. Bob Corker (R-Tenn.) and Ben Cardin (D-Md.) said on THURSDAY AFTERNOON THAT THEY DISAGREED WITH THE U.S. PUSHING THE AGREEMENT THROUGH THE UN BEFORE CONGRESS VOTES THIS SEPTEMBER TO APPROVE OR REJECT IT, a troubling development for an administration still trying to win over both men. Cardin, the top Democrat on the committee, questioned Vice President Joe Biden about the matter during a closed door meeting with committee Democrats on Thursday. He said Biden responded with an explanation of the "differences between the executive and legislative branches." THAT DIDN'T SATISFY CARDIN, WHO

SAID OBAMA SHOULD PUT THE BRAKES ON UN CONSIDERATION UNTIL CONGRESS HAS 60 DAYS TO REVIEW THE BILL, a period that technically hasn't even started yet because the agreement has not been formally submitted to Capitol Hill. "There was nothing to be lost by waiting until after the review period was over," Cardin said in an interview. "It could be inconsistent [with how Congress votes] and therefore it would have been better if that had been deferred until after the 60-day period." Senate Health, Education, Labor and Pensions Committee Chairman Sen. Lamar Alexander, R-Tenn., listens to testimony on Capitol Hill in Washington, Wednesday, Jan. 21, 2015, during the committee's hearing looking at ways to fix the No Child Left Behind law. Alexander said he is open to discussion on whether the federal government should dictate standardized testing or leave it up to states. Corker called Obama's move an "affront to the American people." He chastised U.S. Ambassador to the United Nations Samantha Power by telephone on Thursday morning and said because **CONGRESS HAS NOT YET VOTED ON LIFTING SANCTIONS THAT ARE CRUCIAL TO THE DEAL, THE UN IS MOVING FORWARD ON AN INTERNATIONAL AGREEMENT THEY MAY NOT BE ABLE TO IMPLEMENT**.

"I question the judgment of our president," Corker told reporters, fuming into the microphones as Biden escaped a press scrum down a narrow flight of stairs. "This is exactly what we were trying to stop. We wanted the American people to understand this agreement before it went in place." White House spokesman Eric Schultz said the UN process "does not lessen the importance of Congress or its review." "We will not begin implementation of the plan until after the Congressional review period is over," Schultz said. Despite frustrations among key lawmakers, **THE WHITE HOUSE WAS MAKING STEADY**

INROADS WITH SKEPTICAL DEMOCRATS AS OFFICIALS BLANKETED LAWMAKERS WITH BRIEFINGS BY BIDEN, TOP SECURITY OFFICIALS AND PERSONAL PHONE CALLS. BOTH THE HOUSE AND THE SENATE WILL GET ALL-MEMBERS BRIEFINGS NEXT WEEK. Senate Majority Leader Mitch McConnell of Ky., joined by from left, Sen. Lamar Alexander, R-Tenn., Sen. John Barrasso, R-Wy., Sen. John Thune, R-S.D., and Sen. John Cornyn, R-Texas., speaks to media after a policy luncheon on Capitol Hill in Washington, Wednesday, July 8, 2015. (AP Photo/Carolyn Kaster) In nearly a dozen interviews with lawmakers exiting this week's briefings, **DEMOCRATS SEEMED REASSURED BY ANSWERS THEY WERE GETTING, SUGGESTING THE ADMINISTRATION CAN BUILD THE SUPPORT IT NEEDS TO SUSTAIN A VETO OF ANY GOP LEGISLATION THAT WOULD SCUTTLE THE DEAL.**

"He answered a whole series of difficult and demanding questions and provided encouraging and thoughtful responses," said Sen. Chris Coons (D-Del.) of Biden. Meanwhile, Sen. Ted Cruz of Texas, a conservative aspirant for the GOP presidential nomination, announced his intent to delay all State Department nominees and legislation to authorize the agency until Obama tells Cruz that he will block a UN vote. "It seems your administration intended all along to circumvent this domestic review," Cruz wrote in a letter to the president. "That Samantha Power has already introduced a draft resolution to the Security Council portrays an offensive level of disrespect for the American people and their elected representatives in Congress." It's unclear how widespread the ramifications of the administration's submission to the U.N. will be. But **IT DOESN'T APPEAR TO BE DOING THE ADMINISTRATION ANY FAVORS WITH CARDIN, A KEY SWING DEMOCRAT THAT THE ADMINISTRATION IS LIKELY TO NEED ON ITS SIDE, OR CORKER, THE UNDECIDED CHAIRMAN WHO WILL LEAD AN AGGRESSIVE HEARING SCHEDULE OVER THE NEXT TWO WEEKS.**

PC fails—poor congressional relations

Miller 7/21 (Aaron David Miller; July 21, 2015; American Middle East analyst, author, and negotiator. He is currently Vice President for New Initiatives at the Woodrow Wilson International Center for Scholars, and has been an advisor to both Republican and Democratic secretaries of state; Wall Street Journal; <http://blogs.wsj.com/washwire/2015/07/21/how-not-to-sell-the-iran-nuclear-deal/>) jskullz

The "Father Knows Best" demeanor: In more than 20 years at the State Department, I had to try to market my fair share of ideas, plans, and even agreements to a skeptical Congress and media. I know that negotiators can fall in love with their discussions and the accords they produce. **THERE IS** also **A TENDENCY IN GOVERNMENT TO FEEL THAT YOU HAVE ALL THE INFORMATION** (and your critics don't), **THAT YOU'RE CHARGED WITH PROTECTING THE NATIONAL INTEREST** (and critics have narrower agendas), and that you got the best deal you could (and critics are living in a fantasy land). **BUT TONE IS STILL IMPORTANT. AND THE ADMINISTRATION HAS ADOPTED A PREEMPTORY, AND SOMETIMES ARROGANT, TONE IN SELLING THIS ACCORD.** A better deal may or may not have been possible. But it doesn't help matters to suggest, as Secretary of State John Kerry has, that those who think there was an alternative are fantasizing or to dismiss as dumb any criticism that he wasn't tough enough with Iran. The more certain and authoritative the administration sounds, and **THE MORE IT SUGGESTS IN WORD AND TONE THAT IT ALONE KNOWS BEST, THE MORE PUSHBACK IT WILL DRAW.** After all, it's not as if this agreement doesn't have major flaws.¶ Preempting Congress: Maybe an adversarial relationship with

Congress was inevitable. The president eventually signed the bill giving lawmakers 60 days to review a deal, largely because Sen. Bob Corker managed to offer sensible legislation that had bipartisan support and seemed to give Congress a voice, though not an easy route to kill the accord. The White House probably figured that if worse came to worse, the administration would have the numbers in at least one house of Congress to sustain a presidential veto. Still, the U.N. Security Council's vote Monday to endorse the accord—even with a 90-day implementation period over actions on sanctions, to cover Congress's 60-day review—is being interpreted as boxing in Congress. CRITICISM IS COMING FROM DEMOCRATS WHOSE SUPPORT THE ADMINISTRATION NEEDS AND FROM REPUBLICANS WHO SAY THAT THE ADMINISTRATION IS DOING AN END-RUN AROUND THE HILL. It's hard not to draw that conclusion when Secretary Kerry says things like: "If Congress were to veto the deal, Congress—the United States of America—would be in noncompliance with this agreement and contrary to all of the other countries in the world." ¶ THIS ISN'T A PEACE TREATY: THE OBAMA ADMINISTRATION HAS ACKNOWLEDGED THAT EVEN WITH A NUCLEAR AGREEMENT, CHALLENGES REMAIN IN DEALING WITH IRAN, PARTICULARLY ITS BEHAVIOR AND REGIONAL POLICIES. The U.S. intends to hold Iran accountable for its actions, Secretary Kerry told NPR on Monday, largely by supporting regional allies such as Saudi Arabia. But the case is far from convincing. The administration was loath to challenge Iran's support for Syrian President Bashar al-Assad or Hezbollah in the run-up to the accord. Why would it risk causing problems during the implementation period? The U.S. tendency might well be the opposite: to test the possibility that Iran can be engaged as a partner in the region—precisely the outcome feared by traditional allies such as Israel and Saudi Arabia. Even before the agreement was reached, the White House was making the case that Iran would put assets unfrozen by sanctions relief into its economy, not toward funding terrorism. Secretary Kerry said as much to journalist Judy Woodruff last week, implying that Iran is somehow prevented from assisting its bad allies and suggesting that the CIA has concluded that Iran's fiscal needs will induce its regime to direct assistance to its economy. A more compelling (and honest) approach would have been to admit that there are problems with sanctions relief and to look into ways to address them. ¶ This Iran deal would be a hard sell under any circumstances. But SMART POLITICS IS ABOUT EXPANDING THE RANKS OF THOSE WHO SUPPORT YOU, NOT WILLFULLY MAKING ENEMIES. AT THIS POINT, EVEN IF THE DEAL GOES THROUGH, THE ADMINISTRATION HAS BROKEN MORE CROCKERY WITH CONGRESS AND AMONG ITS TRADITIONAL ALLIES IN THE MIDDLE EAST THAN IT HAD TO. On such a consequential foreign policy issue, that's really too bad.

Impact

Deal Bad

Iran deal leads to nuclear proliferation

Rogin 6/24/14 (Josh, writer for Bloomberg, "Clinton Defense Chief: Iran Deal Could Spark Proliferation", [//BW">http://www.bloombergtview.com/articles/2015-06-24/clinton-defense-chief-iran-deal-could-spark-proliferation\)//BW](http://www.bloombergtview.com/articles/2015-06-24/clinton-defense-chief-iran-deal-could-spark-proliferation)

GULF ARAB POWERS ARE LIKELY TO RESPOND TO PRESIDENT BARACK OBAMA'S PENDING NUCLEAR DEAL WITH IRAN BY DEVELOPING THEIR OWN NUCLEAR PROGRAMS, former Defense Secretary William Cohen said Wednesday. He said they don't trust either the Iranians or the United States to protect their interests. "THE ADMINISTRATION'S INTENT WAS TO HAVE A COUNTER-PROLIFERATION PROGRAM. AND THE IRONY IS, IT MAY BE JUST THE OPPOSITE," he told a meeting of Bloomberg reporters Wednesday morning. As Secretary of State John Kerry prepares to meet Iranian leaders for the final push toward a comprehensive nuclear deal with Iran, there's growing angst in countries like Saudi Arabia, the United Arab Emirates, Qatar and Israel about THE DEAL, which WILL LEAVE IRAN WITH SIGNIFICANT URANIUM ENRICHMENT CAPABILITIES and may not give the international community the right to inspect all of Iran's nuclear facilities. The administration argues that a deal with Iran will remove the need for other regional powers to pursue their own nuclear enrichment and weapons programs. Cohen said the region doesn't see it that way. "ONCE YOU SAY THEY ARE ALLOWED TO ENRICH, THE GAME IS PRETTY MUCH UP IN TERMS OF HOW DO YOU SUSTAIN AN INSPECTION REGIME IN A COUNTRY THAT HAS CARRIED ON SECRET PROGRAMS FOR 17 YEARS AND IS STILL DETERMINED TO MAINTAIN AS MUCH OF THAT SECRECY AS POSSIBLE," said Cohen, who was a Republican lawmaker from Maine before serving under President Clinton from 1997 to 2001. Other regional powers are further skeptical of the international community's ability to enforce any deal with Iran because the Obama administration has lost credibility in the region, according to Cohen. He said America's relationships in the region were damaged in 2013, when President Obama backed away from striking Syria after telling Gulf allies he would do so, even though the Assad regime had crossed his "red line" on chemical weapons. "It was mishandled and everybody in the region saw how it was handled. And I think it shook their confidence in the administration. ... The Saudis, the UAE and the Israelis were all concerned about that," Cohen said. "They are looking at what we say, what we do, and what we fail to do, and they make their judgments. In the Middle East now, they are making different calculations." Cohen acknowledged that without a nuclear deal, IRAN COULD HAVE THE ABILITY TO EXPAND ITS NUCLEAR ACTIVITIES WITH NO RESTRICTIONS, LEADING TO AN EVEN MORE DANGEROUS SITUATION FOR THE U.S. AND THE REGION. He doesn't agree with some lawmakers, such as Senator Tom Cotton, who argue that a military strike on Iran's nuclear facilities could be a solution. Cohen said that if a deal is reached, there will be significant international momentum for implementing the deal and lifting sanctions against Iran. The drive to do business in Iran will be alluring, especially to European countries, who have been eager to return to Iran but have been held back by the U.S.-led sanctions. Iranian officials have said that if the U.S. is the only country left with sanctions on Iran, that would amount to America sanctioning itself. "I anticipate this deal will be done. I think Congress is going to be hard-pressed to reject it," said Cohen. "Congress, the only chance it has to influence it is now, before it's signed." Cohen disagrees with those who believe that a nuclear deal will mollify Iran. He is skeptical that giving Iran large economic benefits will lead to significant reform in the Islamic Republic. "Most people that I know believe that Iran will continue to be a revolutionary country, and that's what bothers all of the others in the region, that this is going to continue the expansion of power, that they will be at a disadvantage, and they can't count on the United States," he said. Overall, COUNTRIES IN THE MIDDLE EAST HAVE LOST CONFIDENCE IN THE OBAMA ADMINISTRATION, Cohen said, in part because the U.S. has failed to articulate a clear vision for America's role in the world in the 21st century. That may not be resolved in the remainder of this administration. "THERE'S A LOT OF WORRY ABOUT U.S. LEADERSHIP AND WHAT WE'LL DO NEXT. You couple that with the Iran situation, and you could see there's a lot of nervousness now about where we are," he said. "That's something the next president will have to deal with."

Iran deal leads to global proliferation and hurts the economy

Yashar, 7/2/15 (Ari, writer for Israel Nation News, "Experts Warn Iran Deal Will Kill Nuclear Non-Proliferation", [//BW">http://www.israelnationalnews.com/News/News.aspx/197588#.VaVjMRNViko">//BW](http://www.israelnationalnews.com/News/News.aspx/197588#.VaVjMRNViko)

FOREIGN POLICY EXPERTS WARNED THIS WEEK THAT IF THE US PROVES ITSELF UNABLE TO ENFORCE A HARD LINE AGAINST IRAN'S PURSUIT OF NUCLEAR POWER, AMERICA WILL BE RENDERED UNABLE TO

OPPOSE NUCLEAR PROLIFERATION ON A GLOBAL SCALE. The experts were speaking at the Heritage Foundation on Tuesday, reports the Washington Free Beacon, in an event just a week ahead of the extended July 7 deadline for a nuclear deal between world powers and Iran over the latter's controversial nuclear program. "THE FUNDAMENTAL PROBLEM IS THAT WE'RE GIVING GROUND ON WHAT HAS BEEN A PRINCIPLE OF US NON PROLIFERATION POLICY FOR 70 YEARS, WHICH (VIEWS) THE SPREAD OF ENRICHMENT and reprocessing TO ANY COUNTRY, even our allies, AS A PROBLEM," said Matthew Kroenig, associate professor at Georgetown University. "What this Iran deal does is make an exception, not just for any country, but for Iran, a country that's continually cheating on its agreements. So in the wake of the deal, I THINK IT BECOMES VERY HARD FOR US TO GO TO OUR ALLIES AND SAY, 'WE TRUST TEHRAN WITH THIS TECHNOLOGY, BUT WE DON'T TRUST YOU.'" Brian Finaly, vice president of the Washington DC-based think tank Stimson Center, added to Kroenig's troubling assessment. "As we understand how the world is changing, IT IS CERTAINLY IMPACTING HOW WE MANAGE THE PROLIFERATION THREAT, and I believe that getting out in front of this, THINKING BEYOND THE LIMITED ABILITY OF THE STATE TO CONTROL PROLIFERATION IN THE FUTURE, IS GOING TO BE ESSENTIAL TO SUCCESSFUL NON-PROLIFERATION EFFORTS," warned Finaly. He explained that non-state actors such as multinational companies can play a role in preventing nuclear crises, noting on the conflict between India and Pakistan in the 1980s. "A group of very senior level executives from an array of companies got together and sent a very clear message to the Indian Prime Minister: 'THIS CRISIS IS BAD FOR BUSINESS and if we decide to leave India, we will not return,'" Finaly said. That warning "had the ultimate effect of, I think, contributing significantly to the easing of nuclear tensions between the two countries, and it returned to semi-regular relations between the two countries," he added. REGARDING ECONOMIC INCENTIVES, EXPERTS HAVE WARNED THAT THE CURRENT SANCTIONS REGIME AGAINST IRAN HAS NOT BEEN TOUGH ENOUGH TO HAVE AN EFFECT, as the Iranian GDP grew 3% in 2014. Just this Monday Iranian officials announced that 13 tons of gold had been repatriated as part of sanctions relief, bringing the total in unfrozen assets since the November 2013 interim deal was signed to just under \$12 billion.

Deal causes runaway prolif—breakdown of non-proliferation treaty

Pletka 7/14 (Danielle Pletka; July 14 2015; vice president for foreign and defense policy studies at the American Enterprise Institute; "8 Unplanned Results of the Iran Deal"; Politico; www.politico.com/magazine/story/2015/07/eight-unplanned-results-of-the-iran-deal-120129.html?mi=tl_38_b) jskullz

4. THE BEGINNING OF THE END OF THE NPT Like any set of rules, THE NUCLEAR NON-PROLIFERATION TREATY IS ONLY AS GOOD AS ITS MEMBERS MAKE IT. ONCE, A COUNTRY THAT HID BEHIND THE NPT TO VIOLATE SAFEGUARDS AGREEMENTS and work on nuclear weapons FACED THE CERTAINTY OF INTERNATIONAL PUNISHMENT. THAT IS WHAT HAPPENED TO NORTH KOREA. WITH THIS DEAL, THE EXACT REVERSE IS HAPPENING with Iran. AFTER USING THE TREATY TO ADVANCE ITS NUCLEAR WEAPONS PROGRAM, IRAN IS NOW BEING PARDONED, REHABILITATED AND ALLOWED TO KEEP ITS NUCLEAR INFRASTRUCTURE. WE CAN EXPECT OTHER COUNTRIES — ESPECIALLY THOSE MOST WORRIED ABOUT IRAN'S RISING POWER IN THE MIDDLE EAST — TO EMULATE IRAN IN USING THE NPT AS COVER FOR ADVANCING THEIR OWN NUCLEAR WEAPONS PROGRAMS.

Deal causes Israeli first strike—escalates to nuclear war

Worral 15 (Eric Worral; Apr 28 2015; Writer for Breitbart; “Israel Will Strike Iran First To Thwart Nuclear Attack”; Breitbart; <http://www.breitbart.com/big-government/2015/04/28/israel-will-strike-iran-first-to-thwart-nuclear-attack/>) jskullz

ISRAEL IS NOT IN A PLEASANT SITUATION. EVERY DAY, her arch enemy IRAN DRAWS CLOSER TO Refining enough uranium to build 100s of NUCLEAR WEAPONS.¶ Every day THE IRANIAN PROGRAM BECOMES MORE DIFFICULT TO DISLodge – as the uranium is concentrated, the number of centrifuges required to complete the process decreases, allowing the remaining refining operation to be moved to smaller and more covert facilities.¶ America, ostensibly Israel’s ally, is rumoured to have ordered US warships to shoot down Israeli aircraft, should a strike on Iran appear to be in progress. According to Israeli newspapers, President Obama thwarted a planned 2014 Israeli attack against Iranian nuclear facilities, by threatening to shoot down the Israeli bombers.¶ America is currently sending additional warships to the Persian Gulf – ostensibly to blockade Iranian supply runs to rebels in Yemen, but if rumours of President Obama’s threat against Israel are correct, perhaps also to reinforce US firepower, should Israel decide to mount an attack against Iran.¶ There is no doubt an attack is on the drawing board – the Israeli Defence Force admitted they are training for an attack on Iran, in a recent interview with The Times of Israel.¶ IRAN MAY POSE A GRAVE EXISTENTIAL THREAT TO ISRAEL – AT LEAST ISRAEL BELIEVES THEY DO and they appear to have good reasons for their concerns. According to an Israeli report written in 2008, Iran regularly state that Israel will shortly be wiped from the face of the Earth.¶ REGARDLESS OF WHETHER THE IRANIAN THREATS ARE AS BAD AS IS CLAIMED, or whether Iran actually means what they say, THE IRANIAN NUCLEAR PROGRAMME WILL PROVIDE IRAN WITH THE MEANS TO FULFILL this terrifying threat.¶ Iran is currently purchasing an advanced Russian air defence system – which will further complicate the job of attacking Iran, should Israel choose to mount an attack.¶ If Israel does decide to mount an attack against Iran, they will run a gauntlet – they will have to fly long distances, over hostile Syria, and other unfriendly countries. They will potentially face a massive counterattack from the growing American presence in the Persian Gulf. When they finally reach Iran, they will suffer even more casualties from the advanced Russian anti-aircraft systems, which will shortly be operational.¶ And when a handful of Israeli aircraft finally reach their targets, the surviving ISRAELI WARPLANES WILL HAVE TO SOMEHOW INFLICT SUFFICIENT DAMAGE ON HEAVILY ARMoured NUCLEAR FACILITIES, some of which are BURIED HUNDREDS OF FEET UNDERGROUND, TO PREVENT THEM FROM BEING REPAIRED.¶ THERE IS ONLY ONE KIND OF BOMB in Israel’s arsenal, WHICH CAN FULFILL THIS military REQUIREMENT.¶ A weak IRAN DEAL, if it is ratified, WILL in my opinion be a lot more than a diplomatic failure – for the reasons I have provided, I believe it may TRIGGER A NUCLEAR WAR.

Despite the nuclear deal, Iran is still belligerent

Tamara Cofman **Wittes, 7/14**, senior fellow and the director of the Center for Middle East Policy at Brookings, July 14, 2015 , “An Iran deal won’t stabilize the messy Middle East — but maybe Arab states can”, http://www.brookings.edu/blogs/markaz/posts/2015/07/14-iran-nuclear-deal-us-middle-east-wittes?utm_campaign=Brookings+Brief&utm_source=hs_email&utm_medium=email&utm_content=20603985&_hsenc=p2ANqtz-8OoJpmi79Mwck0F_5tTOKCv1XJfiYeJ47JNQR5QW97ziIJXupWdf3uk6CVwG7J8s6yFOL7tld6NVq5eYPDMYrvARu3NA&_hsmi=20603985 //Zabner

IRAN'S PROCLIVITY FOR REGIONAL MEDDLING IS LONGSTANDING, AND THE CHAOTIC POLITICS OF THE ARAB WORLD SINCE 2011 HAS GIVEN THE ISLAMIC REPUBLIC UNPRECEDENTED OPPORTUNITIES TO INSERT ITSELF INTO LOCAL POLITICS IN DESTABILIZING WAYS. In my recent congressional testimony, and in remarks to the Herzliya Conference in Israel last month, I explained my view THAT IRAN'S REGIONAL TROUBLEMAKING IS LIKELY TO GROW WORSE IN COMING YEARS, REGARDLESS OF A DEAL OVER THE NUCLEAR PROGRAM. I said: In fact, WHETHER THERE'S A NUCLEAR DEAL OR NOT, I PREDICT WE WILL SEE A MORE AGGRESSIVE APPROACH BY IRAN IN A HOST OF ARENAS AROUND THE REGION, WHERE THE UPHEAVAL HAS GIVEN THEM GREATER OPPORTUNITIES THAN BEFORE. IF THERE IS A NUCLEAR DEAL, THE HARDLINE ELEMENTS WITHIN THE IRANIAN REGIME, THOSE MOST OPPOSED TO A DEAL, ARE ALSO THOSE WITH THE GREATEST INTEREST AND INVESTMENT IN REGIONAL TROUBLEMAKING. THEY ARE LIKELY TO USE THEIR ABILITY TO MAKE NOISE REGIONALLY TO TRY AND COMPENSATE FOR THE POWER DISADVANTAGES THEY SEE INHERENT IN A DEAL — AND THEY ARE LIKELY TO HAVE A GREEN LIGHT FROM THE SUPREME LEADER TO DO SO, BECAUSE HE WILL WANT TO COMPENSATE THEM FOR THEIR UNHAPPINESS WITH A DEAL. If there's no deal on the nuclear issue, however, then the Iranian leadership will want to scale up its regional assertions of power for a different reason: in order to solidify or even strengthen its current regional power position in advance of whatever tougher American / Israeli / Sunni Arab efforts it anticipates to contain it. I stand by that prediction. While sanctions relief will give Iran considerably more resources, it has never lacked motivation for its assertions of power, and it continues to face ample opportunity. As my Herzliya panel partner, Meir Javandefar, revealed at the conference, IRAN'S SANCTIONS-INDUCED ECONOMIC HARDSHIP IN RECENT YEARS HAS NOT PREVENTED IRAN FROM SPENDING BILLIONS OF DOLLARS AND ITS OWN SOLDIERS' LIVES KEEPING BASHAR AL-ASSAD IN POWER. SO YES, IRANIAN MEDDLING ACROSS THE REGION WILL GET WORSE IN THE WAKE OF AN IRAN DEAL — but it was going to get worse anyway. The real question about Iran's regional behavior is not, therefore, whether a nuclear deal is too dangerous for the Middle East because it will give Iran more ability to make trouble. Trouble, in case you haven't noticed, is not lacking in the Middle East, and Iran is one major source (though not, to be sure, the only one). THE REAL QUESTION IS WHAT THE UNITED STATES AND AMERICA'S ARAB ALLIES ARE PREPARED TO DO ABOUT IT. Note that, in my view, America's Arab allies have an essential role to play here, independent of the United States. Read on to see what I mean.

The deal changes nothing

Suzanne **Maloney, 7/15**, interim deputy director of the Foreign Policy program at the Brookings Institution and a senior fellow in the Brookings Center for Middle East Policy, July 15, 2015, Brookings, "For the U.S. and Iran, a nuclear accord upends old assumptions", http://www.brookings.edu/blogs/markaz/posts/2015/07/15-iran-deal-diplomacy-sanctions-rouhani-beginning?utm_campaign=Brookings+Brief&utm_source=hs_email&utm_medium=email&utm_content=20624082&_hsenc=p2ANqtz-9SEY60r2pRxzjZc8Zu75XmCIZT-sdnEWMIAMc36o-qbMilxtyiusrW5bawoJ6D5CCKUxda4qPpcueDZOOQw4TxorWVg&_hsmi=20624082 //Zabner

But though the negotiating process itself has ended, the factors that undermine its relationship with the world have not. THE DEAL WILL NOT PUT AN END TO THE DISPUTE OVER IRAN'S NUCLEAR AMBITIONS. The agreement will now undergo an excruciating dissection in both capitals, with every word of the 159-page English language text probed for signs of leniency or capitulation. Then, IF IT SURVIVES LEGISLATIVE SCRUTINY (AS IT IS LIKELY TO DO), A LABORIOUS IMPLEMENTATION PROCESS WILL ENSURE THAT THE ISSUE REMAINS A MAJOR PREOCCUPATION FOR EACH OF THE STATES THAT IS A PARTY TO THE AGREEMENT, AS WELL AS A SOURCE OF CONTINUING FRICTIONS AND SUSPICIONS BETWEEN WASHINGTON AND TEHRAN. NOR DO WASHINGTON'S OTHER DIFFERENCES WITH TEHRAN APPEAR TO BE NEARING A MORE AUSPICIOUS CONCLUSION. ONLY THE MOST CREDULOUS OPTIMIST CAN ASSERT THAT A NUCLEAR DEAL WILL SOMEHOW PRODUCE AN IRANIAN EPIPHANY ABOUT THE HORRIFIC AND DESTABILIZING CONSEQUENCES OF ITS ASSISTANCE TO BASHAR

AL ASSAD. TEHRAN'S APPROACH TO EXTENDING ITS REGIONAL INFLUENCE, VIA THE FUNDING AND DIRECTION OF VIOLENT PROXIES ACROSS THE REGION, WILL CONTINUE to exacerbate instability in Iraq, Yemen, Lebanon, and beyond, WHILE FUELING THE GEOSTRATEGIC RIVALRY WITH SAUDI ARABIA AND THE RELATED SECTARIAN TENSIONS. This week's resumption of a trial of a Washington Post reporter underscores that IRAN'S UNJUST DETENTION OF AMERICAN CITIZENS FOR MONTHS OR EVEN YEARS WILL LIKELY CONTINUE AS WELL. The same streets where Iranians celebrated a deal yesterday were the scenes of anti-American and anti-Israeli protests, where both flags were burnt in effigy, only a few days ago. Perhaps most importantly, as I'll argue in a follow-up piece tomorrow examining the uncertain prospects for new beginnings, THE UNDERLYING LOGIC OF ISLAMIC REGIME IS UNLIKELY TO BE ALTERED SIGNIFICANTLY BY THE RESOLUTION OF THE NUCLEAR IMPASSE. THE NUCLEAR AGREEMENT WAS A TRANSACTIONAL DECISION FOR IRANIAN LEADERS, NOT A TRANSFORMATIONAL ONE, AND THE ODDS AGAINST THE MODERATION OF THE IRANIAN SYSTEM REMAIN OVERWHELMINGLY STACKED AGAINST THE ESTABLISHMENT OF THE REVOLUTION'S ELUSIVE THERMIDOR.

Turn—the Iran bill is problematic and shouldn't pass—concedes too much nuclear power to Iran

Edelman and Takeyh 7/17, Eric Edelman, undersecretary of defense for policy from 2005 to 2009, is a scholar in residence at Johns Hopkins School of Advanced International Studies. Ray Takeyh is a senior fellow at the Council on Foreign Relations., "On Iran Congress should just say no," Washingtonpost, 7/17/15, http://www.washingtonpost.com/opinions/on-iran-congress-should-just-say-no/2015/07/17/56e366ae-2b30-11e5-bd33-395c05608059_story.html

AFTER TWO YEARS OF PAINSTAKING DIPLOMACY, THE OBAMA ADMINISTRATION HAS FINALLY CONCLUDED A NUCLEAR AGREEMENT WITH IRAN. A CAREFUL EXAMINATION OF THE Joint Comprehensive Plan of Action (JCPOA) REVEALS THAT IT CONCEDES AN ENRICHMENT CAPACITY THAT IS TOO LARGE; SUNSET CLAUSES THAT ARE TOO SHORT; A VERIFICATION REGIME THAT IS TOO LEAKY; AND ENFORCEMENT MECHANISMS THAT ARE TOO SUSPECT. No agreement is perfect, but at times THE SCALE OF IMPERFECTION IS SO GREAT THAT THE JUDICIOUS COURSE IS TO REJECT THE DEAL AND RENEGOTIATE A MORE STRINGENT ONE. THE WAY FOR THIS TO HAPPEN IS FOR CONGRESS TO DISAPPROVE THE JCPOA. Prior to the 2013 interim accord, the Obama administration's position rested on relatively sensible precepts. The United States insisted that, given Iran's practical needs, it should only have a symbolic enrichment program of a few hundred centrifuges, and that the Islamic republic could not be considered a member of the Nuclear Non-Proliferation Treaty (NPT) in good standing until it secured the trust and confidence of the international community in the peaceful nature of its program. These were not just U.S. aspirations but also the position of members of the "P5+1" powers — the five U.N. Security Council members plus Germany. THESE PRUDENT PARAMETERS WERE OVERTAKEN BY A CAVALCADE OF CONCESSIONS THAT BEGAN IN 2013. THE ADMINISTRATION SOON BRANDISHED THE NOTION OF A ONE-YEAR BREAKOUT PERIOD THAT WOULD ALLOW IRAN TO MAINTAIN A SUBSTANTIAL ENRICHMENT APPARATUS, IN EFFECT ABANDONING THE GOAL OF PREVENTING DEVELOPMENT OF AN IRANIAN NUCLEAR CAPABILITY IN FAVOR OF MANAGING ITS EMERGENCE. THE MUCH HERALDED ONE-YEAR BREAKOUT PERIOD WILL ONLY SHRINK OVER TIME AS THE JCPOA CONCEDES THAT IRAN CAN BEGIN PHASING OUT ITS PRIMITIVE CENTRIFUGES IN FAVOR OF MORE ADVANCED ONES. Even more troublesome is the agreement's stipulation that after its limits expire, THE "IRANIAN NUCLEAR PROGRAM WILL BE TREATED IN THE SAME MANNER AS THAT OF ANY OTHER NON-NUCLEAR WEAPON STATE PARTY TO THE NPT." THIS MEANS THAT IRAN CAN PROCEED WITH THE CONSTRUCTION OF AN INDUSTRIAL-SIZED NUCLEAR INFRASTRUCTURE SIMILAR TO THAT OF JAPAN. At that time, IRAN COULD EASILY SPRINT TO THE BOMB WITHOUT RISKING TIMELY DETECTION. In the coming weeks, the administration will justify its concessions by professing that the agreement establishes an unprecedented inspections regime. THE VERIFICATION MEASURES OF THE JCPOA RELY ON "MANAGED ACCESS" WHEREBY THE INTERNATIONAL ATOMIC ENERGY AGENCY HAS TO FIRST OFFER CREDIBLE EVIDENCE OF UNTOWARD ACTIVITY AND THEN NEGOTIATE WITH IRAN FOR TIMELY ACCESS TO THE SUSPECT FACILITY. THIS CERTAINLY FALLS SHORT OF THE INSPECTION MODALITY PLEDGED BY

ENERGY SECRETARY ERNEST MONIZ, THE ADMINISTRATION'S CHIEF NUCLEAR PHYSICIST, WHO SAID IN APRIL THAT "WE EXPECT TO HAVE ANYWHERE, ANYTIME ACCESS." Under the current arrangement, THE LIKELY RESPONSE TO IRANIAN MISCHIEF WILL BE PROLONGED NEGOTIATIONS Mired IN ARCANE DETAIL OVER AT LEAST A THREE-WEEK PERIOD. IN AS LITTLE AS A FEW MONTHS, IRAN WILL FOR ALL INTENTS AND PURPOSES NO LONGER BE A SANCTIONED COUNTRY. Although elaborate and protracted procedures are in place for the re-imposition of the U.N. Security Council sanctions resolutions, THE ECONOMIC SANCTIONS IMPOSED BY THE European Union AND THE United States — ALWAYS THE MOST ESSENTIAL ONES — WILL BE ROLLED BACK QUICKLY AND WILL NOT BE EASILY RECONSTITUTED. THE EUROPEAN OIL EMBARGO, INTERNATIONAL BANKING RESTRICTIONS AND EFFORTS TO SEGREGATE IRAN FROM THE GLOBAL ECONOMY WILL BE SUSPENDED. AND THE NOTION THAT U.S. BUSINESS WILL BE LEFT OUT OF THE COMMERCIAL MARCH TO IRAN BECAUSE CONGRESSIONALLY IMPOSED U.S. SANCTIONS WILL REMAIN IN PLACE IS ITSELF UNDERMINED BY A LOOPHOLE IN THE DEAL ALLOWING "NON-U.S. ENTITIES THAT ARE OWNED OR CONTROLLED BY A U.S. PERSON TO ENGAGE IN ACTIVITIES WITH IRAN THAT ARE CONSISTENT WITH THIS JCPOA." THE JCPOA STANDS AS ONE OF THE MOST TECHNOLOGICALLY PERMISSIVE ARMS-CONTROL AGREEMENTS IN HISTORY. All is not lost, however, and with sensible amendments the accord can be strengthened. THE United States SHOULD RETURN TO THE TABLE AND INSIST THAT AFTER THE EXPIRATION OF THE SUNSET CLAUSE, THE P5+1 AND IRAN SHOULD VOTE ON WHETHER TO EXTEND THE AGREEMENT FOR AN ADDITIONAL 10 YEARS. A majority vote every 10 years should determine the longevity of the agreement, not an arbitrary time-clock. Further, the JCPOA has usefully stressed that all of Iran's spent fuel from its heavy-water reactor will be shipped out permanently. A similar step should be taken with Iran's enriched uranium. THE REVISED AGREEMENT SHOULD ALSO LIMIT IRAN TO THE FIRST-GENERATION CENTRIFUGES AND RELY ON "ANYTIME, ANYWHERE ACCESS." These and other such measures could help forestall an Iranian bomb and stem the proliferation cascade in the Middle East that this agreement is likely to trigger. AT THIS LATE DATE, THE ONLY WAY THAT THE AGREEMENT CAN BE REOPENED AND AMENDED IS FOR CONGRESS TO FIRST REJECT IT. At that time, the Obama administration or its successor can return to the table and confess that given the absence of a bipartisan foundation of support in the United States, KEY PROVISIONS OF THE AGREEMENT HAVE TO BE RECONSIDERED. AT THE END OF SUCH A PROCESS, THE United States MAY YET BE ABLE TO OBTAIN A VIABLE ACCORD THAT RELIABLY ALTERS IRAN'S NUCLEAR TRAJECTORY.

Bomb Good

Iran bomb good—no prolif or terrorism, and prevents escalatory war with Israel and other states

Waltz 12 (Kenneth N. Waltz; July/Aug 2015; Political Science prof at Columbia and one of the single most influential international relations scholars; Why Iran Should Get the Bomb; Foreign Affairs <https://www.foreignaffairs.com/articles/iran/2012-06-15/why-iran-should-get-bomb>) jskullz

The third possible outcome of the standoff is that Iran continues its current course and publicly goes nuclear by testing a weapon. U.S. AND ISRAELI OFFICIALS HAVE DECLARED THAT OUTCOME UNACCEPTABLE, ARGUING that A NUCLEAR IRAN IS a uniquely terrifying prospect, even AN EXISTENTIAL THREAT. SUCH LANGUAGE IS TYPICAL of major powers, which have historically gotten riled up whenever another country has begun to develop a nuclear weapon of its own. Yet so far, EVERY TIME ANOTHER COUNTRY HAS MANAGED TO SHOULDER ITS WAY INTO THE NUCLEAR CLUB, THE OTHER MEMBERS HAVE ALWAYS CHANGED TACK AND DECIDED TO LIVE WITH IT. IN FACT, BY REDUCING IMBALANCES IN MILITARY POWER, NEW NUCLEAR STATES generally PRODUCE MORE REGIONAL AND INTERNATIONAL STABILITY, not less. ¶ ISRAEL'S REGIONAL NUCLEAR MONOPOLY, which has proved remarkably durable for the past four decades, HAS LONG FUELED INSTABILITY IN THE MIDDLE EAST. IN NO OTHER REGION of the world DOES A LONE, UNCHECKED NUCLEAR STATE EXIST. IT IS ISRAEL'S NUCLEAR ARSENAL, NOT IRAN'S DESIRE FOR ONE, THAT HAS CONTRIBUTED MOST TO THE CURRENT CRISIS. Power, after all, begs to be balanced. What is surprising about the Israeli case is that it has taken so long for a potential balancer to emerge. ¶ Of course, it is easy to understand why ISRAEL wants to remain the sole nuclear power in the region and why it IS WILLING TO USE FORCE TO SECURE THAT STATUS. In 1981, ISRAEL BOMBED IRAQ to prevent a challenge to its nuclear monopoly. It did the same to SYRIA in 2007 AND IS NOW CONSIDERING SIMILAR ACTION AGAINST IRAN. But THE VERY ACTS THAT HAVE ALLOWED ISRAEL TO MAINTAIN ITS NUCLEAR EDGE IN THE SHORT TERM HAVE PROLONGED AN IMBALANCE THAT IS UNSUSTAINABLE IN THE LONG TERM. ISRAEL'S proven ABILITY TO STRIKE POTENTIAL NUCLEAR RIVALS WITH IMPUNITY HAS inevitably MADE its ENEMIES ANXIOUS TO DEVELOP THE MEANS TO PREVENT ISRAEL FROM DOING SO AGAIN. In this way, the CURRENT TENSIONS ARE BEST VIEWED NOT AS THE EARLY STAGES OF A relatively RECENT IRANIAN NUCLEAR CRISIS BUT RATHER AS THE FINAL STAGES OF A DECADES-LONG MIDDLE EAST nuclear CRISIS that will end only when a balance of military power is restored. ¶ UNFOUNDED FEARS ¶ ONE REASON THE DANGER OF A NUCLEAR IRAN HAS BEEN GROSSLY EXAGGERATED IS THAT THE DEBATE SURROUNDING IT HAS BEEN DISTORTED BY MISPLACED WORRIES and fundamental misunderstandings of how states generally behave in the international system. THE first PROMINENT CONCERN, which undergirds many others, IS THAT THE IRANIAN REGIME IS INNATELY IRRATIONAL. Despite a widespread belief to the contrary, Iranian policy is made not by "mad mullahs" but by perfectly sane ayatollahs who want to survive just LIKE ANY OTHER LEADERS. ALTHOUGH IRAN'S LEADERS INDULGE IN INFLAMMATORY and hateful RHETORIC, THEY SHOW NO PROPENSITY FOR SELF-DESTRUCTION. It would be a grave error for policymakers in the United States and Israel to assume otherwise. ¶ Yet that is precisely what many U.S. and Israeli officials and analysts have done. Portraying Iran as irrational has allowed them to argue that the logic of nuclear deterrence does not apply to the Islamic Republic. IF IRAN ACQUIRED A NUCLEAR WEAPON, THEY WARN, IT WOULD NOT HESITATE TO USE IT IN A FIRST STRIKE against Israel, EVEN THOUGH DOING SO WOULD INVITE MASSIVE RETALIATION AND RISK DESTROYING EVERYTHING THE IRANIAN REGIME HOLDS DEAR. ¶ Although it is impossible to be certain of Iranian intentions, IT IS FAR MORE LIKELY THAT IF IRAN DESIRES NUCLEAR WEAPONS, IT IS FOR THE PURPOSE OF providing for ITS OWN SECURITY, not to improve its offensive capabilities (or destroy itself). Iran may be intransigent at the negotiating table and defiant in the face of sanctions, but it still acts to secure its own preservation. IRAN'S LEADERS DID NOT, for example, ATTEMPT TO CLOSE THE STRAIT OF HORMUZ DESPITE issuing blustery WARNINGS THAT THEY MIGHT DO so after the EU announced its planned oil embargo in January. THE

IRANIAN REGIME CLEARLY CONCLUDED THAT IT DID NOT WANT TO PROVOKE WHAT WOULD SURELY HAVE BEEN A SWIFT and devastating American RESPONSE to such a move. ¶ Nevertheless, even SOME observers and policymakers who accept that the Iranian regime is rational still worry Y THAT A NUCLEAR WEAPON WOULD EMBOLDEN IT, PROVIDING TEHRAN WITH A SHIELD THAT WOULD ALLOW IT TO ACT MORE AGGRESSIVELY AND INCREASE ITS SUPPORT FOR TERRORISM. SOME analysts even FEAR THAT IRAN WOULD DIRECTLY PROVIDE TERRORISTS WITH NUCLEAR ARMS. THE PROBLEM WITH THESE CONCERNS IS THAT THEY CONTRADICT THE RECORD OF EVERY OTHER NUCLEAR WEAPONS STATE going back to 1945. History shows that wHEN COUNTRIES ACQUIRE THE BOMB, THEY FEEL INCREASINGLY VULNERABLE and become acutely aware that THEIR NUCLEAR WEAPONS MAKE THEM A POTENTIAL TARGET IN THE EYES OF MAJOR POWERS. THIS AWARENESS DISCOURAGES NUCLEAR STATES FROM BOLD AND AGGRESSIVE ACTION. Maoist CHINA, for example, BECAME MUCH LESS BELLICOSE AFTER ACQUIRING NUCLEAR WEAPONS in 1964, AND INDIA AND PAKISTAN HAVE BOTH BECOME MORE CAUTIOUS SINCE GOING NUCLEAR. There is little reason to believe Iran would break this mold. ¶ As for the risk of a handoff to terrorists, nO COUNTRY COULD TRANSFER NUCLEAR WEAPONS WITHOUT RUNNING A HIGH RISK OF BEING FOUND OUT. U.S. surveillance capabilities would pose a serious obstacle, as would the United States' impressive and growing ability to identify the source of fissile material. Moreover, COUNTRIES CAN NEVER ENTIRELY CONTROL OR EVEN PREDICT THE BEHAVIOR OF THE TERRORIST GROUPS they sponsor. ONCE a country such as IRAN ACQUIRES A NUCLEAR CAPABILITY, IT WILL HAVE EVERY REASON TO MAINTAIN FULL CONTROL OVER ITS ARSENAL. After all, building a bomb is costly and dangerous. It would make little sense to transfer the product of that investment to parties that cannot be trusted or managed. ¶ ANOTHER oft-touted WORRY IS THAT IF IRAN OBTAINS THE BOMB, OTHER STATES IN THE REGION WILL FOLLOW suit, leading to a nuclear arms race in the Middle East. But THE NUCLEAR AGE IS NOW ALMOST 70 YEARS OLD, AND SO FAR, FEARS OF PROLIFERATION HAVE PROVED TO BE UNFOUNDED. Properly defined, the term "PROLIFERATION" MEANS A RAPID AND UNCONTROLLED SPREAD. NOTHING LIKE THAT HAS OCCURRED; in fact, since 1970, THERE HAS BEEN A MARKED SLOWDOWN IN THE EMERGENCE OF NUCLEAR STATES. There is no reason to expect that this pattern will change now. SHOULD IRAN BECOME THE SECOND MIDDLE EASTERN NUCLEAR POWER since 1945, IT WOULD HARDLY SIGNAL THE START OF A LANDSLIDE. WHEN ISRAEL ACQUIRED THE BOMB in the 1960s, IT WAS AT WAR with many of its neighbors. ITS NUCLEAR ARMS WERE A MUCH BIGGER THREAT TO THE ARAB WORLD THAN IRAN'S PROGRAM IS TODAY. **If an atomic Israel did not trigger an arms race then, there is no reason a nuclear Iran should now.** ¶ REST ASSURED ¶ In 1991, the historical rivals INDIA AND PAKISTAN SIGNED A TREATY AGREEING NOT TO TARGET EACH OTHER'S NUCLEAR FACILITIES. THEY REALIZED THAT FAR MORE WORRISOME THAN THEIR ADVERSARY'S NUCLEAR DETERRENT WAS THE INSTABILITY PRODUCED BY CHALLENGES TO IT. Since then, even in the face of high tensions and risky provocations, the two countries have kept the peace. Israel and Iran would do well to consider this precedent. If Iran goes nuclear, Israel and Iran will deter each other, as nuclear powers always have. There has never been a full-scale war between two nuclear-armed states. **Once Iran crosses the nuclear threshold, deterrence will apply, even if the Iranian arsenal is relatively small. No other country in the region will have an incentive to acquire its own nuclear capability, and the current crisis will finally dissipate, leading to a Middle East that is more stable than it is today.**

Defense

Iran won't launch a nuke—only interested for defensive purposes

Shanahan 15 (Roger Shanahan; Jan. 8th 2015; ANU's National Security College and is a non-resident fellow at the Lowy Institute for International Policy; "Would Iran Start a Nuclear War?"; National Interest; <http://nationalinterest.org/blog/the-buzz/would-iran-start-nuclear-war-11995>) jskullz

¶ THE LANGUAGE IS DRAMATIC BUT THE POSTS LACK MUCH BY THE WAY OF REASONED ARGUMENT.

Don't get me wrong, I'm a devoted counter-proliferator and think that a nuclear-armed Iran should be stopped simply to avoid other states seeking to do the same. But I disagree with the view advocated by Andy Nikolic and others that a nuclear-armed Iran will seek to use those weapons to become more regionally influential or to launch them against Israel.¶ ¶ (Recommended: 5 Iranian Weapons of War Israel Should Fear) ¶ ¶ The main reason I oppose such views is because they lack intellectual rigour. Firstly, SIMPLY HAVING NUCLEAR WEAPONS DOESN'T MAKE ANYONE MORE INFLUENTIAL. PAKISTAN AND INDIA ARE NO MORE INFLUENTIAL FOLLOWING THEIR ACQUISITION OF A NUCLEAR CAPABILITY THAN THEY WERE BEFORE IT. INFLUENCE COMES THROUGH A RANGE OF MEDIA, and IRAN HAS ALWAYS UNDERSTOOD that in many ways IT'S AN OUTSIDER IN THE REGION—ETHNICALLY, LINGUISTICALLY AND RELIGIOUSLY different from its Arab and Turkic neighbours. HENCE ITS RELIANCE ON ALLIES AND PROXIES to exert influence—AND THAT WOULDN'T CHANGE IF IT BECAME a NUCLEAR-CAPABLE country.¶ ¶ Second, Andy's argument is predicated on Iran's seeing a nuclear weapon as simply an offensive weapon. THE REALITY IS THAT NUCLEAR WEAPONS ARE OFTEN THE ULTIMATE DEFENSIVE WEAPON. Tehran could look east and see how Islamabad's nuclear capability has stopped it from going to war with India, and it could look west and see how Tel Aviv's undeclared capability has deterred its neighbours from invading it. Its nuclear capability hasn't stopped conflict or guaranteed military success for Israel, as it has faced two intifadas, invaded Gaza, had to withdraw from southern Lebanon and fought a short but bloody war against Hizbullah in 2006. But none of those have been existential threats.¶ ¶ (Recommended: Five Israeli Weapons of War Iran Should Fear) ¶ ¶ The argument follows that TEHRAN SEES A NUCLEAR CAPABILITY AS THE ULTIMATE SHIELD, RATHER THAN AS A POTENTIAL SWORD. Having been invaded by the British and the Soviets in World War II, and then suffering through eight years of a war with Iraq backed by its Arab neighbours and some in the West that cost hundreds of thousands of lives, it's easy to see the logic of Tehran viewing a nuclear weapon as the ultimate shield.¶ ¶ IN ORDER TO PROTECT THE ISLAMIC REVOLUTION THE LEADERSHIP SEEKS TO GUARANTEE ITS SURVIVAL FROM EXTERNAL ATTACK FIRST AND FOREMOST AND A NUCLEAR WEAPON WOULD DO THAT. ANY PREEMPTIVE USE OF SUCH WEAPONS WOULD BE NEARLY GUARANTEED TO RECEIVE MORE IN RETURN AND HENCE END THE RULE OF THOSE CHARGED WITH RULING IN ACCORDANCE WITH GOD'S WILL. Again, there seems to be no reason why the Supreme Leader would seek to do such a thing. Some have argued that a strain of Shi'a millenarianism would see Iran loose off volleys of nuclear weapons in order to set the conditions to hasten the arrival of the Awaited Imam. There's no explanation of how that would follow, nor evidence of any support for such a concept by the Supreme Leader, who is in charge of Iran's nuclear file.¶ ¶ (Recommended: 5 Israeli Weapons of War ISIS Should Fear) ¶ ¶ Andy claims that Iran exhibits "a determination to leverage the anticipated benefits of that [nuclear] investment" and that it seeks a nuclear capability "because of the prestige, power and authority which Iran believes such weapons would give it, both regionally and beyond." What he doesn't do is explain exactly what he sees those benefits to be, nor how he sees Tehran achieving power and authority as a nuclear state. I agree that Tehran seeks regional influence commensurate with how it views its rightful place in the international system. But I don't see how having a nuclear capability achieves that other than by safeguarding it from existential threats. Rather, I'd argue that Iranian national power, and hence that of the Islamic Revolution, will be furthered by leveraging its enormous potential economic and human capabilities. In many ways that's what its Gulf neighbours truly fear.¶

No US-Israel: General

Iran deal strains US-Israeli relations

NYT 7/14/2015 (http://www.nytimes.com/2015/07/15/world/middleeast/iran-nuclear-deal-israel.html?_r=0, Isabel Kershner, EM)

JERUSALEM — Furiously denouncing the accord to limit Iran's nuclear program on Tuesday as a "historic mistake," Prime Minister Benjamin Netanyahu said that Israel would not be bound by the agreement and warned of negative repercussions in a region already riven with rivalries and armed conflict. Contrary to President Obama's assertion that the agreement will cut off every pathway for Iran to obtain nuclear weapons,

Israel's leaders rejected the deal as a dangerous compromise that will exacerbate regional tensions and pave the way over time for Iran to produce multiple bombs — "an entire

arsenal with the means to deliver it," Mr. Netanyahu said. Israel views a nuclear-armed Iran as a threat to its survival. For Mr. Netanyahu, **the accord is the bitter culmination of a long struggle that has severely strained Israel's relations with the United States**, its crucial ally. The disagreement

showed no sign of abating. In a phone call hours after the signing of the deal, Mr. Obama told Mr. Netanyahu that it "will remove the specter of a nuclear-armed Iran, an outcome in the national security interest of the United States and Israel," according to a statement from the White House. Mr. Netanyahu told Mr. Obama that the agreement raised the danger that Iran would obtain nuclear weapons either by waiting out the 10 to 15 years of restrictions specified by the accord, or by violating it. Referring to the expected lifting of sanctions Mr. Netanyahu said in a televised statement in English: "In the coming decade, the deal will reward Iran, the terrorist regime in Tehran, with hundreds of billions of dollars. This cash bonanza will fuel Iran's terrorism worldwide, its aggression in the region and its efforts to destroy Israel, which are ongoing." Describing Iran as a "rogue regime," he added, "We will always defend ourselves." Israeli experts said that even though the agreement contained positive aspects that freeze or even roll back Iran's nuclear program over the coming decade, it was still deeply problematic given the Israeli conviction that Iran is patient when it comes to building its nuclear capabilities. Ephraim Asculai, who worked at the Israel Atomic Energy Commission for over 40 years, said the main problem he foresaw after reading the agreement was verification of Iranian compliance, particularly inspecting sites other than declared nuclear installations. Mr. Asculai said the verification mechanism "is lacking." "Access is limited," said Mr. Asculai, who is now at the Institute for National Security Studies in Tel Aviv. "One cannot go and search for undeclared facilities or undeclared materials and activities." Permission to visit an undeclared facility depends on inspectors presenting evidence of why they want to go there, he said. Since he speculated that that would involve revealing sensitive intelligence to the Iranians, he said "their hands are tied from the beginning." Emily Landau, the director of the institute's arms control and regional security project, asked, "If there is no perceivable change in Iran's military aspirations in the nuclear realm, the question is, why would sun-setting the deal be a good idea?" More fundamentally, Israeli experts say the agreement empowers Iran and affords legitimacy to its nuclear program, which it insists is for peaceful purposes. That, they say, is likely to trigger a nuclear arms race in the region, with Saudi Arabia, Egypt and Turkey likely to want to acquire similar capabilities. In a rare display of Israeli consensus, criticism of the deal crossed the political lines. Isaac Herzog, the leader of the center-left Zionist Union party and head of the opposition in Parliament, said that Israel was on the verge of "a new era in the Middle East that poses security and diplomatic challenges for Israel that are more dangerous and complex than any we have known before." Avigdor Lieberman, the former foreign minister and leader of the ultranationalist Yisrael Beiteinu party, which is also in the opposition, compared the accord to the Munich Agreement reached with Nazi Germany in 1938, saying, "It is an agreement of total capitulation to unrestrained terrorism and violence in the international arena." But Mr. Netanyahu's domestic opponents have differed on Israel's approach, particularly toward relations with the Obama administration. Some critics

are portraying the deal as a personal failure for **the prime minister**, who **infuriated the White House by addressing a joint meeting of Congress** in the spring **to attack the negotiations**. They

say that **the spoiled relations with the Obama administration harmed Israel's ability to influence** the outcome. **Mr. Netanyahu is now gearing up for the next fight: to lobby Congress** to reject the deal and ultimately override any presidential veto. **But that is likely to lead to further confrontation** between Mr. Netanyahu and Mr. Obama **at a time when many Israelis say what is needed is the rebuilding of trust and intimacy between the allies**

Amos Yadlin, a former chief of Israel's military intelligence, said in an interview that his recommendation was for Israel "not to meddle in internal American affairs." But he said that Israel could still come to understandings with the United States about what happens if Iran violates the agreement or decides to race toward building a bomb. At the same time, Mr. Yadlin said, Israel should maintain its "operational options," including a military option against Iran's nuclear facilities "for when all other options are exhausted." Aside from a possible nuclear arms race in the Middle East, Israeli experts are also concerned that American compensation for the deal in the form of arms packages for other United States allies in the region, such as Saudi Arabia, could also erode Israel's so-called qualitative edge when it comes to weapons. Although Israel and Saudi Arabia share concerns about Iran, they do not have diplomatic relations. "There is an agreement between Israel and the United States, which I hope won't be violated, that Israel should keep its qualitative edge under any circumstances," said Yaakov Amidror, a former Israeli national security adviser who is now at the Begin-Sadat Center for Strategic Studies at Bar-Ilan University near Tel Aviv. "This is not compensation but an obligation," he added. "In the Middle East," Mr. Amidror said, "the enemy of my enemy is not my friend, but another enemy."

US-Israeli relations have collapsed now

Steele 15 (Michael, 4-2-15, "Can US-Israeli relations get any worse?", MSNBC columnist and former RNC chairman, <http://www.msnbc.com/msnbc/can-us-israeli-relations-get-any-worse>, MJW)

Who would have thought, just a few years ago, that **relations between the United States and Israel would hit such an historic rock bottom?** Whether it's from the assorted tantrums, slights or outright "in-your-face" moments, the clear and present danger of the United States and Israel at odds with one another is troublesome. With the March 17 re-election of Israeli Prime Minister Benjamin Netanyahu behind them and the establishment of a possible Palestinian state thrown into doubt, as well as Netanyahu's legitimate opposition to the nuclear deal that the Obama administration is negotiating with Iran, now is the time for both the president and the prime minister to act less like playground bullies with each other and more like the leaders we need them to be.

The US- Israeli relationship is completely and permanently broken

Rosenberg 15 (MJ, contributor for the Huffington Post, 5-12-15, "The US-Israel Relationship Has Changed Permanently", http://www.huffingtonpost.com/mj-rosenberg/us-israel-relationship_b_6854930.html, MJW)

Don't believe it when you read that in a few days, weeks or months, everything will be back to normal in the U.S.-Israel relationship. They won't be. This is an old lobby mantra and it tends to emanate from friends of the lobby who simply cannot contemplate that anything will ever break the hold it has on policymakers. In one sense it's true. It is as unlikely that AIPAC will go down as it was 10 years ago that most U.S. states would legalize gay marriage! But it is going to happen because Prime Minister Netanyahu along with AIPAC (and its Congressional cutouts) have deeply embarrassed the American Jewish community in several ways. Note: when it comes to the power of the lobby, the Jewish community is the ball game. Those millions of Christian Zionists out there do not fund Congressional candidacies, nor are their votes in play. Moreover, for them Israel takes a way back seat to such issues as gay rights, illegal immigration, abortion and hating liberals and secularism. AIPAC is focused on only one issue, and directs money to campaigns on only one issue. **The conservative Christians are irrelevant.** That last point gets to one of **the ways the Netanyahu/Letter of 47 brouhaha has permanently damaged Israel's standing in America. It has made it partisan. Even before anyone contemplated Netanyahu coming to Congress to challenge President Obama, support for Israel was becoming a Republican issue** with Republicans in near solid support while Democrats were divided down the middle. **That trend is only accelerating now, as the Israeli government has made clear that it has no use for Democrats, and certainly not the Democratic president who it has treated with an open contempt rarely seen in international relations.** Given that the overwhelming majority of American Jews are Democrats and Obama supporters, **Netanyahu (with AIPAC's connivance) has successfully launched a wrecking ball at the foundation of Israel's support base in America.**

Relations with Israel are dead

Bremmer 15 (Ian, 5-2-15, President of Eurasia Group, and Global Research Professor at New York University, "The U.S. and Israel Are Divided — and That Won't Change", <http://time.com/3768165/us-israel-relations-middle-east-iran-divide/>, MJW)

Obama and Netanyahu don't like each other, but Israel and the U.S. will have problems even when they're both out of office. Some accuse President Obama of undermining Israel's security to protect a peace process that's going nowhere. Others say Prime Minister Benjamin Netanyahu is poisoning Israel's relations with his country's superpower protector and isolating Israel internationally. It's clear that Obama and Netanyahu don't trust or like each other. But the widening divide between these countries can't be reduced to a personality conflict between leaders. Differences in the interests and worldviews of the two governments are becoming more important. Begin with the "two-state solution." In Washington, leaders of both parties will continue to prioritize the U.S. commitment to Israel's security. But Obama isn't the only U.S. official who publicly supports the idea of an eventual Israeli compromise with Palestinians. Former President George W. Bush described himself in 2008 as the "first American president to call for a Palestinian state." Support for this aspiration remains part of the Republican Party platform. **Israelis, on the other hand, even those who support a two-state solution in principle, are far more aware of the challenges in creating a viable country that connects Gaza and the West Bank**—to say nothing of the political nightmare of trying to evict thousands of Israeli settlers from

disputed land. Support for a two-state solution is not dead in either country, but Americans and Israelis do not look at this question with the same eyes. With every surge in Israeli-Palestinian violence, that gap becomes more obvious. Obama and Netanyahu also hold opposing views on how best to ensure that Iran doesn't develop nuclear weapons, but that difference reflects divergent ideas within their governments on the role Iran might play in the future. For the Obama administration, Iran might one day become an agent of change in the Middle East. because it's a country that holds genuinely contested elections, however flawed, and it's one in which a sizeable majority isn't old enough to remember the religious revolution that the country's leaders say gives them their mandate. For Israel's government, Iran's hardliners remain in firm control. Whatever the aspirations of its young people, Israel believes Iran must remain isolated until its elections are fully free and fair and its leaders recognize Israel's right to exist. Nuclear negotiations have widened this gap.

US-Israel relations on the brink—lowest in years

Steele, American Politician, April 2, 2015 (Michael Steele, American Politician and MSNBC political analyst, "Can US-Israeli relations get any worse?", MSNBC, 4/2/15, AKHB)

Who would have thought, just a few years ago, that relations between the United States and Israel would hit such an historic rock bottom?

Whether it's from the assorted tantrums, slights or outright "in-your-face" moments, the clear and present danger of the United States and Israel at odds with one another is troublesome. With the March 17 re-election of Israeli Prime Minister Benjamin Netanyahu behind them and the establishment of a possible Palestinian state thrown into doubt, as well as Netanyahu's legitimate opposition to the nuclear deal that the Obama administration is negotiating with Iran, now is the time for both the president and the prime minister to act less like playground bullies with each other and more like the leaders we need them to be.

Unfortunately, it doesn't take much to get a sense of the impact the tensions between these two men is having on the rest of us.

Support for Mr. Netanyahu's speech before the Congress hit a brick wall with most Democrats. Minority Leader Nancy Pelosi summed it up this way: "AS ONE WHO VALUES THE U.S.-ISRAEL RELATIONSHIP, AND LOVES ISRAEL, I WAS NEAR TEARS THROUGHOUT THE PRIME MINISTER'S SPEECH — SADDENED BY THE INSULT TO THE INTELLIGENCE OF THE UNITED STATES as part of the P5 +1 nations, AND SADDENED BY THE CONDESCENSION TOWARD OUR KNOWLEDGE OF THE THREAT POSED BY IRAN AND OUR BROADER COMMITMENT TO PREVENTING NUCLEAR PROLIFERATION."

Similarly strong views emerged regarding the administration after Mr. Netanyahu's successful re-election: "MR. OBAMA'S CLUMSY AND MALICIOUS HANDLING OF RELATIONS WITH ISRAEL ... IS BUT ONE BRICK IN A WALL OF FAILURE AND INFAMY," Peter Wehner wrote in Commentary. "The fact that ... Netanyahu emerged victorious in his (election) confrontation with Obama – a confrontation that can be traced to Obama's hostility not just to Netanyahu but to Israel – is a heartening development in a world that is increasingly chaotic and violent."

No US-Israel: Econ Specific

Israel wants to sever ties with US due to economy boom

NBC 13 (Written by Martin Fletcher, who's a correspondent and writer for the NBC, 4/14/13, http://worldnews.nbcnews.com/_news/2013/04/14/17690032-israels-booming-economy-puts-billions-in-us-aid-under-spotlight, "Israel's Booming Economy puts Billions in US Aid Under Spotlights", EM)

TEL AVIV, Israel -- **BOOSTED BY NEWLY DISCOVERED NATURAL RESOURCES, ISRAEL IS SURGING AHEAD ECONOMICALLY** -- a success that is pushing the issue of the country's \$3 billion in annual aid from the United States onto the agenda. The country made its first intervention in the foreign currency market in almost two years Tuesday, buying \$100 million to peg back the growing strength of its shekel. A Bloomberg survey this week said **THE SHEKEL WAS THE STRONGEST OF 31 MAJOR CURRENCIES** tracked over the last six months. Last week, Israel passed another milestone, a potential gamechanger for its economy. **GAS BEGAN TO FLOW FROM GAS FIELDS OFF THE COAST. BY 2015 ISRAEL IS EXPECTED TO BE FULLY ENERGY INDEPENDENT, AND MAY BE A NET EXPORTER.** And there's more good news: In this water-challenged region, **ISRAEL IS WELL ON THE WAY TO WATER INDEPENDENCE.** Its water desalination industry supplies up to 40 percent of the country's demand for water, and another 40 percent comes from recycled water from domestic and commercial consumption. Israel reuses its water two to three times. The boom may give a louder voice to calls for a reduction to the \$3 billion worth of financial assistance Israel receives from the U.S. each year -- especially in the Washington, where budget battles continue. U.S. campaign groups such as Stop The Blank Check and the Council for the National Interest have long campaigned for the aid program to end, but Republican Sen. Rand Paul recently joined the debate by saying the U.S. could no longer afford to keep borrowing money and then handing it out to others. "It will be harder to be a friend of Israel if we are out of money. It will be harder to defend Israel if we destroy our country in the process," Paul told the Jerusalem Institute for Market Studies, an Israeli think tank, in January. 'A political football' That view is echoed by some in Israel, such as **NAFTALI BENNETT, A** software tycoon and **LEADER OF THE RIGHT-WING JEWISH HOME POLITICAL PARTY**, who during the recent election campaign **SAID THE COUNTRY NEEDED TO FREE ITSELF FROM U.S. ASSISTANCE.** "Our situation today is very different from what it was 20 and 30 years ago. **ISRAEL IS MUCH STRONGER, MUCH WEALTHIER, AND WE NEED TO BE INDEPENDENT," HE SAID.** Michael Koplow, program director of the Israel Institute, a Washington think tank, said: "Foreign aid is always a political football -- even more so when it comes to Israel. There is no doubt American attention is focused on its own finances." However, he noted that 74 percent of the U.S. aid, which is meant for military and defense equipment, has to be spent with U.S. companies. "Given that Israel is a reliable military spender, you would have to think the defense lobby is going to make sure this aid continues," Koplow said. Even those hostile to the aid think it unlikely that Israel's prosperity will prompt a change. "The money doesn't help alleviate poverty in Israel now, so there is no reason why lack of poverty there would cause it to end," said Robert Naiman, director of Just Foreign Policy. Yossi Mekelberg, associate fellow of the Middle East and North Africa Program at the U.K.'s Chatham House think tank, said: "It would be a matter of national pride to be economically successful and independent, but providing financial support also gives some leverage with Israel." And Israel still has economic problems. Unemployment is relatively low at 6.3 per cent, but the gap between rich and poor is one of the highest of all developed countries, according to the OECD. "I don't think a natural gas boom is going to do much to change that," observed Koplow. That disparity swept Yair Lapid, an inexperienced but popular new politician, into the finance ministry earlier this year as part of Prime Minister Benjamin Netanyahu's ruling coalition. Most of his support came from the disillusioned middle class whose summer of protests in 2011 changed the country's priorities from political to social issues. Now Lapid, 49, has to make good on his election challenge. "Where's the Money?" Newspapers on Wednesday reported that Lapid had clashed with officials in his department who proposed increases to tuition fees for university students. Lapid responded on his Facebook page that "if students have to pay more I'll go home and demonstrate against myself." And as the government searches for budgets to cut and taxes to raise, newspapers are full of reports that Israel's richest man, Idan Ofer, has decided to relocate to London in order to avoid paying more taxes -- a motive his associates deny. He has become a juicy target for critics who have long claimed that the country's handful of tycoons have been milking the country dry, leaving the poor to foot the bill. The gap between rich and poor, and how strange this is for Israel is brought up on the kibbutz ethos of "we're all equal," was well illustrated by the proverbial taxi driver who told a reporter, "Israel has changed. We all used to wear sandals. If you were rich, you wore better sandals."

US-Israel Strong

US-Israeli relations unshakeable- common goals, security cooperation, economic development

Garamone 15 Jim, US DoD reporter, DoD News, June 10, 2015,
<http://www.defense.gov/news/newsarticle.aspx?id=129015>, CC

THOUGH THE United States AND ISRAEL DISAGREE ABOUT the proposed deal to limit IRAN'S NUCLEAR PROGRAM, THAT DOES NOT AFFECT AMERICA'S UNSHAKABLE COMMITMENT TO THE DEFENSE OF ISRAEL, a senior administration official said here today. Speaking on background, the official said THE TWO COUNTRIES HAVE A "NEAR IDENTICAL" UNDERSTANDING OF THE THREAT IRAN POSES to the region. U.S. AND ISRAELI OFFICIALS HAVE SAID IRAN CANNOT BE ALLOWED TO GAIN NUCLEAR CAPABILITY AND that all options are on the table to prevent that from happening. Where the two allies diverge is in determining the best way to proceed. The U.S. position is that sanctions and negotiations are the best means to accomplish this, and the Israelis believe Iran cannot be trusted, the official said. Israeli Prime Minister Benjamin Netanyahu called the proposed pact with Iran a "grave danger" to Israel and said it legitimized the pariah state's nuclear program. Iran agreed to the pact April 2, and negotiators are working out the details with a July 1 deadline for a final agreement. THE United States AND ISRAEL AGREE THAT IRAN IS A THREAT WITH OR WITHOUT NUCLEAR WEAPONS, the official said. Iran is spreading ballistic missile technology, selling weapons in the region and operating throughout the region via surrogates and proxies, he said. IRANIAN moves with naval mines and UNDERSEA ACTIVITIES ARE Another CONCERN, AS IS IRAN'S THREAT IN CYBERSPACE, the official said. But a nuclear Iran would make all this much worse, he added. "The threat affects us differently because of our size and location, but we agree on the threat completely," the official said. "WE AGREE ON THE strategic OBJECTIVE COMPLETELY, WHICH IS TO PREVENT IRAN FROM GETTING A NUCLEAR WEAPON." U.S. officials say a pact will include inspection and verification protocols that would preclude Iranian cheating. "We know we need to get a good deal," the official said. "There isn't going to be a deal if it doesn't meet those needs." The bottom line is the U.S. COMMITMENT TO ISRAELI SECURITY IS A BEDROCK COMMITMENT DEAL OR NO DEAL, he said. U.S. support to Israel will continue even after an agreement with Iran, the official said. "As we look at the world after the negotiations, ... we will work with Israel on strengthening security cooperation further," he said. "If additional elements need to be brought into that security agreement, we will talk together and figure those out." That the Israelis look at the situation differently is to be expected, the official acknowledged. They live in the region, and they have heard Iranian leaders "threaten to wipe them off the map," the official said. "They are the ones who see Iranian proxies from multiple directions being armed and conducting terrorist activities or destabilizing neighbors, or shooting missiles at them," he added. "You can absolutely understand that when you sit here and look out at those threats at much closer proximity, ... you might have a different calculus on that decision than we do," he said. "We need to take that into account, and we do, and it frankly informed our decisions." It's never comfortable to have public disagreements with a close friend, the official said. "Still, IT'S A SIGN OF HOW CLOSE THE RELATIONSHIP BETWEEN THE United States AND ISRAEL IS, and how unshakeable -- that EVEN WHEN WE HAVE AN IMPORTANT DISAGREEMENT on a serious subject and it's become public, ... ALL THAT BEDROCK joint SECURITY COOPERATION, all that PEOPLE-TO-PEOPLE WORK, all the JOINT ECONOMIC PROGRESS CONTINUES APACE," he said.

AT: Impact

Israel-Iran

Israel won't attack Iran

Keck 15 (Zachary, february 9th 2015, "5 Reasons Israel Won't Attack Iran", <http://nationalinterest.org/commentary/five-reasons-israel-wont-attack-iran-9469>, MJW)

First, **if Israel was going to strike Iran's nuclear facilities, it would have done so a long time ago. Since getting caught off-guard at the beginning of the Yom Kippur War in 1973, Israel has generally acted proactively to thwart security threats.** On no issue has this been truer than with nuclear-weapon programs. For example, **Israel bombed Saddam Hussein's program when it consisted of just a single nuclear reactor.** According to ABC News, **Israel struck Syria's lone nuclear reactor just months after discovering it.** The IAEA had been completely in the dark about the reactor, and took years to confirm the building was in fact housing one. **Contrast this with Israel's policy toward Iran's nuclear program. The uranium-enrichment facility in Natanz and the heavy-water reactor at Arak first became public knowledge in 2002. For more than a decade now, Tel Aviv has watched as the program has expanded into two fully operational nuclear facilities, a budding nuclear-research reactor, and countless other well-protected and -dispersed sites. Furthermore, America's extreme reluctance to initiate strikes on Iran was made clear to Israel at least as far back as 2008. It would be completely at odds with how Israel operates for it to standby until the last minute when faced with what it views as an existential threat.**

Israel won't strike Iran alone, despite nuclear deal

Tarnopolsky, 7-15-2015(Noga, Noga Tarnopolsky has two decades of experience covering the Israeli-Palestinian conflict, the US in the Middle East, and human rights in South America. Among many destinations, Noga has reported from Argentina, Mexico, Jordan, Uzbekistan, Poland, Turkey and France. Her work has been published in the New York Times, the New Yorker, the Washington Post, Ha'aretz, El País and DailyBeast, among others, and she has appeared as an analyst on CNN, Univisión and Televisa. She once was a food and wine columnist. Noga grew up in Switzerland where she attended the International School of Geneva and is a graduate of Amherst College, "Israel won't strike Iran alone, no matter how much it hates the nuclear deal," Reuters, <http://blogs.reuters.com/great-debate/2015/07/15/israel-wont-strike-iran-alone-no-matter-how-much-it-hates-the-nuclear-deal/>, A.ZHU)

The day after a nuclear deal with Iran was announced, the sun rose high above Jerusalem's shimmering hills just as it does every July, as if the ancient land shrugged off two decades of apocalyptic warnings from Israeli Prime Minister Benjamin Netanyahu and decided to go about its usual routine. ISRAELI OFFICIALS ACROSS THE POLITICAL LANDSCAPE DECRIED THE "VERY BAD DEAL," AS NETANYAHU TERMED THE AGREEMENT, which the United States and five world powers hope will curb Iran's weaponization of its nuclear program. BUT NO ONE, NOT EVEN THE PRIME MINISTER, RATTLED THE SABERS OF WAR. "AN ISRAELI ATTACK ON IRANIAN NUCLEAR SITES IS NO LONGER A RELEVANT SCENARIO," WROTE AMOS HAREL, MILITARY ANALYST FOR THE ISRAELI DAILY HAARETZ. Once the agreement was announced late Tuesday night, NETANYAHU'S FIRST, BRIEF STATEMENT IGNORED THE NUCLEAR ISSUE ENTIRELY AND ASSERTED THAT "THE WORLD IS A MUCH MORE DANGEROUS PLACE TODAY THAN IT WAS YESTERDAY." "The leading international powers have bet our collective future on a deal with the foremost sponsor of international terrorism," the statement said. "They've gambled that in 10 years' time, Iran's terrorist

regime will change while removing any incentive for it to do so." It was not a frivolous sentiment for the leader of a small state on permanent war alert with two of Iran's ruthless proxies, Hezbollah and Hamas, on its northern and southern borders. In an interview with the New York Times a few hours later, President Barack Obama responded soberly (if testily) to the charge. "WHAT'S BEEN STRIKING TO ME IS THAT INCREASINGLY THE CRITICS ARE SHIFTING OFF THE NUCLEAR ISSUE, AND THEY'RE MOVING INTO 'WELL,' " THE PRESIDENT SAID, SLIPPING INTO HIS OPPONENTS' CHARACTERS, " "EVEN IF THE NUCLEAR ISSUE IS DEALT WITH, THEY'RE STILL GOING TO BE SPONSORING TERRORISM AND THEY'RE STILL GOING TO GET THE SANCTIONS RELIEF AND SO THEY'RE GOING TO HAVE MORE MONEY TO ENGAGE IN THESE BAD ACTIVITIES.' " "That is a possibility," the president acknowledged. "AND WE ARE GOING TO HAVE TO SYSTEMATICALLY GUARD AGAINST THAT AND WORK WITH OUR ALLIES, THE GULF COUNTRIES, ISRAEL, TO STOP THE WORK THAT THEY ARE DOING OUTSIDE OF THE NUCLEAR PROGRAM."

No chance of Israel strike – CIA director

Ginsburg, 7-15-2015, (Mitch, Mitch Ginsburg, a literary translator and long-time journalist, is military correspondent at the Times of Israel, "For Israel, Iran deal could signify a renewed military option," Times of Israel, <http://www.timesofisrael.com/for-israel-iran-deal-could-signify-a-renewed-military-option/>, A.ZHU)

INTERNATIONALLY, THERE SEEMS TO BE A SENSE OF NEAR UNANIMITY REGARDING ISRAEL'S INABILITY TO CARRY OUT A DEBILITATING STRIKE IN IRAN. FORMER CIA DIRECTOR AND COMMANDER OF US FORCES IN IRAQ GEN. DAVID PETRAEUS PRACTICALLY RIDICULED THE notion in a recent conversation with Jeffrey Goldberg in Aspen. Patiently, as though to a group of school children, HE NOTED THAT ISRAEL LACKS THE 30,000-POUND BOMB THAT THE US HAS AND POSSESSES NO PLANE CAPABLE OF CARRYING IT. Therefore, he left unsaid, ISRAEL HAS NO WAY TO THWART MILITARILY IRAN'S NUCLEAR AMBITIONS.

Impact Turn: Terrorism

Impact Turn- Us-Israeli relations motivate terrorism (including 911) and undermine all US foreign policy goals

Madar 14 (Chase, February 10 2014, civil rights attorney in New York and writer for the Nation, "Why Bankrolling Israel Prevents Peace in the Middle East", <http://www.thenation.com/article/washingtons-military-aid-israel/>, MJW)

Silence about **US-Israel relations is**, to a large degree, **hardwired into Beltway culture**. As George Perkovich, director of the nuclear policy program at the Carnegie Endowment for International Peace told *The Washington Post*, "It's like all things having to do with Israel and the United States. If you want to get ahead, you don't talk about it; you don't criticize Israel, you protect Israel. **This is regrettable, as Washington's politically invisible military aid to Israel is not just an impediment to lasting peace but also a strategic and security liability**. As General David Petraeus, then head of US Central Command, testified to the Senate Armed Services Committee in 2010, **the failure to reach a lasting resolution to the conflict between the Israelis and Palestinians makes Washington's other foreign policy objectives in the region more difficult to achieve. It also**, he pointed out, **fosters anti-American hatred and fuels al-Qaeda** and other violent groups. Petraeus's successor at CENTCOM, General James Mattis, echoed this list of liabilities in a public dialogue with Wolf Blitzer last July: "I paid a military security price every day as a commander of CENTCOM because the **Americans were seen as biased in support of Israel, and that [alienates] all the moderate Arabs who want to be with us because they can't come out publicly in support of people who don't show respect for the Arab Palestinians**. Don't believe the generals? **Ask a terrorist. Khalid Sheikh Mohammed, mastermind of the 9/11 attacks** now imprisoned at Guantánamo, **told interrogators that he was motivated to attack the United States in large part because of Washington's leading role in assisting Israel's repeated invasions** of Lebanon and the ongoing dispossession of Palestinians.

Terrorists are motivated to attack the US because of our support for Israel

Blair 05 (Tony, National Post (Canada), July 18th 2005, "Pulling the jihadis up by their roots", <http://www.lexisnexis.com.proxy.lib.umich.edu/hottopics/Inacademic/>, MJW)

From the mid 1990s onwards, **statements from al-Qaeda gave very clear expression to this ideology. According to this way of thinking, every Muslim is supposed to carry hatred toward Americans, Jews and Christians. The creation of Israel, they believe, is a crime that has to be erased. Thus, targeting Americans and Jews and killing them** anywhere you find them **is presented as one of the greatest duties** and acts of piety **one can offer to God Almighty**.

No Israel Attack

No Israel attack—Israel should have attacked long ago

Keck, managing editor, February 9, 2015 (Zachary Keck, editing manager of The Diplomat and The National Interest, “5 Reasons Israel Won’t Attack Iran”, The National Interest, 2/9/15, AKHB)

First, if Israel was going to strike Iran’s nuclear facilities, it would have done so a long time ago. Since getting caught off-guard at the beginning of the Yom Kippur War in 1973, Israel has generally acted proactively to thwart security threats. On no issue has this been truer than with nuclear-weapon programs. For example, Israel bombed Saddam Hussein’s program when it consisted of just a single nuclear reactor. According to ABC News, Israel struck Syria’s lone nuclear reactor just months after discovering it. The IAEA had been completely in the dark about the reactor, and took years to confirm the building was in fact housing one.

Contrast this with Israel’s policy toward Iran’s nuclear program. The uranium-enrichment facility in Natanz and the heavy-water reactor at Arak first became public knowledge in 2002. For more than a decade now, Tel Aviv has watched as the program has expanded into two fully operational nuclear facilities, a budding nuclear-research reactor, and countless other well-protected and -dispersed sites. Furthermore, America’s extreme reluctance to initiate strikes on Iran was made clear to Israel at least as far back as 2008. It would be completely at odds with how Israel operates for it to standby until the last minute when faced with what it views as an existential threat.

No motive to attack—Israel attack bad for them and good for Iran; will cause Iran to retaliate

Keck, managing editor, February 9, 2015 (Zachary Keck, editing manager of The Diplomat and The National Interest, “5 Reasons Israel Won’t Attack Iran”, The National Interest, 2/9/15, AKHB)

Much like a U.S. strike, only with much less tactical impact, an Israeli air strike against Iran’s nuclear facilities would only increase the likelihood that Iran would build the bomb. At home, Supreme Leader Ali Khamenei could use the attack to justify rescinding his fatwa against possessing a nuclear-weapons program, while using the greater domestic support for the regime and the nuclear program to mobilize greater resources for the country’s nuclear efforts.

Israel’s attack would also give the Iranian regime a legitimate (in much of the world’s eyes) reason to withdraw from the Nuclear Non-Proliferation Treaty (NPT) and kick out international inspectors. If Tehran’s membership didn’t even prevent it from being attacked, how could it justify staying in the regime? Finally, support for international sanctions will crumble in the aftermath of an Israeli attack, giving Iran more resources with which to rebuild its nuclear facilities.

3. Helps Iran, Hurts Israel

Relatedly, an Israeli strike on Iran’s nuclear program would be a net gain for Iran and a huge loss for Tel Aviv. Iran could use the strike to regain its popularity with the Arab street and increase the pressure

against Arab rulers. As noted above, it would also lead to international sanctions collapsing, and an outpouring of sympathy for Iran in many countries around the world.

Meanwhile, a strike on Iran's nuclear facilities would leave Israel in a far worse-off position. Were Iran to respond by attacking U.S. regional assets, this could greatly hurt Israel's ties with the United States at both the elite and mass levels. Indeed, a war-weary American public is adamantly opposed to its own leaders dragging it into another conflict in the Middle East. Americans would be even more hostile to an ally taking actions that they fully understood would put the U.S. in danger.

Furthermore, the quiet but growing cooperation Israel is enjoying with Sunni Arab nations against Iran would evaporate overnight. Even though many of the political elites in these countries would secretly support Israel's action, their explosive domestic situations would force them to distance themselves from Tel Aviv for an extended period of time. Israel's reputation would also take a further blow in Europe and Asia, neither of which would soon forgive Tel Aviv.

Attack makes no sense—deal with Iran has been made to prevent access to a bomb
Mullen and Robertson, editor for CNN Digital and Senior International Correspondent respectively, July 14, 2015 (Jethro Mullen is a writer and editor for CNN Digital with a focus on news in the Asia-Pacific region, Nic Robertson is a CNN Senior International Correspondent, "Landmark deal reached on Iran nuclear program", CNN Politics, 7/14/15, AKHB)

After arduous talks that spanned 20 months, negotiators have reached a landmark deal aimed at reining in Iran's nuclear program.

The agreement, a focal point of U.S. President Barack Obama's foreign policy, appears set to reshape relations between Iran and the West, with its effects likely to ripple across the volatile Middle East.

Representatives of Iran, the United States and the other nations involved in the marathon talks held a final meeting in Vienna on Tuesday.

Obama will hold a press conference on Wednesday in the East Room of the White House to address questions on the agreement.

The president praised the deal on Tuesday morning, saying the agreement met the goals he had in place throughout negotiations.

"Today after two years of negotiation the United States together with the international community has achieved something that decades of animosity has not: a comprehensive long-term deal with Iran that will prevent it from obtaining a nuclear weapon," Obama said from the White House, with Vice President Joe Biden at his side.

"This deal is not built on trust. It's built on verification," Obama said Tuesday.

Iranian President Hassan Rouhani also praised the deal, speaking after Obama finished, as televisions in Iran broadcast the U.S. President's statement live, translated into Farsi.

"Negotiators have reached a good agreement and I announce to our people that our prayers have come true," Rouhani said in a live address to the nation following Obama.

The essential idea behind the deal is that in exchange for limits on its nuclear activities, Iran would get relief from sanctions while being allowed to continue its atomic program for peaceful purposes.

After news of the deal emerged, Yukiya Amano, the chief of the International Atomic Energy Agency, said he had signed a "roadmap" with the Iranian government "for the clarification of past and present outstanding issues regarding Iran's nuclear program."

Israel will not strike, deterrence focus

Beres and Edney, 7-14-2015, (Louis René and Leon, Louis René Beres is emeritus professor of political science and international law at Purdue. He is the author of many major books and articles on nuclear strategy and nuclear war, as well as several research monographs prepared for IDC Herzliya, the BESA Center for Strategic Studies at Bar-Ilan University and the Institute for National Security Studies in Tel-Aviv. His tenth book, "Israel's Nuclear Strategy: Surviving Amid Chaos," will be published later this year, Leon "Bud" Edney, a retired U.S. Navy admiral, served as the vice chief of naval operations, NATO supreme allied commander atlantic and commander-in-chief of the U.S. Atlantic Command. Adm. Edney, who holds an advanced degree from Harvard, was also a distinguished professor of leadership at the U.S. Naval Academy, "What Now for Israel?," US News & World Report, <http://www.usnews.com/opinion/blogs/world-report/2015/07/14/after-the-iran-nuclear-agreement-what-are-israels-security-options>, A.ZHU)

To be sure, following careful assessments of the new Iran agreement, Israel's prime minister will need to make an 11th-hour decision on preemption. In principle, at least, considering any such defensive first strike against Iranian nuclear assets and infrastructures could still make strategic sense if the following conditions were assumed: 1. Iran will inevitably become militarily nuclear; 2. Iran will very likely plan to use its new nuclear forces in a first-strike aggression against Israel; and 3. Iran's key decision makers will likely be irrational. Regarding core definitions, irrational decision-makers would be those Iranian leaders who could sometime value certain preferences or combinations of preferences (e.g., certain Shiite religious expectations) more highly than Iran's national survival. In the absence of any one of these three critical assumptions, THE EXPECTED RETALIATORY COSTS TO ISRAEL OF ANY CONTEMPLATED PREEMPTION WOULD PLAUSIBLY EXCEED THE EXPECTED BENEFITS. MOREOVER, THERE WOULD BE NOTHING GENUINELY SCIENTIFIC ABOUT MAKING SUCH DIFFICULT POLICY CHOICES. For one thing, ALL OF THE ASSOCIATED PROBABILITY JUDGMENTS WOULD NEED TO BE OVERWHELMINGLY SUBJECTIVE. How, for example, could Israeli analysts say anything meaningfully predictive about unique or unprecedented circumstances? In science, probabilities must always be based upon the determinable frequency of past events. Here, however, in pertinent history, there exists no usable guidance. To wit, exactly HOW MANY PREEMPTIVE ATTACKS HAVE ALREADY BEEN LAUNCHED BY A NUCLEAR STATE AGAINST A NEARLY-NUCLEAR STATE? THE "ZERO" ANSWER IS OBVIOUS AND IRREFUTABLE. It must, therefore, be a cautionary reply. An additional complication exists. The nearly-nuclear state, IRAN, WILL STILL POSSESS LARGE CONVENTIONAL AND CHEMICAL ROCKET FORCES. MANY OTHER THREATENING MISSILES WILL REMAIN UNDER THE OPERATIONAL CONTROL OF ITS SUB-STATE TERRORIST PROXIES. HEZBOLLAH, THE WELL-ARMED SHIITE MILITIA, ALREADY HAS MORE ROCKETS IN ITS ARSENAL THAN DO ALL NATO COUNTRIES COMBINED; it is even less likely than Iran's own leaders to hold back on any post-preemption retaliations. All things considered, Israel's best security plan, going forward, would be to enhance its underlying nuclear deterrence posture, and to render this critical enhancement as conspicuous as possible. More precisely, this means that Jerusalem should do everything possible to

signal to any future Iranian aggressor that its own nuclear forces are plainly survivable, and capable of penetrating any of Tehran's ballistic missile or other active defenses. CORRESPONDINGLY, IT WILL ALSO BECOME NECESSARY FOR ISRAEL TO MOVE VERY CAREFULLY BEYOND ITS TRADITIONAL POSTURE OF DELIBERATE NUCLEAR AMBIGUITY, OR THE SO-CALLED "BOMB IN THE BASEMENT." In the irremediably arcane world of Israeli nuclear deterrence, it can never be adequate that enemy states should simply acknowledge the Jewish State's nuclear status. It is equally important that these adversarial states believe Israel to hold usable and survivable nuclear forces, and be willing to employ these weapons in certain clear and readily identifiable circumstances. Israel's nuclear doctrine and weapons are necessary to various scenarios that could require conventional preemptive action, or more residually, a specifically nuclear retaliation. In any event, FOR ISRAEL, THE CORE PURPOSE OF ITS NUCLEAR WEAPONS MUST ALWAYS BE DETERRENCE EX ANTE, NOT REVENGE EX POST. An integral part of Israel's multi-layered security system lies in maintaining effective ballistic missile defenses, primarily, the Arrow or "Hetz." YET, EVEN THE WELL-REGARDED AND SUCCESSFULLY-TESTED ARROW COULD NEVER ACHIEVE A SUFFICIENTLY HIGH CAPACITY FOR MISSILE INTERCEPT, A QUALITY NEEDED TO ADEQUATELY PROTECT ISRAELI CIVILIANS FROM ANY IRANIAN NUCLEAR ATTACK. IN ESSENCE, THIS MEANS THAT ISRAEL CAN NEVER RELY TOO HEAVILY UPON ACTIVE DEFENSES FOR ITS NATIONAL PROTECTION. What about the prospect of an irrational Iranian adversary? Any Israeli move from ambiguity to disclosure, however selective, might not help in the particular case of an irrational nuclear enemy. It remains possible, or even plausible, that certain elements of Iranian leadership will determinedly subscribe to certain end-times visions of a Shiite apocalypse. STILL, TAKEN BY ITSELF, SUCH SUBSCRIPTION DOES NOT AUTOMATICALLY OR EVEN PERSUASIVELY CALL FOR AN ISRAELI PREEMPTION. A few months ago, the German Federal Security Council approved the delivery of a fifth Dolphin-II class submarine to Israel. When it is time for Israel to selectively ease away from nuclear ambiguity, a fully-survivable, hardened and dispersed strategic second-strike force should be made generally recognizable. Further, such a robust strategic force should be designed to make any foe understand that the costs of planned nuclear aggression against Israel would assuredly result in destruction of the attacker's key cities. On this core point of high-value targeting, there should be reserved a very special place for sea-basing (submarines) a suitable portion of Israel's nuclear deterrent. New agreements notwithstanding, growing instability in the Middle East now heightens the prospect for expansive new wars, either by deliberateness or by miscalculation. From the critical perspective of maintaining its credible nuclear deterrence against a still-nuclearizing Iran, Israel should prepare, inter alia, to reexamine and aptly modify its traditional policy of deliberate nuclear ambiguity. As for any last-minute Israeli preemption against Iran, there exists no compelling scientific reason to believe that such a defensive strike would be ascertainably rational, or appropriately cost-effective.

!! Israeli attack not possible despite Iran deal

Harel 7/14/15 Amos, one of Israel's leading media experts on military and defense issues. He has been the military correspondent and defense analyst for Haaretz for the last 12 years. In this role, he has written extensively about Israel's ongoing fight against terrorist organizations, its battles during the Palestinian Intifadah (uprising) and the last war in Lebanon. Bachelor's in law. July 14, 2015, Haaretz, <http://www.haaretz.com/news/diplomacy-defense/.premium-1.666059>, CC

The serious crisis in U.S.-Israeli relations, at whose lies the tense relationship between Obama and Benjamin Netanyahu, has produced a situation in which the prime minister's influence over the nuclear talks' final stages was marginal. Now, beyond the criticism that he will level at the U.S. president,

Netanyahu is expected to gear up for the battle in Congress in an effort to hamstring Obama. In other words, he will strive to block the administration's promises to lift Congressional sanctions on Iran. Despite Netanyahu's following among Republicans and the fact that the delay of the Vienna signing date added two months to the Congressional approval period, Netanyahu's success hinges on recruiting 13 Democratic Senators to the nuclear agreement's opponents. Prospects for that don't appear high at the moment, despite the agreement's many flaws. In any event, the Prime Minister's Office will invest huge effort in the battle, which will of course also see a sharper tone vis-a-vis Obama and his policies. One would hope that disagreements on principles and personalities won't burn the bridges that link Jerusalem and Washington. Ultimately, **EVEN AFTER THE CONFRONTATION IN CONGRESS, OBAMA IS EXPECTED** to be waiting at the White House, checkbook in hand, for Netanyahu. He's expected **TO PUT TOGETHER A PACKAGE GIVING ISRAEL GENEROUS MILITARY COMPENSATION FOR THE IRANIAN AGREEMENT. OBAMA** and his spokespeople **WILL** try to **PROMOTE THE DEAL AS A HUGE AMERICAN FOREIGN-POLICY SUCCESS**, as the most important development in the president's two terms. In practice, one could have hoped for a better agreement, but even if the Vienna accord is full of loopholes, it's close to being a fait accompli. On the other hand, **DESPITE THE FERVENT RHETORIC OF** some **Israeli politicians, an Israeli attack on Iranian nuclear sites is no longer a relevant scenario. IF**, as **OBAMA** expects, he **OVERCOMES CONGRESSIONAL OPPOSITION, WE WILL BE LEFT WITH IRAN** as a strong regional power with its slew of bad intentions, but at this stage **WITHOUT A MILITARY NUCLEAR CAPABILITY**. The Israeli response to this threat depends on achieving closer ties with the United States, enhancing the Israel Defense Forces' capabilities with American assistance, and strengthening the cooperation with the more moderate Sunni countries in the region. It's a complicated picture, but not necessarily the bleakest one.

Surveillance doesn't solve Iran

War now with Iran only way to stop its quest for nuclear weapons

Muravchik 15 (The Washington Post, Joshua Muravchik is a fellow at the Foreign Policy Institute of Johns Hopkins University's School of Advanced International Studies. "War with Iran is Probably our Best Option", http://www.washingtonpost.com/opinions/war-with-iran-is-probably-our-best-option/2015/03/13/fb112eb0-c725-11e4-a199-6cb5e63819d2_story.html, EM)

The logical flaw in the indictment of a looming "very bad" nuclear deal with Iran that Israeli Prime Minister Benjamin Netanyahu delivered before Congress this month was his claim that we could secure a "good deal" by calling Iran's bluff and imposing tougher sanctions. **THE IRANIAN REGIME** that Netanyahu described so vividly — violent, rapacious, devious and redolent with hatred for Israel and the United States — **IS BOUND TO CONTINUE ITS QUEST FOR NUCLEAR WEAPONS BY REFUSING ANY "GOOD DEAL"** or by cheating. This gives force to the Obama administration's taunting rejoinder: What is Netanyahu's alternative? War? But the administration's position also contains a glaring contradiction. National security adviser Susan Rice declared at an American Israel Public Affairs Committee conference before Netanyahu's speech that **"A BAD DEAL IS WORSE THAN NO DEAL."** So **IF IRAN WILL ACCEPT ONLY A "BAD DEAL," WHAT IS PRESIDENT OBAMA'S ALTERNATIVE? WAR?** Obama's stance implies that we have no choice but to accept Iran's best offer — whatever is, to use Rice's term, "achievable" — because the alternative is unthinkable. **SANCTIONS MAY HAVE INDUCED IRAN TO ENTER NEGOTIATIONS, BUT THEY HAVE NOT PERSUADED IT TO ABANDON ITS QUEST FOR NUCLEAR WEAPONS. NOR WOULD THE STIFFER SANCTIONS THAT NETANYAHU ADVOCATES BRING A DIFFERENT RESULT.** Sanctions could succeed if they caused the regime to fall; the end of communism in Ukraine and Kazakhstan, and of apartheid in South Africa, led to the abandonment of nuclear weapons in those states. But since 2009, there have been few signs of rebellion in Tehran. Otherwise, only military actions — by Israel against Iraq and Syria, and through the specter of U.S. force against Libya — have halted nuclear programs. Sanctions have never stopped a nuclear drive anywhere. **DOES THIS MEAN THAT OUR ONLY OPTION IS WAR? YES,** although an air campaign targeting Iran's nuclear infrastructure would entail less need for boots on the ground than the war Obama is waging against the Islamic State, which poses far smaller a threat than Iran does. **WOULDN'T AN ATTACK CAUSE ORDINARY IRANIANS TO RALLY BEHIND THE REGIME? PERHAPS, BUT MILITARY LOSSES HAVE ALSO SERVED TO UNDERMINE REGIMES,** including the Greek and Argentine juntas, the Russian czar and the Russian communists. **WOULDN'T DESTROYING MUCH OF IRAN'S NUCLEAR INFRASTRUCTURE MERELY DELAY ITS PROGRESS? PERHAPS, BUT WE CAN STRIKE AS OFTEN AS NECESSARY.** Of course, Iran would try to conceal and defend the elements of its nuclear program, so we might have to find new ways to discover and attack them. Surely **THE UNITED STATES COULD BEST IRAN IN SUCH A TECHNOLOGICAL RACE.** Much the same may be said in reply to objections that airstrikes might not reach all the important facilities and that Iran would then proceed unconstrained by inspections and agreements. The United States would have to make clear that it will hit wherever and whenever necessary to stop Iran's program. **OBJECTIONS THAT IRAN MIGHT CONCEAL ITS PROGRAM SO BRILLIANTLY THAT IT COULD PROGRESS UNDETECTED ALL THE WAY TO A BOMB APPLY EQUALLY TO ANY NEGOTIATED DEAL WITH IRAN.** And finally, **WOULDN'T IRAN RETALIATE BY USING ITS OWN FORCES OR PROXIES TO ATTACK AMERICANS** — as it has done in Lebanon, Iraq and Saudi Arabia — with new ferocity? **PROBABLY.** We could attempt to deter this by warning that we would respond by targeting other military and infrastructure facilities. Nonetheless, **WE MIGHT ABSORB SOME STRIKES.** Wrenchingly, **THAT MIGHT BE THE PRICE OF AVERTING THE HEAVIER LOSSES THAT WE AND OTHERS WOULD SUFFER IN THE LARGER MIDDLE EASTERN CONFLAGRATION THAT IS THE LIKELY OUTCOME OF IRAN'S DRIVE TO THE BOMB.** Were Iran, which is already embroiled in Iraq, Syria, Yemen, Lebanon and Gaza, further emboldened by becoming a "nuclear threshold state," it would probably overreach, kindling bigger wars — with Israel, Arab states or both. The United States would probably be drawn in, just as we have been in many other wars from which we had hoped to remain aloof. **YES, THERE ARE RISKS TO MILITARY ACTION. BUT IRAN'S NUCLEAR PROGRAM AND VAUNTING AMBITIONS HAVE MADE THE WORLD A MORE DANGEROUS PLACE.** Its achievement of a bomb would magnify that danger manifold. Alas, sanctions and deals will not prevent this.

No Iran War

Iran deal makes Iran war scenario the controlling impact

Daily Signal 7/7/15 (This article is written by Genevieve Wood, who works with the Heritage Foundation and writes for the Daily Signal, <http://dailysignal.com/2015/07/17/4-reasons-iran-deal-would-take-us-closer-to-nuclear-war/>, "4 Reasons Iran Deal Would Take us Closer to War", EM)

President Obama finally got his long sought after nuclear deal with Iran. But as many have said from the very beginning, no deal is better than a bad deal – and The Heritage Foundation believes **THIS IS A VERY BAD DEAL**. There are numerous flaws in the agreement. But it's because of the following four reasons Heritage national security experts believe this nuclear agreement with Iran means **WE HAVE TAKEN ONE STEP CLOSER TO NUCLEAR WAR**. First, **THE DEAL LEAVES IRAN'S VAST NUCLEAR INFRASTRUCTURE LARGELY INTACT. INSPECTIONS WENT FROM ANYTIME/ANYWHERE TO SOMETIMES/SOMEPLACES**. This deal amounts to dismantling sanctions in exchange for a partial freeze on uranium enrichment. Research and development on centrifuges and ballistic missiles is not included. Second, **SANCTIONS RELIEF WILL MAKE THE REGION FAR LESS SAFE AS BILLIONS OF DOLLARS, POTENTIALLY \$300 TO \$400 BILLION, WILL NOW FLOW INTO THE IRANIAN ECONOMY**. But let's be clear – all those dollars won't be finding their way in to the pockets of the Iranian people. Much of **THIS MONEY WILL BE TAKEN IN BY THE IRANIAN REGIME AND** that means a lot of money will go to fund terrorist groups such as **HEZBOLLAH, HAMAS AND SHIA INSURGENCIES** in Yemen. This could reshape the regional balance and undermine U.S. interests in the region. This deal diminishes our influence and increases Iran's. Third, **TURKEY AND MANY OF IRAN'S ARAB NEIGHBORS WILL NOW BE MORE INCLINED TO START THEIR OWN ENRICHMENT PROGRAMS. WHY SHOULD THEY SIT BY WHILE THE BIGGEST INSTIGATOR IN INTERNATIONAL TERRORISM IS, at best, DELAYED IN PRODUCING A NUCLEAR WEAPON?** This will make an already unstable Middle East yet more unpredictable and dangerous. Fourth, **THE DEAL WOULD BE TEMPORARY**. The **RESTRICTIONS ON URANIUM ENRICHMENT WILL COME TO AN END – ALL THE WHILE IRAN WILL BE DOING ITS HOMEWORK ON HOW TO USE THAT URANIUM TO BUILD A NUCLEAR WEAPON**. And **WE SHOULDN'T ASSUME IRAN WILL** delay and **PLAY BY THE RULES. IRAN HAS FREQUENTLY VIOLATED ITS OBLIGATIONS UNDER OTHER NUCLEAR AGREEMENTS**. Here's the deal on the deal: It does not block Iran's pathway to a nuclear weapon. That's why it's a good deal for Iran and a very bad deal for America and the rest of the world.

Iran deal means Iran war not a threat

Reuters 7/15/15 ("Rouhani: Iran will no Longer be Called a World Threat", <http://www.reuters.com/article/2015/07/15/us-iran-nuclear-rouhani-idUSKCN0PP0Z420150715>, EM)

The nuclear deal with world powers is a political victory for Iran, President Hassan Rouhani said on Wednesday, adding that **THE AGREEMENT MEANT TEHRAN WOULD NO LONGER BE REGARDED AS AN INTERNATIONAL THREAT**. "No one can say Iran surrendered," Rouhani told a cabinet meeting broadcast on state television. "The deal is a legal, technical and political victory for Iran. It's an achievement that Iran won't be called a world threat any more." Iran and six world powers reached a deal on Tuesday, capping more than a decade of negotiations with an agreement that could transform the Middle East. Under the deal, **SANCTIONS IMPOSED BY THE UNITED STATES, THE EUROPEAN UNION AND THE UNITED NATIONS WILL BE LIFTED IN RETURN FOR IRAN AGREEING LONG-TERM CURBS ON A NUCLEAR PROGRAM** that the West has suspected was **AIMED AT CREATING A NUCLEAR BOMB**. "No deal is perfect. There should be always compromise," Rouhani said in his remarks to cabinet ministers. "It was really difficult to preserve some of our red lines. There was a time we doubted there could be a deal. It's a historic deal and Iranians will be proud of it for generations to come." Among Iran's main conditions, or "red lines", at the talks were a refusal to accept a long freeze on nuclear research and development and a demand for a rapid lifting of sanctions.

Iran deal proves no chance of nuclear war with Iran

Ali 7/7/15 ("Energy and Economic Diplomacy can Trump the Nuclear 'Threat' of the Iran Deal", <http://theconversation.com/energy-and-economic-diplomacy-can-trump-the-nuclear-threat-of-the-iran-deal-44702>, written by Saleem Ali who is a Chair in Sustainable Resource Development at The University of Queensland, EM)

The critics argue that although the new agreement defers Iran's nuclear enrichment capability by more than a decade, this activity has not been banned outright. This is true, but **WHY WOULD IRAN HAVE EVEN ENTERED NEGOTIATIONS IF IT FACED A PROSPECT OF NO NUCLEAR TECHNOLOGY DEVELOPMENT WHATSOEVER?** If Iran had been wedged into that position, the outcome would probably have been similar to North Korea's nuclear development, which was able to proceed despite sanctions. Estranged by the international community, **IRAN COULD HAVE WITHDRAWN FROM THE NUCLEAR NONPROLIFERATION TREATY AND PROCEEDED AS A ROGUE NUCLEAR WEAPONS STATE.** The new accord's Joint Comprehensive Plan of Action will see Iran come under greater vigilance than it might otherwise have done had it remained secretive about its activities. **EVEN IF WE CONSIDER THE MOST EXTREME PESSIMISTIC SITUATION, IN WHICH IRAN THROUGH SUBTERFUGE WERE SOMEHOW ABLE TO DEVELOP A NUCLEAR WEAPON EVEN UNDER THIS NEW ENHANCED SCRUTINY, WHAT WOULD IT GAIN? APART FROM THE BRAVADO OF NUCLEAR OWNERSHIP, THE WEAPONS WOULD HAVE NO POTENTIAL FOR USE BECAUSE THERE IS AMPLE DETERRENCE THROUGH MUTUALLY ASSURED DESTRUCTION.** The Bulletin of Atomic Scientists estimates that Israel has at least 80 nuclear warheads – an arsenal big enough to obliterate most Iranian cities. Add to that the enormous nuclear weapons capabilities of the United States, and there is little doubt that **IRAN WOULD STAND NO CHANCE IF IT EVER DARED (either directly or indirectly, through terrorist proxies) TO USE NUCLEAR WEAPONS** in the region. Saudi Arabia has even less to fear, being hallowed ground for all Muslims, including Iran's Shia majority. There is zero chance that Iran would launch a nuclear weapon there. **PERHAPS THE NIGHTMARE SCENARIO FOR NUCLEAR WEAPONS** proliferation **WOULD BE** the use of a nuclear weapon **THROUGH A STEALTH TERRORIST ATTACK TO DELIBERATELY PROVOKE A WAR,** a scenario envisaged by the 2002 Hollywood film *The Sum of All Fears*. **BUT** as the movie points out, **THIS DANGER IS MORE LIKELY TO MATERIALISE THROUGH A BLACK MARKET FOR LOST WEAPONS,** or independently wealthy rogue elements, **THAN FROM A STATE** such as Iran. Prevention of such an eventuality requires better intelligence, closer monitoring of existing nuclear stockpiles, and more attention to the issue of "lost bombs", which are not currently monitored by International Atomic Energy Authority inspectors.

AT: Cybersecurity

!! The threats of cyberattacks are overstated

Lewis 6 (James A. Lewis, Center for Strategic and International Studies, January 2006, "Cybersecurity and Critical Infrastructure Protection", <http://cip.management.dal.ca/publications/Cybersecurity%20and%20Critical%20Infrastructure%20Protection.pdf>)

The term "Digital Pearl Harbor" appeared in the mid 1990s, coinciding with the commercialization of the internet. Digital Pearl Harbor scenarios predicted a world where hackers would plunge cities into blackness, open floodgates, poison water supplies, and cause airplanes to crash into each other. But no cyber attack—and there have been tens of thousands of cyber attacks in the last ten years—has produced these results. The dire predictions arose from a lack of insight into the operations of complex systems, from an overestimation of both the interconnectedness of critical infrastructures and the power and utility of software as a weapon to be used against them.

Determining the actual degree of risk posed by computer network vulnerabilities requires an estimate of the probability that a computer malfunction will damage a critical infrastructure in ways that will affect the national interest. For this to occur, a number of simultaneous or sequential events must take place to let a digital attack in cyberspace have a physical effect. This is not a simple transformation. Computer networks are indeed vulnerable, but this does not mean that the critical infrastructures these networks support are equally vulnerable. Terrorists are attracted to different kinds of weapons, particularly explosives, which are more reliable and which better meet their political and psychological need for violence. Infrastructures are robust and resilient, capable of absorbing damage without interrupting operations and accustomed to doing so after natural disasters, floods, or other extreme weather conditions. In short, the cyber threat to critical infrastructure has been overstated, particularly in the context of terrorism.

AT: Judicial Deference HSS

UQ

2AC — Not Unique

Violation of deference is inevitable — public pressures.

Anderson 11

Elizabeth Anderson, John Rawls Collegiate Professor of Philosophy and Women's Studies at the University of Michigan, Ann Arbor, ("The War at Home", Democracy: A Journal of Ideas, Issue #22, Fall 2011, <http://www.democracyjournal.org/22/the-war-at-home.php>)

WE SHOULD DRAW SOME SOBERING LESSONS from this experience. THE CENTRAL INSTITUTIONS AMERICANS COUNT ON TO CHECK ABUSES OF STATE POWER—laws promoting transparency in government; a vigorous, skeptical press; competitive political parties; an independent judiciary empowered to enforce constitutional rights—FAILED TO CHECK THE POLITICAL DYNAMICS OF FEAR-MONGERING. THOSE FAILURES HAVE LEFT TERRIBLE LEGACIES. JUDICIAL DEFERENCE to state power HAS CREATED dangerous precedents. AMERICANS HAVE BECOME MOSTLY INURED TO MASSIVE SECRET SURVEILLANCE OF THEIR DAILY LIVES. And much of the American public has succumbed to panics over imagined invocations of Sharia law in the United States. The politics of fear-mongering has produced political incentives that have heightened the perceived cost of respecting civil liberties and the rule of law, whether or not such respect has played any role in security failures. The result has been a systematic undermining of our democracy and our values. But LOOKING AHEAD, there may be grounds for hope. Some of THE FACTORS BEHIND THE 9/11 DECADE'S WEAKENING OF DEMOCRACY MAY BE TEMPORARY, and the new normal may not be the norm after all. AS THE AFGHAN WAR WINDS DOWN and the specter of Al Qaeda recedes, public demand for privacy, civil liberties, and greater transparency is likely—one hopes, anyway—to override the fears that underwrite state violations of constitutional rights. AS OCCURRED AFTER earlier episodes of repression, FROM THE RED SCARE TO the MCCARTHY era. NEWSPAPERS MAY BE IN DECLINE, BUT AS INVESTIGATIVE JOURNALISM FINDS NEW LIFE ONLINE on sites such as ProPublica, AND AS CITIZENS PARTICIPATE MORE FULLY IN NEWS REPORTING AND ANALYSIS via crowdsourcing, wikis, and blogging, WE MAY CREATE NEW PLATFORMS FOR THE DEMOCRATIC FUNCTIONS OF THE PRESS. The recent increase in anti-Muslim agitation is also not simply a product of 9/11, but of the recession, an attendant general rise in anti-immigrant sentiment, and anxiety about a multiracial president. As the economy returns to normal—perhaps more slowly than we'd like, but it will get there—we should expect a decline in xenophobia. Perhaps more important, THE UNITED STATES IS UNDERGOING A HISTORIC DEMOGRAPHIC SHIFT DUE TO A RISING IMMIGRANT POPULATION AND THE END OF MAJORITY STATUS FOR WHITES. POLITICAL PARTIES WILL SOON SEE THAT THEY HAVE MORE TO GAIN BY INTEGRATING IMMIGRANTS AND THEIR AMERICAN CHILDREN into society THAN BY PANDERING TO ANTI-IMMIGRANT PREJUDICE—and WITH SUCH A CHANGE, we may also eventually see judiciaries that are more willing to act as a check on state infringements on constitutional rights.

1AR — Not Unique

Courts are shifting away from deference to rein in executive power.

Benvenisti and Downs 9

(Eyal and George W., Professor of Law at Tel Aviv University and Professor of Politics at New York University, “National Courts, Domestic Democracy, and the Evolution of International Law”, Feb 2009, European Journal of International Law, p. 59-72, ProQuest, kc)

The TRADITIONAL DEFERENCE OF NATIONAL COURTS TO THEIR EXECUTIVE BRANCHES IN MATTERS CONNECTED WITH FOREIGN POLICY DID NOT VANISH OVER NIGHT. Even today it continues to persist in some areas of global regulation such as trade, as was recently reflected in the judgment of the ECJ which refused to give direct effect to the EU's obligations under the WTO absent the promise of reciprocity by other courts.¹⁵ But AS COURTS HAVE DEVELOPED INCREASINGLY MORE EFFECTIVE WAYS OF COPING WITH THE EFFECTS OF GLOBALIZATION DESCRIBED ABOVE, THEY HAVE ALSO SLOWLY SET ABOUT THE TASK OF TRYING TO REIN IN THE GROWTH OF EXECUTIVE BRANCH DISCRETION. To accomplish this THE COURTS STILL HAD TO SOLVE THEIR perennial PROBLEM OF HOW TO GO ABOUT DOING THIS WITHOUT DAMAGING THEIR EXECUTIVE BRANCHES' EFFECTIVENESS IN THE AREA OF FOREIGN POLICY AND RISKING SERIOUS POLITICAL PROBLEMS for themselves domestically.

The executive branch has no authority over surveillance matters. Although surveillance may sometimes fall under the realm of national security, it does not justify judicial deference to the executive – hampers legislative powers. **United States v. AT&T proves.**

Cole 14 – Jared P., Legislative Attorney, 2014 (“Disclosure of FISA Opinions—Select Legal Issues,” *Congressional Research Service*, Available Online at <http://www.fas.org/sgp/crs/secrecy/R43404.pdf>, p.10-11)

The U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit) has made explicit that control over access to classified information is shared.⁹³ IN 1976, THE SUBCOMMITTEE ON OVERSIGHT AND INVESTIGATIONS OF THE HOUSE INTERSTATE AND FOREIGN COMMERCE COMMITTEE ISSUED A SUBPOENA TO the American Telephone and Telegraph Company (AT&T) SEEKING INFORMATION CONCERNING WARRANTLESS WIRETAPPING BY THE EXECUTIVE BRANCH.⁹⁴ CITING THE POTENTIAL DANGER TO NATIONAL SECURITY IF THE INFORMATION WERE RELEASED, THE DEPARTMENT OF JUSTICE SOUGHT AN INJUNCTION THAT WOULD PREVENT AT&T FROM COMPLYING WITH THE SUBPOENA.⁹⁵ On appeal to the D.C. Circuit, the legislative branch argued that its subpoena power “cannot be impeded by the Executive”;⁹⁶ while THE EXECUTIVE BRANCH ARGUED THAT BECAUSE “THE PRESIDENT RETAINS ULTIMATE AUTHORITY TO DECIDE WHAT RISKS TO NATIONAL SECURITY ARE ACCEPTABLE,” THE JUDICIARY SHOULD DEFER TO THE EXECUTIVE BRANCH.⁹⁷ **The court, however, rejected both claims.** NOTING THAT THE CONGRESSIONAL SUBPOENA POWER WAS INDEED BROAD, BUT NOT “ABSOLUTE IN THE CONTEXT OF A CONFLICTING CONSTITUTIONAL INTEREST ASSERTED BY A COORDINATE BRANCH OF GOVERNMENT.”⁹⁸ Likewise, the court noted, WHILE THE JUDICIARY IS SOMETIMES DEFERENTIAL TO THE EXECUTIVE BRANCH IN THE AREA OF NATIONAL SECURITY, SUPREME COURT JURISPRUDENCE **does “not establish judicial deference to executive determinations** IN THE AREA OF NATIONAL SECURITY

WHEN THE RESULT OF THAT DEFERENCE WOULD BE TO IMPEDE CONGRESS IN EXERCISING ITS LEGISLATIVE POWERS.⁹⁹ The court ultimately declined to rule on the merits of the injunction, and remanded the case to the district court, urging the parties to continue negotiating.¹⁰⁰

Those negotiations again reached an impasse, and the parties soon returned to the D.C. Circuit. As before, both sides made broad assertions of authority. The executive branch argued that its duty to protect national security trumped the congressional subpoena power.¹⁰¹ However, the court again rejected this assertion, explaining that the two branches shared power over national security:

the executive would have it that the Constitution confers on the executive absolute discretion in the area of national security. This does not stand up. While the Constitution assigns to the President a number of powers relating to national security, including the function of commander in chief and the power to make treaties and appoint Ambassadors, it confers upon Congress other powers equally inseparable from the national security, such as the powers to declare war, raise and support armed forces and, in the case of the Senate, consent to treaties and the appointment of ambassadors.¹⁰²

Deference Link Defense

2AC — Link Defense

The “observer effect” solves. The executive regulates itself in accordance to the courts regardless of deference.

Deeks 13(Ashley S. Deeks, Senior Fellow at the Center for National Security Law and Associate Professor of Law at The University of Virginia, Fordham Law Review, Volume 82, Issue 2, 2013, da: Jul 6 2015, “The Observer Effect: National Security Legislation, Executive Policy Changes, and Judicial Deference”, <http://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?article=4941&context=flr>, PS)

Other scholars, in contrast, bemoan the absence of courts from the playing field.⁵ To them, the executive has undue incentives to emphasize security values over liberty values, and only a vigorous judicial role can counter that. More broadly, these scholars view robust judicial deference to the executive as weakening a critical tool by which to inhibit a single branch of government from accruing undue power. BOTH CAMPS TEND TO ASSUME, HOWEVER, THAT THE COURTS DO PLAY ONLY A LIMITED ROLE IN EXECUTIVE CALCULATIONS ABOUT APPROPRIATE NATIONAL SECURITY POLICIES. THAT ASSUMPTION IS FLAWED, and this Article demonstrates why. Against a backdrop of limited direct judicial involvement in its security policies, the executive is highly attuned to potential court action. WHEN THE EXECUTIVE FACES A CREDIBLE THREAT OF LITIGATION or the pendency of one or more specific cases, IT OFTEN ALTERS THE AFFECTED NATIONAL SECURITY POLICIES IN WAYS THAT RENDER THEM MORE RIGHTS PROTECTIVE. THESE POLICY CHANGES REMAIN IN PLACE REGARDLESS OF THE OUTCOMES OF PARTICULAR CASES and affect a large number of individuals. This Article refers to this phenomenon as the “observer effect.” In physics, the “observer effect” refers to the changes that an act of observation makes on the phenomenon being observed.⁶ In psychology, some experts believe that individuals alter their performance or behavior when they know that someone else is observing them.⁷ In the context of this Article, THE OBSERVER EFFECT REFERS TO THE EFFECT ON THE EXECUTIVE WHEN IT BECOMES AWARE THAT A COURT SOON MAY REVIEW on the merits A PARTICULAR EXECUTIVE POLICY. For example, in the context of looming litigation, THE GOVERNMENT REPEATEDLY HAS AMENDED ITS DETENTION REVIEW PROCEDURES IN Afghanistan, each time granting detainees increased levels of procedural protections—EVEN THOUGH COURTS HAVE NEVER MANDATED THAT IT DO SO. IT HAS REGULATED ITS OWN INVOCATION OF THE state secrets doctrine, INTRODUCING additional layers of process and a COMMITMENT TO external oversight. EVEN THOUGH THE COURTS ULTIMATELY UPHELD THE GOVERNMENT’S USE OF THAT DOCTRINE in several series of cases. It has revealed details about the long-classified process by which it determines when and under what conditions it would transfer security detainees to foreign governments. AND IT HAS ESTABLISHED MORE rigorous, procedural hurdles FOR ITSELF before it will seek to use secret evidence in deportation cases—ALL AS A RESULT OF THE OBSERVER EFFECT. Legal scholarship lacks a sustained theoretical account of how and why this phenomenon works to influence executive policymaking.⁹ Courts are not the only audiences for executive policies, and as a result the observer effect is not the executive’s only source of incentives to alter those policies. However, because courts can strike down executive policies, force the executive to comply with specific policies crafted by the courts, and mandate the creation of new policies as a matter of law, COURTS ARE A KEY AUDIENCE FOR THE EXECUTIVE’S NATIONAL SECURITY POLICIES. As a result, it is important to understand when, how, and why the observer effect works. The observer effect, however, does more than simply inform why and how the executive changes its national security policies. It also can (and should) inform ongoing descriptive and normative debates about national security deference. Some SCHOLARS CLAIM THAT “IN CRISES, THE EXECUTIVE

GOVERNS NEARLY ALONE, at least so far as law is concerned,”¹⁰ and that THE COURTS’ MONITORING FUNCTION IS BROKEN.¹¹ Scholars are sharply divided about whether that is a good thing or a bad thing. The existence of THE OBSERVER EFFECT calls into question a key premise of the debate by REVEALING THAT THE EXECUTIVE DOES NOT IN FACT GOVERN “NEARLY ALONE,” AT LEAST WHEN THE EXECUTIVE REASONABLY CAN FORESEE THAT A COURT MAY STEP IN to review particular security policies. Yet the way THE OBSERVER EFFECT operates ALLOWS THE EXECUTIVE TO PRESERVE AND UTILIZE ITS FUNCTIONAL ADVANTAGES TO CRAFT PRAGMATIC SECURITY POLICIES, avoiding what critics see as the more problematic effects of judicial involvement in national security decisionmaking. A word is in order about the normative desirability of the observer effect. The overriding goal of this Article is to explain the observer effect, rather than to justify it. It also is exceedingly complicated (if not impossible), as an empirical matter, to determine whether the policy shifts engendered by the effect advance or hinder an ideal balance between national security and individual liberty.¹² Nevertheless, in laying out the operation of the observer effect, THIS ARTICLE SHOWS WHY THE PRESENT SYSTEM IS BETTER THAN WE MAY THINK AT PRESERVING THE RESPECTIVE STRENGTHS OF COURTS AND THE EXECUTIVE, as long as courts periodically (and perhaps unpredictably) decline to defer to the executive.

No link – courts have ruled public admission circumvents deference --- also proves they’ve broke deference in the context of surveillance

Bazze 12

Timothy Bazze, J.D., Georgetown University Law Center, M.I.A., School of International and Public Affairs at Columbia University, October 2012, (“SHUTTING THE COURTHOUSE DOORS: INVOKING THE STATE SECRETS PRIVILEGE TO THWART JUDICIAL REVIEW IN THE AGE OF TERROR”, <http://civilrightslawjournal.com/issues/23.29.pdf>)

PERHAPS THE MOST THOROUGH TREATMENT OF WHETHER THE STATE SECRETS PRIVILEGE PRECLUDES JUDICIAL REVIEW OF THE TERRORIST SURVEILLANCE PROGRAM OCCURRED IN HEPTING V. AT&T Corp., WHERE the PLAINTIFFS ARGUED that AT&T’S ALLEGED WARRANTLESS WIRETAPPING of its communications VIOLATED THEIR FIRST AND FOURTH AMENDMENT RIGHTS.⁷⁰ THE BUSH ADMINISTRATION INTERVENED, MOVING FOR DISMISSAL ON STATE SECRETS GROUNDS.⁷¹ After reviewing the purportedly secret evidence in camera,⁷² THE District COURT for the Northern District of California denied the government’s motion to dismiss, RULING that DISCOVERY SHOULD COMMENCE BECAUSE THE STATE SECRETS CLAIM WAS inapplicable in light of the government’s repeated admissions about the existence of the program.⁷³ The district court’s thoughtful opinion offers a framework for review of state secrets claims in the war-on-terror context. THE DISTRICT COURT’S THRESHOLD INQUIRY IN RESOLVING THE STATE SECRETS CLAIM WAS DETERMINING WHETHER THE NSA SURVEILLANCE PROGRAM THAT GAVE RISE TO THE SUIT ACTUALLY QUALIFIED AS A “SECRET.”⁷⁴ Because the government had disclosed the existence of the program and AT&T admitted to assisting the government in classified matters when asked, THE COURT CONCLUDED THAT STATE SECRETS DID NOT FORECLOSE DISCOVERY.⁷⁵ WHILE THE STATE SECRETS PRIVILEGE DID NOT SUPPORT PRE-DISCOVERY DISMISSAL of the case, THE COURT FOUND THAT THERE WAS SUFFICIENT AMBIGUITY ABOUT THE EXTENT OF AT&T’S INVOLVEMENT in the program, AND THE CONTENTS OF ANY COMMUNICATION RECORDS SURVEYED, SO AS TO PERMIT AT&T TO NOT DISCLOSE THE EXTENT OF ITS PARTICIPATION IN THE TSP.⁷⁶ The court made clear, however, that if information about AT&T’s role in

supporting the TSP became public during the course of the litigation, the government could no longer invoke state secrets to resist disclosing this information.⁷⁷ AFTER REJECTING THE GOVERNMENT'S MOTION TO DISMISS ON STATE SECRETS GROUNDS, THE COURT REITERATED ITS CONSTITUTIONAL DUTY TO EXERCISE JUDICIAL REVIEW.⁷⁸ But it is important to note that even the state secrets privilege has its limits. WHILE THE COURT RECOGNIZES AND RESPECTS THE [E]XECUTIVE'S CONSTITUTIONAL DUTY TO PROTECT THE NATION FROM THREATS, THE COURT ALSO TAKES SERIOUSLY ITS CONSTITUTIONAL DUTY TO ADJUDICATE the DISPUTES that come before it. To defer TO A BLANKET ASSERTION OF SECRECY HERE WOULD BE TO ABDICATE THAT DUTY, PARTICULARLY BECAUSE THE VERY SUBJECT MATTER OF THIS LITIGATION HAS BEEN SO PUBLICLY AIRD. The compromise between liberty and security remains a difficult one. But dismissing this case at the outset would sacrifice liberty for no apparent enhancement of security.⁷⁸ THIS IS A REVEALING STATEMENT BY THE COURT, WHILE FORCEFULLY ASSERTING ITS AUTHORITY to decide the complicated constitutional questions at issue in this case, THE COURT IMPLIED THAT THIS DUTY IS NOT ABSOLUTE, and that the balance between liberty and security may tilt toward security under different facts. OF PARTICULAR IMPORTANCE, ESPECIALLY WITH REGARD TO HOW THE GOVERNMENT HAS APPLIED THE STATE SECRETS PRIVILEGE TO SUBVERT JUDICIAL REVIEW in the war-on-terror context, IS THE WEIGHT THE COURT CONFERRED TO THE PUBLIC AIRING OF THE WIRETAPPING PROGRAM.⁷⁹ The court was reluctant to defer to the government's claim of secrecy in this case because the government's own public statements about the existence of the program directly contradicted its state secrets claim.⁸⁰ ACKNOWLEDGING THE EXTENSIVE MEDIA COVERAGE OF THE PROGRAM, THE COURT INSISTED THAT THE ONLY RELEVANT PUBLIC DISCLOSURES ABOUT THE CONTESTED GOVERNMENT PROGRAM, AT LEAST WITH RESPECT TO MEASURING A CLAIM OF GOVERNMENT SECRECY, ARE PUBLIC STATEMENTS BY THE GOVERNMENT AND ITS IMPLICATED PRIVATE ACCOMPLICES.⁸¹ THE COURT reasonably CONCLUDED that the government cannot simultaneously admit that a program exists and that its existence is secret.⁸² UNDER THE COURT'S REASONING, OFFICIAL PUBLIC CONFIRMATION THAT A PROGRAM EXISTS LIMITS THE GOVERNMENT'S ABILITY TO ASSERT THE STATE SECRETS PRIVILEGE TO BLOCK DISCOVERY on the program. This REASONING could influence how courts adjudicate state secrets claims with respect to other post-9/11 government programs.⁸³ IT COULD ALSO HAVE AN even broader impact IN LIGHT OF THE PROLIFERATION OF NEW MEDIA SOURCES AND A RENEWED APPETITE FOR GOVERNMENT OPENNESS, ALL OF WHICH WILL APPLY PRESSURE ON THE GOVERNMENT TO COME CLEAN ABOUT ITS CLANDESTINE NATIONAL SECURITY PROGRAMS. Official public admissions about once secret programs will undercut those programs' secrecy, and if the Hepting analysis is any indication, prevent the government from invoking the state secrets privilege to shield those programs from judicial scrutiny.⁸⁴

2AC — No Spillover

Deference does not spill over- administrations of different agencies check.

Nichols 3

(Lindsay J. Nichols; Attorney at Law Center to Prevent Gun Violence, JD from University of California, Berkeley - School of Law, MA in Classics and Classical Languages, Literatures, and Linguistics from University of California, Los Angeles; "The NMFS's National Standard Guidelines: Why Judicial Deference May Be Inevitable", October 2003, Available at: <http://scholarship.law.berkeley.edu/californialawreview/vol91/iss5/4>, kc)

THIS COMMENT ARGUES THAT, BECAUSE OF OTHER ADMINISTRATIVE LAW DOCTRINES, the Court's decision IN, MEAD is not likely to cause a significant decrease in the overall amount of deference GIVEN TO AGENCY INTERPRETATIONS OF STATUTES. To demonstrate this, this Comment focuses on the NMFS and its interpretations of the Fisheries Conservation and Management Act, now known as the Magnuson Stevens Act (Magnuson Act). "THE CONTINUING IMPLEMENTATION OF THE MAGNUSON ACT BY THE NMFS SERVES AS A PARTICULARLY APPROPRIATE CASE STUDY in this regard BECAUSE IT INVOLVES MANY OF THE ISSUES THAT WERE RELEVANT TO THE COURT'S DECISION IN MEAD AND THAT CONCERN A BROAD ARRAY OF ADMINISTRATIVE AGENCIES: notice and comment procedures, implementing regulations, National Standards, and, most importantly, administrative Guidelines that officially do not carry the weight of law. The status of the NMFS's National Standard Guidelines (Guidelines) is not unlike the status of many documents and reports created by other administrative agencies, both inside and outside the context of fisheries management. THUS, THE ISSUE OF WHETHER COURTS SHOULD DEFER TO THE GUIDELINES HAS WIDE RELEVANCE.

Surveillance cases are narrow rulings- no spillover.

Hammond 14

(Brian Hammond, Senior Editor of Telecommunication Reports - leading journal of intelligence on domestic and international telecom business and policy strategies; BA from University of Virginia, quoting Jameel Jaffer, ACLU Deputy Legal Director and Director of Center for Democracy, "Federal Judge Rules NSA Collection Of Phone Metadata Likely Unconstitutional", Jan 1, 2014, Accessed via ProQuest, kc)

Sen. Ron **WYDEN** (D., Ore.), who is sponsoring legislation that would amend the Foreign Intelligence Surveillance Act (FISA) to prohibit bulk collection of Americans' phone and e-mail records, **COMMENTED:** "**JUDGE LEON'S RULING HITS THE NAIL ON THE HEAD. IT MAKES CLEAR THAT BULK PHONE RECORDS COLLECTION IS INTRUSIVE** DIGITAL SURVEILLANCE AND NOT SIMPLY INOFFENSIVE DATA COLLECTION AS **SOME HAVE SAID.** The court noted that this metadata can be used for 'repetitive, surreptitious surveillance of a citizen's private goings on,' that creates a mosaic of personal information and is likely unconstitutional. **THIS RULING DISMISSES THE USE OF AN OUTDATED SUPREME COURT DECISION AFFECTING ROTARY PHONES AS A DEFENSE FOR THE TECHNOLOGICALLY ADVANCED COLLECTION OF MILLIONS OF AMERICANS' RECORDS.** It clearly underscores the need to adopt meaningful surveillance

reforms that prohibit the bulk collection of Americans' records." ¹ "AS JUDGE LEON NOTES, THE GOVERNMENT'S DEFENSE OF THE PROGRAM HAS RELIED ALMOST ENTIRELY ON A 30-YEAR-OLD CASE THAT INVOLVED SURVEILLANCE OF A SPECIFIC CRIMINAL SUSPECT OVER A PERIOD OF TWO DAYS," MR. [JAMEEL JAFFER] SAID. "The idea that this narrow precedent authorizes the government to place every American under permanent surveillance is preposterous. We hope that Judge Leon's thoughtful ruling will inform the larger conversation about the proper scope of government surveillance powers, especially the debate in Congress about the reforms necessary to bring the NSA's surveillance activities back in line with the Constitution. The bipartisan USA Freedom Act, which has 130 co-sponsors already, would address the constitutional problems that Judge Leon identifies."

1AR — Observer Effect

The “observer effect” proves that the executive will stay within the fringes of constitutionality even without public court rulings

Deeks 13(Ashley S. Deeks, Senior Fellow at the Center for National Security Law and Associate Professor of Law at The University of Virginia, Fordham Law Review, Volume 82, Issue 2, 2013, da: Jul 6 2015, “The Observer Effect: National Security Legislation, Executive Policy Changes, and Judicial Deference”, <http://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?article=4941&context=flr>, PS)

A. Defining the Observer Effect¹ The phrase “observer effect” describes the impact on executive policy¹ setting of pending or probable court consideration of a specific national¹ security policy. The executive’s awareness of likely judicial oversight over¹ particular national security policies—an awareness that ebbs and flows— plays a significant role as a forcing mechanism. It drives the executive¹ branch to alter, disclose, and improve those policies before courts actually¹ review them. **THE OBSERVER EFFECT IS DISTINCT FROM THE EXECUTIVE’S RESPONSE¹ TO COURT ORDERS THAT REQUIRE THE EXECUTIVE TO MAKE SPECIFIC CHANGES¹ TO A¹ PARTICULAR SECURITY POLICY. **THE OBSERVER EFFECT LEADS TO NONMANDATORY¹ POLICY CHANGES BY THE EXECUTIVE—EVEN BEFORE A COURT REACHES THE MERITS OF A CASE¹ CHALLENGING THAT POLICY** (or a related one)—as a result of newfound¹ uncertainty about whether and how courts may evaluate those policies.¹ **THE EFFECT LEADS THE EXECUTIVE TO SELECT DIFFERENT POLICIES THAN THOSE IT¹ WOULD ADOPT IF IT WERE CERTAIN THAT THOSE POLICIES WOULD NOT FACE JUDICIAL¹ CONSIDERATION.** Where the executive has a high degree of confidence that a¹ court will review its policy, the executive has strong incentives to select a¹ policy option it is confident a court would uphold.¹⁸ Where—**AS OFTEN IS¹ TRUE IN NATIONAL SECURITY CASES**—there is more doubt about whether a court will intervene, **THE EXECUTIVE MAY TAKE A GREATER GAMBLE IN SETTING A POLICY.**¹⁹ **As long as judicial review is reasonably foreseeable**, however, **the observer effect results in a form of executive deference to courts**—or deference to a¹ prediction about the type of national security policy an “average” court¹ would uphold.²⁰ The theory that the executive responds to an observer effect contains a¹ critical assumption worth stating plainly: the executive views law—¹ including case law—as binding and tends to comply with it. In *The¹ Executive Unbound*, Eric POSNER and Adrian Vermeule express doubt about¹ this proposition, **ARGUING THAT THE EXECUTIVE IS UNFETTERED BY LEGAL¹ CONSTRAINTS.**²¹ Their critics highlight various ways in which that statement is¹ false as a descriptive matter, including by offering examples of situations in¹ which the executive has declined to pursue its preferred course of action¹ because it viewed that course as legally unavailable.²² **THE OBSERVER EFFECT¹ OFFERS ADDITIONAL SUPPORT** for the conclusion **THAT THE EXECUTIVE BRANCH IS¹ ATTUNED TO THE POWER OF LAW** BY SHOWING HOW THE EXECUTIVE INTERNALIZES¹ ANTICIPATED JUDICIAL RESPONSES TO ITS POLICIES WHEN DRAWING POLICY LINES.²³ Several scholars have expressed an intuition that legal uncertainty plays¹ an important role in limiting the extent to which the political branches¹ aggrandize their own powers.²⁴ However, legal scholarship offers no¹ discussion of why and how uncertainty about judicial involvement affects¹ executive policy choices, particularly in the national security area.²⁵ This¹ section does so. The observer effect results from the confluence of at least¹ three elements: (1) a triggering event; (2) robust jurisdictional or¹ substantive uncertainty; and (3) the likelihood of recurring scenarios.¹**

1. Triggering Event¹ Various litigation-related activity can trigger the observer effect. This¹ ranges from the filing of a nonfrivolous case, to some indication from a¹ court that it may reach the merits of a case (i.e., ordering briefing on an¹ issue, or rejecting the government’s motion for summary judgment), to the¹ court’s consideration of the issue on the merits. **THE OBSERVER**

EFFECT most clearly COMES INTO PLAY WHEN A COURT BECOMES SEIZED WITH A NATIONAL SECURITY CASE AFTER AN EXTENDED PERIOD OF JUDICIAL NONINVOLVEMENT in security issues. The observer effect then kicks in to influence the executive's approach to the policy being challenged in the triggering case, as well as to future (or other preexisting) executive policies in the vicinity of that triggering case. The other executive policies affected by the triggering case must be loosely related to the policy being challenged in the triggering case, but need not overlap with that precise policy. Thus, a U.S. SUPREME COURT HOLDING THAT THE UNITED STATES MUST PROVIDE CERTAIN REVIEW PROCEDURES to individuals being held as enemy combatants in a particular geographic location WILL TRIGGER THE OBSERVER EFFECT FOR MANY FUTURE POLICIES RELATED TO DETENTION, whether or not those policies directly implicate the factual or legal scenarios in the case that the Court decided.²⁶ CONSIDER A SITUATION IN WHICH THE EXECUTIVE BRANCH LONG OPERATED WITHOUT JUDICIAL OVERSIGHT. Military decisions about who to detain as enemy belligerents offer a paradigmatic case.²⁷ For decades, THE MILITARY MADE INDEPENDENT DECISIONS ABOUT WHICH INDIVIDUALS TO DETAIN DURING ARMED CONFLICT without considering that a court might oversee or revisit these decisions.²⁸ Along came YASER HAMDI, AN AMERICAN CITIZEN DETAINED BY U.S. FORCES on the battlefield in Afghanistan in 2001 and brought to the United States.²⁹ Hamdi's father filed a habeas petition in June 2002, contending that Hamdi's detention was unlawful.³⁰ THE SUBSEQUENT SUPREME COURT DECISION CAME AS A SURPRISE to many in the U.S. government.³¹ The decision accepted the government's legal theory that it may detain individuals associated with the Taliban as "enemy combatants."³² But THE OPINION GAVE LITTLE DEFERENCE TO THE ARGUMENT THAT THE EXECUTIVE'S constitutional AUTHORITIES during wartime PERMITTED THE GOVERNMENT TO AVOID GIVING HAMDI ANY OPPORTUNITY TO CHALLENGE HIS DETENTION. Rather, the Court ordered the U.S. government to create a process whereby a citizen-detainee may challenge his classification as an enemy combatant and required that that process include notice of the factual basis for his classification and a fair opportunity to rebut those assertions before a neutral decisionmaker.³³ The Court thus effectively prevented the executive from retaining sole discretion about whether, when, and how to review the status of its detainees. The filing of the litigation and, more importantly, the Court's holding serve as a triggering event in the detention area.³⁴ The existence of the observer effect leads to a prediction that U.S. national security policies will cycle between more aggressive and more cautious postures.³⁵ Where the executive is quite certain that courts will not review particular security policies, its policies will tend to be more aggressive. Then, one or more triggering events leads the executive to shift a variety of its national security policies in a more modest direction, partly to fend off further judicial encroachments. As executive policies "improve" over time, and as courts establish predictable jurisprudence on the issue and give increasing deference to those more rights-protective policies, the observer effect weakens until it falls away.³⁶ At that point, a new triggering case will be needed to start the cycle again.

No link- the executive modifies policy even without actually ruling

Deeks 13(Ashley Deeks, Senior Fellow at the Center for National Security Law and Associate Professor of Law at The University of Virginia, New Republic, October 21 2013, da: July 7 2015, "Courts Can Influence National Security Without Doing a Single Thing", <http://www.newrepublic.com/article/115270/courts-influence-national-security-merely-watching>, PS)

When these three elements are present, the observer effect is likely to come into play. How does the Executive react? The Executive attempts to maximize the total value of two elements: a sufficiently

security-focused policy and unilateral control over national security policymaking. To achieve this goal, the Executive often is willing to cede some ground on the first element to retain the second element. The Executive therefore often responds to the presence of these three elements by shifting its policy to a position that gives it greater confidence that the courts would uphold it if presented with a challenge to that policy. This does not mean that it will establish or revise its policy to a point at which it has full confidence that a court will deem the policy acceptable. Instead, the Executive has strong incentives to take a gamble: all it needs to do is establish a policy that is close enough to what a court would find acceptable that it alters the court's calculation about whether to engage on the merits. It is, in short, a governmental game of chicken.¹ I don't want to suggest that a potentially adverse decision by a court is the sole driver of Executive policy-making. While courts may be one important audience for national security policies, there are many other audiences, including Congress, the general public, the media, and elites. Proving what causes the Executive to select or modify a particular policy is notoriously difficult because many factors and influences usually coalesce to produce government policy. But IMPORTANT PRESSURES ARE BROUGHT TO BEAR BY AN INCREASED EXECUTIVE AWARENESS OF POSSIBLE COURT INTERVENTION, especially because courts have the power to rewrite national security policies in a way that members of the public and the media do not.¹ One important lesson to draw from the observer effect is that IT MATTERS WHAT SIGNALS THE COURTS AND THE EXECUTIVE SEND TO EACH OTHER AND HOW THEY SEND THEM. When COURTS hear cases on the merits or when Justices issue statements related to denials of certiorari, they HAVE THE OPPORTUNITY TO INITIATE A DIALOGUE WITH THE EXECUTIVE—WHETHER OR NOT THE COURTS ultimately DEFER TO THE EXECUTIVE's position. THAT DIALOGUE ALLOWS THE COURTS TO GESTURE AT ACCEPTABLE AND UNACCEPTABLE POLICY CHOICES, while the Executive gauges which policies to adopt and how large of a "cushion" to build into those policies to avoid future adverse decisions. For instance, when Justice Kennedy (along with two other Justices) concurred in the denial of certiorari in a case called *Padilla v. Hanft*, his concurrence implied that the Court would step in to hear the case if the Executive, which had shifted Jose Padilla from military custody to civilian custody, re-detained Padilla as an enemy combatant. This allowed the Court to send a strong signal to the Executive about a national security policy that the Court would have a hard time upholding.¹ THE OBSERVER EFFECT HAS REAL-WORLD IMPLICATIONS FOR NATIONAL SECURITY POLICY CHANGES ON THE HORIZON. For example, if Congress attempts to establish judicial oversight of the Executive branch's targeted killing program, it is useful to understand the nuanced ways in which the Executive can and does respond to potential—but somewhat uncertain—judicial oversight and decisions, even those that stop short of adjudicating issues on the merits. In shedding light on the Executive/judicial relationship, the observer effect should inform Congressional considerations in crafting such a court.¹ It is true that courts have decided only a limited number of substantive issues in the national security arena, notwithstanding the continuing proliferation of litigation. However, IMPORTANT substantive POLICY CHANGES HAVE OCCURRED SINCE 2002—changes due NOT TO THE DIRECT SUNLIGHT OF COURT ORDERS, BUT TO THE SHADOW CAST BY THE THREAT or reality OF COURT DECISIONS on Executive policymaking in related areas of activity. Court decisions, particularly in the national security realm, have a wider ripple effect than many recognize because the Executive has robust incentives to try to preserve security issues as its sole domain. In areas where the observer effect shifts Executive policies closer to where courts likely would uphold them, demands for deference by the Executive turn out to be more modest than they might seem if considered from the isolated vantage of a single case at a fixed point in time. It remains critical for courts to police the outer bounds of Executive national security policies, BUT THEY NEED NOT ENGAGE SYSTEMATICALLY TO HAVE A

POWERFUL EFFECT ON THE SHAPE OF THOSE POLICIES and, consequently, the constitutional national security order.

1AR — Deference Unecessary

Deference unnecessary- judges will make the rational decisions.

Legal Monitor Worldwide 13

(Legal Monitor Worldwide is a subscription-based publication covering legal news and developments from worldwide jurisdictions. Legal Monitor Worldwide covers multiple legal subjects and topics such as constitutional and administrative law, criminal law, contract law, tort law, property law, equity and trusts; as well as legal systems including civil law, common law and equity, and religious law. Published in Amman, Jordan, "The Case Against Deference", June 1, 2013, Lexis, kc)

Second, **THE VIRTUES OF JUDICIAL DEFERENCE HAVE DECLINED OVER TIME** EARLY SUPREME COURT DECISIONS JUSTIFIED DEFERENCE AS NECESSARY TO ENSURE THAT THE NEWLY ESTABLISHED FEDERAL GOVERNMENT COULD FULFILL ITS ESSENTIAL RESPONSIBILITIES. As Chief Justice John Marshall explained in the famous 1824 case *Gibbons v. Ogden*, a "narrow construction" of government powers "would cripple the government, and render it unequal to the object for which it is declared to be instituted." Accordingly, the Court concluded "we cannot perceive the propriety of strict construction, nor adopt it as the rule by which the Constitution is to be expounded." ¶ **DEFERENCE TO EXERCISES OF GOVERNMENT POWER** arguably **MADE MORE SENSE IN THE REPUBLIC'S EARLY DAYS, TO ENSURE THAT FEDERAL POWER COULD ACCOMPLISH THE CONSTITUTION'S BASIC, ENUMERATED ENDS BUT** as the administrative state has matured, **THE SHEER WEIGHT OF GOVERNMENT HAS GROWN EXPONENTIALLY, AND EVERY NEW ACCRETION WEIGHS MORE HEAVILY ON INDIVIDUAL LIBERTY**. Complex statutory frameworks increasingly operate at cross-purposes, and statutes rarely get repealed, with new regulations being piled on top of old ones. Today, **THE CUMULATIVE REACH OF GOVERNMENT POWER IS FAR MORE THAN ADEQUATE TO COUNSEL JUDGES AGAINST KNEE-JERK DEFERENCE TO ALL EXERCISES OF GOVERNMENT POWER**. The unfolding IRS scandal, accompanied by the Obama administration's remarkable claim that the president should not oversee the federal government's law enforcement activities, makes the need for vigorous judicial review of governmental actions all the more apparent. **THE COURTS MUST UNAPOLOGETICALLY ENFORCE CONSTITUTIONAL BOUNDARIES TO FACILITATE TRUST IN, AND ACCOUNTABILITY OF, GOVERNMENT**.

1AR — No Spillover

No spillover – issues of deference stay compartmentalized Chesney, 9

(Robert M. Chesney, Graduated Harvard Law School, American lawyer and the Charles I. Francis Professor in Law at The University of Texas School of Law, where he serves as the Associate Dean for Academic Affairs and teaches courses relating to U.S. national security and constitutional law, "NATIONAL SECURITY FACT DEFERENCE", Virginia Law Review, <http://www.virginialawreview.org/sites/virginialawreview.org/files/1361.pdf>)

EXAMINING THESE ARGUMENTS AS THEY MAY APPLY in the context of a national security fact deference claim does not yield a one-size-fits-all solution. Indeed, ONE OF THE CORE LESSONS OF VIEWING SUCH CLAIMS THROUGH THE LENS OF THE DECISION RULES LITERATURE is that THE DEFERENCE QUESTION IS DEEPLY DEPENDENT ON CONTEXT, INCLUDING THE NATURE OF THE PARTICULAR LEGAL RULE GIVING RISE TO THE FACTUAL DISPUTE, the nature of the interests of the litigants and of society that may be at stake in the case, and, especially, THE PRECISE NATURE OF THE "FACT" IN ISSUE AND THE PROCESS BY WHICH THE EXECUTIVE MADE A JUDGMENT CONCERNING IT. But PARSING THESE FACTORS NONETHELESS DUES YIELD INSIGHTS THAT COLLECTIVELY CAN SERVE TO SHIFT THE RESOLUTION OF SUCH CLAIMS ONTO MUCH FIRMER GROUND. In brief, this approach calls for a DE-EMPHASIS ON CONSIDERATIONS SUCH AS FORMAL LEGITIMACY CLAIMS, COMPARATIVE INSTITUTIONAL EFFICIENCY, AND COLLATERAL CONSEQUENCES FOR OTHER GOVERNMENT OPERATIONS, AND HEIGHTENED (and more nuanced) ATTENTION TO CLAIMS OF COMPARATIVE INSTITUTIONAL ACCURACY AND DEMOCRATIC ACCOUNTABILITY. This approach also highlights the unspoken role that institutional self-preservation concerns likely play in connection with many national security fact deference claims.

Second Circuit Ruling

2AC — Link Not Unique

No internal link. Deference was already broken by the Second Circuit in *ACLU v. Clapper*.

Hawkins 5-8(Katherine Hawkins, National Security Fellow at Open the Gov, Investigator for Detainee Task Force, May 8 2015, da: Jul 20 2015, “

ACLU v. Clapper Shows that Secret Courts are No Substitute for Real Judicial Review,” Open the Government, <http://classifiedsection.openthegovernment.org/2015/05/08/aclu-v-clapper-shows-that-secret-courts-are-no-substitute-for-real-judicial-review/>,PS)

A unanimous panel of THE SECOND CIRCUIT COURT OF APPEALS YESTERDAY RULED THAT THE NSA’S NATIONWIDE COLLECTION OF AMERICANS’ PHONE RECORDS ILEGAL, unauthorized by section 215 of PATRIOT or any other statute.¶ THE OPINION IN ACLU V. CLAPPER IS ONLY THE LATEST IN A SERIES OF COURT DECISIONS AND GOVERNMENT REPORTS DISCREDITING THE BULK COLLECTION PROGRAM. Even so, the Second Circuit’s ruling is a landmark—and it demonstrates the fundamental difference between independent, adversarial judicial review, and secret legal approvals for secret programs.¶ As THE New York Times wrote, yesterday’s RULING WAS “the first time a higher-level court IN THE REGULAR JUDICIAL SYSTEM HAS REVIEWED THE PROGRAM” although it had repeatedly been approved in secret by the Foreign Intelligence Surveillance Court (FISC) since 2006. The FISC approved the bulk collection program for years without issuing any opinion—even a classified one—analyzing its legality. THE FISC also NEVER HEARD LEGAL ARGUMENTS THAT THE PROGRAM VIOLATED THE CONSTITUTION, or was unauthorized by statute.¶ As Second Circuit’s opinion states, CONGRESS REAUTHORIZED SECTION 215 OF THE PATRIOT ACT after the call records program began, BUT IT DID SO WHEN THE PROGRAM WAS SHROUDED IN THE SECRECY applicable to classified information, AND ONLY A LIMITED SUBSET OF MEMBERS OF CONGRESS HAD A COMPREHENSIVE UNDERSTANDING of the program or of its purported legal bases. There was certainly no opportunity for broad discussion in the Congress or among the public of whether the FISC’s interpretation of § 215 was correct. Finding the government’s interpretation of the statute to have been “legislatively ratified” under these circumstances would ignore reality.¶ THE COURT CALLS THIS SECRECY “UNDERSTANDABLE.” That is debatable, particularly since the government did not simply classify the extent of NSA surveillance before Edward Snowden’s disclosures. IT also ACTIVELY MISLED CONGRESS, THE PUBLIC, AND THE COURTS ABOUT THEM, IN AN EFFORT TO PREVENT OPEN DEBATE OR JUDICIAL REVIEW.¶ Both the Second Circuit opinion and Judge Robert Sack’s concurrence acknowledge that the Snowden leaks “led to this litigation.” THE OPINION NOTES THAT THE SECOND CIRCUIT may well have REACHED A DIFFERENT RESULT FROM FISC in part BECAUSE THE FORMER “RECEIVED THE BENEFIT OF AN ADVERSARIAL PRESENTATION OF THE ISSUES” in open court.¶ Judge Sack’s concurrence explains this at greater length. He compares Snowden’s disclosures to Daniel Ellsberg’s leak of the Pentagon Papers, and discusses the crucial differences between secret ex parte proceedings and ordinary judicial review:¶ Two of the fundamental characteristics of ordinary Article III Courts that are often considered central to their mission are transparency (“openness”) and a properly functioning adversary system.... most Article III courts, including this Court, operate under a strong presumption that their papers and proceedings are open to the public.¶ Sack’s concurrence also discusses the crucial role that a New York Times attorney’s cross-examination of government witnesses played in the Pentagon Papers case, leading the district court judge to “find as a fact” that the government had not demonstrated “that the publication of these historical documents would seriously

breach the national security.”[¶] THE EXECUTIVE BRANCH also SEEMS TO REALIZE WHAT A DIFFERENCE PUBLIC DISCLOSURE AND ADVERSARIAL, independent JUDICIAL REVIEW CAN MAKE in evaluating the legality of national security programs. It has responded by using state secrets privilege, classification, and standing arguments to oppose judicial review whenever possible, and by concealing its own controlling interpretations of law from Congress and the public. Too often, the federal courts have acquiesced. In 2013, in *Clapper v. Amnesty International*, the Supreme Court held that civil society organizations, detainees’ lawyers and journalists could not challenge NSA spying under section 702 of the FISA Amendments Act, because their fears of surveillance were “highly speculative” (overturning a Second Circuit decision in which Judges Sack and Lynch took part). The reason the plaintiffs were forced to “speculate” about whether the NSA was collecting their communications, of course, was the secrecy in which the agency operated. The government also made several inaccurate statements about the 702 program during oral arguments.[¶] In February 2015, in *Jewel v. NSA*, a federal judge in California held that the plaintiffs could not challenge the 702 program based on a similar *Catch 22*. The plaintiffs’ evidence that their communications were targeted remained were too “speculative” for them to be allowed to sue. In any case, the judge said, the case had to be dismissed on grounds of state secrets privilege, because the government had shown that “could not proceed without risking exceptionally grave damage to national security.” The only proof of the harm to national security was contained in government declarations that were kept secret not only from the public, but from the plaintiffs and their lawyers.[¶] The use of secret, ex parte government declarations to dismiss cases is not limited to surveillance. In March of this year, a federal judge in New York dismissed a private defamation case on grounds of state secrets privilege, in *Restis v. American Coalition Against Nuclear Iran, Inc.* The plaintiffs and their lawyers were not only denied access to the government’s declarations, but were also not told which government agency submitted them. As the court stated, dismissing the case meant that “Plaintiffs not only do not get their day in court, but cannot be told why.” It dismissed the case anyway.[¶] As the *Restis* court noted, federal cases often rely on secret, ex parte government declarations on the need for secrecy even in cases where opposing counsel have high-level security clearances. Clearance or no, the government gets to decide whether opposing counsel have a “need to know” the information that may well prove decisive to their client’s case.[¶] STANDING AND THE STATE SECRETS DOCTRINE ARE only TWO of a host of legal ARGUMENTS THAT THE GOVERNMENT CAN USE TO PERSUADE COURTS NOT TO RULE ON THE LEGALITY OF ITS NATIONAL SECURITY PROGRAMS. The Executive can also argue that the defendants have immunity from suit; that the case is a “political question”; that even if the government’s acted illegally there is no right to sue them for it; that the plaintiffs are not, legally, speaking, “persons”. The list of ways in which plaintiffs can lose national security cases without any ruling on the legality of the government’s actions is nearly endless.[¶] If regular courts do not hear national security cases on the merits, then who says what the law is? Sometimes, it is a secret court like the FISC. More often, it is attorneys within the Executive Branch itself—particularly the Justice Department’s Office of Legal Counsel (OLC). OLC opinions, as former Attorney General Eric Holder acknowledged in 2010, are often “effectively...the final word on the controlling law” for the United States government on issues “that are unlikely to be resolved by the courts.” Under the Bush administration, OLC memos redefined torture. Under Obama, they set the legal limits on the drone program. Surveillance under Executive Order 12333 is governed in part by an OLC memo written during the Reagan administration. But most OLC memos remain as secret from the public, and as inaccessible to Congress, as the Section 215 program was before the Snowden disclosures. Even for unclassified memos, OLC routinely redacts their titles and dates as well as their content in response to Freedom of

Information Act requests. When it comes to OLC memos about classified programs—OLC won't even reveal how many it has written under the Obama administration.¶ The intelligence community constantly reassures us that its actions are legal and constitutional. But AS THE SECOND CIRCUIT'S RULING DEMONSTRATES, WITHOUT AN OPPORTUNITY TO READ THE LEGAL JUSTIFICATIONS, Or debate them in Congress, or test them in independent courts that hear arguments from more than one side, THOSE REASSURANCES HAVE LITTLE VALUE. That is why meaningful surveillance reform must include checks on government secrecy.

1AR — Link Not Unique

Second circuit ruling already changed government practices

Jaffer 5-12(Jameel Jaffer, Deputy Legal Director at the American Civil Liberties Union and the Director of the ACLU's Center for Democracy, Counsel to the plaintiffs in the litigation in *ACLU v. Clapper*, May 12 2015, da: Jul 20 2015, "What *ACLU v. Clapper* Means," Just Security, <http://justsecurity.org/22961/aclu-v-clapper-means/>,PS)

Many others have already weighed in about the significance of last week's ruling in *ACLU v. Clapper*. Here are my own quick thoughts. As regular readers of this blog already know, I'm counsel to the plaintiffs in the litigation.¶ 1. **THE RULING IS A MAJOR VICTORY FOR THE MANY ADVOCATES FROM ACROSS THE POLITICAL SPECTRUM, OUTSIDE THE GOVERNMENT AND INSIDE**, who have been arguing that some of the government's surveillance activities are overbroad and unlawful and that the system of oversight that Congress established in 1978 isn't working. **THE FISA COURT SIGNED OFF ON THE CALL RECORDS PROGRAM DOZENS OF TIMES AFTER HEARING ARGUMENT ONLY FROM THE GOVERNMENT.** Now the first appeals court to have considered the issue after adversarial presentation has concluded, in an opinion that no one could characterize as anything other than meticulous and comprehensive, that the program is illegal. **THE SECOND CIRCUIT'S OPINION IS RESPECTFUL TOWARDS THE FISA COURT** and the congressional intelligence committees, but **there is no doubt that the opinion is an indictment of the oversight system.** 2. The ruling means that even if Congress reauthorizes Section 215 by June 1, the government will have to discontinue bulk collection under that provision unless Congress adds language expressly authorizing bulk collection or the government prevails on the Supreme Court to vacate the ruling. That the Second Circuit declined to enjoin the call records program is immaterial. If Congress reauthorizes Section 215 in its current form, the district court will likely issue an injunction. Even without an injunction, telecommunications providers may begin to resist compliance with production demands.¶ 3. The ruling means that **THE GOVERNMENT WILL HAVE TO RECONSIDER OTHER BULK COLLECTION PROGRAMS THAT ARE OPERATED UNDER OTHER AUTHORITIES** but predicated on the same now-discredited theory of "relevance." We know the DEA had a bulk call records program until 2013. We know the NSA was collecting Internet metadata in bulk until 2011. In what contexts the government is engaging in bulk collection now is not entirely clear, but news reports indicate that there are other bulk collection programs that haven't yet been officially acknowledged. If the government is operating other bulk collection programs — or even "bulky" collection programs — it will now have to reconsider them. Even if it doesn't reconsider them of its own accord, **PRIVATE ENTITIES WHOSE ASSISTANCE THE GOVERNMENT NEEDS** (telecommunications companies, financial companies, technology companies) **MAY RESIST DEMANDS THAT THEY MIGHT NOT HAVE RESISTED BEFORE LAST WEEK.** I suspect that general counsels of corporations that hold large volumes of third-party records will read the Second Circuit's decision especially closely.¶ 4. **The ruling will change the dynamics on the Hill** — and to some extent it already has. The Senate majority leader was already struggling to marshal support for a straight reauthorization of Section 215. Now his task is harder, first, because the Second Circuit's ruling makes it even clearer that the Patriot Act's surveillance provisions are being abused; and, second, because, again, even a straight reauthorization won't enable the government to continue bulk collection under Section 215 unless the Supreme Court vacates the Second Circuit's decision. The flipside is that **THE LEVERAGE OF THE USA FREEDOM ACT'S SUPPORTERS HAS INCREASED, AND THEY MAY BE ABLE TO USE THAT LEVERAGE TO STRENGTHEN THE ACT** — for example, to tighten the restriction against bulk collection under Section 215, to impose stronger minimization requirements, to require greater transparency

about the government's surveillance activities, and to prohibit "backdoor" searches under the FISA Amendments Act. If the USA Freedom Act isn't strengthened, some who previously supported it may ask whether it accomplishes significantly more than what the Second Circuit has already accomplished, and they may begin to wonder why Section 215 shouldn't simply be allowed to sunset. On the other hand, if the reform bill is significantly strengthened, it may attract support from organizations and individuals that haven't until now been willing to support it. (Currently, the ACLU is neither supporting the bill nor opposing it.) IT WILL BE EASIER TO SAY IN THREE YEARS, OR PERHAPS EVEN THREE MONTHS, PRECISELY HOW SIGNIFICANT THE SECOND CIRCUIT'S DECISION WAS. But THE DECISION HAS ALREADY SHAKEN THINGS UP, AND IT COULD CHANGE THE GOVERNMENT'S SURVEILLANCE PRACTICES QUITE DRAMATICALLY. I wrote two years ago that the Snowden disclosures should spark reform, and I wrote here nine months ago that they would. It's too early to know whether I was right, but I'm more optimistic today than I was a week ago.

Deference Bad

Violates Constitution

Deference allows rampant rights abuses- empirics

Scales and Spitz 02(Ann Scales, professor at the University of Denver Law School, Laura Spitz, professor at the University of Colorado Law School, Seattle Journal for Social Justice, Volume 1, Issue 3, December 2002, da: July 9 2015, "The Jurisprudence of the Military- Industrial Complex", <http://digitalcommons.law.seattleu.edu/cgi/viewcontent.cgi?article=1416&context=sjsj>)

First, OUR NATION'S HISTORY AND LEGITIMACY REST UPON A SEPARATION OF MILITARY POWER FROM DEMOCRATIC GOVERNANCE. For that reason, the armed forces are subject to constitutional constraint. Second, however, AS AN ASPECT OF SEPARATION OF POWERS, COURTS TRY NOT TO INTERFERE IN AREAS OF FOREIGN POLICY AND MILITARY AFFAIRS. Often this is referred to as the "political question" doctrine, a determination that a matter is beyond the capabilities of judges. THE STRONGEST ARGUMENT FOR THIS DEFERENCE IS THAT THE POLITICAL BRANCHES—or the military itself—HAVE SUPERIOR EXPERTISE IN MILITARY MATTERS. That may be true in some situations. I am not sure, for example, the Supreme Court would have been the best crowd to organize the invasion of Normandy. But **what we now have is an increasingly irrational deference.**⁷ Consider three cases: In **Korematsu v. United States**,⁸ THE SUPREME COURT said the INTERMENT of Japanese-Americans at the beginning of 1942 WAS CONSTITUTIONAL, BASED UPON A MILITARY ASSESSMENT of the possibility of espionage in preparation for a Japanese invasion of the United States. It turns out that THE INFORMATION PROVIDED BY THE MILITARY TO THE SUPREME COURT WAS FALSIFIED.⁹ But note two things: (1) the nation was in the midst of a declared world war, and (2) in subsequent less urgent circumstances, Korematsu would seem to argue strongly for military justifications to have to be based upon better, more reliable information than was offered there. b. IN the 1981 case of **Rostker v. Goldberg**,¹⁰ THE Supreme COURT DECIDED THAT IT WAS CONSTITUTIONAL FOR CONGRESS TO EXCLUDE WOMEN FROM THE peacetime registration of potential DRAFTEES, even though both the Department of Defense and the Army Chief of Staff had testified that including women would increase military readiness. But CONGRESS GOT THE BENEFIT OF THE MILITARY DEFERENCE DOCTRINE as a cover for what I think was a sinister political purpose—to protect the manliness of war—AND THE SUPREME COURT FELT PERFECTLY FREE TO IGNORE WHAT THOSE WITH THE REAL EXPERTISE HAD TO SAY.¹¹ c. Most recently, in **Hamdi v. Rumsfeld**,¹¹ the Fourth Circuit held that a U.S. CITIZEN WHO HAD BEEN DESIGNATED AN "ENEMY COMBATANT"¹² COULD BE DETAINED INDEFINITELY without access to counsel. In this case, however, NOT ONLY IS THERE NO DECLARED WAR,¹³ but also, THE ONLY EVIDENCE REGARDING MR. HAMDI WAS A TWO-PAGE AFFIDAVIT BY A DEFENSE DEPARTMENT UNDERLING, Mr. Mobbs. Mobbs stated that Mr. Hamdi was captured in Afghanistan, and had been affiliated with a Taliban military unit. The government would not disclose the criteria for the "enemy combatant" designation, the statements of Mr. Hamdi that allegedly satisfied those criteria, nor any other bases for the conclusion of Taliban "affiliation."¹⁴ And that is as good as the evidence for life imprisonment without trial has to be. **Deference to the military has become abdication.**¹⁵ In other words, WHAT WE PRESENTLY HAVE IS not civilian government under military control, but something potentially worse, A CIVILIAN GOVERNMENT IGNORING MILITARY ADVICE, BUT USING THE LEGAL DOCTRINE OF MILITARY DEFERENCE FOR ITS OWN IMPERIALIST ENDS.

Constitutional violations lead to anarchy

Smith 07(Andrew Smith, graduated from Valparaiso University School of Law, 2007, da: Jul 19 2015, Valparaiso University Law Review, Volume 41, Number 4, "Breaking the Stalemate: The Judiciary's Constitutional Role in Disputes over the War Powers," <http://scholar.valpo.edu/cgi/viewcontent.cgi?article=1194&context=vulr>, PS)

THE CONSTITUTIONAL DIVISION OF THE WAR POWER BETWEEN THE EXECUTIVE AND LEGISLATIVE BRANCHES CAN CAUSE AN INHERENT CONFLICT when one branch exercises its power in opposition of the other. While the Supreme Court would typically find such a conflict nonjusticiable under the political question doctrine, THE COURT SHOULD FIND THESE DISPUTES COGNIZABLE IF THE PRESIDENT OVERSTEPS THE BREADTH OF HIS CONSTITUTIONAL AUTHORITY impeding upon the power attributed to another branch, OR IF IT IMPLICATES A FUNDAMENTAL LIBERTY INTEREST RETAINED BY AMERICAN CITIZENS. President Bush's domestic surveillance program, conflicts with acts of Congress such as FISA and the War Powers Resolution. THESE ACTS AIM TO REIN IN THE PRESIDENT'S POWER TO WAGE WAR, BUT THE NSA PROGRAM SEEMINGLY DISREGARDS THESE RESTRICTIONS. THE PROGRAM CONTRADICTS THE POWER OF CONGRESS. As a result, THE SUPREME COURT MUST MEDIATE THE DISPUTE between Congress and the president because the executive has invaded the constitutional authority retained by Congress. Moreover, the NSA program collects the personal information of the citizenry without a warrant, and the Fourth Amendment requires the government to obtain a warrant in order to collect this information. Because the Supreme Court has failed to recognize a national security exception to the warrant requirement, the NSA program violates the fundamental liberty interest protected by the Fourth Amendment. **In order to prevent the harm to liberty that could lead towards anarchy, THE SUPREME COURT MUST DETERMINE THE BREADTH OF THE PRESIDENT'S CONSTITUTIONAL POWER** to exercise military force under the auspice of national security.

An unconstitutional Supreme Court leads to a laundry list of civil liberties violations.

Adler 12

(Jonathan H., Johan Verheij Memorial Professor of Law; Director, Center for Business Law & Regulation, Case Western Reserve University School of Law; JD, Summa Cum Laude, from George Mason University School of Law, "Seidman: "Let's Give Up on [Parts of] the Constitution"", December 31, 2012, <http://volokh.com/2012/12/31/seidman-lets-give-up-on-parts-of-the-constitution/>, kc)

Seidman writes that if we followed his advice: "The Supreme Court could stop pretending that its decisions protecting same-sex intimacy or limiting affirmative action were rooted in constitutional text." So SUPREME COURT OPINIONS WOULD BE NOTHING MORE THAN POLICY BRIEFS AND APPEALS TO MORAL PRINCIPLE? It seems to me THAT IS A RECIPE FOR UNDERMINING THE LEGITIMACY OF JUDICIAL REVIEW AND ULTIMATELY RELEGATING ALL SUCH QUESTIONS TO THE POLITICAL PROCESS — AND PRODUCING QUITE A FEW RESULTS I doubt Seidman would much LIKE (e.g. GREATER LIMITS ON EXPRESSION, LESSER PROTECTION OF CRIMINAL DEFENDANTS, AND MORE EXPANSIVE NATIONAL SECURITY AUTHORITY). There are reasonable arguments for constraining (or even eliminating) judicial review — I don't agree with them, but I think they are reasonable — but I don't take that to be Seidman's argument. To the contrary, he seems to want to keep judicial review, but just for those constitutional provisions he likes, but that's hardly the basis for a principled argument for "constitutional disobedience," as such.

Deference causes constitutional abuse and upsets the balance of power.

Legal Monitor Worldwide 13

(Legal Monitor Worldwide is a subscription-based publication covering legal news and developments from worldwide jurisdictions. Legal Monitor Worldwide covers multiple legal subjects and topics such as constitutional and administrative law, criminal law, contract law, tort law, property law, equity and trusts; as well as legal systems including civil law, common law and equity, and religious law. Published in Amman, Jordan, "The Case Against Deference", June 1, 2013, Lexis, kc)

THE principal conservative RESPONSE WAS TO PROMOTE JUDICIAL DEFERENCE: Judges should resist the temptation to legislate from the bench and "defer" to the political branches. UNFORTUNATELY, TIME HAS SHOWN THAT THIS RESPONSE WAS TOO BLUNT. PARTICULARLY IN CONSTITUTIONAL CASES, JUDICIAL DEFERENCE HAS LED TO A STEADY EXPANSION OF GOVERNMENT POWER. THIS, IN TURN, HAS UNDERMINED THE DELICATE CONSTITUTIONAL ARCHITECTURE, WHICH CALLS FOR A FEDERAL GOVERNMENT OF LIMITED AND ENUMERATED POWERS. ¶ Fortunately, a younger generation of conservative lawyers has come to recognize that there is no principled distinction between inventing new rights, unmoored from the Constitution's text or history, and refusing to uphold constitutionally anchored limits on government power. IN BOTH INSTANCES, JUDGES ARE IGNORING THE CONSTITUTION and engaging in-for lack of a better term-judicial activism. JUDICIAL DEFERENCE MAY HAVE REINED IN JUDICIAL POWER, BUT AT AN UNACCEPTABLE CONSTITUTIONAL PRICE. For both doctrinal and pragmatic reasons, THE CONCEPT NEEDS RETHINKING.

Deference continues the political question doctrine- hurts separation of powers, which is key to efficient policymaking.

Cole 14

(Jared P. Cole, Legislative Attorney at Congressional Research Service; JD from University of Virginia School of Law, "The Political Question Doctrine: Justiciability and the Separation of Powers", December 23, 2014, <https://www.fas.org/sgp/crs/misc/R43834.pdf>, kc)

A REDUCTION IN SITUATIONS WHERE COURTS MAY DECLINE TO ADJUDICATE A CASE ON POLITICAL QUESTION GROUNDS MAY HAVE IMPORTANT IMPLICATIONS FOR THE SEPARATION OF POWERS, at least as between Congress and the executive branch. Finding a political question in a case where no disagreement exists between the political branches can be understood as an exercise of judicial minimalism without important consequences for the relationship between Congress and the executive branch.²⁵¹ In contrast, FINDING A POLITICAL QUESTION IN A CASE WHERE A CORE ISSUE PRESENTED IS WHETHER THE EXECUTIVE BRANCH IS BOUND BY A STATUTE OBVIOUSLY CAN IMPACT THE SEPARATION OF POWERS,²⁵² SUCH JUDICIAL RELUCTANCE to enforce a statute, one might argue, leaves resolution of such questions to the political branches, and ALLOWS SOME CONSTITUTIONAL QUESTIONS TO BE RESOLVED VIA A STRUGGLE BETWEEN THE POLITICAL BRANCHES, RATHER THAN BY THE COURTS. Others have argued, however, that the practice actually favors the executive branch at the expense of Congress.²⁵³ Instead of determining a statute's constitutionality, the argument goes, COURTS EFFECTIVELY DECLINE TO FORCE THE EXECUTIVE BRANCH TO COMPLY WITH CONGRESSIONAL WILL— ESSENTIALLY EXPANDING EXECUTIVE BRANCH POWER. Whether the practice functioned to allow the political branches to determine separations of powers disputes between themselves, or effectively

sanctioned executive branch practices, Zivotofsky can be read to restrict lower courts' discretion to apply the doctrine in the future. If so, THIS MAY ENTAIL MORE JUDICIAL RESOLUTION OF SEPARATION OF POWERS DISPUTES, ULTIMATELY AFFIRMING THE JUDICIARY'S ROLE TO "SAY WHAT THE LAW IS," AND POSSIBLY REDUCING THE CONSTITUTIONAL INTERPRETATIVE POWER OF THE POLITICAL BRANCHES.²⁵⁴

Deference precludes enforcement of the Constitution- judicial decisions are key. Legal Monitor Worldwide 13

(Legal Monitor Worldwide is a subscription-based publication covering legal news and developments from worldwide jurisdictions. Legal Monitor Worldwide covers multiple legal subjects and topics such as constitutional and administrative law, criminal law, contract law, tort law, property law, equity and trusts; as well as legal systems including civil law, common law and equity, and religious law. Published in Amman, Jordan, "The Case Against Deference", June 1, 2013, Lexis, kc)

First, THE "COUNTER-MAJORITARIAN DIFFICULTY" THAT LIES AT THE HEART OF JUDICIAL RESTRAINT HAS BEEN OVERSOLD. The label itself suggests that judges should esteem current majoritarian preferences and be loath to overturn them. But why, when the Constitution instructs otherwise? Article VI declares that the Constitution is the "supreme law of the land," and trumps conflicting ordinary laws. JUDGES TAKE AN OATH TO "SUPPORT THIS CONSTITUTION," reflecting their duty to heed the constitutional language. ENFORCING THE WRITTEN CONSTITUTION- NOT REFLEXIVELY DEFERRING TO EXTANT LEGISLATIVE MAJORITIES- WAS (AND STILL IS) THE WILL OF WE THE PEOPLE. If the people desire constitutional change, Article V provides the mechanism, allowing every generation to put its stamp on our fundamental legal charter. ¶ In Federalist 78, ALEXANDER HAMILTON DESCRIBED THE CRUCIAL JUDICIAL ROLE IN ENSURING THAT THE CONSTITUTION REIGNS SUPREME, EXPLAINING THAT JUDICIAL INDEPENDENCE WAS "PECULIARLY ESSENTIAL IN A LIMITED CONSTITUTION," WHERE THE GOVERNMENT POSSESSED ONLY ENUMERATED POWERS. In such a government, he observed, "[L]IMITATIONS of this kind CAN BE PRESERVED IN PRACTICE NO OTHER WAY THAN THROUGH THE MEDIUM OF COURTS OF JUSTICE, whose duty it must be to declare all acts contrary to the manifest tenor of the Constitution void. Without this, all the reservations of particular rights or privileges would amount to nothing." Hamilton and other FRAMERS UNDERSTOOD THAT ROBUST JUDICIAL REVIEW WAS ESSENTIAL TO ENFORCE LIMITED AND ENUMERATED POWERS.

Deference bad- impedes judges from upholding the Constitution. Legal Monitor Worldwide 13

(Legal Monitor Worldwide is a subscription-based publication covering legal news and developments from worldwide jurisdictions. Legal Monitor Worldwide covers multiple legal subjects and topics such as constitutional and administrative law, criminal law, contract law, tort law, property law, equity and trusts; as well as legal systems including civil law, common law and equity, and religious law. Published in Amman, Jordan, "The Case Against Deference", June 1, 2013, Lexis, kc)

It is high time for judges to abandon reflexive deference. JUDGES SHOULD BE UNAFRAID TO REVIEW GOVERNMENT ACTIONS AND DEFEND CONSTITUTIONAL PRINCIPLES. THIS WOULD ENTAIL, among other things, BEEFING UP THE "RATIONAL BASIS" REVIEW OF GOVERNMENT ACTIONS AND MAKING IT A SERIOUS EXAMINATION of both the government's ends-are they properly derived from the government's legitimate purposes?-as well as the government's means-do

they rationally advance the ends that the government articulated at the time it undertook the action being challenged? BY MAKING THESE IMPORTANT SHIFTS IN THE WAY constitutional CASES and the facts underlying them ARE VIEWED, JUDGES CAN BEST LIVE UP TO THEIR OBLIGATION TO UPHOLD THE CONSTITUTION-A GOAL JUDGES OF ALL POLITICAL STRIPES SHOULD BE ABLE TO EMBRACE.

Hurts Freedom of Speech

Reversing previous Court precedents is key – deference emboldens the government to decimate free speech altogether.

Moshirnia 13 – Andrew Moshirnia, Presidential IT Fellow @ Harvard Law School with a PhD in Educational Technology, 2013 (“Valuing Speech and Open Source Intelligence in the Face of Judicial Deference”, Harvard Law School National Security Journal, available online at <http://harvardnsj.org/wp-content/uploads/2013/05/Vo.4-Moshirnia-Final.pdf>, accessed 6/17/15, KM)

III. Recent Government Positions Threaten to Chill Valuable Intelligence The Government’s and the Court’s recent legal stances are intended to chill sources of open source intelligence involving terrorists themselves, foreign reporters, and domestic individuals who have had contact with foreign terror organizations. In the trial and appeal of al-Qaeda propagandist, Ali Hamza Al-Bahlul, the Government has advanced the theory that no part of the First Amendment reaches enemy aliens tried in an American courtroom. The chilling effects of HLP are exacerbated by the trial of Al-Bahlul. Taking these precedents together, a future court could merge the broad definition of material support with a solicitation charge decoupled from First Amendment limitations. That is, if the Court may disregard the First Amendment in solicitation cases involving foreign combatants and in material support cases involving Americans who have associated with terrorists, the Government will be emboldened to ignore First Amendment concerns in crimes involving the solicitation of material support for terrorism. The Government has also detained and threatened several foreign reporters, specifically noting the subsequent chilling of speech as a desired result.

Hurts Bioweapons Research

Unchecked military power leads to bioweapons and human subjects research

Parasidis 12(Efthimios Parasidis, Assistant Professor of Law, Center for Health Law Studies, Saint Louis University School of Law, Social Science Research Network, Ohio State Law Journal, Volume 73, Number 4, 2012, da: Jul 10 2015, "Justice and Beneficence in Military Medicine and Research", http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2176914)

The military has long nurtured a culture and identity that is fundamentally distinct from civil society,⁵²² and THE U.S. GOVERNMENT HAS A HISTORY OF BENDING AND BREAKING THE LAW DURING TIMES OF WAR.⁵²³ WHILE THE MILITARY HAS TRADITIONALLY ENJOYED GREAT DEFERENCE FROM CIVILIAN COURTS in the United States,⁵²⁴ military discipline and national security interests should not grant government officials carte blanche to violate fundamental human rights.⁵²⁵ To the contrary, Congress and the courts should work to ensure that military and intelligence agencies remain subordinate to the democratic rule of law.⁵²⁶ The motto of the American military physician is "to conserve the fighting force," yet the last decade has seen a notable shift in emphasis to enhancing the fighting force through novel applications of biomedical enhancements.⁵²⁷ THE NEFARIOUS CONDUCT OF MILITARY OFFICIALS DURING THE COURSE OF THE mustard gas, radiation, biological warfare, and psychotropic drug experiments PROVIDES ample EVIDENCE OF THE "LIES AND HALF-TRUTHS" THAT THE DOD HAS UTILIZED IN THE NAME OF NATIONAL SECURITY.⁵²⁸ Indeed, the Army Inspector General has acknowledged the "inadequacy of the Army's institutional memory" regarding experimental research.⁵²⁹ When one considers socio-economic dimensions of the armed forces, this history of neglect has served to further societal inequalities.⁵³⁰ As a judge on the Sixth Circuit, and former Commander in Chief of the Ohio National Guard explains, "IN A DEMOCRACY WE HAVE FAR MORE TO FEAR FROM THE LACK OF MILITARY ACCOUNTABILITY THAN FROM THE LACK OF MILITARY DISCIPLINE OR AGGRESSIVENESS."⁵³¹ Despite the Supreme Court's deference to military judgment, the Court has also indicated that service members are entitled to constitutional protections as Americans.⁵³² At the individual level, each service member should maintain patient autonomy and the right to refuse investigational products without fear of punitive repercussions. In the aggregate, the law should serve to instill a sense of confidence in service members that those with power will be held accountable for actions that violate individual rights. EXPERIMENTATION WITHOUT CONSENT CAN NEVER BE JUSTIFIED,⁵³³ AND PATIENT AUTONOMY and human dignity OUGHT NOT BE EXTINGUISHED BECAUSE ONE ELECTS TO SERVE THEIR COUNTRY and defend American freedoms.⁵³⁴ To the extent that changing levels of liability result in changing levels of accident avoidance,⁵³⁴ Congress should disincentivize behavior that unnecessarily increases risks to service members by enacting legislation that limits the scope of the Feres doctrine. The primary purpose of military medicine must be to care for service members and veterans—to enhance each patient's expectation of recovery, reduce the severity of symptoms, and prevent longterm disability.⁵³⁵ SERVICE MEMBERS HAVE LONG BEEN "OUT-OF-SIGHT, OUT-OF-MIND" for both Congress and academics⁵³⁶ AND HAVE ENDURED DECADES OF UNJUST TREATMENT AT THE HANDS OF THE MILITARY ESTABLISHMENT. As Justice Brennan wisely observed in *United States v. Stanley*, "[s]oldiers ought not be asked to defend a Constitution indifferent to their essential human dignity."⁵³⁷ Towards this end, the proposed reforms serve to harmonize national security interests with fundamental principles of patient autonomy and human dignity. THE PREFERRED METHOD OF PROTECTING SERVICE MEMBERS AND PRESERVING MILITARY ORDER and discipline IS TO

religiously FOLLOW POLICIES THAT PROMOTE JUSTICE and beneficence in military, medicine and research.

Hurts Environment

Deference allows rampant violations of environment laws

Yap 04(Julie G. Yap, JD Candidate at Fordham University, 2004, da: Jul 15, "Just Keep Swimming: Guiding Environmental Stewardship out of the Riptide of National Security," Fordham Law Review 1289, Volume 73 Issue 3, <http://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?article=4052&context=fldr>)

NEPA DOES NOT CONTAIN SPECIFIC MEASURES TO EXCLUDE THE MILITARY. ¶ It is well settled that NEPA does apply to the military, even though the statute does not explicitly provide for this.⁶ The statute provides that all federal agencies must comply "to the fullest extent possible." ⁶ 7 ¶ The EIS is subject to the limits of the Freedom of Information Act ("FOIA").⁶⁸ Therefore, if the military is exempted under FOIA from disclosing to the public classified material dealing with national security, the procedural mandates of NEPA cannot override this exemption.⁶⁹ This situation, where NEPA applies and FOIA is invoked, must be handled in most cases by the judiciary.⁷⁰ The history of judicial deference to the military's declarations of national security concerns ⁷¹ makes NEPA an ineffective tool for communities to "stop a major federal action or ... to force serious consideration of environmental impacts."⁷ 2 ¶ THE U.S. SUPREME COURT'S OPINION IN WEINBERGER V. CATHOLIC ACTION,⁷³ a case in which the Court rejected a NEPA challenge to a Navy construction project, ILLUSTRATES THE DEGREE OF JUDICIAL DEFERENCE AFFORDED TO THE MILITARY WHEN THE ISSUE OF NATIONAL SECURITY IS INVOKED. ¶ In Catholic Action, THE NAVY BUILT FORTY-EIGHT earth-covered MAGAZINES ON HAWAII THAT HAD CAPABILITIES FOR STORING NUCLEAR WEAPONS.⁷⁴ Actual nuclear storage at the site could not be confirmed due to classification for national security reasons.⁷⁵ No EIS was prepared.⁷⁶ "A local citizens' group... filed suit calling for an EIS that would analyze: (1) the risk and consequences of a nuclear accident, (2) the effect of a plane from nearby Honolulu International Airport crashing into one of the magazines, and (3) the hazard to local residents from low-level radiation."⁷⁷ The U.S. Court of Appeals for the Ninth Circuit had ordered that the Navy prepare a hypothetical EIS for a facility capable of storing nuclear weapons." THE Supreme COURT HELD THAT AN EIS WAS NOT REQUIRED BECAUSE THE NAVY WAS ONLY CONTEMPLATING STORING NUCLEAR WEAPONS AT THE SITE; nuclear storage was not actually proposed.⁷⁹ The Court also stated that "[u]ltimately, whether or not the Navy has complied with NEPA 'to the fullest extent possible' is beyond judicial scrutiny" because the trial would ultimately lead to the disclosure of confidential information."⁸⁰ GIVEN THIS LEVEL OF JUDICIAL DEFERENCE TO MILITARY SECRECY, THE INVOCATION OF NATIONAL SECURITY BY THE MILITARY WOULD ALMOST ALWAYS ELIMINATE NEPA'S EFFECTIVENESS as a check on the military's decision-making process, even when the proposals and decisions may involve major risks to the community and the environment where the proposed action is to occur. ¶ 81

Hurts Court Credibility

Breaking judicial deference solves – counteracts Precautionary Principle risk assessments and increases court credibility.

Cover 14 – Avidan Cover, Assistant Professor of Law at the Case Western Reserve University School of Law and Director of the Institute for Global Security Law & Policy, BA degree from Princeton University and a JD cum laude from Cornell School of Law, 2014 (“Presumed Imminence: Judicial Risk Assessment in the Post-9/11 World”, Case Western School of Law, April 10, available online at <http://www.cardozolawreview.com/content/35-4/COVER.35.4.pdf>, accessed 6/18/15, KM)

V. REVISING JUDICIAL REVIEW IN THE POST-9/11 WORLD This Part proposes a way forward in which judicial review is less deferential to the political branches and less subject to the various cognitive errors that generally pervade risk assessments. Building on Cass Sunstein’s framework for judicial analysis, which attempts to counteract the Precautionary Principle’s adverse effects, this Part proposes refinements to that framework. In particular, I propose that courts should apply burdens of proof and presumptions regarding evidence that favor the persons or groups whose civil liberties are curtailed. Second, courts should insist on specific evidence that supports deprivations of liberty, particularly those aimed at minority groups. In light of courts’ tendencies to defer to government interpretations of evidence and dilute evidentiary requirements, imposing set standards may counter these propensities. Drawing from literature on the regulation of judicial emotions, I propose that courts adopt candid disclosures, in the mien of Judges Lipez and Silberman, regarding the impact of the post-9/11 heuristic on their decision making. These admissions are more likely to earn trust for the courts in the public discourse of terrorism in a post-9/11 world. A. Adjusting Sunstein’s Framework Sunstein accepts both that courts lack information and expertise to gauge whether curtailing civil liberties may be justified and that the probability of an attack may defy estimation.²⁹⁹ Notwithstanding these limitations, Sunstein proposes a framework for judges to review government counterterrorism measures. Specifically, courts should (1) require restrictions on civil liberties to be authorized by the legislature;³⁰⁰ (2) exact special scrutiny to measures that restrict the liberty of members of identifiable minority groups because the ordinary political safeguards are unreliable when the burdens imposed by law are not widely shared;³⁰¹ and (3) apply second-order balancing because case-by-case ad hoc balancing is more likely to permit excessive intrusions.³⁰² How might Humanitarian Law Project have fared in Sunstein’s framework? Congress’s passage of the material support law suggests that a court should defer under the first prong. However, the ambiguity as to whether the teaching of peaceful advocacy constitutes “training” or “expert advice or assistance” under the material support ban would warrant careful judicial review. Under the second prong, because the ban targets political speech, this speech would also deserve special scrutiny. Roberts may have come fairly close to applying the scrutiny envisioned by Sunstein by applying a level of scrutiny somewhere between strict scrutiny and that which is reserved for conduct.³⁰³ And yet, Roberts’s deference to the government’s evidence overrode even that high level of scrutiny.³⁰⁴ Finally, what second order balancing applies? Sunstein identifies the considerations of imminence and likelihood from *Brandenburg* as factors that a court might consider.³⁰⁵ It was precisely these elements that Breyer asked to be considered in his dissent.³⁰⁶ But would the second order balancing have made a difference to Roberts? The answer is almost certainly no. It is this fact that illustrates the limitations of Sunstein’s proposal. Just as the gravity of the harm may be exaggerated, the probability and imminence of that harm also may be overstated. Much of this may be attributed to cultural cognition—Roberts’s understanding that we now live in a “different world.”³⁰⁷ As a result,

Roberts, like many other judges, appeared to presume the probability and imminence of an attack.³⁰⁸ Sunstein's second example—torture—similarly illustrates the inevitably subjective calculations and related fact-finding that also pervade second-order balancing. Theorizing that torture might be justified in a specific instance under ad hoc balancing, Sunstein contends that utilitarian arguments of the potential for widespread and unjustified torture would lead courts to reject its isolated use. However, it is not clear that these utilitarian considerations would make a judge any more likely to strike down the use of torture. Based on various biases and cultural affinities, courts could come to different conclusions; and even if this second order balancing is adopted, the potential number of lives saved by torture could offset significant numbers of people wrongly tortured. Judge Silberman adverted to this in his acceptance of the idea of letting a potentially guilty man go free in a criminal context based upon second-order considerations, as well as in his refusal to authorize the release of a possible Al Qaeda detainee because of the “infinitely greater downside risk to our country.”³⁰⁹ As a result, specific standards of evidence that the government must satisfy in order to justify infringements of civil liberties should be grafted onto Sunstein's framework. These standards should favor the individuals or groups whose liberties may be infringed because the government is likely to pursue measures that not only disregard probability, but are also calculated to curry popular favor.³¹⁰ Researchers found, in a series of studies, that judgments of blameworthiness for failing to prevent an attack are far more likely to affect anti-terror budget priorities than probability judgments.³¹¹ The authors of these studies concluded that because people blame policy makers more for high consequence events than for more probable ones,³¹² policy makers will be tempted to “prevent attacks that are more severe and more upsetting without sufficiently balancing the attack's likelihood against its outcome.”³¹³ To counteract this emotional tendency, these authors suggested that policy makers explicitly consider likelihood data in formulating counterterrorism policy.³¹⁴ Similarly, without prescribed evidentiary standards, courts are likely to craft opinions that defer to the government's interpretation of evidence and ignore probability and imminence, often by diluting the evidentiary requirements to the point where they favor the government. Indeed, Roberts decried the dissent's call in Humanitarian Law Project “demanding hard proof—with ‘detail,’ ‘specific facts,’ and ‘specific evidence,’—that [the] proposed activities will support terrorist attacks.”³¹⁵ Rather, it was sufficient to rely on the Blood and Belief- sourced notion that “[a] foreign terrorist organization introduced to the structures of the international legal system might use the information to threaten, manipulate, and disrupt.”³¹⁶ And Roberts was content to rely simply on the idea that “[t]his possibility is real, not remote.”³¹⁷ But failing to require any demonstrable risk when the First Amendment and national security conflict, invites imaginings of the possible and plausible, without sufficient regard for the probable. Applying such a rule, Breyer argued, will grant the government a victory in every instance.³¹⁸ Breyer's and Roberts's dispute over the quantum of evidence required to establish a connection between the human rights advocates' speech and terrorist attacks reverberates in the lower courts. This has played out most fully in the post-Boumediene litigation in the D.C. Circuit and district courts. In most instances, the D.C. Circuit has crafted evidentiary standards that benefit the government.³¹⁹ For example, the D.C. Circuit has held that the government need only show by a preponderance of the evidence that a detainee is a member of Al Qaeda or an associated force.³²⁰ Yet, many of the judges have chafed at the higher preponderance standard, advocating a lesser burden of proof.³²¹ Furthermore, at least one D.C. Circuit member has contended that the courts' opinions merely invoke the “preponderance of the evidence standard while in fact requiring nothing more than substantial evidence to deny habeas petitions.”³²² Not content with the reduced burden of proof, the D.C. Circuit has also held that government intelligence reports enjoy a

presumption of regularity.³²³ The D.C. Circuit has also insisted that courts undertake “conditional probability analysis,” or a “mosaic approach,” which entails reviewing evidence collectively, as opposed to in isolation.³²⁴ The practical effect of these decisions has been to, in the words of D.C. Circuit Judge David Tatel, “mov[e] the goal posts” and “call[] the game in the government’s favor.”³²⁵ Humanitarian Law Project and the post-Boumediene litigation demonstrate that in the absence of clearly prescribed evidentiary standards, courts will craft a set of standards that support the government’s contentions, fearful of both the potential for harm and the public’s ire.³²⁶ Thus, my proposal requires that burdens of proof be placed squarely on the government and that presumptions about evidence should not tilt against the person or group whose liberty interest has been implicated. This proposal does not ignore valid security interests or call the game in favor of civil liberties. What it does recognize, however, is that the government—and judges—often overstate the harm, the probability, and the imminence of terrorist threats. In order to justify a limitation on a liberty interest, the government must provide specific evidence supporting its assessments of the danger, probability, and imminence of a terrorist attack. Evidence must rise above generality and speculation.³²⁷ Courts should also adopt Cristina Wells’s proposed refined balancing, which entails clarifying the interests implicated and examining the government’s evidence supporting curtailment of the protected activity.³²⁸ A prescribed set of questions or checklist might have the salutary effect of moving judges from an intuitive process to a more deliberative one. Moreover, requiring such specificity is consistent with Philip Tetlock’s admonition that “we as a society would be better off if participants in policy debates stated their beliefs in testable forms.”³³⁰ This approach can obtain greater accuracy and accountability of all participants, including the government, experts, and judges.³³¹ Finally, requiring the government to meet a substantial burden of proof should not be alarming. It is hard to understand, for example, how a “clear and convincing” burden of proof in the detention context would prize civil liberty too dearly. This is not an unbearable burden for the government. As Baher Azmy argues, courts have applied this standard in a variety of sensitive and complex contexts including the pretrial detention of people for dangerousness, the “civil commitment of ‘sexually violent predators,’” and the commitment of those “found not guilty by reason of insanity.”³³² A lesser standard is more likely to feed biases: neglecting probability and presuming imminence.

Hurts Privacy

Courts are a better actor than the legislative branch, especially when it comes to privacy – empirics show that Congress doesn't respond to deference – no defense applies

Solove 5 – Daniel Solove, Associate Professor @ George Washington University Law School, J.D. @ Yale, 2005 ("Fourth Amendment Codification and Professor Kerr's Misguided Call for Judicial Deference", Fordham Law School, available online at <http://ir.lawnet.fordham.edu/flr/vol74/iss2/14/>, accessed 6/20/15, KM)

II. CONGRESS VERSUS THE COURTS The previous part demonstrated that, for a significant portion of criminal investigations, especially those involving information, a regime of federal statutes-rather than the Fourth Amendment-governs. Orin Kerr is one of the few to have analyzed the implications of this profound shift from constitutional to statutory regulation of government investigations. Kerr contends that legislative rules are in many respects preferable to judicial ones, and he goes on to argue that "the legislative branch rather than the judiciary should create the primary investigative rules when technology is changing." 110 Legislatures, according to Kerr, "offer significant institutional advantages over courts."¹¹ Accordingly, "[c]ourts should recognize their institutional limitations and remain cautious until the relevant technology and its applications stabilize." What does Kerr mean by invoking the language of judicial "caution"? The language is that of deference, which is also referred to as judicial restraint. Elsewhere, I have critiqued the underpinnings used to justify judicial deference, concluding that "d]eference is the negation of critical inquiry."¹¹³ Kerr is unclear in his article about what precisely judges should do when faced with applying the Fourth Amendment to a new technology. One interpretation of Kerr's call for "caution" is for judges to be more reluctant to find the Fourth Amendment applicable to new technologies-in other words, to conclude that, when law enforcement activities involve new technologies, they fall outside of the Fourth Amendment's protection. Because Fourth Amendment applicability turns on whether or not there is a reasonable expectation of privacy, perhaps Kerr is suggesting that courts should be reluctant to find a reasonable expectation of privacy. As Kerr notes, "[j]udicial deference has often invited Congressional regulation." Therefore, the most deferential position courts can take is simply to hold that the Fourth Amendment does not apply, and allow Congress to fill the void. The question becomes the following: Should courts be more bold in expanding the scope of the Fourth Amendment to encompass new technologies? Or should courts cautiously hold off and allow legislatures to craft the regulation? The next part of this Article argues that Kerr is too quick to extol the virtues of Congress and that he is especially misguided in suggesting that courts take a back seat to legislatures in creating criminal procedure rules for new technologies. A. Are Legislative Rules Better than Judicial Rules? Kerr makes a number of arguments in support of his call for judicial restraint. Kerr's key contentions are that (1) legislatures create rules that are more comprehensive, balanced, clear, and flexible; (2) legislatures are better able to keep up with technological change; and (3) legislatures are more adept at understanding complex new technologies. 115 The following sections examine each contention in turn. 1. Creating a Comprehensive and Balanced Set of Rules Kerr argues that a key goal in drafting criminal procedure rules is to create "a rule-structure that simultaneously respects privacy interests and law enforcement needs."¹¹⁶ According to Kerr, unlike courts, "[l]egislatures can enact comprehensive rules based on expert input and can update them frequently as technology changes." Moreover, legislative rules "are more nuanced, clear, and . . .

optimize the critical balance between privacy and public safety more effectively when technology is in flux."¹¹⁸ However, there seems to be no reason why a statutory regime will inevitably be any more comprehensive, balanced, or clear than a regime based on Fourth Amendment principles. When the Fourth Amendment covers a particular law enforcement activity, it provides a set of rules to regulate it. Once a law enforcement activity falls within the Fourth Amendment's regulatory regime, courts will examine whether the search or seizure was "reasonable."¹⁹ A search with a warrant supported by probable cause is generally reasonable. Only on very rare occasions are searches pursuant to a valid warrant unreasonable.¹²⁰ A search without a valid warrant is often deemed unreasonable. This is known as the "per se warrant rule."¹²¹ Warrants are a judicial authorization for a particular search. Warrants must be supported by probable cause, which exists when there is "reasonably trustworthy information" that the search will turn up evidence of a crime.¹²² The purpose of a warrant is to have an independent party (judges or magistrates) ensure that government officials really do have probable cause to conduct a search. Kerr criticizes the Fourth Amendment rules as inflexible, but in reality they show a remarkable degree of flexibility. First, the warrant requirement balances privacy interests and law enforcement needs by allowing searches and seizures to occur only after law enforcement officials justify them before a judge or magistrate. Second, in situations where warrants and probable cause do not work well, the Court has made exceptions. Indeed, there are numerous exceptions to the warrant and probable cause requirements, such as *Terry* stops, exigent circumstances, and "special needs" in schools and workplaces.¹²³ These exceptions allow the courts to accommodate a wide range of government investigative activity within the protective framework of the Fourth Amendment. In contrast, the statutory regime that Kerr extols has many deficiencies that caution against Kerr's enthusiasm for legislative rules. When the statutes are examined as a whole-as an alternative regulatory regime to the Fourth Amendment-there are many severe problems that refute Kerr's belief in the superiority of a legislative regime. First, Congress's statutes lack effective remedies because the federal statutes often lack exclusionary rules. For example, there is no exclusionary rule to protect e-mail under the Wiretap Act,' and the Stored Communications Act and Pen Register Act both lack an exclusionary rule.¹²⁶ Kerr, in fact, wrote an article lamenting exactly this fact.¹²⁷ Most of the statutes regulating law enforcement access to records held by third parties also lack an exclusionary rule.¹²⁸ As a result, there is often little incentive for criminal defendants to challenge violations of these statutes. Second, there are many gaps in the statutes. Consider electronic surveillance law, for example. The Wiretap Act fails to cover silent video surveillance.¹²⁹ As one court observed, Television surveillance is identical in its indiscriminate character to wiretapping and bugging. It is even more invasive of privacy, just as a strip search is more invasive than a pat-down search, but it is not more indiscriminate: the microphone is as "dumb" as the television camera; both devices pick up anything within their electronic reach, however irrelevant to the investigation. As another court observed, "[V]ideo surveillance can be vastly more intrusive [than audio surveillance], as demonstrated by the surveillance in this case that recorded a person masturbating before the hidden camera."¹³¹ Beyond video surveillance, there are numerous technologies Congress has failed to regulate. Global positioning systems enable people's movements to be tracked wherever they go.¹³² Facial recognition systems can enable surveillance photos and videos to be scanned to identify particular people based on their facial features.¹³³ Satellite technology may be used to examine practically any open area on earth.¹³⁴ Radio frequency identification ("RFID") involves tags placed into products, objects, and even human beings that emit a decipherable signal.¹³⁵ As this technology develops and tags can be read at greater distances, RFID might be used to track people's movements. Congress has not passed statutes to address the privacy implications of any of

these technologies. Nor has Congress passed a law to regulate video surveillance of citizens. Ironically, FISA regulates video surveillance, but the ECPA does not,¹³⁶ meaning that the video surveillance of a foreign spy receives more federal statutory protection than that of a U.S. citizen. ¹³⁷ Nor has Congress regulated the use of tracking devices, key logging devices, or other new technologies. Kerr critiques the Supreme Court's ruling in *Kyllo v. United States* as the exemplar of the shortcomings of judicial rules for regulating technology. ¹³⁹ *Kyllo* involved the use of thermal sensors by law enforcement officials to detect marijuana heat lamps inside a person's home.¹⁴⁰ The Court held that the Fourth Amendment required a search warrant before using such devices to detect activities inside a person's home.¹⁴¹ Kerr argues that "the [*Kyllo*] opinion captures the prevailing zeitgeist about law, technology, and privacy. When technology threatens privacy, the thinking goes, the courts and the Constitution should offer the primary response. *Kyllo* sets forth the Court's current approach to analyzing sensory enhancement technology: When the technology is not in general public use and is used to detect activities in the home, a warrant is required. ¹⁴³ This does leave open many questions: What happens when technology enters general public use? What about uses beyond the home? Certainly, *Kyllo* has problems in articulating a clear approach to when sensory enhancement technology can be employed. But was Congress any better? Congress has never passed a law addressing sensory enhancement technologies, despite having had a long time to do so. Back in 1986, the Supreme Court held in *Dow Chemical Co. v. United States* that the Fourth Amendment did not apply to highly magnified photographs taken from a high-tech aerial camera at very high altitudes. The Court reasoned as follows: "The mere fact that human vision is enhanced somewhat, at least to the degree here, does not give rise to constitutional problems." The *Dow Chemical* case raised a host of questions about what limits, if any, should be placed on sensory enhancement technology. The Court cautiously refused to impose a rule to regulate such technologies. Congress could have responded with legislation, but it did not. There is little reason, therefore, to assume that if the courts hold that the Fourth Amendment is inapplicable to a new technology, Congress will swoop in and save the day. Beyond electronic surveillance law, the law regulating government access to records held by third parties also has tremendous gaps. Although the RFPA and the FCRA regulate government access to financial data, ¹⁴⁶ there are many situations where financial data is unprotected, such as when the information is held by employers, landlords, merchants, creditors, database companies, and others.¹⁴⁷ HIPAA regulates access to medical records, but only when in the hands of certain third parties (doctors, hospitals, insurers, and so on).¹⁴⁸ Medical websites containing people's personal information are not covered by HIPAA. ¹⁴⁹ Basically, the problem is that the statutes focus on who is holding the information, rather than on the information itself. Thus, the same piece of information can be protected if held by one third party and completely unprotected if held by a different third party. Some third parties that have extensive information about individuals are not covered at all, including bookstores, merchants, restaurants, employers, and other businesses. There are numerous database companies that compile extensive dossiers on individuals, yet existing statutes often do not cover law enforcement access to this data. Second, beyond enormous gaps in protection, the statutes offer far less protection than the Fourth Amendment. Most permit law enforcement access to information based only on a court order or subpoena, rather than on a warrant. ¹⁵⁰ Prosecutors, not judges, issue the subpoenas. ¹⁵¹ Professor William Stuntz observed as follows: "[W]hile searches typically require probable cause or reasonable suspicion and sometimes require a warrant, subpoenas require nothing, save that the subpoena not be unreasonably burdensome to its target. Few burdens are deemed unreasonable."⁵² The court orders required by the statutes also require far less than probable cause. Typically, mere "relevance" to an ongoing criminal investigation is

all that such statutes require. 153 Thus, in areas where the courts have backed off and left a void that Congress has attempted to fill, the statutes have not, in large part, measured up. Given a choice, it seems that a better balance between privacy interests and law enforcement needs could have been reached if the courts had held that the Fourth Amendment covered a particular law enforcement activity. Thus, we could have the courts take Kerr's advice and exercise caution and restraint, allowing Congress to craft the rules, or we could have the courts be more willing to expand the coverage of the Fourth Amendment. Where the courts have left open areas for legislative rules to fill in, Congress has created an uneven fabric of protections that is riddled with holes and that has weak protections in numerous places. Therefore, Kerr's claim that legislatures create more comprehensive and balanced rules than courts is simply not borne out by the evidence. Another of Kerr's reasons for preferring legislatures to courts is his view that legislatures will craft clearer rules than courts. Kerr is particularly keen on avoiding unclear rules, and he lists "rule clarity" as a key goal for a criminal procedure system.¹⁵⁴ Kerr argues that "[u]nclear rules mean unclear limits on government power, increasing the likelihood of abuses by aggressive government officials."¹⁵⁵ According to Kerr, legislative rules "are more nuanced, clear, and . . . optimize the critical balance between privacy and public safety more effectively when technology is in flux."¹⁵⁶ Yet the rules of the ECPA are notoriously confusing and unclear, as Kerr himself frequently points out in his writings.¹⁵⁷ If electronic surveillance law were clear, Kerr would have a lot less to write about. He has written countless articles seeking to explain the meaning of the electronic surveillance laws,¹⁵⁸ and has built his reputation as one of the few people on the planet who can actually make sense of the law. It is no wonder that Kerr prefers the statutes; this is his home turf. As for clarity, there are many open questions under electronic surveillance law, and many provisions subject to conflicting interpretations. Kerr really does not point us to a clearer regime; rather, he simply points us to one that he understands better. Furthermore, federal statutes are not self-executing, meaning that they must be interpreted and applied by courts. In reality, Kerr's argument concerns only whether Fourth Amendment rules interpreted by judges are preferable to statutory rules interpreted by judges. In fact, judges have frequently botched interpreting statutory law, as Kerr repeatedly has lamented.¹⁵⁹ A large part of the problem is that the statutory law is extremely complicated. For instance, Kerr's favorite law, the ECPA, is immensely complicated, and he notes that it is "unusually difficult to understand."¹⁶⁰ He also observes that the "law of electronic surveillance is famously complex, if not entirely impenetrable." The problem, then, is not the Fourth Amendment, but the outdated, overly complex statutes that courts must apply. Part of the problem with the complexity of electronic surveillance law stems from the flexibility that Kerr praises. Kerr commends Congress for dreaming up eight different kinds of "statutory thresholds" for electronic surveillance law. While this certainly is more flexible, it has also led to great confusion. Kerr has painstakingly attempted to explain these different standards, which are readily confused and difficult to figure out.¹⁶³ Not only federal officials, but also local law enforcement officials, must understand these standards. Most local police officers, however, lack the benefit of having years to study the mysteries of the ECPA. The problem is that flexibility and clarity are often in conflict. The multiple exceptions to the warrant and probable cause requirement of the Fourth Amendment, which give the Fourth Amendment rules some flexibility, have been criticized as confusing. As Silas Wasserstrom and Louis Michael Seidman observe, the per se warrant rule is "so riddled with exceptions, complexities, and contradictions that it has become a trap for the unwary."¹⁶⁴ The problems of clarity and flexibility are endemic to all rules, whether legislative or judicial. An examination of the current law, however, far from revealing legislative superiority in

achieving clarity and flexibility, demonstrates that both legislatures and courts are for the most part in the same boat.

Even if Fourth Amendment criminal procedure has become split between Congressional statutes and judicial review, courts should not defer – judicial interpretation of the law is necessary to protect civil liberties.

Solove 5 – Daniel Solove, Associate Professor @ George Washington University Law School, J.D. @ Yale, 2005 (“Fourth Amendment Codification and Professor Kerr’s Misguided Call for Judicial Deference”, Fordham Law School, available online at <http://ir.lawnet.fordham.edu/flr/vol74/iss2/14/>, accessed 6/20/15, KM) **Prof. Kerr argues for judicial deference

When there is no legislative rule addressing an issue, courts should apply the Fourth Amendment without any deference or caution. This does not mean that the Fourth Amendment should always apply, but there is no justification for caution or restraint in applying it. The courts have taken too narrow a view of the Fourth Amendment with regard to many issues involving information, such as the third party doctrine. Courts have restricted Fourth Amendment applicability based on a narrow conception of privacy, which has impeded courts in looking at the crucial question of whether a particular law enforcement practice creates a problem, and if so, how that problem ought to be addressed. In other words, the Fourth Amendment often gets caught up in an analytical game that loses sight of the problems. As a result, the Fourth Amendment does not protect against serious threats to privacy and many law enforcement abuses. A better approach toward applying the Fourth Amendment is definitely in order, and such an approach should not be discouraged in favor of the hope of legislative solutions. A different scenario exists when courts must examine a case involving new technologies where a federal statute already exists to regulate law enforcement use of those technologies. These are cases where, for example, the Wiretap Act, Stored Communications Act, or Pen Register Act would apply. Courts could take a few possible approaches. First, in order to preserve the space upon which Congress has legislated, courts could hold that the Fourth Amendment does not apply. Such an approach should be rejected, as the federal legislation in many cases has not been sufficiently protective of privacy. Second, courts could hold that the Fourth Amendment applies, and then determine whether Congress’s legislation is adequate to satisfy Fourth Amendment requirements. This Article supports such an approach. Although, in many cases, warrants supported by probable cause are the best form of protection,²⁰³ warrants are a means to an end, not an end in themselves. Elsewhere, I identified three central principles embodied in the Fourth Amendment: minimization, particularization, and control.²⁰⁴ Government investigations must be minimized to prevent sweeping dragnet searches. Investigations must be particularized to specific individuals suspected of criminal wrongdoing. And there must be meaningful oversight over law enforcement activities. In any particular case in which the Fourth Amendment applies, courts should apply the Fourth Amendment as they normally would. But suppose that law enforcement officials were following a statute that establishes different procedures for conducting surveillance or searches than typical Fourth Amendment rules. Here, the courts should not hold the law enforcement activity invalid simply because it was not conducted pursuant to the regular Fourth Amendment rules the courts have established. These regular, judicial Fourth Amendment rules should be viewed as the default rules, not the only valid rules. Thus, courts should examine whether the statutory procedures followed by law enforcement in a given case satisfy the basic principles of the Fourth Amendment. If law enforcement officials follow a statutory provision that departs from regular Fourth Amendment procedures but

nevertheless adequately addresses minimization, particularization, and control, then courts should conclude that the search was valid. Certainly, courts should not have a monopoly on crafting the rules, and this is where courts and legislatures can establish a useful dialogue. To illustrate this approach more concretely, suppose that Congress passes the Thermal Sensor Protection Act ("TSPA"). The TSPA provides a set of rules to regulate law enforcement use of a thermal sensor. The TSPA, however, also allows the use of a thermal sensor based on a court order that differs in its standards from the Kyllo requirements for a warrant supported by probable cause. Although the court order is not a warrant, it does have other built-in protections. Courts should not simply conclude that any procedures that differ from the traditional ones required in Kyllo are invalid under the Fourth Amendment. Instead, courts should examine whether the TSPA adequately addresses minimization, particularization, and control. If it does, then the surveillance should be upheld. The Wiretap Act represents an example of this process. Under traditional Fourth Amendment doctrine, search warrants generally authorize a single search. A second search is sometimes justified if it "is a reasonable continuation of the original search."²⁰⁶ For electronic surveillance, these restrictive rules would not make much sense. Surveillance generally must be continuous and extend for a period of time in order to capture the necessary communications. The Wiretap Act authorizes a long period of surveillance, specifically a thirty-day order renewable for another thirty-day period.²⁰⁷ This is much broader than the kind of search the Fourth Amendment typically permits. The Wiretap Act, however, has other protections to compensate for the departure from these minimization goals of the Fourth Amendment. It requires that courts place minimization procedures in surveillance orders, and it makes such orders harder to justify, with law enforcement officials having to explain why other investigative techniques would not be viable.²⁰⁸ It limits the kind of officials who may obtain such an order to high-level officials.²⁰⁹ As a result, it compensates for the thirty-day rule with other ways to achieve minimization. This provision came about because, just a year before its passage, the Court in Berger explained how Fourth Amendment principles were to be embodied in electronic surveillance law.²¹⁰ In the Berger model, the Court played a leading role in the process. The Court laid down the basic principles and then let Congress work out the specifics. Courts should look to whether legislation comports with basic Fourth Amendment principles. Congress can fill in the gaps or be more precise where necessary, but this is a bold role for the courts, not a cautious one. In short, courts should be very active in shaping new criminal procedure rules. To the extent that Kerr is urging courts to apply basic Fourth Amendment principles and be open to allowing legislatures to fill in the details, his advice is sound. But Kerr's article appears to suggest much more than that. Kerr is right that we need to do a lot more thinking about our dualist system of criminal procedure. Scholars and many courts still operate under the assumption that the Fourth Amendment is the nearly exclusive occupier of the field. Now that we have a large body of statutory regulation, there are new questions about how we should modulate the relationship between the Fourth Amendment and the statutes. Kerr's article has made a significant contribution. It is time for a focus on statutes. Unfortunately, the bulk of his article focuses on pushing the courts aside and suggesting a deferential approach based on faulty legal process arguments and an incorrect view of the effectiveness of the statutes. Far from being cautious, courts need to take a larger role in the process to ensure that the statutes embody basic Fourth Amendment principles.

Executive Powers Bad

2AC — Executive Powers Bad

Obama is abusing exec flex now – expanding powers results in tyrannical control justifying violence, wars, and surveillance

Napolitano, 15

(Andrew P. Napolitano, a former judge of the Superior Court of New Jersey, is an analyst for the Fox News Channel. He has written seven books on the U.S. Constitution, “Obama ignores constitutional limits of presidential power”, <http://www.washingtontimes.com/news/2015/mar/4/andrew-napolitano-obama-ignores-constitutional-lim/?page=all>, ZS)

Can the president rewrite federal laws? Can he alter their meaning? Can he change their effect? These are legitimate questions in an era in which we have AN UNPOPULAR PROGRESSIVE DEMOCRATIC PRESIDENT WHO HAS BOASTED THAT HE CAN GOVERN WITHOUT CONGRESS BY USING HIS PHONE AND HIS PEN, AND A MOSTLY NEWLY ELECTED, LARGELY CONSERVATIVE REPUBLICAN CONGRESS WITH ITS OWN IDEAS ABOUT BIG GOVERNMENT.¶ These are not hypothetical questions. In 2012, President OBAMA SIGNED EXECUTIVE ORDERS THAT ESSENTIALLY SAID TO ABOUT 1.7 MILLION UNLAWFULLY PRESENT IMMIGRANTS WHO ARRIVED IN THE UNITED STATES BEFORE THEIR 16TH BIRTHDAYS AND WHO ARE NOT YET 31 YEARS OF AGE THAT IF THEY COMPLIED WITH CERTAIN CONDITIONS THAT HE MADE UP OUT OF THIN AIR, THEY WILL NOT BE DEPORTED.¶ In 2014, THE PRESIDENT SIGNED ADDITIONAL EXECUTIVE ORDERS THAT ESSENTIALLY MADE THE SAME OFFER TO ABOUT 4.7 MILLION UNLAWFULLY PRESENT IMMIGRANTS, WITHOUT THE AGE LIMITS THAT HE HAD MADE UP OUT OF THIN AIR. A FEDERAL COURT ENJOINED ENFORCEMENT OF THE 2014 ORDERS LAST MONTH.¶ Last week, the Federal Communications Commission — the bureaucrats appointed by the president who regulate broadcast radio and television — decreed that it has the authority to regulate the Internet, even though federal courts have twice ruled that it does not.¶ Also last week, the federal Bureau of Alcohol, Tobacco, Firearms and Explosives, whose director is appointed by the president, proposed regulations that would outlaw the only mass-produced bullets that can be fired from an AR-15 rifle. This rifle has been the target of the left for many years because it looks like a military weapon; yet it is a lawful and safe civilian rifle commonly owned by many Americans.¶ This week, THE PRESIDENT’S PRESS SECRETARY TOLD REPORTERS THAT THE PRESIDENT IS SERIOUSLY THINKING OF SIGNING EXECUTIVE ORDERS INTENDED TO RAISE TAXES ON CORPORATIONS BY DIRECTING THE INTERNAL REVENUE SERVICE TO REDEFINE TAX TERMINOLOGY SO AS TO INCREASE CORPORATE TAX BURDENS. He must have forgotten that those additional taxes would be paid by either the shareholders or the customers of those corporations, and those shareholders and customers elected a Congress they had every right to expect would be writing the tax laws. He has eviscerated that right.¶ What’s going on here?¶ WHAT’S GOING ON IS THE EXERCISE OF AUTHORITARIAN IMPULSES BY A DESPERATE PRESIDENT TERRIFIED OF POWERLESSNESS AND IRRELEVANCE, the Constitution be damned. I say “damned” because when the PRESIDENT WRITES LAWS, WHETHER UNDER THE GUISE OF ADMINISTRATIVE REGULATIONS OR EXECUTIVE ORDERS, HE IS EFFECTIVELY DAMNING THE CONSTITUTION BY USURPING THE POWERS OF CONGRESS.¶ The Constitution could not be clearer. Article I, Section 1 begins, “All legislative Powers herein granted shall be vested in a Congress of the United States.” Mr. OBAMA ACTUALLY ASKED CONGRESS TO WRITE THE LAWS HE IS NOW PURPORTING TO WRITE, AND CONGRESS DECLINED, AND SO HE DOES SO AT HIS PERIL.¶ In 1952, President Truman seized America’s closed steel mills because steel workers went on strike and the military needed hardware to fight the Korean War. He initially asked Congress for

authorization to do this, and Congress declined to give it to him; so he seized the mills anyway. His seizure was challenged by Youngstown Sheet & Tube Co., then a huge operator of steel mills. In a famous Supreme Court decision, the court enjoined the president from operating the mills.¶ Youngstown is not a novel or arcane case. The concurring opinion by Justice Robert Jackson articulating the truism that when the president acts in defiance of Congress he operates at his lowest ebb of constitutional power and can be enjoined by the courts unless he is in an area uniquely immune from congressional authority is among the most highly regarded and frequently cited concurring opinions in modern court history. It reminds the president and the lawyers who advise him that the Constitution imposes limits on executive power.¶ The president's oath of office underscores those limits. It requires that he enforce the laws faithfully. The reason James Madison insisted on using the word "faithfully" in the presidential oath and putting the oath itself into the Constitution was to instill in presidents the realization that they may need to enforce laws with which they disagree — even laws they hate.¶ But Mr. OBAMA REJECTS THE YOUNGSTOWN DECISION AND THE MADISONIAN LOGIC. HERE IS A PRESIDENT WHO CLAIMS HE CAN KILL AMERICANS WITHOUT DUE PROCESS, spy on Americans without individualized probable cause, START WARS ON HIS OWN, BORROW MONEY ON HIS OWN, REGULATE THE INTERNET, BAN LAWFUL GUNS, TELL ILLEGAL IMMIGRANTS HOW TO AVOID THE CONSEQUENCES OF FEDERAL LAW, AND NOW RAISE TAXES ON HIS OWN.¶ One of the safeguards built into the Constitution is the separation of powers: Congress writes the laws, the president enforces the laws, and the courts interpret them. The purpose of this separation is to prevent the accumulation of too much power in the hands of too few — a valid fear when the Constitution was written and a valid fear today.¶ WHEN THE PRESIDENT EFFECTIVELY WRITES THE LAWS, CONGRESS IS EFFECTIVELY NEUTERED. Yet, THE REASON WE HAVE THE SEPARATION OF POWERS IS NOT TO PROTECT CONGRESS, BUT TO PROTECT ALL INDIVIDUALS FROM THE LOSS OF PERSONAL LIBERTY. Under Mr. Obama, that loss has been vast. Will Congress and the courts do anything about it?

Executive overreach spills over – justifies global preeminence, which results in war Sloane, 8

(Robert, R. Gordon Butler Scholar in International Law, Professor of Law, BA, magna cum laude, Columbia University JD, Yale Law School, "SYMPOSIUM: THE ROLE OF THE PRESIDENT IN THE TWENTY-FIRST CENTURY: ARTICLE: THE SCOPE OF EXECUTIVE POWER IN THE TWENTY-FIRST CENTURY: AN INTRODUCTION", <https://litigation-essentials.lexisnexis.com/webcd/app?action=DocumentDisplay&crawlid=1&srctype=smi&srcid=3B15&doctype=cite&docid=88+B.U.L.+Rev.+341&key=c2e9f4965846884ce1289f069f1aef2e>, Lexis, ZS)

There is a great deal more constitutional history that arguably bears on the scope of the executive power in the twenty-first century. But it is vital to appreciate that the scope of the executive power, particularly in the twenty-first century, is not only a constitutional or historical issue. As an international lawyer rather than a constitutionalist, I want to stress briefly that THESE DEBATES AND THEIR CONCRETE MANIFESTATIONS IN U.S. LAW AND POLICY POTENTIALLY EXERT A PROFOUND EFFECT ON THE SHAPE OF INTERNATIONAL LAW. Justice Sutherland's sweeping dicta in *United States v. Curtiss-Wright Export Corp.*, that THE PRESIDENT enjoys a "very delicate, plenary and exclusive power ... AS THE SOLE ORGAN OF THE FEDERAL GOVERNMENT IN THE FIELD OF INTERNATIONAL RELATIONS - A POWER WHICH DOES NOT REQUIRE AS A BASIS FOR ITS EXERCISE AN ACT OF CONGRESS," n52 HAS BEEN (correctly, in my view) CRITICIZED on a host of grounds. n53 But in practice, in part for institutional and structural

reasons, n54 it accurately reflects the general preeminence of the President in the realm of U.S. foreign affairs. BECAUSE OF THE NATURE OF THE INTERNATIONAL LEGAL AND POLITICAL SYSTEM, WHAT U.S. PRESIDENTS DO AND SAY OFTEN ESTABLISH PRECEDENTS THAT STRONGLY INFLUENCE WHAT OTHER STATES DO AND SAY - WITH potentially DRAMATIC CONSEQUENCES FOR THE SHAPE OF CUSTOMARY INTERNATIONAL LAW. The paradigmatic example is the establishment of customary international law on the continental shelf following the Truman Proclamation of September 28, 1945, n55 which produced an echo of similar claims and counterclaims, culminating in a whole new corpus of the international law of the sea for what had previously been understood only as a geological term of art. n56 Many states took note, for example, when in the 2002 National Security Strategy of the United States ("NSS"), President BUSH ASSERTED THAT THE UNITED STATES HAD THE RIGHT UNDER INTERNATIONAL LAW TO ENGAGE IN PREVENTIVE WARS OF [*350] SELF-DEFENSE. n57 While, contrary to popular belief, the United States never in fact formally relied on that doctrine in practice, many would argue that President Bush de facto exercised this purported right when he initiated an armed conflict with Iraq based on claims, which have since proved unfounded, about its incipient programs to develop catastrophic weapons. The 2006 NSS notably retreats from the 2002 NSS's robust claims of a right to engage in preventive wars of self-defense. n58 Yet even within this brief, four-year period, AN ASTONISHING NUMBER OF OTHER STATES HAVE ASSERTED A COMPARABLE RIGHT TO ENGAGE IN PREVENTIVE SELF-DEFENSE. THESE INCLUDE NOT ONLY STATES THAT THE UNITED STATES HAS DESCRIBED AS "ROGUE STATES," SUCH AS NORTH KOREA AND IRAN, BUT AUSTRALIA, JAPAN, THE UNITED KINGDOM, CHINA, INDIA, IRAN, ISRAEL, RUSSIA, and (though technically not a state) TAIWAN. n59 I doubt we will welcome the consequences of this pattern for the evolving jus ad bellum of the twenty-first century. Equally, after President Bush's decision to declare a global war on terror or terrorism - rather than, for example, the Taliban, al-Qaeda, and their immediate allies - virtually every insurgency or disaffected minority around the world, including peoples suffering under repressive regimes and seeking to assert legitimate rights to liberty and self-determination, has been recharacterized by opportunistic state elites as part of the enemy in this global war. n60 THE TECHNIQUES EMPLOYED AND JUSTIFIED BY THE UNITED STATES, INCLUDING THE RESURRECTION OF RATIONALIZED TORTURE AS AN "ENHANCED INTERROGATION TECHNIQUE," N61 LIKEWISE HAVE EMERGED - AND WILL CONTINUE TO EMERGE - IN THE [*351] PRACTICE OF OTHER STATES. Because of customary international law's acute sensitivity to authoritative assertions of power, THE WIDESPREAD REPETITION OF CLAIMS AND PRACTICES INITIATED BY THE U.S. EXECUTIVE may well SHAPE INTERNATIONAL LAW IN WAYS THE UNITED STATES ULTIMATELY FINDS DISAGREEABLE in the future. So as we debate the scope of the executive power in the twenty-first century, the stakes, as several panelists point out, could not be higher. They include more than national issues such as the POTENTIAL FOR EXECUTIVE BRANCH OFFICIALS TO BE PROSECUTED OR IMPEACHED FOR EXCEEDING THE LEGAL SCOPE OF THEIR AUTHORITY OR VIOLATING VALID STATUTES. N62 THEY ALSO INCLUDE INTERNATIONAL ISSUES LIKE THE POTENTIAL USE OF CATASTROPHIC WEAPONS BY A ROGUE REGIME ASSERTING A RIGHT TO ENGAGE IN PREVENTIVE WAR; the DETERIORATION OF INTERNATIONAL HUMAN RIGHTS NORMS AGAINST PRACTICES LIKE TORTURE, norms which took years to establish; and the atrophy of genuine U.S. power in the international arena, which, as diplomats, statesmen, and international relations theorists of all political persuasions appreciate, demands far more than the largest and most technologically advanced military arsenal. In short, WHAT PRESIDENTS DO, internationally as well as domestically - THE PRECEDENTS THEY ESTABLISH - may AFFECT NOT ONLY THE TECHNICAL SCOPE OF THE EXECUTIVE POWER, AS A MATTER OF CONSTITUTIONAL LAW, BUT THE PRACTICAL ABILITY OF FUTURE PRESIDENTS TO EXERCISE THAT POWER BOTH AT HOME AND ABROAD.

We should candidly debate whether terrorism or other perceived crises require an expanded scope of executive power in the twenty-first century. But it is dangerous to cloak the true stakes of that debate with the expedient of a new - and, in the view of most, indefensible - "monarchical executive" theory, which claims to be coextensive with the defensible, if controversial, original Unitary Executive theory.

n63 WE SHOULD ALSO WEIGH THE COSTS AND BENEFITS OF AN EXPANDED SCOPE OF EXECUTIVE POWER. BUT IT IS VITAL TO APPRECIATE THAT THERE ARE COSTS. THEY INCLUDE NOT ONLY SHORT-TERM, ACUTE CONSEQUENCES BUT LONG-TERM, SYSTEMIC CONSEQUENCES THAT MAY NOT BECOME FULLY APPARENT FOR YEARS. In fact, the exorbitant exercise of broad, supposedly inherent, executive powers may well - as in the aftermath of the Nixon administration - culminate in precisely the sort of reactive statutory constraints and de facto diplomatic obstacles that proponents of a robust executive regard as misguided and a threat to U.S. national security in the twenty-first century.

1AR — Spillover

Past precedent proves – Obama is willing to abuse war powers, any increase in executive flex justifies a massive overreach in power

Cooper, 15

(Ryan Cooper, National Correspondent at TheWeek, Reed College, "Obama's war-powers farce: If you want to limit presidential power, don't start illegal wars", <http://theweek.com/articles/539263/obamas-war-powers-farce-want-limit-presidential-power-dont-start-illegal-wars>, ZS)

President Obama is seeking a new Authorization for Use of Military Force, as the U.S. continues its bombing campaign against the Islamic State. It comes just a tad late: about three and half months after it was necessary, according to the War Powers Act. This raises the question: Why is he even bothering?¶ Matt Yglesias, following on the heels of his interview with the president, argues that THIS DRIVE FOR A NEW AUMF IS ABOUT LIMITING PRESIDENTIAL POWER, BECAUSE IT WOULD INTRODUCE A MORE LIMITED LEGAL FRAMEWORK FOR FUTURE WARS. I don't doubt that's a major part of the administration's rationale. SCRAMBLING TO HEM IN THE NEXT PERSON'S ABILITY TO DO STUFF YOU CONSIDER BAD IS A TRADITIONAL END-OF-PRESIDENCY ACTIVITY.¶ But as Greg Sargent points out, this is closing the barn door after the horse has bolted. WHEN IT COMES TO LEGAL LIMITS ON THE PRESIDENT'S AUTHORITY TO START NEW WARS, OBAMA HAS ALREADY BLOWN A HOLE IN THEM BIG ENOUGH TO DRIVE THROUGH AN AIRCRAFT CARRIER.¶ If the president wanted to stop President Cruz's future wars of aggression, he should have done so in 2011, when he started his first illegal war in Libya. The War Powers Act, as commonly interpreted, says that the president can use force for 60 days without congressional authorization, and if he doesn't get it, then he has to stop hostilities within 30 days.¶ Even that might not have passed legal muster in Libya, because the law states that any unauthorized use of force has to be in response to "a national emergency created by attack upon the United States, its territories or possessions, or its armed forces."¶ Is legal polygamy next?¶ The hijacking of libertarian principles.¶ At any rate, OBAMA CASUALLY BLEW OFF THE 90-DAY LIMIT anyway. THE JUSTICE DEPARTMENT'S OFFICE OF LEGAL COUNSEL IS SUPPOSED TO BE THE AUTHORITATIVE VOICE ON LEGAL INTERPRETATION FOR THE EXECUTIVE BRANCH, BUT WHEN THE OLC INSISTED THE WAR POWERS ACT APPLIED IN THIS SITUATION, OBAMA IGNORED THE LAWYERS AND BROUGHT IN POLITICAL HACKS TO COOK UP ANOTHER RATIONALE. Eventually they settled, ludicrously, on arguing the NEW WAR DIDN'T REALLY CONSTITUTE "HOSTILITIES." WHEN CONGRESS REFUSED TO PASS A NEW AUMF, HE IGNORED THAT, TOO.¶ The LATEST WAR WITH THE ISLAMIC STATE HAS FOLLOWED THE SAME SCRIPT, except this time OBAMA IS CLAIMING IT'S THE 2001 AUMF THAT COVERS THE USE OF FORCE. Though somewhat less preposterous than the Libya case, IT'S STILL NONSENSE. That statute is clearly directed at those who "planned, authorized, committed, or aided " the 9/11 attacks, and the Islamic State didn't even exist in 2001.¶ Of course, THE 2001 AUMF HAS TURNED INTO A BLANK LEGAL CHECK FOR DIRTY WARS AROUND THE GLOBE, AND OBAMA'S PROPOSAL LEAVES IT IN PLACE, MAKING THIS WHOLE EXERCISE POINTLESS. As Jameel Jaffer of the ACLU told Sargent:¶ "If you don't repeal the original AUMF, you create the possibility the president will continue to rely on it," Jaffer said. "Any limitations Congress imposes under the new AUMF could be ignored. This is a meaningless exercise unless it includes repeal of the original AUMF." [The Washington Post]¶ Finally, there's the political reality. CONGRESSIONAL RESTRICTIONS ON PRESIDENTIAL POWER ARE ONLY AS GOOD AS CONGRESS' WILLINGNESS TO ACT WHEN THE RESTRICTIONS ARE BREACHED. And RIGHT NOW THERE IS APPROXIMATELY ZERO REASON TO THINK

THAT CONGRESS GIVES A CRAP ABOUT ILLEGAL WAR. In response to Libya, Congress should have threatened to remove him from office. But the best it could do was offer some annoyed muttering, which lapsed into virtual silence by the time Obama turned to the Islamic State.¶ In other words, IN TODAY'S POLITICAL CLIMATE, OBAMA IS BASICALLY ASKING FOR THE AUTHORITY TO START WAR AGAINST ANYONE WHO'S WATCHED AN ISLAMIC STATE VIDEO. Indeed, the main axis of debate is whether the proposed authority is broad enough. Except for Sen. Rand Paul, Republicans are basically fine with Obama being able to make war wherever he wants.¶ So until Congress starts caring about fulfilling its constitutional prerogatives, lawmakers might as well save their breath when it comes to new authorizations.

Turn: presidential war powers are only meaningful with prior authorization- one-sided action undermines effectiveness.
