Though the President's inherent authority to act in times of emergency and war can arguably make CONGRESSIONAL AUTHORIZATION of force unnecessary, it IS EXTREMELY IMPORTANT FOR THE CONFLICT AGAINST AL-QAEDA AND ITS ALLIES. First, as seen above, the existence of a state of war or national emergency is not entirely clear and might not authorize offensive war anyway. Next, assuming that a state of war did exist, SPECIFIC CONGRESSIONAL AUTHORIZATION WOULD FURTHER LEGITIMATE AND GUIDE THE EXECUTIVE BRANCH IN THE PROSECUTION OF THIS CONFLICT BY SETTING OUT EXACTLY WHAT CONGRESS AUTHORIZES AND WHAT IT DOES NOT. Finally, Congress should specifically set out what the President can and cannot do TO LIMIT HIS DISCRETIONARY AUTHORITY AND PREVENT ADDING TO THE GLOSS ON EXECUTIVE POWER.¶ Even during a state of war, A CONGRESSIONAL AUTHORIZATION FOR CONFLICT THAT CLEARLY SETS OUT THE ACCEPTABLE TARGETS AND MEANS WOULD FURTHER LEGITIMATE THE PRESIDENT'S ACTIONS AND HELP GUIDE HIS DECISION MAKING DURING THIS NEW FORM OF WARFARE. Under Justice Jackson's framework from[¶] Youngstown, presidential authority is at its height when the Executive is acting pursuant to an implicit or explicit congressional authorization.⁷⁴ In this zone, the President can act quickly and decisively because he knows the full extent of his power.⁷⁵ In contrast, the constitutionality of presidential action merely supported by a president's inherent authority exists in the "zone of twilight."⁷⁶ WITHOUT A CONGRESSIONAL GRANT OF POWER, THE PRESIDENT'S WAR ACTIONS ARE OFTEN OF QUESTIONABLE CONSTITUTIONALITY because Congress has not specifically delegated any of its own war powers to the executive.⁷⁷ THIS PROBLEM FORCES THE PRESIDENT TO MAKE COMPLEX JUDGMENTS REGARDING THE EXTENT AND SCOPE OF HIS INHERENT AUTHORITY. THE RESULTING UNCERTAINTY CREATES UNWELCOME ISSUES OF CONSTITUTIONALITY THAT MIGHT HINDER THE PRESIDENT'S ABILITY TO PROSECUTE THIS CONFLICT EFFECTIVELY. In time-sensitive and dangerous situations, where the President needs to make splitsecond decisions that could fundamentally impact American lives and safety, he should not have to guess at the scope of his authority. Instead, Congress should provide a clear, unambiguous grant of power, which would mitigate many questions of authorization. ALLOWING

THE PRESIDENT TO UNDERSTAND THE EXTENT OF HIS AUTHORITY WILL ENABLE HIM TO ACT QUICKLY, decisively but also constitutionally.

Their impact ev is wrong- the theory of fourth-generation warfare is baseless fear-mongering.

Echevarria 5

(Antulio J. Echevarria II, Director of Research, Director of National Security Affairs, and Acting Chairman of the Regional Strategy and Planning Department at the Strategic Studies Institute; Graduate of the U.S. Army's Command and General Staff College and the U.S. Army War College; M.A. and Ph.D. degrees in History from Princeton University, "Fourth-Generation War And Other Myths", November 2005, <http://www.strategicstudiesinstitute.army.mil/pdffiles/PUB632.pdf>, kc)

The notion of **[FOURTH GENERATION WARFARE]** 4GW FIRST **APPEARED** in the late 1980s **AS A VAGUE SORT OF "OUT OF THE BOX" THINKING**, and it entertained every popular conjecture about future warfare. However, instead of examining the way terrorists belonging to Hamas or Hezbollah (or now Al Qaeda) actually behave, **IT MISLEADINGLY PUSHED THE STORM-TROOPER IDEAL AS THE TERRORIST OF TOMORROW**. Instead of looking at the probability that such terrorists would improvise with respect to the weapons they used—box cutters, aircraft, and improvised explosive devices—**IT POSITED HIGH-TECH "WONDER" WEAPONS**.¹ The theory went through a second incarnation when the notion of nontrinitarian war came into vogue; but it failed to examine that notion critically. The theory also is founded on myths about the so-called Westphalian system and the theory of blitzkrieg. **THE THEORY OF 4GW REINVENTED ITSELF** once again **AFTER** September 11, 2001 (**9/11**), when its proponents claimed that Al Qaeda was waging a 4GW against the United States. **RATHER THAN THINKING CRITICALLY ABOUT FUTURE WARFARE, THE THEORY'S PROPONENTS BECAME MORE CONCERNED WITH DEMONSTRATING THAT THEY HAD PREDICTED THE FUTURE. WHILE THEIR RECOMMENDATIONS ARE OFTEN ROOTED IN COMMON SENSE, THEY ARE UNDERMINED BY BEING TETHERED TO AN EMPTY THEORY**.¹ **WHAT WE ARE REALLY SEEING IN THE WAR ON TERROR**, and the campaign in Iraq and elsewhere, **IS** that the increased "dispersion and democratization of technology, information, and finance" brought about by **GLOBALIZATION HAS GIVEN TERRORIST GROUPS GREATER MOBILITY AND ACCESS WORLDWIDE**. At this point, globalization seems to aid the nonstate actor more than the state, but states still play a central role in the support or defeat of terrorist groups or insurgencies.¹ **WE WOULD DO WELL TO ABANDON THE THEORY OF 4GW ALTOGETHER, SINCE IT SHEDS VERY LITTLE, IF ANY, LIGHT ON THIS PHENOMENON**.

1AR — Impact

Unrelenting executive power allows forgoing of Congress for war – results in conflict Friedman, 11

(George, President of Stratfor, PhD in Government from Cornell University, “What Happened to the American Declaration of War?”, <https://www.stratfor.com/weekly/20110328-what-happened-american-declaration-war>, ZS)

All of this came just before the United States emerged as the world's single global power -- a global empire -- that by definition would be waging war at an increased tempo, from Kuwait, to Haiti, to Kosovo, to Afghanistan, to Iraq, and so on in an ever-increasing number of operations. And now in Libya, WE HAVE REACHED THE POINT THAT EVEN RESOLUTIONS ARE NO LONGER NEEDED. IT IS SAID THAT THERE IS NO PRECEDENT FOR FIGHTING AL QAEDA, FOR EXAMPLE, BECAUSE IT IS NOT A NATION BUT A SUBNATIONAL GROUP. Therefore, BUSH COULD NOT REASONABLY HAVE BEEN EXPECTED TO ASK FOR A DECLARATION OF WAR. But there is precedent: Thomas Jefferson asked for and received a declaration of war against the Barbary pirates. This authorized Jefferson to wage war against a subnational group of pirates as if they were a nation. HAD BUSH REQUESTED A DECLARATION OF WAR ON AL QAEDA ON SEPT. 12, 2001, I SUSPECT IT WOULD HAVE BEEN GRANTED OVERWHELMINGLY, AND THE PUBLIC WOULD HAVE UNDERSTOOD THAT THE UNITED STATES WAS NOW AT WAR FOR AS LONG AS THE PRESIDENT THOUGHT WISE. THE PRESIDENT WOULD HAVE BEEN FREE TO CARRY OUT OPERATIONS AS HE SAW FIT. Roosevelt did not have to ask for special permission to invade Guadalcanal, send troops to India, or invade North Africa. In the course of fighting Japan, Germany and Italy, it was understood that he was free to wage war as he thought fit. In the same sense, a declaration of war on Sept. 12 would have freed him to fight al Qaeda wherever they were or to move to block them wherever the president saw fit. LEAVING ASIDE THE MILITARY WISDOM OF AFGHANISTAN OR IRAQ, THE LEGAL AND MORAL FOUNDATIONS WOULD HAVE BEEN CLEAR -- SO LONG AS THE PRESIDENT AS COMMANDER IN CHIEF SAW AN ACTION AS NEEDED to defeat al Qaeda, IT COULD BE TAKEN. Similarly, as commander in chief, Roosevelt usurped constitutional rights for citizens in many ways, from censorship to internment camps for Japanese-Americans. Prisoners of war not adhering to the Geneva Conventions were shot by military tribunal -- or without. In a state of war, different laws and expectations exist than during peace. MANY OF THE ARGUMENTS AGAINST BUSH-ERA INTRUSIONS ON PRIVACY ALSO COULD HAVE BEEN MADE AGAINST ROOSEVELT. BUT ROOSEVELT HAD A DECLARATION OF WAR AND FULL AUTHORITY AS COMMANDER IN CHIEF DURING WAR. Bush did not. He worked in twilight between war and peace. One of the dilemmas that could have been avoided was the massive confusion of whether the United States was engaged in hunting down a criminal conspiracy or waging war on a foreign enemy. If the former, then the goal is to punish the guilty. If the latter, then the goal is to destroy the enemy. Imagine that after Pearl Harbor, FDR had promised to hunt down every pilot who attacked Pearl Harbor and bring them to justice, rather than calling for a declaration of war against a hostile nation and all who bore arms on its behalf regardless of what they had done. THE GOAL IN WAR IS TO PREVENT THE OTHER SIDE FROM ACTING, NOT TO PUNISH THE ACTORS. The Importance of the Declaration A DECLARATION OF WAR, I am arguing, IS AN ESSENTIAL ASPECT OF WAR FIGHTING PARTICULARLY FOR THE REPUBLIC WHEN ENGAGED IN FREQUENT WARS. It achieves a number of things. First, **it holds both Congress and the president equally responsible for the decision**, and does so unambiguously. Second, it affirms to the people that their lives have now changed and that they will be bearing burdens. Third, IT GIVES THE

PRESIDENT THE POLITICAL AND MORAL AUTHORITY HE NEEDS TO WAGE WAR ON THEIR BEHALF AND FORCES EVERYONE TO SHARE IN THE MORAL RESPONSIBILITY OF WAR. And finally, by submitting it to a political process, many wars might be avoided. When we look at some of our wars after World War II it is not clear they had to be fought in the national interest, NOR IS IT CLEAR THAT THE PRESIDENTS WOULD NOT HAVE BEEN BETTER REMEMBERED IF THEY HAD BEEN RESTRAINED. A DECLARATION OF WAR BOTH FREES AND RESTRAINS THE PRESIDENT, AS IT WAS MEANT TO DO. I began by talking about the American empire. I won't make the argument on that here, but simply assert it. What is most important is that the republic not be overwhelmed in the course of pursuing imperial goals. THE DECLARATION OF WAR IS PRECISELY THE POINT AT WHICH IMPERIAL INTERESTS CAN OVERWHELM REPUBLICAN PREROGATIVES. There are enormous complexities here. **Nuclear war has not been abolished.** The United States has treaty obligations to the United Nations and other countries. Covert operations are essential, as is military assistance, both of which can lead to war. I AM NOT MAKING THE ARGUMENT THAT CONSTANT ACCOMMODATION TO REALITY DOES NOT HAVE TO BE MADE. I AM MAKING THE ARGUMENT THAT THE SUSPENSION OF SECTION 8 OF ARTICLE I AS IF IT IS POSSIBLE TO AMEND THE CONSTITUTION WITH A WINK AND NOD REPRESENTS A MORTAL THREAT TO THE REPUBLIC. If this can be done, what can't be done? My readers will know that I am far from squeamish about war. I have questions about Libya, for example, but I am open to the idea that it is a low-cost, politically appropriate measure. But I am not open to the possibility that quickly after the commencement of hostilities the president need not receive authority to wage war from Congress. And I AM ARGUING THAT NEITHER THE CONGRESS NOR THE PRESIDENT HAS THE AUTHORITY TO SUBSTITUTE RESOLUTIONS FOR DECLARATIONS OF WAR. NOR SHOULD EITHER WANT TO. Politically, THIS HAS TOO OFTEN LED TO DISASTER FOR PRESIDENTS. Morally, committing the lives of citizens to waging war requires meticulous attention to the law and proprieties. As our international power and interests surge, it would seem reasonable that our commitment to republican principles would surge. These commitments appear inconvenient. They are meant to be. WAR IS A SERIOUS MATTER, AND PRESIDENTS AND PARTICULARLY CONGRESSES SHOULD BE INCONVENIENCED ON THE ROAD TO WAR. Members of CONGRESS SHOULD NOT BE ABLE TO HIDE BEHIND AMBIGUOUS RESOLUTIONS ONLY TO TURN ON THE PRESIDENT DURING DIFFICULT TIMES, claiming that they did not mean what they voted for. A vote on a declaration of war ends that. **It also prevents a president from acting as king by default.** Above all, it prevents the public from pretending to be victims when their leaders take them to war. The possibility of war will concentrate the mind of a distracted public like nothing else. It turns voting into a life-or-death matter, a tonic for our adolescent body politic.

Multiple alt causes to child pornography investigations — jurisdiction, tech resources, computer forensics, and medical examiners

Wells et al. 7 — Melissa Wells, Assistant Professor of Social Work at the University of New Hampshire, PhD in Sociology at the University of New Hampshire, David Finkelhor, Director of the Crimes Against Children Research Center, Co-Director of the Family Research Laboratory, Professor of Sociology at the University of New Hampshire, PhD in Sociology from the University of New Hampshire, Janis Wolak, Research Assistant Professor at the Crimes Against Children Research Center, JD from Southwestern University, Kimberly Mitchell, Research Assistant Professor of Psychology at the University of New Hampshire, PhD in Experimental Psychology from the University of Rhode Island, 2007 (“Defining Child Pornography: Law Enforcement Dilemmas in Investigations of Internet Child Pornography Possession,” *Police Practice and Research*, July, Available online at <http://www.unh.edu/ccrc/pdf/CV96.pdf>, Accessed 6-30-15)

DESPITE THESE EMERGING INVESTIGATIVE PRACTICES, LAW ENFORCEMENT INVESTIGATIONS OF INTERNET CHILD PORNOGRAPHY POSSESSION CAN ALSO PRESENT SPECIFIC INVESTIGATIVE CHALLENGES. These cases may require digital evidence collection, undercover operations, and tailored interviewing practices (SEARCH, 2001). In addition, THESE CASES MAY INVOLVE MULTIPLE LAW ENFORCEMENT JURISDICTIONS WHEN CHILD PORNOGRAPHY IS TRANSMITTED VIA THE INTERNET. Due to the global reach of the Internet, an individual may possess child pornography images created or disseminated from anywhere in the world (Copine Project, 2003). There is a general consensus THAT GLOBAL PARTNERSHIPS AND INTERNATIONAL LAW ENFORCEMENT COLLABORATION ARE NEEDED TO EFFECTIVELY ADDRESS ONLINE CHILD PORNOGRAPHY (International Centre for Missing & Exploited Children, 2002; ‘International Cooperation to Tackle Child Pornography,’ 2001).

The Internet has opened up new avenues of child pornography possession and law enforcement agencies have developed approaches that facilitate investigations and convictions in these crimes. However, INVESTIGATIONS OF INTERNET CHILD PORNOGRAPHY POSSESSION MAY POSE SOME DILEMMAS AND REQUIRE SPECIFIC RESOURCES. COMPUTERS MAY NEED TO BE PURCHASED OR UPGRADED FOR ELECTRONIC COMMUNICATION, PERSONNEL ARE NEEDED TO WORK ONLINE, TRAINING IN ONLINE INVESTIGATIONS MAY BE REQUIRED, AND SPECIFIC DIGITAL TECHNOLOGY IS OFTEN USEFUL IN TRACKING SUSPECTS.

IN CASES WHERE OFFENDERS ARE REPORTED TO POSSESS IMAGES OF CHILD PORNOGRAPHY ON A COMPUTER, IT IS POSSIBLE THAT IMAGES WILL HAVE BEEN DELETED BY THE TIME LAW ENFORCEMENT INVESTIGATORS EXAMINE THE COMPUTER. COMPUTER FORENSICS EXPERTS WITH SPECIFIC TRAINING MAY BE ABLE TO LOCATE FILES THAT HAVE BEEN DELETED, and in most cases deleted information can be retrieved and used as evidence (Hardy & Kreston, 2002). ONCE IMAGES ARE LOCATED, INVESTIGATORS MUST BE ABLE TO IDENTIFY THE AGE OF VICTIMS IN THE PHOTOS, WHICH MAY REQUIRE EXPERT TESTIMONY BY MEDICAL EXPERTS.

Targeted warrants solve — Donohue just says the Third-Party Doctrine is useful for metadata

Link inevitable — Supreme Court will hear new case Third Party Doctrine case soon

Villasenor 13 — John Villasenor, a Nonresident Senior Fellow At The Brookings Institution and A Professor Of Electrical Engineering And Public Policy At UCLA, 2013 ("What You Need to Know about the Third-Party Doctrine," *The Atlantic*, December 30th, Available Online at <http://www.theatlantic.com/technology/archive/2013/12/what-you-need-to-know-about-the-third-party-doctrine/282721/>, Accessed 7-2-2015)

FACED WITH THE TASK OF DETERMINING WHETHER THE PROGRAM IS CONSTITUTIONAL, LOWER COURT JUDGES BOUND BY SUPREME COURT PRECEDENT HAVE A CHOICE. THEY CAN CONCLUDE THAT THE METADATA COLLECTION IS ANALOGOUS—though obviously on a completely different scale—TO THE PEN REGISTER IN the 1979 SMITH case, AND FIND IT TO BE CONSTITUTIONAL IN ACCORDANCE WITH THE THIRD PARTY DOCTRINE. THIS IS WHAT JUDGE William H. PAULEY III of the Southern District of New York DID in his December 27 ruling dismissing the ACLU's lawsuit in ACLU et al. v Clapper et al.

ALTERNATIVELY, JUDGES CAN CONCLUDE THAT THE NSA PROGRAM IS PROBABLY NOT CONSTITUTIONAL, BUT IN DOING SO THEY NEED TO EXPLAIN WHY THEY BELIEVE THE PROGRAM FALLS OUTSIDE THE SCOPE OF THE DOCTRINE. THIS IS WHAT JUDGE Richard J. LEON of the U.S. District Court for the District of Columbia DID in his December 16 ruling [PDF] granting (and immediately staying pending appeal) an injunction against the NSA in Klayman et al. v. Obama et al. WHAT A LOWER COURT JUDGE CANNOT DO, HOWEVER, IS DECIDE THAT THE THIRD PARTY DOCTRINE SHOULD SIMPLY NO LONGER APPLY.

Thus, THE COURTS THAT WILL HEAR THE INITIAL APPEALS OF BOTH OF THE ABOVE RULINGS ARE IN AN UNENVIABLE AND ALL-TOO-COMMON POSITION: THEY WILL NEED TO APPLY LEGAL PRECEDENTS THAT PREDATE THE DIGITAL ERA TO QUESTIONS THAT ARE ARISING IN LARGE PART PRECISELY DUE TO THE STUNNING ADVANCES IN DIGITAL TECHNOLOGIES IN RECENT YEARS. It's a challenging exercise.

THE ONE COURT THAT CAN ACTUALLY CHANGE THE THIRD-PARTY DOCTRINE INSTEAD OF JUST APPLYING IT IS THE SUPREME COURT. AND, in the next few years, the Supreme Court will almost certainly be asked—perhaps in a petition arising from one of the NSA lawsuits, or perhaps in a different matter altogether—to hear a new, major third-party doctrine case.

No solvency — stopping child pornography doesn't prevent the sexual abuse

Link non-unique — Los Angeles v. Patel

Rosenzweig 15 — Paul Rosenzweig, founder of Red Branch Consulting PLLC, a homeland security consulting company and a Senior Advisor to The Chertoff Group, formerly served as Deputy Assistant Secretary for Policy in the Department of Homeland Security, a Distinguished Visiting Fellow at the Homeland Security Studies and Analysis Institute, also serves as a Professorial Lecturer in Law at George Washington University, a Senior Editor of the *Journal of National Security Law & Policy*, and as a Visiting Fellow at The Heritage Foundation, B.A., Haverford College, M.S., Scripps Institution of Oceanography, University of California at San Diego, J.D., University of Chicago, 2015 ("Waiting for Patel," *Lawfare*, June 18th, Available Online at <http://www.lawfareblog.com/waiting-patel>, Accessed 6-30-2015)

The annual ritual has begun. Every June, official Washington waits in anticipation for the Supreme Court to complete its term. All of the "blockbuster" cases await decision. This year, most of the press and public are waiting for the gay marriage case and for the Obamacare/ACA tax decision. BUT THERE ARE MORE THAN A DOZEN CASES YET TO BE DECIDED AND ONE OF THE POSSIBLE SLEEPERS IS CITY OF LOS ANGELES V. PATEL. To be honest, it will probably be a bust, but THERE ARE SOME WAYS IN WHICH IT MIGHT BE ONE OF THE MORE SIGNIFICANT PRIVACY/FOURTH AMENDMENT CASES -- depending, of course, on how the case is decided.

Patel involves a lawsuit brought by hotel operators who were challenging the City of Los Angeles' rules allowing the inspection of hotel registration records. Hotel records are generally thought of as public records both here in the US and in Europe. As a result, THE HOTELS ARE OBLIGED TO MAINTAIN THE RECORDS AND ROUTINELY MAKE THEM AVAILABLE FOR POLICE INSPECTION. Thus THE QUESTION presented is "WHETHER A HOTEL HAS AN EXPECTATION OF PRIVACY UNDER THE FOURTH AMENDMENT IN A HOTEL GUEST REGISTRY WHERE THE GUEST-SUPPLIED INFORMATION IS MANDATED BY LAW and an ordinance authorizes the police to inspect the registry, and if so, whether the ordinance is facially unconstitutional under the Fourth Amendment unless it expressly provides for pre-compliance judicial review before the police can inspect the registry."

By way of background, Patel and the other hotel operators run relatively small hotel operations in Los Angeles -- ones that are sometimes called "parking meter hotels" because they rent by the hour. Some of the renters are, it seems, unsavory characters. Hence, the LAPD took a rather strong interest in the guest registers and, reportedly, often found therein some who had outstanding warrants or were engaging in illegal activity. UNDER THE LA ORDINANCE THE POLICE INSPECTIONS OF THE REGISTERS COULD BE WITHOUT WARNING AND WITHOUT A WARRANT. THE NINTH CIRCUIT FOUND THE ORDINANCE UNCONSTITUTIONAL -- and held that an administrative warrant (of the sort required by the Supreme Court in *Marshall v. Barolow's Inc.*) was required. Most OBSERVERS (including me) THINK that THE COURT TOOK THE CASE TO REVERSE -- THE DOCTRINE HAS LONG BEEN THAT WARRANTLESS SEARCHES OF "CLOSELY REGULATED" INDUSTRIES IS PERMITTED UNDER THE FOURTH AMENDMENT, and hotel guest registries have been regulated since Colonial times in the US (and for far longer in Europe). More to the point, LA argues that surprise inspections of guest information at these types of hourly rental hotels is necessary to prevent them from being used as easy locations for drugs and prostitution. Given that argument (and given that the hotel is asserting the derivative privacy interests of their customers rather than their own direct interests) this might be an easy case -- and it probably will be.

But if we press a little deeper, there are some privacy/liberty/security questions buried in the case that it would be fun if the Court were to address:

DO THE HOTEL GUESTS HAVE ANY PRIVACY INTEREST IN THE DATA THEY SHARE WITH THE HOTEL IN ORDER TO GET A ROOM? THIS pretty clearly implicates the third-party doctrine, WHICH HAS BEEN UNDER SOME STRESS IN THE NATIONAL SECURITY CONTEXT.

Investigations fail — pedophiles' tech is always one step ahead and the FBI lacks resources to follow investigations

Henzey 11 — Michael J. Henzey, Assistant Commonwealth's Attorney, Office of the Commonwealth's Attorney of the City of Hampton, VA, Master of Laws (LLM) degree in Criminal Law with Honors from

State University of New York at Buffalo - Law School, J.D. from The Catholic University of America, Columbus School of Law, B.A. in history from George Mason University, 2015 ("Going On The Offensive: A Comprehensive Overview Of Internet Child Pornography Distribution And Aggressive Legal Action," *Appalachian Journal of Law* (11 Appalachian J. L. 1), Available Online to Subscribing Institutions via Lexis-Nexis)

ANOTHER OBSTACLE TO EFFECTIVELY INVESTIGATING AND ELIMINATING CHILD PORNOGRAPHY IS THAT MANY POLICE AGENCIES ARE AT A DISADVANTAGE WITH TECHNICAL KNOW-HOW VIS-A-VIS INTERNET PEDOPHILES. As a group, INTERNET PEDOPHILES HAVE AN UNUSUALLY HIGH DEGREE OF TECHNICAL SOPHISTICATION WHEREAS LAW ENFORCEMENT OFFICERS TYPICALLY DO NOT. MOREOVER, THE MORE TECHNICAL TRAINING A LAW ENFORCEMENT AGENT RECEIVES, THE MORE ATTRACTIVE PRIVATE FIRMS BECOME WITH THEIR CORRESPONDINGLY HIGHER SALARIES AND NORMAL WORKING HOURS. Further, AS THE INTERNET PEDOPHILES ARE TECHNOLOGICALLY SAVVY, THEY ARE QUICK TO ADOPT NEW TECHNOLOGIES AND TECHNIQUES BEFORE LAW ENFORCEMENT. n282 Interestingly, THEY MONITOR LAW ENFORCEMENT ACTIVITIES JUST AS LAW ENFORCEMENT MONITORS THEM. JENKINS DOCUMENTED MANY INSTANCES OF PEDOPHILES SCRUTINIZING MEDIA ACCOUNTS OF ARRESTS IN CHILD PORNOGRAPHY CASES IN ORDER TO ASSESS LAW ENFORCEMENT METHODS. n283 He writes, "Board participants are well aware of the various traps and investigations and regularly post news clippings and summaries of criminal cases as they arise, so other ENTHUSIASTS CAN LEARN ABOUT LAW ENFORCEMENT TECHNIQUES AND BE SURE NOT TO MAKE THE SAME MISTAKE THEMSELVES." n284 Thus, BECAUSE OF MOST POLICE ORGANIZATIONS' DEARTH OF TECHNICAL KNOW-HOW AND [*53] INSTITUTIONAL PRESSURES TO MAKE ARRESTS, Jenkins argues POLICE OFFICERS ONLY SUCCEED AT ARRESTING THE LOW HANGING FRUIT: INEXPERIENCED PEDOPHILES OR THOSE STUPID ENOUGH TO ACTIVELY SOLICIT CHILDREN IN INTERNET CHAT ROOMS. n285 THE CORE OF THE INTERNET CHILD PORNOGRAPHY SUBCULTURE, Jenkins believes, has been active for decades and will continue to elude law enforcement. n286

A FUNDAMENTAL PROBLEM FRUSTRATING EFFORTS TO CRACKDOWN ON INTERNET CHILD PORN DISTRIBUTION IS THE LARGE TIME COMMITMENT THESE INVESTIGATIONS REQUIRE. ACCORDING TO THE FBI, FORENSIC EXAMINATIONS OF A COMPUTER TAKE ON AVERAGE FORTY HOURS TO COMPLETE, DEPENDING ON THE COMPUTER'S CONDITION AND THE DATA VOLUME. n287 However, AN EXAMINATION OF A COMPUTER PROTECTED BY A TECHNICALLY SAVVY PERPETRATOR CAN TAKE MUCH LONGER. n288 The FBI notes THE AMOUNT OF DATA FORENSIC INVESTIGATORS MUST ANALYZE HAS SHARPLY INCREASED due to the greater availability of high speed Internet and innovations in digital storage devices that have increased the volume of data that can be cheaply stored. n289 In fact, a report from the Department of Justice Office of Inspector General detailed THAT ALTHOUGH THE NUMBER OF COMPUTER FORENSIC INVESTIGATIONS FOR CHILD SEXUAL EXPLOITATION CASES REMAINED STABLE BETWEEN 2005 AND 2007, n290 THE VOLUME OF DATA REQUIRING EXAMINATION SHARPLY INCREASED BY 38%, FROM 429 TERABYTES TO 591 TERABYTES. n291 THE INTERNET, ALONG WITH COMPUTER INNOVATIONS, HAVE ALLOWED CHILD PORNOGRAPHY DISTRIBUTION TO INCREASE IN FREQUENCY AND VOLUME CAUSING FORENSIC EXAMINATIONS OF COMPUTERS TO TAKE MUCH LONGER. Also troubling, an official with THE FBI'S INNOCENT IMAGES NATIONAL INITIATIVE STATED FORENSIC EXAMINATIONS ON AVERAGE CAN TAKE 100 DAYS; AND REPRESENTATIVES FROM THE UNITED STATES ATTORNEY'S OFFICES HAVE ALSO REPORTED PROTRACTED PROCESSING TIME FOR FBI FORENSIC EXAMINATION OF DIGITAL EVIDENCE. AS DIGITAL TECHNOLOGY BECOMES BOTH MORE SOPHISTICATED AND LESS

EXPENSIVE, THE PROBLEM SURELY WILL ONLY GET WORSE: officials with the FBI have stated they believe the amount of digital evidence seized in child pornography cases will continue to rise more quickly than law enforcement agencies' ability to timely process the evidence. n292 THE EFFECT IS THE VAST NUMBERS OF REPORTED CHILD PORNOGRAPHY CASES GO UNINVESTIGATED. This is illustrated by law enforcement's experience in an investigation dubbed "Operation Ore." INVESTIGATORS [*54] HAD THE NAMES OF 7,200 SUSPECTS WHO HAD PAID TO ACCESS CHILD PORNOGRAPHY WEBSITES operated by a group known as Landslide Productions. n293 LAW ENFORCEMENT AGENCIES WERE OVERWHELMED BY THE NUMBER OF LEADS AND WERE FORCED TO "TRIAGE" WHICH SUSPECTS WOULD BE INVESTIGATED. AGENCIES GAVE EMPHASIS TO CONVICTED SEX OFFENDERS OR THOSE WITH IMMEDIATE ACCESS TO CHILDREN. EVEN WITH THIS RANKING SCHEME, IT WAS NOT POSSIBLE TO SEARCH THE HOMES OF MORE THAN A MINORITY OF THE 7,200 SUSPECTS WITHIN A YEAR. n294

Impact inevitable — law enforcement fails to prevent child pornography now

Henzey 11 — Michael J. Henzey, Assistant Commonwealth's Attorney, Office of the Commonwealth's Attorney of the City of Hampton, VA, Master of Laws (LLM) degree in Criminal Law with Honors from State University of New York at Buffalo - Law School, J.D. from The Catholic University of America, Columbus School of Law, B.A. in history from George Mason University, 2015 ("Going On The Offensive: A Comprehensive Overview Of Internet Child Pornography Distribution And Aggressive Legal Action," *Appalachian Journal of Law* (11 Appalachian J. L. 1), Available Online to Subscribing Institutions via Lexis-Nexis)

F. Shortcomings of Current Law Enforcement Methods

Despite the aforementioned successes, CURRENT LAW ENFORCEMENT STRATEGIES AND TACTICS APPEAR TO HAVE LITTLE EFFICACY IN CURBING INTERNET CHILD PORNOGRAPHY DISTRIBUTION. On this point, researchers Schell, Martin, Hung, and Rueda write: "METHODS CURRENTLY EMPLOYED TO COMBAT CHILD PORNOGRAPHY ARE CONSIDERED EVEN BY THE EXPERTS THEMSELVES TO BE RATHER PRIMITIVE AND INEFFICIENT." n244 Indeed, BY ALMOST EVERY METRIC, CHILD PORNOGRAPHY SEEMS TO BE PROLIFERATING. THE NUMBER OF CASES THE FBI INVESTIGATED BETWEEN 1996 AND 2005 ROSE BY 2,026%, from 113 investigations to 2,402 WHILE THE NUMBER OF ARRESTS SKYROCKETED 2,325%, from 68 arrests to 1,649. n245 FEDERAL CHILD PORNOGRAPHY AND CHILD ABUSE PROSECUTIONS INCREASED MORE THAN 350% BETWEEN 1995 AND 2005. n246 THESE CRIME STATISTICS, WHILE DAUNTING, DO NOT EVEN CONSIDER U.S. LOCAL LAW ENFORCEMENT AGENCIES' EFFORTS. A report by the NCMEC indicated that FEDERAL LAW ENFORCEMENT AGENCIES PARTICIPATED IN ONLY 46% OF CHILD PORNOGRAPHY INVESTIGATIONS. Thus, THE STATISTICS ABOVE DO NOT EVEN REFLECT HALF OF THE PROBLEM IN THIS COUNTRY, LET ALONE THE PROBLEM INTERNATIONALLY. Further, the NCMEC's CYBERTIPLINE RECORDED A THIRTY-FOLD INCREASE IN INTERNET CHILD PORNOGRAPHY REPORTS BETWEEN 1998 AND 2004, FROM 3,267 TO 106,119 REPORTS. n247 While some increase is probably attributable to greater awareness of the CyberTipLine's existence and ISPs' legal duty to file reports, from these statistics experts have concluded, "IT IS CLEAR THAT THE INTERNET IS HELPING TO FUEL AN EPIDEMIC OF CHILD PORNOGRAPHY." n248

As the Internet knows no borders, the CHILD PORNOGRAPHY CRISIS IS NOT MERELY CONFINED TO THE UNITED STATES. A 2005 Canadian report by the [*47] Office of Statistics stated CHARGES RELATING TO CHILD PORNOGRAPHY INCREASED EIGHT-FOLD BETWEEN 1998 AND 2003. n249 Ireland's version of the NCMEC's CyberTipLine, the HOTLINE, SHOWED A SUBSTANTIAL INCREASE IN INTERNET CHILD

PORNOGRAPHY REPORTS FROM 2003 TO 2005. n250 The United Kingdom's INTERNET WATCH FOUNDATION CLAIMS THERE ARE AN INCREASING NUMBER OF WEBSITES HOSTING CHILD PORNOGRAPHY, including commercial sites hosted in the U.S. or Russia. n251 Finally, an axiom of law enforcement is the crimes investigated and prosecuted typically only represent a small portion of the overall problem. Therefore, **child pornography continues to proliferate across the Internet unabated despite a decade of significant law enforcement, private sector, and media attention.** How is this possible?

[Note to fellow students: NCMEC is the National Center for Missing and Exploited Children, a 501(c)(3) nonprofit organization, provides several services to assist law enforcement's efforts]

Child pornography is moving to “peer-to-peer” technology — removes the third-party to render the doctrine useless

Henzey 11 — Michael J. Henzey, Assistant Commonwealth's Attorney, Office of the Commonwealth's Attorney of the City of Hampton, VA, Master of Laws (LLM) degree in Criminal Law with Honors from State University of New York at Buffalo - Law School, J.D. from The Catholic University of America, Columbus School of Law, B.A. in history from George Mason University, 2015 (“Going On The Offensive: A Comprehensive Overview Of Internet Child Pornography Distribution And Aggressive Legal Action,” *Appalachian Journal of Law* (11 *Appalachian J. L.* 1), Available Online to Subscribing Institutions via Lexis-Nexis)

However, Jenkins observed the INTERNET PEDOPHILIA SUBCULTURE HAD BECOME SKILLED AT EVADING AUTOMATED WEB SURVEILLANCE BY USING CODE WORDS RELATING TO SPORTS. The pedophiles efforts, however, only succeed in keeping the website alive for only a few hours or minutes; as pedophiles from the boards flood the site, the administrator becomes aware of a spike in traffic, investigates, and deletes the site. THIS CAT-AND-MOUSE GAME IS REPEATED COUNTLESS TIMES AND IS THE REASON WHY ERADICATING CHILD PORNOGRAPHY, even when the content is hosted on websites in western countries with strict laws and significant enforcement resources, IS SO DIFFICULT: AS SOON AS THE AUTHORITIES RESPOND, THE PEDOPHILES HAVE MOVED ON. “If there were indeed [*50] thousands of Web sites with known, fixed URLs,” Jenkins writes, “they could all be shut down in a matter of days.” n266

Moreover, PEDOPHILES USE CHILD PORNOGRAPHY DISTRIBUTION METHODS OTHER THAN TRADITIONAL WEBSITES THAT ARE DIFFICULT TO DETECT AND DISRUPT, SUCH AS PEER-TO-PEER TECHNOLOGY n267 AND USENET NEWSGROUPS. n268 PEER-TO-PEER TECHNOLOGY IS “A FORM OF NETWORKING THAT ALLOWS DIRECT COMMUNICATION BETWEEN COMPUTER USERS SO THAT THEY CAN ACCESS AND SHARE EACH OTHER’S FILES (including images, video, and software).” n269 Peer-to-peer technology comes in two varieties: centralized and decentralized. CENTRALIZED PEER-TO-PEER TECHNOLOGY USES A CENTRAL SERVER AS A BROKER TO MATCH FILE “SELLERS” WITH FILE “BUYERS” (though no money is exchanged), whereas DECENTRALIZED PEER-TO-PEER TECHNOLOGY ALLOWS FILE EXCHANGE WITHOUT USING A CENTRAL BROKER (and thus no central server that keeps track of users and their transactions). A RECENT STUDY FOUND CHILD PORNOGRAPHY IS PREVALENT ON THE MOST POPULAR PEER-TO-PEER CLIENT, GNUTELLA. THE STUDY CONFIRMED A “LARGE AMOUNT OF PEER-TO-PEER TRAFFIC IS DEDICATED TO CHILD PORNOGRAPHY.” n270 Further, the study found peer-to-peer queries requested

subjects with a median age of thirteen years old. n271 However, the researcher was unable to confirm when material actually contained the material its filename claimed as it is illegal under U.S. law even for bona fide researchers to view child pornography. n272 THE INCREASED USE OF PEER-TO-PEER TECHNOLOGY IS TROUBLING BECAUSE IT MAY REPRESENT THE EASIEST MEANS OF DISTRIBUTING CHILD PORNOGRAPHY. AN INTERNET PEDOPHILE NEITHER NEEDS ANY PARTICULAR TECHNOLOGICAL EXPERTISE nor must pay a subscription fee to use peer-to-peer applications. Further, the increased use of decentralized peer-to-peer technology is a major frustration to law enforcement investigations as it cuts out a centralized "middle man," WHICH WOULD BE A MAJOR REPOSITORY OF RECORDS. WHILE THIS DOES NOT PRECLUDE INVESTIGATIONS OF CHILD PORNOGRAPHY ON PEER-TO-PEER NETWORKS, IT MAKES IT MORE DIFFICULT AND TIME CONSUMING FOR LAW ENFORCEMENT (THUS RESULTS IN FEWER ARRESTS).

1AR Extensions

Extend: “Investigations Fail”

Criminal innovation offsets any law enforcement benefits of the third-party doctrine

Jacobi and Kind 15 — Tonja Jacobi, Research professor at the Northwestern University School of Law, and Jonah Kind, law clerk to Joel M. Flaum, judge at the 7th circuit US Court of Appeals, 2015 (“Criminal Innovation And The Warrant Requirement: Reconsidering The Rights-Police Efficiency Trade-Off” *William & Mary Law Review* (56 Wm. & Mary L. Rev. 759), Available Online to Subscribing Institutions via Lexis-Nexis)

CONCLUSION

Throughout Fourth Amendment law, COURTS ASSUME THAT REQUIRING LAW ENFORCEMENT TO OBTAIN A WARRANT FOR AN INVESTIGATION WILL GREATLY HARM LEOS' ABILITY TO SOLVE CRIME AND PROSECUTE CRIMINALS. This assumption appears in debates about the search/nonsearch distinction, about possible exceptions to the warrant requirement, and about the warrant requirement itself. Yet it is often not true. In some situations, LEOS WILL INDEED BE BETTER ABLE TO INVESTIGATE CRIME WHEN THEY DO NOT HAVE TO INCUR THE COSTS OF OBTAINING A WARRANT. HOWEVER, WHEN CRIMINALS ARE ABLE TO INNOVATE IN WAYS THAT REDUCE THE LIKELIHOOD OF LAW-ENFORCEMENT DETECTION, REQUIRING LEOS [*832] TO OBTAIN A WARRANT WILL DO LITTLE OR NO HARM TO LAW-ENFORCEMENT INVESTIGATIONS IN MANY CASES. REDUCED COSTS OF LAW-ENFORCEMENT INVESTIGATION will incentivize criminals to innovate MORE OFTEN. THIS INCREASED INNOVATION will often completely offset THE GAINS LEOS RECEIVE FROM NOT HAVING TO OBTAIN A WARRANT.

Other than differences in constitutional interpretation, n318 THE MAIN ARGUMENT IN FAVOR OF DOING AWAY WITH THE WARRANT REQUIREMENT IS THAT OBTAINING A WARRANT MAKES POLICE WORK MUCH MORE DIFFICULT. n319 Yet WHEN CRIMINAL INNOVATION IS TAKEN INTO ACCOUNT, IT IS CLEAR THAT THIS ARGUMENT IS greatly oversold. For too long, FOURTH AMENDMENT JURISPRUDENCE HAS OVERLOOKED THE FACT THAT CRIMINALS will work harder TO HIDE THEIR CRIMES IF LEOS DO NOT HAVE TO WORK AS HARD TO INVESTIGATE THEM. LAW ENFORCEMENT HAS LONG RECOGNIZED THE NEED TO ANTICIPATE AND RESPOND TO POTENTIAL CRIMINAL INNOVATION, AND INVESTIGATION STRATEGIES ARE COMMONLY STRUCTURED AROUND THE EXPECTATION THAT CRIMINALS WILL INNOVATE. It is time the courts recognize this interaction.

WHEN CRIMINAL INNOVATION IS TAKEN INTO ACCOUNT, MANY OF THE ASSUMPTIONS OF FOURTH AMENDMENT LAW BECOME LESS CLEAR, AND MANY OF THE STRANGE DOCTRINAL INNOVATIONS THAT THE COURT HAS MADE TO ACCOUNT FOR POLICE EFFICIENCY LOOK FOOLHARDY. This Article has shown that, contrary to common beliefs, LAW ENFORCEMENT WILL OFTEN REALIZE NO GAIN WHEN AN INVESTIGATION IS CLASSIFIED AS A NONSEARCH OR IS OTHERWISE EXEMPT FROM THE WARRANT REQUIREMENT. These outcomes will only occur more often as use of electronic technology increases. Courts deciding Fourth Amendment questions must begin to take into account the incentives that cause criminals to innovate, and give less weight to the claim of police efficiency when deciding whether the warrant requirement applies.

Extend: “Alt Causes”

Lack of coordination, resource shortages, and the changing nature of the internet are all alt causes to child pornography investigations

Wells et al. 7 — Melissa Wells, Assistant Professor of Social Work at the University of New Hampshire, PhD in Sociology at the University of New Hampshire, David Finkelhor, Director of the Crimes Against Children Research Center, Co-Director of the Family Research Laboratory, Professor of Sociology at the University of New Hampshire, PhD in Sociology from the University of New Hampshire, Janis Wolak, Research Assistant Professor at the Crimes Against Children Research Center, JD from Southwestern University, Kimberly Mitchell, Research Assistant Professor of Psychology at the University of New Hampshire, PhD in Experimental Psychology from the University of Rhode Island, 2007 (“Defining Child Pornography: Law Enforcement Dilemmas in Investigations of Internet Child Pornography Possession,” *Police Practice and Research*, July, Available online at <http://www.unh.edu/ccrc/pdf/CV96.pdf>, Accessed 6-30-15)

This study identifies specific challenges law enforcement agents may encounter in investigations of Internet child pornography possession. DEFINING CHILD PORNOGRAPHY CAN BE COMPLICATED BY DEFINITIONAL CHALLENGES AND IDENTIFYING THE AGE OF CHILDREN DEPICTED IN IMAGES. While this analysis examined a sample of cases known to US law enforcement agents, CHILD PORNOGRAPHY CRIMES MAY INVOLVE MULTIPLE JURISDICTIONS AND CROSS NATIONAL BORDERS. Therefore, THIS ANALYSIS SUGGESTS AT LEAST THREE IMPLICATIONS FOR POLICY AND LAW ENFORCEMENT PRACTICE. FIRST, THERE IS A NEED FOR A MORE FORMAL NATIONAL AND GLOBAL INFRASTRUCTURE TO SUPPORT THESE INVESTIGATIONS. SECOND, LAW AGENCIES NEED ADDITIONAL RESOURCES, SPECIFICALLY ALLOCATED FOR ASSISTING IN EXPERT WITNESS OR OTHER ASSISTANCE IN ASCERTAINING IF IMAGES DEPICT MINOR CHILDREN. FINALLY, this analysis suggests that while law enforcement investigators report using innovative, technology-enhanced investigation strategies, THE NATURE OF THE INTERNET APPEARS TO PRESENT SIGNIFICANT CHALLENGES FOR LAW ENFORCEMENT. Continued analysis of the impact of the Internet on both the commission and investigation of child pornography crimes is essential.

Extend: “Link inevitable”

Link inevitable — the third-party doctrine is on the brink of being overturned

Ghoshray 11 — Saby Ghoshray, President and Founder of the Institute of Interdisciplinary Studies at North Kentucky University, work has appeared in a number of publications including, among others, Albany Law Review, ILSA Journal of International and Comparative Law, European Law Journal ERA-Forum, Toledo Law Review, Georgetown International Environmental Law Review, Temple Political & Civil Rights Law Review, Fordham International Law Journal, Santa Clara Law Review, Michigan State International Law Journal, Loyola Law Journal, New England Law Review, and Miami Law Review, 2011 (“Privacy Distortion Rationale For Reinterpreting The Third-Party Doctrine Of The Fourth Amendment,” *Florida Coastal Law Review* (13 Fl. Coastal L. Rev. 33), Available Online to Subscribing Institutions via Lexis-Nexis)

Therefore, I argue that **the third-party doctrine OF THE FOURTH AMENDMENT has come to a breaking point, MORE DRIVEN BY THE SHAPING EFFECT OF 9/11 THAN THE INDIVIDUAL'S USE OF TECHNOLOGY TO SUBVERT THE LAW, MORE VIA DISCONNECT WITH GROWING ADVANCEMENT OF TECHNOLOGY THAN OWING TO THE DOCTRINE'S INABILITY TO SUSTAIN THE LAW'S ORIGINAL ASPIRATIONS.** n334 By examining the existing lament in legal scholarship regarding the continued viability of the third-party doctrine, this Article reveals an uncultivated dimension that is absent in contemporary discourse. n335 **BY ADEQUATELY EXPLAINING THE RIGHT OF PRIVACY THROUGH THE PRISM OF THE RIGHT TO LIFE WITHIN THE CONTEXT OF LIFE EVOLVING IN CYBERSPACE, I QUESTION THE CONTINUED APPLICABILITY OF THE THIRD-PARTY DOCTRINE.** n336 Detailing the modes of the automation world in which post-modern individuals navigate, **EXISTING JUDICIAL CONSTRUCTION OF THE THIRD-PARTY DOCTRINE MAY NOT SUFFER FROM A FATAL FLAW BUT INDEED NEEDS A FACELIFT.** n337 Is the judiciary ready?

Affirmative Answers

AT: Judicial Independence Impact

Empirically won't undermine independent judiciary

Geyh, 03 --- Professor of Law at Indiana (Winter/Spring 2003, Charles G., Indiana Law Journal, "Judicial Independence, Judicial Accountability, and the Role of Constitutional Norms in Congressional Regulation of the Courts," 78 Ind. L.J. 153))

THE WELL-DOCUMENTED, CYCLICAL ATTACKS ON THE COURTS mentioned above SERVE TO PUNCTUATE PHASES IN THE RELATIONSHIP BETWEEN THE FEDERAL COURTS AND THE POLITICAL BRANCHES in ways that justify their use as section headings in Part II, which chronicles the development of customary independence. By themselves, however, these episodic altercations between the judiciary and the political branches tell a story that is woefully incomplete, first because they tend primarily to involve the Supreme Court to the frequent exclusion of the lower courts, and second because they dwell on moments of heightened interbranch tension, while ignoring protracted periods of relative calm [*158] between crises. WHEN THE MORE COMPLETE STORY IS TOLD, WE FIND THAT WHILE CONGRESS AND THE PRESIDENT HAVE ATTACKED THE SUPREME COURT IN GENERATIONAL CYCLES, their support for the emergence of an independent judicial branch has been largely uninterrupted over time. in fact, SOME OF THE MOST MEANINGFUL STEPS TOWARD PROMOTING AN INCREASINGLY STRONG AND INDEPENDENT JUDICIARY HAVE BEEN TAKEN DURING AND IMMEDIATELY AFTER BITTER CONFRONTATIONS BETWEEN THE BRANCHES OVER ALLEGED EXCESSES OF THE SUPREME COURT. As I intend to demonstrate, there were three primary manifestations of these emerging independence norms: first, a congressional resistance to other than minimalist, incremental reform of the judiciary's basic structure throughout the nineteenth century; second, a congressional commitment to furnishing the judiciary with the tools to govern itself throughout the twentieth century; and third, a gradual decline over the nineteenth and twentieth centuries in the acceptability of holding the judiciary accountable for its decisions by means of impeachment or by changes in court structure, size, or jurisdiction.

The prevailing impression, derived from scholarly obsession with the battles between Congress and the Supreme Court, is that episodic, independence-threatening confrontations are the defining features of the interbranch landscape. When the Supreme Court's cyclical battles with the political branches are superimposed upon the underlying saga of the judiciary's largely uninterrupted progress toward independence, however, a different and more complete story emerges--one which suggests that these EPISODIC BATTLES ARE BETTER CHARACTERIZED AS DEPARTURES FROM A DEEPER AND MORE STABLE CONSTITUTIONAL CUSTOM OF INTERBRANCH COMITY. Thus, occasional episodes of brinkmanship have periodically served to revalidate the emerging rule of an independent judicial branch.

AT: Judicial Salary Increases --- Court Ruling Ensures Payment

Court ruling ensures Congressional pay for judges

Denniston, 12 --- has been covering the Supreme Court for fifty-five years (10/7/2012, Lyle, "Major victory – and pay raises – for U.S. judges," <http://www.scotusblog.com/2012/10/major-victory-and-pay-raises-for-u-s-judges/>, JMP)

AFTER BATTLING FOR YEARS TO GET A PAY RAISE THAT THEY SAY CONGRESS HAD ONCE PROMISED THEM, SIX FEDERAL JUDGES FINALLY WON IN A SPECIALIZED FEDERAL COURT on Friday. If the ruling withstands a likely trip to the Supreme Court, THOSE JUDGES – AND PRESUMABLY OTHERS – WILL get annual cost-of-living increases THAT HAVE BEEN SPECIFICALLY VETOED BY CONGRESS. The ten-to-two decision by the Federal Circuit is here.

THE COURT RULED THAT, IN A 1989 LAW UPON WHICH THE JUDGES HAVE BEEN RELYING, CONGRESS TRIGGERED THE JUDGES' RIGHT UNDER THE CONSTITUTION NOT TO HAVE THEIR PAY LEVEL DIMINISHED. THE COMPENSATION CLAUSE ITSELF, the decision said, CREATES "BASIC EXPECTATIONS AND PROTECTIONS" ON JUDGES' PAY.

Thus, IT CONCLUDED, "in the unique context of the 1989 act, THE CONSTITUTION PREVENTS CONGRESS FROM ABROGATING THAT STATUTE'S PRECISE AND DEFINITE COMMITMENT TO AUTOMATIC YEARLY COST OF LIVING ADJUSTMENTS FOR SITTING MEMBERS OF THE JUDICIARY."

In reaching its decision, the Federal Circuit overruled a decision it had reached in 2001 – one that the Supreme Court had refused to disturb in 2002– and it found that it was not bound by a 1980 decision of the Supreme Court. Both of those rulings had gone against judges claiming that they were unconstitutionally denied pay raises.

The Supreme Court has played a continuing role in this prolonged constitutional fight, and in June of last year told the Federal Circuit to decide whether the six judges' case (the latest of several such cases) should be dismissed on the theory that it was barred by the Federal Circuit's 2001 precedent.

AT: Judicial Salary Increases --- Congress Must Pay

No internal link – congress is mandated to pay the salaries – means it can't be cut

Moyer, 15 – [Bruce, is on the Federal Bar Association government relations counsel, Federal Bar Association, “Federal Judges Score a Pay Adjustment, Quietly”, January 2015, <http://www.fedbar.org/Advocacy/Washington-Watch/WW-Archives/2015/JanuaryFebruary-2015-Federal-Judges-Score-a-Pay-Adjustment-Quietly.aspx>, 7/6/15]JRO

Congressional Reaction Members of Congress are inquiring how much these raises will cost. ACCORDING TO THE Congressional Budget Office (CBO), the bill will be considerable. THE CBO IN OCTOBER ANNOUNCED THAT THE FEDERAL GOVERNMENT WILL SPEND A COLLECTIVE \$1 BILLION MORE TO PAY ITS JUDGES OVER THE NEXT 10 YEARS, INCLUDING THE COSTS OF THE BACKPAY awards. Most of THE TAB REPRESENTS “MANDATORY SPENDING,” MEANING CONGRESS WILL HAVE NO CHOICE BUT TO PAY THE TAB BECAUSE IT IS REQUIRED BY STATUTE. Over this time period, an additional \$190 million will need to be appropriated with discretionary funds to pay for the rise in the salaries of non-Article III judges. Given the widespread distrust of government, some Americans may see the judicial pay litigation as little more than self-interested, activist judges mandating themselves a pay raise. But the judges presciently turned to an ancient common-law doctrine to validate their actions: the “Rule of Necessity,” which permits judges with an interest in a case before them to still hear and decide the case if it could not otherwise be heard elsewhere. Whether that explanation convinces members of Congress unhappy with their smaller paycheck remains to be seen.

AT: Judicial Salary Increases --- No Impact

Judicial pay does not affect judicial performance --- statistics prove

Baker, 2007- Professor at the Washington University in Saint Louis – School of Law (Scott, "Should We Pay Federal Circuit Judges More?", Boston University Law Review, July 4, 2007, SSRN database)//TT

Conclusion

Chief Justice Roberts, his brethren, and many prominent members of the legal community have issued statements about the corrosive effect of low judicial salaries. The heated rhetoric is itself telling: low judicial salaries are creating a "constitutional crisis";¹⁴⁵ because of low salaries "the nation is in danger of having a judiciary that is no longer considered one of the leading judiciaries of the world";¹⁴⁶ and "eroding federal judicial salaries will lead, sooner or later, to less capable judges and ultimately to inferior adjudication."¹⁴⁷

THIS ARTICLE IS THE FIRST TO TEST WHETHER JUDICIAL SALARIES REALLY DO IMPACT JUDICIAL PERFORMANCE. Given the available data, the effect of low judicial pay is non-existent, at least when judicial pay is measured against the next best financial opportunity for most circuit judges. LOW PAY DOES NOT IMPACT VOTING PATTERNS, CITATION PRACTICES, THE SPEED OF CONTROVERSIAL CASE DISPOSITION, OR OPINION QUALITY. Low pay does lead to slightly fewer dissents. While statistically significant, THE MAGNITUDE OF THIS EFFECT IS SLIGHT.

LOW JUDICIAL SALARIES MIGHT HAVE A CORROSIVE CHARACTER. THE SOURCE OF THE CORROSION, HOWEVER, RESTS outside judicial performance. Chief Justice Roberts is probably half right: low judicial salaries erect a barrier to entry onto the bench for some candidates. But THIS BARRIER IS INCONSEQUENTIAL IF THOSE CANDIDATES WHO ARE WILLING TO TAKE JUDGESHIPS ARE INDISTINGUISHABLE FROM THOSE CANDIDATES DRIVEN FROM THE APPLICANT POOL BY LOW JUDICIAL SALARIES. That is the story these data support.

Judicial salaries don't affect judicial independence and decisions

Baker, 2007- Professor at the Washington University in Saint Louis – School of Law (Scott, "Should We Pay Federal Circuit Judges More?", Boston University Law Review, July 4, 2007, SSRN database)//TT

This Article is the first to test the impact of judicial pay on performance of federal circuit judges. By comparing judicial salaries to salaries of the next best financial opportunity for most circuit judges – partnership in regional law firms – this Article finds that JUDICIAL COMPENSATION IS IRRELEVANT TO MOST QUANTIFIABLE MEASURES OF JUDICIAL PERFORMANCE. REGARDLESS OF THE DIFFERENCE BETWEEN THEIR SALARY and their next best opportunity, JUDGES OF BOTH POLITICAL PARTIES VOTE THE SAME IN CONTROVERSIAL CASES; THEY ARE EQUALLY LIKELY TO CITE AS PERSUASIVE AUTHORITY OPINIONS BY JUDGES FROM THE OTHER POLITICAL PARTY; THEY DECIDE CONTROVERSIAL CASES IN THE SAME AMOUNT OF TIME; AND THEY WRITE EQUALLY STRONG OPINIONS.⁸ Indeed, the only statistically significant effect of low judicial salaries is that judges paid poorly as against their next best opportunity dissent less often in controversial cases. But the magnitude of this effect is tiny. In short, PRETTY MUCH NOTHING WOULD HAPPEN IF CONGRESS DECIDED TO RAISE JUDICIAL SALARIES.

These empirical results make sense. There are very few federal circuit judgeships, and many people want them. Salary, a generous pension, and a number of non-pecuniary perks make the federal circuit judgeship attractive. The president picks his nominee based on his preferences in combination with the views of the senators. The composition and depth of the candidate pool makes little difference. TRUE, SOMEONE MIGHT TURN DOWN THE JOB FOR FINANCIAL REASONS, BUT THE NEXT PERSON PICKED WILL BE INDISTINGUISHABLE IN HIS OR HER EVENTUAL JUDICIAL PERFORMANCE.

Part I.A sets forth the constitutional structure, statutory scheme, and history of the law governing judicial salaries. Part I.B summarizes the debate about judicial salaries, considering the arguments made for higher salaries. Based on these arguments, Part I.B articulates competing theories about the likely impact of judicial pay on judicial performance. Part II details the statistical methodology used to test the theories. It develops two approaches – judge-to-judge direct comparisons and pool-to-pool comparisons – that can be used to determine whether higher salaries would alter judicial performance. Part III performs the statistical analysis, reporting that JUDICIAL PAY DOES NOT AFFECT THE NATURE OF JUDICIAL VOTES IN CONTROVERSIAL CASES,

THE SPEED OF CASE DISPOSITION IN CONTROVERSIAL CASES, THE CHARACTER OF JUDICIAL CITATIONS IN WRITTEN OPINIONS, OR THE STRENGTH OF JUDICIAL OPINIONS. Part III does show that judges who give up a lot of money to take the bench dissent less frequently. By inference, then, LOW JUDICIAL PAY (i.e., big spreads between judicial pay and private sector pay) YIELDS MARGINALLY LESS DISSENT. Part IV deals with some potential objections to the analysis, and, finally, there is a brief conclusion.

Impacts to judicial pay are grossly exaggerated

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

Taking these words of warning to heart, one might think that the judiciary is truly on the short road to perdition. Fortunately, however, these predictions of apocalyptic catastrophe are gross exaggerations. For starters, despite doomsday claims that judicial salary levels have reached unprecedented lows, HISTORICAL DATA DEMONSTRATES THAT JUDICIAL SALARIES HAVE ALWAYS BEEN LESS THAN THE MARKET RATE FOR LAWYERS, without any serious consequences. ¹⁴ Furthermore, shrill predictions that these SALARY LEVELS will spell the end of the judiciary are similarly not a new phenomenon, ¹⁵ having been made in previous eras, and HAVING RESULTED IN NEITHER THE DEMANDED SALARY INCREASES NOR THE TERRIBLE PLAGUES PREDICTED BY THESE PROPHETS. ¹⁶ Rather than showing the necessity of salary increases, these salary critics have simply demonstrated the truth of Yogi Berra's observation: "[I]t's tough to make predictions, especially about the future."¹⁷ One safe bet, however, is that CRITICS WILL CONTINUE TO COMPLAIN ABOUT JUDICIAL SALARY LEVELS AND MAKE PREDICTIONS OF DOOM, YET no serious harm WILL BEFALL THE JUDICIARY, or at least none related to judicial compensation. This prediction is based on over two hundred years of history, and although the past does not foreordain the future, it offers a good roadmap for determining where the judiciary is headed.¹⁸

Despite the decline in judicial pay, there has been no impact on the quality of the judiciary

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

Today, many judges follow in the tradition of Learned Hand. Consider the quality of the judiciary that present judicial salaries buy for the American taxpayer. THOSE PUSHING FOR A JUDICIAL PAY INCREASE FAIL TO MENTION THE NUMBER OF EXCELLENT JURISTS THAT CONTINUE TO TOIL ON THE FEDERAL BENCH, DESPITE PRESENT SALARY LEVELS. Excellent judges, such as the Seventh Circuit's Richard A. Posner and Frank H. Easterbrook and the Fourth Circuit's J. Michael Luttig, to name but a few,¹⁹ serve despite their obvious ability to command superior salaries in the private sector. And these judges are no fools: THEY KNOW THEY COULD GREATLY INCREASE THEIR SALARIES, YET, FOR LOVE OF THEIR DUTIES, THEY CHOOSE TO REMAIN IN THEIR PRESENT POSITIONS. PERHAPS THEY ARE WISE ENOUGH TO REALIZE THAT MONEY IS NOT THE ONLY THING THAT MAKES FOR A FULFILLING CAREER IN THE LAW.

Besides warning that the quality of judges is declining or will decline if salaries are not increased, critics also take aim at the quality of judicial work product. Because of the high quality of the judiciary, deficient decisions are uncommon, and most are based on legal theories that did not originate with the judges who have adopted them.²⁰ A meaningful discussion of the quality of judicial opinions would require more ink than can be spilt on the subject here, but it is worth noting that CRITICS OF THE PRESENT JUDICIAL COMPENSATION STRUCTURE HAVE NOT BEEN ABLE TO SHOW THAT SALARIES HAVE ADVERSELY AFFECTED THE QUALITY OF JUDICIAL DECISIONS.

Admittedly, it is difficult to conceive of a suitable standard by which to measure the overall quality of judicial decisions—it would entail an analysis of the grammar, syntax, clarity, conciseness, organization, and sophistication of decisions, as well as an analysis of their outcome, their basis in the law, the complexity of the issues presented, the citation to precedent, the amendments to the opinion required to garner majority support, the time required to produce the decision, and the legislative or judicial reversal rate, to name but a few factors. In the end, however, the complexity in evaluation really makes no difference because under any system of measurement, modern judicial opinions fare no worse, and probably much better, than those of previous generations, some of whom were paid more (in actual purchasing power) than the present judiciary.²¹ Take reversal rates, for example. THERE HAS BEEN NO NOTICEABLE INCREASE IN

THE RATE OF REVERSAL IN THE FEDERAL SYSTEM, DESPITE THE DECLINE IN the real value of JUDICIAL SALARIES,¹⁴ THE STYLISTIC QUALITY OF JUDICIAL OPINIONS HAS NOT SIGNIFICANTLY DIMINISHED either,¹⁵ and possibly because of developments in computer technology and the adoption of citation standards, they have arguably improved. The same thing goes for the quantity of decisions produced: FEDERAL JUDGES PRODUCE MORE OPINIONS (WITH MORE CITATIONS TO PRECEDENT) THAN EVER BEFORE. THE WORKLOAD OF THE FEDERAL JUDICIARY, WHICH WAS NEVER LIGHT, Has increased significantly with the explosion of federalizing legislation that makes every citizen's sneeze a federal concern.^{11 6} True, better technology and law clerks serve to lighten the load for many judges and may be partly responsible for this increased productivity,¹⁷ and judges of previous generations did not enjoy these privileges,"^{1 8} but IT IS ULTIMATELY THE JUDGE HIMSELF WHO IS RESPONSIBLE FOR THE OUTCOME OF A CASE AND THE FINAL FORM OF A WRITTEN DECISION, REGARDLESS OF WHETHER THE FIRST DRAFT OF THE OPINION HAD ITS GENESIS IN A LAW CLERK. In short, no matter how you slice it, there is just no hard evidence that the modern federal judiciary or its work product is inferior to that of prior generations.

There is no correlation between high salaries and excellence

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS""", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

It is also worth noting that if WEALTHY, WOULD-BE JUDGES ARE UNSATISFIED WITH JUDICIAL PAY, THEY NEED NOT SEEK JUDICIAL POSITIONS. Contrary to popular notions, THE JUDICIARY WOULD NOT BE WORSE OFF WERE THIS TO HAPPEN AND, INDEED, IT WOULD BE MUCH BETTER OFF.^{3 46} Although some commentators assume that lawyers who toil in large firms and pull down heavenly salaries are generally the best qualified for judicial service,³⁴⁷ little evidence supports this view. These attorneys, for whom judicial service would constitute a financial sacrifice, have hardly cornered the market on skills essential to judging. The fact that a lawyer commands a whopping salary in the private sector is certainly a factor that suggests competence-assuming that their clients are rational maximizers and can differentiate between quality legal work and inferior products-since the market places a higher value on their work. But there may also be other factors that explain an attorney's heavenly salary factors that do not correlate with excellence-such as nepotism, favoritism, family connections, lack of accountability, or client ignorance as to the quality of legal services. Because these factors undoubtedly come into play, ONE CANNOT SAY WITH CERTAINTY THAT A HIGHLY-COMPENSATED ATTORNEY IS ALSO A HIGHQUALITY ATTORNEY SIMPLY BECAUSE HE COMMANDS A LOFTY SALARY. AN ATTORNEY'S ABILITY TO DEMAND A HIGH SALARY FROM WEALTHY CLIENTS DOES NOT GUARANTEE HIS 348 EXCELLENCE, just as a lawyer who voluntarily foregoes a high salary should not, by that fact alone, be presumed inferior.³⁴⁹ MANY TALENTED LAWYERS ELECT NOT TO PURSUE HIGHLY COMPENSATED POSITIONS, CHOOSING INSTEAD THE NONPECUNIARY BENEFITS OF OTHER POSITIONS. Some of these ATTORNEYS LIKELY PLACE A HIGHER PRIORITY ON INTELLECTUAL CHALLENGE, OR THE LOVE OF AMERICA, OR PUBLIC SERVICE. THESE ARE THE SAME ATTORNEYS WHO LIKELY WILL BE ATTRACTED TO JUDICIAL SERVICE TO THE EXTENT IT ENTAILS THESE BENEFITS.

Take, for example, Justice Thurgood Marshall, who lost \$3500 his first year of practice³⁵⁰ and who preferred litigating constitutional cases to the riches of private practice. Although as an Associate Justice his left-leaning philosophy often left much to be desired, no one can deny that as an attorney he was a talented litigator who tirelessly championed one of the worthiest causes: eradication of government-sponsored racism. The fact that he was never handsomely compensated, or even that he lost money practicing law, does not mean that he was an inferior attorney; it simply means there was not a substantial market for his skills. Similarly, many law professors or government lawyers would make excellent jurists and would not object to laboring at the present judicial salary levels, even though these attorneys are not presently commanding lofty salaries.³⁵¹ As Chief Justice Rehnquist has noted, judicial service often entails a pay increase for these attorneys.³⁵² If whatever their motivations-these gifted individuals are willing to serve according to the present pay scale, the American taxpayer should not be forced to pay wages according to the rate of their more expensive colleagues. It simply is not true that "better pay would attract even better judges than now sit on the federal bench,"³⁵³ and the American taxpayer should not be compelled to disprove this theory.

Not only are many less-well-compensated attorneys sufficient to the judicial task, many would be an improvement over attorneys who place money high on their list of priorities. America would be better served by such individuals-those with the wisdom and discipline to control their spending habits and live within their means-than their less-frugal counterparts.

As two scholars have posited:

[F]OR ANY TWO INDIVIDUALS WITH THE SAME ABILITY, THE ONE WHO SEEKS PROMOTION TO THE JUDICIARY BECAUSE OF ITS NONPECUNIARY BENEFITS RATHER THAN BECAUSE OF ITS MONETARY

COMPENSATION WILL LIKELY PROVE TO BE THE BETTER JUDGE. This is because THE NONMONETARILY ORIENTED INDIVIDUAL WOULD BE MORE LIKELY TO EXHIBIT SELF-RESTRAINT. Therefore, it is these individuals whom we would like to capture in our selection process. Our analysis suggests that THIS CAN BE ACCOMPLISHED BY FORCING THE CANDIDATES WHO WISH TO SERVE ON THE BENCH TO ACCEPT SALARY REDUCTIONS IN GIVING UP THEIR PRIVATE PRACTICES.³⁵⁴

America could certainly use more judges habituated to exercise restraint. Similarly, frugal judges might be a little more frugal with taxpayers' money when running prisons, hospitals, and school districts. Requiring a little sacrifice might not be so bad for the quality of the judiciary after all.

Remember, this sacrifice is not exactly severe. Attorneys who desire to be judges are not being called upon to sacrifice their first-born child or their happiness (unless their happiness is inextricably tied to lofty salaries). It is not as though federal judges must go begging in order to feed or clothe their families. Everyone concedes that the "concern here is not that federal judges are impoverished.,³⁵⁵ JUDGES "RECEIVE A RESPECTABLE AMOUNT OF COMPENSATION ON BOTH STATE AND FEDERAL LEVELS. 356 ALTHOUGH FEDERAL JUDGES LACKING INDEPENDENT WEALTH CANNOT LIVE EXTRAVAGANTLY, THEY CERTAINLY CAN LIVE COMFORTABLY, AND AT LEVELS HIGHER THAN THE AVERAGE AMERICAN THAT STRUGGLES TO PAY HIS OWN BILLS, INCLUDING THE TAXES THAT PAY FOR JUDICIAL SALARIES.³⁵⁷ Just as nothing is inherently wrong with having a judiciary primarily composed of the wealthy, there would be nothing wrong with having those of moderate means control the courthouses of America regardless of whether judicial pay is increased, decreased, or maintained at its present level.

True, not everyone has the temperament conducive to a career in the judiciary. As Alexander Hamilton believed, the number of individuals capable of offering their wisdom in service on the judiciary is quite small.

Hence it is, that THERE CAN BE BUT FEW MEN IN THE SOCIETY WHO WILL HAVE SUFFICIENT SKILL IN THE LAWS TO QUALIFY THEM FOR THE STATIONS OF JUDGES. And MAKING THE PROPER DEDUCTIONS FOR THE ORDINARY DEPRAVITY OF HUMAN NATURE, THE NUMBER MUST BE STILL SMALLER OF THOSE WHO UNITE THE REQUISITE INTEGRITY WITH THE REQUISITE KNOWLEDGE.³⁵⁸ Or, as Roscoe Pound put it: "THE ADMINISTRATION OF JUSTICE IS NOT AN EASY TASK TO WHICH EVERY MAN IS COMPETENT., 359 THE AMERICAN BAR PRODUCES A SUFFICIENT NUMBER OF EXCEPTIONAL ATTORNEYS TO STAFF THE FEDERAL AND STATE COURTS, 360 AND NOT ALL OF THESE ARE CUTTING THEIR TEETH AT SILK STOCKING LAW FIRMS.

Low judicial salaries don't prompt judges to leave – history proves

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fe-d-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

The foregoing history of the judicial salary "crisis" is not meant to be an encompassing overview of the subject. Rather, it is meant to catalyze further understanding of the contemporary clamoring for raises by showing THAT DISSATISFACTION WITH SALARY LEVELS IS NOT A RECENT PHENOMENON, and that, DESPITE OVER TWO HUNDRED YEARS OF DISSATISFACTION WITH JUDICIAL SALARIES, THE EVILS FORECAST BY SALARY CRITICS HAVE NOT YET COME TO PASS.⁸⁶ THE IDEA THAT A DESIRE FOR GREATER REMUNERATION FREQUENTLY MOTIVATED DEPARTURES FROM THE BENCH is likewise not of recent origin, but HAS BEEN VOICED FOR CENTURIES. Furthermore, this HISTORY poignantly ILLUSTRATES THAT JUDGES WHO REMAIN ON THE BENCH ARE SAVVY ENOUGH TO POINT TO THE DEPARTURE OF THEIR BRETHREN AT THE SAME TIME THEY REMIND CONGRESS ABOUT A PAY RAISE. The import of this veiled threat is not ignored, however empty this threat usually is.

History has also shown that THE NUMBER OF JUDGES DEPARTING THE BENCH HAS INCREASED IN RECENT YEARS⁸⁷ SOME OF THESE DEPARTURES undoubtedly ARE BASED UPON FINANCIAL CONCERNS ENGENDERED BY JUDICIAL SALARIES.⁸⁸ HOWEVER, THE INCONVENIENT TRUTH FOR SALARY CRITICS REMAINS: IN "THE

LAST 200 YEARS, RELATIVELY FEW JUDGES HAVE EXPLICITLY CITED LOW PAY AS THEIR REASON FOR RESIGNATION.⁸⁹

This brief account of the salary "crisis" demonstrates that, DESPITE MUCH WAILING AND GRINDING OF TEETH, THE FEDERAL JUDICIARY REMAINS A POWERFUL (some might say too powerful)⁹⁰ and viable entity that shows NO SIGN OF LOSING ITS VIGOR.⁹¹ Generally, THE JUDICIARY CONTINUES TO BE RECOGNIZED FOR ITS EXCELLENCE.⁹² Yet, some critics still point to judicial problems as evidence that low judicial salaries have a deleterious effect on America's justice system. Among these problems are the crowded dockets, the inferior judges producing pedestrian opinions, the increased risk of bribery and corruption, and the threat that the judiciary will become a club for only the wealthy. As the analysis below demonstrates, NONE OF THESE CHARGES HAVE MUCH MERIT.

Raising judicial wages are bad – it attracts candidates who only care about the pecuniary aspects of the job

Baker, 2007 - Professor at the Washington University in Saint Louis – School of Law (Scott, "Should We Pay Federal Circuit Judges More?", Boston University Law Review, July 4, 2007, SSRN database)//TT

THE FAMILIAR ECONOMIC ARGUMENT IS THAT HIGHER WAGES ATTRACT BETTER WORKERS. IN OTHER WORDS, WORKERS WITH THE GREATEST SKILL OR HUMAN CAPITAL COMMAND THE HIGHEST WAGES.⁴² THIS ARGUMENT DOES NOT READILY TRANSFER TO THE POOL OF FEDERAL CIRCUIT JUDICIAL NOMINEES. Almost every nominee for a judgeship takes a pay cut for the bench. Even nominees that come from the public sector could, if they wanted to, work in law firms, which would pay more than a circuit judgeship. The real impact of higher judicial salaries is a reduction of the pay cut nominees have to take. As we shall see, REDUCING THE SIZE OF THE PAY CUT COULD THEORETICALLY AFFECT THE JUDICIARY'S PERFORMANCE.

PEOPLE CARE ABOUT both NON-PECUNIARY and pecuniary ASPECTS OF A JOB.⁴³ For any person, a preference profile can be constructed indicating how much he or she subjectively values each non-pecuniary aspect and each pecuniary aspect of a given job. This profile will differ for each person depending on the individual's wealth, how much he or she values consumption versus leisure, and many other personal factors.

Now take judges. JUDGES CARE ABOUT A NUMBER OF THINGS BESIDES MONEY: STATUS, PRESTIGE, LEISURE, POWER TO AFFECT POLICY, AND PUBLIC SERVICE.⁴⁴ DIFFERENT PEOPLE ATTACH DIFFERENT WEIGHTS TO THESE NON-PECUNIARY ASPECTS OF THE JOB. THE SPREAD BETWEEN THE JUDICIAL SALARY AND THE WAGE IN A CANDIDATE'S NEXT BEST OPPORTUNITY REVEALS THE STRENGTH OF THE CANDIDATE'S ATTACHMENT TO THE NON-PECUNIARY ASPECTS OF JUDGING. In other words, the spread reflects the person's taste for becoming a judge; a candidate willing to accept a large spread has a strong preference for judging.⁴⁵ Furthermore, AN INDIVIDUAL'S PREFERENCES OVER THE VARIOUS NON-PECUNIARY ASPECTS OF A JUDGESHIP MIGHT THEN INFLUENCE EVENTUAL JUDICIAL PERFORMANCE. A strong desire for the circuit judgeship could, for example, correlate with a strong preference for leisure, which might manifest itself by that judge taking a long time to write her opinions.

By raising salaries, Congress reduces the spread between judicial salaries and the candidate's next best opportunity. As a result, HIGHER SALARIES MIGHT WEED OUT SOME OF THE PEOPLE WITH THE STRONGEST DESIRES FOR THE JUDICIAL ROLE. Sure, the true ideologue, the leisure maximizer, the prestige-obsessed, and the committed public servant will still be interested in the judgeship, but now so will a lot of other people. Under the "salary matters" theory, INCREASED COMPETITION AFFECTS THE KIND OF PERSON EVENTUALLY SELECTED FOR THE BENCH.

To see why this might be so, suppose that the pay for circuit judges is zero. In this case, individuals willing to take the job must really want to be judges. These individuals value non-pecuniary aspects of the job a lot – leisure, power, prestige, public service, etc. – and money less so (perhaps because they are wealthy already). Suppose the pay is increased to \$150,000 a year. In that case, people who would take the judgeship for nothing would still compete for the judicial slot, but now people who place a lower value on non-pecuniary perks and a higher value on wages would enter the pool. Increasing pay to \$2 million a year expands the pool even further; it now includes some lawyers who do not care much about the non-pecuniary aspects of the judgeship and care a lot about money. In this way, RAISING JUDICIAL PAY (1) EXPANDS THE CANDIDATE POOL AND (2) ALTERS THE PROFILE OF "TASTES" FOR THE JUDICIAL ROLE AMONG POOL MEMBERS.

Salaries not key— non pecuniary parts of the job alone motivates judges to serve

Frank, 2002 — Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY 'CRISIS'", Marquette Law Review, July 17, 2002, [//TT](http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf)

Also important to an understanding of the judicial salary "crisis" is the motivation of those who seek judgeships. Certainly no judge has ever been misled into believing that a federal judgeship is a fast track to wealth and material prosperity²³⁹ -although federal judgeships entail an abundance of retirement and disability benefits²⁴⁰ -so IT MUST BE SOMETHING ELSE THAT ENTICES ATTORNEYS TO THE BENCH AND KEEPS THEM HAPPY ENOUGH TO CONTINUE IN SERVICE. MANY JUDGES ARE HAPPY. In the words of Justice Breyer: "I think we have a fabulous job.,²⁴¹ "THE FACT THAT VERY FEW JUDGES .EVER RESIGN FROM THE BENCH INDICATES THAT THE NONPECUNIARY BENEFITS FROM THIS WORK ARE PROBABLY WORTH CONSIDERABLY MORE TO THEM" THAN THE INCOME THEY FOREGO.²⁴² Similarly, judging from the number of attorneys still seeking positions on the federal bench, it is apparent that many of them share Justice Breyer's sentiments and believe that they can be fulfilled through judicial service, despite moderate salaries.⁴³

B. Non-Pecuniary Income

No one disputes that FEDERAL JUDGES WORK HARD, perhaps harder than most government employees. JUDGES ALSO FACE DIFFICULT DECISIONS OF GREAT IMPORTANCE TO THE COMMUNITY.²⁴⁴ No doubt, most could obtain greater compensation in private practice. But as many contemporary judges understand, THERE IS MUCH MORE TO LIFE THAN MONEY, AND THE DAILY GRIND OF A LAW FIRM PARTNERSHIP, while meaningful for some, MAY NOT BE EVERYONE'S CUP OF TEA. Take for example Justice Felix Frankfurter, who conceded that "I wanted to be a lawyer, but I didn't want to have clients.,²⁴⁵ Frankfurter could have escaped the headaches associated with clients by remaining in academia, but found the lure of the bench irresistible. Certainly he understood that serving as a judge could be downright fun, or in the words of Judge Posner, "judging is a gas."²⁴⁶ Chief Justice Rehnquist is probably correct that as a matter of cosmic fairness there should be an increase in judicial salaries. But THERE IS LITTLE BASIS for his claim THAT SUCH AN INCREASE IS NECESSARY TO RECRUIT AND MAINTAIN A FIRST-RATE JUDICIARY, BECAUSE MANY SEEK SERVICE ON THE JUDICIARY FOR REASONS OTHER THAN THE PAY.

A large part of the reason why SALARY LEVELS HAVE NOT DELETERIOUSLY AFFECTED RECRUITMENT OR RETENTION OF JUDGES IS THAT ATTORNEYS AND JUDGES SEEK THE BENCH FOR A MULTIPLICITY OF REASONS, MANY OF WHICH HAVE LITTLE TO DO WITH MONEY. They can derive net utility from various aspects of judging and being a judge. Indeed, "NONPECUNIARY SATISFACTIONS ARE AN IMPORTANT PART OF MOST FEDERAL JUDGES' 'INCOME.'"²⁴⁷ "[S]alary figures do not tell the whole story of the trend in federal judicial income. 'Income,' when used realistically to denote the features that make one job more or less attractive than another, obviously contains nonpecuniary as well as pecuniary elements; nor are the pecuniary elements exhausted in salary.²⁴⁸ In the words of Judge Sprecher, MONETARY "COMPENSATION IS NOT THE PRIMARY ATTRACTION FOR THOSE WHO ASPIRE TO JUDICIAL SERVICE.,,"²⁴⁹ There are at least nine non-monetary aspects of a judge's compensation that must be included in any calculation of the "income" they derive from their jobs, and which attract attorneys to a judicial career.

Prestige is enough to attract judges to join the bench

Frank, 2002 — Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY 'CRISIS'", Marquette Law Review, July 17, 2002, [//TT](http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf)

"Public esteem is difficult to measure but it is an important factor in the desirability of any job or office.²⁵⁰ MANY WHO UNDERTAKE A CAREER ON THE BENCH DO SO, IN PART, BECAUSE OF THE PRESTIGE AND HONOR OF THE JOB.²⁵¹ WHO, after all, DOES NOT DESIRE THE ESTEEM OF ONE'S PEERS? Judge Bork, certainly an authority on the judiciary, believes that the dignity OF THE POSITION is "a major attraction OF A CAREER ON THE BENCH, 252 AND MANY OTHER EXPERTS AGREE.²⁵³ Thus, for some judges, the honors "inherent in service on the federal bench outweigh simple calculations of personal income potential.²⁵⁴ Money takes second place TO THE ESTEEM THAT CAN BE GAINED ON THE BENCH: Litigants stand when judges enter the courtroom; judges are addressed by a special title; judges wear special robes; judges are the center of attention in court; JUDGES OF EVEN

MODEST MENTAL MEANS ARE PERCEIVED AS WISE AND KNOWLEDGEABLE; AND JUDGES ENJOY PRIVILEGES THAT MAKE THEIR COLLEAGUES IN THE OTHER TWO BRANCHES SALIVATE.²⁵⁵ With this kind of

stature, it is no wonder that MANY ATTORNEYS SEEK JUDGESHIPS,²⁵⁶ for "no position which offers prestige ever lacks applicants."²⁵⁷

Accordingly, SO LONG AS JUDICIAL SALARIES PERMIT THE MAINTENANCE OF A REASONABLY COMFORTABLE EXISTENCE, WHAT JUDGES LACK IN MONEY CAN FREQUENTLY BE MADE UP IN PRESTIGE.²⁵⁸

Power, authority, and public service are enough to recruit qualified candidates

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

Closely related to the prestige of federal judgeships is the power and authority that judges wield,²⁵⁹ AS JUDGES RECEIVE RESPECT LARGELY BECAUSE OF THEIR AUTHORITY AND THE EFFECT OF THEIR DECISIONS.²⁶⁰ Law impacts everyone's life; therefore, judges-as interpreters of law, arbiters of legal disputes, and creators of common law-exercise their power over the smallest and greatest among men. "We are under a Constitution, but the Constitution is what the judges say it is,"²⁶¹ and the judges have been doing a lot of saying of late.

"Count de Tocqueville remarked more than a century ago that hardly a political issue arose in the United States that was not converted into a legal question and taken to the courts for decision. Today de Tocqueville's observation is even closer to the mark,²⁶² resulting in judges exercising greater control over the smallest details of the state, often to their pleasure. As St. Augustine observed: "The desire to rule over our equals is an intolerable lust of the soul."²⁶³ Undoubtedly some judges burn with this lust,²⁶⁴ while others simply enjoy having people pay attention to their view on how things ought to be. As an example of the encompassing power of judges, consider that America's judiciary recently decided the outcome of the 2000 Presidential election.²⁶⁵ Certainly the issue need not always be so lofty to warrant judicial attention. Judges are willing to give their opinion on much more pedestrian matters, such as the administration of prisons, hospitals, and public housing²⁶⁶ or whom the Boy Scouts should admit to their ranks.²⁶⁷ Frankly, NO QUESTION IS TOO GREAT OR TOO SMALL TO WARRANT JUDICIAL ATTENTION. ALTHOUGH THE JUDICIARY WAS ORIGINALLY CONSIDERED THE WEAKEST OF THE THREE BRANCHES, THIS CONCEPT IS HARDLY TRUE TODAY.268 BECAUSE ATTORNEYS DO NOT LIVE IN A VACUUM, THEY ARE FULLY AWARE OF THE POWER THEY COULD WIELD AS JUDGES.

For those so inclined, then, SERVING AS A JUDGE ENTAILS ENTRUSTMENT WITH SUBSTANTIAL AUTHORITY; INDEED, MORE AUTHORITY THAN THEY COULD EVER EXERCISE IN PRIVATE PRACTICE. "Because prestige, power, and high incomes are commonly available amenities for partners in large law firms and because those partners are willing to take substantial reductions in income to become judges, it follows that the judiciary confers more prestige (and power) ON THESE INDIVIDUALS THAN IS AVAILABLE TO THEM IN THE LAW FIRM CONTEXT."²⁶⁹ THE JUDICIAL POSITION AFFORDS THEM THE OPPORTUNITY TO ADVANCE THEIR POLITICAL AGENDA OR FAVORITE CONSTITUTIONAL THEORY WELL BEYOND THE RANGE OF A MERE ATTORNEY.^{7*} Such a lawyer, weighing the benefits of a judgeship, will consider "not only the virtually absolute authority bestowed by a judgeship over litigants and lawyers, but also the broader social impact a judge's decisions have as precedent and as social policy."²⁷¹ For these chosen few, because THEY RECEIVE A BENEFIT IN THE POWER THEY WIELD, THE MONETARY REWARDS OF A JUDGESHIP NEED NOT BE GREAT TO RECRUIT OR RETAIN THEM. THEY WILL STICK AROUND IF THEY ARE REASONABLY WELL PAID AND PERCEIVE THEIR POSITION AS AN INFLUENTIAL ONE.

3. Public Service

Not all judges who enjoy the power of the bench do so because they possess a tyrannical or authoritarian streak.²⁷² Many see THE VALUE THAT THIS AUTHORITY HAS FOR SERVING THE COMMON WEAL.²⁷³ After all, WHERE ELSE CAN AN INDIVIDUAL IMPACT PEOPLE'S LIVES IN SUCH A POSITIVE WAY WITH SUCH MOMENTOUS POWER? MANY ATTORNEYS WHO SEEK JUDICIAL POSITIONS, therefore, DESIRE A JOB THAT ENTAILS THE REAL POSSIBILITY OF CONTRIBUTING TO THE BETTERMENT OF LAW AND^{274, 215} SOCIETY. Indeed, THE VERY PURPOSE OF LAW IS "THE WELFARE OF SOCIETY, SO JUDGES WHO SEEK THE POSITION TO ENHANCE THAT WELFARE ARE DOING SO WITH THE 276 NOBLEST SENTIMENTS.^{7 6} As Senator Patrick Leahy has noted, THOSE INTERESTED IN SERVING ON THE JUDICIARY "ARE motivated by public service, not by pay, AND THAT HAS ALWAYS BEEN THE CASE,²⁷⁷ Because many private sector jobs are not as fulfilling to such individuals,²⁷⁸ these judges obtain substantial psychic income from serving on the judiciary that they could not obtain elsewhere.²⁷⁹ Accordingly, they are willing to serve for less remuneration than someone less inclined to public service.

Intellectual challenge and excitement are desired attributes of judgeship—not only money

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY 'CRISIS'", Marquette Law Review, July 17, 2002, [//TT](http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf)

Even those who are committed to the enhancement of the public welfare may be reluctant to undertake a career that is boring or lacks intellectual stimulation. Indeed, MANY AN ATTORNEY FINDS LAW AN ATTRACTIVE VOCATION BECAUSE OF THE INTELLECTUAL CHALLENGE AND EXCITEMENT IT PROVIDES. In a related vein, some JUDGES ARE EXTREMELY "INTERESTED IN PROBLEMS AND THEIR SOLUTIONS," AND THEY SEE THE JUDICIARY AS A DISTINCT OPPORTUNITY WITHIN WHICH TO EXERCISE THEIR PROBLEM-SOLVING SKILLS.²⁸⁰ Indeed, this was one of the attractions that lured Justice Story to the bench, despite the inferior salary.²⁸¹

INTELLECTUAL GROWTH AND STIMULATION ARE UNDOUBTEDLY DESIRED ATTRIBUTES OF ANY POSITION, but perhaps even more so for attorneys. They are substantial benefits that are highly valued in any attorney's career calculation, especially since drudgery is, unfortunately, a real part of almost every attorney's practice. Importantly, then, FEDERAL JUDGESHIPS GENERALLY PROVIDE JUDGES WITH AN ABUNDANCE OF MENTAL STIMULATION.²⁸² In the words of Judge Oakes, SERVING ON THE FEDERAL BENCH "REMAINS ONE OF THE MOST CHALLENGING AND INTERESTING OF ALL JOBS, WITH CONSISTENTLY NEW LEARNING EXPERIENCES EVERY SINGLE DAY."²⁸³ Thus, it IS NOT SURPRISING THAT MANY JUDGES-LIKE MANY LAW PROFESSORS-ARE WILLING TO FOREGO SOME OF THE MONETARY BENEFITS OF PRIVATE PRACTICE SO THAT THEY MIGHT ENJOY THE INTELLECTUAL STIMULATION OF BEING A JUDGE. Frequently, FOR THOSE JUDGES WHO ENJOY THE INTELLECTUAL NATURE AND PROBLEM-SOLVING ASPECTS OF BEING A JUDGE, MONEY IS "OF ONLY SECONDARY INTEREST TO HIM. He fills his emotional needs through the solution of complex problems.,²⁸⁴ This TYPE OF JUDGE SEES SERVICE ON THE JUDICIARY AS AN "opportunity to engage in interesting, exciting and challenging work"²⁸⁵ to an extent that he might not find at a law firm. Thus, such a judge can easily find substantial contentment on the bench without burdening taxpayers with the higher taxes necessary to fund a judicial pay increase.²⁸⁶

AT: Judicial Salary Increases --- Doesn't Impact Decisions

Judges still work hard regardless of pay and "overcrowded" dockets

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, [//TT](http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf)

1. Surviving Crowded Dockets

In light of heavy caseloads faced by some courts, salary-level critics could argue that these caseloads are somehow related to inadequate salaries. Perhaps judges feel less compelled to maintain a consistent work level, and maybe crowded dockets are a symptom of a judiciary in crisis—a crisis caused by low salaries. SUCH AN ARGUMENT, however, IS EASILY SHOWN TO BE DEVOID OF MERIT.

DESPITE DISSATISFACTION WITH SALARY, THE FEDERAL COURTS HAVE CONTINUED TO FUNCTION WELL EVEN WHILE ENCOUNTERING INCREASED DEMANDS AND EXPANDING CASELOADS. CROWDED DOCKETS ARE essentially unrelated TO THE JUDICIAL PAY scale and instead have their genesis in congressional activity (the federalization of crimes),⁹³ and congressional inactivity (the failure to promptly confirm judicial nominees and to create judgeships).⁹⁴ Not surprisingly, then, caseloads are excessive in many districts and circuits where nominees are awaiting Senate confirmation⁹⁵ or where the drug trade has increased the number of federal criminal cases.⁹⁶ Contrary to salary critics' arguments, JUDGES GENERALLY WORK HARDER TODAY THAN THEY DID EVEN FIFTY YEARS AGO, DESPITE THEIR ABILITY TO MAKE MORE MONEY IN THE PRIVATE SECTOR. Accordingly, salaries have not had a deleterious effect on the amount of judicial work being produced.

Problems with busy caseloads and crowded dockets are hardly recent phenomena.⁹⁷ In 1921, Roscoe Pound complained as follows: "[T]he condition of pressure under which causes are passed upon in the American urban communities of today, where crowded calendars preclude the thoroughness in presentation and deliberation in judicial study which were possible a century ago, prevent judicial lawmaking from achieving its best."⁹⁸ A few years later, Justice Cardozo lamented: "Crowded dockets make it impossible for judges, however able, to probe every case to its foundations."⁹⁹ ONE CAN HARDLY ASCRIBE CROWDED DOCKETS TO ANY RECENT DROP IN THE PURCHASING POWER of federal judges. Thus, THE ACT OF INCREASING SALARIES WILL PROBABLY NOT ALLEVIATE BUSY DOCKETS, DESPITE ARGUMENTS TO THE CONTRARY. After all, it is not as though judges have agreed to a work slowdown to pressure Congress to increase judicial salaries, despite the fact that this practice has proven successful for other workers. In short, JUDICIAL SALARY LEVELS, though lower than what judges could make as attorneys in private practice, are not so pathetic as to disrupt the functioning of the judiciary.

LOW SALARY LEVELS DON'T PRODUCE SUBSTANDARD DECISIONS

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY "CRISIS"", Marquette Law Review, July 17, 2002, [//TT](http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf)

Salary-level critics also suggest that existing salary levels have resulted in an inferior judiciary that produces inferior decisions. As discussed above, the federal judiciary has not reduced its caseload, which would be one sign of a judiciary in crisis. Similarly, FEDERAL JUDGES ARE NOT PRODUCING NOTICEABLY LOWER-QUALITY OPINIONS, OR AT LEAST NONE THAT ARE ATTRIBUTABLE TO "INFERIOR" JUDGES, and CRITICS HAVE NOT IDENTIFIED A RASH OF POOR QUALITY OPINIONS THAT MIGHT SUPPORT THEIR CONTENTIONS. Although some critics suggest that the modern judiciary is of a lower quality because of inadequate salary levels, NONE OF THESE SALARY CRITICS HAVE IDENTIFIED THESE "INFERIOR" JUDGES, SUGGESTING THAT NO SUCH IDENTIFIABLE GROUP EXISTS. As Judge Posner has observed: "Although federal judges like everyone else consider themselves underpaid and would like higher salaries, I do not think that the current salary level is a serious threat to the quality of the federal judiciary. . . ." ¹⁰⁰ Indeed, despite a number of unpopular rulings, THE FEDERAL JUDICIARY STILL RETAINS A HIGH DEGREE OF RESPECT among the American public AND IS GENERALLY CONSIDERED ONE OF THE BRIGHT SPOTS OF THE FEDERAL GOVERNMENT.' O' THIS SCENARIO IS NOT exactly THE GLOOMY SCENARIO that critics of salary levels have been forecasting.

THE ACADEMIC CREDENTIALS OF JUDGES TELL A SIMILAR STORY. THE JUDGES OF TODAY generally ENDURE A MORE SYSTEMATIC AND INTENSIVE FORMAL EDUCATION THAN THEIR PREDECESSORS ENJOYED. This is especially true if one considers that before the 1900s, few lawyers or judges even attended law school, much less three years at a premier legal academy. ¹⁰²

Critics would be hard pressed to name more than a handful of sitting federal judges who do not possess judicial acumen. Undoubtedly, inferior judges on the federal bench are ubiquitous (by definition, not every judge can be the best), just as there likely are bad lawyers practicing at the bar. But **BELIEVING THAT JUDICIAL SALARIES ATTRACT JUDGES TO THE BENCH OR KEEP THEM FROM PURSUING PRIVATE PRACTICE IS BASELESS.** Indeed, many a law firm would hire any federal judge with alacrity, and in light of the prestige and revenue that attracting a former federal judge would likely entail, it is probable that many a law firm would hire even an incompetent one. ¹⁰³ Furthermore, even the prestige of the bench follows departing jurists to the private firm: "Retired judges (even judges who have resigned to pursue a career in practice) usually retain the title 'judge,' and the title commands some deference even when separated from the office." ¹⁰⁴ **IF SUCH A JUDGE WERE INTERESTED ONLY IN HIS FINANCIAL WELL-BEING AND SOME MODICUM OF PRESTIGE, HE WOULD QUICKLY JUMP TO A PRIVATE LAW FIRM.** Other than the back-loaded nature of the judicial compensation scheme, ¹⁰⁵ the level of judicial salaries gives such a judge little incentive to stick around. Accordingly, there is little basis for arguing that the present salary structure results in the retention of incompetent judges while encouraging talented jurists to depart for the greener pastures of a private law firm.

It is true, of course, that judicial salaries hardly compare to the earnings achievable in the private sector. From time to time, this disparity has encouraged some judges to leave the bench and discouraged talented members of the bar from committing to the judiciary, ¹⁰⁶ at least temporarily. **But salary has never seriously affected the quality of the judiciary.** In fact, some of the greatest American jurists have served in times when judicial salaries were on the leaner side.

Deficient salaries don't increase the risk of bribery

Frank, 2002 – Judge advocate in the US Army Judge Advocate General's Corps (Michael J., "JUDGE NOT, LEST YEE BE JUDGED UNWORTHY OF A PAY RAISE: AN EXAMINATION OF THE FEDERAL JUDICIAL SALARY 'CRISIS'", Marquette Law Review, July 17, 2002, <http://judgewatch.org/library/fed-judicial-salaries/Judge%20Not,%20Lest%20Yee%20Be%20Judged%20Unworthy%20of%20a%20Pay%20Raise-%20An%20Examina.pdf>)/TT

Despite warnings that deficient salaries might increase the incidence of bribery, ⁹ this evil has not materialized. Notwithstanding allegedly inadequate salary levels, most judges have not sought to supplement their incomes through graft and corruption, and **NO CORRELATION HAS BEEN SHOWN BETWEEN THE INCIDENCE OF JUDICIAL CORRUPTION AND THE RATE OF JUDICIAL COMPENSATION.** Indeed, federal judges are thought to be among the most respectable and honest members of the federal government. Perhaps **THIS IS BECAUSE AN INDIVIDUAL'S SALARY LEVEL IS NOT INDICATIVE OF HIS OR HER PERSONAL HONESTY.** For example, take Brazilian judges, whose salary "is over thirty times that of the average salary," an amount that, according to the logic of salary critics, decreases "the incentives for corrupt behavior."¹²⁰ Perhaps these generous salaries diminish some of the incentive for corruption, but Brazilians, whose average monthly income is just \$260,¹² are hardly getting their money's worth. With no disrespect to Brazilian judges, they certainly do not enjoy an international reputation for above-average moral rectitude commensurate with their salary level. Indeed, "Brazil is replete with tales of corrupt judges, arbitrary rulings and requests for bribes."¹²² Demonstrating the law of diminishing returns, it is apparent that **PAYING JUDGES THIRTY TIMES THE AVERAGE BRAZILIAN SALARY IS NOT PURCHASING THIRTY TIMES THE AVERAGE AMOUNT OF BRAZILIAN HONESTY, ¹²³ NOR IS THERE ANY REASON TO BELIEVE THAT INCREASING THE SALARY OF AMERICAN JUDGES WOULD INCREASE THE AMERICAN'S MORAL RECTITUDE.** Because **honesty is not a commodity that can be bought and sold,** Brazilians, like Americans, could better spend their tax revenue elsewhere. Taxpayers cannot purchase integrity for morally weak judges, and they should not be forced to enrich judges who are willing to prostitute their honesty for material gain. ¹²⁴

THE RATIONALE BEHIND THE CRITICS' THEORY-THAT WELL-COMPENSATED JUDGES DO NOT NEED BRIBES TO SURVIVE, while under-compensated judges do **IS PROBABLY ACCURATE ONLY IN EXTREME SITUATIONS WHEN JUDICIAL SALARIES ARE ONLY SLIGHTLY ABOVE THE POVERTY LEVEL,** a situation not faced by members of the American judiciary. ¹²⁵ Thus, for example, if a judge could not buy food for his children, his moral resolve might be overcome by a strong desire to preserve his family, perhaps by accepting money from litigants in exchange for desired rulings. ¹²⁶ **NO ONE CONTENDS THAT AMERICAN FEDERAL JUDICIAL SALARIES ARE CLOSE TO THE POVERTY LEVEL.** "The salaries judges receive do not impose the sort of economic hardship that could even begin to explain, let alone justify, a judge's decision to shade her rulings for economic gain."¹²⁷ The problem judges and would-be judges face is more likely to be a problem with sending their children to prestigious (read: expensive) universities, ²⁸ and maintaining an affluent lifestyle. As Professor David Barnhizer mused, "[J]udicial corruption is generally not related to levels of judicial compensation. Judges receive a respectable amount of compensation on both state and federal levels."¹²⁹

This is not to say that wealthy politicians and judges never seek bribes. They obviously do. ¹³⁰ **BUT INCREASING SALARIES IS NOT AN EFFECTIVE MEANS OF INHIBITING SUCH CONDUCT.** In fact, it is arguable that **INCREASED SALARIES WILL ACTUALLY ATTRACT THOSE WHO VALUE MONEY ABOVE OTHER GOODS-SUCH AS HONESTY-AND SUCH JUDGES WOULD BE MORE INCLINED TO ACCEPT BRIBES.**¹³¹ **HIGHER SALARIES MIGHT "ATTRACT THE**

VENAL TO OFFICE, PLAUSIBLY INCREASING RATHER THAN DECREASING THE INCIDENCE OF CORRUPTION.

³² As Archbishop Fulton Sheen once wrote: "Riches in great abundance have a peculiar quality; they make men more greedy." ³³ Thus, encouraging the wealthy to join the judiciary or making judges wealthy is not a wise course of action, at least from the perspective of preventing bribery. "SIMPLY INCREASING JUDICIAL SALARIES WILL NOT AUTOMATICALLY IMPROVE THE QUALITY OF THE JUDICIARY. THE HIGHER THE SALARY THE MORE DESIRABLE THE POSITION BECOMES TO THE LEAST DESIRABLE CANDIDATES. 134 JUDGES WHO DESIRE FINANCIAL WEALTH MORE THAN SERVING HONESTLY WILL LIKELY EITHER RESIGN THEIR POSTS OR PURSUE GRAFT, REGARDLESS OF WHAT THEY ARE PAID. Because the public fisc could never afford to satisfy such a judge's lust for riches-even if such satisfaction were possible-it is also doubtful that a substantial increase in pay would persuade these judges to serve faithfully and honestly. Therefore, THE PRESENT SALARY SCHEME WISELY ENCOURAGES JUDGES WHO VALUE MONEY AT A LEVEL ABOVE THE NON-MONETARY BENEFITS OF SERVING ON THE JUDICIARY TO DEPART THE BENCH.

AT: Court Stripping

Congress won't strip the court

Devins, 7 --- Professor of Law and Government at William and Mary (Winter 2007, Neal, University of Dayton Law Review, "ENACTING AND INTERPRETING STATUTES IN THE CONSTITUTION'S SHADOWS SYMPOSIUM: CONSTITUTIONAL AVOIDANCE AND THE ROBERTS COURT," 32 Dayton L. Rev. 339, JMP)

III. Conclusion: The Roberts Court and Constitutional Avoidance

What lessons should the Roberts Court glean from recent congressional attacks against the Court and from the Warren era? SHOULD THE ROBERTS COURT MAKE USE OF CONSTITUTIONAL AVOIDANCE BECAUSE IT HAS A HIGH OPINION OF CONGRESS-that is, IT BELIEVES CONGRESS CARES ABOUT THE CONSTITUTION AND WANTS TO ENGAGE IN MEANINGFUL CONSTITUTIONAL DIALOGUES? Alternatively, SHOULD IT MAKE USE OF CONSTITUTIONAL AVOIDANCE BECAUSE IT FEARS THAT CONGRESS IS LIKELY TO STRIKE BACK AT CONSTITUTIONAL RULINGS INVALIDATING FEDERAL STATUTES? The answer is no to both questions.

First, unlike Congress in the Warren era, TODAY'S CONGRESS IS LESS ENGAGED IN CONSTITUTIONAL MATTERS AND LESS INTERESTED IN ASSERTING ITS PREROGATIVE TO INDEPENDENTLY INTERPRET THE CONSTITUTION. n35 Second, IT DOES NOT SEEM THAT CONGRESS IS POISED TO STRIKE BACK AT THE COURT. Unlike the Warren Court rulings, Rehnquist Court rulings did not prompt the ire of Congress. Recent court-stripping proposals, for example, have largely focused on state n36 and lower federal court n37 rulings rather than Supreme Court decisions. This has been a distinguishing feature for most of these proposals. And, as mentioned, the rulings in which the Court reinvigorated federalism by striking down all or part of 31 statutes did not prompt any significant response from Congress.

Lawmakers do not have incentives to strip the Court OF JURISDICTION OR OTHERWISE ENGAGE IN MEANINGFUL COURT-CURBING PRACTICES. THOUGH SOME LAWMAKERS ARE INTERESTED IN SCORING POINTS WITH THEIR CONSTITUENTS by introducing anti-court legislation and making rhetorical statements about activist judges, THERE IS little risk of Congress waging battle with the courts BY ENACTING JURISDICTION-STRIPPING PROPOSALS. n38

Congressional response to Hamdan actually disproves the link

Devins, 7 --- Professor of Law and Government at William and Mary (Winter 2007, Neal, University of Dayton Law Review, "ENACTING AND INTERPRETING STATUTES IN THE CONSTITUTION'S SHADOWS SYMPOSIUM: CONSTITUTIONAL AVOIDANCE AND THE ROBERTS COURT," 32 Dayton L. Rev. 339, JMP)

What then of THE MILITARY COMMISSION ACT, n39 WHICH WAS CONGRESS'S RESPONSE TO the Roberts Court's 2006 decision in HAMDAN v. Rumsfeld? n40 Not only did Congress authorize military commission trials of enemy combatants, but lawmakers stripped the federal courts of habeas jurisdiction, while allowing federal court review of both commission verdicts and the determination of whether a detainee is an enemy combatant. n41 This legislation, for reasons I have detailed elsewhere, n42 WAS not intended to be a rebuke to the Supreme Court. LAWMAKERS CLAIMED TO BE FOLLOWING THE COURT'S DIRECTION THAT CONGRESS SORT OUT WHETHER GUANTANAMO DETAINEES SHOULD BE TRIED BY MILITARY COMMISSIONS OR FEDERAL COURTS. ALSO, LAWMAKERS MADE CLEAR THAT THEY WERE NOT STRIPPING THE COURTS OF THEIR AUTHORITY TO HEAR HABEAS CORPUS CLAIMS GROUNDED IN THE CONSTITUTION; INSTEAD, LAWMAKERS ARGUED THAT ENEMY COMBATANTS DO NOT POSSESS CONSTITUTIONAL HABEAS RIGHTS. n43 Under this view, the only habeas protections afforded enemy combatants are the ones that Congress granted them through legislation-something that Congress could rescind. For this very reason, lawmakers made clear that the Court could conclude that enemy combatants possess constitutional habeas rights and thereby neuter the statute's prohibition of habeas filings. Bill sponsor Senator Lindsey Graham (R-S.C.) put it this way: "It is a statutory right of habeas that has been granted to enemy combatants. And if there is a constitutional right of habeas corpus given to enemy combatants, that is a totally different endeavor, and it would change in many ways what I have said." n44

The Roberts Court, in other words, can make use of straightforward statutory interpretation techniques to negate the habeas provision of post-Hamdan legislation. n45 There is no need to invalidate the bill as an unconstitutional restriction on court jurisdiction. More significant for purposes of this essay, there would be no need to make explicit use of [*347] constitutional avoidance techniques because of the Court's desire to avoid the constitutional question as a reason to limit the statute's reach. The Court, instead, can simply declare that the statute does not interfere with constitutional habeas, including the Court's power to sort out

whether the Constitution provides habeas protections to enemy combatants. In this way, THE ROBERTS COURT CAN USE A STATUTORY PROHIBITION OF HABEAS JURISDICTION AS AN OCCASION TO ASSERT ITS AUTHORITY TO DEFINE THE CONSTITUTION'S MEANING

--- XT: Congress Won't Strip

Congress won't force passage of stripping bills --- just wants to rhetorically attack courts

Devins, 7 --- Professor of Law and Government at William and Mary (Winter 2007, Neal, University of Dayton Law Review, "ENACTING AND INTERPRETING STATUTES IN THE CONSTITUTION'S SHADOWS SYMPOSIUM: CONSTITUTIONAL AVOIDANCE AND THE ROBERTS COURT," 32 Dayton L. Rev. 339, JMP)

II. The Rehnquist Court

Fast-forward to 2006 (when John Roberts became Chief Justice of the United States). THERE ARE DRAMATIC DIFFERENCES BETWEEN the Rehnquist-era Congress and earlier Congresses. These differences explain why LAWMAKERS TODAY are less interested in constitutional questions and also HAVE INCENTIVES TO LAUNCH RHETORICAL ATTACKS AGAINST THE COURTS. THE DEFINING FEATURE OF TODAY'S CONGRESS IS POLITICAL POLARIZATION ALONG IDEOLOGICAL LINES. ⁿ¹⁵ No longer are there liberal Rockefeller Republicans or conservative southern Democrats. Before the 2006 elections, if a line of ideology had been drawn in the House and Senate, all Republicans would have been to the right of all Democrats. ⁿ¹⁶ This phenomenon is fueled by party primaries, in which candidates in both the House and Senate must appeal to their respective base when running for election. ⁿ¹⁷ It is also fueled in the House of Representatives by redistricting, which typically guarantees safe seats for Republicans or Democrats. ⁿ¹⁸

What are the consequences of this ideological polarization? One consequence is greater cohesion within the parties and a sense that the parties want to deliver a message that will resonate with their base. ⁿ¹⁹ This is ["343] so-called "message politics," where the Democrats and Republicans develop distinctive, competing messages. There is also less interest in what happens to legislation after it is enacted, including Supreme Court decisions invalidating legislation. This stems from "position-taking legislation," where the focus is on making judgmental statements that are pleasing to the base, instead of producing certain results for constituents. For example, by enacting the Gun-Free School Zones Act, ⁿ²⁰ lawmakers were able to take a position in favor of protecting children, regardless of whether the Court upheld the law. ⁿ²¹

Another consequence of message politics is that lawmakers are less interested in independently interpreting the Constitution. There are several indications of this loss of interest. First, there has been a clear decline in the percentage of hearings raising significant constitutional issues. Outside of the Judiciary Committees (which have strong incentives to continue holding constitutional hearings) the number of hearings that raised significant constitutional issues declined across the board between 1970 and 2000. ⁿ²² For example, the Foreign Affairs Committee, which used to have its own expertise on constitutional questions, does not hold nearly as many constitutional hearings as it once did. ⁿ²³ Second, when Congress does hold constitutional hearings, lawmakers increasingly look for witnesses who will support the preexisting views of the party that selects them. ⁿ²⁴ Of course, hearings have never really been a bipartisan search for the truth. However, some committees used to have unified staffs, and the hearings were less of the staged press conferences that they are today. ⁿ²⁵

A final consequence is that there has been a dramatic change in lawmaker attitudes toward congressional interpretation of the Constitution since Morgan conducted his study of the 1959 Congress. Bruce Peabody tried to replicate the Morgan study by questioning members of Congress in 2000 using the same questionnaire that Morgan used. ⁿ²⁶ This recent survey occurred during the height of the Rehnquist Court federalism revival. ["344] Notwithstanding this revival, only 13.8% of lawmakers, as compared to 40% in the Morgan survey, thought that the Court should give controlling weight to congressional interpretations of the Constitution. ⁿ²⁷ Correspondingly, Peabody found that 71.3% of lawmakers thought that the courts should give either limited or no weight to congressional assessments of the constitutionality of legislation. ⁿ²⁸

Notably, the federalism revival did not prompt any meaningful backlash in Congress. Federalism-related hearings did not increase in the 1990s as compared to other periods, and the federalism hearings that did take place were not related to Court decisions. Rather, they were about the Contract with America. ⁿ²⁹ The Court's federalism revival was of no interest to Congress, at least with respect to hearings--there is virtually no mention of the federalism decisions in the Congressional Record. ⁿ³⁰ Congress, in other words, was not interested in engaging in any kind of dialogue with the Court on these issues.

Against this backdrop, it is not surprising that TODAY'S LAWMAKERS SEE COURT- STRIPPING PROPOSALS ON SOCIALLY-DIVISIVE ISSUES AS A WAY TO SPEAK TO THEIR BASE. Like position-taking legislation, LAWMAKERS ARE MOST INTERESTED IN LAUNCHING RHETORICAL ATTACKS AGAINST THE COURT. Moreover, BECAUSE THERE IS SOME FEAR THAT MEDIAN VOTERS SUPPORT JUDICIAL INDEPENDENCE, ⁿ³¹ SOCIAL CONSERVATIVES do not want to risk a backlash against their agenda BY PUSHING FOR THE ENACTMENT OF SUCH BILLS. ⁿ³² Indeed, they can reach out to their base by introducing bills and making floor statements about them. Consider, for example, the proposed legislation stripping the courts of jurisdiction on same-sex marriage and the Pledge of Allegiance. ⁿ³³ In 2004, the House approved these measures shortly before the November elections, at a time when the Senate never had an opportunity to consider them. ⁿ³⁴ If Congress had been truly interested in getting that legislation approved, those bills would have been taken up earlier, and they would have made their way from the House to the Senate or the Senate would have independently considered ["345] them. That did not happen. Instead, SOCIAL CONSERVATIVES IN THE HOUSE WANTED TO SEND A MESSAGE THAT WOULD RESONATE WITH THEIR BASE WITHOUT RISK OF POLITICAL BACKLASH.

Congress won't strip courts

Devins, 7 --- Professor of Law and Government at William and Mary (Winter 2007, Neal, University of Dayton Law Review, "ENACTING AND INTERPRETING STATUTES IN THE CONSTITUTION'S SHADOWS SYMPOSIUM: CONSTITUTIONAL AVOIDANCE AND THE ROBERTS COURT," 32 Dayton L. Rev. 339, JMP)

In the pages that follow, I will compare Court-Congress relations in the early Warren Court era to those during the Rehnquist Court era. Following this comparison, I will argue that THE ROBERTS COURT HAS NO REASON TO EMPLOY CONSTITUTIONAL AVOIDANCE TECHNIQUES. ^{First,} TODAY'S CONGRESS IS NOT PARTICULARLY INTERESTED IN CONSTITUTIONAL QUESTIONS, SO THERE IS NO GOOD GOVERNANCE REASON TO USE CONSTITUTIONAL AVOIDANCE. ^{Second,} THOUGH A WHOLE RAFT OF COURT-STRIPPING PROPOSALS HAS BEEN INTRODUCED IN THE PAST FEW YEARS, THE EVIDENCE SUGGESTS THAT TODAY'S CONGRESS IS NOT INTERESTED IN STRIKING BACK AT THE SUPREME COURT IN THAT WAY.

AT: Congressional Override

Interest groups ensure that Congress doesn't override Supreme Court decisions

Eskridge, 91 – Professor of Law, Georgetown University Law Center, John A. Garver Professor of Jurisprudence at Yale Law School (William N., “Overriding Supreme Court Statutory Interpretation Decisions”, 101 Yale L.J. 331 1991-1992, 19991, [//TT](http://digitalcommons.law.yale.edu/cgi/viewcontent.cgi?article=4816&context=fss_papers)

WHY DOES CONGRESS NOT OVERRIDE MORE OF THE SUPREME COURT'S STATUTORY DECISIONS?¹⁴⁰ THE MOST OBVIOUS REASON SUGGESTED BY THIS STUDY¹⁴¹ IS THE EXISTENCE OF CONFLICTUAL DEMAND PATTERNS. Many Supreme Court statutory decisions involve big stakes and sharply clashing interests. While the losers often have enough clout to bring decisions to the congressional agenda, the winners are also likely to have some influence. In such cases, UNLESS THE LOSERS AT THE SUPREME COURT LEVEL CAN PERSUADE OTHER GROUPS TO BE SUPPORTIVE OR NEUTRAL, THEIR CHANCES OF OVERTURNING A SUPREME COURT DECISION ARE NOT PROMISING. This explanation squares with the data generated by the current survey. THE SUPREME COURT'S MOST CONTROVERSIAL STATUTORY DECISIONS ARE USUALLY NOT OVERRIDDEN BECAUSE THERE ARE STRONG INTEREST GROUP ALIGNMENTS ON BOTH SIDES OF THE ISSUES, LEAVING THE COURT'S DECISIONS FIRMLY INTACT. The congressional overrides listed in Appendix I tend to involve Supreme Court cases in which the winning interests were not powerful at the time of the override—because the interests are diffuse or outside the political process (decisions benefiting accused criminals) or because the substantive position was weak (Gilbert) or had lost force over time (Boutillier).

AT: Money Laundering SDI

US isn't key – London is the center of money laundering.

Hanning and Connett 15

(James and David, July 4, <http://www.independent.co.uk/news/uk/crime/london-is-now-the-global-moneylaundering-centre-for-the-drug-trade-says-crime-expert-10366262.html>, "London is now the global money-laundering centre for the drug trade, says crime expert", twm)

The City of London is the money-laundering centre of the world's drug trade, according to an internationally acclaimed crime expert. UK banks and financial services have ignored so-called "know your customer" rules designed to curb criminals' abilities to launder the proceeds of crime, Roberto Saviano warned. Mr Saviano, author of the international bestseller Gomorrah, which exposed the workings of the Neapolitan crime organisation Camorra, said: "The British treat it as not their problem because there aren't corpses on the street." His warning follows a National Crime Agency (NCA) threat assessment which stated: "We assess that hundreds of billions of US dollars of criminal money almost certainly continue to be laundered through UK banks, including their subsidiaries, each year."

Money laundering is a very small part of domestic surveillance.

Jenifer Fenton 7-17-2015(Activits: US overstates encryption threat, underreports wiretap figures, Executive Producer Talk to Al Jazeera at Al Jazeera Media Network, <http://america.aljazeera.com/articles/2015/7/17/overstating-encryption-threat-underreporting-wiretap-numbers.html> ZV)

But the MOST "PREVALENT TYPE OF CRIMINAL OFFENSE INVESTIGATED using wiretaps" – 89 percent – WAS DRUG OFFENSES. FOUR PERCENT WERE RELATED TO homicide and the OTHERS INCLUDED smuggling and MONEY LAUNDERING, according to the Wiretap Report. "THEY ARE CONFLATING two different sets of iSSUES and THEY ARE DOING IT INTENTIONALLY," said Gidari.

Effective control in the united states will push money laundering to other countries – means all of their impacts are still triggered.

Financial Action Task Force 15

(an inter-governmental body established in 1989 by the Ministers of its Member jurisdictions, FATF, 2015, <http://www.fatf-gafi.org/pages/faq/moneylaundering/>, ASN)

Launderers are continuously looking for new routes for laundering their funds. ECONOMIES WITH GROWING OR DEVELOPING FINANCIAL CENTRES, BUT INADEQUATE CONTROLS ARE PARTICULARLY VULNERABLE AS ESTABLISHED FINANCIAL CENTRE COUNTRIES IMPLEMENT COMPREHENSIVE ANTI-MONEY LAUNDERING REGIMES. DIFFERENCES BETWEEN NATIONAL ANTI-MONEY LAUNDERING SYSTEMS WILL BE EXPLOITED BY LAUNDERERS, WHO TEND TO MOVE THEIR NETWORKS TO COUNTRIES AND FINANCIAL SYSTEMS WITH WEAK OR INEFFECTIVE COUNTERMEASURES. Some might argue that developing economies cannot afford to be too selective about the sources of capital they attract. But postponing action is dangerous. THE MORE IT IS DEFERRED, THE MORE ENTRENCHED ORGANISED CRIME CAN BECOME. AS WITH THE DAMAGED INTEGRITY OF AN INDIVIDUAL FINANCIAL INSTITUTION, THERE IS A DAMPING EFFECT ON FOREIGN DIRECT INVESTMENT WHEN A COUNTRY'S COMMERCIAL AND FINANCIAL SECTORS ARE PERCEIVED TO BE SUBJECT TO THE CONTROL

AND INFLUENCE OF ORGANIZED CRIME. Fighting money laundering and terrorist financing is therefore a part of creating a business friendly environment which is a precondition for lasting economic development.

Non unique – US not stopping money laundering now

Hanning and Connett 15

(James and David, July 4, <http://www.independent.co.uk/news/uk/crime/london-is-now-the-global-moneylaundering-centre-for-the-drug-trade-says-crime-expert-10366262.html>, “London is now the global money-laundering centre for the drug trade, says crime expert”, ellipses in original, twm)

Interviewed by The Independent on Sunday, Mr Saviano said of the international drugs trade that “Mexico is its heart and London is its head”. He said the cheapness and the ease of laundering dirty money through UK-based banks gave London a key role in drugs trade. “Antonio Maria Costa of the UN Office on Drugs and Crime found that drug trafficking organisations were blatantly recycling dirty money through European and American banks, but no one takes any notice,” he said. “He found that banks were welcoming dirty money because they need cash, liquidity during the financial crisis. The figures are too big to be rejected Yet there was no reaction.”

London and Austria block EU efforts to fight money laundering.

Hanning and Connett 15

(James and David, July 4, <http://www.independent.co.uk/news/uk/crime/london-is-now-the-global-moneylaundering-centre-for-the-drug-trade-says-crime-expert-10366262.html>, “London is now the global money-laundering centre for the drug trade, says crime expert”, twm)

He accused the British Government, together with Austria, of consistently blocking anti-money-laundering moves by the European Union. “They will carry on like that until someone gets killed here by the Russians or the Italians.” he said. Mr Saviano said he feared one reason was because banks are a key source of political funding. “Every time there’s an election campaign, I wonder if someone will come forward and start a campaign on money laundering ... but it never happens. The reason, I am convinced but I don’t have the proof, is that a good part of the money that comes from money laundering goes into the election campaign. Not illegally, legally, because it can come in because of a lack of regulation.”

Non-unique criminal organizations are too embedded - in some instances they are running their own banks.

Hanning and Connett 15

(James and David, July 4, <http://www.independent.co.uk/news/uk/crime/london-is-now-the-global-moneylaundering-centre-for-the-drug-trade-says-crime-expert-10366262.html>, “London is now the global money-laundering centre for the drug trade, says crime expert”, twm)

Twenty years ago, drug money was laundered offshore because the top international banks “were afraid of opening their doors to dirty money, they were afraid of losing control”, he said. “The more criminal capital comes in, the more criminals there are on the boards. The Mafia set up its own bank, Michele Sindona’s Banca Privata Finanziaria, and the other banks would have nothing to do with them,” he said. “Not any more. Now, because of the problem of cash, they can’t wait to get the Mafia organisations in.”

Impact turn - Less money laundering will actually hurt economies.

Quinn 13

(freelance journalist in Guadalajara where he writes about technology, real estate and security issues faced by international companies, “ Mexico’s new anti-money laundering law is bad for business”,

Quartz, October 29, 2013, <http://qz.com/139570/mexicos-new-anti-money-laundering-law-is-bad-for-business/>, GCM)

MONEY LAUNDERING IN MEXICO IS BIG BUSINESS: \$10 BILLION IN DRUG MONEY WAS WASHED THERE IN 2012, ACCORDING TO GLOBAL RISK MANAGEMENT FIRM KROLL. Even so, MEXICO'S LATEST ATTEMPT TO CRACK DOWN ON THE CRIME PUTS A HEFTY BURDEN ON THE PRIVATE SECTOR IN A COUNTRY THAT'S BEEN SLOW TO TARGET KNOWN LAUNDERERS. The law went into effect in July and focuses on "vulnerable activities," or industries like gaming, jewelry, automobile, ART AND REAL ESTATE THAT ARE OFTEN TARGETS FOR MONEY LAUNDERING BECAUSE THEY HANDLE LARGE AMOUNTS OF CASH. The requirements vary per sector, BUT FOR MOST, CASH TRANSACTIONS OVER A CERTAIN AMOUNT (pdf) MUST BE REPORTED TO THE GOVERNMENT. In certain cases, identification is required for purchases regardless of the form of payment. Jewelers will have to maintain files for customers who make purchases valued at more than 52,000 pesos, or roughly \$4,000. THIS CREATE CHALLENGES FOR JEWELERS WHO DEAL WITH INTERNATIONAL CLIENTS, said Miguel Cotero Ochoa, the president of the state of Jalisco's Jewelry Chamber. Those CLIENTS WILL LIKELY TURN TO OTHER COUNTRIES THAT DON'T REQUIRE SUCH BUREAUCRATIC ENTANGLEMENTS, he said. "WE SUPPORT THE AUTHORITIES IN THEIR EFFORT TO COMBAT THIS PROBLEM. HOWEVER, SOME OF THE REGULATIONS IN THE LAW LEAVE US OUT OF THE GLOBAL COMPETITION," Cotero Ochoa said in an interview in Spanish. A CONSULTANT IN MEXICO CITY ESTIMATED THE REQUIREMENTS WILL LIKELY COST BUSINESSES IN THE AFFECTED INDUSTRIES 3-8% OF THEIR INCOME (link in Spanish). Businesses are required to train employees and maintain an archive of those transactions that meet the law's requirements, said Cotero Ochoa. "THE MAJORITY OF OUR COMPANIES ARE SMALL FIRMS AND THE REQUIREMENTS AND REGULATIONS THE SECRETARY OF FINANCE IS PLACING ARE GOING TO BE IMPOSSIBLE—or very complicated—TO FULFILL," he said. THE JEWELRY INDUSTRY PLANS TO WORK WITH AUTHORITIES TO MODIFY THE LAW BASED ON SOME OF THEIR CONCERNS, Cotero Ochoa said. And THEY'RE NOT THE ONLY ONES CHALLENGING IT. LARGE RETAIL CHAINS IN MEXICO, INCLUDING DEPARTMENT STORES LIKE EL PALACIO DE HIERRO, LIVERPOOL, SEARS, AND SANBORNS, HAVE ALREADY TAKEN LEGAL ACTION (link in Spanish) CLAIMING THAT THE LAW VIOLATES THEIR CONSTITUTIONAL RIGHTS OF EQUALITY AND NON-DISCRIMINATION, FREE ECONOMIC COMPETITION AND TAX EQUITY. They, along with members of the real estate and automotive industries, ARGUE THAT THEIR BUSINESSES HAVE BEEN UNFAIRLY TARGETED WHILE BRITISH BANK HSBC WAS FINED A MERE \$27.5 MILLION IN MEXICO FOR ITS LAX MONEY-LAUNDERING CONTROLS.

AT: Nationalized Internet Emory

2ac to Nationalization

1. Nationalization is inevitable

Goldstein, Writer for the Atlantic, 2014

[Gordon M. Goldstein, The End of the Internet?,
<http://www.theatlantic.com/magazine/archive/2014/07/the-end-of-the-internet/372301/>]

SOME EXPERTS ANTICIPATE A FUTURE WITH A BRAZILIAN INTERNET, A EUROPEAN INTERNET, AN IRANIAN INTERNET, AN EGYPTIAN INTERNET—all with different content regulations and trade rules, and perhaps with contrasting standards and operational protocols. Eli NOAM, a PROFESSOR of economics and finance AT COLUMBIA Business School, BELIEVES THAT SUCH A PROGRESSIVE FRACTURING of the global Internet IS INEVITABLE. “WE MUST GET USED TO THE IDEA THAT THE STANDARDISED INTERNET IS THE PAST BUT NOT THE FUTURE,” he wrote last fall. “And that THE FUTURE IS A FEDERATED INTERNET, NOT A UNIFORM ONE.” Noam thinks that can be managed, in part through the development of new intermediary technologies that would essentially allow the different Internets to talk to each other, and allow users to navigate the different legal and regulatory environments.

Perhaps. But at a minimum, this patchwork solution would be disruptive to American companies like Google, Facebook, Amazon, and eBay, which would see their global reach diminished. And it would make international communications and commerce more costly. THE U.S. GOVERNMENT IS RESISTING THIS TRANSFORMATION. BUT THE INTERNET IS SIMPLY TOO CONSEQUENTIAL—SOCIALY, POLITICALLY, AND ECONOMICALLY—FOR STATES TO READILY FORGO CONTROL OF IT, and America, as Marc Andreessen observes, has lost “the moral high ground” in the debate. PERHAPS IT WAS NEVER REALISTIC TO EXPECT THE WORLD WIDE WEB TO LAST.

2. Not reverse causal – people are pushing for nationalization because of NSA fears – that does NOT mean they will stop if the NSA does the plan.

3. Greed will determine internet decisions

Wagner, Commentator for Information Week, 08

[Mitch Wagner, Should The U.S. Nationalize The Internet?,
<http://www.informationweek.com/software/information-management/should-the-us-nationalize-the-internet/d/d-id/1069315?>]

THE INTERNET FACES MANY PROBLEMS FROM COMPANIES LOOKING TO MAXIMIZE PROFITS AT THE EXPENSE OF THE PUBLIC GOOD. GREEDY BUSINESSES threaten innovation BY TRYING TO PUT AN END

TO NET NEUTRALITY, MEDIA COMPANIES WANT TO CONTROL EVERY INTERNET-CONNECTED DEVICE IN AN EFFORT TO LOCK DOWN DISTRIBUTION channels, and spammers and other fraudsters have pretty much taken over e-mail.

Now, TechCrunch is reporting that Vint CERF, the so-called "father of the Internet," SAYS MAYBE WE SHOULD THINK OF THE INTERNET AS BEING LIKE THE HIGHWAY SYSTEM -- A PUBLIC GOOD THAT SHOULD BE NATIONALIZED.

Erick Schonfeld at TechCrunch writes:

Should the Internet be owned and maintained by the government, just like the highways? Vint Cerf, the "father of the Internet" and Google's Internet evangelist, made this radical suggestion while he was sitting next to me on a panel yesterday about national tech policy at the Personal Democracy Forum. Maybe he was inspired by the presence of one of the other panelists, Claudio Prado, from Brazil's Ministry of Culture, who kept on talking about the importance of embracing Internet "peeracy." (Although, I should note that Mr. Cerf frowned upon that ill-advised coinage). But I think (or hope, rather) that he was really trying to spark a debate about whether the Internet should be treated more like the public resource that it is.

His comment was in the context of a bigger discussion about the threat to net neutrality posed by the cable and phone companies, who are making moves to control the amount and types of bits that can go through their pipes. It was made almost in passing and the discussion quickly moved to other topics.

THE CASE FOR LETTING THE GOVERNMENT RUN THE INTERNET IS TEMPTING. Rather than letting telcos, media companies, and spammers fight to control the Internet, WE COULD JUST LET THE GOVERNMENT RUN THE PIPE TO ENSURE ITS CONTINUED FAIRNESS.

4. Timeframe for the disad is long – no idea when nationalized internet control will actually occur – it is decades away before private businesses would be willing to give up control.

5. Government control won't stop cyber-terror

Holmes, former assistant secretary of state & distinguished fellow at the Heritage Foundation, 2013

[Kim R. Holmes, Washington Times, April 17, 2013, <http://www.washingtontimes.com/news/2013/apr/17/holmes-staying-one-step-ahead-of-cyberattacks/>]

IMPOSING AN OLD-FASHIONED, TOP-DOWN REGULATORY SOLUTION as the Obama administration and some in Congress want to do IS TEMPTING. After a proposed Senate cybersecurity act failed to pass, the administration issued an executive order that reflects this regulatory approach.

BUT HEAVY-HANDED REGULATION IS A 19TH-CENTURY SOLUTION TO A 21ST-CENTURY PROBLEM. FEDERAL REGULATIONS ARE SLOW TO IMPLEMENT, CUMBERSOME TO MANAGE AND UNABLE TO KEEP UP WITH THE RAPID ADVANCES OF HACKERS AND CYBERWARRIORS, who continually change their lines of attack. THIS APPROACH USHERS IN A CLUMSY BUREAUCRATIC REGIME THAT UNDOUBTEDLY WILL BECOME EVEN SLOWER AND MORE CUMBERSOME OVER TIME. That is the nature of regulatory bureaucracy.

There is a better way. The rule of thumb for policymakers should be to encourage companies and other entities to find methods to better protect themselves from cyberattacks. They need to be able to share information voluntarily and protect themselves from liabilities associated with doing that, while ensuring that their proprietary information is safeguarded.

Companies sharing information on cyberattacks need to know that they will not be put at a competitive disadvantage in the marketplace. All shared information should be exempted from Freedom of Information Act requests and regulatory use. Moreover, private-public partnerships should be established so information could be shared fully and in a timely manner.

Developing a cybersecurity liability and insurance system would be another step in the right direction. As explained in the Heritage report, "such a system returns cyber-security liability to those who are largely responsible for cyber-security losses" i.e., not the consumer but the software manufacturers who, through negligence or other reasons, fail to offer safeguards against cyberincursions and companies that do little about security weaknesses in their cybersystems.

The Heritage report contains another innovative recommendation: Create a nonprofit organization that can assess the surety of an organization's supply chain, similar to the way Underwriters Laboratories Inc. assesses the safety of various commercial products. Once a company is given a grade, consumers of software and technical equipment can decide for themselves how safe a purchase would be.

Finally, there is the critical issue of cyberattacks by states, terrorists and criminals. A model to pursue is the one used by the former Soviet state of Georgia in response to cyberattacks from Russia in 2012. The Georgian government planted a malware booby trap in a file that Russian intelligence hacked, foiling that attempt at espionage and, more importantly, identifying the perpetrator. U.S. companies should be allowed to execute similar operations, either in cooperation with law enforcement or on their own.

CYBERSECURITY IS A COMPLEX PROBLEM. THAT IS WHY A ONE-SIZE-FITS-ALL, TOP-DOWN REGULATORY REGIME RUN BY THE FEDERAL GOVERNMENT IS UNWISE. TO STAY A STEP AHEAD OF HACKERS, AMERICANS NEED A SYSTEM THAT EMPOWERS THEM TO PROTECT THEMSELVES.

6. Cyber-terror is all hype

Singer, Director, 21st Century Defense Initiative, Senior Fellow, Foreign Policy @ Brookings Institute, 2012

[Peter W. Singer, The Cyber Terror Bogeyman, Armed Forces Journal, November 2012, <http://www.brookings.edu/research/articles/2012/11/cyber-terror-singer>]

WE HAVE LET OUR FEARS OBSCURE HOW TERRORISTS REALLY USE THE INTERNET.

About 31,300. That is roughly the number of magazine and journal articles written so far that discuss the phenomenon of cyber terrorism.

ZERO. That IS THE NUMBER OF PEOPLE THAT WHO BEEN HURT OR KILLED BY CYBER TERRORISM at the time this went to press.

In many ways, CYBER TERRORISM IS LIKE the Discovery Channel's "SHARK WEEK," when WE OBSESS about shark attacks DESPITE THE FACT THAT YOU ARE ROUGHLY 15,000 TIMES MORE LIKELY TO BE HURT OR KILLED IN AN ACCIDENT INVOLVING A TOILET. But by looking at how terror groups actually use the Internet, rather than fixating on nightmare scenarios, we can properly prioritize and focus our efforts.

PART OF THE PROBLEM IS THE WAY WE TALK ABOUT THE ISSUE. The FBI defines cyber terrorism as a "premeditated, politically motivated attack against information, computer systems, computer programs and data which results in violence against non-combatant targets by subnational groups or clandestine agents." A key word there is "violence," yet MANY DISCUSSIONS SWEEP ALL SORTS OF NONVIOLENT ONLINE MISCHIEF INTO THE "TERROR" BIN. Various reports lump together everything from Defense Secretary Leon Panetta's recent statements that a terror group might launch a "digital Pearl Harbor" to Stuxnet-like sabotage

(ahem, committed by state forces) to hacktivism, WikiLeaks and credit card fraud. As one congressional staffer put it, the way we use a term like cyber terrorism “has as much clarity as cybersecurity — that is, none at all.”

Another part of the problem is that WE OFTEN MIX UP OUR FEARS WITH THE ACTUAL STATE OF AFFAIRS. Last year, Deputy Defense Secretary William Lynn, the Pentagon’s lead official for cybersecurity, spoke to the top experts in the field at the RSA Conference in San Francisco. “It is possible for a terrorist group to develop cyber-attack tools on their own or to buy them on the black market,” Lynn warned. “A couple dozen talented programmers wearing flip-flops and drinking Red Bull can do a lot of damage.”

The deputy defense secretary was CONFLATING FEAR AND REALITY, not just about what stimulant-drinking programmers are actually hired to do, but also what is needed to pull off an attack that causes meaningful violence. The requirements go well beyond finding top cyber experts. Taking down hydroelectric generators, or designing malware like Stuxnet that causes nuclear centrifuges to spin out of sequence doesn’t just require the skills and means to get into a computer system. It’s also knowing what to do once you are in. To cause true damage requires an understanding of the devices themselves and how they run, the engineering and physics behind the target.

THE STUXNET CASE, FOR EXAMPLE, INVOLVED not just cyber experts well beyond a few wearing flip-flops, but also EXPERTS IN AREAS THAT RANGED FROM INTELLIGENCE AND SURVEILLANCE TO NUCLEAR PHYSICS TO THE ENGINEERING OF A SPECIFIC KIND OF SIEMENS-BRAND INDUSTRIAL EQUIPMENT. It also required expensive tests, not only of the software, but on working versions of the target hardware as well.

AS George R. LUCAS Jr., a PROFESSOR AT THE U.S. NAVAL ACADEMY, PUT IT, CONDUCTING A TRULY MASS-SCALE ACTION USING CYBER MEANS “SIMPLY OUTSTRIPS THE INTELLECTUAL, ORGANIZATIONAL AND PERSONNEL CAPACITIES OF EVEN THE MOST WELL-FUNDED AND WELL-ORGANIZED TERRORIST ORGANIZATION, as well as those of even the most sophisticated international criminal enterprises.”

Lucas said THE THREAT of cyber terrorism HAS BEEN VASTLY OVERBLOWN.

“To be blunt, neither the 14-year-old hacker in your next-door neighbor’s upstairs bedroom, nor the two- or three-person al-Qaida cell holed up in some apartment in Hamburg are going to bring down the Glen Canyon and Hoover dams,” he said.

We should be crystal clear: This is not to say that terrorist groups are uninterested in using the technology of cyberspace to carry out acts of violence. In 2001, al-Qaida computers seized in Afghanistan were found to contain models of a dam, plus engineering software that simulated the catastrophic failure of controls. Five years later, jihadist websites were urging cyber attacks on the U.S. financial industry to retaliate for abuses at Guantanamo Bay.

Nor does it mean that cyber terrorism, particularly attacks on critical infrastructure, is of no concern. In 2007, Idaho National Lab researchers experimented with cyber attacks on their own facility; they learned that remotely changing the operating cycle of a power generator could make it catch fire. Four years later, the Los Angeles Times reported that white-hat hackers hired by a water provider in California broke into the system in less than a week. Policymakers must worry that real-world versions of such attacks might have a ripple effect that could, for example, knock out parts of the national power grid or shut down a municipal or even regional water supply.

But so far, WHAT TERRORISTS HAVE ACCOMPLISHED IN THE CYBER REALM DOESN’T MATCH OUR FEARS, THEIR DREAMS OR EVEN WHAT THEY HAVE MANAGED THROUGH TRADITIONAL MEANS.

Bad for Economy

Nationalized internet would collapse global growth

McDowell, FCC Chair, 2012

[5/31/31, Comm'r. McDowell's Congressional Testimony, <http://www.fcc.gov/document/commr-mcdowells-congressional-testimony-5-31-2012>]

It is a pleasure and an honor to testify beside my friend, Ambassador Phil Verveer. First, please allow me to dispense quickly and emphatically any doubts about the bipartisan resolve of the United States' to resist efforts to expand the International Telecommunication Union's ("ITU") authority over Internet matters. Some ITU officials have dismissed our concern over this issue as mere "election year politics." Nothing could be further from the truth as evidenced by Ambassador Verveer's testimony today as well as recent statements from the White House, Executive Branch agencies, Democratic and Republican Members of Congress and my friend and colleague, FCC Chairman Julius Genachowski. We are unified on the substantive arguments and have always been so. Second, it is important to define the challenge before us. The threats are real and not imagined, although they admittedly sound like works of fiction at times. For many years now, scores of countries led by China, Russia, Iran, Saudi Arabia, and many others, have pushed for, as then-Russian Prime Minister Vladimir Putin said almost a year ago, "international control of the Internet" through the ITU.¹ I have tried to find a more concise way to express this issue, but I can't seem to improve upon now-President Putin's crystallization of the effort that has been afoot for quite some time. More importantly, I think we should take President Putin very seriously. ¹ Vladimir Putin, Prime Minister of the Russian Federation, Working Day, GOV'T OF THE RUSSIAN FED'N, <http://premier.gov.ru/eng/events/news/15601/> (June 15, 2011) (last visited May 14, 2012). Six months separate us from the renegotiation of the 1988 treaty that led to insulating the Internet from economic and technical regulation. What proponents of Internet freedom do or don't do between now and then will determine the fate of the Net, affect global economic growth and determine whether political liberty can proliferate. During the treaty negotiations, the most lethal threat to Internet freedom may not come from a full frontal assault, but through insidious and seemingly innocuous expansions of intergovernmental powers. This subterranean effort is already under way. While influential ITU Member States have put forth proposals calling for overt legal expansions of United Nations' or ITU authority over the Net, ITU officials have publicly declared that the ITU does not intend to regulate Internet governance while also saying that any regulations should be of the "light-touch" variety.² But which is it? It is not possible to insulate the Internet from new rules while also establishing a new "light touch" regulatory regime. Either a new legal paradigm will emerge in December or it won't. The choice is binary. Additionally, as a threshold matter, it is curious that ITU officials have been opining on the outcome of the treaty negotiation. The ITU's Member States determine the fate of any new rules, not ITU leadership and staff. I remain hopeful that the diplomatic process will not be subverted in this regard. As a matter of process and substance, patient and persistent incrementalism is the Net's most dangerous enemy and it is the hallmark of many countries that are pushing the proregulation agenda. Specifically, some ITU officials and Member States have been discussing an alleged worldwide phone numbering "crisis." It seems that the world may be running out of phone numbers, over which the ITU does have some jurisdiction. ² Speech by ITU Secretary-General Touré, The Challenges of Extending the Benefits of Mobile (May 1, 2012), http://www.itu.int/net/pressoffice/press_releases/index.aspx?lang=en (last visited May 29, 2012). ³ Today, many phone numbers are used for voice over Internet protocol services such as Skype or Google Voice. To function properly, the software supporting these services translate traditional phone numbers into IP addresses. The Russian Federation has proposed that the ITU be given jurisdiction over IP addresses to remedy the phone number shortage.³ What is left unsaid, however, is that potential ITU jurisdiction over IP addresses would enable it to regulate Internet services and devices with abandon. IP addresses are a fundamental and essential component to the inner workings of the Net. Taking their administration away from the bottomup, non-governmental, multi-stakeholder model and placing it into the hands of international bureaucrats would be a grave mistake. Other efforts to expand the ITU's reach into the Internet are seemingly small but are tectonic in scope. Take for example the Arab States' submission from February that would change the rules' definition of "telecommunications" to include "processing" or computer functions.⁴ This change would essentially swallow the Internet's functions with only a tiny edit to existing rules.⁵ When ITU leadership claims that no Member States have proposed absorbing Internet governance into the ITU or other intergovernmental entities, the Arab States' submission demonstrates that nothing could be further from the truth. An infinite number of avenues exist to ³ Further Directions for Revision of the ITRs, Russian Federation, CWG-WCIT12 Contribution 40, at 3 (2011), <http://www.itu.int/md/T09-CWG.WCIT12-C-0040/en> (last visited May 29, 2012) ("To oblige ITU to allocate/distribute some part of IPv6 addresses (as same way/principle as for telephone numbering, simultaneously existing of many operators/numbers distributors inside unified numbers space for both fixed and mobile phone services) and determination of necessary requirements."). ⁴ Proposed Revisions, Arab States, CWG-WCIT12 Contribution 67, at 3 (2012), <http://www.itu.int/md/T09CWG.WCIT12-C-0067/en> (last visited May 29, 2012). ⁵ And Iran argues that the current definition already includes the Internet. Contribution from Iran, The

Islamic Republic of Iran, CWG-WCIT12 Contribution 48, Attachment 2 (2011), <http://www.itu.int/md/T09-CWG.WCIT12C-0048/en> (last visited May 29, 2012).³ accomplish the same goal and it is camouflaged subterfuge that proponents of Internet freedom should watch for most vigilantly. Other examples come from China. China would like to see the creation of a system whereby Internet users are registered using their IP addresses. In fact, last year, China teamed up with Russia, Tajikistan and Uzbekistan to propose to the UN General Assembly that it create an "International Code of Conduct for Information Security" to mandate "international norms and rules standardizing the behavior of countries concerning information and cyberspace."⁶ Does anyone here today believe that these countries' proposals would encourage the continued proliferation of an open and freedom-enhancing Internet? Or would such constructs make it easier for authoritarian regimes to identify and silence political dissidents? These proposals may not technically be part of the WCIT negotiations, but they give a sense of where some of the ITU's Member States would like to go. Still other proposals that have been made personally to me by foreign government officials include the creation of an international universal service fund of sorts whereby foreign – usually state-owned – telecom companies would use international mandates to charge certain Web destinations on a "per-click" basis to fund the build-out of broadband infrastructure across the globe. Google, iTunes, Facebook and Netflix are mentioned most often as prime sources of funding. In short, the U.S. and like-minded proponents of Internet freedom and prosperity across the globe should resist efforts to expand the powers of intergovernmental bodies over the Internet⁶ Letter dated 12 September 2011 from the Permanent Representatives of China, the Russian Federation, Tajikistan, and Uzbekistan to the United Nations addressed to the Secretary-General, Item 93 of the provisional agenda - Developments in the field of information and telecommunications in the context of international security, 66th Session of the United Nations General Assembly, Annex (Sep. 14, 2011), http://www.cs.brown.edu/courses/csci1800/sources/2012_UN_Russia_and_China_Code_o_Conduct.pdf (last visited May 29, 2012), even in the smallest of ways. As my supplemental statement and analysis explains in more detail below, such a scenario would be devastating to global economic activity, but it would hurt the developing world the most. Thank you for the opportunity to appear before you today and I look forward to your questions. Thank you, Chairman Walden and Ranking Member Eshoo, for holding this hearing. Its topic is among the most important public policy issues affecting global commerce and political freedom: namely, whether the International Telecommunication Union (ITU), or any other intergovernmental body, should be allowed to expand its jurisdiction into the operational and economic affairs of the Internet. As we head toward the treaty negotiations at the World Conference on International Telecommunications (WCIT) in Dubai in December, I urge governments around the world to avoid the temptation to tamper with the Internet. Since its privatization in the early 1990s, the Internet has flourished across the world under the current deregulatory framework. In fact, the long-standing international consensus has been to keep governments from regulating core functions of the Internet's ecosystem. Yet, some nations, such as China, Russia, India, Iran and Saudi Arabia, have been pushing to reverse this course by giving the ITU or the United Nations itself regulatory jurisdiction over Internet governance. The ITU is a treaty-based organization under the auspices of the United Nations.¹ Don't take my word for it, however. As Russian Prime Minister Vladimir Putin said almost one year ago, the goal of this well-organized and energetic effort is to establish "international control over the Internet using the monitoring and supervisory capabilities of the [ITU]."² Motivations of some ITU Member states vary. Some of the arguments in support of such actions may stem from frustrations with the operations of Internet Corporation for Assigned Names and Numbers (ICANN). Any concerns regarding ICANN, however, should not be used as a pretext to end the multi-stakeholder model that has served all nations – especially the developing world – so well. Any reforms to ICANN should take place through the bottom-up multi-stakeholder process and should not arise through the WCIT's examination of the International Telecommunication Regulations (ITRs). Constructive reform of the ITRs may be needed. If so, the scope of any review should be limited to traditional telecommunications services and not expanded to include information services or any form of Internet services. Modification of the current multistakeholder Internet governance model may be necessary as well, but we should all work together to ensure no intergovernmental regulatory overlays are placed into this sphere. Not only would nations surrender some of their national sovereignty in such a pursuit, but they would suffocate their own economies as well, while politically paralyzing engineering and business decisions within a global regulatory body. ¹ History, I <http://www.itu.int/en/about/Pages/history.aspx>">U, <http://www.itu.int/en/about/Pages/history.aspx> (last visited May 14, 2012). ² Vladimir Putin, Prime Minister of the Russian Federation, Working Day, GOV'T OF THE RUSSIAN FED'N, <http://premier.gov.ru/eng/events/news/15601/> (June 15, 2011) (last visited May 14, 2012). Every day headlines tell us about industrialized and developing nations alike that are awash in debt, facing flat growth curves, or worse, shrinking GDPs. Not only must governments, including our own, tighten their fiscal belts, but they must also spur economic expansion. An unfettered Internet offers the brightest ray of hope for growth during this dark time of economic uncertainty, not more regulation. Indeed, we are at a crossroads for the Internet's future. One path holds great promise, while the other path is fraught with peril. The promise, of course, lies with keeping what works, namely maintaining a freedom-enhancing and open Internet while insulating it from legacy regulations. The peril lies with changes that would ultimately sweep up Internet services into decades-old ITU paradigms. If successful, these efforts would merely imprison the future in the regulatory dungeon of the past. The future of global growth and political freedom lies with an unfettered Internet. Shortly after the Internet was privatized in 1995, a mere 16 million people were online worldwide.³ As of early 2012, approximately 2.3 billion people were using the Net.⁴

Internet connectivity quickly evolved from being a novelty in industrialized countries to becoming an essential tool for commerce – and sometimes even basic survival – in all nations, but especially in the developing world. Such explosive growth was helped, not hindered, by a deregulatory construct. Developing nations stand to gain the most from the rapid pace of deployment and adoption of Internet technologies brought forth by an Internet free from intergovernmental regulation. By way of illustration, a McKinsey report released in January examined the Net's effect on the developing world, or "aspiring countries."⁵ In 30 specific aspiring countries studied, including Malaysia, Mexico, Morocco, Nigeria, Turkey and Vietnam,⁶ Internet penetration has grown 25 percent per year for the past five years, compared to only five percent per year in developed nations.⁷ Obviously, broadband penetration is lower in aspiring countries than in the developed world, but that is quickly changing thanks to mobile Internet access technologies. Mobile subscriptions in developing countries have risen from 53 percent of the global market in 2005 to 73 percent in 2010.⁸ In fact, Cisco estimates that the number of mobile-connected devices will exceed the world's population sometime this year.⁹ Increasingly, Internet users in these countries use only mobile devices for their Internet access.¹⁰ This trend has resulted in developing countries growing their global share of Internet users from 33 percent in 2005, to 52 percent in 2010, with a projected 61 percent share by 2015.¹¹ The 30 aspiring countries discussed earlier are home to one billion Internet users, half of all global Internet users. The effect that rapidly growing Internet connectivity is having on aspiring countries' economies is tremendous. The Net is an economic growth accelerator. It contributed an average 1.9 percent of GDP growth in aspiring countries for an estimated total of \$366 billion in 2010.¹³ In some developing economies, Internet connectivity has contributed up to 13 percent of GDP growth over the past five years.¹⁴ In six aspiring countries alone, 1.9 million jobs were associated with the Internet.¹⁵ And in other countries, the Internet creates 2.6 new jobs for each job it disrupts.¹⁶ I expect that we would all agree that these positive trends must continue. The best path forward is the one that has served the global economy so well, that of a multi-stakeholder governed Internet. One potential outcome that could develop if pro-regulation nations are successful in granting the ITU authority over Internet governance would be a partitioned Internet. In particular, fault lines could be drawn between countries that will choose to continue to live under the current successful model and those Member States who decide to opt out to place themselves under an intergovernmental regulatory regime. A balkanized Internet would not promote global free trade or increase living standards. At a minimum, it would create extreme uncertainty and raise costs for all users across the globe by rendering an engineering, operational and financial morass. For instance, Harvard and the Massachusetts Institute of Technology (MIT) recently announced placing many of their courses online for free – for anyone to use. The uncertainty and economic and engineering chaos associated with a newly politicized intergovernmental legal regime would inevitably drive up costs as cross border traffic and cloud computing become more complicated and vulnerable to regulatory arbitrage. Such costs are always passed on to the end user consumers and may very well negate the ability of content and application providers such as Harvard and MIT to offer first-rate educational content for free. Nations that value freedom and prosperity should draw a line in the sand against new regulations while welcoming reform that could include a non-regulatory role for the ITU. Venturing into the uncertainty of a new regulatory quagmire will only undermine developing nations the most.

Cyber Terror Impact Answer

Cyberwar isn't a big threat—best studies prove

Jason **HEALEY**, Director of the Cyber Statecraft Initiative at the Atlantic Council, **13** ["No, Cyberwarfare Isn't as Dangerous as Nuclear War," March 20, 2013, www.usnews.com/opinion/blogs/world-report/2013/03/20/cyber-attacks-not-yet-an-existential-threat-to-the-us]

America does not face an existential cyberthreat today, despite recent **warnings**. Our cybervulnerabilities are undoubtedly grave and **THE THREATS WE FACE ARE SEVERE BUT far from COMPARABLE TO nuclear war**.

The most recent alarms come in a Defense Science Board report on how to make military cybersystems more resilient against advanced threats (in short, Russia or China). It warned that the "cyber threat is serious, with potential consequences similar in some ways to the nuclear threat of the Cold War." Such fears were also expressed by Adm. Mike Mullen, then chairman of the Joint Chiefs of Staff, in 2011. He called cyber "The single biggest existential threat that's out there" because "cyber actually more than theoretically, can attack our infrastructure, our financial systems."

WHILE IT IS TRUE THAT CYBER ATTACKS MIGHT DO THESE THINGS, IT IS ALSO TRUE they have not only never happened but are far more difficult to accomplish than mainstream thinking believes. The consequences from cyber threats may be similar in some ways to nuclear, as the Science Board concluded, but mostly, they are incredibly dissimilar.

Eighty years ago, the generals of the U.S. Army Air Corps were sure that their bombers would easily topple other countries and cause their populations to panic, claims which did not stand up to reality. **A study OF THE 25-YEAR HISTORY OF CYBER CONFLICT, BY THE ATLANTIC COUNCIL AND CYBER CONFLICT STUDIES ASSOCIATION, HAS SHOWN** a similar dynamic where **THE IMPACT OF DISRUPTIVE CYBERATTACKS has been consistently overestimated.**

Rather than theorizing about future cyberwars or extrapolating from today's concerns, the history of cyberconflict that have actually been fought, shows that cyber incidents have so far tended to have effects that are either widespread but fleeting or persistent but narrowly focused. **NO ATTACKS, SO FAR, HAVE BEEN BOTH WIDESPREAD AND PERSISTENT. THERE HAVE BEEN no AUTHENTICATED cases of anyone dying FROM A CYBER ATTACK. ANY WIDESPREAD DISRUPTIONS,** even the 2007 disruption against Estonia, **HAVE BEEN SHORT-LIVED** causing no significant GDP loss.

Moreover, as with conflict in other domains, cyberattacks can take down many targets but keeping them down over time in the face of determined defenses has so far been out of the range of all but the most dangerous adversaries such as Russia and China. Of course, if the United States is in a conflict with those nations, cyber will be the least important of the existential threats policymakers should be worrying about. **PLUTONIUM TRUMPS BYTES IN A SHOOTING WAR.**

This is not all good news. Policymakers have recognized the problems since at least 1998 with little significant progress. Worse, the threats and vulnerabilities are getting steadily more worrying. **STILL, experts have been warning of a cyber Pearl Harbor for 20 of the 70 years since the actual Pearl Harbor.**

The transfer of U.S. trade secrets through Chinese **CYBER ESPIONAGE COULD SOMEDAY ACCUMULATE INTO AN EXISTENTIAL THREAT. BUT IT DOESN'T SEEM SO SEEM JUST YET,** with only handwaving estimates of annual losses of 0.1 to 0.5 percent to the total U.S. GDP of around \$15 trillion. That's bad, but **IT DOESN'T ADD UP TO AN EXISTENTIAL CRISIS** or "economic cyberwar."

Cyber threats are hype

The Economist, 12/8/2012. "Hype and fear," <http://www.economist.com/news/international/21567886-america-leading-way-developing-doctrines-cyber-warfare-other-countries-may>.

EVEN as anxiety about jihadi terrorist threats has eased, thanks to the efforts of intelligence agencies and drone attacks' disruption of the militants' sanctuaries, [FEARS OVER WESTERN SOCIETIES' VULNERABILITY TO CYBER-ASSAULTS HAVE GROWN](#).

Political and military leaders miss no chance to declare that cyberwar is already upon us. America's defence secretary, Leon [PANETTA](#), [TALKS OF A "CYBER-PEARL HARBOUR"](#). A senior official says privately that a cyber-attack on America that "would make 9/11 look like a tea party" is only a matter of time.

[THE NIGHTMARES ARE OF](#) [mouseclicks](#) [EXPLODING FUEL REFINERIES, FRYING POWER GRIDS OR BLINDING AIR-TRAFFIC CONTROLLERS, THE REALITY IS ALREADY OF COUNTLESS ANONYMOUS ATTACKS ON GOVERNMENTS AND BUSINESSES](#). These seek to disrupt out of malice, or to steal swathes of valuable commercial or security-related data. Some experts believe that such thefts have cost hundreds of billions of dollars in stolen R&D.

Many of these attacks are purely criminal. But the most sophisticated are more often the work of states, carried out either directly or by proxies. Attribution—detecting an enemy's fingerprints on a cyber-attack—is still tricky, so officials are reluctant to point the finger of blame publicly. But China is by far the most active transgressor. It employs thousands of gifted software engineers who systematically target technically advanced Fortune 100 companies. The other biggest offenders are Russia and, recently, Iran (the suspected source of the Shamoon virus that crippled thousands of computers at Saudi Arabia's Aramco and Qatar's RasGas in August).

America and its allies are by no means passive victims. Either America, Israel or the two working together almost certainly hatched the Stuxnet worm, found in 2010, that was designed to paralyse centrifuges at Iran's Natanz uranium-enrichment plant. The Flame virus, identified by Russian and Hungarian experts this year, apparently came from the same source. It was designed to strike at Iran by infecting computers in its oil ministry and at targets in the West Bank, Syria and Sudan.

Boring, not lurid

For all the hype, policies on cyber-warfare remain confused and secretive. The American government is bringing in new rules and a clearer strategy for dealing with cyber-threats. Barack Obama is said to have signed in October a still-secret directive containing new guidelines for federal agencies carrying out cyber-operations. It sets out how they should help private firms, particularly those responsible for critical national infrastructure, to defend themselves against cyber-threats by sharing information and setting standards.

The directive is partly a response to the stalling of cyber-legislation in the Senate. Republican senators argue that it imposes too great a regulatory burden on industry, which is already obliged to disclose when it is subject to a cyber-attack. It is also meant to govern how far such bodies as the Department of Homeland Security can go in their defence of domestic networks against malware attacks.

The Pentagon is also working on more permissive rules of engagement for offensive cyber-warfare, for example to close down a foreign server from which an attack was thought to be emanating. General Keith Alexander heads both Cyber Command (which has a budget of \$3.4 billion for next year) and the National Security Agency. He has often called for greater flexibility in taking the attack to the "enemy". The emergence of new cyber-warfare doctrines in America is being watched closely by allies who may follow where America leads—as well as by potential adversaries.

However, Jarno Linnell of Stonesoft, a big computer security firm, says that all levels of government in the West lack strategic understanding on cyber-warfare. So, although questions abound, answers are few. For example, it is not clear how much sensitive information about threats or vulnerabilities government agencies should share even with private-sector firms that are crucial to national security. Often the weakest link is their professional advisers, such as law firms or bankers who have access to sensitive data.

Almost all (roughly 98%) of the vulnerabilities in commonly used computer programmes that hackers exploit are in software created in America. Making private-sector companies more secure might involve a controversial degree of intrusion by government agencies, for example the permanent monitoring of e-mail traffic to make sure that every employee is sticking to security rules. Government hackers may also like to hoard such vulnerabilities rather than expose them. That way they can later create "backdoors" in the software for offensive purposes.

Also controversial is the balance between defence and attack. General Alexander stresses that in cyber-warfare, the attacker has the advantage. Mr Linnell says that, although America has better offensive cyber-capabilities than almost anybody, its defences get only three out of ten.

Setting rules for offensive cyber-warfare is exceptionally tricky. When it comes to real, physical war, the capability may become as important as air superiority has been for the past 70 years: though it cannot alone bring victory, you probably can't win if the other side has it.

China has long regarded the network-centric warfare that was developed by America in the late-1980s and copied by its allies as a weakness it might target, particularly as military networks share many of the same underpinnings as their civilian equivalents. The People's Liberation Army (PLA) talks about "informationisation" in war, "weakening the information superiority of the enemy and operational effectiveness of the enemy's computer equipment". China's planning assumes an opening salvo of attacks on the enemy's information centres by cyber, electronic and kinetic means to create blind spots that its armed forces would then be able to exploit. Yet as the PLA comes to rely more on its own information networks it will no longer enjoy an asymmetric advantage. FEW DOUBT THE IMPORTANCE OF BEING ABLE TO DEFEND YOUR OWN MILITARY NETWORKS FROM CYBER-ATTACKS (and to operate effectively when under attack), while threatening those of your adversaries.

BUT TO CONCLUDE THAT FUTURE WARS WILL BE CONDUCTED LARGELY IN CYBERSPACE IS AN EXAGGERATION. MARTIN LIBICKI OF THE RAND CORPORATION, a think-tank, ARGUES THAT WITH SOME EXCEPTIONS CYBER-WARFARE NEITHER DIRECTLY HARMS PEOPLE NOR DESTROYS EQUIPMENT. AT BEST IT "CAN CONFUSE AND FRUSTRATE...AND THEN ONLY TEMPORARILY". IN SHORT, "CYBER-WARFARE CAN ONLY BE A SUPPORT FUNCTION" for other forms of war.

Four horsemen

Besides the cyber element of physical warfare, FOUR OTHER WORRIES ARE: STRATEGIC CYBERWAR (direct attacks on an enemy's civilian infrastructure); CYBER-ESPIONAGE; CYBER-DISRUPTION, such as the distributed denial-of-service attacks that briefly overwhelmed Estonian state, banking and media websites in 2007; AND CYBER-TERRORISM. Gauging an appropriate response to each of these is hard. Mr Linnell calls for a "triad" of capabilities: resilience under severe attack; reasonable assurance of attribution so that attackers cannot assume anonymity; and the means to hit back hard enough to deter an unprovoked attack.

FEW WOULD ARGUE AGAINST IMPROVING RESILIENCE, PARTICULARLY OF CRITICAL NATIONAL INFRASTRUCTURE such as power grids, sewerage and transport systems. BUT SUCH TARGETS ARE NOT AS VULNERABLE AS IS NOW OFTEN SUGGESTED. CYBER-ATTACKS ON PHYSICAL ASSETS ARE MOST LIKELY TO USE WHAT MR LIBICKI CALLS "ONE-SHOT WEAPONS" AIMED AT INDUSTRIAL CONTROL SYSTEMS. STUXNET WAS AN EXAMPLE: IT DESTROYED PERHAPS A TENTH OF THE IRANIAN CENTRIFUGES AT NATANZ AND DELAYED SOME URANIUM ENRICHMENT FOR A FEW MONTHS, BUT THE VULNERABILITIES IT EXPOSED WERE SOON REPAIRED. Its limited and fleeting success will also have led Iran to take measures to hinder future attacks. IF THAT IS THE BEST THAT TWO FIRST-RATE CYBER-POWERS CAN DO AGAINST A THIRD-RATE INDUSTRIAL POWER, NOTES MR LIBICKI, IT PUTS INTO PERSPECTIVE THE MORE ALARMIST PREDICTIONS OF IMPENDING CYBER-ATTACKS ON INFRASTRUCTURE IN THE WEST.

Moreover, ANYONE CONTEMPLATING A CYBER-ATTACK on physical infrastructure has little idea how much actual damage it will cause, and if people will die. They CANNOT KNOW IF THEY ARE CROSSING AN ADVERSARY'S RED LINE and in doing so would trigger a violent "kinetic" response (involving real weapons). WHETHER OR NOT AMERICA HAS EFFECTIVE CYBER-WEAPONS, IT HAS MORE THAN ENOUGH CONVENTIONAL ONES TO MAKE ANY POTENTIAL AGGRESSOR THINK TWICE.

For that reason, improving attribution of cyber-attacks is a high priority. Nigel Inkster, a former British intelligence officer now at the International Institute for Strategic Studies, highlights the huge risk to the perpetrator of carrying out an infrastructure attack given the consequences if it is detected. In October Mr Panetta said that "potential aggressors should be aware that the United States has the capacity to locate them and hold them accountable for actions that harm America or its interests."

He may be over-claiming. Given that cyber-attacks can be launched from almost anywhere, attribution is likely to remain tricky and to rely on context, motive and an assessment of capabilities as much as technology. That is one reason why countries on the receiving end of cyber attacks want to respond in kind—ambiguity cuts both ways. But poor or authoritarian countries attacking rich democratic ones may not have the sorts of assets that are vulnerable to a retaliatory cyber-attack.

The difficulty is even greater when it comes to the theft (or “exfiltration”, as it is known) of data. For China and Russia, ransacking Western firms for high-tech research and other intellectual property is tempting. The other way round offers thinner pickings. In 2009 hackers from an unnamed “foreign intelligence agency” made off with some 24,000 confidential files from Lockheed Martin, a big American defence contractor. As a result they could eavesdrop on online meetings and technical discussions, and gather information about the sensors, computer systems and “stealth” technology of the F-35 Joint Strike Fighter. This may have added to the delays of an already troubled programme as engineers tried to fix vulnerabilities that had been exposed in the plane’s design. Investigators traced the penetrations with a “high level of certainty” to known Chinese IP addresses and digital fingerprints that had been used for attacks in the past. Less than two years later, China unveiled its first stealth fighter, the J-20.

Theft from thieves

As Mr Libicki asks, “what can we do back to a China that is stealing our data?” Espionage is carried out by both sides and is traditionally not regarded as an act of war. But the massive theft of data and the speed with which it can be exploited is something new. Responding with violence would be disproportionate, which leaves diplomacy and sanctions. But America and China have many other big items on their agenda, while trade is a very blunt instrument. It may be possible to identify products that China exports which compete only because of stolen data, but it would be hard and could risk a trade war that would damage both sides.

CYBER-DISRUPTION HAS NUISANCE VALUE AND MAY BE COSTLY TO REPAIR, BUT IT CAN BE MITIGATED BY DECENT DEFENCES. CYBER-TERRORISM HAS REMAINED LARGELY IN THE IMAGINATION OF FILM-MAKERS, but would be worth worrying about if it became a reality. Stonesoft’s Mr Linnell reckons that, though al-Qaeda and its offshoots show little sign of acquiring the necessary skills, they could buy them. Mr Libicki is more sceptical. BIG TEAMS OF HIGHLY QUALIFIED PEOPLE ARE NEEDED TO PRODUCE STUXNET-TYPE EFFECTS, WHICH MAY BE BEYOND EVEN SOPHISTICATED TERRORIST GROUPS. ALSO, THE LARGER THE TEAM THAT IS NEEDED, THE MORE LIKELY IT IS TO BE PENETRATED.

Hurts the Internet

Balkanization would destroy the internet – crushes trade & economic growth McDowell, Commission of the FCC, 2012

[Robert M. McDowell, The U.N. Threat to Internet Freedom,
<http://www.wsj.com/articles/SB10001424052970204792404577229074023195322>]

Merely saying "no" to any changes to the current structure of Internet governance is likely to be a losing proposition. A more successful strategy would be for proponents of Internet freedom and prosperity within every nation to encourage a dialogue among all interested parties, including governments and the ITU, to broaden the multi-stakeholder umbrella with the goal of reaching consensus to address reasonable concerns. As part of this conversation, we should underscore the tremendous benefits that the Internet has yielded for the developing world through the multi-stakeholder model.

UPENDING THIS MODEL WITH A NEW REGULATORY TREATY IS LIKELY TO PARTITION THE INTERNET as some countries would inevitably choose to opt out. **A balkanized Internet would be devastating to global free trade and national sovereignty.** IT WOULD IMPAIR INTERNET GROWTH MOST SEVERELY IN THE DEVELOPING WORLD BUT ALSO GLOBALLY AS TECHNOLOGISTS ARE FORCED TO SEEK BUREAUCRATIC PERMISSION to innovate and invest. **THIS WOULD ALSO UNDERMINE THE PROLIFERATION OF NEW CROSS-BORDER TECHNOLOGIES, SUCH AS CLOUD COMPUTING.**

A TOP-DOWN, CENTRALIZED, INTERNATIONAL REGULATORY OVERLAY IS ANTITHETICAL TO THE ARCHITECTURE OF THE NET, WHICH IS A GLOBAL NETWORK OF NETWORKS WITHOUT BORDERS. NO GOVERNMENT, let alone an intergovernmental body, CAN MAKE ENGINEERING AND ECONOMIC DECISIONS IN LIGHTNING-FAST INTERNET TIME. PRODUCTIVITY, RISING LIVING STANDARDS AND THE SPREAD OF FREEDOM EVERYWHERE, BUT ESPECIALLY IN THE DEVELOPING WORLD, WOULD GRIND TO A HALT as engineering and business decisions become politically paralyzed within a global regulatory body.

ANY ATTEMPTS TO EXPAND INTERGOVERNMENTAL POWERS OVER THE INTERNET—no matter how incremental or seemingly innocuous—**SHOULD BE TURNED BACK.** Modernization and reform can be constructive, but not if the end result is a new global bureaucracy that departs from the multi-stakeholder model. **ENLIGHTENED NATIONS SHOULD DRAW A LINE IN THE SAND AGAINST NEW REGULATIONS** while welcoming reform that could include a nonregulatory role for the ITU.

State control destroys the value of the internet Alford, Senior Program Officer, Internet Freedom, Freedom House, 2014

[Gigi Alford, State Partitioning of the Internet Harms Users Everywhere,
http://www.huffingtonpost.com/freedom-house/state-partitioning-of-the_b_5843162.html]

For as long as the global internet has withstood attempts by states to subjugate its cables, servers, and protocols, the virtual world has been a refuge for users who are deprived of their fundamental freedoms offline. This boon of technology is what led UN experts to declare the internet

"an indispensable tool for realizing a range of human rights" and to debate whether access to such an engine of human progress constitutes a right in itself.

However, SINCE Edward SNOWDEN DISCLOSED documents on SECRET U.S. and British data-COLLECTION PROGRAMS, THE INTERNET HAS FACED INTENSIFIED CHALLENGES FROM ALL SIDES—some genuine and others opportunistic— THAT COULD LEAD STATES TO PARTITION THE DIGITAL COMMONS INTO NATIONAL AND REGIONAL DEMESNES.

AN INTERNET THAT IS FRAGMENTED BY political, legal, and technical BOUNDARIES WOULD THROTTLE THE ANIMATING PURPOSE OF THE INTERNATIONAL BILL OF HUMAN RIGHTS, while an indivisible and global internet is able to facilitate such goals. AS STATES FULLY FATHOM THE INTERNET'S DISRUPTIVE POWER AND RUSH TO IMPOSE CHOKE POINTS IN THE NAME OF NATIONAL SOVEREIGNTY, THE DIGITAL WORLD INCREASINGLY MIRRORS THE ANALOG WORLD'S HUMAN RIGHTS DEFICIENCIES, which it once transcended. The virtual refuge is being dismantled, and for individuals on the wrong side of the new borders, it has been replaced with separate and unequal "splinternets."

SUCH DIGITAL APARTHEID FLIES IN THE FACE OF THE UNIVERSALITY OF HUMAN RIGHTS, AND IT CONTRADICTS INTERNATIONAL JURISPRUDENCE THAT REJECTS SEPARATE-BUT-EQUAL REGIMES. As the UN Human Rights Council has affirmed, "the same rights that people have offline must also be protected online."

Champions of a unified internet are putting forth strong economic and geopolitical arguments to counter these challenges—including earlier this month at the ninth annual Internet Governance Forum (IGF) in Istanbul, Turkey, and next month at the International Telecommunications Union (ITU) plenipotentiary meeting in Busan, South Korea. But stakeholders often miss the bigger picture when they overlook the human rights case against a "Westphalian web" model of internet governance.

Internet Good

Internet solves everything – access is key Genachowski 13

[Chair-FCC, 4/16, "The Plot to Block Internet Freedom",
http://www.foreignpolicy.com/articles/2013/04/16/plot_block_internet_freedom?page=full]

The Internet has created an extraordinary new democratic forum for people around the world to express their opinions. It is revolutionizing global access to information: Today, more than 1 billion people worldwide have access to the Internet, and at current growth rates, 5 billion people -- about 70 percent of the world's population -- will be connected in five years. But this growth trajectory is not inevitable, and threats are mounting to the global spread of an open and truly "worldwide" web. The expansion of the open Internet must be allowed to continue: The mobile and social media revolutions are critical not only for democratic institutions' ability to solve the collective problems of a shrinking world, but also to a dynamic and innovative global economy that depends on financial transparency and the free flow of information. The threats to the open Internet were on stark display at last December's World Conference on International Telecommunications in Dubai, where the United States fought attempts by a number of countries -- including Russia, China, and Saudi Arabia -- to give a U.N. organization, the International Telecommunication Union (ITU), new regulatory authority over the Internet. Ultimately, over the objection of the United States and many others, 89 countries voted to approve a treaty that could strengthen the power of governments to control online content and deter broadband deployment. In Dubai, two deeply worrisome trends came to a head. First, we see that the Arab Spring and similar events have awakened nondemocratic governments to the danger that the Internet poses to their regimes. In Dubai, they pushed for a treaty that would give the ITU's imprimatur to governments' blocking or favoring of online content under the guise of preventing spam and increasing network security. Authoritarian countries' real goal is to legitimize content regulation, opening the door for governments to block any content they do not like, such as political speech. Second, the basic commercial model underlying the open Internet is also under threat. In particular, some proposals, like the one made last year by major European network operators, would change the ground rules for payments for transferring Internet content. One species of these proposals is called "sender pays" or "sending party pays." Since the beginning of the Internet, content creators -- individuals, news outlets, search engines, social media sites -- have been able to make their content available to Internet users without paying a fee to Internet service providers. A sender-pays rule would change that, empowering governments to require Internet content creators to pay a fee to connect with an end user in that country. Sender pays may look merely like a commercial issue, a different way to divide the pie. And proponents of sender pays and similar changes claim they would benefit Internet deployment and Internet users. But the opposite is true: If a country imposed a payment requirement, content creators would be less likely to serve that country. The loss of content would make the Internet less attractive and would lessen demand for the deployment of Internet infrastructure in that country. Repeat the process in a few more countries, and the growth of global connectivity -- as well as its attendant benefits for democracy -- would slow dramatically. So too would the benefits accruing to the global economy. Without continuing improvements in transparency and information sharing, the innovation that springs from new commercial ideas and creative breakthroughs is sure to be severely inhibited. To their credit, American Internet service providers have joined with the broader U.S. technology industry, civil society, and others in opposing these changes. Together, we were able to win the battle in Dubai over sender pays, but we have not yet won the war. Issues affecting global Internet openness, broadband deployment, and free speech will return in upcoming international forums, including an important meeting in Geneva in May, the World Telecommunication/ICT Policy Forum. The massive investment in wired and wireless broadband infrastructure in the United States demonstrates that preserving an open Internet is completely compatible with broadband deployment. According to a recent UBS report, annual wireless capital investment in the United States increased 40 percent from 2009 to 2012, while investment in the rest of the world has barely inched upward. And according to the Information Technology and Innovation Foundation, more fiber-optic cable was laid in the United States in 2011 and 2012 than in any year since 2000, and 15 percent more than in Europe. All Internet users lose something when some countries are cut off from the World Wide Web. Each person who is unable to connect to the Internet diminishes our own access to information. We become less able to understand the world and formulate policies to respond to our shrinking planet. Conversely, we gain a richer understanding of global events as more people connect around the world, and those societies nurturing nascent democracy movements become more familiar with America's traditions of free speech

and pluralism. That's why we believe that the Internet should remain free of gatekeepers and that no entity -- public or private -- should be able to pick and choose the information web users can receive. That is a principle the United States adopted in the Federal Communications Commission's 2010 Open Internet Order. And it's why we are deeply concerned about arguments by some in the United States that broadband providers should be able to block, edit, or favor Internet traffic that travels over their networks, or adopt economic models similar to international sender pays. We must preserve the Internet as the most open and robust platform for the free exchange of information ever devised. Keeping the Internet open is perhaps the most important free speech issue of our time.

Russia Controls

Russia controlling the internet

Bloomberg 5 – 1 – 14

[Ilya Khrennikov and Anastasia Ustinova, Putin's Next Invasion? The Russian Web, <http://www.bloomberg.com/bw/articles/2014-05-01/russia-moves-toward-china-style-internet-censorship>]

Google (GOOG) Executive Chairman Eric SCHMIDT WARNED last year THAT RUSSIA WAS "ON THE PATH" TOWARD CHINESE-STYLE INTERNET CENSORSHIP. Vladimir PUTIN IS PROVING HIM RIGHT. At a meeting with media executives in St. Petersburg on April 24, the Russian president said his government will impose greater control over information flowing through the Internet, which the former KGB lieutenant colonel has called a creation of U.S. spy agencies.

RUSSIA'S PARLIAMENT HAS APPROVED A LAW SIMILAR TO CHINA'S THAT WOULD REQUIRE INTERNET COMPANIES SUCH AS GOOGLE TO LOCATE SERVERS HANDLING RUSSIAN TRAFFIC INSIDE THE COUNTRY AND STORE USER DATA LOCALLY FOR SIX MONTHS. The legislation, which is scheduled to take effect on Aug. 1, also classifies the roughly 30,000 Russian bloggers who have 3,000 or more readers as media outlets, making them and the companies that host them subject to regulation. "THIS LAW IS A STEP TOWARD SEGMENTING AND NATIONALIZING THE INTERNET AND PUTTING IT UNDER THE KREMLIN'S CONTROL," SAYS Matthew SCHAAF, a program officer at Freedom House, a research group in Washington. "IT COULD HAVE A SERIOUS CHILLING EFFECT ON ONLINE EXPRESSION IN RUSSIA, MAKING USERS STOP TO THINK HOW THEIR GOOGLE SEARCHES AND FACEBOOK POSTS COULD BE USED AGAINST THEM."

X-IM is an alt cause to lack of nuclear competitiveness

Ted Jones, 6/10, Director of International Supplier Relations for NEI, JUNE 10, 2015, "What Heritage Gets Wrong About Nuclear Energy and Ex-Im Bank",

<http://neinuclearnotes.blogspot.com/2015/06/what-heritage-gets-wrong-about-nuclear.html>

EX-IM ENABLES U.S. NUCLEAR SUPPLIERS TO REDUCE RUSSIAN ENERGY DOMINANCE. Notably, Jack acknowledges the challenges posed by Russian competition in global nuclear energy markets. He accepts that U.S. nuclear exporters are contending with aggressive Russian expansion and that favorable financing terms is one of Russia's key competitive advantages. And he acknowledges that Russia's expansion into nuclear energy increases the overreliance of U.S. partners on Russian energy, implicating broader U.S. national security interests. AS AN ALTERNATIVE RESPONSE TO RUSSIA'S NUCLEAR ENERGY EXPORT STRATEGY, JACK SUGGESTS STREAMLINING U.S. EXPORT REGULATIONS FOR U.S. NUCLEAR COOPERATION PARTNERS. MODERNIZING U.S. NUCLEAR EXPORT CONTROLS IS A NECESSARY BUT INSUFFICIENT STEP TOWARD A LEVEL PLAYING FIELD WITH RUSSIAN AND OTHER FOREIGN NUCLEAR ENERGY SUPPLIERS. Crucially, IT WOULD DO NOTHING TO ADDRESS THE COMPETITIVE IMBALANCE IN FINANCING, WHICH IS OFTEN THE DECISIVE FACTOR IN NUCLEAR ENERGY TENDERS. In short, IF THE EX-IM BANK GOES AWAY, THE U.S. NUCLEAR ENERGY INDUSTRY WILL LOSE A CRITICAL TOOL FOR COMPETING AGAINST RUSSIAN NUCLEAR ENERGY SUPPLY. EXPORT CONTROL REFORM IS NOT A SUBSTITUTE. Russia's edge in financing proved critical in reactor sale to Hungary. Although Jack is correct to note that energy-security concerns give an advantage to non-Russian energy suppliers, the Russian edge in financing is so powerful that it has been decisive in recent tenders IN EASTERN EUROPE. IF THE EX-IM BANK GOES AWAY, NUCLEAR ENERGY SUPPLIERS FROM FRANCE, SOUTH KOREA AND JAPAN – ALL BACKED BY NATIONAL EXPORT CREDIT AGENCIES – WILL BENEFIT FROM WORRIES ABOUT OVERRELIANCE ON RUSSIA. The U.S. industry will not even be at the table. This circumstance has led Ambassador John Bolton to write that while Tea Party Republicans might have a point about economic subsidies, they're getting the Ex-Im Bank issue horribly wrong when it comes to geo-politics. Ex-Im is a requirement to compete. Jack repeats the claim that private financing can fill the void left by the Ex-Im Bank. But the commercial banks have repeatedly debunked this myth about Ex-Im and private financing – as recently as last week. In no business sector is the indispensability of the Ex-Im Bank clearer than in the export of nuclear power. THERE DOES NOT EXIST A COMMERCIAL BANK THAT WILL FINANCE A NUCLEAR POWER PLANT FOR 18 YEARS PLUS THE TERM OF CONSTRUCTION – THE AGREED LIMIT AMONG MEMBERS OF THE ORGANIZATION FOR ECONOMIC COOPERATION AND DEVELOPMENT (OECD). According to the commercial banking executives that I've consulted, their unwillingness to finance nuclear power plants without the Ex-Im Bank holding a stake has nothing to do with project risk. Foreign utilities are typically very low credit risks. Rather, they explain that Basel III capital reserve requirements prevent them from allocating billions of dollars in tier one capital for as many years as necessary to finance a nuclear power plant. Jack claims that foreign customers "can demand support from export credit agencies for the simple reason that such support is available." If Ex-Im Bank goes away, export credit agency support will still be demanded by suppliers, and it will still be available – but from non-U.S. suppliers only. Again, U.S. nuclear suppliers will not even be able to compete. Jack correctly points out that the U.S. industry has some advantages, including "reliable and efficient products, operational excellence, and safety culture." But if these advantages are often insufficient today, how can they be adequate when U.S. nuclear suppliers lose the ability to offer a competitive financing package? JACK RIGHTLY POINTS OUT THAT THE GLOBAL ELIMINATION OF EXPORT CREDIT AGENCIES IS THE MOST DESIRABLE SOLUTION. BUT AS FORMER REAGAN-ERA ASSISTANT SECRETARY OF DEFENSE FRANK GAFFNEY HAS POINTED OUT, UNILATERAL DISARMAMENT IS A TERRIBLE STRATEGY TO ACHIEVE THAT OUTCOME. Through leverage provided by the Ex-Im Bank, the United States has successfully imposed discipline on other export credit agencies in multiple business sectors, including nuclear energy. Under the Nuclear Sector Understanding of the OECD, export credit financing terms and trade-related aid in the nuclear energy sector must conform to agreed limits. If the United States shuts down the Bank, it would lose its greatest source of leverage for disciplining the 59 export credit agencies operating worldwide. Uncertainty about Ex-Im is already hurting U.S. suppliers. Although Jack writes that the Ex-Im Bank is "inherently political," it enjoyed strong bipartisan support from its establishment almost eight decades ago until 2011, when Heritage Action and other groups made it a target. I speak regularly to nuclear energy executives, who compete every day in international markets. Every one of them has a story about international customers asking whether their company will be able to close deals,

given the uncertainty about Ex-Im Bank. Some of the executives have confirmed that their international competitors were the sources of the customers' worries about Ex-Im Bank. This is the burden that U.S. nuclear exporters have carried since 2011. If Ex-Im goes away, that burden will in many cases become insuperable.

Russia's economy is in trouble and economic decline means it can't fight a war

Anders Åslund, 14, Economist and a Senior Fellow at the Atlantic Council and Chairman of the International Advisory Council at the Center for Social and Economic Research, April 22, 2014, "Russia Is in No Economic Shape to Fight a War", <http://www.themoscowtimes.com/opinion/article/russia-is-in-no-economic-shape-to-fight-a-war/498728.html>

But RUSSIA HAS ONLY A 2.9 PERCENT SHARE OF GLOBAL GROSS DOMESTIC PRODUCT. This is only 6 percent of NATO's GDP. In 2012, RUSSIA'S DEFENSE EXPENDITURES CORRESPONDED TO ONE-TENTH OF NATO'S DEFENSE EXPENDITURES. A COUNTRY SO ECONOMICALLY WEAK WOULD BE WELL ADVISED NOT TO CHALLENGE FAR WEALTHIER AND STRONGER NEIGHBORS. To make matters worse, RUSSIA HAS FEW ALLIES. IN PARTICULAR, RUSSIA IS LIKELY TO BE HIGHLY VULNERABLE TO FINANCIAL SANCTIONS. One month ago, the Western discussion on possible sanctions against Russia focused on whether they could be effective. During the spring meeting of the International Monetary Fund in Washington April 12 to 13, the question was turned around: Do we really want to destroy Russia that fast? The dominant theme was that geopolitical risk is back, and Russia is seen as the main risk. Official Russian reactions to the Western threat of sanctions have been that Russia's state corporations would invest in Russia and that Russia would establish its own payments system, making itself independent of the Western financial system. But none of this is realistic. In its March report on the Russian economy, the World Bank showed that the country's total foreign debt at the end of January was \$732 billion. The distribution between public and private debt is only available from October last year. Then, state banks had \$128 billion and nonfinancial state corporations \$164 billion of foreign debt. Adding \$80 billion of government foreign debt, Russia's total public foreign debt was \$372 billion, while its international currency reserves are \$477 billion, but much of those can be frozen as well. This makes Russia highly vulnerable to international financial sanctions. In an insightful article in Foreign Affairs magazine on April 10, Robert Kahn argued that "RUSSIA'S RELATIONSHIP TO GLOBAL FINANCIAL MARKETS — INTEGRATED, HIGHLY LEVERAGED AND OPAQUE — CREATES VULNERABILITY, WHICH SANCTIONS COULD EXPLOIT TO PRODUCE A RUSSIAN 'LEHMAN MOMENT': A SHARP, RAPID DELEVERAGING WITH MAJOR CONSEQUENCES FOR RUSSIA'S ABILITY TO TRADE AND INVEST." THAT COULD MEAN A "SUDDEN STOP" OF INTERNATIONAL FINANCE TO RUSSIA, WHICH WOULD HAVE DEVASTATING CONSEQUENCES FOR ITS ECONOMY. State banks and other state-controlled corporations are not creditors to the West but big borrowers. Companies such as Rosneft have larger debts than their market capitalization, and their debts are held abroad. IF THEY ARE NOT ABLE TO ROLL OVER THEIR LARGE FOREIGN DEBTS, THEY WILL BE STARVED OF CAPITAL. IN RECENT WEEKS, THE DISCUSSION IN WASHINGTON HAS HARDLY BEEN ABOUT WHETHER TO SANCTION RUSSIAN STATE BANKS BUT RATHER WHICH ONES AND WHEN IS THE BEST TIME TO DO IT. ANY SIGNIFICANT BANK THAT ESTABLISHED ITSELF IN CRIMEA WOULD BE SANCTIONED. Gazprombank appears a prime target since its beneficiary owner, Bank Rossiya, is already sanctioned. In addition, it is relatively small and not that well connected with the rest of the financial system, so it could be used as a trial balloon. Ukraine's Prosecutor General's Office has just initiated a criminal case against Sberbank, and probably will for other Russian state banks, for "financing terrorists," which is considered an extremely serious crime in the U.S. BASED ON RECENT U.S. STATEMENTS, IT WOULD BE SURPRISING IF WASHINGTON DOES NOT SANCTION ONE OR SEVERAL RUSSIAN STATE BANKS THIS WEEK. Moreover, Kahn writes, "The West can mete out some degree of financial punishment without even explicitly sanctioning Russian banks." This can be accomplished by simply tightening rules governing due diligence and money-laundering activities. USUALLY, SANCTIONS ARE ONLY EFFECTIVE IF EUROPEAN COUNTRIES APPLY THE SANCTIONS AS WELL, BUT GIVEN THE DOMINANT ROLE OF THE U.S. IN THE REGULATION OF GLOBAL FINANCE, LITTLE CAN BE DONE WITHOUT THE APPROVAL OF U.S. AUTHORITIES. RECENTLY, U.S. LAW ENFORCEMENT FINED BRITISH BANK HSBC \$1.2 BILLION FOR HAVING LAUNDERED DRUG MONEY IN MEXICO. PUTIN'S IDEA OF A RUSSIAN PAYMENT SYSTEM IS A PIPE DREAM. WHO WOULD ACCEPT RUSSIAN CREDIT CARDS ABROAD? The big Russian state banks have already problems maintaining elementary correspondent relations because of their opacity. VTB Capital, for example, has complained about regulatory problems in London. To judge by growth forecasts, JP Morgan and Finnish BOFIT assess that sheer market volatility in March alone shaved off 2 percentage points from Russia's expected economic growth this year. IN THE FIRST

QUARTER, RUSSIA'S GDP CONTRACTED BY HALF A PERCENT. IN MARCH, THE WORLD BANK PRESENTED A "HIGH-RISK" SCENARIO IN WHICH RUSSIA'S GDP WOULD DECLINE BY 1.8 PERCENT IN 2014, CAPITAL flight may reach \$133 billion, and investment may fall by one-tenth. At present, that looks like a low-risk scenario. The IMF and the Washington-based Institute of International Finance have recently produced much more pessimistic scenarios, which have not been published as yet. Both consider stress scenarios with a decline of Russia's GDP this year of about 4 percent, capital outflows in \$150 billion to \$180 billion and sharply falling exchange rates. Similarly, former Finance Minister Alexei Kudrin predicts a capital outflow of \$160 billion this year. GDP COULD FALL MORE BECAUSE THE RISKS ARE MANY, AND THEY ARE NEARLY ALL ON THE DOWNSIDE. THE IMPACT OF THE KREMLIN'S AGGRESSION AGAINST UKRAINE ON THE RUSSIAN ECONOMY WILL BE POWERFUL AND MULTIFACETED. THE COUNTRY'S INTERNATIONAL CURRENCY RESERVES WILL FALL, BUT PROBABLY NOT BELOW \$350 BILLION. THE RUBLE EXCHANGE RATE WILL PLUNGE, WHILE INFLATION AND INTEREST RATES WILL RISE, REDUCING INVESTMENT AND CONSUMPTION. The main positive effects will come from the cheaper ruble that will boost exports and improve the current account as well as the budget balance. THE CENTRAL PROBLEM WILL BE FALLING STANDARD OF LIVING, WHICH IS VITAL FOR PUTIN'S POWER. If Russia's National Security Council had invited one of the country's many good economists, it would probably have heard that RUSSIA IS IN NO SHAPE TO CARRY OUT AN AGGRESSIVE WAR IN UKRAINE.

Russia's economy low now

Peter **Hobson**, 15, Business editor at Moscow Times, April 19, 2015, "Weak Russian Economic Data Blunt Putin's Optimism", <http://www.themoscowtimes.com/business/article/russia-economic-data-blunts-putin-s-optimism/519340.html>

THE RUBLE SLUMPED 4 PERCENT AND MOSCOW-LISTED STOCKS FELL on Friday AFTER OFFICIAL DATA SHOWED THAT RUSSIA'S ECONOMY CONTRACTED SHARPLY IN THE FIRST QUARTER OF THIS YEAR. The data, which showed a deep decline in real wages and consumer spending, came a day after President Vladimir Putin told Russians that the worst of the economic crisis was behind them, saying, "We have passed the peak of our problems. ... Nothing burst, and everything is working," according to a transcript on the Kremlin website. But despite Putin's positivity, RUSSIA'S PROBLEMS AREN'T OVER YET. ECONOMIC ACTIVITY PLUMMETED IN THE FIRST THREE MONTHS OF THE YEAR ACCORDING TO FIGURES RELEASED BY THE ROSSTAT STATE STATISTICS SERVICE. RETAIL SALES CONTRACTED BY 8.7 PERCENT IN MARCH, COMPARED TO THE SAME MONTH IN 2014. REAL WAGES FELL 9.3 PERCENT YEAR-ON-YEAR. UNEMPLOYMENT ROSE BY 100,000 PEOPLE IN MARCH TO 4.5 MILLION, OR 5.9 PERCENT OF THE ECONOMICALLY ACTIVE POPULATION. RUSSIA'S ECONOMY IS UNDER PRESSURE FROM WESTERN SANCTIONS imposed on Moscow over its actions in UKRAINE AND STEEP FALLS IN THE PRICE OF OIL, RUSSIA'S MAIN EXPORT. INVESTMENT SLUMPED BY 5.3 PERCENT COMPARED WITH MARCH 2014, the Rosstat figures showed. Industrial production was down by 0.6 percent year-on-year. According to London-based economic research company Capital Economics, THE DATA WAS CONSISTENT WITH THE RUSSIAN ECONOMY CONTRACTING 3-3.5 PERCENT IN THE FIRST QUARTER COMPARED TO THE SAME PERIOD LAST YEAR. THE FIGURES DROVE A SELL OFF OF RUSSIAN ASSETS. Dollar-traded shares on Moscow's RTS index closed down 5.9 percent at 998 points, while the ruble-denominated MICEX, which is buoyed by a weaker Russian currency, fell 1.8 percent to 1,657 points. The ruble on Friday fell 4 percent against the U.S. dollar to 51.9 and 4.5 percent against the euro to 56.1. Russian shares and the ruble had rebounded sharply since last year, when jitters over Western sanctions and the rapidly falling oil price prompted panic selling that briefly forced the ruble to 80 against the dollar. From one of the world's worst-performing currencies last year, the ruble this year became one of the best-performing. However, the RUSSIAN CURRENCY IS STILL ONE-THIRD WEAKER TO THE DOLLAR THAN AT THE START OF 2014, before Moscow's annexation of Crimea from Ukraine prompted the West to retaliate with sanctions. The ruble's rally had fueled optimism that Russia would weather the economic crisis better than expected. Finance Minister Anton Siluanov said last week the economy could return to growth in the second half of this year. Inflation, which had sped to its highest in 13 years as the weakening ruble raised the price of foreign goods, this month saw its first weekly fall since last summer, to 16.8 percent year-on-year. Last Wednesday the ruble strengthened below 50 to the dollar for the first time since November last year, leading Central Bank Governor Elvira Nabiullina to suggest that Russia now had leeway to cut interest rates. "With other things being equal and no new significant negative factors, the ruble's strengthening will allow us to cut the key rate," Elvira Nabiullina told reporters on Thursday in Washington, where finance ministers and central bankers gathered for International Monetary Fund meetings, the

Bloomberg news agency reported. "The ruble is in a more or less balanced situation," Bloomberg quoted Nabiullina as saying. THE CENTRAL BANK LAST YEAR RAISED INTEREST RATES FROM 5.5 PERCENT TO 17 PERCENT TO BOLSTER THE RUBLE, BUT TRIMMED ITS BENCHMARK RATE TO 14 PERCENT THIS YEAR AS THE CURRENCY FIRMED. Officials and businesses have leaned heavily on the bank to cut rates further and faster to make borrowing affordable and stimulate investment. RUSSIA'S ECONOMY IS EXPECTED TO CONTRACT BY UP TO 5 PERCENT THIS YEAR. Timothy Ash, chief emerging markets economist at Standard Bank in London, said in a note to investors on Friday that the Central Bank would likely cut rates. THE RATE CUT WOULD LIKELY PROMPT THE RUBLE TO FALL AGAIN, HE SAID. "[THE] RUBLE RALLY HAD SIMPLY RUN TOO FAR," he wrote. "I expect to see it now weaken back to more like 55-60 [to the dollar]."

1. Offshoring doesn't boost the economy

Bivens, Research and Policy Director at the Economic Policy Institute (EPI), 05

[L. Josh Bivens, Truth and consequences of offshoring, Recent studies overstate the benefits and ignore the costs to American workers, Briefing Paper #155, <http://www.epi.org/publication/bp155/>]

Conclusion

THE ISSUE OF OFFSHORING DEMANDS A CAREFUL RESPONSE BY POLICY MAKERS, WITH THE GREAT CHALLENGE BEING TO MAKE SURE ANY POTENTIAL BENEFITS ARE EQUITABLY DISTRIBUTED among firms and workers. Any policy response must therefore be well informed about the costs and benefits of offshoring. Proponents of offshoring and many economists have claimed that its negative impact on the U.S. economy over the past four years has been exaggerated by politicians and others. Even if true, this ignores the fact that offshoring is likely to grow rapidly in the future and could well have large effects on the U.S. economy in years to come. Therefore, balanced analyses about what these effects would be are needed. The three reports examined in this paper exaggerate the size of the benefits offered to American workers by offshoring and gloss over the more troubling distributional consequences.

WHILE OFFSHORING HAS CLEARLY PROVIDED SUBSTANTIAL COST SAVINGS AND IMPROVED PROFITS FOR A NUMBER OF FIRMS that have engaged in it, ONE CANNOT ASSUME THAT THESE BENEFITS WILL SCALE UP FOR THE BROADER ECONOMY. MAINSTREAM INTERNATIONAL ECONOMICS TEACHES THAT DEEPENING INTERNATIONAL INTEGRATION USUALLY INCREASES NATIONAL INCOME, BUT NOT ALWAYS. THE OFFSHORING OF WHITE-COLLAR WORK AND ITS CONSEQUENCES (i.e., foreign productivity growth in what is an export sector for the United States) FITS IN WITH MANY OF THE CHARACTERISTICS OF THE EXCEPTIONS.

Further, even if this offshoring does increase national income, AMERICAN WORKERS WILL STILL LIKELY MISS OUT ON MANY OF THE BENEFITS. Mainstream international economics is equally clear that INTERNATIONAL INTEGRATION REDISTRIBUTES MORE INCOME THAN IT CREATES. If total U.S. GDP is raised by offshoring, but American workers lose at the expense of corporate profits, then workers are wholly justified in resisting offshoring, at least until they receive some compensation for their losses. GOOD ECONOMIC POLICY SHOULD NOT REST ON INSISTING THAT AMERICAN WORKERS SACRIFICE THEIR OWN SELF-INTEREST IN TERMS OF LOWER WAGES TO THE LARGER NATIONAL INTEREST OF INCREASED NATIONAL INCOME. Policy should also not be driven by studies that mask the costs of offshoring while providing inflated estimates of its benefits. If proponents of offshoring want to reap the potential efficiency gains it offers, a new social contract needs to be proffered to American workers to insure them against the very real risks offshoring poses to their living standards.

2. The link isn't reversible – many companies may have left because of NSA fears – that doesn't mean they will return as a result of the plan.

3. Access to Employees & cost savings determine offshoring – not surveillance Business Insider 2011

[Here's The TRUE Reason US Companies Offshore Jobs, 1/25/11,
<http://www.businessinsider.com/heres-the-true-reason-us-companies-offshore-jobs-2011-1>]

Most AMERICAN COMPANIES ENGAGED IN OFFSHORING SAY A SHORTAGE OF SKILLED DOMESTIC EMPLOYEES – not cost cutting – IS THE PRIMARY REASON WHY THEY MOVE SOME JOB FUNCTIONS OVERSEAS.

Also, manufacturers and HIGH-TECH/telecommunication (NASDAQ:QQQQ) COMPANIES ARE LESS LIKELY TO ESTABLISH OFFSHORE OPERATIONS AND ARE MOVING INCREASINGLY TOWARD THE USE OF THIRD-PARTY PROVIDERS OF OFFSHORE LABOR.

These are among the findings of the sixth annual study on corporations' offshoring trends by the Center for International Business Education and Research's Offshoring Research Network (ORN) at Duke University's Fuqua School of Business and The Conference Board, an independent research association. THE STUDY IS PART OF ONGOING RESEARCH INTO THE EFFECTS OF OFFSHORING TRENDS ON AMERICAN COMPETITIVENESS AND REFLECTS THE SENTIMENTS OF BUSINESS MANAGERS.

"Over half of the participants in our survey say offshoring has resulted in no change in the number of domestic jobs in most functions," said Arie Lewin, Fuqua professor of strategy and international business. "The finding THAT THE U.S. SOFTWARE SECTOR HAS THE HIGHEST RATIO OF OFFSHORE TO DOMESTIC EMPLOYEES – almost 13 offshored jobs per 100 domestic jobs – MAY BE A REFLECTION OF A SCARCITY OF DOMESTIC SCIENCE AND ENGINEERING GRADUATES IN THE U.S."

4. Link is about overall NSA fears – the plan isn't big enough to fix all the problems their link evidence is about.

5. Non-Unique – Recent data decisions Hoover, Business Journal's Washington Bureau, 5 – 13 – 15

[Kent Hoover, House votes to end NSA bulk data collection; will this restore trust in tech?,
<http://www.bizjournals.com/bizjournals/washingtonbureau/2015/05/house-votes-to-end-nsa-bulk-data-collection-will.html>]

THE TECHNOLOGY INDUSTRY WON A VICTORY Wednesday afternoon WHEN THE HOUSE PASSED LEGISLATION THAT WOULD END THE National Security AGENCY'S BULK COLLECTION OF telephone and Internet METADATA.

The USA Freedom Act(H.R. 2048) passed on a 338-88 vote. The legislation allows more targeted collection of data by intelligence agencies. The White House endorsed the bill, saying it "strikes an appropriate balance between significant reform and preservation of important national security tools. "

Similar legislation is pending in the Senate, which faces a June 1 deadline because that's when the Patriot Act's existing authorities for intelligence-gathering expire.

THE TECHNOLOGY INDUSTRY STRONGLY SUPPORTED THE MEASURE, SAYING IT WAS NECESSARY IN ORDER TO RESTORE PUBLIC TRUST IN AMERICAN TECHNOLOGY COMPANIES.

"That **TRUST HAS DECLINED MEASURABLY** among both U.S. citizens and citizens of our foreign allies since the revelations regarding the U.S. surveillance programs began two years ago," stated a joint letter to House members from seven technology industry groups, ranging from the Internet Association to TechNet. "As a result of increasing concern about the level of access the U.S. government has to user-generated data held by technology companies, **MANY DOMESTIC AND FOREIGN USERS HAVE TURNED TO FOREIGN TECHNOLOGY PROVIDERS WHILE**, simultaneously, foreign jurisdictions have implemented reactionary policies that threaten the fabric of the borderless internet."

The USA Freedom Act "ends the indiscriminate collection of bulk data, avoids data retention mandates, and creates a strong transparency framework for both government and private companies to report national security requests."

6. Not a big enough internal link into the economy – even if tech companies are important – losing all of that growth isn't enough to cause a recession.

7. No impact to economic decline – prefer new data

Daniel W. **DREZNER**, professor of international politics at the Fletcher School of Law and Diplomacy at Tufts University, **14** ["The System Worked: Global Economic Governance during the Great Recession," *World Politics*, Vol. 66, No. 1 (January 2014), p. 123-164]

The final significant outcome addresses **A DOG THAT HASN'T BARKED**: the effect of the Great Recession on cross-border conflict and violence. **DURING THE INITIAL STAGES OF THE CRISIS, MULTIPLE ANALYSTS ASSERTED THAT THE FINANCIAL CRISIS WOULD LEAD STATES TO INCREASE THEIR USE OF FORCE** as a tool for staying in power.⁴² They voiced genuine concern that the global economic downturn would lead to an increase in conflict—**WHETHER THROUGH** greater internal **REPRESSION, DIVERSIONARY WARS, ARMS RACES, OR A RATCHETING UP OF GREAT POWER CONFLICT**. Violence in the Middle East, border disputes in the South China Sea, and even the disruptions of the Occupy movement fueled impressions of a surge in global public disorder.

The aggregate data suggest otherwise, HOWEVER. The Institute for Economics and Peace has concluded that "**THE AVERAGE LEVEL OF PEACEFULNESS IN 2012 IS APPROXIMATELY THE SAME AS IT WAS IN 2007**."⁴³ **INTERSTATE VIOLENCE** in particular **HAS DECLINED SINCE THE START OF THE FINANCIAL CRISIS, AS HAVE MILITARY EXPENDITURES** in most sampled countries. Other **STUDIES CONFIRM THAT THE GREAT RECESSION HAS NOT TRIGGERED ANY INCREASE IN VIOLENT CONFLICT**, as Lotta Themner and Peter Wallensteen conclude: "[T]he pattern is one of relative stability when we consider the trend for the past five years."⁴⁴ **THE secular DECLINE IN VIOLENCE THAT STARTED WITH THE END OF THE COLD WAR HAS NOT BEEN REVERSED**. Rogers Brubaker observes that "**THE CRISIS HAS NOT** to date **GENERATED THE SURGE IN PROTECTIONIST NATIONALISM OR ETHNIC EXCLUSION THAT MIGHT HAVE BEEN EXPECTED**."⁴³

8. Turn – fears of the NSA are hurting US business and the economy Horne, Aussie financial technology executive, 2013

[Peter Horne, Cautionary Tales of Restrictive U.S. Internet Policies,
<http://www.customers.com/forum/cautionary-tales-of-restrictive-us-internet-policies/>]

But these SHENANIGANS BY THE ZEALOTS OF THE U.S. INTELLIGENCE COMMUNITIES NOT ONLY DISADVANTAGED NON-U.S. COMPANIES; THEY WERE IN SERIOUS DANGER OF PUTTING U.S. COMPANIES AT SERIOUS RISK OF LOSING THEIR PLACE IN THE NEW RACE. The U.S. does not have the monopoly on knowledgeable, smart, and motivated technologists, and so people started to solve the problem for themselves. In fact during the period of restrictions on the use of SSL outside of the U.S., an enterprising pair of Australians called Eric Young and Tim Hudson created an SSL library called SSLeay which became the defacto global standard implementation of the SSL protocol to the point where it is also now used as a default around the world in the OpenSSL package (every Mac has it). The rather strangely named "legion of the bouncy castle" is also a website domiciled in Australia that hosts the development of the benchmark SSL library for the Java environment. What was starting to happen was that the open source movement and smart people outside the U.S. were working their way around restrictive U.S. policies, and I have no doubt that had the restrictions continued both Netscape and Microsoft would have been toppled by a foreign developed web browser.

Now wind forward 20 years, and this weekend we are hearing of cloud based web email services from LavaBit and Silent Circle closing their doors because (and it is illegal for them to give any specific detail) they would rather close their doors than allow U.S. intelligence agencies to demand access to their networks and databases. We also know that while Google and Microsoft were willing participants in the NSA data collection processes revealed by the whistle blower Edward Snowden, the NSA was able to coerce Yahoo and Apple against their will to do the same.

I hope someone with some ounce of wisdom is thinking about this in the U.S. government. THE DRUMS ARE BANGING, THE TECHNOLOGISTS ARE ACTIVATING, AND THE CYPHERPUNKS ARE PRINTING NEW T-SHIRTS. HISTORY TELLS US THAT IF YOU KEEP GOING YOU ARE GOING TO FIND THAT THOSE OUTSIDE THE U.S. ACTUALLY HAVE THE SMARTS AND ECONOMIC POWER TO HIT YOU WHERE IT HURTS - IN YOUR TECH INDUSTRY. THINGS WILL SLOW DOWN, TEMPER WILL GO UP, INDUSTRY WILL GET HURT, NOT A LOT WILL BE ACHIEVED, AND YOU'LL HAVE TO CHANGE BECAUSE IF THERE IS ONE THING AMERICA LIKES MORE THAN CHASING BOOGIE MEN, IT IS ITS INDUSTRIES MAKING MONEY AND IT'S PEOPLE IN JOBS.

We don't have to go through this lesson again, do we? It's only been 20 years since the last time.

9. US economy weak now Boak, AP economics Writer, 5 – 7 – 15

[Josh Boak, A Hazy View of U.S. Economy Emerges,
<http://www.usnews.com/news/business/articles/2015/05/07/a-hazy-view-of-us-economy-emerges-ahead-of-april-jobs-report>]

When the government reports Friday on job growth during April, it could help clarify an increasingly nagging question:

Just HOW STRONG IS THE U.S. ECONOMY?

THE PICTURE HAS GROWN HAZIER OF LATE. Employers added only 126,000 jobs in March, ending a yearlong streak of monthly gains above 200,000. For April, economists predict a rebound to 222,500 added jobs.

Yet WEAKNESSES HAVE EMERGED IN REPORTS SHOWING FALLING WORKER PRODUCTIVITY, A SLOWDOWN IN EXPORTS, MODEST CONSUMER SPENDING AND SLUGGISH OVERALL ECONOMIC EXPANSION.

Over the past few years, the United States has served as a powerful engine for the world's economy. But on Thursday, THE INTERNATIONAL MONETARY FUND PREDICTED THAT ASIAN ECONOMIES WOULD LEAD GLOBAL GROWTH IN 2015, IN PART THANKS TO RECOVERIES IN INDIA AND JAPAN.

SINCE THE YEAR BEGAN, THE U.S. ECONOMY HAS SENT SIGNALS OF BOTH POTENTIAL STRENGTH AND POTENTIALLY DEBILITATING WEAKNESS. LOWER OIL PRICES HAVE FORCED CUTBACKS AT ENERGY COMPANIES AND THE MANUFACTURERS SUPPLYING THEM. THE STRONGER DOLLAR HAS SQUASHED EXPORT GROWTH AND HELD DOWN CORPORATE PROFITS. WORKER PAY, A CHRONIC DRAG ON U.S. GROWTH, HAS YET TO RISE SIGNIFICANTLY FOR MANY.

Ext – Offshoring Doesn't Help

Pro offshoring studies flawed

Bivens, Research and Policy Director at the Economic Policy Institute (EPI), 05

[L. Josh Bivens, Truth and consequences of offshoring, Recent studies overstate the benefits and ignore the costs to American workers, Briefing Paper #155, <http://www.epi.org/publication/bp155/>]

Over the past two years, ECONOMIC OBSERVERS HAVE FOCUSED ATTENTION ON A NEW TREND IN THE AMERICAN ECONOMY: INCREASED GLOBAL COMPETITION FOR WHITE-COLLAR JOBS that used to seem well-insulated and secure. While blue-collar labor (particularly in manufacturing) has felt a squeeze from global competition for decades, both in terms of employment security and wage growth, white-collar jobs held by well-credentialed Americans have been largely safe from pressures stemming from the global labor market. RECENT REPORTS OF COMPANIES SENDING WORK ABROAD, RANGING FROM CALL-CENTER OPERATORS TO SOFTWARE PROGRAMMERS, HAVE CHANGED THIS FEELING OF SECURITY.

SUCH INSECURITY, especially coming from a group that many assumed would be a prime beneficiary of globalization—i.e., well-credentialed, white-collar workers—HAS GENERATED A POTENT POLITICAL ANXIETY ABOUT THE IMPLICATIONS OF GLOBAL ECONOMIC INTEGRATION for American workers.

In response to this anxiety and an incipient political backlash against offshoring, a number of studies have been released by various organizations touting large economic benefits that will accrue to the American economy through the offshoring of white-collar work. A CLOSER EXAMINATION OF these STUDIES, however, SHOWS THAT THE PROMISED BENEFITS OF OFFSHORING ARE FAR OVERSTATED, while the likely economic costs are not addressed at all. FURTHER, EVEN THE POTENTIAL BENEFITS TO THE AMERICAN ECONOMY FROM OFFSHORING ARE LIKELY TO BE CONCENTRATED IN THE INCOMES OF A RELATIVELY SELECT PERCENTAGE OF AMERICAN HOUSEHOLDS.

This briefing paper examines three STUDIES CLAIMING THAT THE OFFSHORING OF WHITE-COLLAR WORK WILL RESULT IN LARGE BENEFITS to the U.S. economy. These studies—written by McKinsey Global Institute (MGI), Global Insight (GI), and Catherine Mann in a policy brief for the Institute for International Economics (IIE)—HAVE BEEN CITED OFTEN in business reporting about the overall impact of white-collar offshoring on the American economy. HOWEVER, THESE FINDINGS DO NOT HOLD UP TO SCRUTINY, AND in fact, EACH paper MAKES EXCESSIVE CLAIMS ABOUT THE BENEFITS OF WHITE-COLLAR OFFSHORING.

Economy Impact Answers

Empirics prove no war.

Miller 1—Morris Miller is an adjunct economics professor at the University of Ottawa [Jan.-Mar, 2001, "Poverty: A Cause of War?" *Peace Magazine*, <http://peacemagazine.org/archive/v17n1p08.htm>]

Economic Crises?

SOME SCHOLARS HAVE ARGUED THAT IT IS NOT POVERTY, as such, THAT CONTRIBUTES TO the support for ARMED CONFLICT, BUT rather some catalyst, such as an ECONOMIC CRISIS. HOWEVER, A STUDY BY Minxin PEI AND Ariel ADESNIK SHOWS THAT THIS HYPOTHESIS LACKS MERIT. AFTER STUDYING 93 EPISODES OF ECONOMIC CRISIS IN 22 COUNTRIES in Latin American and Asia SINCE WORLD WAR II, THEY CONCLUDED THAT MUCH OF THE CONVENTIONAL THINKING ABOUT THE POLITICAL IMPACT OF ECONOMIC CRISIS IS WRONG:

"THE SEVERITY OF ECONOMIC CRISIS—as measured in terms of inflation and negative growth—BORE NO RELATIONSHIP TO THE COLLAPSE OF REGIMES ... OR (in democratic states, rarely) TO AN OUTBREAK OF VIOLENCE... In the cases of dictatorships and semi-democracies, THE RULING ELITES RESPONDED TO CRISES BY INCREASING REPRESSION (thereby USING ONE FORM OF VIOLENCE TO ABORT ANOTHER)."

No impact to the economy

Jervis 11—Robert Jervis, Professor in the Department of Political Science and School of International and Public Affairs at Columbia University [December 2011, "Force in Our Times," *Survival*, Vol. 25, No. 4, p. 403-425]

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be A WORSENING OF the CURRENT ECONOMIC DIFFICULTIES, which COULD itself PRODUCE GREATER NATIONALISM, UNDERMINE DEMOCRACY AND BRING BACK OLD-FASHIONED BEGGAR-MY-NEIGHBOR ECONOMIC POLICIES. WHILE THESE DANGERS ARE REAL, it is hard to believe that the conflicts could be great enough TO LEAD the MEMBERS OF THE COMMUNITY TO CONTEMPLATE FIGHTING EACH OTHER. IT IS NOT SO MUCH THAT ECONOMIC INTERDEPENDENCE has proceeded to the point where it COULD NOT BE REVERSED – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. RATHER IT IS THAT even if the more extreme versions of free trade and economic liberalism become discredited, IT IS HARD TO SEE HOW without building on a preexisting high level of political conflict LEADERS AND MASS OPINION WOULD COME TO BELIEVE THAT THEIR COUNTRIES COULD PROSPER BY IMPOVERISHING OR even ATTACKING OTHERS. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? WHILE A PESSIMIST

COULD NOTE THAT THIS ARGUMENT DOES NOT APPEAR AS OUTLANDISH AS IT DID BEFORE THE FINANCIAL CRISIS, AN OPTIMIST COULD REPLY (CORRECTLY, in my view) THAT THE VERY FACT THAT WE HAVE SEEN **such a sharp economic down-turn** WITHOUT **anyone** SUGGESTING THAT FORCE of arms IS THE SOLUTION SHOWS THAT **even if bad times bring about greater economic conflict, it will not make war thinkable.**

Answers to “Growth solves Poverty”

Economic growth causes poverty

Trainer 7—Visiting Fellow in the Faculty of Arts at the University of NSW (Ted, “We can't go on living like this”, <http://www.onlineopinion.com.au/author.asp?id=1973>)

WE SAY WE WANT TO save the environment, and to have peace, and to ELIMINATE POVERTY. And we do - but only until we see what this requires. THE FUNDAMENTAL CAUSE OF THE big global PROBLEMS THREATENING US NOW IS SIMPLY OVER-CONSUMPTION, THE RATE AT WHICH WE IN RICH COUNTRIES ARE USING UP RESOURCES IS GROSSLY UNSUSTAINABLE. It's far beyond levels that can be kept up for long or that could be spread to All people. Yet MOST PEOPLE TOTALLY FAIL TO GRASP THE MAGNITUDE OF THE OVER-SHOOT. The REDUCTIONS REQUIRED ARE SO BIG THAT THEY CANNOT BE ACHIEVED WITHIN A CONSUMER-CAPITALIST SOCIETY. HUGE AND EXTREMELY RADICAL CHANGE TO VERY SYSTEMS AND CULTURE ARE NECESSARY.

Growth leads to increased inequality – decline solves

Hugh **Stretton 76**. “Capitalism, Socialism and the Environment”. Cambridge University Press. Hugh Stretton AC (born 15 July 1924) is an Australian historian and professor and Rhodes Scholar. He was educated at Mentone Grammar School, Scotch College, Melbourne, the University of Melbourne, the University of Oxford and Princeton University.[1] He has been voted one of Australia's ten most influential public intellectuals[2]. GD

ENVIRONMENTAL STRESSES VARIED from year to year and from country to country ACCORDING TO NATIONAL LUCK AND RESOURCES. But HOWEVER THE PROBLEMS VARIED, THE DEMOCRACIES DEALT WITH THEM ROUTINELY. They DEVELOPED THEIR EXISTING MACHINERY FOR RURAL AND URBAN CONSERVATION, national parks, CLEAN AIR AND WATER, pure food, public health, AND SO ON. WHENEVER THEY FOUND THOSE WELL-TRIED METHODS INSUFFICIENT THEY MADE pragmatic INNOVATIONS OF THE KINDS RECOMMENDED BY their ENVIRONMENTAL ECONOMISTS AND ADMINISTRATORS. Inequalities increased. That was NOT BECAUSE ENVIRONMENTAL POLITICIANS INTRODUCED REACTIONARY PHILOSOPHIES - BEING DEMOCRATIC POLITICIANS THEY ASSURED THE WORLD AS BLANDLY AS EVER THAT THEIR POLICIES HAD SCARCELY ANY COSTS AND BENEFITED EVERYBODY. But ALTHOUGH THERE WAS NO SYSTEMATIC PHILOSOPHY OF DISTRIBUTION THERE WAS A SYSTEMATIC EFFECT: INEQUALITIES INCREASED. They did not increase to a South African scale. The democracies were not as bad as the frostbitten oligarchies of the previous chapter. For one thing they were not as frugal. Perhaps self-government is always self-indulgent, as the oligarchs alleged. Democracies do seem to behave, like many of their investors and economists, as 5 percenters - they discount futures at 5 % per year and rarely worry more than twenty years ahead. That is far enough to iron out short fluctuations - after the famous one in the 1970s there have been no more temporary fuel crises - but of course it is not far enough ahead to guarantee the perpetual stability that some conservationists dream of. DEMOCRATIC ADMINISTRATORS CAN 'T PROVE THAT THERE WILL NEVER BE A GLOBAL DOOMSDAY. But THEY DO INVEST HEAVILY IN RESEARCH AND TECHNICAL DEVELOPMENT. WhETHER OR NOT THAT AVERTS ANY DOOMSDAY it MAKES LIFE MORE COMFORTABLE MEANWHILE. Whenever a technical change ameliorates an environmental problem, to that degree the need for abstinence is less. So THE HARDSHIPS are less. For democratic reasons they ARE also a little BETTER DISTRIBUTED. Traditions of welfare have survived, the votes of the poor still carry some weight, labor unions have held on to some entrenched positions. There were also for a while some traditions of common cause and shared sacrifice. The Y LIVED ON AS SENTIMENTAL MEMORIES OF NATIONAL CRISES RATHER THAN AS PEACETIME PRINCIPLES OF COMMERCIAL OR POLITICAL

BEHAVIOR, so it was only in times of crisis that they had much effect - which accounts for an ironical rhythm in the relations between inequalities and environmental troubles. There were periods when new troubles were mild enough to be met without actual loss - the year's new corrective measures absorbed only part of the year's increase of productivity. Such LIGHT COSTS WERE SPREAD AS IMPERCEPTIBLY AS POSSIBLE, usually through inflation and price movements, to fall chiefly onto the mass of householders and consumers. Thus THE YEARS OF LEAST TROUBLE SAW LEAST INCREASE OF HARDSHIP, BUT MOST INCREASE OF INEQUALITY. At THE OPPOSITE EXTREME WERE TIMES OF CRISIS WHEN THERE WAS NEGATIVE ECONOMIC GROWTH, WITH SUDDEN UNEMPLOYMENT AND ACUTE SHORTAGES OF PARTICULAR RESOURCES. Those more dramatic HARDSHIPS HAD TO BE DISTRIBUTED WITH A GREATER SHOW OF FAIRNESS. There were emergency doles and transfers, emergency rations. Some rich accepted symbolic losses, sometimes real, usually temporary. So IN BAD YEARS THERE WAS MORE SUFFERING BUT SLIGHTLY LESS INEQUITY. The DEMOCRACIES WERE thus GENTLER IN THE WAY THEY INCREASE INEQUALITIES - BUT THEY DID INCREASE THEM. They DID IT NEGATIVELY BY THEIR RESPONSES TO SHORTAGES, INVOLUNTARILY BY THEIR MECHANISMS OF INFLATION, AND POSITIVELY BY THE WAY THEY DISTRIBUTED THE COSTS AND CONSEQUENCES OF ENVIRONMENTAL REFORM.

Ext – US Economy Weak Now

US economy is weak

New York Times 4 – 29 – 15

[Nelson D. Schwartz, U.S. Economy Grew at 0.2% Rate in First Quarter,
http://www.nytimes.com/2015/04/30/business/gdp-q1-united-states-economy.html?_r=0]

Repeating an all-too-familiar pattern, THE AMERICAN ECONOMY SLOWED TO A CRAWL IN THE FIRST QUARTER OF 2015, WEIGHED DOWN BY A WEAKER TRADE PERFORMANCE, FALLING BUSINESS INVESTMENT AND STILL-CAUTIOUS CONSUMERS.

At 0.2 percent, the annualized growth rate last quarter was better than the winter wipeout in the first quarter of 2014, when the economy contracted at a 2.1 percent rate. But THE FIGURES RELEASED on Wednesday BY THE COMMERCE DEPARTMENT CONFIRM OTHER SIGNALS in recent weeks THAT THE ECONOMY, WHICH WAS HIT AGAIN BY HARSH WEATHER IN LARGE PORTIONS OF THE NATION, BEGAN 2015 BY TREADING AT WATER AT BEST.

“THE U.S. ECONOMY STUMBLERD BADLY in the first quarter,” SAID Scott ANDERSON, senior vice president and chief economist at Bank of the West in San Francisco. “MODEST GROWTH IN THE FOURTH QUARTER OF 2014 TURNED INTO VIRTUALLY NO GROWTH IN THE FIRST QUARTER OF 2015.”

THE ANEMIC SHOWING WAS LED BY TWO AREAS THAT WERE ESPECIALLY WEAK: NET EXPORTS AND BUSINESS INVESTMENT.

Real Economic Growth

Annual rate of change in the gross domestic product, based on quarterly figures adjusted for inflation and seasonal fluctuations.

PLUNGING INVESTMENT BY BUSINESSES ALSO WEIGHED ON THE AMERICAN ECONOMY, A TREND SOME EXPERTS ATTRIBUTE TO BIG CUTS IN SPENDING IN THE ENERGY SECTOR, as falling oil prices prompted drillers and oil production companies to pull back on new projects.

AT: Overload Core Michigan 7

A2: terror da

Yes Overload

Experts agree – squo surveillance is counterproductive and wastes money

Ward 15 – staff writer (Stan, “NSA swamped with data overload also trashes the Constitution,” Best VPN, 5/18/2015, <https://www.bestvpn.com/blog/19187/nsa-swamped-with-data-overload-also-trashes-the-constitution/>) //RGP

Almost on the second anniversary of the Edward Snowden revelations, ANOTHER (in)FAMOUS NSA WHISTLEBLOWER HAS AGAIN SPOKEN UP. This comes at a pivotal juncture in the legislative calendar as contentious debate about surveillance rages over the impending sunset of some of the Patriot Act. IT HAS LONG BEEN AN ARGUMENT of the civil liberties crowd THAT BULK DATA GATHERING WAS COUNTER-PRODUCTIVE, if not counter- intuitive. The argument was couched in language suggesting that TO “COLLECT IT ALL”, AS The then NSA director James CLAPPER FAMOUSLY DECRIED, was to, in effect, gather nothing, AS THE choking amounts of information COLLECTED WOULD BE SO GREAT AS TO BE UNABLE TO BE ANALYZED EFFECTIVELY. This assertion is supported by William Binney, a founder of Contrast Security and a former NSA official, logging more than three decades at the agency. IN ALLUDING TO WHAT HE TERMED “BULK DATA FAILURE”, BINNEY SAID THAT AN ANALYST TODAY CAN RUN ONE SIMPLE QUERY ACROSS THE NSA’S VARIOUS DATABASES, ONLY TO BECOME IMMEDIATELY OVERLOADED WITH INFORMATION. With about four billion people (around two-thirds of the world’s population) under the NSA and partner agencies’ watchful eyes, according to his estimates, THERE IS FAR TOO MUCH DATA BEING COLLECTED. “THAT’S WHY THEY COULDN’T STOP THE BOSTON BOMBING, OR THE PARIS SHOOTINGS, BECAUSE THE DATA WAS ALL THERE... The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that. But that doesn’t stop it.” Binney is in a position to know, EARNING HIS STRIPES DURING THE TERRORISM BUILD UP THAT CULMINATED WITH THE 9/11 WORLD TRADE CENTER BOMBING IN 2001. He left just days after the draconian legislation known as the USA Patriot Act was enacted by Congress on the heels of that attack. One of the reasons which prompted his leaving was the scrapping of a surveillance system on which he long worked, only to be replaced by more intrusive systems. It is interesting to note here that Edward Snowden, in alluding to Binney, said he was inspired by Binney’s plight, and that this, in part, prodded him to leak thousands of classified documents to journalists. Little did Binney know that his work was to be but the tip of the iceberg in a program that eventually grew to indiscriminately “collect it all.” What is worrisome is the complicity with the bulk data collection by dozens of private companies – maybe as many as 72. Yet THIS TYPE OF COLLECTION PALES IN COMPARISON TO THAT OF THE “UPSTREAM” PROGRAM IN WHICH THE NSA TAPPED INTO UNDERSEA FIBER OPTIC CABLES. With the cooperation of Britain’s GCHQ, the NSA is able to sift more than 21 petabytes a day. GATHERING SUCH ENORMOUS AMOUNTS OF INFORMATION IS EXPENSIVE AND INEFFECTIVE, ACCORDING TO BINNEY, BUT IT GETS LAWMAKERS ATTENTION IN A WAY THAT RESULTS IN MASSIVE INCREASES IN NSA BUDGETS. Binney warns that, “They’re taking away half of the Constitution in secret.” President Obama has presided over this agency’s land grab, and has endorsed it, often to referring to Upstream as a “critical national security tool.” His feckless approach to the spying build up is the reason for its proliferation, and is why Congress meanders rudderless in attempts to curtail it. The President’s anti-privacy stance is being “rewarded” by repudiation among members of his own party, and is reflected in their rejecting his latest legacy-building, pet piece of legislation – the Trans Pacific Partnership (TPP). But their constituents would be better served by producing legislation that would restore Constitutional rights trampled on by the NSA.

Bulk data collection fails – it saps critical resources and diverts attention

Maass 15 – Journalist for The Intercept (Peter, “INSIDE NSA, OFFICIALS PRIVATELY CRITICIZE “COLLECT IT ALL” SURVEILLANCE,” The Intercept, 5/28/2015, <https://firstlook.org/theintercept/2015/05/28/nsa-officials-privately-criticize-collect-it-all-surveillance/>) //RGP

AS MEMBERS OF CONGRESS struggle to agree on which surveillance programs to re-authorize before the Patriot Act expires, they might consider the unusual advice of an intelligence analyst at the National Security Agency who warned about the danger of collecting too much data. Imagine, the analyst wrote in a leaked document, that you are standing in a shopping aisle trying to decide between jam, jelly or fruit spread, which size, sugar-free or not, generic or Smucker’s. It can be paralyzing. “WE IN THE AGENCY ARE AT RISK OF A

SIMILAR, COLLECTIVE PARALYSIS IN THE FACE OF A DIZZYING ARRAY OF CHOICES EVERY SINGLE DAY,” the analyst wrote in 2011. “ANALYSIS PARALYSIS’ ISN’T only a cute rhyme. It’s THE TERM FOR WHAT HAPPENS WHEN YOU SPEND SO MUCH TIME ANALYZING A SITUATION THAT YOU ULTIMATELY STYMIE ANY OUTCOME ... It’s what happens in SIGINT [signals intelligence] when we have access to endless possibilities, but we struggle to prioritize, narrow, and exploit the best ones.” The document is one of about a dozen in which NSA INTELLIGENCE EXPERTS EXPRESS CONCERNS usually heard from the agency’s critics: THAT THE U.S. GOVERNMENT’S “COLLECT IT ALL” STRATEGY CAN UNDERMINE THE EFFORT TO FIGHT TERRORISM. The documents, provided to The Intercept by NSA whistleblower Edward Snowden, appear to contradict years of statements from senior officials who have claimed that pervasive surveillance of global communications helps the government identify terrorists before they strike or quickly find them after an attack. THE PATRIOT ACT, portions of which expire on Sunday, has been used since 2001 to conduct a number of dragnet surveillance programs, including the bulk collection of phone metadata from American companies. But the DOCUMENTS SUGGEST THAT ANALYSTS AT THE NSA HAVE DROWNED IN DATA SINCE 9/11, MAKING IT MORE DIFFICULT FOR THEM TO FIND THE REAL THREATS. The titles of the documents capture their overall message: “Data Is Not Intelligence,” “The Fallacies Behind the Scenes,” “Cognitive Overflow?” “Summit Fever” and “In Praise of Not Knowing.” Other titles include “Dealing With a ‘Tsunami’ of Intercept” and “Overcome by Overload?” The documents are not uniform in their positions. Some acknowledge the overload problem but say the agency is adjusting well. They do not specifically mention the Patriot Act, just the larger dilemma of cutting through a flood of incoming data. But IN AN APPARENT SIGN OF THE SCALE OF THE PROBLEM, THE DOCUMENTS CONFIRM THAT THE NSA EVEN HAS A SPECIAL CATEGORY OF PROGRAMS THAT IS CALLED “COPING WITH INFORMATION OVERLOAD.” The jam vs. jelly document, titled “Too Many Choices,” started off in a colorful way but ended with a fairly stark warning: “The SIGINT mission is far too vital to unnecessarily expand the haystacks while we search for the needles. Prioritization is key.” THESE DOUBTS ARE INFREQUENTLY HEARD FROM OFFICIALS INSIDE THE NSA. These DOCUMENTS ARE A WINDOW INTO THE PRIVATE THINKING OF mid-level OFFICIALS who are almost never permitted to discuss their concerns in public. AN AMUSING PARABLE circulated at the NSA a few years ago. Two people go to a farm and purchase a truckload of melons for a dollar each. They then sell the melons along a busy road for the same price, a dollar. As they drive back to the farm for another load, they realize they aren’t making a profit, so one of them suggests, “Do you think we need a bigger truck?” The parable was written by an intelligence analyst in a document dated Jan. 23, 2012 that was titled, “Do We Need a Bigger SIGINT Truck?” It expresses, in a lively fashion, a critique of the agency’s effort to collect what former NSA Director Keith Alexander referred to as “the whole haystack.” The critique goes to the heart of the agency’s drive to gather as much of the world’s communications as possible: because it may not find what it needs in a partial haystack of data, the haystack is expanded as much as possible, on the assumption that more data will eventually yield useful information. “THE PROBLEM IS THAT WHEN YOU COLLECT IT ALL, WHEN YOU MONITOR EVERYONE, YOU UNDERSTAND NOTHING.” –EDWARD SNOWDEN The Snowden files show that in practice, it doesn’t turn out that way: MORE IS NOT NECESSARILY BETTER, AND IN FACT, EXTREME VOLUME CREATES ITS OWN CHALLENGES. “Recently I tried to answer what seemed like a relatively straightforward question about which telephony metadata collection capabilities are the most important in case we need to shut something off when the metadata coffers get full,” wrote the intelligence analyst. “By the end of the day, I felt like capitulating with the white flag of, ‘We need COLOSSAL data storage so we don’t have to worry about it,’ (aka we need a bigger SIGINT truck).” The analyst added, “WITHOUT METRICS, HOW DO WE KNOW THAT WE HAVE IMPROVED SOMETHING OR MADE IT WORSE?” There’s a running joke ... that we’ll only know if collection is important by shutting it off and seeing if someone screams.” Another document, while not mentioning the dangers of collecting too much data, expressed concerns about pursuing entrenched but unproductive programs. “How many times have you been watching a terrible movie, only to convince yourself to stick it out to the end and find out what happens, since you’ve already invested too much time or money to simply walk away?” the document asked. “THIS ‘GONE TOO FAR TO STOP NOW’ MENTALITY IS OUR BUILT-IN MECHANISM TO HELP US ALLOCATE AND RATION RESOURCES. However, it can work to our detriment in prioritizing and deciding which projects or efforts are worth further expenditure of resources, regardless of how much has already been ‘sunk.’ As has been said before, insanity is doing the same thing over and over and expecting different results.” “WE ARE DROWNING IN INFORMATION. AND YET WE KNOW NOTHING. FOR SURE.” –NSA INTELLIGENCE ANALYST Many of these documents were written by intelligence analysts who had regular columns distributed on NSANet, the agency’s intranet. One of the columns was called “Signal v. Noise,” another was called “The SIGINT Philosopher.” Two of the documents cite the academic work of Herbert Simon, who won a Nobel Prize for his pioneering research on what’s become known as the attention economy. Simon wrote that consumers and managers have trouble making smart choices because their exposure to more information decreases their ability to understand the information. Both documents mention the same passage from Simon’s essay, Designing Organizations for an Information-Rich World: “IN AN INFORMATION-RICH WORLD, THE WEALTH OF INFORMATION MEANS A DEARTH OF SOMETHING ELSE: A SCARCITY OF WHATEVER IT IS THAT INFORMATION CONSUMES. WHAT INFORMATION CONSUMES IS RATHER OBVIOUS: IT CONSUMES THE

ATTENTION OF ITS RECIPIENTS. Hence A WEALTH OF INFORMATION CREATES A POVERTY OF ATTENTION AND A NEED TO ALLOCATE THAT ATTENTION EFFICIENTLY AMONG THE OVERABUNDANCE OF INFORMATION SOURCES THAT MIGHT CONSUME IT." In addition to consulting Nobel-prize winning work, NSA analysts have turned to easier literature, such as Malcolm Gladwell's best-selling Blink: The Power of Thinking Without Thinking. The author of a 2011 document referenced Blink and stated, "THE KEY TO GOOD DECISION MAKING IS NOT KNOWLEDGE. IT IS UNDERSTANDING. WE ARE SWIMMING IN THE FORMER. WE ARE DESPERATELY LACKING IN THE LATTER." The author added, "Gladwell has captured one of the biggest challenges facing SID today. Our costs associated with this information overload are not only financial, such as the need to build data warehouses large enough to store the mountain of data that arrives at our doorstep each day, but also include the more intangible costs of too much data to review, process, translate and report." Alexander, the NSA director from 2005 to 2014 and chief proponent of the agency's "collect it all" strategy, vigorously defended the bulk collection programs. "What we have, from my perspective, is a reasonable approach on how we can defend our nation and protect our civil liberties and privacy," he said at a security conference in Aspen in 2013. He added, "You need the haystack to find the needle." The same point has been made by other officials, including James Cole, the former deputy attorney general who told a congressional committee in 2013, "If you're looking for the needle in the haystack, you have to have the entire haystack to look through." NSA Slide, May 2011 The opposing viewpoint was voiced earlier this month by Snowden, who noted in an interview with the Guardian that THE MEN WHO COMMITTED RECENT TERRORIST ATTACKS IN FRANCE, CANADA AND AUSTRALIA WERE UNDER SURVEILLANCE—THEIR DATA WAS IN THE HAYSTACK YET THEY WEREN'T SINGLED OUT. "IT WASN'T THE FACT THAT WE WEREN'T WATCHING PEOPLE OR NOT," SNOWDEN SAID. "IT WAS THE FACT THAT WE WERE WATCHING PEOPLE SO MUCH THAT WE DID NOT UNDERSTAND WHAT WE HAD. The problem is that WHEN YOU COLLECT IT ALL, WHEN YOU MONITOR EVERYONE, YOU UNDERSTAND NOTHING." In a 2011 interview with SIDtoday, a deputy director in the Signals Intelligence Directorate was asked about "analytic modernization" at the agency. His response, while positive on the NSA's ability to surmount obstacles, noted that it faced difficulties, including the fact that some targets use encryption and switch phone numbers to avoid detection. He pointed to volume as a particular problem. "WE LIVE IN AN INFORMATION AGE WHEN WE HAVE MASSIVE RESERVES OF INFORMATION AND DON'T HAVE THE CAPABILITY TO EXPLOIT IT," he stated. "I was told that there are 2 petabytes of data in the SIGINT System at any given time. How much is that? That's equal to 20 million 4-drawer filing cabinets. How many cabinets per analyst is that? By the end of this year, we'll have 1 terabyte of data per second coming in. You can't crank that through the existing processes and be effective." The documents noted the difficulty of sifting through the ever-growing haystack of data. For instance, a 2011 document titled "ELINT Analysts – Overcome by Overload? Help is Here with IM&S" outlined a half dozen computer tools that "are designed to invert the paradigm where an analyst spends more time searching for data than analyzing it." Another document, written by an intelligence analyst in 2010, bluntly stated that "we are drowning in information. And yet we know nothing. For sure." The analyst went on to ask, "Anyone know just how many tools are available at the Agency, alone? Would you know where to go to find out? Anyone ever start a new target...without the first clue where to begin? Did you ever start a project wondering if you were the sole person in the Intelligence Community to work this project? How would you find out?" The analyst, trying to encourage more sharing of tips about the best ways to find data in the haystack, concluded by writing, in boldface, "Don't let those coming behind you suffer the way you have." THE AGENCY APPEARS TO BE SPENDING SIGNIFICANT SUMS OF MONEY TO SOLVE THE HAYSTACK PROBLEM. The document headlined "Dealing With a 'Tsunami' of Intercept," written in 2006 by three NSA officials and previously published by The Intercept, outlined a series of programs to prepare for a near future in which the speed and volume of signals intelligence would explode "almost beyond imagination." The document referred to a mysterious NSA entity—the "Coping With Information Overload Office." This appears to be related to an item in the Intelligence Community's 2013 Budget Justification to Congress, known as THE "BLACK BUDGET"—\$48.6 MILLION FOR PROJECTS RELATED TO "COPING WITH INFORMATION OVERLOAD."

Mass surveillance is counter-productive for fighting terrorism – it causes information overload

Gross 13 – covers technology and telecom policy in the U.S. government for the IDG News Service, and is based in Washington, D.C. (Grant, "Critics question whether NSA data collection is effective," PC World, 6/25/2013, <http://www.pcworld.com/article/2042976/critics-question-whether-nsa-data-collection-is-effective.html>) //RGP

The RECENTLY REVEALED MASS COLLECTION OF PHONE RECORDS AND OTHER COMMUNICATIONS BY THE U.S. NATIONAL SECURITY AGENCY MAY NOT BE EFFECTIVE IN PREVENTING TERRORISM, according to some critics. THE DATA COLLECTION PROGRAMS, as revealed by former NSA contractor Edward Snowden, IS GIVING GOVERNMENT AGENCIES information overload, critics said during the Computers, Freedom and Privacy Conference in Washington, D.C. "IN KNOWING A LOT ABOUT A LOT OF DIFFERENT PEOPLE [THE DATA COLLECTION] IS GREAT FOR THAT," said Mike German, a former Federal Bureau of Investigation special agent whose policy counsel for national security at the American Civil Liberties Union. "IN ACTUALLY FINDING THE VERY FEW BAD ACTORS THAT ARE OUT THERE, NOT SO GOOD." The mass collection of data from innocent people "won't tell you how guilty people act," German added. THE PROBLEM WITH CATCHING TERRORISM SUSPECTS HAS NEVER BEEN THE INABILITY TO COLLECT INFORMATION, BUT TO ANALYZE THE "OCEANS" OF INFORMATION COLLECTED, he said. MASS DATA COLLECTION IS "LIKE trying to look for needles by building bigger haystacks," added Wendy Grossman, a freelance technology writer who helped organize the conference. But Timothy Edgar, a former civil liberties watchdog in the Obama White House and at the Office of Director of National Intelligence, partly defended the NSA collection programs, noting that U.S. intelligence officials attribute the surveillance programs with preventing more than 50 terrorist actions. Some critics have disputed those assertions. Edgar criticized President Barack Obama's administration for keeping the NSA programs secret. He also said it was "ridiculous" for Obama to suggest that U.S. residents shouldn't be concerned about privacy because the NSA is collecting phone metadata and not the content of phone calls. Information about who people call and when they call is sensitive, he said. But Edgar, now a visiting fellow at the Watson Institute for International Studies at Brown University, also said that Congress, the Foreign Intelligence Surveillance Court and internal auditors provide some oversight of the data collection programs, with more checks on data collection in place in the U.S. than in many other countries. Analysts can query the phone records database only if they see a connection to terrorism, he said. The U.S. has some safeguards that are "meaningful and substantive, although I'm sure many in this room ... and maybe even me, if I think about it long enough, might think they're not good enough," Edgar said. While German noted that the NSA has reported multiple instances of unauthorized access by employees to the antiterrorism databases, Edgar defended the self-reporting. "It's an indication of a compliance system that's actually meaningful and working," he said. "If you had a compliance system that said there was no violation, there were never any mistakes, there was never any improper targeting that took place ... that would be an indication of a compliance regime that was completely meaningless." THE MASS DATA COLLECTION COMBINED WITH BETTER DATA ANALYSIS TOOLS TRANSLATES INTO AN "ARMS RACE" WHERE INTELLIGENCE OFFICIALS TRY TO FIND NEW CONNECTIONS WITH THE DATA THEY COLLECT, said Ashkan Soltani, a technology and privacy consultant. NEW DATA ANALYSIS TOOLS LEAD INTELLIGENCE OFFICIALS TO BELIEVE THEY CAN FIND MORE LINKS TO TERRORISM IF THEY JUST HAVE "ENOUGH DATA," BUT THAT BELIEF IS "too much sci fi," he said. "THIS IS THE DIFFICULT PART, IF YOU'RE SAYING THAT IF WE HAVE ENOUGH DATA WE'LL BE ABLE TO PREDICT THE FUTURE," the ACLU's German said.

NSA is overloaded – disproportion between analysts and data risks surprises SIDtoday, 11

The Signals Intelligence Directorate Today Editor, "Is There a Sustainable Ops Tempo in S2? How Can Analysts Deal With the Flood of Collection? – An interview with [redacted] (conclusion)," 4/16/11, <https://s3.amazonaws.com/s3.documentcloud.org/documents/2089125/analytic-modernization.pdf> // IS

Q: 7. (U//FOUO) Various PUSHES FOR ANALYTIC MODERNIZATION HAVE BEEN GOING ON for decades AT NSA, but now the issue really seems to be taking center stage. In fact, the number one "SIGINT Goal for 2011-2015" is to "revolutionize analysis." What's different now?

A: (S//SI//REL) We live in an Information Age when WE HAVE MASSIVE RESERVES OF INFORMATION AND DON'T HAVE THE CAPABILITY TO EXPLOIT IT. I was told that there are 2 petabytes of data in the SIGINT System at any given time. How much is that? That's equal to 20 million 4-drawer filing cabinets. How many cabinets per analyst is that?? BY THE END OF THIS YEAR, WE'LL HAVE 1 TERABYTE OF DATA

PER SECOND COMING IN. YOU CAN'T CRANK THAT THROUGH THE EXISTING PROCESSES AND BE EFFECTIVE.

Q: (U) ...So IT'S A MATTER OF VOLUME?

A: (S//SI//REL) NOT VOLUME ALONE, BUT ALSO COMPLEXITY. WE NEED TO PIECE TOGETHER THE DATA. IT'S impossible TO DO THAT USING TRADITIONAL METHODS. STRONG SELECTORS - LIKE PHONE NUMBERS - WILL BECOME A THING OF THE PAST. IT USED TO BE THAT IF YOU HAD A TARGET'S NUMBER, YOU COULD FOLLOW IT FOR MOST OF YOUR CAREER. NOT ANYMORE. My daughter doesn't even make phone calls, and many targets do the same. Also, THE COMMERCIAL MARKET DEMANDS PRIVACY, AND THIS WILL DRIVE OUR TARGETS to go encrypted, maybe INTO UNEXPLOITABLE REALMS. Our nation needs us to look for patterns surrounding a particular spot on Earth and make the connections - who can do that if not us? And we can't do it using traditional methods.

Q: (U) Looking into the future, is there anything that especially worries you? ...An eventuality (internal or external) that would make it hard for A&P to continue to put out quality intelligence?

A: (U//FOUO) I'M WORRIED THAT WE HAVE SO MUCH GOOD STUFF THAT WE COULD LOCK DOWN ANALYSTS AND HAVE THEM JUST PRODUCING PRODUCT, AND something would jump out and surprise us. So we need the discipline to invest in the wild and the unknowns.

Analyst improvement is key to check overload SID Reporting Board, 7

Signals Intelligence Directorate Reporting Board, part of the largest functional directorate in the NSA, "Data Is Not Intelligence," 09/18/07, <https://s3.amazonaws.com/s3.documentcloud.org/documents/2088973/data-is-not-intelligence.pdf> // IS

(U) 'Data Is Not Intelligence'

FROM: [Redacted]

SID Reporting Board (S12R) Run Date: 09/18/2007

(U//FOUO) THESE WORDS CAME FROM DR. THOMAS FINGAR (PICTURED) IN HIS KEYNOTE ADDRESS AT THE ANALYTIC TRANSFORMATION SYMPOSIUM IN CHICAGO on 5 September. Such a strong reminder at the opening of his address was intended to remind those at the symposium of the importance he and the Director of National Intelligence, the Honorable J. Michael McConnell, place on improving analysis throughout the Intelligence Community.

(U//FOUO) Dr. Fingar, the Deputy Director of National Intelligence for Analysis, made this statement at the opening of the symposium sponsored by the Intelligence and National Security Alliance, a non-profit, non-partisan public policy forum focusing on intelligence and national security issues. The symposium was held in Chicago, Illinois, from 4 to 6 September 2007.

(U//FOUO) DR. FINGAR CONTINUED BY SAYING THAT "INTELLIGENCE COMES FROM THE brains of analysts."

He clearly wanted those attending the symposium to understand his view of the importance of the analytic process in producing intelligence. THE EMPHASIS THROUGHOUT HIS REMARKS WAS THAT THE INTELLIGENCE COMMUNITY MUST TRANSFORM ITS ANALYTIC MISSION. THE TRANSFORMATION IS BEING EFFECTED IN THREE AREAS: ENHANCING THE QUALITY OF ANALYTIC PRODUCTS; MANAGING THE MISSION MORE EFFECTIVELY at a Community level; AND BUILDING MORE INTEGRATED ANALYTIC OPERATIONS across the Intelligence Community.

(U//FOUO) TO ENHANCE THE QUALITY OF ANALYTIC PRODUCTS, ANALYSTS THEMSELVES MUST IMPROVE. THEY CAN DO THIS BY RECEIVING MORE AND BETTER FORMAL TRAINING, AND BY CONTINUING TO LEARN THROUGH EXPERIENCE and mentoring from more experienced analysts. In addition, they must alter mindsets that keep them from sharing information, especially that which would improve an intelligence product. An adjunct to changing mindsets about sharing information is establishing trust between and among analysts as a way to improve the quality of analytic products.

(U//FOUO) In an explanation of how to manage the analytic mission more effectively at the Community level, Dr. Fingar reviewed the A-Space and Library of National Intelligence (LNI) programs. While some leaders might consider these two programs more as tools, Dr. Fingar stressed that they were programs to help analysts enhance products. A-Space will provide a virtual environment in which analysts can work on data and collaborate. The LNI will give analysts a research facility that will help them gather already-disseminated intelligence on a topic.

(U//FOUO) THE EFFORT TO BUILD MORE INTEGRATED ANALYTIC OPERATIONS INVOLVES, IN PART, GREATLY IMPROVING COLLABORATION. SETTING COMMON STANDARDS IS A KEY TO COLLABORATION, and collaboration will enhance the quality of analytic products, according to Dr. Fingar. He emphasized that the IC analytic standards recently approved were a step, but only a step. He called for "transparency" in intelligence analysis; that is, that all analysis has to be reproducible. Following established common standards will help ensure transparency. More importantly, collaboration will help establish an analytic community.

(U//FOUO) Dr. Fingar's address set the tone for the rest of the symposium. The point was that THE QUALITY OF INTELLIGENCE PRODUCTS MUST IMPROVE--MUST "transform." THE MOST IMPORTANT PART IN THE TRANSFORMATION IS THE ANALYST. IN TRAINING ANALYSTS BETTER, BY ENCOURAGING THEM TO LEARN CONTINUALLY THROUGH EXPERIENCE and mentoring, PRODUCT WILL IMPROVE. MORE EFFECTIVE MANAGEMENT, through programs such as A-Space and the LNI, WILL HELP GIVE ANALYSTS DATA AND INTELLIGENCE THEY NEED, and a better environment in which to work. COLLABORATION IS ENCOURAGED AND MADE EASIER BY THESE PROGRAMS, and collaboration is part of building integrated operations. ALL OF THESE TOGETHER WILL HELP ENSURE THAT THE QUALITY OF ANALYTIC PRODUCTS IMPROVES--THAT CUSTOMERS RECEIVE INTELLIGENCE, not data.

Data risks errors which have immediate and larger impacts – our timeframe is nanoseconds

Zoldan, 13

Ari Zoldan is an entrepreneur in the technology industry and business analyst based primarily in New York City and Washington, D.C. "More Data, More Problems: is Big Data Always Right?" Wired, May 2013, <http://www.wired.com/2013/05/more-data-more-problems-is-big-data-always-right/> // IS

Which leads us to our second problem: THE SHEER AMOUNT OF DATA! NO WONDER WE ARE MORE PRONE TO "SIGNAL ERROR" AND "CONFIRMATION BIAS." SIGNAL ERROR IS WHEN LARGE GAPS OF DATA HAVE BEEN OVERLOOKED BY ANALYSTS. If places like Coney Island and Rockaway were overlooked in Hurricane Sandy, like they were in the Twitter study, we could be looking at a higher death toll today. CONFIRMATION BIAS IS THE PHENOMENON THAT PEOPLE WILL SEARCH WITHIN THE DATA TO CONFIRM THEIR OWN PREEXISTING VIEWPOINT, AND DISREGARD THE DATA THAT GOES AGAINST THEIR PREVIOUSLY HELD POSITION. In other words, you will find what you seek out. What if FEMA looked at the Twitter data with a preexisting belief that the worst hit part of the Tri-state area was Manhattan? They may have allocated their resources in places that didn't need it the most. The third problem is best described by Marcia Richards Suelzer, senior analyst at Wolters Kluwer. She says, "WE CAN NOW MAKE CATASTROPHIC MISCALCULATIONS IN nanoseconds AND BROADCAST THEM UNIVERSALLY. WE HAVE LOST THE BALANCE IN 'LAG TIME.'" SIMPLY PUT, WHEN WE BOTCH THE FACTS, OUR ABILITY TO CREATE DAMAGE IS greatly magnified BECAUSE OF OUR ENHANCED TECHNOLOGY, GLOBAL INTERCONNECTIVITY, AND HUGE DATA SIZES.

Upstream controls the bulk of data – whistleblowers confirm

Whittaker, 15

Zack Whittaker is a writer-editor for ZDNet, and sister sites CNET and CBS News, citing an NSA whistleblower, "NSA is so overwhelmed with data, it's no longer effective, says whistleblower," ZDNet, 4/30/15, [//IS">http://www.zdnet.com/article/nsa-whistleblower-overwhelmed-with-data-ineffective/?tag=nl.e539&s_cid=e539&ttag=e539&ftag=TRE17cfd61 // IS](http://www.zdnet.com/article/nsa-whistleblower-overwhelmed-with-data-ineffective/?tag=nl.e539&s_cid=e539&ttag=e539&ftag=TRE17cfd61)

"The Upstream PROGRAM IS WHERE THE VAST BULK OF THE INFORMATION WAS BEING COLLECTED," SAID BINNEY, TALKING ABOUT HOW THE NSA TAPPED UNDERSEA FIBER OPTIC CABLES. With help from its British counterparts at GCHQ, THE NSA IS ABLE TO "BUFFER" MORE THAN 21 PETABYTES A DAY. BINNEY SAID THE "collect it all" MANTRA NOW MAY BE THE NORM, BUT IT'S **expensive AND ineffective.**

NSA's spot-a-terrorist data-mining algorithms fail

Musgrave 13 (Shawn, Projects Editor at the public records intelligence site MuckRock.com, 6/8, "Does Mining Our Big Data for Terrorists Actually Make Us Any Safer?" <http://motherboard.vice.com/blog/does-mining-our-big-data-for-terrorists-actually-make-us-any-safer//Tang>)

Whether it's at the NSA, FBI, CIA or some more classified body we mere citizens aren't mature enough to know about, data-mining is the belle of the intelligence ball. The power of statistical prediction to connect the dots, preemptively identify the bad guys and thwart the next terrorist attack has been trumpeted loudly in defense of surveillance programs, including the NSA's latest misadventure. But MANY COUNTERTERRORISM AND STATISTICAL EXPERTS DOUBT THAT EVEN THE MOST ADVANCED SPOT-A-TERRORIST ALGORITHMS CAN PRODUCE ANYTHING BEYOND FALSE POSITIVES AND MANGLED CIVIL LIBERTIES. In his address Friday afternoon, President Obama downplayed the recent revelations about NSA surveillance, dismissing much of the ensuing scrutiny as "hype." HE SAID THAT THE NSA'S EXTENSIVE COLLECTION OF PHONE CALL METADATA FROM VERIZON, SPRINT AND AT&T, AS WELL AS ITS PRISM PROGRAM to vacuum up server data from Google, Facebook, Microsoft and other Internet service providers (Dropbox coming soon!) were both legal and appropriately supervised. These

programs "HELP US PREVENT TERRORIST ATTACKS," he said, and "on net it was worth us doing." Senator Diane Feinstein, standing next to Saxby Chambliss, her Republican counterpart on the Senate Intelligence Committee, explained to the citizenry, "It's called protecting America." As construction workers put the finishing touches on the NSA's new data facility in Utah—it is said that it will be the largest data center in the world—details continue to emerge that flesh out the exact shape and scope of NSA's various dragnets. As groups like the Electronic Frontier Foundation have been warning for years, it's clear that the agency is pouring considerable resources into collecting and parsing through vast datasets in hopes of neutralizing terrorist threats. But, as has been asked of the TSA and DHS more widely, WHERE'S THE ACTUAL PROOF THESE PROGRAMS OFFER MORE BENEFITS THAN DOWNSIDES? Where are the thwarted plots to balance against the chill of privacy loss and the threats to, say, activists and the government's political opponents? AMONG NATIONAL SECURITY EXPERTS AND DATA SCIENTISTS, THERE'S CONSIDERABLE SKEPTICISM THAT NSA-STYLE DATA-MINING IS AN APPROPRIATE TOOL FOR FERRETING OUT SECURITY THREATS. As Ben Smith reported yesterday, finding the BOSTON BOMBERS RELIED ON OLD FASHIONED POLICE WORK, NOT TROVES OF DATA. In a 2008 study, THE NATIONAL RESEARCH COUNCIL CONCLUDED THAT COMBING DATA STREAMS FOR TERRORISTS IS "NEITHER FEASIBLE AS AN OBJECTIVE NOR DESIRABLE AS A GOAL." In particular, THE REPORT'S AUTHORS UNDERScore DUBIOUS DATA QUALITY AND HIGH RISK OF FALSE POSITIVES AS PRACTICAL OBSTACLES TO MINING DATA FOR SIGNATURES OF TERRORIST BEHAVIOR. "There's been considerable interest in the intelligence community around using data to identify terrorists," says Stephen Fienberg, a professor of statistics and social sciences at Carnegie Mellon University, who contributed to the NRC report. "But the specifics have always been elusive, and the claims are rarely backed up by serious empirical study." IN A 2006 INTERVIEW WITH THE NEW YORK TIMES, AN FBI OFFICIAL JOKED THAT THE ENDLESS STREAM OF LEADS MEANT MORE "CALLS TO PIZZA HUT" OR CONTACTING A "SCHOOL TEACHER WITH NO INDICATION THEY'VE EVER BEEN INVOLVED IN INTERNATIONAL TERRORISM - CASE CLOSED." Fienberg insists that the RARITY OF TERRORIST EVENTS (AND TERRORISTS THEMSELVES) MAKES PREDICTING THEIR OCCURRENCE A FRAUGHT CRAPSHOOT. He says that INTELLIGENCE ANALYSTS LACK TRAINING DATA – INDICATIVE PATTERNS OF BEHAVIOR DRAWN FROM OBSERVING MULTIPLE ITERATIONS OF A COMPLEX EVENT – TO VERIFY WHETHER THEIR MODELS HAVE PREDICTIVE VALIDITY. "These are very, very rare events – terrorist events and terrorists themselves – that you're trying to predict. Clearly there are places where this kind of predictive activity has been very successful – fraud detection in telecommunications, for example – but there we're talking not-so-rare events." Jeff Jonas, a data scientist at IBM and senior associate at the Center for Strategic and International Studies, agrees, dismissing such terrorism prediction models as "civil liberty infringement engines." In a 2006 paper co-written by Jim Harper of the Cato Institute, JONAS ASSERTS THAT SHEER PROBABILITY AND A LACK OF HISTORICAL DATA DOOMS COUNTERTERRORISM DATA-MINING TO A QUAGMIRE OF FALSE POSITIVES. "Unless investigators can winnow their investigations down to data sets already known to reflect a high incidence of actual terrorist information," Jonas and Harper write, "THE HIGH NUMBER OF FALSE POSITIVES WILL RENDER ANY RESULTS ESSENTIALLY USELESS." Ethical (not to mention constitutional) issues of wrongly painting people as terrorists aside, Jonas and Harper suggest that CHASING DOWN SO MANY BOGUS LEADS ONLY DETRACTS FROM PURSUING GENUINE ONES, AND THUS ACTUALLY HAMPERS EFFECTIVE COUNTERTERRORISM. In a 2006 interview with the New York Times, AN FBI OFFICIAL CONFIRMED THE CONSIDERABLE WASTE AND FRUSTRATION OF RUNNING DOWN BOGUS TIP-OFFS FROM THE NSA'S WIRETAP DRAGNET, JOKING THAT THE ENDLESS STREAM OF LEADS MEANT MORE "CALLS TO PIZZA HUT" or contacting a "school teacher with no indication they've ever been involved in international terrorism - case closed." Given enough data and fine-tuning of algorithms, of course, other experts emphasize that false positives can be reduced significantly, and insist that data-mining will play a key role in counterterrorism. Kim Taipale of the Center for Advanced Studies in Science and Technology Policy testified to this effect before the Senate Judiciary Committee in 2007, criticizing Jonas and Harper specifically for making "pseudo-technical" arguments that fail to reflect the way actual data-mining algorithms work. NSA's Utah data center. Photo courtesy NSA. And even critics admit that, with enough data to develop these training sets, analysts might be able to sift out terrorist markers. "If you can get your arms around a big enough set of data, you'll always find something in there," says Fred Cate, director of the Center for Applied Cybersecurity Research at Indiana University Law School, another contributor to the NRC report. "It's not unreasonable to think that the more data you can get access to that you might discover something of predictive value." The ease of mining personal data may make these systems ripe for abuse, but that ease also lends itself to a "better safe than sorry" mindset. "There's a certain 'because it's there' nature to this," says Cate. "If you know all these records are there, you worry about explaining why you didn't try to get access to them" to stop a terror plot. AS MORE AND MORE REVEALING INFORMATION FINDS ITS WAY ONLINE AND INTO COMMERCIAL DATABASES, THE TEMPTATION INCREASES FOR INTELLIGENCE AGENCIES TO GOBBLE UP THIS DATA JUST IN CASE. But the wider the net we cast—and the broader incursion on the privacy of Americans and others—the heavier the burden becomes to produce a terrorist or two. And to

Cate's knowledge, despite extensive mining, the NSA has struck no such motherlode. While the government has acknowledged that these latest data surveillance programs are several years old, they have yet to trot out any concrete evidence of their efficacy. Between the NSA's dismal record, drowsy oversight from the top-secret FISA courts and vague promises from Obama, Feinstein and others that this will all be worth it someday, Washington should buckle up for plenty more "hype" from the civil libertarian set. Absent public exposure, independent oversight, and robust evaluation, it's impossible to determine whether such efforts truly have anything to throw on the scale against citizen privacy.

NSA mass surveillance results in overload

Angwin 13 (Julia, writer for WSJ, 12/25, "NSA Struggles to Make Sense of Flood of Surveillance Data," <http://www.wsj.com/articles/SB10001424052702304202204579252022823658850//Tang>)

William BINNEY, creator of some of the computer code used by the National Security Agency to snoop on Internet traffic around the world, DELIVERED AN UNUSUAL MESSAGE HERE IN SEPTEMBER TO AN AUDIENCE WORRIED THAT THE SPY AGENCY KNOWS TOO MUCH. IT KNOWS SO MUCH, HE SAID, THAT IT CAN'T UNDERSTAND WHAT IT HAS. "WHAT THEY ARE DOING IS MAKING THEMSELVES DYSFUNCTIONAL BY TAKING ALL THIS DATA." Mr. Binney said at a privacy conference here. THE AGENCY IS DROWNING IN USELESS DATA, WHICH HARMS ITS ABILITY TO CONDUCT LEGITIMATE SURVEILLANCE, claims Mr. Binney, who rose to the civilian equivalent of a general during more than 30 years at the NSA before retiring in 2001. ANALYSTS ARE SWAMPED WITH SO MUCH INFORMATION THAT THEY CAN'T DO THEIR JOBS EFFECTIVELY, AND THE ENORMOUS STOCKPILE IS AN IRRESISTIBLE TEMPTATION FOR MISUSE. Mr. Binney's warning has gotten far less attention than legal questions raised by leaks from former NSA contractor Edward Snowden about the agency's mass collection of information around the world. Those revelations unleashed a re-examination of the spy agency's aggressive tactics. MORE Snowden Warns of Dangers of Citizen Surveillance But the NSA needs more room to store all the data it collects—and new phone records, data on money transfers and other information keep pouring in. A new storage center being built in Utah will eventually be able to hold more than 100,000 times as much as the contents of printed materials in the Library of Congress, according to outside experts. Some of the documents released by Mr. Snowden detail concerns inside the NSA about drowning in information. AN INTERNAL BRIEFING DOCUMENT IN 2012 ABOUT FOREIGN CELLPHONE-LOCATION TRACKING BY THE AGENCY SAID THE EFFORTS WERE "OUTPACING OUR ABILITY TO INGEST, PROCESS AND STORE" DATA. IN MARCH 2013, some NSA ANALYSTS ASKED FOR PERMISSION TO COLLECT LESS DATA THROUGH A PROGRAM CALLED MUSCULAR BECAUSE THE "RELATIVELY SMALL INTELLIGENCE VALUE IT CONTAINS DOES NOT JUSTIFY THE SHEER VOLUME OF COLLECTION," another document shows. In response to questions about Mr. Binney's claims, an NSA spokeswoman says the agency is "not collecting everything, but we do need the tools to collect intelligence on foreign adversaries who wish to do harm to the nation and its allies." Existing surveillance programs were approved by "all three branches of government," and each branch "has a role in oversight," she adds. In a statement through his lawyer, Mr. Snowden says: "When your working process every morning starts with poking around a haystack of seven billion innocent lives, you're going to miss things." He adds: "WE'RE BLINDING PEOPLE WITH DATA WE DON'T NEED." A PRESIDENTIAL PANEL RECOMMENDED EARLIER THIS MONTH THAT THE AGENCY SHUT DOWN ITS BULK COLLECTION OF TELEPHONE-CALL RECORDS OF ALL AMERICANS. THE FEDERAL GOVERNMENT COULD ACCOMPLISH THE SAME GOAL BY QUERYING PHONE COMPANIES, THE PANEL CONCLUDED. THE PANEL ALSO RECOMMENDED THE CREATION OF "SMART SOFTWARE" THAT COULD SORT DATA AS THE INFORMATION IS COLLECTED, rather than the current system where "vast amounts of data are swept up and the sorting is done after it has been copied" on to data-storage systems. ADMINISTRATION OFFICIALS ARE REVIEWING THE REPORT. A separate task force is expected to issue its own findings next year, and lawmakers have proposed several bills that would change how the NSA collects and uses data. The 70-year-old Mr. Binney says he is generally underwhelmed by the panel's "bureaucratic" report, though "IT WOULD BE SOMETHING MEANINGFUL" IF THE CONTROVERSY LEADS TO ADOPTION OF THE "SMART SOFTWARE" STRATEGY AND CREATION OF A TECHNOLOGY OVERSIGHT GROUP WITH FULL ACCESS TO "BE IN THE KNICKERS OF THE NSA"" and Federal Bureau of Investigation. Mr. Binney lives off his government pension and makes occasional appearances to talk about his work at the NSA. The spy agency has defended its sweeping surveillance programs as essential in the fight against terrorism. But HAVING TOO MUCH DATA

CAN HURT THOSE EFFORTS, ACCORDING TO MR. BINNEY AND A HANDFUL OF COLLEAGUES WHO HAVE RAISED CONCERNS SINCE LOSING AN INTERNAL BATTLE TO BUILD PRIVACY-PROTECTING INTERNET

SURVEILLANCE TOOLS in the late 1990s. At the time, the agency was struggling to transform itself from a monitor of mostly analog signals, such as radio and satellite transmissions, to an effective sleuth in the emerging digital world. Diane Roark, a House Intelligence Committee staff member assigned to oversee the NSA, says she was "very disturbed" to learn in meetings at the agency's headquarters in Fort Meade, Md., in 1997 "what bad shape they were in." She saw a glimmer of hope in a corner of the NSA called the Sigint Automation Research Center. Mr. Binney, who joined the agency in 1965 with a cadre of young mathematicians hired to tackle the increasingly mathematical world of ciphers and codes, was working with the research center's chief to create an innovative approach to monitoring Internet traffic. "Our approach was to focus on the known terrorist community, which predominately existed overseas," recalls Ed Loomis, who ran the research center. "However, we were also interested in any communications they had with anyone in America." The push was legally tricky. Only the FBI is allowed to collect such information within the U.S.—and usually must prove to a judge that there is a good reason to launch surveillance. Mr. Loomis worried that the rules were too restrictive and could hinder the NSA's terrorist-catching abilities. So Messrs. Binney and Loomis built a system to scrape data from the Internet, throw away the content about U.S. citizens and zoom in on the leftover metadata—or the "to" and "from" information in Internet traffic. They called it ThinThread. To keep the data-gathering effort manageable, the two men designed ThinThread to collect data within "two hops" of a suspected bad guy. That meant the system would be built to automatically flag people who communicated with "dirty numbers" or possible terrorists—and records of people who contacted them. Messrs. BINNEY AND LOOMIS ALSO BELIEVED THAT THINTHREAD'S POWERS SHOULD BE CONSTRAINED TO PROTECT THE PRIVACY OF AMERICANS. MR. BINNEY DESIGNED A WAY TO ENCRYPT ALL THE U.S. METADATA, AND THEIR PLANS ALLOWED THE SPY AGENCY'S ANALYSTS TO UNSCRAMBLE THE INFORMATION ONLY WITH PERMISSION FROM A WARRANT APPROVED BY THE FOREIGN INTELLIGENCE SURVEILLANCE COURT. The court oversees NSA

activities that affect U.S. residents. THINTHREAD WAS NEVER DEPLOYED. Agency lawyers refused to relax a ban on recording any U.S. communications. Dickie George, a senior NSA official who retired in 2011, says the consensus was that Mr. Binney's "heart was in the right place," but the technology wasn't ready. Messrs. Binney and Loomis say ThinThread could have done the job for which it was built. But Mr. Loomis was told to shut down the project. Instead, he was told, the NSA would fund a surveillance program called Trailblazer, built by outside contractors. Distraught about the decision, Messrs. Binney and Loomis and another NSA employee, Kirk Wiebe, announced plans to retire on Oct. 31, 2001. Mr. Binney reconsidered after the Sept. 11, 2001, terrorist attacks, but left as intended after hearing about new plans to use his metadata-analysis technology to hunt for terrorists. There was one big difference. The privacy protections designed to shield Americans from illegal intrusions weren't on the drawing board anymore, he says. In 2002, the three retired NSA employees and Ms. Roark asked the Defense Department's inspector general to investigate whether the decision to halt ThinThread and fund Trailblazer was made appropriately. Trailblazer's data-filtering system was never built, either. Instead, NSA officials secretly sought and won support for an array of programs to conduct warrantless wiretapping of phone and Internet content. They got similar approval to collect and analyze metadata from nearly every U.S. phone call and vast swaths of Internet traffic. Mr. Binney settled into retirement. But the spy agency's surveillance efforts began to draw more attention. In 2006, AT&T Inc. technician Mark Klein leaked documents showing that the company was working with the NSA to scour the Internet with technology that was similar to the system built by Messrs. Binney and Loomis. Outside criticism of the agency grew after articles in the New York Times and Baltimore Sun about the agency's surveillance efforts, including ThinThread. President George W. Bush briefly shut down the warrantless wiretapping program, but then parts of it were legalized by a new law passed in Congress. Meanwhile, the metadata analysis program continued in secret. Federal officials suspected the three retired NSA employees and Ms. Roark, the former House staff member, of involvement in the leaks, according to government documents. FBI agents swooped in on all four, and Mr. Binney says agents drew their guns on him while he was in the shower. A Justice Department official couldn't be reached for comment on the case. Messrs. Binney, Loomis and Wiebe and Ms. Roark weren't charged with wrongdoing, but the FBI soon pursued NSA official Thomas Drake, a ThinThread supporter. In 2010, prosecutors charged him with violating the Espionage Act, citing "willful retention" of classified documents. Mr. Drake pleaded guilty to one count of exceeding authorized use of a government computer. Mr. Drake says government officials "wanted to make an object lesson of me, drive the stake of national security right through me, and then prop me out on the public commons as punishment for holding up the mirror of their own malfeasance and usurpations of power." The raids and prosecution of Mr. Drake angered Mr. Binney. He decided to go public with his concerns. In April 2012, he spoke at an event called a "Surveillance Teach-in" at the Whitney Museum of American Art in New York. Wearing a short-sleeve, collared shirt and jeans, Mr. Binney looked like a grandfatherly professor amid the crowd of activists, some wearing Anonymous masks. "I was focused on foreign threats," he said. "Unfortunately, after 9/11, they took my solutions and directed them at this country and everybody in it." Mr. Binney's claims were hard to prove. Even Mr. Loomis, the co-creator of ThinThread, didn't think it was possible that the same NSA lawyers who refused to budge on the ban against recording any U.S. communications had approved more invasive surveillance procedures after he left the agency. "After all my struggles with those folks, I just couldn't believe that they went 180 degrees against the law," he said. In August 2012, filmmaker Laura Poitras released an eight-minute, online documentary about Mr. Binney. She called him a whistleblower. Mr. Snowden saw the video and reached out to Ms. Poitras with an avalanche of undisclosed documents, she says. Some of the documents leaked by the NSA contractor back up Mr. Binney. For example, documents detailed the agency's two clandestine metadata-surveillance programs: the bulk collection of phone-calling records and Internet traffic-analysis program. The NSA hasn't disputed the documents. THE OBAMA ADMINISTRATION SAYS THE INTERNET PROGRAM WAS SHUT DOWN IN 2011, WHILE THE BULK COLLECTION OF PHONE RECORDS STILL IS GOING ON. John C. Inglis, THE NSA'S DEPUTY DIRECTOR, TOLD LAWMAKERS IN JULY THAT THE AGENCY HAD COURT APPROVAL TO DO WARRANTLESS

"THIRD-HOP" QUERIES OF BULK TELEPHONE RECORDS. A "THIRD-HOP" ANALYSIS OF ONE SUSPECTED TERRORIST COULD ALLOW THE NSA TO SIFT THROUGH THE RECORDS OF AT LEAST A MILLION PEOPLE. Mr. BINNEY SAYS HE ADVISED NSA OFFICIALS TO "NEVER GO BEYOND TWO HOPS." HE HAS URGED LAWMAKERS AND AN OVERSIGHT BOARD TO LIMIT DATA COLLECTION TO "TWO HOPS" AND ESTABLISH A TECHNICAL AUDITING TEAM TO VERIFY THE SPY AGENCY'S CLAIMS ABOUT ITS DATA COLLECTION AND USAGE. THE PRESIDENTIAL PANEL SUGGESTED ENDING THE BULK COLLECTION OF PHONE METADATA ENTIRELY. INSTEAD, PHONE COMPANIES SHOULD STORE THE RECORDS AND TURN THEM OVER ONLY WITH A COURT ORDER, THE PANEL ADDED. President Barack Obama will decide in coming weeks which of the panel's recommendations he will implement. The recommendations aren't binding. In recent months, the retired computer-code creator has been greeted like a hero almost everywhere he goes. Mr. Snowden, living in Russia under temporary asylum, says through his lawyer that he has "tremendous respect" for Mr. Binney, "who did everything he could according to the rules."

Most recent ev

Puiu 15 – staff writer (Tibi, "The NSA is gathering so much data, it's become swamped and ironically ineffective at preventing terrorism," ZME Science, 5/6/2015, <http://www.zmescience.com/research/technology/nsa-overwhelmed-data-53354/>) //RGP

One of the most famous NSA whistleblowers (or the 'original NSA whistleblower'), William BINNEY, SAID THE AGENCY IS COLLECTING STUPENDOUS AMOUNTS OF DATA – SO MUCH THAT IT'S ACTUALLY HAMPERING INTELLIGENCE OPERATIONS. Binney worked for three decades for the intelligence agency, but left shortly after the 9/11 attacks. A program he had developed was scrapped and replaced with a system he said was more expensive and more intrusive, which made him feel he worked for an incompetent employer. Plans to enact the now controversial Patriot Act was the last straw, so he quit. Since then, Binney has frequently criticized the agency and revealed some of its operations hazards and weaknesses. Among these, he alleges: THE NSA BURIED KEY INTELLIGENCE THAT COULD HAVE PREVENTED 9/11. The agency's bulk data collection from internet and telephone communications is unconstitutional and illegal in the US; Electronic intelligence gathering is being used for covert law enforcement, political control and industrial espionage, both in and beyond the US; Edward Snowden's leaks could have been prevented. Ironically, Snowden cites Binney as an inspiration. His greatest insights however is that THE NSA IS INEFFECTIVE AT PREVENTING TERRORISM BECAUSE ANALYSTS ARE TOO SWAMPED WITH INFORMATION under its bulk collection programme. CONSIDERING BINNEY'S IMPECCABLE TRACK RECORD – HE WAS CO-FOUNDER AND DIRECTOR OF THE WORLD GEOPOLITICAL & MILITARY ANALYSIS AT THE SIGNALS INTELLIGENCE AUTOMATION RESEARCH CENTER (SARC), a branch with 6,000 employees – I can only presume HE KNOWS WHAT HE'S TALKING ABOUT. The Patriot Act is a U.S. law passed in the wake of the September 11, 2001 terrorist attacks. Its goals are to strengthen domestic security and broaden the powers of law-enforcement agencies with regards to identifying and stopping terrorists. In effect, the law laxes the restrictions authorities have to search telephone, e-mail communications, medical, financial, and other records. Because a lot of people use web services whose servers are located in the US, this means that the records of people not located or doing business in the US are also spied upon by the NSA. ALL THIS INFORMATION, however, COMES AT A PRICE: OVERLOAD. According to the Guardian, the NSA buffers a whopping 21 petabytes a day! In this flood of information, AN NSA ANALYST WILL QUICKLY FIND HIMSELF OVERWHELMED. QUEERING KEYWORDS LIKE "BOMB" OR "DRUGS" MIGHT PROVE A NIGHTMARE FOR THE ANALYST IN QUESTION. It's impossible not to, considering four billion people — around two-thirds of the world's population — are under the NSA and partner agencies' watchful eyes, according to Binney. "THAT'S WHY THEY COULDN'T STOP THE BOSTON BOMBING, OR THE PARIS SHOOTINGS, BECAUSE THE DATA WAS ALL THERE," SAID Binney for ZDnet. "The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that," he said. "But that doesn't stop it." So, according to Binney, ANALYSTS STILL USE RUDIMENTARY TOOLS TO FILTER THE VAST AMOUNTS OF INFORMATION THE NSA IS COLLECTING. With everybody speaking about "big data" and other such buzz phrases, IT'S A BIT HILARIOUS TO THINK THE NSA IS ACTUALLY SAFE GUARDING FOR TERRORISM BY LOOKING FOR NEEDLES IN HAYSTACKS. "The Upstream program is where the vast bulk of the information was being collected," said Binney, talking about how the NSA tapped undersea fiber optic cables. Basically, THE NSA is collecting as much data as it can get its hands on at this point (legally or otherwise...), but it all SEEMS TOO GREEDY FOR THEIR OWN GOOD, NOT TO MENTION

PUBLIC SAFETY. According to Binney, THE FACT THE NSA IS COLLECTING THIS MUCH DATA ISN'T TO THEIR ADVANTAGE, BUT ACTUALLY A VULNERABILITY.

Information overload destroys system effectiveness

Mathiesen, professor of sociology of law, '13 (Thomas Mathiesen Professor of Sociology of Law at the University of Oslo, "Towards a Surveillant Society: The Rise of Surveillance Systems in Europe" Pgs 195-196, 2013,

[//GY">https://books.google.com/books?id=X1ZutlZgfD8C&dq=too+much+surveillance+AND+overload&source=gbs_navlinks_s\)//GY](https://books.google.com/books?id=X1ZutlZgfD8C&dq=too+much+surveillance+AND+overload&source=gbs_navlinks_s)

MANY OF THE LARGE SURVEILLANCE SYSTEM DESCRIBED EARLIER ARE NOT EASY TO USE, OR CLOSE TO UNUSABLE, WHEN IT COMES TO FINDING TERRORISTS IN ADVANCE, WHETHER LONE WOLVES OR GROUPS. This goes for Eurodac, the Data Retention Directive, the various PNRs, the API, the Prum Treaty, and perhaps also for the Schengen Information System. THESE FIVE OR MORE SYSTEMS FACE A COMMON THREAT, NAMELY WHAT WE MAY CALL INFORMATION OVERLOAD. THERE IS FAR TOO MUCH INFORMATION – IN ALL OF THE SYSTEMS, WHICH MAKES THE PICKING OUT OF TERRORISTS ON AN INDIVIDUAL OR GROUP BASIS IN ADVANCE EXTREMELY DIFFICULT. The Data Retention Directive, the various PNRs and the Prum Treaty are perhaps particularly vulnerable to this. Take the Data Retention Directive. It collects all information concerning communication (except content) on all citizens in a given State. The information has to be retained for a long period of time – up to two years. SIMPLE ARITHMETIC TELLS US THAT THE INFORMATION WHICH HAS TO BE, AND IS, RETAINED, BECOMES COLOSSAL. Let us say that a particular State is small, and has roughly five million inhabitants (Norway is a small country, and had 4,920,300 inhabitants on 1 January 2011; we will soon have 5 million). Most inhabitants have telephones, often several mobile telephones, as well as access to the Internet and other communication technologies. Say that communication technology equals the number of inhabitants, five million for one year. This is clearly an underestimation, but roughly the average retention period – Norway has in fact a retention period of one year. IF THE GIVEN STATE HAS DECIDED ON MANDATORY RETENTION FOR TWO YEARS – WHICH IS THE LIMIT – THE DATABASE CONTAINS NOT FIVE, BUT TEN MILLION TECHNOLOGIES. HOWEVER, THE TECHNOLOGY CONTAINS A LARGE NUMBER OF DATA ENTRIES. If the given State has decided on mandatory retention on all communication – who owns the communication technology which is used, who uses the communication technology in question, at what time does the communication begin, at what time does it end, from where is the call taken and from where is it received, whether the caller or the called or both are moving around during the communication, to where they have moved, all of this and a number of other data entries for one year brings the database to an enormous number of millions of data entries per year. After one year the data which is stored has to be deleted. But IT NEVER ENDS, BECAUSE A SIMILAR NUMBER OF DATA ENTRIES ARE STORED FOR EACH INDIVIDUAL AND FOR ALL OF THE FIVE MILLION INHABITANTS FOR ANOTHER YEAR, AND ANOTHER YEAR AND ANOTHER YEAR... Add to this that not only the inhabitants of this particular State are in the system, but so are all of the inhabitants of all the States of Europe (and outside States, like Norway). You end up with a fabulous number of data entries which turns the famous finding of the needle in the haystack into a reality – to say the least. For States deciding on two years of mandatory retention – the limit – the number of data entries will be doubled – even more fabulous. Many of the EU States are much larger than Norway – Great Britain had 61 million inhabitants in 2009. There are 27 large and small States in the EU. You stop counting.

Overload = nuke war

Information overload leads to a cyber crash – outweighs nuclear war

Goor, physicist and political scientist, MA Law, '13 (Dan Goor, political scientist, MA in Law and Diplomacy, “PRISM, a symptom of “information explosion,” beware!” 2013, <https://dangoor.wordpress.com/2013/07/02/prism-a-symptom-of-information-explosion-beware/>) //GY

PRISM, A SYMPTOM OF “INFORMATION EXPLOSION,” BEWARE!¶ While the political and security implications of leaks by Edward Snowden are monopolizing the news, THE MAIN DANGER IS FROM INFORMATION OVERLOAD, MISINTERPRETATIONS AND PERHAPS DANGEROUS (OR EVEN ROGUE) ACTION COULD BE THE MAIN ISSUE.¶ TOO MUCH INFORMATION LEADS TO CHAOS. In the mid fifteen hundreds, Miguel de Cervantes Saavedra predicted that too much information will drive people insane by demonstrating how his hero, Don Quixote, went mad because he read too much. Albert Einstein said the: “I fear the day when the [information] technology overlaps with our humanity; the world will only have a generation of idiots.”¶ In George Orwell’s 1984 he wrote of government that has total visibility to what every person does, and soon we shall be able to read people’s minds, to know what thoughts each person may have.¶ Communication is a complex process, which land itself to high level of misinterpretations. WITH GOVERNMENT MONITORING EVERYTHING ITS CITIZENRY DOES, AND TAKE ACTION BASED ON INTERPRETATION BY BOTH MAN AND MACHINE, ONE CAN EXPECT AN EVENTUAL STATE OF CHAOS IN THE WORLD.¶ This year NSA’s one and one half million square foot facility in Utah would become operational, it would accommodate the trillions of bits of information that NSA is gathering from the United States and from around the world. Following is Wikipedia overview of the NSA facility:¶ “The Utah Data Center, also known as the Intelligence Community Comprehensive National Cybersecurity Initiative Data Center,[1] is a data storage facility for the United States Intelligence Community that is designed to store extremely large amounts of data.[2][3][4] Its purpose is to support the Comprehensive National Cybersecurity Initiative (CNCI), though its precise mission is classified.[5] The National Security Agency (NSA), which will lead operations at the facility, is the executive agent for the Director of National Intelligence.[6] It is located at Camp Williams, near Bluffdale, Utah, between Utah Lake and Great Salt Lake.”¶ THE GOOGLE INFORMATION ABOUT JUDICIAL REQUESTS FROM VARIOUS COUNTRIES SUPPORTS THE NOTION THAT THE WORLD IS MOVING TOWARDS AN INFORMATION OVERLOAD, THE WORLD IS LEADING TOWARDS a “cyber crash,” that could well dwarf any nuclear confrontation THAT MAY CONFRONT THE HUMAN RACE.¶ Should, or could, safeguards be put in place to prevent information from going wild?¶ Several years ago when Gordon MOORE OF INTEL PREDICTED THAT EVERY FEW YEARS COMPUTATION POWER WOULD DOUBLE, AN ALARM SHOULD HAVE SOUNDED. MOORE WAS CLOSE TO CORRECT, EXCEPT THAT INFORMATION TECHNOLOGY IS GROWING EVEN FASTER AND COULD BECOME AN AVALANCHE OUT OF CONTROL.¶ It is likely that the human race will survive the “cyber explosion,” just as it survived Malthus prediction of resource shortage, of atomic annihilation. That not withstanding, THE PRUDENT THING FOR BOTH SCIENTISTS AND POLITICIANS TO EXERCISE SOME RATIONAL CONTROL ON INFORMATION GROWTH.

Iran !

Overload causes Iran war

Trobock, 14

Randall Trubbock, Master of Science in Cybersecurity from Utica College, May 2014, "The Application Of Splunk In The Intelligence Gathering Process," Proquest // is amp

FAULTY INTELLIGENCE METHODS, SUCH AS THOSE THAT WOULD BE THE RESULT OF **information overload**, POSE A **significant threat** TO PEACE THROUGHOUT THE WORLD. For example, **HAVING INACCURATE OR INCOMPLETE INTELLIGENCE ON IRAN'S NUCLEAR CAPABILITIES AND THE LOCATIONS OR NATURE OF ITS NUCLEAR PLANTS, A RISK-AVERSE ISRAEL MIGHT OVERESTIMATE ITS NEED TO TAKE BOTH DRASTIC AND PRE-EMPTIVE MEASURES AGAINST IRAN** (Young, 2013). **THIS COULD RESULT IN INVOLVEMENT FROM SEVERAL COUNTRIES, INCLUDING THE UNITED STATES, POTENTIALLY COSTING BILLIONS OF DOLLARS AND THOUSANDS OF SOLDIERS' LIVES.**

Turns aff – drones

Despite a plethora of surveillance technology border surveillance fails due to data overload

Abrams and Cyphers No date (David, Chief Technology Officer, True Systems, Dennis, VP Sales Operations, "TrueSentry Border Surveillance", http://www.daveab.com/files/TrueSentry_Border_Surveillance.pdf//Tang)

BORDER SECURITY REMAINS A KEY HOMELAND SECURITY CHALLENGE. BORDER GUARDS, SURVEILLANCE OPERATORS, AND COMMAND STAFF DO NOT HAVE AN INTEGRATED COMMAND AND CONTROL SYSTEM to protect national borders. There is a lack of sufficient coverage from sensors and cameras. IMPORTANT THREATS ARE LOST IN AN OVERLOAD OF INFORMATION FROM FALSE ALARMS. The collaboration and communications needed for tactical intercept missions is lacking. WIDE AND DIVERSE TERRAIN COUPLED WITH LARGE-SCALE POPULATION CENTERS, SEA PORTS, AND NATIONAL BOUNDARIES MAKE A DIFFICULT ENVIRONMENT TO EFFECTIVELY SCALE-UP BORDER SURVEILLANCE. FAR-FIELD CAMERAS, THERMAL VISION, AND PAN/TILT/ZOOM CAMERAS are used to remotely monitor border zones. Unmanned aerial vehicles (UAVS) fly continuous GPS-guided missions to give operators a bird's eye view. SURVEILLANCE TOWERS typically use radar as a cost-effective way to get broad sensor coverage of diverse border zone terrain. INTRUSION DETECTION SYSTEMS like underground buried cables are used to monitor electromagnetic field changes to distinguish between people, vehicles and animals at a perimeter. OUTDOOR MOTION DETECTION is also done with microwave and infrared sensors. INTELLIGENT PRESSURE FENCE SENSORS detect when intruders climb or cut a fence-line. Yet for ALL THESE ADVANCES IN SURVEILLANCE EQUIPMENT WE ARE STILL LEFT WITH BORDER GUARDS STRUGGLING WITH HIGH FALSE ALARM RATES AND LOW PROBABILITY OF DETECTION AND INTERCEPT. THERE ARE JUST TOO MANY CAMERAS AND NOT ENOUGH BORDER FORCES TO MONITOR THEM ALL. THREATS ARE LOST BECAUSE OF TOO MANY FALSE ALARMS. The COST OF VERIFYING TARGETS, ESCALATING THEM INTO THREATS, AND DISPATCHING RESPONSE TEAMS IS TOO HIGH. INTERCEPT MISSION TEAMS DO NOT HAVE EFFECTIVE COLLABORATION TOOLS. INTELLIGENCE AND THREAT PATTERN ANALYSIS IS JUST TOO TIME CONSUMING TO THWART THE NEXT INTRUSION.

Border drones are ineffective and costly

Bennet 1/7 (Brian, reporter for the LA Times, 1/7/15, "Border drones are ineffective, badly managed, too expensive, official says", <http://www.latimes.com/nation/immigration/la-na-border-drones-20150107-story.html//Tang>)

Drones patrolling the U.S. border are poorly managed and ineffective at stopping illegal immigration, and the government should abandon a \$400-million plan to expand their use, according to an internal watchdog report released Tuesday. The 8-year-old drone program has cost more than expected, according to a report by the Department of Homeland Security's inspector general, John Roth. RATHER THAN SPEND MORE ON DRONES, THE DEPARTMENT SHOULD "PUT THOSE FUNDS TO BETTER USE," Roth recommended. HE DESCRIBED THE PREDATOR B DRONES FLOWN ALONG THE BORDER BY U.S. CUSTOMS AND BORDER PROTECTION AS "DUBIOUS ACHIEVERS." "Notwithstanding the significant investment, WE SEE NO EVIDENCE THAT THE DRONES CONTRIBUTE TO A MORE SECURE BORDER, AND THERE IS NO REASON TO INVEST ADDITIONAL TAXPAYER FUNDS AT THIS TIME." Roth said in a statement. The audit concluded THAT CUSTOMS AND BORDER PROTECTION COULD BETTER USE THE FUNDS ON MANNED AIRCRAFT AND GROUND SURVEILLANCE TECHNOLOGY. The drones were designed to fly over the border to spot smugglers and illegal border crossers. But auditors found that 78% OF THE TIME THAT AGENTS HAD PLANNED TO USE THE CRAFT, THEY WERE

GROUNDING BECAUSE OF BAD WEATHER, BUDGET CONSTRAINTS OR MAINTENANCE PROBLEMS. Even when aloft, auditors found, the drones contributed little. Three drones flying around the Tucson area helped apprehend about 2,200 people illegally crossing the border in 2013, fewer than 2% of the 120,939 apprehended that year in the area. BORDER PATROL SUPERVISORS HAD PLANNED ON USING DRONES TO INSPECT GROUND-SENSOR ALERTS. BUT A DRONE WAS USED IN THAT SCENARIO ONLY SIX TIMES IN 2013. AUDITORS FOUND THAT OFFICIALS UNDERESTIMATED THE COST OF THE DRONES BY LEAVING OUT OPERATING COSTS SUCH AS PILOT SALARIES, EQUIPMENT AND OVERHEAD. Adding such items increased the flying cost nearly fivefold, to \$12,255 per hour. PEOPLE THINK THESE KINDS OF SURVEILLANCE TECHNOLOGIES WILL BE A SILVER BULLET. TIME AFTER TIME, WE SEE THE PRACTICAL REALITIES OF THESE SYSTEMS DON'T LIVE UP TO THE HYPE. - Jay Stanley, ACLU privacy expert "It really doesn't feel like [Customs and Border Protection] has a good handle on how it is using its drones, how much it costs to operate the drones, where that money is coming from or whether it is meeting any of its performance metrics," said Jennifer Lynch, a lawyer for the Electronic Frontier Foundation, a San Francisco-based privacy and digital rights group. THE REPORT'S CONCLUSIONS WILL MAKE IT HARDER FOR OFFICIALS TO JUSTIFY FURTHER INVESTMENT IN THE BORDER SURVEILLANCE DRONES, ESPECIALLY AT A TIME WHEN HOMELAND SECURITY'S BUDGET IS AT THE CENTER OF THE BATTLE over President Obama's program to give work permits to millions of immigrants in the country illegally. EACH PREDATOR B SYSTEM COSTS ABOUT \$20 MILLION. "People think these kinds of surveillance technologies will be a silver bullet," said Jay Stanley, a privacy expert at the American Civil Liberties Union. "Time after time, we see the practical realities of these systems don't live up to the hype." Customs and Border Protection, which is part of Homeland Security, operates the fleet of nine long-range Predator B drones from bases in Arizona, Texas and North Dakota. THE AGENCY PURCHASED 11 DRONES, BUT ONE CRASHED IN ARIZONA IN 2006 AND ANOTHER FELL INTO THE PACIFIC OCEAN OFF SAN DIEGO AFTER A MECHANICAL FAILURE LAST YEAR. Agency officials said in response to the audit that they had no plans to expand the fleet aside from replacing the Predator that crashed last year. The agency is authorized to spend an additional \$433 million to buy up to 14 more drones. The drones — unarmed versions of the MQ-9 Reaper drone flown by the Air Force to hunt targets in Pakistan, Somalia and elsewhere — fly the vast majority of their missions in narrowly defined sections of the Southwest border, the audit found. They spent most of their time along 100 miles of border in Arizona near Tucson and 70 miles of border in Texas. Rep. Henry Cuellar (D-Texas) has promoted the use of drones along the border but believes the agency should improve how it measures their effectiveness. HOMELAND SECURITY "CAN'T PROVE THE PROGRAM IS EFFECTIVE BECAUSE THEY DON'T HAVE THE RIGHT MEASURES," Cuellar said in an interview. "THE TECHNOLOGY IS GOOD, BUT HOW YOU IMPLEMENT AND USE IT — THAT IS ANOTHER QUESTION." THE AUDIT ALSO SAID THAT DRONES HAD BEEN FLOWN TO HELP THE FBI, THE TEXAS DEPARTMENT OF PUBLIC SAFETY AND THE MINNESOTA DEPARTMENT OF NATURAL RESOURCES. SUCH MISSIONS HAVE LONG FRUSTRATED BORDER PATROL AGENTS, WHO COMPLAIN THAT DRONES AND OTHER AIRCRAFT AREN'T AVAILABLE WHEN THEY NEED THEM, said Shawn Moran, vice president of the Border Patrol agents' union. "We saw the drones were being lent out to many entities for nonborder-related operations and we said, 'These drones, if they belong to [Customs and Border Protection], should be used to support [its] operations primarily,'" Moran said.

Turns aff – generic

Additional surveillance directly trades off with security concerns – the more information we have the less effective counter terror measures are

Greenwald 10 (Glenn, constitutional lawyer, 8/9, “The Digital Surveillance State: Vast, Secret, and Dangerous”, <http://www.cato-unbound.org/2010/08/09/glenn-greenwald/digital-surveillance-state-vast-secret-dangerous//Tang>)

What makes THIS LEVIATHAN particularly odious is that it DOES NOT EVEN SUPPLY THE SECURITY WHICH IS ENDLESSLY INVOKED TO JUSTIFY IT. IT ACTUALLY DOES THE OPPOSITE. As many SURVEILLANCE EXPERTS HAVE REPEATEDLY ARGUED, including House Intelligence Committee member Rush Holt, THE MORE SECRET SURVEILLANCE POWERS WE VEST IN THE GOVERNMENT, THE MORE UNSAFE WE BECOME. Cato’s Julian Sanchez put it this way: “We’ve gotten so used to the ‘privacy/security tradeoff’ that it’s worth reminding ourselves, every now and again, that surrendering privacy does not automatically make us more secure—that SYSTEMS OF SURVEILLANCE CAN THEMSELVES BE A MAJOR SOURCE OF INSECURITY.” That’s because THE SURVEILLANCE STATE ALREADY COLLECTS SO MUCH INFORMATION ABOUT US, OUR ACTIVITIES AND OUR COMMUNICATIONS—SO INDISCRIMINATELY AND ON SUCH A VAST SCALE—THAT IT IS INCREASINGLY DIFFICULT FOR IT TO DETECT ANY ACTUAL NATIONAL SECURITY THREATS. NSA whistle blower Adrienne Kinne, when exposing NSA EAVESDROPPING abuses, warned of what ABC News described as “THE WASTE OF TIME SPENT LISTENING TO INNOCENT AMERICANS, INSTEAD OF LOOKING FOR THE TERRORIST NEEDLE IN THE HAYSTACK.” As Kinne explained: BY CASTING THE NET SO WIDE, and continuing to collect on Americans and aid organizations, IT’S ALMOST LIKE THEY’RE MAKING THE HAYSTACK BIGGER AND IT’S HARDER TO FIND THAT PIECE OF INFORMATION THAT MIGHT ACTUALLY BE USEFUL to somebody. YOU’RE ACTUALLY HURTING OUR ABILITY TO EFFECTIVELY PROTECT OUR NATIONAL SECURITY. As the Post put it in its “Top Secret America” series: The NSA sorts a fraction of those [1.7 billion e-mails, phone calls and other types of daily collected communications] into 70 separate databases. The same problem bedevils every other intelligence agency, none of which have enough analysts and translators for all this work. That article details how AMPLE INFORMATION REGARDING alleged FT. HOOD SHOOTER NIDAL HASSAN and ATTEMPTED CHRISTMAS DAY BOMBER UMAR ABDULMUTALLAB WAS COLLECTED BUT SIMPLY WENT UNRECOGNIZED. Similarly, The Washington Post’s David Ignatius previously reported that Abdulmutallab was not placed on a no-fly list despite ample evidence of his terrorism connections because INFORMATION OVERLOAD “CLOGGED” THE SURVEILLANCE SYSTEM AND PREVENTED ITS BEING PROCESSED. Identically, Newsweek’s Mike Isikoff and Mark Hosenball documented that U.S. INTELLIGENCE AGENCIES INTERCEPT, GATHER AND STORE SO MANY EMAILS, RECORDED TELEPHONE CALLS, AND OTHER COMMUNICATIONS THAT IT’S SIMPLY IMPOSSIBLE TO SORT THROUGH OR UNDERSTAND WHAT THEY HAVE, QUITE POSSIBLY CAUSING THEM TO HAVE MISSED CRUCIAL EVIDENCE IN THEIR POSSESSION ABOUT BOTH THE FORT HOOD AND ABDULMUTALLAB PLOTS: This deluge of Internet traffic—involving e-mailers whose true identity often is not apparent—is one indication of the volume of raw intelligence U.S. spy agencies have had to sort through ... THE LARGE VOLUME OF MESSAGES ALSO MAY HELP TO EXPLAIN HOW AGENCIES CAN BECOME SO OVERWHELMED WITH DATA THAT SOMETIMES IT IS DIFFICULT, IF NOT IMPOSSIBLE, TO CONNECT POTENTIALLY IMPORTANT DOTS. As a result, our vaunted Surveillance State failed to stop the former attack and it was only an alert airplane passenger who thwarted the latter. So it isn’t that we keep sacrificing our privacy to an always-growing National Security State in exchange for greater security. The opposite is true: WE KEEP SACRIFICING OUR PRIVACY TO THE ALWAYS-GROWING NATIONAL SECURITY STATE IN EXCHANGE FOR LESS SECURITY.

Info overload will collapse the surveillance state

North 13 (Gary, American Christian Reconstructionist theorist and economic historian. 7/29,

“Surveillance state will collapse; data overload increasingly blinds it”,

<http://nooganomics.com/2013/07/surveillance-state-will-collapse-data-overload-increasingly-blinds-it//Tang>)

Wyden trusts in the wisdom and power of political democracy. He is naive. He should trust in the free market. People's day-to-day economic decisions are the heart of the matter, not their occasional voting. The individual decisions of people in the market will ultimately thwart Congress and the surveillance state. The free market's signals, not the phone taps of the NSA, will shape the future. THE BUREAUCRATS' QUEST FOR OMNISCIENCE AND OMNIPOTENCE WILL COME TO A WELL-DESERVED END, just as it did in the Soviet Union, and for the same reason. THE STATE IS INHERENTLY MYOPIC: SHORT-SIGHTED COMPUTERS MAKE IT BLIND. THE STATE FOCUSES ON THE SHORT RUN. COMPUTERS OVERWHELM BUREAUCRATS WITH SHORT-RUN INFORMATION. Let us not forget that THE INTERNET WAS INVENTED BY DARPA: THE MILITARY'S RESEARCH BRANCH. IT INVENTED THE INTERNET TO PROTECT THE MILITARY'S COMMUNICATIONS NETWORK FROM A NUCLEAR ATTACK BY THE USSR. Today, there is no USSR. There is the World Wide Web: the greatest technological enemy of the state since Gutenberg's printing press. The state is myopic. THE FACT THAT THE NSA'S TWO "COMPUTER FARMS" — IN UTAH AND IN MARYLAND — ARE SEVEN TIMES LARGER THAN THE PENTAGON WILL NOT CHANGE THIS FACT. THEY HAVE BITTEN OFF MORE THAN THEY CAN CHEW. CENTRAL PLANNERS ARE BUREAUCRATS, AND BUREAUCRACY IS BLIND. IT CANNOT ASSESS ACCURATELY the importance of the MOUNTAINS OF DATA THAT ARE HIDDEN IN GOVERNMENT-COLLECTED AND PROGRAM-ASSESSED DIGITS. The knowledge possessed in the free market is always more relevant. Society is the result of human action, not of human design. The bureaucrats do not understand this principle, and even if they did, it would not change reality.

Turns aff - NCTC

The size of the NCTC should be reduced to more effectively combat terrorism

Storm 13 (Darlene, freelance writer, citing Bridget Nolan, sociology phd, worked as a CT analyst at the NCTC, 8/7 "Is US intelligence so big that counterterrorism is failing? 'Yes' say insiders", <http://www.computerworld.com/article/2475096/security0/is-us-intelligence-so-big-that-counterterrorism-is-failing---yes--say-insiders.html//Tang>)

When might you consider quitting your job to be a "win"? When you work for the CIA and "the Company" tries to block the publication of your dissertation about the National Counterterrorism Center. Bridget Rose Nolan, a sociology PhD at the University of Pennsylvania, worked as a counterterrorism analyst at the National Counterterrorism Center (NCTC) from 2010 – 2011. Basically she worked as an analyst while also conducting "ethnographic observations" by interviewing 16 female and seven male analysts for her doctoral dissertation at the University of Pennsylvania. The Philadelphia Inquirer explained, "She set out to explore the culture of the terrorism center and how it, and its counterparts, share information – or fail to." After three years of "fighting" the CIA over the right to publish, she won, but the "win" meant she had to resign. Instead of too big to fail, in essence, counterterrorism may be failing in some areas because it is too big, because counterterrorism analysts suffer from so much information overload that they are not effective in stopping terrorism. "Fewer people in the system could help to streamline the bureaucracy and reduce the number of emails and documents that make the analysts feel overwhelmed with information." Other contributing factors that make terrorism harder to fight include sabotage among co-workers, stove-piping, confusion, bureaucracy that might make your head explode, and agencies that don't play well together. Several people working in counterterrorism suggested that the solutions to be more effective include cutting out the bloat and making the intelligence community smaller, much smaller. NCTC was formed as a "knee-jerk reaction to 9/11." The continuing War on Terror leads to more databases, more information which creates more stove-piping. There is no Google-like search to find information from one agency to the other, and each intelligence agency hoards the good secret stuff for itself. One analyst suggested that NCTC was "never intended to be real. That all along, it's just been a CYA [cover your ass] political maneuver." Another CT analyst suggested that if NCTC were to continue, then it "should be about one-tenth its current size." When it comes to intelligence information, analysts must "publish or perish," but it's more about quantity than quality. There are endless "turf battles" complete with paper ownership battles as well as "strategies of deception and sabotage." Even analysts working for the same agency might try to stall in order to "scoop" another analyst; they also might try to "kill" the piece. That's before the six months to two years for official reviews of the papers, "layers and layers of soul-crushing review." There is also "a lack of faith in management both as qualified reviewers and as unbiased supporters." One analyst said, "Information sharing is when YOU give ME your data."

Turns aff – NSA

NSA failing now – their drowning in information – only the plan makes surveillance effective

Angwin 13 – staff writer (“NSA Struggles to Make Sense of Flood of Surveillance Data,” WSJ, 12/25/2013, <http://www.wsj.com/articles/SB10001424052702304202204579252022823658850>) //RGP

*Language edited

LAUSANNE, Switzerland— WILLIAM BINNEY, creator of some of the computer code used by the National Security Agency to snoop on Internet traffic around the world, DELIVERED AN UNUSUAL MESSAGE HERE IN SEPTEMBER TO AN AUDIENCE WORRIED THAT THE SPY AGENCY KNOWS TOO MUCH. IT KNOWS SO MUCH, he said, that it can't understand what it has. WHAT THEY ARE DOING IS MAKING THEMSELVES DYSFUNCTIONAL BY TAKING ALL THIS DATA.” Mr. Binney said at a privacy conference here. THE AGENCY IS drowning in useless data, WHICH HARMS ITS ABILITY TO CONDUCT LEGITIMATE SURVEILLANCE, claims Mr. Binney, who rose to the civilian equivalent of a general during more than 30 years at the NSA before retiring in 2001. ANALYSTS ARE SWAMPED WITH SO MUCH INFORMATION THAT THEY CAN'T DO THEIR JOBS EFFECTIVELY, and the enormous stockpile is an irresistible temptation for misuse. Mr. Binney's warning has gotten far less attention than legal questions raised by leaks from former NSA contractor Edward Snowden about the agency's mass collection of information around the world. Those revelations unleashed a re-examination of the spy agency's aggressive tactics. MORE Snowden Warns of Dangers of Citizen Surveillance But the NSA needs more room to store all the data it collects—and new phone records, data on money transfers and other information keep pouring in. A new storage center being built in Utah will eventually be able to hold more than 100,000 times as much as the contents of printed materials in the Library of Congress, according to outside experts. Some of the documents released by Mr. Snowden detail concerns inside the NSA about drowning in information. AN INTERNAL BRIEFING DOCUMENT IN 2012 ABOUT FOREIGN CELLPHONE-LOCATION TRACKING BY THE AGENCY SAID THE EFFORTS WERE "OUTPACING OUR ABILITY TO INGEST, PROCESS AND STORE" DATA. in March 2013, some NSA analysts asked for permission to collect less data through a program called Muscular because the “relatively small intelligence value it contains does not justify the sheer volume of collection,” another document shows. In response to questions about Mr. Binney's claims, an NSA spokeswoman says the agency is “not collecting everything, but we do need the tools to collect intelligence on foreign adversaries who wish to do harm to the nation and its allies.” Existing surveillance programs were approved by “all three branches of government,” and each branch “has a role in oversight,” she adds. In a statement through his lawyer, Mr. Snowden says: “WHEN YOUR WORKING PROCESS EVERY MORNING STARTS WITH POKING AROUND A HAYSTACK OF SEVEN BILLION INNOCENT LIVES, YOU'RE GOING TO MISS THINGS.” He adds: “WE'RE BLINDING [overwhelming] people with data we don't need.”

Status quo NSA operations are ineffective due to information overload – makes preventing terrorism impossible

Maass, acclaimed author and journalist on surveillance, 5/28 (PETER MAASS “INSIDE NSA, OFFICIALS PRIVATELY CRITICIZE “COLLECT IT ALL” SURVEILLANCE” 05/28/2015 11:38 AM <https://firstlook.org/theintercept/2015/05/28/nsa-officials-privately-criticize-collect-it-all-surveillance/>) //GY

AS MEMBERS OF CONGRESS struggle to agree on which surveillance programs to re-authorize before the Patriot Act expires, they might consider the unusual advice of an intelligence analyst at THE NATIONAL SECURITY AGENCY who WARNED ABOUT THE DANGER OF COLLECTING TOO MUCH DATA. Imagine, the analyst wrote in a leaked document, that you are standing in a shopping aisle trying to decide between jam, jelly or fruit spread, which size, sugar-free or not, generic or Smucker's. It can be paralyzing. “We in the agency are at risk of a similar, collective paralysis in the face of a dizzying array of choices every

single day," the analyst wrote in 2011. "ANALYSIS PARALYSIS' ISN'T ONLY A CUTE RHYME. IT'S THE TERM FOR WHAT HAPPENS WHEN YOU SPEND SO MUCH TIME ANALYZING A SITUATION THAT YOU ULTIMATELY STYMIE ANY OUTCOME IT'S WHAT HAPPENS IN SIGINT [SIGNALS INTELLIGENCE] WHEN WE HAVE ACCESS TO ENDLESS POSSIBILITIES, BUT WE STRUGGLE TO PRIORITIZE, NARROW, AND EXPLOIT THE BEST ONES."¶ The document is one of about a dozen in which NSA intelligence experts express concerns usually heard from the agency's critics: that THE U.S. GOVERNMENT'S "COLLECT IT ALL" STRATEGY CAN UNDERMINE THE EFFORT TO FIGHT TERRORISM. The documents, provided to The Intercept by NSA whistleblower Edward Snowden, appear to contradict years of statements from senior officials who have claimed that pervasive surveillance of global communications helps the government identify terrorists before they strike or quickly find them after an attack.¶ The Patriot Act, portions of which expire on Sunday, has been used since 2001 to conduct a number of dragnet surveillance programs, including the bulk collection of phone metadata from American companies. But THE DOCUMENTS SUGGEST THAT ANALYSTS AT THE NSA HAVE DROWNED IN DATA SINCE 9/11, MAKING IT MORE DIFFICULT FOR THEM TO FIND THE REAL THREATS. The titles of the documents capture their overall message: "Data Is Not Intelligence," "The Fallacies Behind the Scenes," "Cognitive Overflow?" "Summit Fever" and "In Praise of Not Knowing." Other titles include "Dealing With a 'Tsunami' of Intercept" and "Overcome by Overload?"¶ The documents are not uniform in their positions. Some acknowledge the overload problem but say the agency is adjusting well. They do not specifically mention the Patriot Act, just the larger dilemma of cutting through a flood of incoming data. But in an apparent sign of the scale of the problem, THE DOCUMENTS CONFIRM THAT THE NSA EVEN HAS A SPECIAL CATEGORY OF PROGRAMS THAT IS CALLED "COPING WITH INFORMATION OVERLOAD."¶ The jam vs. jelly document, titled "Too Many Choices," started off in a colorful way but ended with a fairly stark warning: "THE SIGINT MISSION IS FAR TOO VITAL TO UNNECESSARILY EXPAND THE HAYSTACKS WHILE WE SEARCH FOR THE NEEDLES. PRIORITIZATION IS KEY."¶ These doubts are infrequently heard from officials inside the NSA. THESE DOCUMENTS ARE A WINDOW INTO THE PRIVATE THINKING OF MID-LEVEL OFFICIALS WHO ARE ALMOST NEVER PERMITTED TO DISCUSS THEIR CONCERNS IN PUBLIC.¶ AN AMUSING PARABLE circulated at the NSA a few years ago. Two people go to a farm and purchase a truckload of melons for a dollar each. They then sell the melons along a busy road for the same price, a dollar. As they drive back to the farm for another load, they realize they aren't making a profit, so one of them suggests, "Do you think we need a bigger truck?"¶ The parable was written by an intelligence analyst in a document dated Jan. 23, 2012 that was titled, "Do We Need a Bigger SIGINT Truck?" It expresses, in a lively fashion, a critique of the agency's effort to collect what former NSA Director Keith Alexander referred to as "the whole haystack." THE CRITIQUE GOES TO THE HEART OF THE AGENCY'S DRIVE TO GATHER AS MUCH OF THE WORLD'S COMMUNICATIONS AS POSSIBLE: BECAUSE IT MAY NOT FIND WHAT IT NEEDS IN A PARTIAL HAYSTACK OF DATA, THE HAYSTACK IS EXPANDED AS MUCH AS POSSIBLE, ON THE ASSUMPTION THAT MORE DATA WILL EVENTUALLY YIELD USEFUL INFORMATION. THE SNOWDEN FILES SHOW THAT IN PRACTICE, IT DOESN'T TURN OUT THAT WAY: MORE IS NOT NECESSARILY BETTER, AND IN FACT, EXTREME VOLUME CREATES ITS OWN CHALLENGES.¶ "Recently I tried to answer what seemed like a relatively straightforward question about which telephony metadata collection capabilities are the most important in case we need to shut something off when the metadata coffers get full," wrote the intelligence analyst. "By the end of the day, I felt like capitulating with the white flag of, 'We need COLOSSAL data storage so we don't have to worry about it,' (aka we need a bigger SIGINT truck)." The analyst added, "WITHOUT METRICS, HOW DO WE KNOW THAT WE HAVE IMPROVED SOMETHING OR MADE IT WORSE? THERE'S A RUNNING JOKE ... THAT WE'LL ONLY KNOW IF

COLLECTION IS IMPORTANT BY SHUTTING IT OFF AND SEEING IF SOMEONE SCREAMS.”¶ ANOTHER DOCUMENT, WHILE NOT MENTIONING THE DANGERS OF COLLECTING TOO MUCH DATA, EXPRESSED CONCERNS ABOUT PURSUING ENTRENCHED BUT UNPRODUCTIVE PROGRAMS.¶ “How many times have you been watching a terrible movie, only to convince yourself to stick it out to the end and find out what happens, since you’ve already invested too much time or money to simply walk away?” the document asked. “THIS ‘GONE TOO FAR TO STOP NOW’ MENTALITY IS OUR BUILT-IN MECHANISM TO HELP US ALLOCATE AND RATION RESOURCES. HOWEVER, IT CAN WORK TO OUR DETRIMENT IN PRIORITIZING AND DECIDING WHICH PROJECTS OR EFFORTS ARE WORTH FURTHER EXPENDITURE OF RESOURCES, regardless of how much has already been ‘sunk.’ As has been said before, insanity is doing the same thing over and over and expecting different results.” Many of these documents were written by intelligence analysts who had regular columns distributed on NSANet, the agency’s intranet. One of the columns was called “Signal v. Noise,” another was called “The SIGINT Philosopher.” Two of the documents cite the academic work of Herbert Simon, who won a Nobel Prize for his pioneering research on what’s become known as the attention economy. Simon wrote that consumers and managers have trouble making smart choices because their exposure to more information decreases their ability to understand the information. Both documents mention the same passage from Simon’s essay, *Designing Organizations for an Information-Rich World*:¶ “In an information-rich world, the wealth of information means a dearth of something else: a scarcity of whatever it is that information consumes. What information consumes is rather obvious: it consumes the attention of its recipients. Hence A WEALTH OF INFORMATION CREATES A POVERTY OF ATTENTION AND A NEED TO ALLOCATE THAT ATTENTION EFFICIENTLY AMONG THE OVERABUNDANCE OF INFORMATION SOURCES THAT MIGHT CONSUME IT.”¶ In addition to consulting Nobel-prize winning work, NSA analysts have turned to easier literature, such as Malcolm Gladwell’s best-selling *Blink: The Power of Thinking Without Thinking*. The author of a 2011 document referenced *Blink* and stated, “The key to good decision making is not knowledge. It is understanding. We are swimming in the former. We are desperately lacking in the latter.” The author added, “Gladwell has captured one of the biggest challenges facing SID today. OUR COSTS ASSOCIATED WITH THIS INFORMATION OVERLOAD ARE NOT ONLY FINANCIAL, such as the need to build data warehouses large enough to store the mountain of data that arrives at our doorstep each day, BUT ALSO INCLUDE THE MORE INTANGIBLE COSTS OF TOO MUCH DATA TO REVIEW, PROCESS, TRANSLATE AND REPORT.”¶ Alexander, the NSA director from 2005 to 2014 and chief proponent of the agency’s “collect it all” strategy, vigorously defended the bulk collection programs. “What we have, from my perspective, is a reasonable approach on how we can defend our nation and protect our civil liberties and privacy,” he said at a security conference in Aspen in 2013. He added, “You need the haystack to find the needle.” The same point has been made by other officials, including James Cole, the former deputy attorney general who told a congressional committee in 2013, “If you’re looking for the needle in the haystack, you have to have the entire haystack to look through.” The opposing viewpoint was voiced earlier this month by Snowden, who noted in an interview with the Guardian that the men who committed recent terrorist attacks in France, Canada and Australia were under surveillance—their data was in the haystack yet they weren’t singled out. “It wasn’t the fact that we weren’t watching people or not,” Snowden said. “It was the fact that we were watching people so much that we did not understand what we had. THE PROBLEM IS THAT WHEN YOU COLLECT IT ALL, WHEN YOU MONITOR EVERYONE, YOU UNDERSTAND NOTHING.”¶ In a 2011 interview with SIDtoday, a deputy director in the Signals Intelligence Directorate was asked about “analytic modernization” at the agency. His response, while positive on the NSA’s ability to surmount obstacles, noted that it faced difficulties, including the fact that some targets use

encryption and switch phone numbers to avoid detection. He pointed to volume as a particular problem.¶“We live in an Information Age when we have massive reserves of information and don’t have the capability to exploit it,” he stated. “I was told that there are 2 petabytes of data in the SIGINT System at any given time. How much is that? That’s equal to 20 million 4-drawer filing cabinets. How many cabinets per analyst is that? By the end of this year, we’ll have 1 terabyte of data per second coming in. YOU CAN’T CRANK THAT THROUGH THE EXISTING PROCESSES AND BE EFFECTIVE.”¶ THE DOCUMENTS NOTED THE DIFFICULTY OF SIFTING THROUGH THE EVER-GROWING HAYSTACK OF DATA. For instance, a 2011 document titled “ELINT Analysts – Overcome by Overload? Help is Here with IM&S” outlined a half dozen computer tools that “are designed to invert the paradigm where an analyst spends more time searching for data than analyzing it.” Another document, written by an intelligence analyst in 2010, bluntly stated that “we are drowning in information. And yet we know nothing. For sure.” The analyst went on to ask, “Anyone know just how many tools are available at the Agency, alone? Would you know where to go to find out? Anyone ever start a new target...without the first clue where to begin? Did you ever start a project wondering if you were the sole person in the Intelligence Community to work this project? How would you find out?” The analyst, trying to encourage more sharing of tips about the best ways to find data in the haystack, concluded by writing, in boldface, “Don’t let those coming behind you suffer the way you have.”¶

Overload makes surveillance ineffective and infringes on civil rights

Ward, journalist, 5/18 (Stan Ward, correspondent for Best VPN “NSA swamped with data overload also trashes the Constitution” 18 May 2015 <https://www.bestvpn.com/blog/19187/nsa-swamped-with-data-overload-also-trashes-the-constitution/>) //GY

Almost on the second anniversary of the Edward Snowden revelations, another (in)famous NSA whistleblower has again spoken up. This comes at a pivotal juncture in the legislative calendar as contentious debate about surveillance rages over the impending sunset of some of the Patriot Act.¶IT HAS LONG BEEN AN ARGUMENT OF THE CIVIL LIBERTIES CROWD THAT BULK DATA GATHERING WAS COUNTER-PRODUCTIVE, IF NOT COUNTER-INTUITIVE. THE ARGUMENT WAS COINED IN LANGUAGE SUGGESTING THAT TO “COLLECT IT ALL”, as the then NSA director James Clapper famously decried, WAS TO, IN EFFECT, GATHER NOTHING, AS THE CHOKING AMOUNTS OF INFORMATION COLLECTED WOULD BE SO GREAT AS TO BE UNABLE TO BE ANALYZED EFFECTIVELY.¶ This assertion is supported by William Binney, a founder of Contrast Security and a former NSA official, logging more than three decades at the agency. IN ALLUDING TO WHAT HE TERMED “BULK DATA FAILURE”, BINNEY SAID THAT AN ANALYST TODAY CAN RUN ONE SIMPLE QUERY ACROSS THE NSA’S VARIOUS DATABASES, ONLY TO BECOME IMMEDIATELY OVERLOADED WITH INFORMATION.¶ With about four billion people (around two-thirds of the world’s population) under the NSA and partner agencies’ watchful eyes, according to his estimates, THERE IS FAR TOO MUCH DATA BEING COLLECTED.¶ “That’s why they couldn’t stop the Boston bombing, or the Paris shootings, because the data was all there... The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that. But that doesn’t stop it.”¶ Binney is in a position to know, earning his stripes during the terrorism build up that culminated with the 9/11 World Trade Center bombing in 2001. He left just days after the draconian legislation known as the USA Patriot Act was enacted by Congress on the heels of that attack. One of the reasons which prompted his leaving was the scrapping of a surveillance system on which he long worked, only to be replaced by more intrusive systems.¶ It is interesting to note here that Edward Snowden, in alluding to Binney, said he was inspired by Binney’s plight, and that this, in part, prodded him to leak thousands of

classified documents to journalists. Little did Binney know that his work was to be but the tip of the iceberg in a program that eventually grew to indiscriminately “collect it all.”⁴ What is worrisome is the complicity with the bulk data collection by dozens of private companies – maybe as many as 72. Yet this type of collection pales in comparison to that of the “Upstream” program in which the NSA tapped into undersea fiber optic cables. With the cooperation of Britain’s GCHQ, the NSA is able to sift more than 21 petabytes a day. ¶ GATHERING SUCH ENORMOUS AMOUNTS OF INFORMATION IS EXPENSIVE AND INEFFECTIVE, according to Binney. But IT GETS LAWMAKERS ATTENTION IN A WAY THAT RESULTS IN MASSIVE INCREASES IN NSA BUDGETS. BINNEY WARNS THAT, ¶ “THEY’RE TAKING AWAY HALF OF THE CONSTITUTION IN SECRET.” ¶ President Obama has presided over this agency’s land grab, and has endorsed it, often to referring to Upstream as a “critical national security tool.” HIS FECKLESS APPROACH TO THE SPYING BUILD UP IS THE REASON FOR ITS PROLIFERATION, AND IS WHY CONGRESS MEANDERS RUDDERLESS IN ATTEMPTS TO CURTAIL IT. ¶ THE PRESIDENT’S ANTI-PRIVACY STANCE IS BEING “REWARDED” BY REPUDIATION AMONG MEMBERS OF HIS OWN PARTY, and is reflected in their rejecting his latest legacy-building, pet piece of legislation – the Trans Pacific Partnership (TPP). But THEIR CONSTITUENTS WOULD BE BETTER SERVED BY PRODUCING LEGISLATION THAT WOULD RESTORE CONSTITUTIONAL RIGHTS TRAMPLED ON BY THE NSA.

Turns aff – NSA – grid collapse

Strain on surveillance systems threatens power disruptions – collapses the agency

Gorman, '06 (SIOBHAN GORMAN, senior reporter Baltimore Sun "NSA risking electrical overload" August 06, 2006 http://articles.baltimoresun.com/2006-08-06/news/0608060158_1_agency-power-surges-nsa/3) //GY

WASHINGTON -- The National Security Agency is running out of juice. THE DEMAND FOR ELECTRICITY TO OPERATE ITS EXPANDING INTELLIGENCE SYSTEMS HAS LEFT THE HIGH-TECH EAVESDROPPING AGENCY ON THE VERGE OF EXCEEDING ITS POWER SUPPLY, THE LIFE BLOOD of its sprawling 350-acre Fort Meade headquarters, according to current and former intelligence officials. Agency officials anticipated the problem nearly a decade ago as they looked ahead at the technology needs of the agency, sources said, but IT WAS NEVER MADE A PRIORITY, AND NOW THE AGENCY'S ABILITY TO KEEP ITS OPERATIONS GOING IS THREATENED. THE NSA IS ALREADY UNABLE TO INSTALL SOME COSTLY AND SOPHISTICATED NEW EQUIPMENT, including two new supercomputers, for fear of blowing out the electrical infrastructure, they said. At minimum, THE PROBLEM COULD PRODUCE DISRUPTIONS LEADING TO OUTAGES AND POWER SURGES AT THE FORT MEADE HEADQUARTERS, HAMPERING THE WORK OF INTELLIGENCE ANALYSTS AND DAMAGING EQUIPMENT, THEY SAID. At worst, IT COULD FORCE A VIRTUAL SHUTDOWN OF THE AGENCY, PARALYZING THE INTELLIGENCE OPERATION, ERASING CRUCIAL INTELLIGENCE DATA AND CAUSING IRREPARABLE DAMAGE TO COMPUTER SYSTEMS -- ALL DETRIMENTAL TO THE FIGHT AGAINST TERRORISM. Estimates on how long the agency has to stave off such an overload vary from just two months to less than two years. NSA officials "claim they will not be able to operate more than a month or two longer unless something is done," said a former senior NSA official familiar with the problem, who spoke on condition of anonymity. Agency leaders, meanwhile, are scrambling for stopgap measures to buy time while they develop a sustainable plan. LIMITATIONS OF THE ELECTRICAL INFRASTRUCTURE IN THE MAIN NSA COMPLEX AND THE SUBSTATION SERVING THE AGENCY, ALONG WITH GROWING DEMAND IN THE REGION, PREVENT AN IMMEDIATE FIX, according to current and former government officials. "IF THERE'S A MAJOR POWER FAILURE OUT THERE, ANY BACKUP SYSTEMS WOULD BE INADEQUATE TO POWER THE WHOLE FACILITY," said Michael Jacobs, who headed the NSA's information assurance division until 2002. "It's obviously worrisome, particularly on days like today," he said in an interview during last week's barrage of triple-digit temperatures. William Nolte, a former NSA executive who spent decades with the agency, said POWER DISRUPTIONS WOULD SEVERELY HAMPER THE AGENCY. "You've got an awfully big computer plant and a lot of precision equipment, and I don't think they would handle power surges and the like really well," he said. "Even recalibrating equipment would be really time consuming -- with lost opportunities and lost up-time." POWER SURGES CAN ALSO WIPE OUT ANALYSTS' HARD DRIVES, said Matthew Aid, a former NSA analyst who is writing a multivolume history of the agency. The information on those hard drives is so valuable that many NSA employees remove them from their computers and lock them in a safe when they leave each day, he said. A half-dozen current and former government officials knowledgeable about the energy problem discussed it with The Sun on condition of anonymity because of the sensitivity of the issue. NSA spokesman Don Weber declined to comment on specifics about the NSA's power needs or what is being done to address them, saying that even private companies consider such information proprietary. In a statement to The Sun, he said that "as new technologies become available, the demand for power increases and NSA must determine the best and most economical way to use our existing power and bring on additional capacity." Biggest BGE customer, The NSA is Baltimore Gas &

Electric's largest customer, using as much electricity as the city of Annapolis, according to James Bamford, an intelligence expert and author of two comprehensive books on the agency.¶ BGE spokeswoman Linda Foy acknowledged a power company project to deal with the rising energy demand at the NSA, but she referred questions about it to the NSA.¶ THE AGENCY GOT A TASTE OF THE POTENTIAL FOR TROUBLE JAN. 24, 2000, WHEN AN INFORMATION OVERLOAD, RATHER THAN A POWER SHORTAGE, CAUSED THE NSA'S FIRST-EVER NETWORK CRASH. It took the agency 3 1/2 days to resume operations, but with a power outage it could take considerably longer to get the NSA humming again.¶ The 2000 shutdown rendered the agency's headquarters "brain-dead," as then-NSA Director Gen. Michael V. Hayden told CBS's 60 Minutes in 2002.¶ "I don't want to trivialize this. This was really bad," Hayden said. "WE WERE DARK. OUR ABILITY TO PROCESS INFORMATION WAS GONE."¶ As an immediate fallback measure, the NSA sent its incoming data to its counterpart in Great Britain, which stepped up efforts to process the NSA's information along with its own, said Bamford.¶ The agency came under intense criticism from members of Congress after the crash, and the incident rapidly accelerated efforts to modernize the agency.¶ One former NSA official familiar with the electricity problem noted a sense of deja vu six years later. "To think that this was not a priority probably tells you more about the extent to which NSA has actually transformed," the former official said. "In the end, IF YOU DON'T HAVE POWER, YOU CAN'T DO [ANYTHING]."¶ Already some equipment is not being sufficiently cooled, and agency leaders have forgone plugging in some new machinery, current and former government officials said. The power shortage will also delay the installation of two new, multimillion-dollar supercomputers, they said.¶ To begin to alleviate pressure on the electrical grid, the NSA is considering buying additional generators and shutting down so-called "legacy" computer systems that are decades old and not considered crucial to the agency's operations, said three current and former government officials familiar with the situation.¶

Turns aff – UPSTREAM

Information collected by UPSTREAM is ineffective and counterproductive – causes info overload which makes terror attacks less likely to be detected

Whittaker 4/30 (Zach, writer-editor for ZDNet, and sister sites CNET and CBS News., 4/30/15, “NSA is so overwhelmed with data, it’s no longer effective, says whistleblower,”

<http://www.zdnet.com/article/nsa-whistleblower-overwhelmed-with-data-ineffective//Tang>)

A FORMER NATIONAL SECURITY AGENCY OFFICIAL turned whistleblower has spent almost a decade and a half in civilian life. And he says he’s still “pissed” by what he’s seen leak in the past two years. In a lunch meeting hosted by Contrast Security founder Jeff Williams on Wednesday, WILLIAM BINNEY, a former NSA official WHO SPENT MORE THAN THREE DECADES AT THE AGENCY, SAID THE US GOVERNMENT’S MASS SURVEILLANCE PROGRAMS HAVE BECOME SO ENGORGED WITH DATA THAT THEY ARE NO LONGER EFFECTIVE, LOSING VITAL INTELLIGENCE in the fray. THAT, HE SAID, CAN -- AND HAS -- LED TO TERRORIST ATTACKS SUCCEEDING. As the Snowden leaks began, there was “fear and panic” in Congress just a few minutes after the first NSA leak was published, the phones of US lawmakers began to buzz, hours before most of America would find out over their morning coffee. Binney said that AN ANALYST TODAY CAN RUN ONE SIMPLE QUERY ACROSS THE NSA’S VARIOUS DATABASES, ONLY TO BECOME IMMEDIATELY OVERLOADED WITH INFORMATION. With about four billion people -- around two-thirds of the world’s population -- under the NSA and partner agencies’ watchful eyes, according to his estimates, THERE IS TOO MUCH DATA BEING COLLECTED. “THAT’S WHY THEY COULDN’T STOP THE BOSTON BOMBING, OR THE PARIS SHOOTINGS, BECAUSE THE DATA WAS ALL THERE,” said Binney. Because THE AGENCY ISN’T CAREFULLY AND METHODICALLY SETTING ITS TOOLS UP FOR SMART DATA COLLECTION, THAT LEAVES ANALYSTS TO SEARCH FOR A NEEDLE IN A HAYSTACK. “The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that,” he said. “But that doesn’t stop it.” BINNEY CALLED THIS A “BULK DATA FAILURE” -- in that the NSA PROGRAMS, leaked by Edward Snowden, ARE COLLECTING TOO MUCH FOR THE AGENCY TO PROCESS. He said the problem runs deeper across law enforcement and other federal agencies, like the FBI, the CIA, and the Drug Enforcement Administration (DEA), which all have access to NSA intelligence. Binney left the NSA a month after the September 11 attacks in New York City in 2001, days after controversial counter-terrorism legislation was enacted -- the Patriot Act -- in the wake of the attacks. Binney stands jaded by his experience leaving the shadowy eavesdropping agency, but impassioned for the job he once had. He left after a program he helped develop was scrapped three weeks prior to September 11, replaced by a system he said was more expensive and more intrusive. Snowden said he was inspired by Binney’s case, which in part inspired him to leak thousands of classified documents to journalists. Since then, THE NSA HAS RAMPED UP ITS INTELLIGENCE GATHERING MISSION TO INDISCRIMINATELY “COLLECT IT ALL.” Binney said the NSA is today not as interested in phone records -- such as who calls whom, when, and for how long. Although the Obama administration calls the program a “critical national security tool,” the agency is increasingly looking at the content of communications, as the Snowden disclosures have shown. Binney said he estimated that a “maximum” of 72 companies were participating in the bulk records collection program -- including Verizon, but said it was a drop in the ocean. He also called PRISM, the clandestine surveillance program that grabs data from nine named Silicon Valley giants, including Apple, Google, Facebook, and Microsoft, just a “minor part” of the data collection process. “THE UPSTREAM PROGRAM IS WHERE THE VAST BULK OF THE INFORMATION WAS BEING COLLECTED.” said Binney, TALKING ABOUT HOW THE NSA TAPPED UNDERSEA FIBER OPTIC CABLES. With help from its British counterparts at GCHQ, THE NSA IS ABLE TO “BUFFER” MORE THAN 21 PETABYTES A DAY. Binney said THE “COLLECT IT ALL” MANTRA NOW MAY BE THE NORM, BUT IT’S EXPENSIVE AND INEFFECTIVE. “If you have to collect everything, there’s an ever increasing need for more and more budget,” he said. “That means you can build your empire.” They say you never leave the intelligence community. Once you’re a spy, you’re always a spy -- it’s a job for life, with few exceptions. One of those is blowing the whistle, which he did. Since then, he has spent his retirement lobbying for change and reform in industry and in Congress. “They’re taking away half of the constitution in secret,” said Binney. “If they want to change the constitution, there’s a way to do that -- and it’s in the constitution.” An NSA spokesperson did not immediately comment.

Turns cyberterror

Mass surveillance collapses the internet and makes cyberterror likely

Bryant, VICE, 1/26 (Ben Bryant, VICE News "Mass Surveillance Does Not Stop Terrorists, Europe's Top Rights Body Says" January 26, 2015 <https://news.vice.com/article/mass-surveillance-does-not-stop-terrorists-europes-top-rights-body-says>) //GY

MASS SURVEILLANCE IS INEFFECTIVE IN THE FIGHT AGAINST TERRORISM, threatens human rights and violates the privacy enshrined in European law, Europe's top rights body has said.¶ Among a raft of non-binding proposals, parliamentary watchdogs should be given the power to approve intelligence agencies' budgets and whistleblowers should be offered statutory protection, a report by the assembly of the Council of Europe said.¶ The 35-page document drafted by Dutch parliamentarian Pieter Omtzigt proposes measures that should be taken by the assembly's 47 European member states before the "industrial-surveillance complex spins out of control." The assembly, which will now debate the report, provides recommendations to the European Court of Human Rights which are not legally binding but can be influential. European governments are free to ignore the assembly's recommendations, but must explain why if they choose to do so.¶ The report also says that current British laws may be incompatible with the European convention on human rights, an internationally binding treaty. British surveillance may contradict Article 8, the right to privacy; Article 10, the right to freedom of expression; and Article 6, the right to a fair trial.¶ In wake of Paris attacks, David Cameron calls for new powers to break encrypted communications. Read more here.¶ The assembly has been investigating the question of surveillance since last year, and in April heard evidence via videolink from Edward Snowden, the fugitive US National Security Agency whistleblower.¶ ITS REPORT WAS DISMISSIVE OF THE VALUE OF INTELLIGENCE GLEANED FROM MASS SURVEILLANCE, SAYING: "WE HAVE SEEN THAT MASS SURVEILLANCE IS NOT EVEN EFFECTIVE AS A TOOL IN THE FIGHT AGAINST TERRORISM AND ORGANISED CRIME, IN COMPARISON WITH TRADITIONAL TARGETED SURVEILLANCE."¶ It does not specifically mention the recent Paris terrorist attacks in which 17 people were shot dead by terrorists, however. UK Prime Minister David Cameron has used the Paris shootings to call for widening surveillance powers, despite admissions from France that the attackers were known to the authorities, but that they discontinued eavesdropping last summer.¶ CITING INDEPENDENT US REVIEWS OF MASS SURVEILLANCE, THE REPORT SAID "RESOURCES THAT MIGHT PREVENT ATTACKS ARE DIVERTED TO MASS SURVEILLANCE, LEAVING POTENTIALLY DANGEROUS PERSONS FREE TO ACT."¶ SOME ASPECTS OF MASS SURVEILLANCE, SUCH AS THE DELIBERATE WEAKENING OF ENCRYPTION, EVEN PRESENT "A GRAVE DANGER FOR NATIONAL SECURITY" THE REPORT SAID, BECAUSE SUCH weaknesses "can be detected and exploited by rogue states, terrorists cyber-terrorists and ordinary criminals." Cameron has recently called for new powers to break encrypted communications.¶ UK will ask preschool teachers to spy on children in latest counter-terror proposals. Read more here.¶ MASS SURVEILLANCE threatens "the very existence of the Internet AS WE KNOW IT" AND "NOBODY AND NOTHING IS SAFE FROM SNOOPING BY OUR OWN COUNTRIES' AND EVEN FOREIGN INTELLIGENCE SERVICES" WITHOUT TECHNOLOGY THAT SAFEGUARDS PRIVACY, THE DOCUMENT ADDED.¶ The assembly also sent a letter to the German, British and US authorities asking if they had circumvented laws restricting domestic spying by getting a third party to do it for them. The Germans and British deny the accusation, but the US has failed to reply.¶ The report concludes that the British response was probably true — because the UK's Data Retention and Investigatory Powers Act already allows for the wide-ranging collection of personal data.¶ Eric King, deputy director of privacy NGO Privacy International, told VICE News: "This latest report highlights what

has been said all along: intelligence agencies in the UK are in the business of mass, indiscriminate surveillance and there are few if any legal safeguards in place to protect human rights. "It's embarrassing that the British government continues to neither confirm nor deny the essential facts behind this, limiting the opportunity for debate, limiting the opportunity for reform, and limiting proper accountability in the courts. "Secret interpretations of secret laws are plainly not a sustainable position, and place democracy and the rule of law in jeopardy."

Overload negates effectiveness of cybersecurity operations

Conti et al, Director of the Information Technology Operations Center, '06 (Gregory Conti, Kulsoom Abdullah, Julian Grizzard, John Stasko, John A. Copeland, Mustaque Ahamad, Henry L. Owen, and Chris Lee, Georgia Institute of Technology "Countering Security, Information, Overload through Alert and Packet Visualization" March/April 2006 Published by the IEEE Computer Society <http://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=1607922>) //GY

THE MASSIVE AMOUNT OF SECURITY DATA THAT NETWORK SENSORS AND HOST-BASED APPLICATIONS GENERATE CAN QUICKLY OVERWHELM THE OPERATORS CHARGED WITH DEFENDING THE NETWORK. Often, OPERATORS OVERLOOK IMPORTANT DETAILS, AND IT'S DIFFICULT TO GAIN A COHERENT PICTURE OF NETWORK HEALTH AND SECURITY STATUS by manually traversing textual logs, using commandline analysis scripts or traditional graphing and charting techniques. In many instances, THIS FLOOD OF DATA WILL ACTUALLY REDUCE THE OVERALL LEVEL OF SECURITY by consuming operators' available time or misdirecting their efforts. In extreme circumstances, THE OPERATORS WILL BECOME DESENSITIZED AND IGNORE SECURITY WARNINGS ALTOGETHER, EFFECTIVELY NEGATING THE VALUE OF THEIR SECURITY SYSTEMS.

...

Information visualization of security-related data bears great promise in making our personal computers, servers, and networks more secure. Such work is both an art and a science requiring expertise from the computer graphics, information visualization, interface design, and security communities to turn the raw security data into insightful and actionable information and knowledge. THERE IS NO SHORTAGE OF RAW DATA—IN FACT THERE IS FAR MORE THAN CAN BE ANALYZED BY TODAY'S BEST TOOLS. HUMANS OFTEN COPE WITH THIS TORRENT OF DATA BY USING CRUDE STATISTICAL TECHNIQUES, TEXTUAL DISPLAYS, AND OUTDATED GRAPHICAL TECHNIQUES AND BY IGNORING LARGE PORTIONS OF THE DATA. We believe that security visualization, at its best, is both compelling as a video game and several orders of magnitude more effective than the tools we employ today. In this article, we moved toward this goal by exploring the design, implementation, and evaluation of two complementary systems springing from immediate, high-priority security needs and developed by an interdisciplinary team of researchers. By bringing together diverse ideas and expertise, we directly addressed significant problems facing the people who defend our information technology resources.

New CISA bill fails to effectively stop cyberattacks – gathering more information distracts officials from fixing structural problems

Castillo 5/7 (Andrea, program manager of the Technology Policy Program for the Mercatus Center at George Mason University, 5/7/15, "Cybersecurity bill more likely to promote information overload than

prevent cyberattacks,” <http://thehill.com/blogs/congress-blog/homeland-security/241242-cybersecurity-bill-more-likely-to-promote-information//Tang>)

A growing number of information security and hacking incidents emphasize the importance of improving U.S. cybersecurity practices. But **MANY COMPUTER SECURITY EXPERTS ARE CONCERNED THAT** the Cybersecurity Information Sharing Act of 2015 (**CISA**) **IS UNLIKELY TO MEANINGFULLY PREVENT CYBERATTACKS** as supporters claim. **RATHER, IT WILL PROVIDE ANOTHER AVENUE FOR FEDERAL OFFICES TO EXTRACT PRIVATE DATA WITHOUT ADDRESSING OUR ROOT CYBERSECURITY VULNERABILITIES.** The main premise of CISA is that cyber breaches can be prevented by encouraging private companies to share cyber threat data with the government. CISA would extend legal immunity to private entities that share sensitive information about security vulnerabilities—often containing personally identifiable information (PII) about users and customers—with federal offices like the Department of Justice (DOJ), Department of Homeland Security (DHS) and Director of National Intelligence (DNI). This concerns privacy advocates who point out that such data collection could serve as an alternative surveillance tool for the NSA. Section 5(A) of CISA authorizes federal agencies to “disclose, retain, and use” shared data for many purposes beyond promoting cybersecurity, like investigating terrorism, the sexual exploitation of children, violent felonies, fraud, identity theft, and trade secret violation. In other words, CISA would allow federal agencies to use data obtained under the auspices of “cybersecurity protection” in entirely unrelated criminal investigations — potentially indefinitely. Indeed, CISA is currently stalled in the Senate in deference to debate over the NSA’s controversial bulk collection programs. But the Senate cool-down should not let us forget that CISA does not just threaten civil liberties, it could actually undermine cybersecurity. **INFORMATION SECURITY EXPERTS POINT OUT THAT EXISTING INFORMATION SHARING MEASURES RUN BY PRIVATE COMPANIES LIKE IBM AND DELL SECUREWORKS RARELY PREVENT ATTACKS LIKE CISA ADVOCATES PROMISE.** One survey of information security professionals finds that 87 percent of responders did not believe information sharing measures such as CISA will significantly reduce privacy breaches. The federal government already operates at least 20 information sharing offices collaborating on cybersecurity with the private sector, as Eli Dourado and I found in our new analysis through the Mercatus Center at George Mason University. These numerous **FEDERAL INFORMATION-SHARING INITIATIVES HAVE NOT STEMMED THE TIDAL WAVE OF GOVERNMENT CYBERATTACKS.** Another Mercatus Center analysis Dourado and I conducted finds that the number of reported federal information security failures has increased by an astounding 1,012 percent—from 5,502 in FY 2006 to 61,214 in FY 2013. Almost 40 percent of these involved the PII of federal employees and civilians. CISA could therefore have the unintended consequence of creating a juicy and unprepared target for one-stop hacking. **THE OFFICE OF MANAGEMENT AND BUDGET REPORTS THAT MANY OF THE FEDERAL AGENCIES THAT WOULD BE GIVEN LARGE DATA MANAGEMENT RESPONSIBILITIES THROUGH CISA, LIKE THE DOJ AND DHS, REPORTED THOUSANDS OF SUCH BREACHES IN FY 2014.** These agencies’ own information security systems are unlikely to become miraculously impervious to external hacking upon CISA’s passing. In fact, the **MASSIVE AMOUNTS OF NEW DATA TO MANAGE COULD FURTHER OVERWHELM CURRENTLY SUBOPTIMAL PRACTICES.** The **FEDERAL GOVERNMENT’S INFORMATION SECURITY FAILURES INDICATE A TECHNOCRATIC MINDSET THAT FALSELY EQUATES THE COMPLEXITY OF BUREAUCRACY WITH THE STRENGTH OF A SOLUTION. IN REALITY, THE GOVERNMENT’S BRITTLE AND REDUNDANT INTERNAL CYBERSECURITY POLICIES ACTIVELY CONTRIBUTE TO THEIR SECURITY CHALLENGES.** The Government Accountability Office (GAO) has reported for years that **SUCH OVERLAPPING AND UNCLEAR RESPONSIBILITY IN FEDERAL CYBERSECURITY POLICY LIMITS THE OFFICES’ ULTIMATE EFFECTIVENESS.** A 2015 GAO investigation concludes that **WITHOUT SIGNIFICANT CHANGE “THE NATION’S MOST CRITICAL FEDERAL AND PRIVATE SECTOR INFRASTRUCTURE SYSTEMS WILL REMAIN AT INCREASED RISK OF ATTACK FROM ADVERSARIES.” THE FEDERAL GOVERNMENT MUST GET ITS OWN HOUSE IN ORDER BEFORE SUCH COMPREHENSIVE INFORMATION SHARING MEASURES LIKE CISA COULD BE EVEN TECHNICALLY FEASIBLE.** But CISA would be a failure even if managed by the most well-managed government systems because it seeks to impose a technocratic structure on a dynamic system. **EFFECTIVE REFORM WILL PROMOTE A SELF-ORGANIZING “COLLABORATIVE SECURITY APPROACH” AS** outlined by groups like the Internet Society, an international nonprofit devoted to Internet policy and technology standards. Cybersecurity provision is too important a problem to be inadequately addressed by measures that will fail to improve security.

Turns terror

OVERLOAD MAKES TERRORIST ATTACKS MORE LIKELY TO GO UNPREVENTED

Eddington, 1/27 (Patrick Eddington, CATO institute, "No, Mass Surveillance Won't Stop Terrorist Attacks" January 27, 2015 <http://reason.com/archives/2015/01/27/mass-surveillance-and-terrorism#.19hszl:U8Io>) //GY

The recent terrorist attack on the office of French satirical magazine Charlie Hebdo generated a now-familiar meme: Another terrorist attack means we need more surveillance. ¶ Sen. Bob Corker (R-Tenn.) said that while "Congress having oversight certainly is important ... WHAT IS MORE IMPORTANT RELATIVE TO THESE TYPES OF EVENTS IS ENSURING WE DON'T OVERLY HAMSTRING THE NSA'S ABILITY TO COLLECT THIS KIND OF INFORMATION IN ADVANCE AND KEEP THESE KINDS OF ACTIVITIES FROM OCCURRING." Similarly, Sen. Lindsey Graham (R-S.C.) spoke of his "fear" that "our intelligence capabilities, those designed to prevent such an attack from taking place on our shores, are quickly eroding," adding that the government surveillance "designed to prevent these types of attacks from occurring is under siege." ¶ A recent poll demonstrates that their sentiments are widely shared in the wake of the attack. ¶ But would more mass surveillance have prevented the assault on the Charlie Hebdo office? Events from 9/11 to the present help provide the answer: ¶ 2009: Umar Farouk Abdulmutallab—i.e., the "underwear bomber"—nearly succeeded in downing the airline he was on over Detroit because, according to then-National Counterterrorism Center (NCC) director Michael Leiter, the federal Intelligence Community (IC) failed "to connect, integrate, and fully understand the intelligence" it had collected. ¶ 2009: Army Major Nidal Hasan was able to conduct his deadly, Anwar al-Awlaki-inspired rampage at Ft. Hood, Texas, because the FBI bungled its Hasan investigation. ¶ 2013: The Boston Marathon bombing happened, at least in part, because the CIA, Department of Homeland Security (DHS), FBI, NCC, and National Security Agency (NSA) failed to properly coordinate and share information about Tamerlan Tsarnaev and his family, associations, and travel to and from Russia in 2012. Those failures were detailed in a 2014 report prepared by the Inspectors General of the IC, Department of Justice, CIA, and DHS. ¶ 2014: The Charlie Hebdo and French grocery store attackers were not only known to French and U.S. authorities but one had a prior terrorism conviction and another was monitored for years by French authorities until less than a year before the attack on the magazine. ¶ NO, MASS SURVEILLANCE DOES NOT PREVENT TERRORIST ATTACKS. ¶ IT'S WORTH REMEMBERING THAT THE MASS SURVEILLANCE PROGRAMS INITIATED BY THE U.S. GOVERNMENT AFTER THE 9/11 ATTACKS—the legal ones and the constitutionally-dubious ones—WERE PREMISED ON THE BELIEF THAT BIN LADEN'S HIJACKER-TERRORISTS WERE ABLE TO PULL OFF THE ATTACKS BECAUSE OF A FAILURE TO COLLECT ENOUGH DATA. Yet in their subsequent reports on the attacks, the Congressional Joint Inquiry (2002) and the 9/11 Commission found exactly the opposite. THE DATA TO DETECT (AND THUS FOIL) THE PLOTS WAS IN THE U.S. GOVERNMENT'S HANDS PRIOR TO THE ATTACKS; THE FAILURES WERE ONES OF SHARING, ANALYSIS, AND DISSEMINATION. THAT MALADY PERFECTLY DESCRIBES EVERY INTELLIGENCE FAILURE FROM PEARL HARBOR TO THE PRESENT DAY. ¶ The Office of the Director of National Intelligence (created by Congress in 2004) was supposed to be the answer to the "failure-to-connect-the-dots" problem. TEN YEARS ON, THE PROBLEM REMAINS, THE IC BUREAUCRACY IS BIGGER THAN EVER, AND OUR GOVERNMENT IS CONTINUING TO RELY ON MASS SURVEILLANCE PROGRAMS THAT HAVE FAILED TIME AND AGAIN TO STOP TERRORISTS WHILE SIMULTANEOUSLY UNDERMINING THE CIVIL LIBERTIES AND PERSONAL PRIVACY OF EVERY AMERICAN. THE QUEST TO "COLLECT IT ALL," TO BORROW A PHRASE FROM NSA DIRECTOR KEITH ALEXANDER, ONLY LEADS TO THE ACCUMULATION OF MASSES OF USELESS

INFORMATION, MAKING IT HARDER TO FIND REAL THREATS AND COSTING BILLIONS TO STORE.¶ A recent Guardian editorial noted that such MASS-SURVEILLANCE MYOPIA IS SPREADING among European political leaders as well, despite the fact that "terrorists, from 9/11 to the Woolwich jihadists and the neo-Nazi Anders Breivik, have almost always come to the authorities' attention before murdering."¶ MASS SURVEILLANCE IS NOT ONLY DESTRUCTIVE OF OUR LIBERTIES, ITS CONTINUED USE IS A VIRTUAL guarantee of more lethal intelligence failures. AND OUR CONTINUED WILL TO DISBELIEVE THOSE FACTS IS A MENTAL DODGE WE ENGAGE IN AT OUR PERIL.

Overload of data makes terrorism prevention impossible

Tufekci, assistant professor UNC, 2/3 (Zeynep Tufekci, assistant professor at the University of North Carolina, "Terror and the limits of mass surveillance" Feb 03, 2015 <http://blogs.ft.com/the-exchange/2015/02/03/zeynep-tufekci-terror-and-the-limits-of-mass-surveillance/>) //GY

But THE ASSERTION THAT BIG DATA IS "WHAT IT'S ALL ABOUT" WHEN IT COMES TO PREDICTING RARE EVENTS IS NOT SUPPORTED BY WHAT WE KNOW ABOUT HOW THESE METHODS WORK, AND MORE IMPORTANTLY, DON'T WORK. Analytics on massive datasets can be powerful in analysing and identifying broad patterns, or events that occur regularly and frequently, but ARE SINGULARLY UNSUITED TO FINDING UNPREDICTABLE, ERRATIC, AND RARE NEEDLES IN HUGE HAYSTACKS. IN FACT, THE BIGGER THE HAYSTACK — the more massive the scale and the wider the scope of the surveillance — THE LESS SUITED THESE METHODS ARE TO FINDING SUCH EXCEPTIONAL EVENTS, AND THE MORE THEY MAY SERVE TO DIRECT RESOURCES AND ATTENTION AWAY FROM APPROPRIATE TOOLS AND METHODS.¶

After Rigby was killed, GCHQ, Britain's intelligence service, was criticised by many for failing to stop his killers, Michael Adebolajo and Michael Adebowale. A lengthy parliamentary inquiry was conducted, resulting in a 192-page report that lists all the ways in which Adebolajo and Adebowale had brushes with data surveillance, but were not flagged as two men who were about to kill a soldier on a London street. GCHQ defended itself by saying that some of the crucial online exchanges had taken place on a platform, believed to be Facebook, which had not alerted the agency about these men, or the nature of their postings. The men apparently had numerous exchanges that were extremist in nature, and their accounts were suspended repeatedly by the platform for violating its terms of service.¶ "If only Facebook had turned over more data," the thinking goes.¶ But THAT IS MISLEADING, AND MAKES SENSE ONLY WITH THE BENEFIT OF HINDSIGHT. SEEKING LARGER VOLUMES OF DATA, such as asking Facebook to alert intelligence agencies every time that it detects a post containing violence, would deluge the agencies WITH MULTIPLE FALSE LEADS THAT WOULD LEAD TO A DATA QUAGMIRE, RATHER THAN CLUES TO IMPENDING CRIMES.¶ For big data analytics to work, THERE NEEDS TO BE A RELIABLE CONNECTION BETWEEN THE SIGNAL (POSTING OF VIOLENT CONTENT) AND THE EVENT (KILLING SOMEONE). OTHERWISE, THE SIGNAL IS WORSE THAN USELESS. Millions of Facebook's billion-plus users post violent content every day, ranging from routinised movie violence to atrocious violent rhetoric. TURNING OVER THE DATA FROM ALL SUCH OCCURRENCES WOULD MERELY FLOOD THE AGENCIES WITH "FALSE POSITIVES" — ERRONEOUS INDICATIONS FOR EVENTS THAT ACTUALLY WILL NOT HAPPEN. SUCH DATA OVERLOAD IS NOT WITHOUT COST, AS IT TAKES TIME AND EFFORT TO SIFT THROUGH THESE MILLIONS OF STRANDS OF HAY TO CONFIRM THAT THEY ARE, INDEED, NOT NEEDLES — ESPECIALLY WHEN WE DON'T EVEN KNOW WHAT NEEDLES LOOK LIKE. ALL THAT THE INVESTIGATORS WOULD HAVE WOULD BE A LOT OF OPEN LEADS WITH NO RESOLUTION, TAKING AWAY RESOURCES FROM ANY REAL INVESTIGATION. Besides, account suspensions carried out by platforms like Facebook's are haphazard, semi-automated and unreliable indicators. THE FLAGGING SYSTEM MISSES A LOT MORE VIOLENT

CONTENT THAN IT FLAGS, AND IT OFTEN FLAGS CONTENT AS INAPPROPRIATE EVEN WHEN IT IS NOT, AND SUFFERS FROM MANY BIASES. Relying on such a haphazard system is not a reasonable path at all.¶ So is all the hype around big data analytics unjustified? Yes and no. There are appropriate use cases for which massive datasets are intensely useful, and perform much better than any alternative we can imagine using conventional methods. Successful examples include using Google searches to figure out drug interactions that would be too complex and too numerous to analyse one clinical trial at a time, or using social media to detect national-level swings in our mood (we are indeed happier on Fridays than on Mondays).

Overload makes lone wolf terror prevention ineffective

Tufekci, assistant professor UNC, 2/3 (Zeynep Tufekci, assistant professor at the University of North Carolina, "Terror and the limits of mass surveillance" Feb 03, 2015 <http://blogs.ft.com/the-exchange/2015/02/03/zeynep-tufekci-terror-and-the-limits-of-mass-surveillance/>) //GY

In contrast, CONSIDER THE "LONE WOLF" ATTACKER who took hostages at, of all things, a "Lindt Chocolat Café" in Sydney. Chocolate shops ARE NOT REGULAR TARGETS OF POLITICAL VIOLENCE, and random, crazed men attacking them IS NOT A PATTERN ON WHICH WE CAN BASE FURTHER IDENTIFICATION. Yes, the Sydney attacker claimed jihadi ideology and brought a black flag with Islamic writing on it, but given the rarity of such events, it's not always possible to separate the jihadi rhetoric from issues of mental health — every era's mentally ill are affected by the cultural patterns around them. THIS ISN'T A JOB FOR BIG DATA ANALYTICS. (The fact that the gunman was on bail facing various charges and was known for sending hate letters to the families of Australian soldiers killed overseas suggests it was a job for traditional policing).¶ WHEN CONFRONTED WITH THEIR FAILURES IN PREDICTING THOSE RARE ACTS OF DOMESTIC TERRORISM, here's what GCHQ, and indeed the NSA, SHOULD HAVE SAID INSTEAD OF ASKING FOR INCREASED SURVEILLANCE CAPABILITIES: STOP ASKING US TO COLLECT MORE AND MORE DATA TO PERFORM AN IMPOSSIBLE TASK. THIS GLUT OF DATA IS MAKING OUR JOB HARDER, NOT EASIER, AND THE EXPECTATION THAT THERE WILL NEVER BE SUCH INCIDENTS, EVER, IS NOT REALISTIC.¶ Attention should instead be focused on the causal chain that led the Kouachi brothers on their path. It seems that the French-born duo had an alienated, turbulent youth, and then spent years in French prisons, where they were transformed from confused and incompetent wannabe jihadis to hardliners who were both committed and a lot more capable of carrying out complex violence acts than when they entered the prison. UNDERSTANDING SUCH PATHS WILL ALMOST CERTAINLY BE MORE PRODUCTIVE FOR PREVENTING SUCH EVENTS, AND WILL ALSO SPARE ALL OF US FROM ANOTHER REAL DANGER: GOVERNMENTS THAT KNOW TOO MUCH ABOUT THEIR CITIZENS, AND A MISGUIDED BELIEF IN WHAT BIG DATA CAN DO TO FIND NEEDLES IN TOO-LARGE HAYSTACKS.

Mass data mining makes terror prevention impossible

Schneier, 3/24 (Bruce Schneier Advisory Board Member of the Electronic Privacy Information Center, "Why Mass Surveillance Can't, Won't, And Never Has Stopped A Terrorist" Mar 24 2015, 2:15 AM <http://digg.com/2015/why-mass-surveillance-cant-wont-and-never-has-stopped-a-terrorist>) //GY

Data mining is offered as the technique that will enable us to connect those dots. But while corporations are successfully mining our personal data in order to target advertising, detect financial fraud, and

perform other tasks, THREE CRITICAL ISSUES MAKE DATA MINING AN INAPPROPRIATE TOOL FOR FINDING TERRORISTS. ¶ THE FIRST, AND MOST IMPORTANT, ISSUE IS ERROR RATES. FOR ADVERTISING, DATA MINING CAN BE SUCCESSFUL EVEN WITH A LARGE ERROR RATE, BUT FINDING TERRORISTS REQUIRES A MUCH HIGHER DEGREE OF ACCURACY THAN DATA-MINING SYSTEMS CAN POSSIBLY PROVIDE. ¶ Data mining works best when you're searching for a well-defined profile, when there are a reasonable number of events per year, and when the cost of false alarms is low. Detecting credit card fraud is one of data mining's security success stories: all credit card companies mine their transaction databases for spending patterns that indicate a stolen card. There are over a billion active credit cards in circulation in the United States, and nearly 8% of those are fraudulently used each year. Many credit card thefts share a pattern — purchases in locations not normally frequented by the cardholder, and purchases of travel, luxury goods, and easily fenced items — and in many cases data-mining systems can minimize the losses by preventing fraudulent transactions. The only cost of a false alarm is a phone call to the cardholder asking her to verify a couple of her purchases. ¶ Similarly, the IRS uses data mining to identify tax evaders, the police use it to predict crime hot spots, and banks use it to predict loan defaults. These applications have had mixed success, based on the data and the application, but they're all within the scope of what data mining can ACCOMPLISH. ¶ TERRORIST PLOTS ARE DIFFERENT, MOSTLY BECAUSE WHEREAS FRAUD IS COMMON, TERRORIST ATTACKS ARE VERY RARE. THIS MEANS THAT EVEN HIGHLY ACCURATE TERRORISM PREDICTION SYSTEMS WILL BE SO FLOODED WITH FALSE ALARMS THAT THEY WILL BE USELESS. ¶ THE REASON LIES IN THE MATHEMATICS OF DETECTION. ALL DETECTION SYSTEMS HAVE ERRORS, AND SYSTEM DESIGNERS CAN TUNE THEM TO MINIMIZE EITHER FALSE POSITIVES OR FALSE NEGATIVES. IN A TERRORIST-DETECTION SYSTEM, A FALSE POSITIVE OCCURS WHEN THE SYSTEM MISTAKENLY IDENTIFIES SOMETHING HARMLESS AS A THREAT. A false negative occurs when the system misses an actual attack. Depending on how you "tune" your detection system, you can increase the number of false positives to assure you are less likely to miss an attack, or you can reduce the number of false positives at THE EXPENSE OF MISSING ATTACKS. ¶ BECAUSE TERRORIST ATTACKS ARE SO RARE, FALSE POSITIVES COMPLETELY OVERWHELM THE SYSTEM, NO MATTER HOW WELL YOU TUNE. And I mean completely: MILLIONS OF PEOPLE WILL BE FALSELY ACCUSED FOR EVERY REAL TERRORIST PLOT the system finds, if it ever finds any. ¶ We might be able to deal with all of the innocents being flagged by the system if the cost of false positives were minor. Think about the full-body scanners at airports. Those alert all the time when scanning people. But a TSA officer can easily check for a false alarm with a simple pat-down. This doesn't work for a more general data-based terrorism-detection system. Each alert requires a lengthy investigation to determine whether it's real or not. That takes time and money, and prevents intelligence officers from doing other productive work. Or, more pithily, WHEN YOU'RE WATCHING EVERYTHING, YOU'RE NOT SEEING ANYTHING. ¶ The US intelligence community also likens finding a terrorist plot to looking for a needle in a haystack. And, as former NSA director General Keith Alexander said, "you need the haystack to find the needle." That statement perfectly illustrates the problem with mass surveillance and bulk collection. WHEN YOU'RE LOOKING FOR THE NEEDLE, THE LAST THING YOU WANT TO DO IS PILE LOTS MORE HAY ON IT. MORE SPECIFICALLY, THERE IS NO SCIENTIFIC RATIONALE FOR BELIEVING THAT ADDING IRRELEVANT DATA ABOUT INNOCENT PEOPLE MAKES IT EASIER TO FIND A TERRORIST ATTACK, AND LOTS OF EVIDENCE THAT IT DOES NOT. You might be adding slightly more signal, but you're also adding much more noise. And despite the NSA's "collect it all" mentality, its own documents bear this out. The military intelligence community even talks about the problem of "drinking from a fire hose": having so much irrelevant data that it's impossible to find the important bits. WE SAW THIS PROBLEM WITH THE NSA'S

EAVESDROPPING PROGRAM: THE FALSE POSITIVES OVERWHELMED THE SYSTEM. IN THE YEARS AFTER 9/11, THE NSA PASSED TO THE FBI THOUSANDS OF TIPS PER MONTH; EVERY ONE OF THEM TURNED OUT TO BE A FALSE ALARM. The cost was enormous, and ended up frustrating the FBI agents who were obligated to investigate all the tips. We also saw this with the Suspicious Activity Reports — or SAR — database: tens of thousands of reports, and no actual results. And all the telephone metadata the NSA collected led to just one success: the conviction of a taxi driver who sent \$8,500 to a Somali group that posed no direct threat to the US — and that was probably trumped up so the NSA would have better talking points in front of Congress. THE SECOND PROBLEM WITH USING DATA-MINING TECHNIQUES TO TRY TO UNCOVER TERRORIST PLOTS IS THAT EACH ATTACK IS UNIQUE. Who would have guessed that two pressure-cooker bombs would be delivered to the Boston Marathon finish line in backpacks by a Boston college kid and his older brother? Each rare individual who carries out a terrorist attack will have a disproportionate impact on the criteria used to decide who's a likely terrorist, leading to ineffective detection strategies. THE THIRD PROBLEM IS THAT THE PEOPLE THE NSA IS TRYING TO FIND ARE WILY, AND THEY'RE TRYING TO AVOID DETECTION. IN THE WORLD OF PERSONALIZED MARKETING, THE TYPICAL SURVEILLANCE SUBJECT ISN'T TRYING TO HIDE HIS ACTIVITIES. That is not true in a police or national security context. An adversarial relationship makes the problem much harder, and means that most commercial big data analysis tools just don't work. A commercial tool can simply ignore people trying to hide and assume benign behavior on the part of everyone else. Government data-mining techniques can't do that, because those are the very people they're looking for.

Data overload risks terror attacks – whistleblowers confirm

Whittaker, 15

Zack Whittaker is a writer-editor for ZDNet, and sister sites CNET and CBS News, citing an NSA whistleblower, "NSA is so overwhelmed with data, it's no longer effective, says whistleblower," ZDNet, 4/30/15, [// IS](http://www.zdnet.com/article/nsa-whistleblower-overwhelmed-with-data-ineffective/?tag=nl.e539&s_cid=e539&ttag=e539&ftag=TRE17cfd61)

In a lunch meeting hosted by Contrast Security founder Jeff Williams on Wednesday, WILLIAM BINNEY, A FORMER NSA OFFICIAL WHO SPENT MORE THAN THREE DECADES AT THE AGENCY, SAID THE US GOVERNMENT'S MASS SURVEILLANCE PROGRAMS HAVE BECOME SO **engorged** WITH DATA THAT THEY ARE NO LONGER EFFECTIVE, **losing vital intelligence in the fray.**

THAT, HE SAID, CAN -- AND HAS -- LED TO **terrorist attacks succeeding.**

BINNEY SAID THAT AN ANALYST TODAY CAN RUN ONE SIMPLE QUERY ACROSS THE NSA'S VARIOUS DATABASES, ONLY TO BECOME IMMEDIATELY OVERLOADED WITH INFORMATION. WITH ABOUT FOUR BILLION PEOPLE -- AROUND TWO-THIRDS OF THE WORLD'S POPULATION -- UNDER THE NSA AND PARTNER AGENCIES' WATCHFUL EYES, ACCORDING TO HIS ESTIMATES, THERE IS TOO MUCH DATA BEING COLLECTED.

"THAT'S WHY THEY COULDN'T STOP THE **Boston bombing**, OR THE **Paris shootings**, BECAUSE THE DATA WAS ALL THERE," said Binney. **BECAUSE THE AGENCY ISN'T CAREFULLY AND METHODICALLY SETTING ITS TOOLS UP FOR SMART DATA COLLECTION, THAT LEAVES ANALYSTS TO SEARCH FOR A NEEDLE IN A HAYSTACK.**

"The data was all there... the NSA is great at going back over it forensically for years to see what they were doing before that," he said. "But that doesn't stop it."

Binney called this a "bulk data failure" -- in that THE NSA PROGRAMS, LEAKED BY EDWARD SNOWDEN, ARE COLLECTING TOO MUCH FOR THE AGENCY TO PROCESS. He said the problem runs deeper across law enforcement and other federal agencies, like the FBI, the CIA, and the Drug Enforcement Administration (DEA), which all have access to NSA intelligence.

than government or law can keep up."

Overload kills attempts to stop Al Qaeda attacks

Robb, Air Force analyst, '06 (John Robb, Air Force analyst, "NSA: The Problems with Massively Automated Domestic Surveillance" May 11, 2006

http://globalguerrillas.typepad.com/johnrobb/2006/05/nsa_the_problem.html //GY

Noah, at DefenseTech, tapped Valdis Krebs for his analysis of the problems with the slowly leaked details on the NSAs domestic surveillance efforts. Valdis makes the absolutely correct observation that:

THE RIGHT THING TO DO IS TO LOOK FOR THE BEST HAYSTACK, NOT THE BIGGEST HAYSTACK. WE KNEW EXACTLY WHICH HAYSTACK TO LOOK AT in the year 2000 [BEFORE THE 9/11 ATTACKS]. WE JUST DIDN'T DO IT...

To me, it's pretty clear that the people working on this program aren't as smart as they think they are. SOME TOP LEVEL THINKING INDICATES THAT THIS WILL QUICKLY BECOME A RAT HOLE FOR FEDERAL FUNDS (DUE TO WASTED EFFORT) AND A MAJOR SOURCE OF INFRINGEMENT OF PERSONAL FREEDOM.

Here's some detail:

IT WILL GENERATE OODLES OF FALSE POSITIVES. AL QAEDA IS NOW IN A PHASE WHERE MOST DOMESTIC ATTACKS WILL BE GENERATED BY PEOPLE NOT CURRENTLY CONNECTED TO THE MOVEMENT (like we saw in the London bombings). This means that in many respects they will look like you and me until they act. THE LARGE VOLUME OF FALSE POSITIVES GENERATED WILL NOT ONLY BE HUGELY INEFFICIENT, IT WILL BE A MAJOR INFRINGEMENT ON US LIBERTIES. For example, a false positive will likely get you automatically added to a no-fly list, your boss may be visited (which will cause you to lose your job), etc.

IT WILL BE EXPANDED TO INCLUDE TO MONITOR DOMESTIC GROUPS OTHER THAN AL QAEDA. As we have already seen in numerous incidents across the US, every group that opposes the war or deals with issues in the Middle East will eventually fall under surveillance. Eventually, THIS WILL BEGIN TO BUMP UP THE POLITICAL PROCESS BY TARGETING GROUPS THAT ARE POLITICALLY ACTIVE IN THE OPPOSITION PARTY.

THE DATABASE AND ASSOCIATED INFORMATION WILL BE USED FOR PURPOSES OTHER THAN TRACKING GROUPS. For example: finding who leaked a classified document to a reporter by reading the list of all calls made to that reporter (who is likely on the target list due to the subjects they cover).

Info overload creates redundancy – lack of info sharing makes it impossible to stop attacks

Priest and Arkin 10 (Dana Priest, American academic, journalist and writer, Washington Post, William Arkin, American political commentator, best-selling author, journalist, activist, blogger, and former United States Army soldier, 7/19, "Top Secret America," <http://projects.washingtonpost.com/top-secret-america/articles/a-hidden-world-growing-beyond-control/print///Tang>)

And then came a problem that continues to this day, which has to do with the ODN's rapid expansion. When it opened in the spring of 2005, Negroponte's office was all of 11 people stuffed into a secure vault with closet-size rooms a block from the White House. A year later, the budding agency moved to two floors of another building. In April 2008, it moved into its huge permanent home, Liberty Crossing. Today, many officials who work in the intelligence agencies say they remain unclear about what the ODN is in charge of. To be sure, the ODN has made some progress, especially in intelligence-sharing, information technology and budget reform. The DNI and his managers hold interagency meetings every day to promote collaboration. The last director, Blair, doggedly pursued such nitty-gritty issues as procurement reform, compatible computer networks, tradecraft standards and collegiality. But **IMPROVEMENTS HAVE BEEN**

OVERTAKEN BY VOLUME at the ODN, **AS THE INCREASED FLOW OF INTELLIGENCE DATA OVERWHELMS THE SYSTEM'S ABILITY TO ANALYZE AND USE IT. EVERY DAY, COLLECTION SYSTEMS AT THE NATIONAL SECURITY AGENCY INTERCEPT AND STORE 1.7 BILLION E-MAILS, PHONE CALLS AND OTHER TYPES OF COMMUNICATIONS.** The NSA sorts a fraction of those into 70 separate databases. **THE SAME PROBLEM BEDEVILS EVERY OTHER INTELLIGENCE AGENCY, NONE OF WHICH HAVE ENOUGH ANALYSTS AND TRANSLATORS FOR ALL THIS WORK. THE PRACTICAL EFFECT OF THIS UNWIELDINESS IS VISIBLE,** on a much smaller scale, in the office of Michael

Leiter, the director of the National Counterterrorism Center. Leiter spends much of his day flipping among four computer monitors lined up on his desk. Six hard drives sit at his feet. The data flow is enormous, with dozens of databases feeding separate computer networks that cannot interact with one another. There is a long explanation for why these databases are still not connected, and it amounts to this: It's too hard, and some agency heads don't really want to give up the systems they have. But there's some progress: "All my e-mail on one computer now," Leiter says. "That's a big deal." To get another view of how sprawling Top Secret America has become, just head west on the toll road toward Dulles International Airport. As a Michaels craft store and a Books-A-Million give way to the military intelligence giants Northrop Grumman and Lockheed Martin, find the off-ramp and turn left. Those two shimmering-blue five-story ice cubes belong to the National Geospatial-Intelligence Agency, which analyzes images and mapping data of the Earth's geography. A small sign obscured by a boxwood hedge says so. Across the street, in the chocolate-brown blocks, is Carahsoft, an intelligence agency contractor specializing in mapping, speech analysis and data harvesting. Nearby is the government's Underground Facility Analysis Center. It identifies overseas underground command centers associated with weapons of mass destruction and terrorist groups, and advises the military on how to destroy them. Clusters of top-secret work exist throughout the country, but the Washington region is the capital of Top Secret America. About half of the post-9/11 enterprise is anchored in an arc stretching from Leesburg south to Quantico, back north through Washington and curving northeast to Linthicum, just north of the Baltimore-Washington International Marshall Airport. Many buildings sit within off-limits government compounds or military bases. Others occupy business parks or are intermingled with neighborhoods, schools and shopping centers and go unnoticed by most people who live or play nearby. Many of the newest buildings are not just utilitarian offices but also edifices "on the order of the pyramids," in the words of one senior military intelligence officer. Not far from the Dulles Toll Road, the CIA has expanded into two buildings that will increase the agency's office space by one-third. To the south, Springfield is becoming home to the new \$1.8 billion National Geospatial-Intelligence Agency headquarters, which will be the fourth-largest federal building in the area and home to 8,500 employees. Economic stimulus money is paying hundreds of millions of dollars for this kind of federal construction across the region. **IT'S NOT ONLY THE NUMBER OF BUILDINGS THAT SUGGESTS THE SIZE AND COST OF THIS EXPANSION, IT'S ALSO WHAT IS INSIDE: BANKS OF TELEVISION MONITORS. "ESCORT-REQUIRED"**

BADGES. X-RAY MACHINES AND LOCKERS TO STORE CELLPHONES AND PAGERS. Keypad door locks that open special rooms encased in metal or permanent dry wall, impenetrable to eavesdropping tools and protected by alarms and a security force capable of responding within 15 minutes. Every one of these buildings has at least one of these rooms, known as a SCIF, for sensitive compartmented information facility. Some are as small as a closet; others are four times the size of a football field. SCIF size has become a measure of status in Top Secret America, or at least in the Washington region of it. "In D.C., everyone talks SCIF, SCIF, SCIF," said Bruce Paquin, who moved to Florida from the Washington region several years ago to start a SCIF construction business. "They've got the penis envy thing going. You can't be a big boy unless you're a three-letter agency and you have a big SCIF." SCIFs are not the only must-have items people pay attention to. Command centers, internal television networks, video walls, armored SUVs and personal security guards have also become the bling of national security. "You can't find a four-star general without a security detail," said one three-star general now posted in Washington after years abroad. "Fear has caused everyone to have stuff. Then comes, 'If he has one, then I have to have one.' It's become a status symbol." Among the most important people inside the SCIFs are the low-paid employees carrying their lunches to work to save money. They are the analysts, the 20- and 30-year-olds making \$41,000 to \$65,000 a year, whose job is at the core of everything Top Secret America tries to do. At its best, analysis melds cultural understanding with snippets of conversations, coded dialogue, anonymous tips, even scraps of trash, turning them into clues that lead to individuals and groups trying to harm the United States.

Their work is greatly enhanced by computers that sort through and categorize data. But **IN THE END, ANALYSIS REQUIRES HUMAN JUDGMENT, AND HALF THE ANALYSTS ARE RELATIVELY INEXPERIENCED, HAVING BEEN HIRED IN THE PAST SEVERAL YEARS,** said a senior ODN official. Contract analysts are often straight out of college and trained at corporate headquarters. When hired, a typical analyst knows very little about the priority countries - Iraq, Iran, Afghanistan and Pakistan - and is not fluent in their languages. Still, the number of intelligence reports they produce on these key countries is overwhelming, say current and former intelligence officials who try to cull them every day. The ODN doesn't know exactly how many reports are issued each year, but in the process of trying to find out, the chief of analysis discovered 60 classified analytic Web sites still in operation that were supposed to have been closed down for lack of usefulness. "Like a zombie, it keeps on living" is how one official describes the sites.

THE PROBLEM WITH MANY INTELLIGENCE REPORTS, say officers who read them, is THAT THEY SIMPLY RE-SLICE THE SAME FACTS ALREADY IN CIRCULATION. "It's the soccer ball syndrome. SOMETHING HAPPENS, AND THEY WANT TO RUSH TO COVER IT," said Richard H. Immerman, who was the ODN's assistant deputy director of national intelligence for analytic integrity and standards until early 2009. "I SAW TREMENDOUS OVERLAP." Even the analysts at the National Counterterrorism Center (NCTC), which is supposed to be where the most sensitive, most difficult-to-obtain nuggets of information are fused together, get low marks from intelligence officials for not producing reports that are original, or at least better than the reports already written by the CIA, FBI, National Security Agency or Defense Intelligence Agency. When Maj. Gen. John M. Custer was the director of intelligence at U.S. Central Command, he grew angry at how little helpful information came out of the NCTC. In 2007, he visited its director at the time, retired Vice Adm. John Scott Redd, to tell him so. "I told him that after 41/2 years, this organization had never produced one shred of information that helped me prosecute three wars!" he said loudly, leaning over the table during an interview. Two years later, Custer, now head of the Army's intelligence school at Fort Huachuca, Ariz., still gets red-faced recalling that day, which reminds him of his frustration with Washington's bureaucracy. "WHO HAS THE MISSION OF REDUCING REDUNDANCY AND ENSURING EVERYBODY DOESN'T GRAVITATE TO THE LOWEST-HANGING FRUIT?" he said. "WHO ORCHESTRATES WHAT IS PRODUCED SO THAT EVERYBODY DOESN'T PRODUCE THE SAME THING?" He's hardly the only one irritated. In a secure office in Washington, a senior intelligence officer was dealing with his own frustration. Seated at his computer, he began scrolling through some of the classified information he is expected to read every day: CIA World Intelligence Review, WIRe-CIA, Spot Intelligence Report, Daily Intelligence Summary, Weekly Intelligence Forecast, Weekly Warning Forecast, IC Terrorist Threat Assessments, NCTC Terrorism Dispatch, NCTC Spotlight . . . It's too much, he complained. The inbox on his desk was full, too. He threw up his arms, picked up a thick, glossy intelligence report and waved it around, yelling. "Jesus! Why does it take so long to produce?" "Why does it have to be so bulky?" "Why isn't it online?" THE OVERLOAD OF HOURLY, DAILY, WEEKLY, MONTHLY AND ANNUAL REPORTS IS ACTUALLY COUNTERPRODUCTIVE, say people who receive them. SOME POLICYMAKERS AND SENIOR OFFICIALS DON'T DARE DELVE INTO THE BACKUP CLOGGING THEIR COMPUTERS. THEY RELY INSTEAD ON PERSONAL BRIEFERS, AND THOSE BRIEFERS USUALLY RELY ON THEIR OWN AGENCY'S ANALYSIS, RE-CREATING THE VERY PROBLEM IDENTIFIED AS A MAIN CAUSE OF THE FAILURE TO THWART THE ATTACKS: A LACK OF INFORMATION-SHARING.

More surveillance fails to prevent terror attacks – multiple examples

Marlowe 10 (Lara, Paris Correspondent with The Irish Times., citing Top Secret America report, 7/24, "Information overload threatening to choke response to terror."
<http://www.irishtimes.com/news/information-overload-threatening-to-choke-response-to-terror-1.626474/Tang>)

A report on the colossal counter-terrorism intelligence industry in the US shows that it may be drowning in an ocean of raw data THIS, I suspect, IS HOW EMPIRES DIE: OVER-EXTENDED, ASPHYXIATED BY BUREAUCRACY, DROWNING IN INFORMATION THEY CANNOT ADEQUATELY ASSESS OR ACT UPON. The Washington Post published a STUNNING, THREE-DAY SERIES totalling 11 pages this week ON "TOP SECRET AMERICA". It WAS THE RESULT OF AN INVESTIGATION OVER TWO YEARS by Dana Priest and William Arkin into the explosion of the intelligence industry since September 11th, 2001. Consider the statistics: 1,271 GOVERNMENT ORGANISATIONS AND 1,931 PRIVATE COMPANIES ARE NOW DEVOTED TO COUNTER-TERRORISM, "HOMELAND SECURITY" AND INTELLIGENCE, IN 10,000 LOCATIONS ACROSS THE US. An estimated 854,000 Americans – 1.5 times the population of Washington DC – hold top secret security clearances. Nearly one-third of them are private contractors. About half of Top Secret America is concentrated in a swathe of land running diagonally from Virginia to the southwest, across Washington DC and into Maryland to the northeast. IN THE WASHINGTON AREA ALONE, 33 TOP-SECRET BUILDING COMPLEXES, SOME OF THEM UNMARKED AND WINDOWLESS BEHIND HIGH FENCES, HAVE BEEN OR ARE BEING BUILT SINCE 9/11. They total 1.6 million sq m (17 million sq ft), the equivalent of 22 US Capitol buildings. TURF BATTLES BETWEEN INTELLIGENCE AGENCIES, the habit of holding information close to the chest AND THE IMPOSSIBILITY OF CO-ORDINATING SO MUCH ACTIVITY MAKES FOR HUGE AMOUNTS OF DUPLICATION. For example, 51 FEDERAL ORGANISATIONS AND MILITARY COMMANDS ARE DEDICATED TO TRACKING THE MONEY OF TERRORISTS. THE VOLUME of reporting generated

by Top Secret America – 50,000 INTELLIGENCE REPORTS EACH YEAR – MEANS NO ONE HAS A FULL GRASP OF WHAT IS KNOWN. As James Clapper, President Obama’s nominee for director of national intelligence, told the Post: “There’s only one entity in the entire universe that has visibility on all (top secret programmes) – that’s God.” “The complexity of this system defies description,” said another high-ranking source, retired army Lt Gen John Vines, commissioned to track intelligence at the Department of Defence. The Post concluded that despite a 250 per cent increase in intelligence spending since 9/11, despite the creation or restructuring of 263 organisations, “the problems that gusher of money and bureaucracy were meant to solve . . . have not been alleviated”. AGENCIES ARE STILL FAILING TO SHARE INFORMATION OR “CONNECT THE DOTS”. America may not be measurably safer for the more than \$75 billion (£58 billion) it spends each year on intelligence. The National Security Agency intercepts and stores 1.7 billion e-mails, phone calls and other communications daily. But the NSA and other agencies doing similar work don’t have enough analysts and translators to process the information they cull. One could argue that the absence of large-scale, lethal attacks on the US continent since 9/11 shows the system is working. But THREE RECENT CASES SHOW HOW TOP SECRET AMERICA FAILED TO FORESTALL REAL THREATS. LAST NOVEMBER, US ARMY MAJ NIDAL HASAN WENT ON A SHOOTING RAMPAGE AT FORT HOOD TEXAS, KILLING 13 PEOPLE AND WOUNDING 30 OTHERS. WHEN HE WAS TRAINING AS A PSYCHIATRIST AT WALTER REED ARMY MEDICAL CENTRE, HASAN HAD WARNED HIS SUPERIORS OF “ADVERSE EVENTS” IF MUSLIMS WERE NOT ALLOWED TO LEAVE THE ARMY. AND HE EXCHANGED E-MAILS WITH ANWAR AWLAKI, A RADICAL CLERIC BASED IN YEMEN WHOM THE US HAS TARGETED FOR ASSASSINATION. But THE ARMY’S INTELLIGENCE UNIT DID NOT NOTICE HASAN’S BEHAVIOUR. ITS PROGRAMME, called RITA for Radical Islamic Threat to the Army, WAS TOO BUSY REPLICATING WORK BY THE DEPARTMENT OF HOMELAND SECURITY AND FBI ON ISLAMIST STUDENT GROUPS IN THE US. LAST AUTUMN, PRESIDENT OBAMA SIGNED A SECRET ORDER TO SEND DOZENS OF COMMANDOS TO YEMEN, WHERE THEY SET UP AN INTELLIGENCE CENTRE BRISTLING WITH HI-TECH EQUIPMENT. THEIR VOLUMINOUS REPORTS WERE BUNDLED INTO THE 5,000 PIECES OF DATA SENT DAILY TO THE NATIONAL COUNTER-TERRORISM CENTRE IN WASHINGTON. BURIED IN THE DELUGE WAS THE NEWS THAT A RADICAL NIGERIAN STUDENT HAD VISITED YEMEN, THAT A NIGERIAN FATHER WAS WORRIED ABOUT HIS SON WHO’D GONE TO YEMEN. But WHEN UMAR FAROUK ABDULMUTALLAB TRIED TO BLOW HIMSELF UP ON A FLIGHT TO DETROIT ON CHRISTMAS DAY, THE AIRCRAFT WAS SAVED BY A PASSENGER WHO SAW SMOKE COMING FROM ABDULMUTALLAB’S UNDERWEAR AND TACKLED HIM, preventing him from detonating the device. LIKEWISE, IT WAS A VENDOR IN MANHATTAN WHO ALERTED POLICE TO A HOME-MADE CAR BOMB ON TIMES SQUARE AT THE BEGINNING OF MAY. FAISAL SHAHZAD, the Pakistani-born American citizen who concocted the mix of fertiliser and bleach, WAS ALSO IN CONTACT WITH ANWAR AWLAKI. The Post reports that ANALYSTS WORKING ON THE “PRIORITY COUNTRIES” OF IRAQ, IRAN, AFGHANISTAN AND PAKISTAN KNOW LITTLE ABOUT THEM AND DO NOT SPEAK THEIR LANGUAGES, YET PRODUCE AN “OVERWHELMING” NUMBER OF REPORTS. The MANY-TENTACLED INTELLIGENCE COMMUNITY IN THE US SEEMS BLIGHTED BY TWO OF THE SAME WOES AS US JOURNALISM: THE SAME INFORMATION IS REHASHED OVER AND OVER, AND RECIPIENTS ARE POWERLESS TO SIFT THROUGH THE GLUT OF MATERIAL.

Info overload is counterproductive to counterterror efforts – cognitive burden

Maas 5/28 (Peter, written about war, media, and national security for The New York Times Magazine, The New Yorker, and The Washington Post. 5/28/15, “INSIDE NSA, OFFICIALS PRIVATELY CRITICIZE “COLLECT IT ALL” SURVEILLANCE,” <https://firstlook.org/theintercept/2015/05/28/nsa-officials-privately-criticize-collect-it-all-surveillance//Tang>)

AS MEMBERS OF CONGRESS struggle to agree on which surveillance programs to re-authorize before the Patriot Act expires, they might consider the unusual advice of AN INTELLIGENCE ANALYST AT THE NATIONAL SECURITY AGENCY who WARNED ABOUT THE DANGER OF COLLECTING TOO MUCH DATA. IMAGINE, the analyst wrote in a leaked document, THAT YOU ARE STANDING IN A SHOPPING AISLE TRYING TO DECIDE BETWEEN JAM, JELLY OR FRUIT SPREAD,

WHICH SIZE, SUGAR-FREE OR NOT, GENERIC OR SMUCKER'S. IT CAN BE PARALYZING. "WE IN THE AGENCY ARE AT RISK OF A SIMILAR, COLLECTIVE PARALYSIS IN THE FACE OF A DIZZYING ARRAY OF CHOICES EVERY SINGLE DAY," the analyst wrote in 2011. "ANALYSIS PARALYSIS' ISN'T ONLY A CUTE RHYME. IT'S THE TERM FOR WHAT HAPPENS WHEN YOU SPEND SO MUCH TIME ANALYZING A SITUATION THAT YOU ULTIMATELY STYMIE ANY OUTCOME IT'S WHAT HAPPENS IN SIGINT [SIGNALS INTELLIGENCE] WHEN WE HAVE ACCESS TO ENDLESS POSSIBILITIES, BUT WE STRUGGLE TO PRIORITIZE, NARROW, AND EXPLOIT THE BEST ONES." The document is one of about a dozen in which NSA intelligence experts express concerns usually heard from the agency's critics: THAT THE U.S. GOVERNMENT'S "COLLECT IT ALL" STRATEGY CAN UNDERMINE THE EFFORT TO FIGHT TERRORISM. The documents, provided to The Intercept by NSA whistleblower Edward Snowden, appear to contradict years of statements from senior officials who have claimed that pervasive surveillance of global communications helps the government identify terrorists before they strike or quickly find them after an attack. The Patriot Act, portions of which expire on Sunday, has been used since 2001 to conduct a number of dragnet surveillance programs, including the bulk collection of phone metadata from American companies. But the DOCUMENTS SUGGEST THAT ANALYSTS AT THE NSA HAVE DROWNED IN DATA SINCE 9/11, MAKING IT MORE DIFFICULT FOR THEM TO FIND THE REAL THREATS. The titles of the documents capture their overall message: "Data Is Not Intelligence," "The Fallacies Behind the Scenes," "Cognitive Overflow?" "Summit Fever" and "In Praise of Not Knowing." Other titles include "Dealing With a 'Tsunami' of Intercept" and "Overcome by Overload?" The documents are not uniform in their positions. Some acknowledge the overload problem but say the agency is adjusting well. They do not specifically mention the Patriot Act, just the larger dilemma of cutting through a flood of incoming data. But IN AN APPARENT SIGN OF THE SCALE OF THE PROBLEM, THE DOCUMENTS CONFIRM THAT THE NSA EVEN HAS A SPECIAL CATEGORY OF PROGRAMS THAT IS CALLED "COPING WITH INFORMATION OVERLOAD." THE JAM VS. JELLY DOCUMENT, TITLED "TOO MANY CHOICES," STARTED OFF IN A COLORFUL WAY BUT ENDED WITH A FAIRLY STARK WARNING: "THE SIGINT MISSION IS FAR TOO VITAL TO UNNECESSARILY EXPAND THE HAYSTACKS WHILE WE SEARCH FOR THE NEEDLES. PRIORITIZATION IS KEY." These doubts are infrequently heard from officials inside the NSA. These documents are a window into the private thinking of mid-level officials who are almost never permitted to discuss their concerns in public. AN AMUSING PARABLE circulated at the NSA a few years ago. Two people go to a farm and purchase a truckload of melons for a dollar each. They then sell the melons along a busy road for the same price, a dollar. As they drive back to the farm for another load, they realize they aren't making a profit, so one of them suggests, "Do you think we need a bigger truck?" The parable was written by an intelligence analyst in a document dated Jan. 23, 2012 that was titled, "Do We Need a Bigger SIGINT Truck?" It expresses, in a lively fashion, a critique of the agency's effort to collect what former NSA Director Keith Alexander referred to as "the whole haystack." THE CRITIQUE GOES TO THE HEART OF THE AGENCY'S DRIVE TO GATHER AS MUCH OF THE WORLD'S COMMUNICATIONS AS POSSIBLE: BECAUSE IT MAY NOT FIND WHAT IT NEEDS IN A PARTIAL HAYSTACK OF DATA, THE HAYSTACK IS EXPANDED AS MUCH AS POSSIBLE, ON THE ASSUMPTION THAT MORE DATA WILL EVENTUALLY YIELD USEFUL INFORMATION. THE PROBLEM IS THAT WHEN YOU COLLECT IT ALL, WHEN YOU MONITOR EVERYONE, YOU UNDERSTAND NOTHING. –EDWARD SNOWDEN The Snowden files show that in practice, it doesn't turn out that way: MORE IS NOT NECESSARILY BETTER, AND IN FACT, EXTREME VOLUME CREATES ITS OWN CHALLENGES. "Recently I tried to answer what seemed like a relatively straightforward question about which telephony metadata collection capabilities are the most important in case we need to shut something off when the metadata coffers get full," wrote the intelligence analyst. "By the end of the day, I felt like capitulating with the white flag of, 'We need COLOSSAL data storage so we don't have to worry about it,' (aka we need a bigger SIGINT truck)." The analyst added, "Without metrics, how do we know that we have improved something or made it worse? There's a running joke ... that we'll only know if collection is important by shutting it off and seeing if someone screams." Another document, while not mentioning the dangers of collecting too much data, expressed concerns about pursuing entrenched but unproductive programs. "How many times have you been watching a terrible movie, only to convince yourself to stick it out to the end and find out what happens, since you've already invested too much time or money to simply walk away?" the document asked. "This 'gone too far to stop now' mentality is our built-in mechanism to help us allocate and ration resources. However, IT CAN WORK TO OUR DETRIMENT IN PRIORITIZING AND DECIDING WHICH PROJECTS OR EFFORTS ARE WORTH FURTHER EXPENDITURE OF RESOURCES, REGARDLESS OF HOW MUCH HAS ALREADY BEEN 'SUNK.'" As has been said before, insanity is doing the same thing over and over and expecting different results." "WE ARE DROWNING IN INFORMATION. AND YET WE KNOW NOTHING. FOR SURE." –NSA INTELLIGENCE ANALYST Many of these documents were written by intelligence analysts who had regular columns distributed on NSANet, the agency's intranet. One of the columns was called "Signal v. Noise," another was called "The SIGINT Philosopher." Two of the documents cite the academic work of Herbert Simon, who won a Nobel Prize for his pioneering research on what's

become known as the attention economy. Simon wrote that consumers and managers have trouble making smart choices because their exposure to more information decreases their ability to understand the information. Both documents mention the same passage from Simon's essay, *Designing Organizations for an Information-Rich World*: "IN AN INFORMATION-RICH WORLD, THE WEALTH OF INFORMATION MEANS A DEARTH OF SOMETHING ELSE: A SCARCITY OF WHATEVER IT IS THAT INFORMATION CONSUMES." What information consumes is rather obvious: it consumes the attention of its recipients. Hence a wealth of information creates a poverty of attention and a need to allocate that attention efficiently among the overabundance of information sources that might consume it." In addition to consulting Nobel-prize winning work, NSA analysts have turned to easier literature, such as Malcolm Gladwell's best-selling *Blink: The Power of Thinking Without Thinking*. The author of a 2011 document referenced *Blink* and stated, "THE KEY TO GOOD DECISION MAKING IS NOT KNOWLEDGE. IT IS UNDERSTANDING. WE ARE SWIMMING IN THE FORMER. WE ARE DESPERATELY LACKING IN THE LATTER." The author added, "Gladwell has captured one of the biggest challenges facing SID today. Our COSTS ASSOCIATED WITH THIS INFORMATION OVERLOAD ARE NOT ONLY FINANCIAL, such as the need to build data warehouses large enough to store the mountain of data that arrives at our doorstep each day, BUT ALSO INCLUDE THE MORE INTANGIBLE COSTS OF TOO MUCH DATA TO REVIEW, PROCESS, TRANSLATE AND REPORT." Alexander, the NSA director from 2005 to 2014 and chief proponent of the agency's "collect it all" strategy, vigorously defended the bulk collection programs. "What we have, from my perspective, is a reasonable approach on how we can defend our nation and protect our civil liberties and privacy," he said at a security conference in Aspen in 2013. He added, "You need the haystack to find the needle." The same point has been made by other officials, including James Cole, the former deputy attorney general who told a congressional committee in 2013, "If you're looking for the needle in the haystack, you have to have the entire haystack to look through." NSA Slide, May 2011 The opposing viewpoint was voiced earlier this month by Snowden, who noted in an interview with the *Guardian* that the men who committed recent terrorist attacks in France, Canada and Australia were under surveillance—their data was in the haystack yet they weren't singled out. "It wasn't the fact that we weren't watching people or not," Snowden said. "It was the fact that we were watching people so much that we did not understand what we had. The problem is that when you collect it all, when you monitor everyone, you understand nothing." In a 2011 interview with *SIDtoday*, a deputy director in the Signals Intelligence Directorate was asked about "ANALYTIC MODERNIZATION" at the agency. His response, while positive on the NSA's ability to surmount obstacles, noted that it FACED DIFFICULTIES, INCLUDING THE FACT THAT SOME TARGETS USE ENCRYPTION AND SWITCH PHONE NUMBERS TO AVOID DETECTION. HE POINTED TO VOLUME AS A PARTICULAR PROBLEM. "We live in an Information Age when we have massive reserves of information and don't have the capability to exploit it," he stated. "I was told that there are 2 petabytes of data in the SIGINT System at any given time. How much is that? That's equal to 20 million 4-drawer filing cabinets. How many cabinets per analyst is that? By the end of this year, we'll have 1 terabyte of data per second coming in. You can't crank that through the existing processes and be effective." The documents noted the difficulty of sifting through the ever-growing haystack of data. For instance, a 2011 document titled "ELINT Analysts – Overcome by Overload? Help is Here with IM&S" outlined a half dozen computer tools that "are designed to invert the paradigm where an analyst spends more time searching for data than analyzing it." Another document, written by an intelligence analyst in 2010, bluntly stated that "we are drowning in information. And yet we know nothing. For sure." The analyst went on to ask, "Anyone know just how many tools are available at the Agency, alone? Would you know where to go to find out? Anyone ever start a new target...without the first clue where to begin? Did you ever start a project wondering if you were the sole person in the Intelligence Community to work this project? How would you find out?" The analyst, trying to encourage more sharing of tips about the best ways to find data in the haystack, concluded by writing, in boldface, "Don't let those coming behind you suffer the way you have." The agency appears to be spending significant sums of money to solve the haystack problem. The document headlined "Dealing With a 'Tsunami' of Intercept," written in 2006 by three NSA officials and previously published by *The Intercept*, outlined a series of programs to prepare for a near future in which the speed and volume of signals intelligence would explode "almost beyond imagination." The document referred to a mysterious NSA entity—the "Coping With Information Overload Office." This appears to be related to an item in the Intelligence Community's 2013 Budget Justification to Congress, known as the "black budget"—\$48.6 million for projects related to "Coping with Information Overload." The data glut is felt in the NSA's partner agency in Britain, too. A slideshow entitled "A Short Introduction to SIGINT," from GCHQ, the British intelligence agency, posed the following question: "How are people supposed to keep on top of all their targets and the new ones when they have far more than [they] could do in a day? How are they supposed to find the needle in the haystack and prioritise what is most important to look at?" The slideshow continued, "GIVE AN ANALYST THREE LEADS, ONE OF WHICH IS INTERESTING: THEY MAY HAVE TIME TO FOLLOW THAT UP. GIVE THEM THREE HUNDRED LEADS, TEN OF WHICH ARE INTERESTING: THAT'S PROBABLY NOT MUCH USE." These documents tend to shy away from confrontation—they express concern with the status quo but do not blame senior officials or demand an abrupt change of course. They were written by agency staffers who appear to believe in the general mission of the NSA. For instance, the author of a "SIGINT Philosopher" column wrote that if the NSA was a corporation, it could have the following mission statement: "building informed decision makers — so that targets do not suffer our nation's wrath unless they really deserve it — by exercising deity-like monitoring of the target." On occasion, however, the veil of bureaucratic deference is lowered. In another "SIGINT Philosopher" column, "Cognitive Overflow?," the author offered a forthright assessment of the haystack problem and the weakness of proposed solutions: "If an individual brain has finite 'channel capacity,' does the vast collective of SID, comprised of thousands of brilliant, yet limited, brains also have a definite 'channel capacity'? If so, what is it? How do we know when we've reached it? What if we've already

exceeded it? In essence, could SID's reach exceed its grasp? Can the combined cognitive power of SID connect all the necessary dots to avoid, predict, or advise when the improbable, complex, or unthinkable happens?" The column did not offer an optimistic view. "Take for example the number of tools, clearances, systems, compliances, and administrative requirements we encounter before we even begin to engage in the work of the mission itself," the column continued. "The mission then involves an ever-expanding set of complex issues, targets, accesses, and capabilities. THE 'COGNITIVE BURDEN,' SO TO SPEAK, MUST AT TIMES FEEL OVERWHELMING TO SOME OF US." The analyst who wrote the column dismissed, politely but firmly, the typical response of senior officials when they are asked in public about their ability to find needles in their expanding haystack. "Surely someone will point out that the burgeoning amalgam of technological advances will aid us in shouldering the burden," he noted. "However, historically, this scenario doesn't seem to completely bear out. THE ONSLAUGHT OF MORE COMPUTER POWER—often intended to automate some processes—HAS in many respects DEMANDED AN EXPANSION OF OUR COMBINED 'CHANNEL CAPACITY' RATHER THAN CURBING THE FLOW OF THE INFORMATION."

Mass surveillance collects too much data – hurts the fight against terror

Angwin, award-winning senior reporter at the Wall Street Journal, '13 (JULIA ANGWIN, Wall Street Journal, "NSA Struggles to Make Sense of Flood of Surveillance Data" Dec. 25, 2013 10:30 p.m. ET <http://www.wsj.com/articles/SB10001424052702304202204579252022823658850>) //GY

LAUSANNE, Switzerland— William Binney, creator of some of the computer code used by the National Security Agency to snoop on Internet traffic around the world, delivered an unusual message here in September to an audience worried that the spy agency knows too much.¶ It knows so much, he said, that it can't understand what it has.¶ "What they are doing is making themselves dysfunctional by taking all this data," Mr. Binney said at a privacy conference here.¶ THE AGENCY IS DROWNING IN USELESS DATA, WHICH HARMS ITS ABILITY TO CONDUCT LEGITIMATE SURVEILLANCE, claims Mr. Binney, who rose to the civilian equivalent of a general during more than 30 years at the NSA before retiring in 2001. ANALYSTS ARE SWAMPED WITH SO MUCH INFORMATION THAT THEY CAN'T DO THEIR JOBS EFFECTIVELY, AND THE ENORMOUS STOCKPILE IS AN IRRESISTIBLE TEMPTATION FOR MISUSE.¶ Mr. Binney's warning has gotten far less attention than legal questions raised by leaks from former NSA contractor Edward Snowden about the agency's mass collection of information around the world. Those revelations unleashed a re-examination of the spy agency's aggressive tactics.¶ BUT THE NSA NEEDS MORE ROOM TO STORE ALL THE DATA IT COLLECTS—AND NEW PHONE RECORDS, DATA ON MONEY TRANSFERS AND OTHER INFORMATION KEEP POURING IN. A new storage center being built in Utah will eventually be able to hold more than 100,000 times as much as the contents of printed materials in the Library of Congress, according to outside experts.¶ Some of the documents released by Mr. Snowden detail concerns inside the NSA about drowning in information. AN INTERNAL BRIEFING DOCUMENT IN 2012 ABOUT FOREIGN CELLPHONE-LOCATION TRACKING BY THE AGENCY SAID THE EFFORTS WERE "OUTPACING OUR ABILITY TO INGEST, PROCESS AND STORE" DATA.¶ IN MARCH 2013, SOME NSA ANALYSTS ASKED FOR PERMISSION TO COLLECT LESS DATA THROUGH A PROGRAM CALLED MUSCULAR BECAUSE THE "RELATIVELY SMALL INTELLIGENCE VALUE IT CONTAINS DOES NOT JUSTIFY THE SHEER VOLUME OF COLLECTION," another document shows.¶ In response to questions about Mr. Binney's claims, an NSA spokeswoman says the agency is "not collecting everything, but we do need the tools to collect intelligence on foreign adversaries who wish to do harm to the nation and its allies."¶ Existing surveillance programs were approved by "all three branches of government," and each branch "has a role in oversight," she adds.¶ In a statement through his lawyer, Mr. Snowden says: "WHEN YOUR WORKING PROCESS EVERY MORNING STARTS WITH POKING AROUND A HAYSTACK OF SEVEN BILLION INNOCENT LIVES, YOU'RE GOING TO MISS THINGS." He adds: "We're blinding people with data we don't need."¶ A presidential panel recommended earlier this month that the agency shut down its bulk

collection of telephone-call records of all Americans. The federal government could accomplish the same goal by querying phone companies, the panel concluded.¶ The panel also recommended the creation of "smart software" that could sort data as the information is collected, rather than the current system where "vast amounts of data are swept up and the sorting is done after it has been copied" on to data-storage systems. Administration officials are reviewing the report.¶ A separate task force is expected to issue its own findings next year, and lawmakers have proposed several bills that would change how the NSA collects and uses data.¶ The 70-year-old Mr. Binney says he is generally underwhelmed by the panel's "bureaucratic" report, though "it would be something meaningful" if the controversy leads to adoption of the "smart software" strategy and creation of a technology oversight group with full access to "be in the knickers of the NSA" and Federal Bureau of Investigation.¶ Mr. Binney lives off his government pension and makes occasional appearances to talk about his work at the NSA.¶ THE SPY AGENCY HAS DEFENDED ITS SWEEPING SURVEILLANCE PROGRAMS AS ESSENTIAL IN THE FIGHT AGAINST TERRORISM. BUT HAVING TOO MUCH DATA CAN HURT THOSE EFFORTS, according to Mr. Binney and a handful of colleagues who have raised concerns since losing an internal battle to build privacy-protecting Internet surveillance tools in the late 1990s.¶

Turns military readiness

Data overload wrecks military readiness and training

Erwin, National Defense Magazine, '12 (Sandra I. Erwin, National Defense Industrial Association, "Too Much Information, Not Enough Intelligence" May 2012, <http://www.nationaldefensemagazine.org/archive/2012/May/Pages/TooMuchInformation,NotEnoughIntelligence.aspx>) //GY

The Defense Department over the last decade has built up an inventory of billions of dollars worth of spy aircraft and battlefield sensors. THOSE SYSTEMS CREATE AVALANCHES OF DATA THAT CLOG MILITARY INFORMATION NETWORKS AND OVERWHELM ANALYSTS. ¶ INTELLIGENCE EXPERTS SAY THE MILITARY IS DROWNING IN DATA BUT NOT ABLE TO CONVERT THAT INFORMATION INTO INTELLIGIBLE REPORTS THAT BREAK IT DOWN AND ANALYZE IT. ¶ "The challenge for users of intelligence is that all the different types of information come in a stove-piped manner," says Michael W. Isherwood, a defense analyst and former Air Force fighter pilot. ¶ Intelligence feeds include electronic signals, satellite imagery, moving-target data and full-motion video. "How do you integrate this into a clear picture?" Isherwood asks. THAT IS ONE OF THE ENDURING CHALLENGES IN THE ISR [intelligence, surveillance and reconnaissance] ARENA FOR ALL THE SERVICES. ¶ Isherwood, the author of a Mitchell Institute white paper, titled, "Layering ISR Forces," cautions that success in future operations hinges on "timely, astute combinations of ISR resources." ¶ The Pentagon would be wise to shift its future investments from sensors to data-analysis tools, he says. ¶ "The awareness gained from integrated, multi-source intelligence data is of supreme value," says Isherwood. ¶ In actual combat, a coherent picture of the battlefield is not a "routine event," he says. "Coalition forces in Afghanistan have suffered losses when they were surprised by a much larger insurgent force not detected in time by ISR assets." ¶ MILITARY DRONE OPERATORS AMASS UNTOLD AMOUNTS OF DATA THAT NEVER IS FULLY ANALYZED BECAUSE IT IS SIMPLY TOO MUCH, Isherwood says. ¶ In the Air Force alone, the buildup of data collectors has been dramatic. While its inventory of fighter, bomber, tanker and transport aircraft shrank by 11 percent over the past decade, ISR platforms — primarily unmanned air vehicles — increased by nearly 300 percent, says Isherwood. ¶ Air Force leaders have recognized this problem and recently decided to cut its future purchases of Reaper drones in half — from 48 to 24 — because there is not enough manpower to operate and process the data from more aircraft. IT DIDN'T MAKE SENSE TO HAVE THE PRODUCTION OUT THAT FAR AHEAD OF OUR ABILITY TO ACTUALLY DO THE PROCESSING AND EXPLOITATION AND DISSEMINATION FUNCTION, Deputy Assistant Secretary of the Air Force for Budget Marilyn Thomas says at a February news conference. ¶ The military services have funded programs to develop software algorithms to automate data analysis, but no silver bullet has emerged. ¶ "Industry is working on tools so you can pull a Google Earth image and incorporate the SIGINT [signals intelligence], the MTI [moving target indicator], visual imagery, full-motion video," Isherwood says. ¶ What the military needs is a "decathlete analyst" that can process multiple feeds, versus an operator for each type of data, he says. Defense Department leaders understand the problem, BUT THE "ACQUISITION COMMUNITY NOW NEEDS TO TAKE THAT AND TRANSLATE IT INTO SYSTEMS" THAT TACKLE THIS CHALLENGE. ¶ The Air Force is "really good at building an airplane," Isherwood says. But he has yet to see a comparable requirements document or request for technology that meshes all the sensors, he adds. "They go after it piecemeal." ¶ THE INFORMATION DELUGE PROBLEM ALSO IS EXACERBATED BY THE MILITARY'S ORGANIZATIONAL SILOS THAT ZEALOUSLY PROTECT THEIR DATA. ¶ IT'S HARD TO GET THE COMMUNITY TO PLUG THEIR SENSORS IN, says Gregory G. Wenzel, vice president of advanced

enterprise integration at Booz Allen Hamilton.¶ The so-called “PED” process — processing, exploitation and dissemination — has been a long-standing challenge, he says. “It’s a really hard problem.”¶ Automated analysis tools for video feeds are gradually entering the market, Wenzel says. The National Football League has developed software to search video archives that some defense contractors are using as a model. ¶ One of the more promising systems that could help military ISR operators manage data more efficiently is the DI2E, or defense intelligence information enterprise, says Wenzel. The entire Defense Department and intelligence community will be able to share information, he says. The DI2E is a cloud-based system that draws data from many sensors and databases. ¶ Technologies such as DI2E are part of a larger trend toward networking sources of information, says Richard Sterk, senior aerospace and defense analyst at Forecast International. “THERE’S STILL TOO MANY STAND ALONE LEGACY SYSTEMS.”¶ REGARDLESS OF ADVANCES IN TECHNOLOGY, HE SAYS, A LARGER CONUNDRUM FOR THE MILITARY IS FIGURING OUT HOW TO MANAGE INFORMATION SO COMMANDERS AND TROOPS IN THE FIELD DON’T BECOME OVERWHELMED. “THEY HAVE TO SORT OUT HOW MUCH INFORMATION IS ENOUGH,” says Sterk.¶ The Office of Naval Research and the Marine Corps have been experimenting with another approach to analyzing data known as “semantic wiki.”¶ It solves the “intelligence fusion” problem, says George Eanes, vice president of Modus Operandi, a small firm that developed the wiki tool. ¶ It’s a rather simple approach. “If I’m looking for something of interest, like a white van, I can search across all the data stores that I have access to,” Eanes says. “It presents it in a wiki format. ... It’s a really good tool for pulling the data in from multiple sources and present it in one convenient application.”¶ Semantic wiki can search video, human intelligence reports and satellite imagery. Streaming video could be added in the future, he says. The company has spent the past three to four years working on this technology under several small business innovation research contracts worth about \$5 million, says Eanes.¶ “There has been a cultural shift within the Defense Department toward more desire to share information,” Eanes says. “First they thought the solution was to bring everything into a single database. But that proved impractical. There is too much data,” he says. “Now they’re looking at other solutions. You keep the data where it resides. You access only the data you need.” ¶ Former Marine Corps intelligence analyst Tony Barrett, who is now at Modus Operandi, says that during his time on active duty, his team was overwhelmed by data. He would have liked to have had software to scan unstructured data and provide relevant information, based on queries the analyst sets up, he says. “That frees up the analyst to do due diligence rather than extended periods of research,” he adds. “In Iraq, I had individual analysts that all they did was scan reports and find which ones were relevant. ... Research is extremely frustrating. I would rather my guys spent more time thinking.” ¶ “BECAUSE OF THE DATA OVERLOAD, “WHAT YOU END UP DOING IS TAKING YOUR SMARTEST MARINES WHO WOULD BE YOUR BIGGEST HELP IN PROBLEM SOLVING TO WORK ON YOUR SYSTEM’S PROBLEMS,” Barrett says. “I had my smartest guys always be the principal researchers because I was more confident they would be able to discover more data than less talented analysts.”¶ “ISR EXPERTS ALSO WORRY THAT THE MILITARY HAS BECOME ADDICTED TO FULL-MOTION VIDEO, AT THE EXPENSE OF OTHER INTELLIGENCE DISCIPLINES THAT MIGHT GRADUALLY DISAPPEAR AS THE NUMBER OF SKILLED OPERATORS DECLINES. Video imagery is the most “readily understood” intelligence, says Isherwood.¶ For the Iraq and Afghanistan wars, full-motion video provided by aerial sensors was the preferred form of surveillance. But for other combat scenarios in the future, Isherwood says, “THE MILITARY MIGHT NEED TO RELY ON OTHER TYPES OF DATA SUCH AS SIGNALS INTELLIGENCE (collection of electronic intercepts or emissions), MOVING TARGET INDICATOR DATA (Doppler shifts of moving objects to detect and track targets), RADAR IMAGERY; AND MEASUREMENT AND SIGNALS INTELLIGENCE (combines radar, laser,

optical, infrared, acoustic, electromagnetic and atmospheric mediums to identify objects). There is also "cyber-intelligence," a new discipline that is based on electronic-warfare techniques, says Isherwood. ¶ "Full motion video is what everybody wants," says Chief of Naval Operations Adm. Jonathan Greenert. "A still picture is good but you still have to send it back, develop it quickly," he says. ¶ Access to full-motion video, however, might not be feasible in every conflict. "Not all fights will be in the desert," says Mel French, vice president of development at Telephonics, a supplier of military sensors and electronic warfare systems. ¶ THE UNMANNED AIRCRAFT-MOUNTED SENSORS THAT ARE FAVORED TODAY MIGHT NOT WORK IN OTHER ENVIRONMENTS. "The second you introduce rain to any of those systems, the range goes down, it limits utility," says French. ¶ WE NEED TO THINK OF WHERE ELSE WE ARE GOING TO GO," he says. "Possibly places where we need foliage penetration. That's a hard problem to solve." ¶ The full-motion video soda straw view works when the area is not being defended by adversaries who can shoot down surveillance aircraft, he says. ¶ IN INSTANCES WHEN ISR ASSETS MIGHT BE IN DANGER AND RATHER KEPT AT STANDOFF RANGES, THE MILITARY WILL NEED ANALYSTS WHO CAN DISCERN OTHER FORMS OF DATA SUCH AS SYNTHETIC APERTURE RADAR IMAGES, French says. Some field commanders might complain that they "don't understand the [SAR] shadows," he says. They might not realize that video camera pictures can't be obtained from 200 miles away. Images such as SAR require a trained eye. ¶ As to whether there will be a time when analysts will be able to produce "actionable" intelligence, French says there are no easy answers. ¶ "It's one of those problems that will require years of investments and focus," he says. "We fielded a lot of Band-Aids. Now it's getting back to rationalizing what we fielded."

Excess surveillance data hampers military effectiveness and creates a drag on the economy

Claburn 9 (Thomas, Editor at Large, Enterprise Mobility, 7/9, "Military Grapples With Information Overload," <http://www.informationweek.com/architecture/military-grapples-with-information-overload/d/d-id/1081209?//Tang>)

Surging surveillance data threatens to overwhelm the military's ability to deal with the information. A report from a defense advisory group is calling for new data analysis technology and for taking a cue from Google. Information overload has become a significant challenge for the U.S. military and will require new analysis software and a Google-style cloud infrastructure to manage massive data sets, a U.S. defense advisory group report finds. The December 2008 report, "Data Analysis Challenges," was initially withheld from the public. It was obtained by the Federation of American Scientists' Project on Government Secrecy through a Freedom of Information Act request. The report, written by JASON, a group that provides advice to the Department of Defense (DoD) through the non-profit MITRE Corporation, says that the massive amount of sensor and imagery data being gathered is becoming increasingly difficult to store, analyze, and integrate into defense systems. For example, a DoD surveillance system called Constant Hawk typically produces 10's to 100's of Terabytes of data over a period of a few hours. For that information to be useful, it has to be stored, analyzed, and distributed quickly. The report, however, cites concerns voiced by members of the defense and intelligence communities that much of the surveillance data gathered isn't made useful. "Seventy percent of the data we collect is falling on the floor," MIT defense research scientist Pete Rustan said, according to the report. And the problem is likely to get worse. "As the sensors associated with the various surveillance missions improve, the data volumes are increasing with a projection that sensor data volume could potentially increase to the level of Yottabytes (10^{24} Bytes) by 2015," the report says. Jonathan B. Spira, CEO and chief analyst at research consultancy Basex, author of the forthcoming book Overload!, and organizer of Information Overload Awareness Day on August 12, says information overload is a real problem in the workplace, in government and in the military. "We've seen on

the military side, many instances where information overload can create a whole new kind of fog [of war]," he said. Information overload costs the U.S. economy \$900 billion per year, according to BaseX. The JASON report discounts some of the more extreme projections about data volume growth and recommends that the DoD deploy infrastructure similar to that used by Google, Microsoft, and Yahoo. It also sees military applications for the Hive language used by Facebook for data warehousing. The major problem the DoD faces will be in the area of automated information analysis. "The notion of fully automated analysis is today at best a distant reality, and for this reason, it is critical to invest in research to promote algorithmic advances," the report says. "One way to effectively engage the relevant research communities is through the use of grand challenges in the area of data analysis." Spira sees information overload as a broader problem, one that won't vanish with the development of improved automated information analysis technology. He described a cybersecurity conference at a Maxwell Airforce Base, where military brass had gathered to discuss cyber threats. Emerging from the talk, the generals found they had no e-mail, he said. It turned out that the base's e-mail system had been taken down, not by a cyber attack, but by an e-mail about a card game that got forwarded and, through too many reply-alls, multiplied until over a million messages overloaded the e-mail servers. "We need to address a lot of different aspects of data and information overload, not just things that sound sexy," said Spira.

Data collection has reached the neurological breaking point – additional data will make it impossible to function in the field

Shanker and Ritchel 11 (Thom and Matt, writers for the NYT, cites psychologists and neuroscientists, 1/16, "In New Military, Data Overload Can Be Deadly,"

http://www.nytimes.com/2011/01/17/technology/17brain.html?pagewanted=all&_r=0//Tang

WHEN MILITARY INVESTIGATORS LOOKED INTO AN ATTACK BY AMERICAN HELICOPTERS last February THAT LEFT 23 AFGHAN CIVILIANS DEAD, THEY FOUND THAT THE OPERATOR OF A PREDATOR DRONE HAD FAILED TO PASS ALONG CRUCIAL INFORMATION ABOUT THE MAKEUP OF A GATHERING CROWD OF VILLAGERS. But Air Force and Army officials now say THERE WAS ALSO AN UNDERLYING CAUSE FOR THAT MISTAKE: INFORMATION OVERLOAD. At an Air Force base in Nevada, THE DRONE OPERATOR AND HIS TEAM STRUGGLED TO WORK OUT WHAT WAS HAPPENING IN THE VILLAGE, where a convoy was forming. THEY HAD TO MONITOR THE DRONE'S VIDEO FEEDS WHILE PARTICIPATING IN DOZENS OF INSTANT-MESSAGE AND RADIO EXCHANGES WITH INTELLIGENCE ANALYSTS AND TROOPS ON THE GROUND. There were solid reports that the group included children, but the team did not adequately focus on them amid the swirl of data — much like a cubicle worker who loses track of an important e-mail under the mounting pile. The team was under intense pressure to protect American forces nearby, and in the end it determined, incorrectly, that the villagers' convoy posed an imminent threat, resulting in one of the worst losses of civilian lives in the war in Afghanistan. "Information overload — an accurate description," said one senior military officer, who was briefed on the inquiry and spoke on the condition of anonymity because the case might yet result in a court martial. The DEATHS WOULD HAVE BEEN PREVENTED, HE SAID, "IF WE HAD JUST SLOWED THINGS DOWN AND THOUGHT DELIBERATELY." DATA IS AMONG THE MOST POTENT WEAPONS OF THE 21ST CENTURY. UNPRECEDENTED AMOUNTS OF RAW INFORMATION HELP THE MILITARY DETERMINE WHAT TARGETS TO HIT AND WHAT TO AVOID. And DRONE-BASED SENSORS HAVE GIVEN RISE TO A NEW CLASS OF WIRED WARRIORS WHO MUST FILTER THE INFORMATION SEA. But sometimes they are drowning. Research shows that the kind of intense multitasking required in such situations can make it hard to tell good information from bad. The MILITARY FACES A BALANCING ACT: HOW TO HELP SOLDIERS EXPLOIT MASSES OF DATA WITHOUT SUCCEumbing TO OVERLOAD. ACROSS THE MILITARY, THE DATA FLOW HAS SURGED; SINCE THE ATTACKS OF 9/11, THE AMOUNT OF INTELLIGENCE GATHERED BY REMOTELY PILOTED DRONES AND OTHER SURVEILLANCE TECHNOLOGIES HAS RISEN 1,600 PERCENT. On the ground, troops increasingly use hand-held devices to communicate, get directions and set bombing coordinates. And the SCREENS IN JETS CAN BE SO PACKED WITH DATA THAT SOME PILOTS CALL THEM "DROOL BUCKETS" BECAUSE, THEY SAY, THEY CAN GET LOST STARING INTO THEM. "THERE IS INFORMATION OVERLOAD AT EVERY LEVEL OF THE MILITARY — from the general to the soldier on the ground," said Art Kramer, a neuroscientist and director of the Beckman Institute, a

research lab at the University of Illinois. THE MILITARY HAS ENGAGED RESEARCHERS LIKE MR. KRAMER TO HELP IT UNDERSTAND THE BRAIN'S LIMITS AND POTENTIAL. Just as the military has long pushed technology forward, it is now at the forefront in figuring out how humans can cope with technology without being overwhelmed by it. At George Mason University in Virginia, researchers measure the brain waves of study subjects as they use a simulation of the work done at the Nevada Air Force base. On a computer screen, the subjects see a video feed from one drone and the locations of others, along with instructions on where to direct them. The subjects wear a cap with electrodes attached, measuring brain waves. AS THE NUMBER OF DRONES AND THE PACE OF INSTRUCTIONS INCREASES, THE BRAIN SHOWS SHARP SPIKES IN A KIND OF ELECTRICAL ACTIVITY CALLED THETA — CAUSE FOR CONCERN AMONG THE RESEARCHERS. "IT'S USUALLY AN INDEX OF EXTREME OVERLOAD." said Raja Parasuraman, a director of the university's human factors and applied cognition program. AS THE TECHNOLOGY ALLOWS SOLDIERS TO PULL IN MORE INFORMATION, IT STRAINS THEIR BRAINS. And military researchers say the stress of combat makes matters worse. Some research even suggests that younger people wind up having more trouble focusing because they have grown up constantly switching their attention. For the soldier who has been using computers and phones all his life, "multitasking might actually have negative effects," said Michael Barnes, research psychologist at the Army Research Lab at Aberdeen, Md., citing several university studies on the subject. In tests at a base in Orlando, Mr. Barnes's group has found that when soldiers operate a tank while monitoring remote video feeds, they often fail to see targets right around them. MR. BARNES SAID SOLDIERS COULD BE TRAINED TO USE NEW TECHNOLOGY, "BUT WE'RE NOT GOING TO IMPROVE THE NEUROLOGICAL CAPABILITY." On the other hand, he said, the military should not shy away from improving the flow of data in combat. "It would be like saying we shouldn't have automobiles because we have 40,000 people die on the roads each year," he said. "The pluses of technology are too great." The military is trying novel approaches to helping soldiers focus. At an Army base on Oahu, Hawaii, researchers are training soldiers' brains with a program called "mindfulness-based mind fitness training." It asks soldiers to concentrate on a part of their body, the feeling of a foot on the floor or of sitting on a chair, and then move to another focus, like listening to the hum of the air-conditioner or passing cars. "The whole question we're asking is whether we can rewire the functioning of the attention system through mindfulness," said one of the researchers, Elizabeth A. Stanley, an assistant professor of security studies at Georgetown University. Recently she received financing to bring the training to a Marine base, and preliminary results from a related pilot study she did with Amishi Jha, a neuroscientist at the University of Miami, found that it helped Marines to focus. Even as it worries about digital overload, the Army is acknowledging that technology may be the best way to teach this new generation of soldiers — in particular, a technology that is already in their pockets. In Army basic training, new recruits can get instruction from iPhone apps on subjects as varied as first aid and military values. As part of the updated basic training regimen, recruits are actually forced into information overload — for example, testing first aid skills while running an obstacle course. "It's the way this generation learns," said Lt. Gen. Mark P. Hertling, who oversees initial training for every soldier. "It's a multitasking generation. So if they're multitasking and combining things, that's the way we should be training." The intensity of warfare in the computer age is on display at a secret intelligence and surveillance installation at Langley Air Force Base in Virginia, a massive, heavily air-conditioned warehouse where hundreds of TVs hang from black rafters. EVERY DAY ACROSS THE AIR FORCE'S \$5 BILLION GLOBAL SURVEILLANCE NETWORK, CUBICLE WARRIORS REVIEW 1,000 HOURS OF VIDEO, 1,000 HIGH-ALTITUDE SPY PHOTOS AND HUNDREDS OF HOURS OF "SIGNALS INTELLIGENCE" — USUALLY CELLPHONE CALLS. At the Langley center, officially called Distributed Common Ground System-1, heavy multitasking is a daily routine for people like Josh, a 25-year-old first lieutenant (for security reasons, the Air Force would not release his full name). For 12 hours a day, he monitors an avalanche of images on 10 overhead television screens. They deliver what Josh and his colleagues have nicknamed "Death TV" — live video streams from drones above Afghanistan showing Taliban movements, suspected insurgent safehouses and American combat units headed into battle. As he watches, Josh uses a classified instant-messaging system showing as many as 30 different chats with commanders at the front, troops in combat and headquarters at the rear. And he is hearing the voice of a pilot at the controls of a U-2 spy plane high in the stratosphere. "I'll have a phone in one ear, talking to a pilot on the headset in the other ear, typing in chat at the same time and watching screens," Josh says. "It's intense." The stress lingers when the shift is over. Josh works alongside Anthony, 23, an airman first class who says his brain hurts each night, the way feet ache after a long march. "You have so much information coming in that when you go home — how do you take that away? Sometimes I work out," Anthony said. "Actually, one of my things is just being able to enjoy a nice bowl of cereal with almond milk. I feel the tension is just gone and I can go back again." Video games don't do the trick. "I need something real," he said.

We've gotta deal with overload now to improve counterterrorism long term Shanker and Richtel, 11

(Thom and Matt, Graduate Tufts University - The Fletcher School of Law and Diplomacy, Pulitzer prize winning author, New York Times, 1-16-11, "In New Military, Data Overload Can Be Deadly", <http://www.umsl.edu/~sauterv/DSS4Bl/links/17brain.pdf>, amp)

Mr. BARNES SAID SOLDIERS COULD BE TRAINED TO USE NEW TECHNOLOGY, “but WE’re not going to improve the neurological capability.” On the other hand, he said, the military SHOULD NOT SHY AWAY FROM IMPROVING THE FLOW OF DATA in combat. “IT WOULD BE LIKE SAYING WE SHOULDN’T HAVE AUTOMOBILES BECAUSE WE HAVE 40,000 PEOPLE DIE ON THE ROADS EACH YEAR,” he said. “THE PLUSES OF TECHNOLOGY ARE TOO GREAT.”

A2: tech solves

Tech can't solve – it's not fast enough

Horvitz, 13

Leslie Alan Horvitz, American author, "Information Overload: Babel, Borges and the NSA," 7/2/13, <http://lesliehorvitz.com/blog/2013/7/2/information-overload-babel-borges-and-the-nsa> // IS

NSA AND OTHER SECURITY AGENTS RELY ON COMPUTERS USING A VARIETY OF ALGORITHMS (SOME OF THEM DESIGNED TO SEARCH FOR KEY WORDS LIKE 'TERRORISM') TO FIND THE HOPED-FOR NEEDLES IN THE EVER EXPANDING HAYSTACK. BUT I SUSPECT THAT **technology is incapable of keeping up.** THE DATA THREATENS TO BECOME INDIGESTIBLE. AS SOON AS YOU BRING HUMANS INTO THE EQUATION – and eventually you need analysts to assess the credibility of the information and determine whether it is actionable or not – you run the risk of errors, bad judgment and bias. AND IT TAKES TIME – LOTS OF TIME. So analysts couldn't get to them all; instead they put aside what used to be called "bit buckets" in the industry —electronic bits that someday would have to be sorted out...by someone. According to James Lewis, a cyberexpert quoted in The New York Times, "THEY PARK STUFF IN STORAGE IN THE HOPES THAT THEY WILL EVENTUALLY HAVE TIME TO GET TO IT," ALTHOUGH HE ADMITTED THAT "MOST OF IT SITS AND IS NEVER LOOKED AT BY ANYONE." As another expert put it: "This means that if you can't desalinate all the seawater at once, you get to hold on to the ocean until you figure it out."

Technology doesn't check mass surveillance inefficiencies

Ferguson, 1/16 (DAVID FERGUSON, journalist Raw Story, "Mass surveillance is ineffective at fighting terrorism and makes us less safe, says tech expert" 16 JAN 2015 AT 12:53 ET

<http://www.rawstory.com/2015/01/mass-surveillance-is-ineffective-at-fighting-terrorism-and-makes-us-less-safe-says-tech-expert/> //GY

MASS SURVEILLANCE HAS PROVEN TO BE AN INEFFECTIVE TOOL AGAINST TERRORISTS, and yet in the wake of the attacks on the offices of the French satirical magazine Charlie Hebdo, many politicians are calling for even tighter surveillance on private citizens.¶ In a Thursday column for New Scientist, Open University technology specialist Ray Corrigan explained that MASS ELECTRONIC SURVEILLANCE WILL NEVER BE AN EFFECTIVE MEANS OF ENSURING PUBLIC SAFETY, no matter how sophisticated the technology BECOMES OR HOW GRANULAR A LEVEL AT WHICH OFFICIALS BECOME CAPABLE OF EXAMINING OUR LIVES.¶ "Prime Minister David Cameron wants to reintroduce the so-called snoopers' charter — properly, the Communications Data Bill — which would compel telecoms companies to keep records of all internet, email and cellphone activity," wrote Corrigan. The Prime Minister also wants to ban all forms of encrypted communication like Apple iMessage and the message service WhatsApp.¶ However, Corrigan pointed out, "BROTHERS SAID AND CHERIF KOUACHI AND AMEDY COULIBALY, WHO MURDERED 17 PEOPLE, WERE KNOWN TO THE FRENCH SECURITY SERVICES AND CONSIDERED A SERIOUS THREAT. FRANCE HAS BLANKET ELECTRONIC SURVEILLANCE. IT DIDN'T AVERT WHAT HAPPENED."¶ In France, AUTHORITIES LOST TRACK OF THE EXTREMISTS JUST LONG ENOUGH FOR THEM TO CARRY OUT THEIR ATTACK. SURVEILLANCE SYSTEMS ARE IMPERFECT, Corrigan said, and BLANKET DATA GATHERING IS A WILDLY INEFFICIENT WAY TO WEED OUT POTENTIAL TERROR SUSPECTS. IT GENERATES TOO MUCH USELESS INFORMATION TO SIFT THROUGH, HE SAID, AND OFTEN MISSES VITAL INFORMATION THAT ONLY BECOMES CLEAR IN HINDSIGHT.¶ "You cannot fix any of this by treating the entire population as suspects and then engaging in suspicionless, blanket collection and processing of

personal data," he said. It simply doesn't work.¶ In fact, THE PRACTICE MAY MAKE POPULATIONS LESS SAFE BY GENERATING SO MUCH DATA THAT IT BECOMES STATISTICALLY IMPOSSIBLE FOR INVESTIGATORS TO SPOT ACTUAL LEADS, GENERATING FALSE POSITIVES AT AN ASTONISHING RATE.¶ "Even if your magic terrorist-catching machine has a false positive rate of 1 in 1000 — and no security technology comes anywhere near this — every time you asked it for suspects in the UK it would flag 60,000 innocent people," said Corrigan.¶ "Surveillance of the entire population, the vast majority of whom are innocent, leads to the diversion of limited intelligence resources in pursuit of huge numbers of false leads. TERRORISTS ARE COMPARATIVELY RARE, SO FINDING ONE IS A NEEDLE IN A HAYSTACK PROBLEM. YOU DON'T MAKE IT EASIER BY THROWING MORE NEEDLELESS HAY ON THE STACK," he wrote.¶ In the U.S., a series of revelations from intelligence contractor turned whistleblower Edward Snowden revealed programs through which the National Security Agency is gathering information on average citizens, outraging privacy advocates and opening an international debate on the legality of mass surveillance. Now, in addition to being legally dubious, years into the surveillance programs, THE PRACTICE OF INDISCRIMINATE DATA-GATHERING HAS NEITHER CAUGHT ANY TERRORISTS NOR PREVENTED ANY ATTACKS.¶ On Friday, the American Civil Liberties Union reported on the newly-released results of a year-long investigation by the National Academies: Bulk Collection of Signals Intelligence: Technical Operations 2015.¶ Neema Singh Guliani of the ACLU revealed that the report showed "the domestic nationwide call detail record program has never stopped an act of terrorism or led to the identification of a terrorist suspect."¶ Furthermore, "THE REPORT DID NOT FIND THAT THE RESOURCE COSTS, PRIVACY IMPACTS, AND ECONOMIC HARMS ASSOCIATED WITH BULK COLLECTION ARE BALANCED BY ANY CONCRETE BENEFITS IN INTELLIGENCE CAPABILITIES," Guliani wrote.¶ "Finally," she said, "the report acknowledges that there are additional steps that the intelligence community can take to increase transparency, improve oversight, and limit the use of information collected through surveillance."¶ In his column, Corrigan wrote that law enforcement agencies need to "use modern digital technologies intelligently and through targeted data preservation — not a mass surveillance regime — to engage in court-supervised technological surveillance of individuals whom they have reasonable cause to suspect."¶ "That is not, however," he insisted, "the same as building an infrastructure of mass surveillance."

Technology can't check overload

The SIGINT Philosopher, 11

The SIGINT Philosopher, a Russian language analyst employed by SID, "The SIGINT Philosopher: Cognitive Overload?" 4/15/11,

<https://s3.amazonaws.com/s3.documentcloud.org/documents/2088972/cognitive-overflow.pdf> // IS

(U) There's a computer sitting atop your shoulders. Granted, real computers can apparently best human brains on Jeopardy with ease, but all the same... Since Noam Chomsky and his cohorts at MIT opened the floodgates to the study of how we think, cognitive psychology has come a long way. Although the ensuing decades of research have highlighted the astounding capabilities of our gray matter, the field has also exposed the limitations our brains are subject to. It may be worth considering the implications these limitations have for our work in SID.

(U) "CHANNEL CAPACITY" IS THE TERM SOME COGNITIVE PSYCHOLOGISTS HAVE BEGUN TO APPLY TO THE BRAIN'S LIMITS ON THE AMOUNT OF CERTAIN INFORMATION IT CAN RETAIN. For instance, research shows that THE AVERAGE PERSON CAN ONLY DIFFERENTIATE BETWEEN 5-9 DIFFERENT TONES, SHAPES,

OR TEXTURES AT A GIVEN TIME. ANY MORE, AND OUR CAPACITY TO CATEGORIZE BECOMES OVERTAXED, AND WE BEGIN TO MAKE MISTAKES. IN OTHER WORDS, THE SERVERS OVERLOAD. It is yet another example of how unprepared humans are, in evolutionary terms, for the information age. Evolutionary biologist Sherwood Washburn once wrote:

(U) "Most of human evolution took place before the advent of agriculture, when we lived in small groups, face-to-face. Man evolved to feel strongly about few people, short distances, and relatively brief intervals."

(U) The question then becomes: IF AN INDIVIDUAL BRAIN HAS FINITE "CHANNEL CAPACITY," DOES THE VAST COLLECTIVE OF SID, COMPRISED OF THOUSANDS OF BRILLIANT, YET LIMITED, BRAINS ALSO HAVE A DEFINITE "CHANNEL CAPACITY"? If so, what is it? How do we know when we've reached it? What if we've already exceeded it? In essence, could SID's reach exceed its grasp? Can the combined cognitive power of SID connect all the necessary dots to avoid, predict, or advise when the improbable, complex, or unthinkable happens?

(U) TAKE FOR EXAMPLE THE NUMBER OF TOOLS, CLEARANCES, SYSTEMS, COMPLIANCES, AND ADMINISTRATIVE REQUIREMENTS WE ENCOUNTER before we even begin to engage in the work of the mission itself. THE MISSION THEN INVOLVES AN EVER-EXPANDING SET OF COMPLEX ISSUES, TARGETS, ACCESSES, AND CAPABILITIES. THE "COGNITIVE BURDEN," SO TO SPEAK, MUST AT TIMES FEEL overwhelming to some of us. THE SID IS AN ORGANISM WITH MANY MOVING PARTS. SO HOW DO WE ENSURE OUR SIGINT POTENTIAL IS IN LINE WITH, AND DOESN'T OVERWHELM OUR COLLECTIVE COGNITIVE CAPACITY? Can we count on our overarching SID mechanism to self-regulate, to organically cull, sort, and retain? Or is there perhaps something extra we ought to be doing to ensure we operate at full exploitative and analytic force?

(U) Surely SOMEONE WILL POINT OUT THAT THE BURGEONING AMALGAM OF TECHNOLOGICAL ADVANCES WILL AID US IN SHOULDERING THE BURDEN. HOWEVER, historically, THIS SCENARIO DOESN'T SEEM TO COMPLETELY BEAR OUT. THE ONSLAUGHT OF MORE COMPUTING POWER—OFTEN INTENDED TO AUTOMATE SOME PROCESSES—HAS IN MANY RESPECTS DEMANDED AN EXPANSION OF OUR COMBINED "CHANNEL CAPACITY," RATHER THAN CURBING THE FLOW OF THE INFORMATION THAT'S NECESSARY TO RETAIN.

(U) It's an issue worth thinking about and discussing. In the meantime, I'll be working on my 14-character p ass word...

(U) Editor's note: See a Tapioca Pebble on this topic.

A2: more data solves

More data can't solve – current spending and Britain prove Maass, 15

Peter Maass, a Guggenheim Fellow on the advisory boards of the Solutions Journalism Network, and the Program for Narrative and Documentary Practice at Tufts University, "Inside NSA, Officials Privately Criticize 'Collect it All' Surveillance," The Intercept, 5/28/15, <https://firstlook.org/theintercept/2015/05/28/nsa-officials-privately-criticize-collect-it-all-surveillance/> // IS

THE AGENCY APPEARS TO BE SPENDING SIGNIFICANT SUMS OF MONEY TO SOLVE THE HAYSTACK PROBLEM. The document headlined "Dealing With a 'Tsunami' of Intercept," written in 2006 by three NSA officials and previously published by The Intercept, outlined a series of programs to prepare for a near future in which the speed and volume of signals intelligence would explode "almost beyond imagination." THE DOCUMENT REFERRED TO A MYSTERIOUS NSA ENTITY—THE "COPING WITH INFORMATION OVERLOAD OFFICE." THIS APPEARS TO BE RELATED TO AN ITEM IN THE INTELLIGENCE COMMUNITY'S 2013 BUDGET JUSTIFICATION TO CONGRESS, KNOWN AS THE "BLACK BUDGET"—\$48.6 MILLION FOR PROJECTS RELATED TO "COPING WITH INFORMATION OVERLOAD." THE DATA GLUT IS FELT IN THE NSA'S PARTNER AGENCY IN BRITAIN, TOO. A slideshow entitled "A Short Introduction to SIGINT," from GCHQ, THE BRITISH INTELLIGENCE AGENCY, POSED THE FOLLOWING QUESTION: "HOW ARE PEOPLE SUPPOSED TO KEEP ON TOP OF ALL THEIR TARGETS AND THE NEW ONES WHEN THEY HAVE FAR MORE THAN [THEY] COULD DO IN A DAY? HOW ARE THEY SUPPOSED TO FIND THE NEEDLE IN THE HAYSTACK AND PRIORITISE WHAT IS MOST IMPORTANT TO LOOK AT?" THE SLIDESHOW CONTINUED, "GIVE AN ANALYST THREE LEADS, ONE OF WHICH IS INTERESTING: THEY MAY HAVE TIME TO FOLLOW THAT UP. GIVE THEM THREE HUNDRED LEADS, TEN OF WHICH ARE INTERESTING: THAT'S PROBABLY NOT MUCH USE."

More data fails – statistics – and their evidence is hype Bergen et al., 14

Peter Bergen, David Sterman, Emily Schneider, and Bailey Cahill, *Peter Bergen is an American print and broadcast journalist, author, documentary producer, and CNN's national security analyst. **David Sterman is a program associate at New America and holds a master's degree from Georgetown's Center for Security Studies, ***senior program associate for the International Security Program at New America, "Do Nsa's Bulk Surveillance Programs Stop Terrorists?" New America Foundation, January 2014, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf // IS

D. THE ADMINISTRATION HAS REPEATEDLY EXAGGERATED THE ROLE OF NSA BULK SURVEILLANCE PROGRAMS IN PREVENTING TERRORISM AND IS MISLEADING THE PUBLIC WHEN IT SAYS THAT 9/11 COULD HAVE BEEN PREVENTED BY SUCH PROGRAMS WHEN, IN FACT, BETTER INFORMATION-SHARING ABOUT ALREADY EXISTING INTELLIGENCE WOULD HAVE BEEN FAR MORE EFFECTIVE IN PREVENTING 9/11.

Members of CONGRESS, SENIOR GOVERNMENT OFFICIALS, AND NSA OFFICIALS HAVE JUSTIFIED THE PROGRAMS WITH STATEMENTS ABOUT HOW MANY TERRORIST EVENTS THE SURVEILLANCE PROGRAMS HAVE FOILED - CITING A TOTAL OF 54 "EVENTS" AROUND THE GLOBE, of which 13 were in the United

States - AND HAVE WARNED OF THE RISK OF A FUTURE 9/11-LIKE ATTACK IF THE PROGRAMS WERE CURTAILED. As mentioned above, President Obama defended the NSA surveillance programs during a visit to Berlin in June, saying: "We know of at least 50 threats that have been averted because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved."³⁹ Gen. Alexander testified before Congress that: "the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50 potential terrorist events in more than 20 countries around the world."⁴⁰ Rep. Mike Rogers, chairman of the House Permanent Select Committee on Intelligence, said on the chamber floor in July that NSA programs "stopped and thwarted terrorist attacks both here and in Europe - saving real lives" a total of 54 times.⁴¹

THE GOVERNMENT'S DEFENSE HAS DEMONSTRATED A LACK OF PRECISION REGARDING THE EXACT NATURE OF THE THREATS IN THE TERRORISM CASES THE GOVERNMENT HAS CLAIMED WERE PREVENTED BY NSA SURVEILLANCE. WERE THEY REAL ATTACKS THAT WERE THWARTED? SERIOUS PLOTS THAT WERE STILL SOMEWHERE IN THE PLANNING STAGES? PLOTS THAT WERE CONCERNING, BUT NEVER REALLY OPERATIONAL? OR DID THEY INVOLVE SOME SORT OF TERRORISM-SUPPORT ACTIVITY, SUCH AS FUNDRAISING? President Obama has called them "threats," Gen. Alexander called them "events" and then later used the term "activities," while Rep. Rogers and one of Gen. Alexander's slides at the 2013 Black Hat conference referred to them as "attacks."⁴²

Sen. Leahy brought attention to this disconnect at a Senate Judiciary Committee hearing in July 2013, saying he had been shown a classified list of "terrorist events" detected through surveillance which did not show that "dozens or even several terrorist plots" had been thwarted by the collection of American telephone metadata under Section 215.⁴³ SEN. LEAHY ASKED GEN. ALEXANDER: "WOULD YOU AGREE THAT THE 54 CASES THAT KEEP GETTING CITED BY THE ADMINISTRATION WERE NOT ALL PLOTS, AND OF THE 54, ONLY 13 HAD SOME NEXUS TO THE U.S.?" AND GEN. ALEXANDER'S REPLY WAS A SIMPLE "YES."⁴⁴ On this key point, beyond his one-word answer, the NSA director did not elaborate while under oath.

LEADING REPORTERS HAVE SOMETIMES SIMPLY PARROTTED THE GOVERNMENT CLAIMS THAT MORE THAN 50 ATTACKS HAVE BEEN AVERTED. Bob Schieffer of CBS News, for instance, said on "Face the Nation" on July 28: "Fifty-six terror plots here and abroad have been thwarted by the NSA [sic] program. So what's wrong with it, then, if it's managed to stop 56 terrorist attacks? That sounds like a pretty good record."⁴⁵ THIS MISREPRESENTATION IN THE MEDIA MOST LIKELY STEMS FROM CONFUSION ABOUT WHAT THIS OFT-CITED 54 NUMBER REALLY REFERS TO - TERRORIST ACTIVITY SUCH AS FUNDRAISING, PLOTS THAT WERE REALLY ONLY NOTIONAL, OR ACTUAL AVERTED ATTACKS.

Despite the government's narrative that NSA surveillance of some kind prevented 13 domestic "events" or "attacks" in the United States, OF THE EIGHT CASES WE HAVE IDENTIFIED AS POSSIBLY INVOLVING THE NSA, INCLUDING THE THREE THE GOVERNMENT HAS NOT CLAIMED, ONLY ONE CAN BE SAID TO INVOLVE AN OPERATIONAL AL-QAEDA PLOT TO CONDUCT AN ATTACK WITHIN THE UNITED STATES, THREE WERE NOTIONAL PLOTS, AND ONE INVOLVED AN ATTACK PLAN IN EUROPE. AND IN THREE OF THE PLOTS WE IDENTIFIED AS POSSIBLY HAVING BEEN PREVENTED BY THE NSA - MOALIN, MUHTOROV AND JUMAEV, AND WARSAME - THE DEFENDANTS WERE COMMITTING OR ALLEGEDLY COMMITTING CRIMES OF SUPPORT FOR A TERRORIST GROUP, RATHER THAN PLOTTING TERRORIST ATTACKS.

More data fails – empirics

Bergen et al., 14

Peter Bergen, David Serman, Emily Schneider, and Bailey Cahill, *Peter Bergen is an American print and broadcast journalist, author, documentary producer, and CNN's national security analyst. **David Serman is a program associate at New America and holds a master's degree from Georgetown's Center for Security Studies, ***senior program associate for the International Security Program at New America, "Do Nsa's Bulk Surveillance Programs Stop Terrorists?" New America Foundation, January 2014, https://www.newamerica.org/downloads/IS_NSA_surveillance.pdf // IS

These MULTIPLE MISSED OPPORTUNITIES CHALLENGE THE ADMINISTRATION'S CLAIMS THAT THE NSA'S BULK SURVEILLANCE PROGRAM COULD HAVE PREVENTED THE 9/11 ATTACKS. THE KEY PROBLEM WAS ONE OF INFORMATION-SHARING, not lack of information. IF INFORMATION-SHARING HAD BEEN FUNCTIONING, MIHDHAR WOULD LIKELY HAVE BEEN CAUGHT regardless of the collection of telephone metadata, AND IF INFORMATION-SHARING WAS NOT FUNCTIONING, IT IS UNCLEAR WHY COLLECTING MORE INFORMATION WOULD HAVE CHANGED THE RESULT. Even if Mihdhar's phone calls from San Diego to Yemen is considered a moment for preventing the 9/11 attacks, it is likely that more targeted surveillance of that phone number rather than bulk collection of metadata would have been sufficient. Communications to and from the house in Yemen were already being intercepted by the NSA as a result of investigations into the 1998 U.S. embassy bombings in Africa and the USS Cole bombing in 2000.⁶² According to U.S. officials quoted by Josh Meyer, a leading national security reporter at the Los Angeles Times, the information from the calls could have been shared through a FISA warrant under the authorities the NSA had even before 9/11.⁶³ The United States government could and should have been alerted to Mihdhar's phone calls even without the expanded authority to collect the telephone metadata of all Americans under Section 215. Indeed, Richard Clarke, the national coordinator for security, infrastructure protection, and counterterrorism from 1998 to 2001, has explained that the Justice Department "could have asked the FISA Court for a warrant to all phone companies to show all calls from the U.S. which went to the Yemen number. As far as I know, they did not do so. They could have."⁶⁴ Clarke played down the need for bulk collection in such a scenario, continuing, "My understanding is that they did not need the current All Calls Data Base FISA warrant to get the information they needed. Since they had one end of the calls (the Yemen number), all they had to do was ask for any call connecting to it."⁶⁵ (Clarke was one of the five members of the White House review group that President Obama established in August 2013 to review the U.S. government's surveillance activities and which issued its report on December 18, 2013). THE OVERALL PROBLEM FOR U.S. COUNTERTERRORISM OFFICIALS IS NOT THAT THEY NEED THE INFORMATION FROM THE BULK COLLECTION OF PHONE DATA, BUT THAT THEY DON'T SUFFICIENTLY UNDERSTAND OR WIDELY SHARE THE INFORMATION THEY ALREADY POSSESS THAT IS DERIVED FROM CONVENTIONAL LAW ENFORCEMENT AND INTELLIGENCE TECHNIQUES. THIS WAS TRUE OF THE TWO 9/11 HIJACKERS LIVING IN SAN DIEGO AND IT IS ALSO THE UNFORTUNATE PATTERN WE HAVE SEEN IN SEVERAL OTHER SIGNIFICANT TERRORISM CASES: • Chicago resident David Coleman Headley was central to the planning of the 2008 terrorist attacks in Mumbai that killed 166 people. Yet, following the 9/11 attacks, U.S. authorities received plausible tips regarding Headley's associations with militant groups at least five times from his family members, friends, and acquaintances.⁶⁶ These multiple tips were never followed up in an effective fashion. • Maj. Nidal Hasan, a U.S. Army psychiatrist, killed 13 people at Fort Hood, Texas, in 2009. Before the attack, U.S. intelligence agencies had intercepted multiple emails between

Maj. Hasan and Anwar al-Awlaki, a U.S.- born cleric living in Yemen who was notorious for his ties to militants. The emails included a discussion of the permissibility in Islam of killing U.S. soldiers. Counterterrorism investigators didn't follow up on these emails, believing that they were somehow consistent with Maj. Hasan's job as a military psychiatrist.⁶⁷ • Carlos Bledsoe, a convert to Islam, fatally shot a soldier at a **Little Rock**, Ark., military recruiting office in 2009, several months after returning from a stay in Yemen. As a result of that trip, Bledsoe was under investigation by the FBI. Yet, he was still able to buy the weapons for his deadly attack when he was back in the United States.⁶⁸ • Nigerian Umar Farouq Abdulmutallab attempted to blow up **Northwest Flight 253** over Detroit on Christmas Day 2009 with an "underwear bomb." Fortunately, the bomb failed to explode. Yet, a few weeks before the botched attack, Abdulmutallab's father contacted the U.S. Embassy in Nigeria with concerns that his son had become radicalized and might be planning something.⁶⁹ This information wasn't further investigated. Abdulmutallab had been recruited by al-Qaeda's branch in Yemen for the mission. The White House review of the bomb plot concluded that there was sufficient information known to the U.S. government to determine that Abdulmutallab was likely working for al-Qaeda in Yemen and that the group was looking to expand its attacks beyond Yemen.⁷⁰ Yet, Abdulmutallab was allowed to board a plane bound for the United States without any question. ALL OF THE MISSED OPPORTUNITIES IN THESE SERIOUS TERRORISM CASES ARGUE NOT FOR THE GATHERING OF EVER-MORE VAST TROVES OF INFORMATION, BUT SIMPLY FOR A BETTER UNDERSTANDING OF THE INFORMATION THE GOVERNMENT HAS ALREADY COLLECTED THAT WAS DERIVED FROM CONVENTIONAL LAW ENFORCEMENT AND INTELLIGENCE METHODS.

Network and pattern identification fails

Keefe, 6

(Patrick Radden, Century Foundation fellow, author of 'Chatter: Dispatches from the Secret World of Global Eavesdropping', 3-12-2006, New York Times, "Can Network Theory Thwart Terrorists?", lexis, amp)

NETWORK ACADEMICS CAUTION that THE FIELD IS STILL IN ITS INFANCY AND should not be regarded as a panacea. Duncan WATTS OF COLUMBIA University POINTS OUT that IT'S much EASIER TO TRACE A NETWORK WHEN YOU CAN ALREADY IDENTIFY SOME OF ITS MEMBERS. But much SOCIAL-NETWORK RESEARCH INVOLVES simply TRAWLING large DATABASES FOR TELLTALE BEHAVIORS OR ACTIVITIES THAT MIGHT BE TYPICAL OF A TERRORIST. In this case the LINKS AMONG PEOPLE ARE NOT BASED ON ACTUAL RELATIONSHIPS AT ALL, BUT on AN "AFFILIATION NETWORK," IN WHICH INDIVIDUALS ARE CONNECTED BY VIRTUE OF taking part in a SIMILAR ACTIVITY. THIS sort of APPROACH HAS BEEN EFFECTIVE FOR CORPORATIONS IN DETECTING FRAUD. A credit-card company knows that when someone uses a card to purchase \$2 of gas at a gas station, and then 20 minutes later makes an expensive purchase at an electronics store, there's a high probability that the card has been stolen. Marc Sageman, a former C.I.A. case officer who wrote a book on terror networks, notes that correlating certain signature behaviors could be one way of tracking terrorists: jihadist groups in Virginia and Australia exercised at paint-ball courses, so analysts could look for Muslim militants who play paint ball, he suggests. BUT whereas there is a long history of signature behaviors that indicate fraud, jihadist terror networks are a relatively new phenomena and offer fewer reliable patterns.

THERE IS also some DOUBT that IDENTIFYING HUBS WILL DO much GOOD. NETWORKS ARE BY their very NATURE robust and RESISTANT TO ATTACK. After all, WHILE NUMEROUS HIGH RANKING QAEDA

LEADERS HAVE BEEN CAPTURED or killed in the years since Sept. 11, THE NETWORK STILL APPEARS to be FUNCTIONING. **"If you shoot the C.E.O., they'll hire another one,"** Duncan WATTS SAYS. **"THE JOB WILL still GET DONE."**

A2: Congress Checks Overload

Congress can't check overload

Shoemaker, 15

Tim Shoemaker, the Director of Legislation at Campaign for Liberty. He graduated Magna Cum Laude with a Bachelor of Arts from Indiana University of Pennsylvania. "Can Congress Effectively Oversee the Vast Surveillance State," Campaign for Liberty, 4/8/15, [// IS](http://www.campaignforliberty.org/can-congress-effectively-oversee-vast-surveillance-state)

ACCORDING TO A NEW REPORT FROM THE ASSOCIATED PRESS, THE SENATE INTELLIGENCE COMMITTEE IS CREATING A SORT OF "SECRET ENCYCLOPEDIA" OF AMERICA'S SURVEILLANCE PROGRAMS.

Surprisingly, this hasn't picked up as much media attention as it should.

What THE REPORT ACTUALLY TELLS US, WITHOUT DIRECTLY SAYING SO, IS CONGRESS ISN'T CAPABLE OF CONDUCTING INFORMED, **effective oversight** OF THE SURVEILLANCE STATE.

Despite calling Snowden's actions "treason" at the time, it's clear that FEINSTEIN AND OTHER MEMBERS OF CONGRESS WERE COMPLETELY UNAWARE OF THE FOREIGN SURVEILLANCE BEING CONDUCTED UNDER EXECUTIVE ORDER 12333 -- AND WOULD NEVER HAVE LEARNED OF THE PROGRAMS BEING CARRIED OUT BY A SMALL NUMBER OF EXECUTIVE BRANCH EMPLOYEES WITHOUT HIS WHISTLEBLOWING ACTIVITIES.

Of course, what ought to upset us all is how THE INTEL COMMITTEE MEMBERS HAD BEEN BRIEFED ON SOME OF THE MOST CONTROVERSIAL INTELLIGENCE PROGRAMS SUCH AS THE SURVEILLANCE OF AMERICAN'S PHONE RECORDS AND THE PRISM PROGRAM AND OTHER THAN RON WYDEN AND MARK UDALL, NONE OF THEM SEEMED TO BE **overly concerned** about how Americans' civil liberties were being routinely violated.

A2: wastes \$

Mass data collection is cost efficient

Cohen, '14 (Drew F. Cohen, former law clerk to the chief justice of the Constitutional Court of South Africa "The Shrinking Price of Mass Surveillance" February 10, 2014

<http://nationalinterest.org/commentary/the-shrinking-price-mass-surveillance-9848?page=2> //GY

By now most Americans agree that the NSA surveillance program, brought to light by leaked documents from former NSA contractor Edward Snowden, went "too far." Just because the spy agency could keep tabs on every American, did not mean it should. THE PRICE OF SURVEILLANCE TECHNOLOGY, HOWEVER, HAD DROPPED SO PRECIPITOUSLY OVER THE LAST TWO DECADES that once the agency overcame any moral objections it had about the program, few practical considerations stood in its way of implementing a system that could monitor 315 million Americans every day. Indeed, ONE ESTIMATE TAGGED THE NSA'S ANNUAL SURVEILLANCE COSTS AT \$574 PER TAXPAYER, AMOUNTING TO A PALTRY SIX-AND-A-HALF CENTS AN HOUR.¶ If privacy law experts Kevin S. Bankston and Ashkan Soltani are correct, costs, once a significant check on government spying and police monitoring efforts, have become an afterthought. In a recent study published in the Yale Law Journal Online, Bankston and Soltani found that most technologies deployed for mass-surveillance efforts by police departments (e.g., GPS devices and domestic drones) exhibit similar cost structures to the NSA spying program: AS THE NUMBER OF SUBJECTS INCREASE, THE COST OF KEEPING TABS EACH TARGET NEARS ZERO. CHEAPER, MORE EFFECTIVE TRACKING DEVICES HAVE BEEN A BOON TO CASH-STRAPPED POLICE DEPARTMENTS NATIONWIDE, largely to the dismay of civil-liberties groups.

...

NEWER SURVEILLANCE TECHNOLOGIES, HOWEVER, WERE SIGNIFICANTLY CHEAPER WHEN COSTS WERE TABULATED ON AN HOURLY BASIS. The total price tag of tracking a suspect using a GPS device, similar to the one in Jones for instance, came out to \$10 an hour over one day, \$1.43 per hour over a week and \$0.36 per hour over a month. Another relatively new technique, obtaining a suspect's location through their cell phone signal with the carrier's assistance, yielded similar results. As of August 2009, fees for obtaining cell phone location data from carriers ranged from \$0.04 to \$4.17 per hour for one month of surveillance. (Sprint, for example, charges \$30 per month per target while T-Mobile charges \$100 per day).¶ AFTER TABULATING THEIR RESULTS, BANKSTON AND SOLTANI CONCLUDED THAT THE TOTAL COST OF USING A GPS DEVICE TO TRACK AS SUSPECT OVER TWENTY-EIGHT DAYS (THE METHOD REJECTED IN JONES) WAS ROUGHLY THREE HUNDRED TIMES LESS EXPENSIVE THAN THE SAME TRACKING USING A TRANSMITTER (technology approved by the Supreme Court) AND 775 TIMES LESS EXPENSIVE THAN USING THE FIVE CAR PURSUIT METHOD (also approved). Meanwhile, the cost of using transmitter-surveillance technology was only 2.5 times less expensive than undercover car pursuit.

...

A2: Big Data Initiative

BDI isn't enough – it's just a first step

Kirby, 13

Bob Kirby, vice president of sales for CDW·G, a leading technology provider to government and education. "Big Data Can Help the Federal Government Move Mountains. Here's How.," FedTech Magazine, 08/01/13, <http://www.fedtechmagazine.com/article/2013/08/big-data-can-help-federal-government-move-mountains-heres-how> // IS

THE CHALLENGES TO MAXIMIZING THE USE OF BIG DATA ARE GREAT, BUT THE OPPORTUNITIES IT OPENS ARE EVEN GREATER. THE WHITE HOUSE INITIATIVE IS a good first step, BUT agencies must mobilize. SEVERAL FEDERAL PROJECTS HAVE ESTABLISHED A PATH THAT OTHERS CAN FOLLOW TO MAKE THE MOST OF THESE OPPORTUNITIES. When they invest in technologies to help them deal with the massive piles of data they are creating, agencies may find that they can move mountains.

A2: CIA

CIA mass surveillance fails

Fingas, 4/25 (Jon Fingas, Associate Editor Engadget "The CIA couldn't properly use a mass surveillance program for years" April 25th 2015 <http://www.engadget.com/2015/04/25/cia-mass-surveillance-problems/>) //GY

Whatever you think about the morality of using mass surveillance to catch evildoers, THE TECHNOLOGY ONLY WORKS IF PEOPLE CAN USE IT -- JUST ASK THE CIA. THE NEW YORK TIMES HAS OBTAINED A DECLASSIFIED REPORT REVEALING THAT THAT THE AGENCY WAS LARGELY KEPT IN THE DARK about the President's Surveillance Program (aka Stellarwind), WHICH ALLOWS FOR BULK DATA COLLECTION, until at least 2009. Only the highest-ranking officials could use PSP as a general rule, and those few AGENTS THAT DID HAVE ACCESS OFTEN DIDN'T KNOW ENOUGH TO USE IT PROPERLY, FACED "COMPETING PRIORITIES" OR HAD OTHER TOOLS AT THEIR DISPOSAL. TO BOOT, THERE WASN'T DOCUMENTATION SHOWING HOW EFFECTIVE THE PROGRAM WAS IN FIGHTING TERRORISM.¶ It's not certain if the CIA has shaped up in the years since that report, although its shift toward online operations is going to make these kinds of digital initiatives more important. REGARDLESS OF ANY IMPROVEMENTS, IT'S CLEARER THAN EVER THAT THE US GOVERNMENT HAS SOMETIMES HAD PRIVATE DOUBTS about the effectiveness of its large-scale surveillance efforts.

Surveillance can't solve terror

Mass surveillance can't find terrorists – mathematically impossible

Rudmin, '06 (FLOYD RUDMIN Professor of Social & Community Psychology at the University of Tromsø in Norway "Why Does the NSA Engage in Mass Surveillance of Americans When It's Statistically Impossible for Such Spying to Detect Terrorists?" MAY 24, 2006
<http://www.counterpunch.org/2006/05/24/why-does-the-nsa-engage-in-mass-surveillance-of-americans-when-it-s-statistically-impossible-for-such-spying-to-detect-terrorists/>) //GY

The Bush administration and the National Security Agency (NSA) have been secretly monitoring the email messages and phone calls of all Americans. They are doing this, they say, for our own good. To find terrorists. MANY PEOPLE HAVE CRITICIZED NSA'S DOMESTIC SPYING AS UNLAWFUL INVASION OF PRIVACY, AS SEARCH WITHOUT SEARCH WARRANT, AS ABUSE OF POWER, AS MISUSE OF THE NSA'S RESOURCES, AS UNCONSTITUTIONAL, AS SOMETHING THE COMMUNISTS WOULD DO, SOMETHING VERY UNAMERICAN. In addition, however, MASS SURVEILLANCE OF AN ENTIRE POPULATION CANNOT FIND TERRORISTS. IT IS A PROBABILISTIC IMPOSSIBILITY. IT CANNOT WORK. What is the probability that people are terrorists given that NSA's mass surveillance identifies them as terrorists? If the probability is zero ($p=0.00$), then they certainly are not terrorists, and NSA was wasting resources and damaging the lives of innocent citizens. If the probability is one ($p=1.00$), then they definitely are terrorists, and NSA has saved the day. If the probability is fifty-fifty ($p=0.50$), that is the same as guessing the flip of a coin. THE CONDITIONAL PROBABILITY THAT PEOPLE ARE TERRORISTS GIVEN THAT THE NSA SURVEILLANCE SYSTEM SAYS THEY ARE, THAT HAD BETTER BE VERY NEAR TO ONE ($P \approx 1.00$) AND VERY FAR FROM ZERO ($P=0.00$). The mathematics of conditional probability were figured out by the Scottish logician Thomas Bayes. If you Google "Bayes' Theorem", you will get more than a million hits. Bayes' Theorem is taught in all elementary statistics classes. Everyone at NSA certainly knows Bayes' Theorem. To know if mass surveillance will work, Bayes' theorem requires three estimations: 1) The base-rate for terrorists, i.e. what proportion of the population are terrorists; 2) The accuracy rate, i.e., the probability that real terrorists will be identified by NSA; 3) The misidentification rate, i.e., the probability that innocent citizens will be misidentified by NSA as terrorists. NO MATTER HOW SOPHISTICATED AND SUPER-DUPER ARE NSA'S METHODS FOR IDENTIFYING TERRORISTS, NO MATTER HOW BIG AND FAST ARE NSA'S COMPUTERS, NSA'S ACCURACY RATE WILL NEVER BE 100% AND THEIR MISIDENTIFICATION RATE WILL NEVER BE 0%. That fact, plus the extremely low base-rate for terrorists, means IT IS LOGICALLY IMPOSSIBLE FOR MASS SURVEILLANCE TO BE AN EFFECTIVE WAY TO FIND TERRORISTS. I will not put Bayes' computational formula here. It is available in all elementary statistics books and is on the web should any readers be interested. But I will compute some conditional probabilities that people are terrorists given that NSA's system of mass surveillance identifies them to be terrorists. The US Census shows that there are about 300 million people living in the USA. Suppose that there are 1,000 terrorists there as well, which is probably a high estimate. The base-rate would be 1 terrorist per 300,000 people. In percentages, that is .00033% which is way less than 1%. Suppose that NSA surveillance has an accuracy rate of .40, which means that 40% of real terrorists in the USA will be identified by NSA's monitoring of everyone's email and phone calls. This is probably a high estimate, considering that terrorists are doing their best to avoid detection. THERE IS NO EVIDENCE THUS FAR THAT NSA HAS BEEN SO SUCCESSFUL AT FINDING TERRORISTS. AND SUPPOSE NSA'S MISIDENTIFICATION RATE IS .0001, WHICH MEANS THAT .01% OF INNOCENT PEOPLE WILL BE MISIDENTIFIED AS TERRORISTS, AT LEAST UNTIL THEY ARE INVESTIGATED, DETAINED AND INTERROGATED. Note that .01% of the US population is

30,000 people. With these suppositions, then THE PROBABILITY THAT PEOPLE ARE TERRORISTS GIVEN THAT NSA'S SYSTEM OF SURVEILLANCE IDENTIFIES THEM AS TERRORISTS IS ONLY $P=0.0132$, WHICH IS NEAR ZERO, VERY FAR FROM ONE. ERGO, NSA'S SURVEILLANCE SYSTEM IS USELESS FOR FINDING TERRORISTS.¶ Suppose that NSA's system is more accurate than .40, let's say, .70, which means that 70% of terrorists in the USA will be found by mass monitoring of phone calls and email messages. Then, by Bayes' Theorem, the probability that a person is a terrorist if targeted by NSA is still only $p=0.0228$, which is near zero, far from one, and useless.¶ Suppose that NSA's system is really, really, really good, really, really good, with an accuracy rate of .90, and a misidentification rate of .00001, which means that only 3,000 innocent people are misidentified as terrorists. With these suppositions, THEN THE PROBABILITY THAT PEOPLE ARE TERRORISTS GIVEN THAT NSA'S SYSTEM OF SURVEILLANCE IDENTIFIES THEM AS TERRORISTS IS ONLY $P=0.2308$, WHICH IS FAR FROM ONE AND WELL BELOW FLIPPING A COIN. NSA'S DOMESTIC MONITORING OF EVERYONE'S EMAIL AND PHONE CALLS IS USELESS FOR FINDING TERRORISTS.¶ NSA knows this. Bayes' Theorem is elementary common knowledge. So, why does NSA spy on Americans knowing it's not possible to find terrorists that way? MASS SURVEILLANCE OF THE ENTIRE POPULATION IS LOGICALLY SENSIBLE ONLY IF THERE IS A HIGHER BASE-RATE. HIGHER BASE-RATES ARISE FROM TWO LINES OF THOUGHT, NEITHER OF THEM VERY NICE: 1) MCCARTHY-TYPE NATIONAL PARANOIA; 2) POLITICAL ESPIONAGE.¶ The whole NSA domestic spying program will seem to work well, will seem logical and possible, if you are paranoid. Instead of presuming there are 1,000 terrorists in the USA, presume there are 1 million terrorists. Americans have gone paranoid before, for example, during the McCarthyism era of the 1950s. Imagining a million terrorists in America puts the base-rate at .00333, and now the probability that a person is a terrorist given that NSA's system identifies them is $p=.99$, which is near certainty. But only if you are paranoid. If NSA's surveillance requires a presumption of a million terrorists, and if in fact there are only 100 or only 10, then A LOT OF INNOCENT PEOPLE ARE GOING TO BE MISIDENTIFIED AND CONFIDENTLY MISLABELED AS TERRORISTS.¶ The ratio of real terrorists to innocent people in the prison camps of Guantanamo, Abu Ghraib, and Kandahar shows that the US is paranoid and is not bothered by mistaken identifications of innocent people. The ratio of real terrorists to innocent people on Bush's no-fly lists shows that the Bush administration is not bothered by mistaken identifications of innocent Americans.¶ Also, MASS SURVEILLANCE OF THE ENTIRE POPULATION IS LOGICALLY PLAUSIBLE IF NSA'S DOMESTIC SPYING IS NOT LOOKING FOR TERRORISTS, BUT LOOKING FOR SOMETHING ELSE, SOMETHING THAT IS NOT SO RARE AS TERRORISTS. For example, the May 19 Fox News opinion poll of 900 registered voters found that 30% dislike the Bush administration so much they want him impeached. If NSA were monitoring email and phone calls to identify pro-impeachment people, and if the accuracy rate were .90 and the error rate were .01,¶ then the probability that people are pro-impeachment given that NSA surveillance system identified them as such, would be $p=.98$, which is coming close to certainty ($p_1.00$). Mass surveillance by NSA of all Americans' phone calls and emails would be very effective for domestic political intelligence.¶ BUT FINDING A FEW TERRORISTS BY MASS SURVEILLANCE OF THE PHONE CALLS AND EMAIL MESSAGES OF 300 MILLION AMERICANS IS MATHEMATICALLY IMPOSSIBLE, AND NSA CERTAINLY KNOWS THAT.

Effectiveness of mass surveillance is massively overblown – hasn't aided a single case
Bergen et al, PhD, '14 (Bailey Cahall David Sterman Emily Schneider Peter Bergen, member of the Homeland Security Project, a successor to the 9/11 Commission a Professor of Practice at Arizona State University and a fellow at Fordham University's Center on National Security "DO NSA'S BULK SURVEILLANCE PROGRAMS STOP TERRORISTS?" JANUARY 13, 2014

<https://www.newamerica.org/international-security/do-nsas-bulk-surveillance-programs-stop-terrorists/> //GY

However, OUR REVIEW OF THE GOVERNMENT’S CLAIMS ABOUT THE ROLE THAT NSA “BULK” SURVEILLANCE OF PHONE AND EMAIL COMMUNICATIONS RECORDS HAS HAD IN KEEPING THE UNITED STATES SAFE FROM TERRORISM SHOWS THAT THESE CLAIMS ARE OVERBLOWN AND EVEN MISLEADING. An in-depth analysis of 225 individuals recruited by al-Qaeda or a like-minded group or inspired by al-Qaeda’s ideology, and charged in the United States with an act of terrorism since 9/11, demonstrates that TRADITIONAL INVESTIGATIVE METHODS, such as the use of informants, tips from local communities, and targeted intelligence operations, PROVIDED THE INITIAL IMPETUS FOR INVESTIGATIONS IN THE MAJORITY OF CASES, WHILE THE CONTRIBUTION OF NSA’S BULK SURVEILLANCE PROGRAMS TO THESE CASES WAS MINIMAL. Indeed, the controversial bulk collection of American telephone metadata, which includes the telephone numbers that originate and receive calls, as well as the time and date of those calls but not their content, under Section 215 of the USA PATRIOT ACT, APPEARS TO HAVE PLAYED AN IDENTIFIABLE ROLE IN INITIATING, AT MOST, 1.8 PERCENT OF THESE CASES. NSA programs involving the surveillance of non-U.S. persons outside of the United States under Section 702 of the FISA Amendments Act played a role in 4.4 percent of the terrorism cases we examined, and NSA surveillance under an unidentified authority played a role in 1.3 percent of the cases we examined.¶ Regular FISA warrants not issued in connection with Section 215 or Section 702, which are the traditional means for investigating foreign persons, were used in at least 48 (21 percent) of the cases we looked at, although it’s unclear whether these warrants played an initiating role or were used at a later point in the investigation. (Click on the link to go to a database of all 225 individuals, complete with additional details about them and the government’s investigations of these cases: <http://natsec.newamerica.net/nsa/analysis>).¶ Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terrorist-related activity, such as fundraising for a terrorist group. Furthermore, our examination of the role of the database of U.S. citizens’ telephone metadata in the single plot the government uses to justify the importance of the program – that of Basaaly Moalin, a San Diego cabdriver who in 2007 and 2008 provided \$8,500 to al-Shabaab, al-Qaeda’s affiliate in Somalia – calls into question the necessity of the Section 215 bulk collection program. According to the government, the database of American phone metadata allows intelligence authorities to quickly circumvent the traditional burden of proof associated with criminal warrants, thus allowing them to “connect the dots” faster and prevent future 9/11-scale attacks. YET IN THE MOALIN CASE, after using the NSA’s phone database to link a number in Somalia to Moalin, THE FBI WAITED TWO MONTHS TO BEGIN AN INVESTIGATION AND WIRETAP HIS PHONE. Although it’s unclear why there was a delay between the NSA tip and the FBI wiretapping, COURT DOCUMENTS SHOW THERE WAS A TWO-MONTH PERIOD IN WHICH THE FBI WAS NOT MONITORING MOALIN’S CALLS, DESPITE OFFICIAL STATEMENTS THAT THE BUREAU HAD MOALIN’S PHONE NUMBER AND HAD IDENTIFIED HIM. , This undercuts the government’s theory that the database of Americans’ telephone metadata is necessary to expedite the investigative process, since IT CLEARLY DIDN’T EXPEDITE THE PROCESS IN THE SINGLE CASE THE GOVERNMENT USES TO EXTOL ITS VIRTUES.¶ Additionally, A CAREFUL REVIEW OF THREE OF THE KEY TERRORISM CASES THE GOVERNMENT HAS CITED TO DEFEND NSA BULK SURVEILLANCE PROGRAMS REVEALS THAT GOVERNMENT OFFICIALS HAVE EXAGGERATED THE ROLE OF THE NSA IN THE CASES against David Coleman Headley and Najibullah Zazi, and the significance of the threat posed by a notional plot to bomb the New York Stock Exchange.¶ IN 28 PERCENT OF THE CASES WE REVIEWED, COURT RECORDS AND PUBLIC REPORTING DO NOT IDENTIFY

WHICH SPECIFIC METHODS INITIATED THE INVESTIGATION. These cases, involving 62 individuals, may have been initiated by an undercover informant, an undercover officer, a family member tip, other traditional law enforcement methods, CIA- or FBI-generated intelligence, NSA surveillance of some kind, or any number of other methods. In 23 of these 62 cases (37 percent), an informant was used. However, we were unable to determine whether the informant initiated the investigation or was used after the investigation was initiated as a result of the use of some other investigative means. Some of these cases may also be too recent to have developed a public record large enough to identify which investigative tools were used.¶ We have also identified three additional plots that the government has not publicly claimed as NSA successes, but in which court records and public reporting suggest the NSA had a role. However, it is not clear whether any of those three cases involved bulk surveillance programs.¶ Finally, THE OVERALL PROBLEM FOR U.S. COUNTERTERRORISM OFFICIALS IS NOT THAT THEY NEED VASTER AMOUNTS OF INFORMATION FROM THE BULK SURVEILLANCE PROGRAMS, BUT THAT THEY DON'T SUFFICIENTLY UNDERSTAND OR WIDELY SHARE THE INFORMATION THEY ALREADY POSSESS THAT WAS DERIVED FROM CONVENTIONAL LAW ENFORCEMENT AND INTELLIGENCE TECHNIQUES. This was true for two of the 9/11 hijackers who were known to be in the United States before the attacks on New York and Washington, as well as with the case of Chicago resident David Coleman Headley, who helped plan the 2008 terrorist attacks in Mumbai, and it is the unfortunate pattern we have also seen in several other significant terrorism cases.

Surveillance can't solve – their authors inflate data

Nicks, '14 (Denver Nicks, TIME, "Report: Usefulness of NSA Mass Surveillance 'Overblown'" Jan. 13, 2014 <http://swampland.time.com/2014/01/13/report-usefulness-of-nsa-mass-surveillance-overblown/>) //GY

Ever since Edward Snowden's leaks began revealing the extent of the National Security Agency's mass surveillance—or "bulk collection"—programs last June, officials have defended the programs with one number: 50.¶ "We know of at least 50 threats that have been averted because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved," President Obama said on a visit to Berlin. NSA Director Gen. Keith Alexander made the same claim testifying before Congress.¶ BUT A NEW STUDY OUT MONDAY FROM THE NEW AMERICA FOUNDATION SAYS THAT CLAIM IS SIMPLY FALSE, CALLING IT "OVERBLOWN, AND EVEN MISLEADING."¶ "SURVEILLANCE OF AMERICAN PHONE METADATA HAS HAD NO DISCERNIBLE IMPACT ON PREVENTING ACTS OF TERRORISM AND ONLY THE MOST MARGINAL OF IMPACTS ON PREVENTING TERRORIST-RELATED ACTIVITY, SUCH AS FUNDRAISING FOR A TERRORIST GROUP," says the nonpartisan think tank's report, titled "Do NSA's Bulk Surveillance Programs Stop Terrorists?"¶ IN AN ANALYSIS OF 225 AL-QAEDA-LINKED INDIVIDUALS CHARGED WITH TERRORISM IN THE U.S. SINCE 9/11, THE REPORT FOUND NSA MASS SURVEILLANCE OF AMERICANS TELEPHONE RECORDS—AUTHORIZED UNDER SECTION 215 OF THE USA PATRIOT ACT—"PLAYED AN IDENTIFIABLE ROLE IN INITIATING, AT MOST, 1.8 PERCENT" OF INVESTIGATIONS.¶ The report acknowledges that in 28 percent of cases it reviewed, researchers couldn't determine what methods initiated the investigation. But in many of those cases an informant played a role in the investigation, says the report.¶ ACLU Legislative Counsel Michelle Richardson told TIME the report "confirms that THE NUMBERS AND EXAMPLES THE GOVERNMENT HAS FLOATED IN SUPPORT OF ITS DOMESTIC SPYING PROGRAMS ARE GROSSLY INFLATED. More broadly though, it underlines how far the government has actually gotten away from the original lessons of 9/11. Instead of working on

connecting the dots collected from traditional investigations, IT HAS BECOME OBSESSED WITH COLLECTING EVER MORE DATA WHETHER IT IS USEFUL OR NOT."

Surveillance can't solve – their authors are lying

Terbush, '13 (Jon Terbush, correspondent The Week, "Is the NSA's data snooping actually effective?" December 19, 2013 <http://theweek.com/articles/453981/nsas-data-snooping-actually-effective>) //GY

The White House on Wednesday released a much-anticipated independent review of the National Security Agency's spy programs, which offered 46 recommendations for reforming the agency's spy ops.¶ The report concluded that the programs, though they had gone too far, should stay in place. But it nevertheless may have undermined the NSA's claim that the collection of all phone metadata is a necessary tool to combat terrorism.¶ "OUR REVIEW SUGGESTS THAT THE INFORMATION CONTRIBUTED TO TERRORIST INVESTIGATIONS BY THE USE OF SECTION 215 TELEPHONY METADATA WAS NOT ESSENTIAL TO PREVENTING ATTACKS AND COULD READILY HAVE BEEN OBTAINED IN A TIMELY MANNER USING CONVENTIONAL SECTION 215 ORDERS," the report said.¶ That finding came just days after a federal judge ruled that the phone data collection program was "likely unconstitutional." Moreover, he wrote in his decision that, for all the government's bluster, THERE WAS NO INDICATION THE PROGRAM HAD ACTUALLY PRODUCED TANGIBLE RESULTS.¶ "THE GOVERNMENT DOES NOT CITE A SINGLE CASE IN WHICH ANALYSIS OF THE NSA'S BULK METADATA COLLECTION ACTUALLY STOPPED AN IMMINENT TERRORIST ATTACK." Judge Richard Leon wrote.¶ Given the limited record before me at this point in the litigation — most notably, the utter lack of evidence that a terrorist attack has ever been prevented because searching the NSA database was faster than other investigative tactics — I HAVE SERIOUS DOUBTS ABOUT THE EFFICACY OF THE METADATA COLLECTION PROGRAM AS A MEANS OF CONDUCTING TIME-SENSITIVE INVESTIGATIONS IN CASES INVOLVING IMMINENT THREATS OF TERRORISM. [PDF]¶ Granted, the collection of phone data is just one of the NSA's many once-secret tools. And unsurprisingly, the White House, hawkish lawmakers, and those who oversee the spy programs have repeatedly claimed that the NSA's programs in their entirety have proven crucial to snuffing out terror plots.¶ Shortly after whistleblower Edward Snowden's leaks turned up in the press, NSA Director Gen. Keith Alexander defended his agency's surveillance practices before the Senate. The surveillance programs, he said, had stopped dozens of attacks at home and abroad, including a 2009 plot to bomb the New York City subway system.¶ Obama, too, said back in June that the programs had thwarted "at least 50" possible attacks. (He and others often cite 54 as an exact number.) He also defended the tradeoff of civil liberties for security as a necessary one — "we have to make choices as a society" — adding that the programs were merely "modest encroachments on privacy."¶ However, two prominent critics of the NSA, Democratic Sens. Ron Wyden (Ore.) and Mark Udall (Colo.), challenged that assessment in a joint statement following Alexander's testimony.¶ "WE HAVE NOT YET SEEN ANY EVIDENCE SHOWING THAT THE NSA'S DRAGNET COLLECTION OF AMERICANS' PHONE RECORDS HAS PRODUCED ANY UNIQUELY VALUABLE INTELLIGENCE," they wrote.¶ Alexander had only specified a couple of the supposed "dozens" of instances in which NSA spying thwarted terror plots. The two senators added in a subsequent statement that it appeared THE GOVERNMENT HAD ACTUALLY UNCOVERED THOSE PLOTS VIA OTHER INVESTIGATIVE TOOLS, AND THAT THE NSA'S DATA SNOOPING HAD "PLAYED LITTLE OR NO ROLE IN MOST OF THESE DISRUPTIONS."¶ A ProPublica investigation earlier this year likewise determined that there was "NO EVIDENCE THAT THE OFT-CITED FIGURE [OF 54 DISRUPTED PLOTS] IS ACCURATE," AND THAT THE NSA WAS OFTEN "INCONSISTENT ON HOW MANY PLOTS IT HAS HELPED PREVENT AND WHAT ROLE THE SURVEILLANCE PROGRAMS PLAYED."¶ It's pretty

much impossible to say who's right with any certainty. A full explanation of the supposedly disrupted plots remains classified, so only some lawmakers and those involved in the programs know exactly how effective they've been.¶ Still, IT'S LIKELY THAT THE NSA HAS AT LEAST OVERSTATED THE EFFECTIVENESS OF ITS TOOLS, PARTICULARLY IN COMPARISON TO THE SHEER SCALE OF THE SPYING. Sen. Patrick Leahy (D-Vt.), after reviewing the full classified list of thwarted plots, concluded the programs had "value," but that THE 54 FIGURE WAS A GROSS EXAGGERATION.¶ "THAT'S PLAINLY WRONG," HE SAID AT A JULY HEARING. "THESE WEREN'T ALL PLOTS AND THEY WEREN'T ALL THWARTED."

Surveillance doesn't work – can't combat terror

Tufnell, Wired, '14 (NICHOLAS TUFNELL, Wired, "NSA bulk surveillance has 'no discernible impact' on the prevention of terrorism" 14 JANUARY 14 <http://www.wired.co.uk/news/archive/2014-01/14/naf-report-on-nsa>) //GY

The New America Foundation (NAF) has released a damning report claiming THE NSA'S MASS SURVEILLANCE PROGRAMME HAS "NO DISCERNIBLE IMPACT" ON THE PREVENTION OF TERRORISM.¶ The report, "Do NSA's Bulk Surveillance Programs Stop Terrorists?", also claims that THE NSA IS GUILTY OF REPEATEDLY EXAGGERATING THE EFFICACY OF ITS BULK SURVEILLANCE TECHNIQUES IN ADDITION TO MISLEADING THE PUBLIC OVER ASPECTS OF 9/11, AND OF FAILING TO PREVENT CRIME EFFICIENTLY DUE TO AN INSUFFICIENT UNDERSTANDING OF ITS OWN INTELLIGENCE ALREADY SOURCED BY TRADITIONAL MEANS.¶ The NAF describes itself as a non-profit, nonpartisan public policy institute and think tank focussing on a wide range of issues, including national security studies. Investigating claims made by the US government concerning the competence and effectiveness of the NSA's bulk surveillance since 9/11, the NAF report compiled a database of 225 people from the US, including US nationals abroad, who have been indicted, convicted, or killed since the 9/11 terror attacks.¶ Key methods used to initiate investigations on these individuals were identified by the report and divided into eight separate categories:¶ "Those cases in which the initiating or key role was played by the bulk collection of American telephone metadata under Section 215; NSA surveillance of non-US persons overseas under Section 702; NSA surveillance under an unknown authority; tips from the extremist's family or local community members; tips regarding suspicious activity from individuals who were not part of an extremist's family or local community; the use of an undercover informant; the routine conduct of law enforcement or intelligence operations in which the NSA did not play a key role; and self-disclosure of extremist activity on the part of the extremist in question."¶ THE REPORT ALSO ACKNOWLEDGES THAT THE PUBLIC RECORDS FROM WHICH IT DREW THE INFORMATION MAY BE INCOMPLETE AND THAT THERE IS REASON TO BELIEVE THE GOVERNMENT HAS ACTIVELY CONCEALED THE ROLE OF NSA PROGRAMMES IN SOME INVESTIGATIONS: "Drug Enforcement Administration (DEA) agents have been trained in some instances, for example, to conceal the role of a DEA unit that analysed metadata to initiate cases."¶ THE BULK COLLECTION OF US CITIZENS' TELEPHONE METADATA -- which includes phone numbers, both incoming and outgoing, as well as the exact time, date and duration of the calls (but not the content) under Section 215 of the US Patriot Act -- ACCOUNTS FOR HAVING AIDED ONLY 1.8 PERCENT OF THE NSA'S TERRORIST CASES.¶ An equally unimpressive 4.4 percent of terrorism cases were aided by the NSA's surveillance of non-US persons outside of the United States under Section 702 of the FISA Amendments Act.¶ COMMENTING ON THESE FIGURES THE REPORT STATES, "SURVEILLANCE OF AMERICAN PHONE METADATA HAS HAD NO DISCERNIBLE IMPACT ON PREVENTING ACTS OF TERRORISM AND ONLY THE MOST MARGINAL OF IMPACTS ON PREVENTING TERRORIST RELATED ACTIVITY, SUCH AS FUNDRAISING FOR A TERRORIST GROUP."¶ Of the terrorist plot regularly

cited by the US government as evidence of the necessity and success of its surveillance techniques -- namely, Basaaly Moalin, a San Diego taxi driver who provided \$8,500 (£5,171) to an al-Qaeda affiliate in Somalia -- the NAF report states that the NSA's actions contradict its claims that the expediency afforded by Section 215 was largely responsible for the success of Moalin's capture.¶"According to the government, the database of American phone metadata allows intelligence authorities to quickly circumvent the traditional burden of proof associated with criminal warrants, thus allowing them to 'connect the dots' faster and prevent future 9/11-scale attacks. Yet in the Moalin case, after using the NSA's phone database to link a number in Somalia to Moalin, the FBI waited two months to begin an investigation and wiretap his phone."¶The reasons behind the two-month delay -- during which time the FBI was not monitoring Moalin's calls, despite being aware of his number and identity -- are still unclear. What is clear, however, is THAT THE BULK SURVEILLANCE PROGRAMME DID NOT EXPEDITE THE INVESTIGATIVE PROCESS, DESPITE THE US GOVERNMENT'S CLAIMS TO THE CONTRARY. ¶ THE REPORT ALSO REVIEWED THREE KEY TERRORISM CASES FREQUENTLY CITED BY THE US GOVERNMENT IN DEFENCE OF THE NSA'S BULK SURVEILLANCE. It concluded that government officials exaggerated the role of the NSA in the cases against David Coleman Headley and Najibullah ZAZI. THE SIGNIFICANCE OF THE THREAT OF ZAZI, who planned to bomb the New York Stock Exchange, WAS ALSO EXAGGERATED, CLAIMS THE REPORT.¶ MORE EMPHASIS, THE REPORT SUGGESTS, SHOULD BE PLACED ON CONVENTIONAL FORMS OF LAW ENFORCEMENT, WHICH ARE DEMONSTRABLY MORE EFFICIENT. "The overall problem for US counterterrorism officials is not that they need vaster amounts of information from the bulk surveillance programs, but that they don't sufficiently understand or widely share the information they already possess that was derived from conventional law enforcement and intelligence techniques."

Can't solve – studies and Snowden

Osterndorf, 3/17 (Chris Osterndorf, writer Daily Dot, "Edward Snowden is right—NSA surveillance won't stop terrorism" Mar 17, 2015 <http://www.dailydot.com/opinion/edward-snowden-mass-surveillance-nsa-america/>) //GY

It appears that Snowden season is approaching once again.¶The controversial whistleblower made a surprise appearance via Google Hangout at SXSW this week, where his remarks proved captivating as always. Essentially a less flashy sequel to his ACLU speech from 2014, Snowden only spoke to a few people this time around, engaging in a conversation with a select group of leaders from America's tech sector. In particular, he urged tech companies to become "champions of privacy," suggesting that they use their power to help shield Americans from an increasingly watchful government.¶In addition to speaking at SXSW in Austin, Snowden also said a few words at FutureFest in London, where HE WARNED THAT MASSIVE SURVEILLANCE WON'T STOP TERRORISM. In this instance, SNOWDEN IS ABSOLUTELY CORRECT, and it's time we start heeding his advice.¶At this point, the only people clinging to this idea is an effective is the NSA themselves. In 2013, NSA Director Gen. Keith Alexander went before the House Intelligence Committee to testify to claim that increased surveillance had helped to stop terrorist threats over 50 times since 9/11, including attacks on U.S. soil such as a plot to blow up the New York Stock Exchange and a defunct scheme to fund an overseas terrorist group. ¶Other witnesses in the same hearing also suggested that the Snowden leaks had harmed America greatly. "We are now faced with a situation that because this information has been made public, we run the risk of losing these collection capabilities," stated Robert S. Litt, general counsel of the Office of the Director of National Intelligence. "We're not going to know for many months whether these leaks in fact have caused us to lose these

capabilities, but if they do have that effect, there is no doubt that they will cause our national security to be affected.”¶ However, the details the NSA provided in this hearing were somewhat hazy, and A CLOSER LOOK AT THE NUMBERS INDICATES THE BENEFITS OF INCREASED SURVEILLANCE MAY NOT BE SO CLEAR-CUT AFTER ALL. Research from International Security found that out of the 269 terrorist suspects apprehended since 9/11, 158 were brought in through the use of traditional investigative measures. That’s almost 60 percent of all who were arrested. Meanwhile, 78 suspects were apprehended through measures which were “unclear” and 15 were implicated in plots but were not apprehended, while the remaining 18 were apprehended by some form of NSA surveillance.¶ Eighteen is no small number when you’re discussing matters of national security; however, THE ABOVE STATISTICS DO NOT NECESSARILY INDICATE THAT MASS SURVEILLANCE WAS RESPONSIBLE FOR THE APPREHENSION OF THESE 18 TERRORISTS OR WHETHER THESE SUSPECTS WERE DETAINED UNDER MORE TRADITIONAL SURVEILLANCE MEASURES. MOREOVER, THE EVIDENCE SUGGESTS THAT TRADITIONAL MEANS OF COMBATTING TERRORISM ARE MORE EFFECTIVE THAN SURVEILLANCE WHEN IT COMES TO OVERALL ARRESTS.¶ Additional analysis from the New America Foundation further supports these findings. Examining 225 post-9/11 terrorism cases in the U.S., their 2014 report found that THE NSA’S BULK SURVEILLANCE PROGRAM “HAS HAD NO DISCERNIBLE IMPACT ON PREVENTING ACTS OF TERRORISM,” CITING TRADITIONAL METHODS OF LAW ENFORCEMENT AND INVESTIGATION AS BEING FAR MORE EFFECTIVE IN THE MAJORITY OF CASES. In as many as 48 of these cases, traditional surveillance warrants were used to collect evidence, while more than half of the cases were the product of other traditional investigative actions, such as informants and reports of suspicious activity. ¶ In fact, New America determined that the NSA has only been responsible for 7.5 percent of all counterterrorism investigations and that ONLY ONE OF THOSE INVESTIGATIONS LED TO SUSPECTS BEING CONVICTED BASED ON METADATA COLLECTION. And that case, which took months to solve, as the NSA went back and forth with the FBI, involved money being sent to a terrorist group in Somalia, rather than an active plan to perpetrate an attack on U.S. soil.¶ According to the report’s principal author Peter Bergen, who is the director of the foundation’s National Security Program and their resident terrorism expert, the issue has less to do with the collection of data and more to do with the comprehension of it. Bergen said, “THE OVERALL PROBLEM FOR U.S. COUNTERTERRORISM OFFICIALS IS NOT THAT THEY NEED VASTER AMOUNTS OF INFORMATION FROM THE BULK SURVEILLANCE PROGRAMS, BUT THAT THEY DON’T SUFFICIENTLY UNDERSTAND OR WIDELY SHARE THE INFORMATION THEY ALREADY POSSESS THAT WAS DERIVED FROM CONVENTIONAL LAW ENFORCEMENT AND INTELLIGENCE TECHNIQUES.”¶ Of course, EVEN WHEN ALL OF THE DATA HAS BEEN COLLECTED, IT STILL ISN’T ENOUGH TO STOP A TERRORIST ATTACK. “It’s worth remembering that the mass surveillance programs initiated by the U.S. government after the 9/11 attacks—the legal ones and the constitutionally dubious ones—were premised on the belief that bin Laden’s hijacker-terrorists were able to pull off the attacks because of a failure to collect enough data,” asserts Reason’s Patrick Eddington. “Yet in their subsequent reports on the attacks, the Congressional Joint Inquiry (2002) and the 9/11 Commission found exactly the opposite. THE DATA TO DETECT (AND THUS FOIL) THE PLOTS WAS IN THE U.S. GOVERNMENT’S HANDS PRIOR TO THE ATTACKS; THE FAILURES WERE ONES OF SHARING, ANALYSIS, AND DISSEMINATION.” SO ONCE AGAIN, WE SEE THAT THE KEY IS NOT COLLECTION, BUT COMPREHENSION.¶ IF ALL OF THIS STILL DOESN’T SEEM LIKE ENOUGH EVIDENCE THAT MASS SURVEILLANCE IS INEFFECTIVE, CONSIDER THAT A WHITE HOUSE REVIEW GROUP HAS ALSO ADMITTED THE NSA’S COUNTERTERRORISM PROGRAM “WAS NOT ESSENTIAL TO PREVENTING ATTACKS” AND THAT A LARGE PORTION OF THE EVIDENCE THAT WAS COLLECTED “COULD READILY HAVE BEEN OBTAINED IN A TIMELY MANNER USING CONVENTIONAL [COURT]

ORDERS.¶ But mass surveillance isn't just the United States' problem. Research has shown that Canada's Levitation project, which also involves collecting large amounts of data in the service of fighting terrorism, may be just as questionable as the NSA's own data collection practices. Meanwhile, in response to the Charlie Hebdo attacks in Paris, British Prime Minister David Cameron has reintroduced the Communications Data Bill, which would force telecom companies to keep track of all Internet, email, and cellphone activity and ban encrypted communication services. ¶ But support for this type of legislation in Europe doesn't appear to be any stronger than in North America. Slate's Ray Corrigan argued, "Even if your magic terrorist-catching machine has a false positive rate of 1 in 1,000—and no security technology comes anywhere near this—every time you asked it for suspects in the U.K., it would flag 60,000 innocent people."¶ Fortunately, the cultural shift against increased data collection has become so evident in the U.S. that even President Obama is trying to get out of the business of mass surveillance; the president announced plans last March to reform the National Security Agency's practice of collecting call records, which have yet to come to fruition.¶ Benjamin Franklin famously said that "those who would give up essential liberty to purchase a little temporary safety deserve neither liberty nor safety." While this quote has been notoriously butchered and misinterpreted over the years, it has now become evident that we shouldn't have to give up either of these things in pursuit of the other. The U.S. is still grappling with how to fight terrorism in this technologically advanced age, but just because we have additional technology at our disposal, doesn't mean that technology is always going to be used for the common good. You may believe Edward Snowden to be a traitor or a hero, but on this matter, THERE IS VIRTUALLY NO QUESTION: MASS SURVEILLANCE IS NOT ONLY UNCONSTITUTIONAL, IT IS ALSO THE WRONG WAY TO FIGHT TERRORISM.

NSA good - cyberterror

The NSA is key to check cyber threats

Goldsmith, 13

Jack Goldsmith, Henry L. Shattuck Professor at Harvard Law School, "We Need an Invasive NSA," New Republic, 10/10/13, [//IS](http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks)

Such CYBER-INTRUSIONS THREATEN CORPORATE AMERICA AND THE U.S. GOVERNMENT EVERY DAY. "RELENTLESS ASSAULTS ON AMERICA'S COMPUTER NETWORKS BY CHINA AND OTHER FOREIGN GOVERNMENTS, HACKERS AND CRIMINALS HAVE CREATED AN URGENT NEED FOR SAFEGUARDS TO PROTECT THESE VITAL SYSTEMS," the Times editorial page noted last year while supporting legislation encouraging the private sector to share cybersecurity information with the government. It cited GENERAL KEITH ALEXANDER, THE DIRECTOR OF THE NSA, WHO HAD NOTED A 17-FOLD INCREASE IN CYBER-INTRUSIONS ON CRITICAL INFRASTRUCTURE FROM 2009 TO 2011 AND WHO DESCRIBED THE LOSSES IN THE UNITED STATES FROM CYBER-THEFT AS "THE GREATEST TRANSFER OF WEALTH IN HISTORY." If a "catastrophic cyber-attack occurs," the Times concluded, "Americans will be justified in asking why their lawmakers ... failed to protect them."

When catastrophe strikes, the public will adjust its tolerance for intrusive government measures.

The Times editorial board is quite right about the seriousness of the cyber- threat and the federal government's responsibility to redress it. What it does not appear to realize is the connection between the domestic NSA surveillance it detests and the governmental assistance with cybersecurity it cherishes. TO KEEP OUR COMPUTER AND TELECOMMUNICATION NETWORKS SECURE, THE GOVERNMENT WILL EVENTUALLY NEED TO MONITOR AND COLLECT INTELLIGENCE ON THOSE NETWORKS USING TECHNIQUES SIMILAR TO ONES THE TIMES AND MANY OTHERS FIND REPREHENSIBLE WHEN DONE FOR COUNTERTERRORISM ENDS.

THE FATE OF DOMESTIC SURVEILLANCE IS TODAY BEING FOUGHT AROUND THE TOPIC OF WHETHER IT IS NEEDED TO STOP AL QAEDA FROM BLOWING THINGS UP. BUT THE FIGHT TOMORROW, AND THE MORE IMPORTANT FIGHT, WILL BE ABOUT WHETHER IT IS NECESSARY TO PROTECT OUR WAYS OF LIFE EMBEDDED IN COMPUTER NETWORKS

ANYONE ANYWHERE WITH A CONNECTION TO THE INTERNET CAN ENGAGE IN CYBER-OPERATIONS WITHIN THE UNITED STATES. MOST TRULY HARMFUL CYBER-OPERATIONS, HOWEVER, REQUIRE GROUP EFFORT AND SIGNIFICANT SKILL. THE ATTACKING GROUP OR NATION MUST HAVE CLEVER HACKERS, SIGNIFICANT COMPUTING POWER, AND THE SOPHISTICATED SOFTWARE—known as "malware"—that enables the monitoring, exfiltration, or destruction of information inside a computer. THE SUPPLY OF ALL OF THESE RESOURCES HAS BEEN GROWING FAST FOR MANY YEARS—in governmental labs devoted to developing these tools and on sprawling black markets on the Internet.

The NSA is key to check cyber threats – it outweighs other agencies

Finley, 10

Klint Finley, Writer for ReadWriteWeb. He has a BA from The Evergreen State College, where he studied communications and mass media. He's the editor of the blogs Technocult and Mediapunk, and has

been writing about technology and culture for over 10 years, "Do Private Enterprises Need the NSA to Protect Them From Cyber Attacks?" ReadWrite, 7/8/10, [// IS](http://readwrite.com/2010/07/08/nsa-perfect-citizen)

THE WALL STREET JOURNAL REPORTS, CITING UNNAMED SOURCES, THAT THE NSA IS LAUNCHING A PROGRAM TO HELP PROTECT CRITICAL INFRASTRUCTURE - INCLUDING PRIVATE ENTERPRISES - FROM CYBER ATTACKS. ACCORDING TO THE PAPER, DEFENSE CONTRACTOR RAYTHEON HAS RECEIVED THE CONTRACT FOR THE PROJECT, WHICH WOULD RELY ON A SERIES OF SENSORS TO DETECT "UNUSUAL ACTIVITY SUGGESTING AN IMPENDING CYBER ATTACK." This follows the Lieberman-Collins bill passing committee in the Senate.

The Orwellian nature of the name was allegedly not lost on Raytheon: The Wall Street Journal claims to have seen an internal Raytheon e-mail saying "Perfect Citizen is Big Brother."

ALTHOUGH THE PROJECT WILL BE MOSTLY AIMED AT PUBLIC INFRASTRUCTURE WITH OLDER COMPUTER CONTROL SYSTEMS, SUCH AS SUBWAYS AND AIR-TRAFFIC CONTROL SYSTEMS, THE PAPER NOTES THAT THE PROGRAM COULD BE OF USE TO PRIVATE COMPANIES LIKE GOOGLE AND THE MANY OTHER COMPANIES who sustained cyber attacks late last year.

A power struggle has been brewing over who should be in charge of national cybersecurity: the NSA, the Department of Homeland Security, the military, or the private sector. The Lieberman-Collins bill would put the responsibility squarely on the shoulders of the White House and DHS, establishing new cybersecurity organizations in both and requiring private enterprises to take orders from the federal government in the event of a "national cyber emergency."

However, security expert Bruce Schneier notes that DHS HAS BEEN "GETTING HAMMERED" IN SENATE HOMELAND SECURITY COMMITTEE HEARINGS AND THAT THE NSA HAS BEEN CONSOLIDATING ITS POWER. "Perfect Citizen" would appear to be a major power grab by the agency.

Other countries are threats now – NSA is key to assessment **Tadjeh, 15**

Yasmin Tadjeh, former editor-in-chief of VoxPop, Staff Writer at National Defense Magazine, graduated with a B.A. in history from George Mason University, "NSA Chief: China, Russia Capable of Carrying Out 'Cyber Pearl Harbor' Attack," National Defense Magazine, 2/23/15, [// IS](http://www.nationaldefensemagazine.org/blog/Lists/Posts/Post.aspx?List=7c996cd7-cbb4-4018-baf8-8825eada7aa2&ID=1757)

NATIONS SUCH AS CHINA AND RUSSIA HAVE ENOUGH OFFENSIVE CYBER CAPABILITIES TO ONE DAY CARRY OUT A "cyber Pearl Harbor" ATTACK, SAID THE HEAD OF THE NATIONAL SECURITY AGENCY AND U.S. CYBER COMMAND.

"WE'VE TALKED ABOUT OUR CONCERNS WITH CHINA AND WHAT THEY'RE DOING IN CYBER. CLEARLY THE RUSSIANS AND OTHERS HAVE [THOSE TYPES OF] CAPABILITIES," said Navy Adm. Mike Rogers on Feb. 23. "We're mindful of that."

A CYBER PEARL HARBOR COULD INCLUDE AN ATTACK ON critical infrastructure OR THE financial sector, Rogers said during a cyber security forum sponsored by the New America Foundation, a Washington, D.C.-based think tank.

“YOU’VE SEEN SOME [SMALLER EVENTS ALREADY]. YOU LOOK AT WHAT HAPPENED AT SONY, YOU LOOK AT WHAT WE’VE SEEN NATION STATES ATTEMPTING TO DO AGAINST U.S. FINANCIAL WEBSITES FOR SOME YEARS NOW,” Rogers said. There would be dire implications for the nation if ordinary citizens were unable to access their bank accounts, he added.

In the Defense Department, there is great concern about intellectual property being stolen, he noted.

“Certainly in the Department of Defense, IT’S AN ISSUE THAT HAS BEEN OF GREAT CONCERN TO US AS FOR SOME TIME,” HE SAID. NATION STATES HAVE PENETRATED SOME KEY DEFENSE CONTRACTORS, AND STOLEN THE ENABLING TECHNOLOGY THAT GIVES THE U.S. MILITARY AN OPERATIONAL ADVANTAGE, HE SAID.

PART OF THE NSA’S FUNCTION IS TO KEEP TABS ON potential threats TO THE UNITED STATES. In 2013, the agency came under fire after Edward Snowden, a government contractor at the time, leaked classified information that revealed the agency was collecting enormous amounts of phone metadata from U.S. citizens.

Rogers defended the program and said THE BULK COLLECTION OF DATA ABSOLUTELY HELPS THE NATION PREVENT ATTACKS.

Cyber risks are high now – Iran – no treaties can check

Gady, 15

Franz-Stefan Gady is an Associate Editor with The Diplomat and a Senior Fellow with the EastWest Institute, “Iran and the United States Locked in Cyber Combat,” The Diplomat, 2/27/15, <http://thediplomat.com/2015/02/iran-and-the-united-states-locked-in-cyber-combat/> // IS

This month the news website THE INTERCEPT REVEALED A NEW NATIONAL SECURITY AGENCY DOCUMENT OUTLINING THE ONGOING BATTLE BETWEEN IRAN AND THE UNITED STATES IN CYBERSPACE. The memo, dated from April 2013, was prepared for then N.S.A. director and head of U.S. Cyber Command General Keith B. Alexander and contains a number of talking points for the general’s interaction with the head of Britain’s Government Communications Headquarters (GCHQ) — the British equivalent to the American N.S.A.

Most importantly, THE DOCUMENT OUTLINES A CYCLE OF escalating cyberattacks AND COUNTER-ATTACKS, FIRST INITIATED BY THE ISRAELI-AMERICAN STUXNET attack against Iranian computers:

“IRAN CONTINUES TO CONDUCT DISTRIBUTED DENIAL-OF-SERVICE (DDOS) ATTACKS AGAINST NUMEROUS U.S. FINANCIAL INSTITUTIONS, AND IS CURRENTLY IN THE THIRD PHASE OF A SERIES OF SUCH ATTACKS that began in August 2012. SIGINT [signals intelligence] indicates that these attacks are in retaliation to Western activities against Iran’s nuclear sector and that senior officials in the Iranian government are aware of these attacks.”

THE MEMO ALSO OUTLINES WHAT CAN ONLY BE DESCRIBED AS A **cyber-arms race** BETWEEN THE TWO NATIONS: "NSA EXPECTS IRAN WILL CONTINUE THIS SERIES OF ATTACKS, WHICH IT VIEWS AS SUCCESSFUL, WHILE STRIVING FOR INCREASED EFFECTIVENESS BY ADAPTING ITS TACTICS AND TECHNIQUES TO CIRCUMVENT VICTIM MITIGATION ATTEMPTS."

IRANIAN HACKERS, THE MEMO NOTES, HAVE ADAPTED QUICKLY AND LEARNED FROM THEIR ADVERSARY AS ILLUSTRATED BY ONE SPECTACULAR ATTACK:

"Iran's destructive cyberattack against SAUDI ARAMCO IN AUGUST 2012, DURING WHICH DATA WAS DESTROYED ON TENS OF THOUSANDS OF COMPUTERS, WAS THE FIRST SUCH ATTACK NSA HAS OBSERVED FROM THIS ADVERSARY. IRAN, having been a victim of a similar cyberattack against its own oil industry in April 2012, HAS DEMONSTRATED A CLEAR ABILITY TO LEARN FROM THE CAPABILITIES AND ACTIONS OF OTHERS."

The N.S.A. document further emphasizes that THE CYBER CONFLICT BETWEEN THE TWO COUNTRIES IS FAR FROM OVER AND THAT THE CAPABILITIES OF BOTH SIDES ARE EVER EXPANDING: "WE CONTINUALLY UPDATE CONTINGENCY PLANS TO REFLECT THE CHANGES IN BOTH OUR ACCESS AND IRAN'S CAPABILITIES."

After the publication of this document, The New York Times Editorial Board called for cyber arms control treaties. "The best way forward is to accelerate international efforts to negotiate limits on the cyberarms race, akin to the arms-control treaties of the Cold War. Barring that, there are few viable ways to bring these new weapons and their use under control," the board cautions.

YET GIVEN THE EASY PROLIFERATION OF CYBER WEAPONS — ALTHOUGH SOPHISTICATED CYBERATTACKS SUCH AS STUXNET REQUIRE THE BACKING OF A NATION STATE — A CYBER-ARMS CONTROL TREATY **may be illusory** AT THIS STAGE. Perhaps another idea may be worth considering.

Catastrophic cyberattacks are coming now

Erwin et al., 12

Sandra Erwin, Stew Magnuson, Dan Parsons and Yasmin Tadjeh, *Editor of National Defense Magazine, graduated from Coe College with a B.A. in Political Science, "Top Five Threats to National Security in the Coming Decade: The Future of Cyber Wars," National Defense Magazine, November 2012, <http://www.nationaldefensemagazine.org/archive/2012/november/pages/topfivethreatstonationalsecurityinthecomingdecade.aspx> // IS

Army Gen. KEITH ALEXANDER, COMMANDER OF U.S. CYBER COMMAND, SEES A DAY IN THE NOT TOO DISTANT FUTURE WHEN ATTACKS ON COMPUTER NETWORKS CROSS THE LINE FROM THEFT AND DISRUPTION TO "DESTRUCTION."

AND THIS CHAOS WILL NOT ALL TAKE PLACE IN THE DIGITAL WORLD OF ONES AND ZEROES. HE IS REFERRING TO REMOTE ADVERSARIES TAKING DOWN INFRASTRUCTURE SUCH AS **power grids, dams, transportation systems** AND OTHER SECTORS that use computer-based industrial controls.

THE LAST DECADE HAS SEEN MOSTLY EXPLOITATION BY ADVERSARIES, OR THE THEFT OF MONEY AND INTELLECTUAL PROPERTY. NEXT CAME DISTRIBUTED DENIAL OF SERVICE ATTACKS WHEN HACKERS

OVERWHELM NETWORKS AND DISRUPT OPERATIONS OF BUSINESSES OR OTHER ORGANIZATIONS, Alexander said at a recent Woodrow Wilson Center panel discussion on cybersecurity.

OTHER THAN INTERCONTINENTAL BALLISTIC MISSILES AND ACTS OF TERRORISM, AN ADVERSARY SEEKING TO REACH OUT AND HARM THE UNITED STATES HAS ONLY ONE OTHER OPTION: DESTRUCTIVE CYBER-ATTACKS, Alexander said.

THIS COULD RESULT IN LOSS OF LIFE AND DAMAGE TO THE ECONOMY ON PAR WITH WHAT OCCURRED AFTER 9/11.

“ALL OF THAT IS WITHIN THE REALM OF THE POSSIBLE,” HE SAID. “I BELIEVE **that is coming our way.** We have to be out in front of this,” Alexander said.

How to thwart such attacks is the problem the nation is facing.

Most of the Internet’s infrastructure through which malware is delivered is in the private sector’s hands. So too are the banking, energy, transportation and other institutions that are vulnerable to the attacks.

During the past year, THERE HAVE BEEN 200 ATTACKS ON CORE CRITICAL INFRASTRUCTURES IN THE TRANSPORTATION, ENERGY, AND COMMUNICATION INDUSTRIES REPORTED TO THE DEPARTMENT OF HOMELAND SECURITY, said Sen. Susan Collins, R-Maine, and ranking member of the Senate Homeland Security and Governmental Affairs Committee.

“And that is only the tip of the iceberg. Undoubtedly there are more that have not been reported,” she said during the panel.

“In this case, THE DOTS HAVE ALREADY BEEN CONNECTED. THE ALARM HAS ALREADY BEEN SOUNDED, AND WE KNOW IT IS ONLY A MATTER OF WHEN, NOT WHETHER WE HAVE A **catastrophic attack,**” she said.

Alexander, Collins and others are advocating for a more coordinated national effort to share information on cyberthreats. Cyber Command and the National Security Agency have loads of expertise, but can’t always share classified information, or cross lines when it comes to the privacy of U.S. citizens. The rest of the federal government has bits and pieces of information, and different responsibilities. Private sector companies are sometimes reluctant to disclose attacks for fear of upsetting shareholders or opening themselves up to lawsuits. Legislation co-sponsored by Collins to help pave the way for better information sharing died in Congress last summer.

Despite having poured countless amounts of money into cybersecurity on both the federal and private levels, there is still a lot to be learned about the threat, said one analyst.

“Why do we have a cyberwar community? Because we haven’t mastered cyber,” said Martin Libicki, senior management scientist at Rand Corp. The main problem is that computers were originally seen as something to be “tinkered” with, Libicki said.

“We’ve built the most important infrastructure on things that were made to be toys,” said Libicki. Being toys, computer systems from the start have gaps and vulnerabilities needing to be patched.

“Every cyber-attack is a reflection of some vulnerability in the system,” said Libicki.

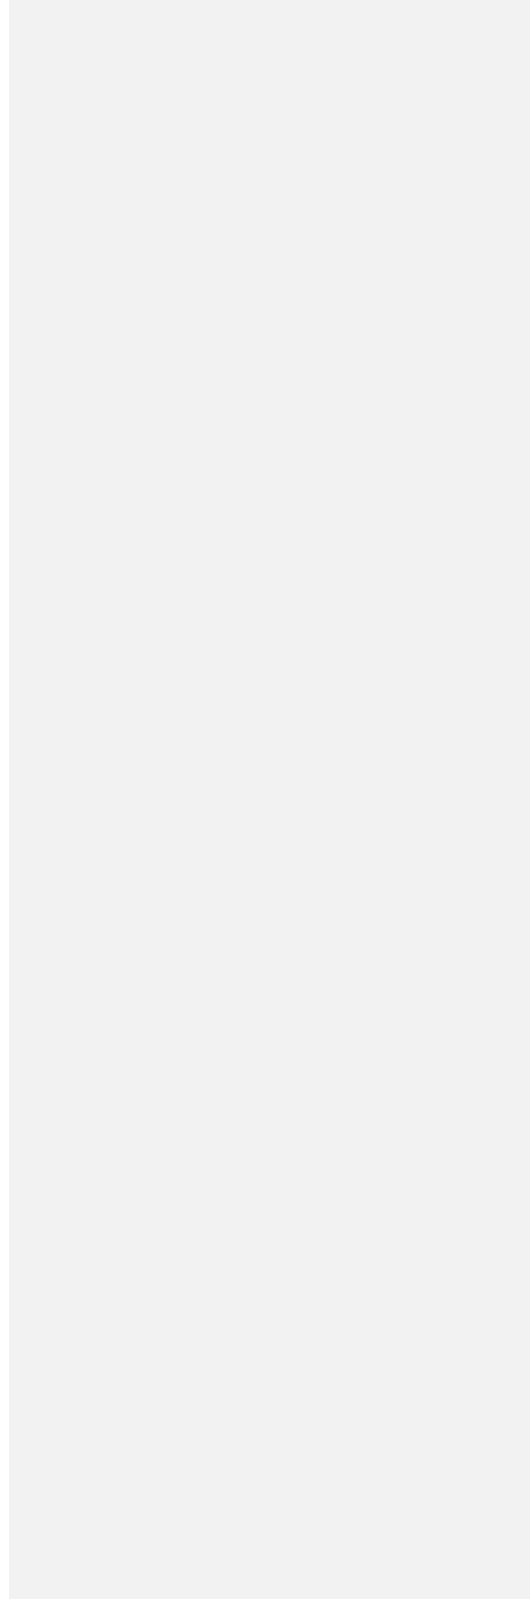

Greg Giaquinto, an analyst at Forecast International, said it's not enough to defend the nation from attacks, offensive capabilities are required.

Increasingly, the United States is taking more proactive measures against adversaries and initiating activity, Giaquinto said.

"We are actually taking proactive action against other adversaries, so it's not only protecting ourselves, but the U.S. taking more proactive stances and actually initiating some activity against U.S. adversaries," he said.

OVER THE NEXT FEW YEARS, THE HACKERS WILL BECOME MORE SOPHISTICATED, SAID CHARLES CROOM, VICE PRESIDENT OF CYBER SECURITY SOLUTIONS AT LOCKHEED MARTIN INFORMATION SYSTEMS & GLOBAL SOLUTIONS. THIS DOESN'T NECESSARILY MEAN THAT THE TECHNOLOGIES ARE BECOMING MORE ADVANCED — EVEN THE MOST SOPHISTICATED THREATS OFTEN USE KNOWN VULNERABILITIES AND MALWARE, CROOM SAID — BUT THE ADVERSARIES HAVE BECOME MORE EFFECTIVE.

AT: SIGINT CP

perm

Perm do both – reducing data collection is key to free up resources for solutions Tufekci, 15

Zeynep Tufekci, an assistant professor at the University of North Carolina, “Terror and the limits of mass surveillance,” Financial Times: The Exchange, 2/3/15, <http://blogs.ft.com/the-exchange/2015/02/03/zeynep-tufekci-terror-and-the-limits-of-mass-surveillance/> // IS

Europe’s top human rights body, THE COUNCIL OF EUROPE, PUT OUT A REPORT LAST WEEK BLASTING GOVERNMENTAL MASS SURVEILLANCE, joining a long list of organisations and individuals who have voiced strong moral and political objections to National Security Agency-type blanket surveillance. THIS LATEST REPORT, LIKE MOST SUCH CRITICISMS, MISSES A KEY POINT: DESPITE THE COMMON NOTION THAT WE ARE TRADING SAFETY FOR LIBERTY BY LETTING GOVERNMENTS SCOOP UP SO MUCH OF OUR DATA, THE TRUTH IS THAT MASS SURVEILLANCE AND BIG DATA ANALYTICS ARE **not the right tool** FOR EXTREMELY RARE EVENTS LIKE ACTS OF TERRORISM in western societies.

THE MOST COMMON JUSTIFICATION GIVEN BY GOVERNMENTS FOR MASS SURVEILLANCE IS THAT THESE TOOLS ARE INDISPENSABLE FOR FIGHTING TERRORISM. The NSA’s ex-director Keith Alexander says big data is “what it’s all about”. Intelligence agencies routinely claim that they need massive amounts of data on all of us to catch the bad guys, like the French brothers who assassinated the cartoonists of Charlie Hebdo, or the murderers of Lee Rigby, the British soldier killed by two men who claimed the act was revenge for the UK’s involvement in the wars in Iraq and Afghanistan.

But THE ASSERTION THAT BIG DATA IS “WHAT IT’S ALL ABOUT” WHEN IT COMES TO PREDICTING RARE EVENTS IS NOT SUPPORTED BY WHAT WE KNOW ABOUT HOW THESE METHODS WORK, AND MORE IMPORTANTLY, **don’t work**. ANALYTICS ON MASSIVE DATASETS CAN BE POWERFUL IN ANALYSING AND IDENTIFYING BROAD PATTERNS, OR EVENTS THAT OCCUR REGULARLY AND FREQUENTLY, BUT ARE SINGULARLY **unsuited** TO FINDING UNPREDICTABLE, ERRATIC, AND RARE NEEDLES IN HUGE HAYSTACKS. In fact, THE BIGGER THE HAYSTACK — THE MORE MASSIVE THE SCALE AND THE WIDER THE SCOPE OF THE SURVEILLANCE — THE LESS SUITED THESE METHODS ARE TO FINDING SUCH EXCEPTIONAL events, and THE MORE THEY MAY SERVE TO DIRECT RESOURCES AND ATTENTION AWAY FROM APPROPRIATE TOOLS AND METHODS.

squo solves

Current programs check analysts SIDtoday, 6

Signals Intelligence Directorate Today, "Dealing with a 'Tsunami' of Intercept," 8/29/06,
<https://s3.amazonaws.com/s3.documentcloud.org/documents/2088984/tsunami-of-intercept.pdf> // IS

(S//SI) Everyone knows that ANALYSTS HAVE BEEN DROWNING IN A TSUNAMI OF INTERCEPT WHOSE VOLUME, VELOCITY AND VARIETY CAN BE OVERWHELMING. But the Human Language Technology Program Management Office (HLT PMO) can predict that in the very near future the speed and volume of SIGINT will increase even more, almost beyond imagination. And WE ARE WORKING ON WAYS TO HELP ANALYSTS DEAL WITH IT ALL.

(S//SI) OF THE HLT PMO'S FIVE STRATEGIC THRUSTS, THE ONE THAT ADDRESSES THIS PROBLEM IS HIGH SPEED/ HIGH VOLUME. It must deal with today's collection and must plan for tomorrow's. The current collection environment is characterized by huge amounts of data, coupled with severely limited capability to send material forward, and extremely limited number of queries that exactly describe messages of value. That means we are capable of finding huge amounts of data, much of which is not what we really want, and that we cannot send it all back for analyst processing.

(TS//SI) To plan for tomorrow, HIGH SPEED/ HIGH VOLUME IS IN LINE WITH CHANGES IN THE OVERALL NSA/CSS SYSTEMS, PARTICULARLY TURBULENCE AND TURMOIL BECAUSE WHEN THEY BECOME A REALITY IN THE NEAR FUTURE, WE CAN EXPECT COLLECTION CAPABILITIES TO INCREASE SIGNIFICANTLY. TURBULENCE IS AN UMBRELLA COVER TERM DESCRIBING THE NEXT GENERATION MISSION ENVIRONMENT THAT WILL CREATE A UNIFIED SYSTEM. TURMOIL IS A PASSIVE FILTERING AND COLLECTION EFFORT ON HIGH-SPEED NETWORKS. THIS IS DESIGNED TO BE FLEXIBLE AND CAN BE MODIFIED QUICKLY TO DELIVER DATA IN ANALYST- READY FORM.

(S//SI) ONE OF HIGH SPEED/ HIGH VOLUME'S FIRST EFFORTS IS IN DEVELOPING AND IMPLEMENTING WAYS TO PUSH HLT CAPABILITIES VERY DOSE TO THE COLLECTION POINTS OF THE SIGINT SYSTEM. IN PARTICULAR, HLT IS ABOUT TO DEMONSTRATE AN OPERATIONAL PROTOTYPE OF LANGUAGE IDENTIFICATION FOR SPECIAL SOURCE OPERATIONS (SSO) COUNTERTERRORISM TEXT TARGETS RUNNING AT LINE SPEEDS (STM-16) at the packet- level. Resources permitting, HLT analytic processors will automatically generate content-based events for TURMOIL based on language.

CP links to PTX

NSA action links to politics Poitras and Risen, 13

Laura Poitras and James Risen, *Academy Award-winning American documentary film director and producer who produced Citizenfour, a documentary on Snowden, **reporter for the New York Times, "N.S.A. Report Outlined Goals for More Power," The New York Times, 11/23/13, <http://www.nytimes.com/2013/11/23/us/politics/nsa-report-outlined-goals-for-more-power.html> // IS

PROMPTED BY A PUBLIC OUTCRY OVER THE N.S.A.'S DOMESTIC OPERATIONS, THE AGENCY'S CRITICS IN CONGRESS HAVE BEEN PUSHING TO LIMIT, RATHER THAN EXPAND, ITS ABILITY TO ROUTINELY COLLECT THE PHONE AND EMAIL RECORDS OF MILLIONS OF AMERICANS, while foreign leaders have protested reports of virtually unlimited N.S.A. surveillance overseas, even in allied nations. Several inquiries are underway in Washington; Gen. Keith B. Alexander, the N.S.A.'s longest-serving director, has announced plans to retire; and the White House has offered proposals to disclose more information about the agency's domestic surveillance activities.

THE N.S.A. DOCUMENT, TITLED "SIGINT STRATEGY 2012-2016," DOES NOT MAKE CLEAR WHAT LEGAL OR POLICY CHANGES THE AGENCY MIGHT SEEK. THE N.S.A.'S POWERS ARE DETERMINED VARIOUSLY BY Congress, EXECUTIVE ORDERS AND THE NATION'S SECRET INTELLIGENCE COURT, and its operations are governed by layers of regulations. While asserting that the agency's "culture of compliance" would not be compromised, N.S.A. officials argued that they needed more flexibility, according to the paper.

NSA reform unpopular – Freedom act *magnifies* the link Gross, 6/6

Grant Gross, Washington, D.C., correspondent for IDG News Service "Don't expect major changes to NSA surveillance from Congress," CIO, 6/6/15, <http://www.cio.com.au/article/576813/don-t-expect-major-changes-nsa-surveillance-from-congress/> // IS

THE SENATE THIS WEEK PASSED THE USA FREEDOM ACT, which aims to end the NSA's mass collection of domestic phone records, and President Barack Obama signed the bill hours later.

AFTER THAT ACTION, EXPECT REPUBLICAN LEADERS IN BOTH THE SENATE AND THE HOUSE OF REPRESENTATIVES TO RESIST FURTHER CALLS FOR SURVEILLANCE REFORM. THAT RESISTANCE IS AT ODDS WITH MANY RANK-AND-FILE LAWMAKERS, including many House Republicans, who want to further limit NSA programs brought to light by former agency contractor Edward Snowden.

CIVIL LIBERTIES GROUPS AND PRIVACY ADVOCATES ALSO PROMISE TO PUSH FOR MORE CHANGES. It may be difficult to get "broad, sweeping reform" through Congress, but many lawmakers seem ready to push for more changes, said Adam Eisgrau, managing director of the office of government relations for the American Library Association. The ALA has charged the NSA surveillance programs violate the Fourth Amendment of the U.S. Constitution, which prohibits unreasonable searches and seizures.

"Congress is not allowed to be tired of surveillance reform unless it's prepared to say it's tired of the Fourth Amendment," Eisgrau said. "The American public will not accept that."

OTHER ACTIVISTS ARE LESS OPTIMISTIC ABOUT MORE CONGRESSIONAL ACTION. "IT WILL A long slog GETTING MORE RESTRAINTS." J. Kirk Wiebe, a former NSA analyst and whistleblower said by email. "The length of that journey will depend on public outcry -- that is the one thing that is hard to gauge."

NSA reform is incredibly unpopular

Ferestein, 14

Gregory Ferenstein, Editor at Ferenstein Wire, graduate of UC-Irvine, "Congress will probably fail to pass NSA reform, in pursuit of perfection — and Presidential politics," 11/16/14, <http://venturebeat.com/2014/11/16/congress-will-fail-to-pass-nsa-reform-in-pursuit-of-perfection-and-presidential-politics/> // IS

CONGRESS HAS YET TO ENACT ANY SURVEILLANCE REFORM — MORE THAN A YEAR AFTER EDWARD SNOWDEN REVEALED THE NATIONAL SECURITY AGENCY'S MASS SPYING PROGRAM. As the new Congress convenes for 2015, it appears that the familiar **squabbles** WILL PREVENT MEANINGFUL REFORM YET AGAIN. The biggest hope for reform at the moment is the USA Freedom Act, which would severely limit the bulk collection of Internet and phone data. It would also appoint a special civilian defense attorney to the court that approves spying requests (among many other reforms). However, INFLUENTIAL SENATORS ARE ALREADY TAKING SIDES against the USA Freedom Act. HAWKISH MEMBERS SERVING ON THE SENATE INTELLIGENCE COMMITTEE HAVE THREATENED TO BLOCK ANY BILL that significantly curtails the NSA's spying powers. SEN. SAXBY CHAMBLISS (R.-GEORGIA) CALLED THE UPCOMING USA FREEDOM ACT "TERRIBLE" AND SAID HE WOULD FILIBUSTER ANY ATTEMPT TO PASS THE BILL. "IT DESTROYS OUR ABILITY TO FIGHT DOMESTIC TERRORISM IN PARTICULAR, AND WE'RE GOING TO HOPEFULLY BE ABLE TO AVOID HAVING THAT BILL COME TO THE FLOOR," CHAMBLISS SAID. ON THE FLIP SIDE, EARLY PRESIDENTIAL FRONT-RUNNER SENATOR RAND PAUL (R.-KENTUCKY) WILL REPORTEDLY OPPOSE THE USA FREEDOM ACT BECAUSE IT DOESN'T GO FAR ENOUGH IN RESTRICTING THE NSA. Speaking about the bill, an aid for Paul told CNN that "Due to significant problems with the bill, at this point he will oppose the Leahy bill." (Sen. Patrick Leahy, D.-Vermont, is a sponsor of the USA Freedom bill.) ONE OF THE UNIQUE AND ULTIMATELY SELF-DEFEATING ASPECTS OF NSA REFORM IS THAT IT ISN'T SPLIT ALONG TRADITIONAL PARTY LINES. THERE'S INTERNAL DISSENT WITHIN BOTH THE REPUBLICAN AND DEMOCRATIC PARTIES. EVEN THOUGH REPUBLICANS WILL CONTROL BOTH THE HOUSE AND SENATE AS OF 2015, THERE'S NO AGREEMENT WITHIN THE LEADERSHIP OF THE PARTY ON SURVEILLANCE REFORM.

Anti-surveillance advocates are emboldened now

Alexis, 15

Alexei Alexis, Bloomberg reporter, "Pressure for Surveillance Overhaul To Continue, Despite New Curbs on NSA, Bloomberg," 6/8/15 <http://www.bna.com/pressure-surveillance-overhaul-n17179927445/> // IS

June 3 — EMBOLDENED BY PASSAGE OF THE USA FREEDOM ACT (H.R. 2048), TECHNOLOGY GROUPS AND PRIVACY ADVOCATES PLAN TO CONTINUE PUSHING FOR SURVEILLANCE CHANGES THAT WERE EXCLUDED FROM THE NEW LAW.

The USA FREEDOM Act, cleared by Congress June 2 and signed by President Barack Obama the same day, overhauls National Security Agency surveillance activities exposed by Edward Snowden.

"THIS IS THE MOST SIGNIFICANT SURVEILLANCE REFORM MEASURE IN THE LAST GENERATION," HARLEY GEIGER, DEPUTY DIRECTOR ON SURVEILLANCE AND SECURITY FOR THE CENTER FOR DEMOCRACY & TECHNOLOGY, TOLD BLOOMBERG BNA JUNE 3. "IT'S DEFINITELY A GREAT FIRST STEP, BUT IT STILL **doesn't solve many problems.**"

solvency deficits

Private companies fail – translation

Mercado, 7

Stephen Mercado, an analyst in the CIA Directorate of Science and Technology “Reexamining the Distinction Between Open Information and Secrets,” CIA, 4/15/07, https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/csi-studies/studies/Vol49no2/reexamining_the_distinction_3.htm // IS

POLICYMAKERS AND INTELLIGENCE EXECUTIVES WOULD ALSO DO WELL TO RESIST THE SIREN CALL OF THOSE WHO ARGUE THAT WE SHOULD SIMPLY PRIVATIZE OSINT. PRIVATE CORPORATIONS ARE AN EXCELLENT SOURCE OF DICTIONARIES, SOFTWARE, AND CONTRACTORS FOR OUR GOVERNMENT. BUT PRIVATE COMPANIES ALONE ARE NO SUBSTITUTE FOR ACCOUNTABLE, DEDICATED OSINT PROFESSIONALS IN GOVERNMENT OFFICES. [12] LET US TAKE THE VITAL ISSUE OF TRANSLATION AS AN EXAMPLE. CONTRACTORS— WHETHER INDIVIDUALS, TRANSLATION AGENCIES, OR RESEARCH COMPANIES (the latter generally subcontracting with translation agencies or independent translators for the talent they lack in house)—TODAY TRANSLATE MOST OF THE FOREIGN NEWSPAPERS, SCIENTIFIC JOURNALS, AND OTHER OPEN INFORMATION FOR THE INTELLIGENCE COMMUNITY. THEY DO SO UNDER THE LEAD OF CLEARED OSINT OFFICERS WHO, knowing both the requirements of the Intelligence Community and the mysteries of the foreign media, MANAGE THE TRANSLATION FLOWS TO PROVIDE ANSWERS TO INTELLIGENCE QUESTIONS. Staff officers are also available to translate priority items themselves on a crash basis when contractors are unavailable. Staff officers serve one master. CONTRACTORS, BUSY WITH A MIX OF ASSIGNMENTS FROM CORPORATE AND GOVERNMENT CUSTOMERS, OFTEN ARE UNAVAILABLE WHEN MOST NEEDED.

Ideally, in my view, the government should develop its own sizeable cadre of translators. Yet, that would be much more expensive than the present system. Some would argue for the opposite path of privatizing OSINT, which would mean intelligence analysts, case officers, and others buying their translations directly from the private sector without OSINT officers to apply their general requests against the appropriate media for the right information or to edit, often heavily, CONTRACTOR TRANSLATIONS THAT ARE FREQUENTLY OF POOR QUALITY.

SIGINT privatization empirically fails and gets leaked

Shorrock, 13

Tim Shorrock, has appeared in many publications, including Salon, Mother Jones, The Progressive, The Daily Beast and the New York Times, “Obama’s Crackdown on Whistleblowers,” The Nation, 3/26/13, <http://www.thenation.com/article/173521/obamas-crackdown-whistleblowers?page=full> // IS

The hypocrisy is best illustrated in the case of FOUR WHISTLEBLOWERS FROM THE NATIONAL SECURITY AGENCY: THOMAS DRAKE, WILLIAM BINNEY, J. KIRK WIEBE AND EDWARD LOOMIS. Falsely accused of leaking in 2007, they HAVE ENDURED YEARS OF LEGAL HARASSMENT FOR EXPOSING THE WASTE AND FRAUD BEHIND A MULTIBILLION-DOLLAR CONTRACT FOR A SYSTEM CALLED TRAILBLAZER, WHICH WAS SUPPOSED TO “REVOLUTIONIZE” THE WAY THE NSA PRODUCED SIGNALS INTELLIGENCE (SIGINT) IN THE DIGITAL AGE. Instead, IT WAS CANCELED IN 2006 AND REMAINS ONE OF THE WORST FAILURES IN US

INTELLIGENCE HISTORY. BUT THE MONEY SPENT ON THIS PRIVATIZATION SCHEME, LIKE SO MUCH AT THE NSA, REMAINS A STATE SECRET.

AT: Yahoo CP

Yahoo doesn't matter

Yahoo is irrelevant and declining O'Brien, 15

Mike O'Brien, Master's degree in journalism from the University of Oregon. "Yahoo's Search Share on the Decline," Search Engine Watch, 3/19/15,
[// IS](http://searchenginewatch.com/sew/news/2400580/yahoos-search-share-on-the-decline)

YAHOO'S RECENT INCREASE IN THE U.S. DESKTOP SEARCH SHARE HAS started to falter, ACCORDING TO COMSCORE'S MONTHLY QSEARCH ANALYSIS. IN DECEMBER, YAHOO REPLACED GOOGLE AS THE DEFAULT SEARCH ENGINE ON MOZILLA FIREFOX. THAT MONTH, THE FIRST IN THE FIVE-YEAR PARTNERSHIP, YAHOO SAW ITS HIGHEST SHARE - 11.8 PERCENT - OF THE DESKTOP SEARCH MARKET SINCE 2009. THE NUMBER INCREASED TO 13 PERCENT IN JANUARY, BEFORE STARTING TO DECLINE. IN FEBRUARY, YAHOO'S SHARE WENT DOWN TO 12.8 PERCENT, WITH THOSE 0.2 PERCENTAGE POINTS DIVIDING BETWEEN GOOGLE AND MICROSOFT. Google continues to have the lion's share of the search market; even with Yahoo's comeback, Google never dipped below 64 percent.

Yahoo doesn't matter Lynch, 14

Jim Lynch, former community manager for ZiffNet, ZDNet, PCMag, ExtremeTech, The FamilyEducation Network, and MSN Games. "The decline and fall of the Yahoo empire," 12/23/14
[// IS](http://jimlynch.com/internet/the-decline-and-fall-of-the-yahoo-empire)

THE ARRIVAL OF MARISSA MAYER FROM GOOGLE WAS SUPPOSED TO RESURRECT YAHOO, BUT IT SEEMS THAT HER EFFORTS HAVE MOSTLY FAILED. The New York Times magazine has a deep and detailed portrait of what went wrong at Yahoo with Mayer as CEO of Yahoo via an excerpt of an upcoming book by Nicholas Carlson called ":

In many ways, YAHOO'S DECLINE FROM A \$128 BILLION COMPANY TO ONE WORTH VIRTUALLY NOTHING IS ENTIRELY NATURAL. YAHOO GREW INTO A COLOSSUS BY SOLVING A PROBLEM THAT NO LONGER EXISTS. AND WHILE YAHOO'S PRODUCTS HAVE UNDENIABLY IMPROVED, AND ITS CULTURE HAS BECOME MORE INNOVATIVE, IT'S UNLIKELY THAT MAYER CAN REVERSE AN INEVITABILITY unless she creates the next iPod. ALL BREAKTHROUGH COMPANIES, AFTER ALL, WILL EVENTUALLY PLATEAU AND THEN DECLINE. U.S. Steel was the first billion-dollar company in 1901, but it was worth about the same in 1991. Kodak, which once employed nearly 80,000 people, now has a market value below \$1 billion. Packard and Hudson ruled the roads for more than 40 years before disappearing. THESE COMPANIES MATURED AND RECEDED OVER THE COURSE OF GENERATIONS, IN SOME CASES EVEN A CENTURY. YAHOO WENT THROUGH THE PROCESS IN 20 YEARS. IN THE TECHNOLOGY INDUSTRY, THINGS MOVE FAST.

Yahoo is merging and might even shut down Lynch, 14

Jim Lynch, former community manager for ZiffNet, ZDNet, PCMag, ExtremeTech, The FamilyEducation Network, and MSN Games. "The decline and fall of the Yahoo empire," 12/23/14
<http://jimlynch.com/internet/the-decline-and-fall-of-the-yahoo-empire/> // IS

SO WHAT NOW FOR YAHOO? ACCORDING TO THE NY TIMES ARTICLE IT SEEMS THAT **Yahoo's days are numbered** AS AN INDEPENDENT COMPANY. A MERGER WITH AOL SEEMS TO BE IN THE WORKS, AND IT THAT HAPPENS THERE WILL NO DOUBT BE A LOT OF LAYOFFS AT YAHOO AS THE COMBINED COMPANY SEEKS TO CUT COSTS BY RESTRUCTURING. AT THIS POINT I DOUBT THERE'S MUCH THAT MARISSA MAYER OR ANYONE ELSE CAN DO TO STOP THIS FROM HAPPENING IF AOL DECIDES TO PURSUE THE MERGER.

IT MAKES ME WONDER IF, IN A FEW YEARS DOWN THE ROAD, WE'LL SEE A STORY ABOUT HOW AOL HAS DECIDED TO PULL THE PLUG ON YAHOO ALTOGETHER AND **shut it down**. What a very sad fate that would be for a former giant of the Internet like Yahoo.

solvency deficit

CP is not enough to solve snowball

Carley and Tsvetovat, 6

Kathleen Carley and Maksim Tsvetovat, *professor in the School of Computer Science in the department - Institute for Software Research - at Carnegie Mellon University, **Ph.D. from Carnegie Mellon University's School of Computer Science, with concentration on computational modeling of organizations, "On effectiveness of wiretap programs in mapping social networks," 8/30/06, Springer Science + Business Media, LLC, Proquest // is amp

OUR EXPERIMENTS SHOW THAT IT IS POSSIBLE TO OBTAIN HIGH-QUALITY DATA ON COVERT NETWORKS WITHOUT USING RANDOM TRAFFIC SAMPLING (E.G. ECHELON) OR snowball sampling, BOTH OF WHICH CAPTURE TOO MUCH UNNECESSARY DATA, AND DO NOT MAKE GOOD USE OF THE DATA THAT HAS BEEN ALREADY CAPTURED. AS AN ALTERNATIVE, USE OF OPTIMIZATION-BASED AND SOCIALLY INTELLIGENT SAMPLING TECHNIQUES ALLOWS FOR A TIGHTLY TARGETED AND RESOURCE-THRIFTY SIGINT gathering PROGRAM. Not only THESE TECHNIQUES ARE SIGNIFICANTLY LESS COSTLY, THEY ALSO PRODUCE BETTER OVERALL INTELLIGENCE DATA WITH A CLOSER MATCH TO THE COVERT NETWORK BEING STUDIED. The annealing-based information capture is not limited to sampling communications within covert networks, but rather is a flexible methodology for surveying networks of hidden populations. AS THE OPTIMIZATION-BASED SAMPLING TECHNIQUES DO NOT REQUIRE AS MUCH INFORMATION CAPTURE AS SNOWBALL SAMPLING, THEY WILL PRESENT LESS OF A RESOURCE STRAIN ON DATA COLLECTORS AND ARE a MORE COST-EFFICIENT way to sample communication for analysis of social networks.

A2: Splunk CP

Squo solves

The government already uses Splunk Splunk, 15

Splunk, "Defense and Intelligence Agencies," Spunk's Website, 2015,
http://www.splunk.com/en_us/solutions/industries/public-sector/defense-and-intelligence-agencies.html // IS

GOVERNMENT DEFENSE AND INTELLIGENCE AGENCIES ARE TASKED WITH COLLECTING, ANALYZING AND STORING MASSIVE AMOUNTS OF DATA TO DETECT AND CORRELATE PATTERNS OF ACTIVITY RELATED TO SECURITY THREATS. They also need systems that can handle extremely granular role-based access controls (RBAC) so that only those that 'need-to-know' have access to the right data at the right time. **Splunk® Enterprise, THE INDUSTRY STANDARD PRODUCT FOR BIG DATA ANALYSIS IS widely deployed ACROSS hundreds of government agencies TO HELP PASS THEIR FISMA ASSESSMENTS AND:** Detect patterns and anomalies across terabytes of raw data in real time without specialized skills, up front data normalizations or fixed schemas Can use Hunk®: Splunk Analytics for Hadoop and NoSQL data stores to provide a unified view or your data Automatically monitor for NIST 800-53 controls supporting the 800-37 risk management framework Support continuous monitoring and the acquisition of context data from any event from any layer of the IT structure

Congress keeps a close watch

Best, 1

(Richard Jr, Specialist in National Defense, Foreign Affairs, Defense, and Trade Division, CRS Report for Congress, "The National Security Agency: Issues for Congress", <http://fas.org/irp/crs/RL30740.pdf>, amp)

NSA'S EFFORTS TO ADJUST TO THE CHANGING geopolitical and technological ENVIRONMENT have been strongly encouraged by Congress and REFLECT A MAJOR SHIFT IN CONGRESSIONAL OVERSIGHT OF THE AGENCY. ALTHOUGH CONGRESS has ALWAYS APPROVED FUNDING for NSA, FOR DECADES ROUTINE OVERSIGHT WAS LIMITED to a few Members and staff. IN THE 1970S, CONGRESSIONAL INVESTIGATIONS OF INTELLIGENCE AGENCIES RESULTED IN GREATER PUBLIC ATTENTION to NSA AND CRITICISM OF ACTIVITIES THAT INFRINGED ON the CIVIL LIBERTIES of U.S. persons. SUBSEQUENTLY, BOTH THE SENATE AND the HOUSE of Representatives ESTABLISHED INTELLIGENCE OVERSIGHT committees THAT have CLOSELY MONITORED NSA'S OPERATIONS. The Foreign Intelligence Surveillance Act (FISA) WAS ENACTED in 1978 to regulate collection by foreign intelligence agencies of the communications of U.S. persons. The end of the Cold War, the expansion of lowcost encryption and the explosion of communications systems led CONGRESS to TAKE A MORE PUBLIC PROFILE in OVERSEEING THE large and SECRETIVE AGENCY.

A2: K

note

All the regular answers to policy overload are responsive

2ac NSA failure bad

The counter-advocacy causes the NSA to fail – that’s what makes the public want to fund it even more – every time a terrorist attack gets through it becomes a justification for defense spending – this results in endless expansion of the surveillance state as more information causes an overload that guarantees even more failure

Engelhardt 14 – co-founder of the American Empire Project, Teaching Fellow at the Graduate School of Journalism at the University of California, Berkeley (Tom, “Failure Is Success: How US Intelligence Works in the 21st Century,” Truthout, 9/30/2014, <http://www.truth-out.org/opinion/item/26529-failure-is-success-how-us-intelligence-works-in-the-21st-century>) //RGP

Whatever the case, WHILE TAXPAYER DOLLARS FLOWED INTO YOUR COFFERS, NO ONE CONSIDERED IT A PROBLEM THAT THE COUNTRY LACKED 17 OVERLAPPING OUTFITS BENT ON PREVENTING APPROXIMATELY 400,000 DEATHS BY FIREARMS IN THE SAME YEARS; NOR 17 INTERLOCKED AGENCIES DEDICATED TO SAFETY ON OUR ROADS, WHERE MORE THAN 450,000 AMERICANS HAVE DIED SINCE 9/11. (An American, it has been calculated, is 1,904 times more likely to die in a car accident than in a terrorist attack.) Almost all the money and effort have instead been focused on the microscopic number of terrorist plots -- some spurred on by FBI plants -- that have occurred on American soil in that period. On the conviction that Americans must be shielded from them above all else and on the fear that 9/11 bred in this country, YOU’VE BUILT AN INTELLIGENCE STRUCTURE UNLIKE ANY OTHER ON THE PLANET WHEN IT COMES TO SIZE, REACH, AND LABYRINTHINE COMPLEXITY. It’s quite an achievement, especially when you consider its one downside: it has a terrible record of getting anything right in a timely way. Never have so many had access to so much information about our world and yet been so unprepared for whatever happens in it. When it comes to getting ahead of the latest developments on the planet, the ones that might really mean something to the government it theoretically serves, the IC is -- as best we can tell from the record it largely prefers to hide -- almost always behind the 8-ball. It seems to have been caught off guard regularly enough to defy any imaginable odds. Think about it, and think hard. SINCE 9/11 (which might be considered the intelligence equivalent of original sin when it comes to missing the mark), what exactly are the triumphs of a system the likes of which the world has never seen before? ONE AND ONLY ONE EVENT IS SURE TO COME IMMEDIATELY TO MIND: THE TRACKING DOWN AND KILLING OF OSAMA BIN LADEN. (Hey, Hollywood promptly made a movie out of it!) Though he was by then essentially a toothless figurehead, an icon of jihadism and little else, the raid that killed him is the single obvious triumph of these years. Otherwise, globally from the Egyptian spring and the Syrian disaster to the crisis in Ukraine, American intelligence has, as far as we can tell, regularly been one step late and one assessment short, when not simply blindsided by events. As a result, the Obama administration often seems in a state of eternal surprise at developments across the globe. Leaving aside the issue of intelligence failures in the death of an American ambassador in Benghazi, for instance, is there any indication that the IC offered President Obama a warning on Libya before he decided to intervene and topple that country’s autocrat, Muammar Gaddafi, in 2011? What we know is that he was told, incorrectly it seems, that there would be a “bloodbath,” possibly amounting to a genocidal act, if Gaddafi’s troops reached the city of Benghazi. Might an agency briefer have suggested what any reading of the results of America’s twenty-first century military actions across the Greater Middle East would have taught an observant analyst with no access to inside information: that the fragmentation of Libyan society, the growth of Islamic militancy (as elsewhere in the region), and chaos would likely follow? We have to assume not, though today the catastrophe of Libya and the destabilization of a far wider region of Africa is obvious. Let’s focus for a moment, however, on a case where more is known. I’m thinking of the development that only recently riveted the Obama administration and sent it tumbling into America’s third Iraq war, causing literal hysteria in Washington. Since June, the most successful terror group in history has emerged full blown in Syria and Iraq, amid a surge in jihadi recruitment across the Greater Middle East and Africa. The Islamic State (IS), an offshoot of al-Qaeda in Iraq, which sprang to life during the U.S. occupation of that country, has set up a mini-state, a “caliphate,” in the heart of the Middle East. Part of the territory it captured was, of course, in the very country the U.S. garrisoned and occupied for eight years, in which it had assumedly developed countless sources of information and recruited agents of all sorts. And yet, by all accounts, when IS’s militants suddenly swept across northern Iraq, the CIA in particular found itself high and dry. The IC seems not to have predicted the group’s rapid growth or spread; nor, though there was at least some prior knowledge of the decline of the Iraqi army, did anyone imagine that such an American created, trained, and armed force would so summarily collapse. Unforeseen was the way its officers would desert their troops who would, in turn, shed their uniforms and flee Iraq’s major northern cities, abandoning all their American equipment to Islamic State militants. Nor could the intelligence community even settle on a basic figure for how many of those militants there were. In fact, in part because IS assiduously uses couriers for its messaging instead of cell phones and emails, until a chance arrest of a key militant in June, the CIA and the rest of the IC evidently knew next to nothing about the group or its leadership, had no serious assessment of its strength and goals, nor any expectation that it would sweep through and take most of

Sunni Iraq. And that should be passing strange. After all, it now turns out that much of the future leadership of IS had spent time together in the U.S. military's Camp Bucca prison just years earlier. All you have to do is follow the surprised comments of various top administration officials, including the president, as ISIS made its mark and declared its caliphate, to grasp just how ill-prepared 17 agencies and \$68 billion can leave you when your world turns upside down. Producing Subprime Intelligence as a Way of Life In some way, THE REMARKABLE NSA REVELATIONS OF EDWARD SNOWDEN MAY HAVE SKEWED OUR VIEW OF AMERICAN INTELLIGENCE. The question, after all, isn't simply: Who did they listen in on or surveil or gather communications from? It's also: WHAT DID THEY FIND OUT? WHAT DID THEY DRAW FROM THE MOUNTAINS OF INFORMATION, THE BILLIONS OF BITS OF INTELLIGENCE DATA THAT THEY WERE COLLECTING FROM INDIVIDUAL COUNTRIES MONTHLY (Iran, 14 billion; Pakistan, 13.5 billion; Jordan, 12.7 billion, etc.)? What was their "intelligence"? And the answer seems to be that, THANKS TO THE MIND-BOGLING NUMBER OF OUTFITS DOING AMERICA'S INTELLIGENCE WORK AND THE YOTTABYTES OF DATA THEY SWEEP UP, THE IC IS A MORASS OF information overload, data flooding, and collective blindness AS TO HOW OUR WORLD WORKS. You might say that THE AMERICAN INTELLIGENCE SERVICES ENCOURAGE THE IDEA THAT THE WORLD IS ONLY KNOWABLE IN AN ATMOSPHERE OF BIG DATA and a penumbra of secrecy. As it happens, an open and open-minded assessment of the planet and its dangers would undoubtedly tell any government so much more. In that sense, THE SYSTEM BOLSTERED AND ELABORATED SINCE 9/11 SEEMS as close to WORTHLESS in terms of bang for the buck as any you could imagine. Which means, in turn, that we outsiders should view with a jaundiced eye the latest fear-filled estimates and overblown "predictions" from the IC that, as now with the tiny (possibly fictional) terror group Khorasan, regularly fill our media with nightmarish images of American destruction. IF THE IC'S POST-9/11 EFFECTIVENESS WERE BEING ASSESSED ON A CORPORATE MODEL, IT'S HARD NOT TO BELIEVE THAT AT LEAST 15 OF THE AGENCIES and outfits in its "community" WOULD SIMPLY BE AXED and the other two downsized. (If the Republicans in Congress came across this kind of institutional tangle and record of failure in domestic civilian agencies, they would go after it with a meat cleaver.) I suspect that the government could learn far more about this planet by anteing up some modest sum to hire a group of savvy observers using only open-source information. For an absolute pittance, THEY WOULD UNDOUBTEDLY GET A DISTINCTLY MORE ACTIONABLE VISION OF HOW OUR WORLD FUNCTIONS AND ITS POSSIBLE DANGERS TO AMERICANS. But of course we'll never know. Instead, whatever clever analysts, spooks, and operatives exist in the maze of America's spy and surveillance networks will surely remain buried there, while THE OVERALL SYSTEM PRODUCES vast reams of subprime intelligence. Clearly, HAVING A LABYRINTH OF 17 OVERLAPPING, PARAMILITARIZED, DEEPLY SECRETIVE AGENCIES DOING VERSIONS OF THE SAME THING IS THE DEFINITION OF COUNTERPRODUCTIVE MADNESS. Not surprisingly, THE ONE THING THE U.S. INTELLIGENCE COMMUNITY HAS RESEMBLED IN THESE YEARS IS THE U.S. MILITARY, WHICH SINCE 9/11 HAS FAILED TO WIN A WAR or accomplish more or less anything it set out to do. On the other hand, all of the above assumes that the purpose of the IC is primarily to produce successful "intelligence" that leaves the White House a step ahead of the rest of the world. WHAT IF, however, IT'S ACTUALLY A SYSTEM ORGANIZED ON THE BASIS OF FAILURE? WHAT IF ANY WORK-PRODUCT DISASTER IS FOR THE IC ANOTHER KIND OF WIN. Perhaps it's worth thinking of those overlapping agencies as A FIENDISHLY CLEVER RUBE GOLDBERG-STYLE MACHINE ORGANIZED AROUND THE PRINCIPLE THAT FAILURE IS THE GREATEST SUCCESS OF ALL. After all, in the system as it presently exists, EVERY FAILURE OF INTELLIGENCE IS JUST ANOTHER INDICATION THAT MORE SECURITY, MORE SECRECY, MORE SURVEILLANCE, MORE SPIES, MORE DRONES ARE NEEDED; only when you fail, that is, DO YOU GET MORE MONEY FOR FURTHER EXPANSION. Keep in mind that THE TWENTY-FIRST-CENTURY VERSION OF INTELLIGENCE BEGAN AMID A CATASTROPHIC FAILURE: much crucial information about the 9/11 hijackers and hijackings was ignored or simply lost in the labyrinth. That FAILURE, of course, LED TO ONE OF THE GREAT INTELLIGENCE EXPANSIONS, or even explosions, in history. (And mind you, no figure in authority in the national security world was axed, demoted, or penalized in any way for 9/11 and a number of them were later given awards and promoted.) HOWEVER THEY MAY FAIL, WHEN IT COMES TO THEIR BUDGETS, THEIR POWER, THEIR REACH, THEIR SECRECY, THEIR CAREERS, AND THEIR STAYING POWER, THEY HAVE SUCCEEDED IMPRESSIVELY.

Serial Policy Failure

Banking on tech advances to solve overload causes serial policy failure Woods, et al, 2

(D.D. Woods, Emily Patterson, Emilie Roth, Professors, Cognitive Systems Engineering Laboratory, Institute for Ergonomics, Cognition, Technology and Work, April 2002, Volume 4, Issue 1, pp 22-36, "Can We Ever Escape From Data Overload? A Cognitive Systems Diagnosis", <http://link.springer.com/article/10.1007/s101110200002>, amp)

EACH ROUND OF TECHNICAL ADVANCEs, whether IN artificial INTELLIGENCE, COMPUTER graphics or electronic CONNECTIVITY, PROMISES TO HELP PEOPLE better understand and MANAGE a whole host of ACTIVITIES, FROM financial ANALYSIS TO MONITORING data from space missions to controlling the national air space. Certainly, THIS ubiquitous COMPUTERISATION OF THE MODERN WORLD HAS TREMENDOUSLY ADVANCED OUR ABILITY TO COLLECT, transmit and transform DATA, PRODUCING UNPRECEDENTED LEVELS OF ACCESS to data.

HOWEVER, OUR ABILITY TO INTERPRET THIS AVALANCHE OF DATA, I.E., TO EXTRACT MEANING FROM ARTIFICIAL FIELDS OF DATA, HAS EXPANDED MUCH MORE SLOWLY, if at all. In studies across multiple settings, we find that PRACTITIONERS ARE BOMBARDED WITH COMPUTER-PROCESSED DATA, especially when anomalies occur. WE FIND USERS LOST IN MASSIVE NETWORKS OF COMPUTERBASED displays, options and MODES. For example, ONE CAN FIND A VERSION OF THE FOLLOWING STATEMENT IN MOST accident INVESTIGATION REPORTS: ALTHOUGH ALL OF THE NECESSARY DATA WAS PHYSICALLY AVAILABLE, IT WAS NOT OPERATIONALLY EFFECTIVE. NO ONE COULD ASSEMBLE THE SEPARATE BITS OF DATA TO SEE WHAT WAS GOING ON. (Joyce and Lapinski 1983) The challenge has become finding what is informative given our interests and needs in a very large field of available data.

The paper is organised as follows. To set the stage, we characterise how TECHNOLOGY CHANGE HAS CREATED A PARADOXICAL SITUATION and, we introduce people as a model of competence THROUGH A HISTORICAL EXAMPLE. From this base we summarise the three different major characterisations of the data overload problem. We then provide a 'diagnosis' of what makes data overload a difficult problem based on a synthesis of results from past studies that examine how new computerised devices can help overcome or can exacerbate data overload-related problems in control centres such as mission control for space shuttle operations, highly automated aviation flight decks, computerised emergency operations control centres in nuclear power plants and surgical anaesthetic management systems in operating rooms. Given this background, we can see how the typical solutions to the data overload problem avoid confronting the heart of the matter directly, remaining content to nibble away at the edges through indirect means. Finally, we outline a direction for progress towards more effective solutions to data overload relying on people as a competence model.

1.1. The Data Availability Paradox

OUR SITUATION SEEMS PARADOXICAL: MORE AND MORE DATA IS AVAILABLE in principle, BUT OUR ABILITY TO INTERPRET WHAT IS AVAILABLE HAS NOT INCREASED. On one hand, all participants in a field of activity recognise that having greater access to data is a benefit in principle. On the other hand, these same participants recognise how THE FLOOD OF AVAILABLE DATA CHALLENGES THEIR ABILITY TO FIND WHAT IS informative or MEANINGFUL for their goals and tasks (Miller 1960). We will refer to this as the data availability paradox. Data availability is paradoxical because of the simultaneous juxtaposition of our success and our vulnerability. TECHNOLOGICAL CHANGE GROWS OUR ABILITY TO MAKE DATA READILY and more directly ACCESSIBLE – the success, and, at the same time and for the same reasons, THE CHANGE increasingly and dramatically CHALLENGES OUR ABILITY TO MAKE SENSE OF THE DATA AVAILABLE – the vulnerability.

1.2. 'A Little More Technology Will Be Enough'

Criando dificuldades para vender facilidades [creating difficulties to sell solutions]. (Common Brazilian saying)

AS the POWERS OF TECHNOLOGY EXPLODE around us, DEVELOPERS IMAGINE potential BENEFITS AND CHARGE AHEAD IN PURSUIT OF THE NEXT technological ADVANCE. THE CLAIM IS THAT DATA OVERLOAD and other problems WILL BE SOLVED BY significant ADVANCES IN MACHINE 'INFORMATION' PROCESSING, i.e., the technology for creating sophisticated graphics, for connecting distant people together and for creating intelligent software agents.

However, AFTER EACH ROUND OF DEVELOPMENT, field RESEARCHERS CONTINUE TO OBSERVE BELEAGUERED PRACTITIONERS actively TRYING TO COPE WITH DATA OVERLOAD in one form or another. This is a fundamental finding, repeatedly noted in many fields of practice and with many kinds of technology (e.g., Woods 1995a; Woods and Patterson 2000). When viewed in context, SYSTEMS, developed putatively TO AID USERS, often turn out to CREATE new WORKLOAD BURDENS WHEN PRACTITIONERS ARE BUSIEST, new ATTENTIONAL DEMANDS WHEN PRACTITIONERS ARE PLAGUED BY multiple channels/VOICES COMPETING FOR THEIR ATTENTION, AND NEW SOURCES OF DATA WHEN PRACTITIONERS ARE OVERWHELMED BY TOO MANY CHANNELS SPEWING OUT TOO MUCH 'RAW' DATA (Woods et al 1994, Ch. 5).

In practice, NEW ROUNDS OF TECH technology development BECOME YET ANOTHER VOICE IN THE DATA CACOPHONY AROUND US. Ironically, THE major IMPACT HAS BEEN TO EXPAND THE PROBLEM BEYOND SPECIALISED TECHNICAL FIELDS of activity (an aircraft cockpit or power plant control room) TO BROADER areas of ACTIVITY (web-based activities we engage in everyday).

Academic studies prove excessive information hurts decisionmaking

Metzger, 5

(Michael, Chair in Business Ethics, Kelley School of Business, Indiana University, December 2005, University of Florida Journal of Law & Public Policy, 16 U. Fla. J.L. & Pub. Pol'y 435, "ARTICLE: BRIDGING THE GAPS: COGNITIVE CONSTRAINTS ON CORPORATE CONTROL & ETHICS EDUCATION", lexis, amp)

FROM A THINKING quality PERSPECTIVE, error can be introduced in every phase of the human thought process. Much of the critical action in decisionmaking of all sorts occurs in the problem identification and classification stages. n89 Do we even admit that we have a problem, n90 and if [*456] we do, how do we classify it and the people involved? n91 Individual desires n92 and bias n93 can play a pivotal role in both problem identification and problem framing. n94 Even things such as the language we use to describe the problem can have a powerful impact on our final decision. n95 [*457] IF OUR ATTENTION IS SELECTIVE, n96 then WE MAY NOT REGISTER ALL OF THE RELEVANT DATA AVAILABLE IN OUR EXTERNAL ENVIRONMENT. n97 If our memories are also selective and frequently inaccurate, n98 this can be expected to have a consequent negative effect on our ability to bring our past experience to bear in solving current problems. n99 Further, our desire to maintain our self- esteem n100 may lead us to accept dubious arguments and data, n101 to reject compelling arguments and data, n102 and to persist in behaviors and strategies long after an objective observer would have concluded that they were ineffective. n103

Even in circumstances where our memories are accurate, our initial perceptions are complete, and our egos are in check, other threats to gooddecisionmaking exist. In the heuristic phase of our reasoning process, [*458] preconscious mental programs called heuristics n104 retrieve relevant information from memory and identify which bits of externally available information are relevant, and therefore subject to further processing. n105 Heuristics are necessary parts of human cognition for at least two reasons. First, they are essential elements in maintaining some semblance of cognitive economy. WE EACH HAVE LIMITED PROCESSING POWER, and thinking shortcuts n106 that require no conscious thought can be a very efficient way to process information. n107 Second, WITHOUT SOME DEVICE TO SCREEN INFORMATION, WE WOULD QUICKLY SUFFER COGNITIVE OVERLOAD FROM THE MILLIONS OF BITS OF INFORMATION EMBEDDED in our consciousness and IN OUR ENVIRONMENT. n108

[*459]

But while heuristics are essential and may work well most of the time, they can sometimes result in bias n109 in our reasoning. n110 So, the INFORMATION THAT SEEMS "RELEVANT" TO US PSYCHOLOGICALLY MAY NOT NECESSARILY BE WHAT IS RELEVANT LOGICALLY. n111 IF THIS HAPPENS, NO AMOUNT OF GOOD REASONING IN THE CONSCIOUS, ANALYTICAL PHASE OF OUR DECISIONMAKING IS LIKELY TO LEAD TO A CORRECT SOLUTION. Why? GOOD REASONING BASED ON BAD INFORMATION IS UNLIKELY TO LEAD TO GOOD CONCLUSIONS. n112 INFORMATION CAN BE "BAD" IF IT IS [*460] inaccurate or incomplete, but it can also be "bad" if it is COMPLETE AND COMPLETELY ACCURATE, BUT NOT REALLY GERMANE TO THE THINKING TASK AT HAND.

EVEN IF OUR INFORMATION IS ACCURATE and complete, AND OUR SELECTION OF IT IS FREE OF BIAS, WE MAY NONETHELESS MAKE THINKING MISTAKES DURING THE CONSCIOUS, ANALYTICAL PHASE OF THE THOUGHT PROCESS IF OUR GRASP OF LOGIC, basic probability principles, OR STATISTICS IS POOR, OR IF CERTAIN ASPECTS OF THE PROBLEM PREVENT US FROM BRINGING OUR FULL REASONING POWERS TO BEAR ON IT. n113 Because it is conscious, and because everyone can learn to improve her logical reasoning ability and improve her understanding of basic statistical principles, n114 the analytical phase of the reasoning process should be the phase that is most amenable to improvement.

The heuristic phase is, by definition, more problematic because it is unconscious. n115 As a leading authority on bias puts it, "the representational [*461] heuristics responsible for many biases constitute preconscious processes. Subjects are aware of that to which they are attending but not of the selective process directing their attention." n116

InfoGlut

We are in an era of information overload – a period characterized by an intractable paradox – while we have access to seemingly infinite amounts of information, we are simultaneously unable to process it – the attempt to become omniscient is counterproductive in that it makes it harder to understand and trust information sources

Andrejevic 13 – Honorary Research Associate Professor, Centre for Critical and Cultural Studies; media scholar who writes about surveillance, new media, and popular culture (Mark, “InfoGlut,” Data Overload) //RGP

AFTER A TWO-YEAR INVESTIGATION INTO THE POST-9/11 INTELLIGENCE INDUSTRY, THE WASHINGTON POST REVEALED THAT A SPRAWLING ARRAY OF PUBLIC AND PRIVATE AGENCIES WAS COLLECTING MORE INFORMATION THAN ANYONE COULD POSSIBLY COMPREHEND. As the newspaper’s report put it, “EVERY DAY, COLLECTION SYSTEMS AT THE NATIONAL SECURITY AGENCY INTERCEPT AND STORE 1.7 BILLION E-MAILS, PHONE CALLS AND OTHER TYPES OF COMMUNICATIONS. The NSA sorts a fraction of those into 70 separate databases.”¹ THE NSA IS MERELY ONE AMONGST HUNDREDS OF AGENCIES AND CONTRACTORS VACUUMING UP DATA to be sifted, sorted, and stored. THE RESULTING FLOOD OF INFORMATION IS, IN PART, A FUNCTION OF THE TECHNOLOGICAL DEVELOPMENTS that have made it possible to automatically collect, store, and share fantastic amounts of data. HOWEVER, MAKING SENSE OF THIS INFORMATION TROVE AT THE ALL-TOO-HUMAN RECEIVING END CAN POSE A PROBLEM: “Analysts who make sense of documents and conversations obtained by foreign and domestic spying share their judgment by publishing 50,000 intelligence reports each year – a volume so large that many are routinely ignored.”² THE SO-CALLED “SUPER USERS” WHO ARE SUPPOSED TO HAVE ACCESS TO THE WHOLE RANGE OF INFORMATION GENERATED BY THE INTELLIGENCE APPARATUS REPORTEDLY TOLD THE POST THAT “THERE IS SIMPLY NO WAY THEY CAN KEEP UP WITH THE NATION’S MOST SENSITIVE WORK.”³ As one of them put it, “I’m not going to live long enough to be briefed on everything.”⁴ THE LAMENT IS A FAMILIAR ONE IN AN ERA OF information overload – and not just for intelligence agencies, marketers, and other collectors of databases. The same challenge is faced by any citizen attempting to read all of the news stories (or Tweets, or status updates, or blogs posts) that are published on a given day, or a financial analyst researching all of the available information pertaining to the performance of a particular company. When I was a journalist in the early 1990s, just as computers entered the newsroom, we had available to us several electronic newswires that updated themselves automatically with stories on topics ranging from international news to US politics to sports and entertainment. I remember thinking at the time that it was impossible to keep up with the news as it unfolded on my screen. By the time I had read one wire story, dozens of new ones had been filed from around the world. That was just a tiny taste of the coming information cornucopia. Now an unimaginably unmanageable flow of mediated information is available to anyone with Internet access. THE PARADOX OF AN ERA OF INFORMATION GLUT EMERGES AGAINST THE BACKGROUND OF THIS NEW INFORMATION LANDSCAPE: AT THE VERY MOMENT WHEN WE HAVE THE TECHNOLOGY AVAILABLE TO INFORM OURSELVES AS NEVER BEFORE, WE ARE SIMULTANEOUSLY AND COMPELLINGLY CONFRONTED WITH THE IMPOSSIBILITY OF EVER BEING FULLY INFORMED. Even more disturbingly, WE ARE CONFRONTED WITH THIS IMPOSSIBILITY AT THE VERY MOMENT WHEN WE ARE TOLD THAT BEING INFORMED IS MORE IMPORTANT THAN EVER before to our livelihood, our security, and our social lives. This is not to suggest that it might, once upon a time, have been possible to be “fully informed” – in the sense of knowing all the details of the daily events, their various causes, explanations, and interpretations relating to our social, cultural, political, and economic lives. As Jorge Luis Borges’s (insomnia-inspired) allegory of the mnemonic phenomenon Funes suggests, EVERY DAY WE ARE BOMBARDED WITH MORE INFORMATION THAN WE CAN POSSIBLY ABSORB OR RECALL. THE ABILITY TO CAPTURE AND RECOUNT ALL OF THIS INFORMATION IN DETAIL IS PRECISELY WHAT MADE FUNES A FREAK – OR A GOD: “We, at one glance, can perceive three glasses on a table; Funes, all the leaves and tendrils and fruit that make up a grape vine. He knew by heart the forms of the southern clouds at dawn on the 30th of April, 1882, and could compare them in his memory with the mottled streaks on a book in Spanish binding he had only seen once and with the outlines of the form raised by an oar in

the Rio Negro the night before the Quebracho uprising.”⁵ There are, of course, some drawbacks to total information awareness, Funes-style: it took him a full day to remember a day (and presumably even longer to recall the day spent remembering it). Moreover, Funes was only recording his direct experiences – as yet un-augmented by the Internet and its bottomless reserves of mediated information. IF IT HAS ALWAYS BEEN IMPOSSIBLE TO FULLY ABSORB THE INFORMATION BY WHICH WE ARE SURROUNDED – STILL MORE SO TO BE “FULLY INFORMED” – HE PALPABLE INFORMATION OVERLOAD ASSOCIATED WITH THE DIGITAL, MULTI-CHANNEL ERA HAS MADE US AWARE AS NEVER BEFORE OF THIS IMPOSSIBILITY. In his book *Data Smog*, David Shenk observed that “IT IS ESTIMATED THAT ONE WEEKDAY EDITION OF TODAY’S NEW YORK TIMES CONTAINS MORE INFORMATION THAN THE AVERAGE PERSON IN SEVENTEENTH-CENTURY ENGLAND WAS LIKELY TO COME ACROSS IN A LIFETIME.”⁶ He does not say who did the estimating – and it is a formulation whose credibility, such as it is, depends on a particular definition of information: “in mass mediated form.” Surely during the 17th century people were absorbing all kinds of information directly from the world around them, as we do today through the course of our daily lives. There is little indication that our sensory apparatus has become more finely tuned or capacious. However, the amount of mediated information – that which we self-consciously reflect upon as information presented to us in constructed and contrived formats (TV shows, movies, newspapers, Tweets, status updates, blogs, text messages, and so on) via various devices including televisions, radios, computers, and so on – has surely increased dramatically, thanks in no small part to the proliferation of portable, networked, interactive devices. EVEN BEFORE THE ADVENT OF THESE DEVICES, ALL WE HAD TO DO WAS GO TO THE LIBRARY TO FEEL OVERWHELMED BY MORE THAN WE COULD POSSIBLY ABSORB. NOW THIS EXCESS CONFRONTS US AT EVERY TURN: IN THE DEVICES WE USE TO WORK, TO COMMUNICATE WITH ONE ANOTHER, TO ENTERTAIN OURSELVES. Gult is no longer a “pull” phenomenon but a “push” one. We don’t go to it, it comes to us. It is the mediated atmosphere in which we are immersed. When all we had to do to keep up with the news, for example, was to read a daily newspaper and watch the network evening news, it was easier to imagine the possibility that someone like Walter Cronkite could tell us “the way it is” during the half-hour interlude of an evening newscast. BY THE FIRST DECADE OF THE 21ST CENTURY, THE ERA OF THE MOST-TRUSTED MAN IN AMERICA WAS LONG GONE, AS EVIDENCED, FOR EXAMPLE, BY A POLL REVEALING THAT DESPITE (OR PERHAPS BECAUSE OF) THE PROLIFERATION OF HOURS DEVOTED TO TELEVISION NEWS, NOT ONE MAJOR NEWS OUTLET WAS TRUSTED BY THE MAJORITY OF THE AMERICAN PEOPLE. Poll upon poll have revealed declining levels of public trust in news outlets and a heightened sense of perceived bias on the part of journalists. The researcher responsible for a 2008 poll noted that “an astonishing percentage of Americans see biases and partisanship in their mainstream news sources” presumably because, “The availability of alternative viewpoints and news sources through the Internet ... contributes to the increased skepticism about the objectivity of profit-driven news outlets owned by large conglomerates.”⁷ IT IS NOT JUST THAT THERE IS MORE INFORMATION AVAILABLE, BUT THAT THIS VERY SURFEIT HAS HIGHLIGHTED THE INCOMPLETENESS OF ANY INDIVIDUAL ACCOUNT. AN ERA OF INFORMATION OVERLOAD COINCIDES, IN OTHER WORDS, WITH THE REFLEXIVE RECOGNITION OF THE CONSTRUCTED AND PARTIAL NATURE OF REPRESENTATION.

Surveillance is no exception – the normalization of intrusive surveillance programs is justified under the pre-emptive logic of deterrence – we are convinced that once we know everything, we can prevent all crime

Andrejevic 13 – Honorary Research Associate Professor, Centre for Critical and Cultural Studies; media scholar who writes about surveillance, new media, and popular culture (Mark, “InfoGlut,” “Foreknowledge is Supremacy”) //RGP

THESE FORMULATIONS BRING US A BIT CLOSER TO THE NOTION OF DETERRENCE: A KIND OF PRE-EMPTION OF THE CORE EXPERIENCE OF DESIRE ITSELF – WHAT GETS AVERTED IS THE MOMENT OF LACK WITH WHICH THIS EXPERIENCE COINCIDES. TAKEN TO ITS LIMIT, THE GOAL IS TO RELEGATE DESIRE TO THE PRE-EMPTED STATUS OF CRIME in “The Minority Report”: “pure metaphysics.” IF YOU’RE JAILED BEFORE YOU

COMMITTED THE CRIME, ARE YOU REALLY GUILTY? If the database knows what you want before you do, did you really want it? THE LACK IS FILLED BEFORE IT IS SUBJECTIVELY PERCEIVED. WOULD THE CRIME REALLY HAVE HAPPENED? Was the desire really there? Is that purchase/ search term really what the subject wanted prior to the precipitation of the moment of consumption or search? The mutants and the statisticians say yes, and who is to prove them wrong? IN HIS DESCRIPTION OF WHAT HE DESCRIBES AS THE SIMULATION OF SURVEILLANCE, BOGARD ARGUES THAT PREDICTIVE ANALYTICS IS NOT SIMPLY ABOUT PREDICTING OUTCOMES, BUT ABOUT DEVISING WAYS OF ALTERING THEM. In policing terms, THE GOAL OF PREDICTING THE LIKELIHOOD OF CRIMINAL BEHAVIOR IS TO DETER IT. In marketing or campaigning terms it is to anticipate desire before it happens – to precipitate an accelerating range of latent desires that were allegedly “already there.” Transposed into business jargon, as one digital marketing executive put it, “In the early days of digital marketing, analytics emerged to tell us what happened and, as analytics got better, why it happened. Then solutions emerged to make it easier to act on data and optimize results.”³³ The more data that can be processed faster, the better for turning “big data into a big opportunity.”³⁴ THE PROMISE OF PREDICTIVE ANALYTICS IS TO INCORPORATE THE FUTURE AS A SET OF ANTICIPATED DATA POINTS INTO THE DECISION-MAKING PROCESS: “Historically all Web analytics have reflected data from the past which has been to a certain extent like driving a car using only the rear view mirror ... for the first time we can be marketers using data in a manner that allows us to drive while facing the road ahead.”³⁵ It is a vision of a future in which the structure outlined by predictions is subject to modification along certain pivot points. If, for example, a credit card company can predict a scenario that might lead to losses, it can intervene in advance to attempt to minimize these, as in one example described by the New York Times: “credit-card companies keep an eye on whether you are making purchases of that kind [indicating marital problems], because divorce is expensive and they are paranoid that you might stop paying your credit-card bill. For example, if you use your card to pay for a marriage counselor, they might decrease your credit line.”³⁶ Similarly, in the book *Super Crunchers*, Ian Ayres describes how the credit card company CapOne uses data mining to predict the smallest possible reduction in interest rates that can be used to retain customers. When someone calls in with a complaint about a card’s high interest rates, a computer uses detailed information about the consumer combined with information about how similar customers have behaved in the past to rapidly generate a range of rates likely to pre-empt the consumer’s cancellation request: “Because of Super Crunching, CapOne knows that a lot of people will be satisfied with this reduction (even when they say they’ve been offered a lower rate from another card).”³⁷ THE FACT THAT MARKETING ANALOGIES ARE SO FREQUENTLY USED TO INTRODUCE THE TOPIC OF PREDICTIVE ANALYTICS REFLECTS BOTH THE PIONEERING ROLE PLAYED BY THE COMMERCIAL SECTOR AND WHAT MIGHT BE DESCRIBED AS ITS ORDINARINESS: the way in which the use of data mining has incorporated itself into our understanding of how the world works in the digital era. Customized recommendations on Amazon.com and targeted advertising on the Internet, not to mention targeted mailings and customized coupons in the supermarket, have become the commonplaces of everyday life in contemporary, information-rich societies. WHAT ONCE MIGHT HAVE SEEMED SLIGHTLY CREEPY – GOOGLE SCANNING OUR EMAIL, FOR EXAMPLE, TO FIGURE OUT HOW BEST TO MARKET TO US – HAS BECOME A NORMAL AND LARGELY OVERLOOKED PART OF DAILY LIFE FOR MILLIONS OF EMAIL USERS. THIS LEVEL OF NORMALCY HELPS TO PAVE THE WAY FOR FORMS OF POPULATION-LEVEL POLICE SURVEILLANCE THAT MIGHT PREVIOUSLY HAVE SEEMED INTRUSIVE OR OTHERWISE INAPPROPRIATE. As a report for the National Institute of Justice put it, “Walmart, for example, learned through analysis that when a major weather event is in the forecast, demand for three items rises: duct tape, bottled water and strawberry Pop-Tarts ... Police can use a similar data analysis to help make their work more efficient ... some in the field believe it has the potential to transform law enforcement by enabling police to anticipate and prevent crime instead of simply responding to it.”³⁸ IF WE ARE SUBMITTING TO DETAILED MONITORING TO HELP ENHANCE POP-TART SALES, SURELY WE CAN DO IT FOR PUBLIC SAFETY AND NATIONAL SECURITY. VIEWED FROM A SLIGHTLY DIFFERENT PERSPECTIVE, IT IS HARD TO AVOID THE NOTION THAT WE ARE LIVING IN AN ERA OF RAMPANT SURVEILLANCE CREEP. Whereas once upon a time it might have seemed strange to allow police to scan and store license plate numbers of everyone who drives by a particular location, this now takes place as a matter of course. Predictive policing, in this regard, is just piggybacking on the “new normal” of digital, interactive monitoring. REINFORCING THIS NORMALITY ARE THE CLAIMS MADE ON BEHALF OF PREDICTIVE POLICING. In Boston, officials reported that serious crime in the Cambridge area in 2011 dropped to its lowest level in 50 years after police adopted a data-driven predictive policing program (tellingly, the claim does not distinguish between correlation and causation). The murder rate actually increased – but police said this was a result of domestic disputes that they could not (yet?) predict.³⁹ In Santa Cruz, police reported a significant drop in burglaries after adopting a predictive policing program developed by mathematicians, an anthropologist, and a criminologist based on models for predicting earthquake aftershocks.⁴⁰ In Memphis, officials reported a 15 percent drop in serious crime over four years after adopting a database-driven predictive policing program.⁴¹ Police are experimenting with a growing range of variables to predict crime, ranging from weather patterns to building code violations. In Arlington, Texas, police reported that every unit increase in physical decay of the neighborhood (measured by code violations) resulted in six more residential burglaries in the city.⁴² For the moment, however, the most common indicator seems to be past patterns of behavior. In Santa Cruz,

for example, two women were taken into custody for peering into cars in a parking garage that the computer indicated would be at risk for burglaries that day: "One woman was found to have outstanding warrants; the other was carrying illegal drugs."⁴³ IF, FOR THE MOMENT, THE METHODOLOGIES SEEM RELATIVELY CRUDE (but potentially effective – at least on occasion), it is worth keeping in mind that current systems rely on only a tiny current of the swelling information flood. However, RECENT REGULATORY SHIFTS PROPOSE TO MAKE MUCH MORE DATA AVAILABLE. As of this writing, LEGISLATORS IN THE UK HAVE PROPOSED GIVING INTELLIGENCE AGENCIES ACCESS TO THE PHONE RECORDS, BROWSING DETAILS, EMAILS, AND TEXT MESSAGES OF ALL BRITONS WITHOUT A WARRANT.⁴⁴ IN THE US, UPDATED "GUIDELINES" FOR THE NATIONAL COUNTER TERRORISM CENTER ALLOW THE ORGANIZATION TO COLLECT DATA ABOUT ANY AMERICAN WITHOUT A WARRANT AND KEEP IT FOR UP TO FIVE YEARS. It also permits the center to data mine this information for the purposes of investigating terrorism.⁴⁵ **Total Information Awareness as a named program may have disappeared, but as an unnamed initiative it continues to develop apace.**

With increasing floods of information comes a widening power gap – those with access to bulk data gain advantage over those without it

Andrejevic 13 – Honorary Research Associate Professor, Centre for Critical and Cultural Studies; media scholar who writes about surveillance, new media, and popular culture (Mark, "InfoGlut," Simulation as Deterrence) //RGP

The question recalls the post-9/11 data-driven plans of Admiral John Poindexter for a Total Information Awareness program that would sift through a giant database of databases in search of threat indicators. Indeed, THE WALL STREET JOURNAL OPENS ITS OP-ED PIECE ABOUT THE COLORADO SHOOTING WITH THE QUESTION, "WOULD TOTAL INFORMATION AWARENESS HAVE STOPPED JAMES EAGAN HOLMES [the suspect in the Colorado shooting]?"² Put that way, THE QUESTION SOUNDS ALMOST RHETORICAL: "TOTAL INFORMATION AWARENESS" IMPLIES A HIGH DEGREE OF PREDICTIVE POWER: if you could keep an electronic eye on everyone's actions all the time, surely you could unearth the symptoms of eventual wrongdoing. Set aside for a moment that THE VERSION OF SECURITY ON OFFER REQUIRES WILLING SUBMISSION TO "TOTAL" SURVEILLANCE AND SIMPLY CONSIDER THE FANTASY OF PRE-EMPTION OPENED UP BY THE TECHNOLOGY: "A FUTURE LANDSCAPE OF SURVEILLANCE WITHOUT LIMITS – EVERYTHING VISIBLE IN ADVANCE, EVERYTHING TRANSPARENT, STERILIZED, AND RISK-FREE, NOTHING SECRET, ABSOLUTE FOREKNOWLEDGE OF EVENTS."³ IF THIS SOUNDS FUTURISTIC AND VAGUELY ABSURD, CONSIDER THE CLAIMS THAT ARE CURRENTLY BEING MADE ON BEHALF OF SO-CALLED PREDICTIVE POLICING, which uses past crime patterns and related data to guide the deployment of police patrols: "It is now possible to predict the future when it comes to crime, such as identifying crime trends, anticipating hotspots in the community, refining resource deployment decisions, and ensuring the greatest protection for citizens in the most efficient manner."⁴ IT IS PERHAPS A TELLING SIGN OF THE POWER OF THE PROMISE OF NEW INFORMATION AND COMMUNICATION TECHNOLOGIES, BASED ON THEIR ABILITY TO COLLECT, STORE, AND PROCESS HUGE AMOUNTS OF DATA, THAT ONE OF OUR FIRST REACTIONS TO THE UNEXPECTED HAS BECOME: "COULD THE DATABASE HAVE PREDICTED IT?" – and the automatic corollary: "could the database have prevented it?" LURKING IN THESE TWO QUESTIONS IS AN ASSUMPTION ABOUT THE CHARACTER OF KNOWLEDGE IN THE DIGITAL ERA: THE NOTION THAT THE ONLY LIMIT ON OUR PREDICTIVE POWER IS THE ABILITY TO EFFECTIVELY ORGANIZE ALL THE AVAILABLE INFORMATION. If this were indeed the case, then the development of technological information storage and processing technology might compensate for the shortcomings of the human brain by ushering in new forms of aggregate "knowledge" and predictive power. SUCH FORMS OF "KNOWING" WOULD, IN A SENSE, EXCEED THE LIMITS OF HUMAN COMPREHENSION. It would no longer be a question of comprehending the data or using it to understand, in referential fashion, the world to which it refers, but rather of

putting the data to use. The promise of automated data processing is to unearth the patterns that are far too complex for any human analyst to detect and to run the simulations that generate emergent patterns that would otherwise defy our predictive power. THE FORM OF “KNOWLEDGE” ON OFFER IS LIMITED TO THOSE WITH ACCESS TO THE DATABASE AND THE PROCESSING POWER, AND IT REPLICATES THE LOGIC OF “KNOWING WITHOUT KNOWING” INsofar AS IT CAN SERVE AS THE BASIS FOR DECISIONS WHILE EXCEEDING THE PROCESSING POWER OF ANY INDIVIDUAL HUMAN BRAIN. IN KEEPING WITH THE LOGIC OF DIGITAL CONVERGENCE, THIS FORM OF KNOWLEDGE IS PORTRAYED BY ITS PROPONENTS AS UNIVERSAL INsofar AS IT IS GENERALIZABLE ACROSS THE POLITICAL, ECONOMIC, AND SOCIAL DOMAINS. It can be used to predict consumer behavior as well as the spread of disease, or the likelihood that someone will need to be hospitalized within the coming year. Keeping this convergent background in mind, this chapter will focus on the somewhat narrower example of policing and security in order to explore the knowledge practices associated with data mining and predictive analytics in the era of “big data.” In particular, the focus will be upon the version of distributed, predictive “knowledge” that emerges from the database. As McCue puts it in her discussion of the use of predictive analytics for security purposes, “With data mining we can perform exhaustive searches of very large databases using automated methods, searching well beyond the capacity of human analysts or even a team of analysts.”⁵ In the wake of the development of database technology, there is an emerging tendency to devalue individual comprehension in comparison with the alleged predictive power derived from “super-crunching” tremendous amounts of data. This DEVELOPMENT HAS SIGNIFICANT IMPLICATIONS FOR THE PROMISE THAT BECAUSE NEW INFORMATION AND COMMUNICATION TECHNOLOGIES ARE LESS OR NON-HIERARCHICAL, THEY ARE THEREFORE FORCES FOR DEMOCRATIZATION AND USER EMPOWERMENT. IF THE (ALLEGEDLY) MORE POWERFUL AND PRODUCTIVE FORMS OF KNOWLEDGE ASSOCIATED WITH “BIG DATA” ARE LIMITED TO THOSE WITH ACCESS TO THE DATABASE AND PROCESSING POWER, DIGITAL-ERA KNOWLEDGE PRACTICES COULD PROVE TO BE EVEN MORE EXCLUSIVE AND ASYMMETRICAL THAN THOSE THEY PROMISE TO DISPLACE. WIDESPREAD ACCESS TO DIGITAL MEDIA WOULD GO HAND-IN-HAND WITH WHAT MIGHT BE DESCRIBED AS THE EMERGENCE OF A “BIG DATA” DIVIDE – ONE THAT COULD NOT BE AMELIORATED BY ANY RELATIVELY SIMPLE TECHNOLOGICAL FIX (such as more widespread broadband access) or by enhanced forms of education and training. In this respect, THE KNOWLEDGE PRACTICES ASSOCIATED WITH BIG DATA REPRESENT A PROFOUNDLY UN-DEMOCRATIC SHIFT INsofar AS THEY ARE RELIANT UPON ACCESS TO HUGE AND COSTLY DATABASES AS WELL AS TO THE PROCESSING POWER AND TECHNOLOGICAL KNOW-HOW TO MAKE USE OF THE DATA.

Something about Baudrillard

Andrejevic 13 – Honorary Research Associate Professor, Centre for Critical and Cultural Studies; media scholar who writes about surveillance, new media, and popular culture (Mark, “InfoGlut,” Simulation as Deterrence) //RGP

The French cultural theorist Jean BAUDRILLARD famously DEFINED SIMULATION AS A FORM OF DETERRENCE, taking as his model the Cold War logic of “mutually assured destruction” (MAD). THE DETERRENT EFFECT OF SIMULATION HAS BEEN A RECURRING THEME IN POPULAR SCIENCE FICTION that received perhaps its most iconic pop-culture treatment in the movie War Games, which portrays a computer game that goes awry, accessing the United States missile defense system and transforming a game of simulated nuclear war into the real thing. DISASTER IS AVERTED WHEN THE PROGRAM CONSIDERS ALL POSSIBLE OUTCOMES OF THE “GAME” OF GLOBAL THERMONUCLEAR WAR AND DISCOVERS THAT, AS IN TIC-TAC-TOE, IF BOTH SIDES PLAY RATIONALLY, ATTEMPTING TO WIN, THERE CAN BE NO WINNER. The computer, which is programmed to learn, describes its assessment of “global thermonuclear war” in the movie’s finale: “A strange game! THE ONLY WINNING MOVE IS NOT TO PLAY.” OR, MORE ACCURATELY, THE ONLY RIGHT WAY TO PLAY IS BY NOT PLAYING: THE GAME IS ALREADY BEING PLAYED, AS IT WERE, PRIOR TO ANY MISSILE ATTACK. The logic of mutual assured destruction relies on the ability to avoid a possible future by modeling it. SIMULATION STANDS IN FOR A KIND OF KNOWLEDGE ABOUT THE FUTURE THAT EXERTS CONTROL IN THE PRESENT: “What stirs in the shadow of this posture under the pretext of a maximal ‘objective’ menace, and thanks to that nuclear sword of Damocles, is the perfection of the best system of control which has never existed.”⁶ SIMULATION AS DETERRENCE, then, OPERATES IN A PARADOXICALLY

COUNTERFACTUAL REALM: THAT OF THE PROVEN NEGATIVE. ON THE ONE HAND IS THE PROMISE OF INFORMATION AS CONTROL THAT STIPULATES A KIND OF MECHANISTIC CAUSALITY, ON THE OTHER IS THE CLAIM TO INTERVENE IN THE MECHANISM OF CAUSALITY ITSELF. This is why, TAKEN TO THEIR LIMITS, STRATEGIES OF SIMULATION INVOKE BOTH TOTAL CONTROL AND ITS ECLIPSE: A KIND OF SMOTHERING STASIS IN WHICH ALL POSSIBILITIES ARE FULLY SATURATED – EVERYTHING HAS BEEN MODELED IN ADVANCE, INCLUDING THE MODELING PROCESS ITSELF. As Baudrillard puts it in his discussion of the virtualization of reality via simulation, “What is the idea of the Virtual? It seems that it would be the radical effectuation, the unconditional realization of the world, the transformation of all our acts, of all historical events, of all material substance and energy into pure information. THE IDEAL WOULD BE THE RESOLUTION OF THE WORLD BY THE ACTUALIZATION OF ALL FACTS AND DATA.”⁷ THE APPARENT OBSTACLE TO SUCH A RESOLUTION IS THE LIMIT OF HUMAN PERCEPTIONS, ANALYTIC ABILITY, AND TIME. The ability to overcome such limits is relegated to the realm of the superhuman. As Laplace, the pioneer of mathematical probability, put it, “Given for one instant an intelligence which could comprehend all the forces by which nature is animated and the respective situation of the beings who compose it – an intelligence sufficiently vast to submit these data to analysis ... for it, NOTHING WOULD BE UNCERTAIN AND THE FUTURE, AS THE PAST, WOULD BE PRESENT TO ITS EYES.”⁸ THE NAME FOR THAT INTELLIGENCE, VIEWED THROUGH ONE HISTORICAL LENS, WOULD BE GOD. IN THE DIGITAL ERA, IT IS THE COMPUTER AND THE DATABASE. In the era of predictive analytics, popular fiction continues to experiment with the paradoxes of simulation. Consider, for example, the television show *Person of Interest*, in which a renegade computer programmer taps into the government’s data-mining apparatus (which he created) in order to predict when and where life-threatening crimes will occur. The show’s premise is that automated surveillance has become both ubiquitous and multifaceted – all spaces and practices are monitored via technologies ranging from smart cameras equipped with facial recognition technology to telephones with embedded voice-stress analyzers. The seemingly distributed network of commercial, public, and personal sensors and communication devices (closed-circuit surveillance cameras, Webcams, smart phones, and so on) has been covertly colonized by a centralized monitoring apparatus. This apparatus – which becomes increasingly “subjectivized” over the course of the series – can watch, listen, and communicate with the main cast members through the full range of networked devices. It is as if all of our various smart devices have teamed up to create an emergent machine intelligence. The show’s opening sequence represents the monitoring process at work by portraying the view from the perspective of the all-seeing surveillance apparatus. We see quick intercut shots of people viewed in grainy surveillance video overlaid with terms meant to suggest the various forms of monitoring at work: “voice capture stress percentage”; “GPS (global positioning system): active, tracking location”; “searching: all known databases”; etc. In this world, THE ENVIRONMENT ITSELF HAS BEEN REDOUBLED AS BOTH SETTING AND SPECTATOR. NO ONE IN PARTICULAR IS WATCHING, BUT EVERYONE IS WATCHED ALL THE TIME. The result is what Bogard describes as “the impersonal domination of the hypersurveillance assemblage.”⁹ On the show, this assemblage comes to serve as a technologized version of the mutant, prescient “pre-cogs” in Steven Spielberg’s 2002 movie MINORITY REPORT, BASED ON THE PHILIP K. DICK STORY that envisions a world in which crime is prevented before it takes place. Dick’s story STAGES THE PARADOX OF SIMULATED DETERRENCE IN A DISCUSSION BETWEEN TWO OFFICIALS ENGAGED IN FIGHTING “PRE-CRIME”: “You’ve probably grasped the basic legalistic drawback to precrime methodology. We’re taking in individuals who have broken no law ... So the commission of the crime itself is absolute metaphysics. We claim they’re culpable. They, on the other hand, eternally claim they’re innocent. And, in a sense, they are innocent.”¹⁰ THE DIFFERENCE BETWEEN THE MODELING OF POSSIBLE FUTURES PROPOSED BY MINORITY REPORT AND THE STRATEGIES OF SIMULATED DETERRENCE CURRENTLY UNDER DEVELOPMENT IN THE UNITED STATES AND ELSEWHERE IS THAT BETWEEN DETERMINISM AND PROBABILITY. THE FICTIONAL PORTRAYALS ENVISION A CONTRADICTIONARY WORLD IN WHICH INDIVIDUAL ACTIONS CAN BE PREDICTED WITH CERTAINTY AND EFFECTIVELY THWARTED. They weave oracular fantasies about perfect foresight. PREDICTIVE ANALYTICS, by contrast, POSITS A WORLD IN WHICH PROBABILITIES CAN BE MEASURED AND RESOURCES ALLOCATED ACCORDINGLY. Because forecasts are probabilistic, they never attain the type of certitude that would, for example, justify arresting someone for a crime he or she has not yet committed. Rather, they distribute probabilities across populations and scenarios. THE MOBILIZATION OF SUCH FORMS OF DATA MINING ARE ANTICIPATED IN MICHEL FOUCAULT’S DESCRIPTION OF THE RISE OF APPARATUSES OF SECURITY, governed by questions such as “How can we predict statistically the number of thefts at a given moment, in a given society, in a given town, in the town or in the country, in a given social stratum, and so on? Second, are there times regions, and penal systems that will increase or reduce this average rate? Will crises, famines, or wars, severe or mild punishment, modify something in these proportions? ... What is the cost of suppressing these thefts ... What therefore is the comparative cost of theft and of its repression ...?”¹¹ WHAT EMERGES IS

A KIND OF ACTUARIAL MODEL OF CRIME: ONE THAT LENDS ITSELF TO AGGREGATE CONSIDERATIONS REGARDING HOW BEST TO ALLOCATE RESOURCES UNDER CONDITIONS OF SCARCITY – A SET OF CONCERNS THAT FITS NEATLY WITH THE CONJUNCTION OF GENERALIZED THREAT and the constriction of public-sector funding. The algorithm promises not simply to capitalize on new information technology and the data it generates, but simultaneously to address reductions in public resources. THE CHALLENGES POSED BY REDUCED MANPOWER CAN BE COUNTERED (ALLEGEDLY) BY MORE INFORMATION. As in other realms, ENHANCED INFORMATION PROCESSING PROMISES TO MAKE THE BUSINESS OF POLICING AND SECURITY MORE EFFICIENT AND EFFECTIVE. However, IT DOES SO ACCORDING TO NEW SURVEILLANCE IMPERATIVES, INCLUDING THE GUIDANCE OF TARGETED SURVEILLANCE BY COMPREHENSIVE MONITORING, the privileging of prediction over explanation (or causality), and new forms of informational asymmetry. THE DATA-DRIVEN PROMISE OF PREDICTION, IN OTHER WORDS, RELIES UPON SIGNIFICANT SHIFTS IN CULTURES AND PRACTICES OF INFORMATION COLLECTION.

Authenticity

The glut of information that is fed to us by the surveillance state makes authenticity impossible – instead we wait to be told what to desire

Horning 14 (Rob, Executive Editor of The New Inquiry and author of Marginal Utility, citing Mark Andrejevic, author of Infoglut, 7/10, “No Life Stories,” <http://thenewinquiry.com/essays/no-life-stories//Tang>)

Purveyors of targeted marketing often try to pass off these sorts of intrusion and filtering as a kind of manufactured serendipity. Andrejevic cites a series of examples of MARKETING HYPE INVITING US TO IMAGINE A WORLD IN WHICH RETAILERS KNOW WHAT CONSUMERS WANT BEFORE THE CONSUMERS DO, as though this were a long-yearned-for miracle of convenience rather than a creepy effort to circumvent even the limited autonomy of shopping sovereignty. “IN THE WORLD OF DATABASE-DRIVEN TARGETING,” Andrejevic argues, “THE GOAL IS, IN A SENSE, TO PRE-EMPT CONSUMER DESIRE.” THIS IS A STRANGE GOAL, GIVEN THAT DESIRE IS THE MEANS BY WHICH WE KNOW OURSELVES, IN HOPING TO ANTICIPATE OUR DESIRES, ADVERTISERS AND THE PLATFORMS THAT SERVE ADS WORK TO DISMANTLE OUR SENSE OF SELF AS SOMETHING WE MUST ACTIVELY CONSTRUCT AND MAKE DESIRE SOMETHING WE EXPERIENCE PASSIVELY, as a fait accompli rather than a potentially unmanageable spur to action. INSTEAD OF CONSTRUCTING A SELF THROUGH DESIRE, WE EXPERIENCE AN OVERLOAD OF INFORMATION ABOUT OURSELVES AND OUR WORLD, WHICH MAKES FASHIONING A COHERENT SELF SEEM IMPOSSIBLE WITHOUT HELP. IF BIG DATA’S DISMANTLING THE INTRINSIC-SELF MYTH HELPED PEOPLE CONCLUDE THAT AUTHENTICITY WAS ALWAYS AN IMPOSSIBILITY, A CHIMERA INVENTED TO SUSTAIN THE FANTASY THAT WE COULD CONSUME OUR WAY TO AN ERSATZ UNIQUENESS, THAT WOULD BE ONE THING. But INSTEAD, BIG DATA AND SOCIAL MEDIA FOREGROUND THE MEDIATED, INCOMPLETE SELF NOT TO DESTROY THE NOTION OF THE TRUE SELF altogether BUT TO OPEN US TO MORE DESPERATE ATTEMPTS TO FIND OUR AUTHENTIC SELVES. WE ARE ENTICED INTO EXPERIENCING OUR “SELF ” AS A PRODUCT WE CAN CONSUME, ONE THAT SURVEILLANCE CAN SUPPLY US WITH. THE MORE THAT IS KNOWN ABOUT US, THE MORE OUR ATTENTION CAN BE COMPELLED AND OVERWHELMED, WHICH IN TURN LEADS TO A DEEPER RELIANCE ON THE AUTOMATIC FILTERS AND ALGORITHMS, A FURTHER WILLINGNESS TO LET MORE INFORMATION BE PASSIVELY COLLECTED ABOUT US TO HELP US COPE with it all. But instead of leading to resolution, a final discovery of the “authentic” self, THIS MERELY ACCELERATES THE CYCLE OF FURTHER TARGETED STIMULATION. The ostensible goal of anticipating consumer desire and sating it in real time only serves the purpose of allowing consumers to want something else faster. SO AS SURVEILLANCE BECOMES MORE AND MORE TOTAL, Andrejevic argues, WE EXPERIENCE OUR INCREASINGLY SPECIFIED AND INFORMATION-RICH PLACE IN THIS MATRIX AS CONFUSION, A LOSS OF CLARITY OR TRUTH ABOUT THE WORLD AND OURSELVES. Because EXCESS INFORMATION IS “PUSHED” AT US RATHER THAN SOMETHING WE HAVE TO SEEK OUT, WE ARE ALWAYS BEING REMINDED THAT THERE IS MORE TO KNOW THAN WE CAN ASSIMILATE, AND THAT WHAT WE KNOW IS A PARTIAL REPRESENTATION, A CONSTRUCT. Like a despairing dissertation writer, we cannot help but know that we can’t assimilate all the knowledge it’s possible to collect. EACH NEW PIECE OF INFORMATION RAISES FURTHER QUESTIONS, OR INVITES MORE RESEARCH TO PROPERLY CONTEXTUALIZE IT. UBIQUITOUS SURVEILLANCE THUS MAKES INFORMATION OVERLOAD EVERYONE’S PROBLEM. TO SOLVE IT, MORE SURVEILLANCE AND INCREASINGLY AUTOMATED TECHNIQUES FOR ORGANIZING THE DATA IT COLLECTS ARE AUTHORIZED. In a series of chapters on predictive analytics, prediction markets, and body-language analysis and neuromarketing, Andrejevic examines the variety of emerging technology-driven methods meant to allow data to “speak for itself.” BY FILTERING DATA THROUGH ALGORITHMS, BRAIN SCANS, OR MARKETS, AN ALLEGEDLY UNMEDIATED TRUTH CONTAINED WITHIN IT CAN BE UNVEILED, AND WE CAN BYPASS THE SLIPPERINESS OF

DISCURSIVE REPRESENTATION AND SLIDE DIRECTLY INTO THE REAL Understanding why outcomes occur becomes unnecessary, as long as the probabilities of the correlations hold to make accurate predictions.

Deliberation/identity

Big Data kills democratic deliberation and social identity

Horning 14 (Rob, Executive Editor of The New Inquiry and author of Marginal Utility, citing Mark Andrejevic, author of Infoglut, 7/10, "No Life Stories," <http://thenewinquiry.com/essays/no-life-stories//Tang>)

FAR FROM BEING NEUTRAL OR OBJECTIVE, DATA CAN BE STOCKPILED AS A POLITICAL WEAPON THAT CAN BE SELECTIVELY DEPLOYED TO ERADICATE CITIZENS' ABILITY TO PARTICIPATE IN DELIBERATIVE POLITICS. Many researchers have pointed out that "RAW DATA" IS AN OXYMORON, if not A MYSTIFICATION OF THE POWER INVESTED IN THOSE WHO COLLECT IT. SUBJECTIVE CHOICES MUST CONTINUALLY BE MADE ABOUT WHAT DATA IS COLLECTED AND HOW, AND ABOUT ANY INTERPRETIVE FRAMEWORK TO DEPLOY TO TRACE CONNECTIONS AMID THE INFORMATION. As sociologists Kate Crawford and danah boyd point out, BIG DATA "is the kind of data that ENCOURAGES the practice of APOPHENIA: SEEING PATTERNS WHERE NONE ACTUALLY EXIST, SIMPLY BECAUSE MASSIVE QUANTITIES OF DATA CAN OFFER CONNECTIONS THAT RADIATE IN ALL DIRECTIONS." THE KINDS OF "TRUTHS" BIG DATA CAN UNVEIL DEPENDS GREATLY ON WHAT THOSE WITH DATABASE ACCESS CHOOSE TO LOOK FOR. As Andrejevic notes, THIS ACCESS IS DEEPLY ASYMMETRICAL, UNDOING ANY DEMOCRATIZING TENDENCY INHERENT IN THE BROADER ACCESS TO INFORMATION IN GENERAL. In his 2007 book *iSpy: Surveillance and Power in the Interactive Era*, he argues that "ASYMMETRICAL MONITORING ALLOWS FOR A MANAGERIAL RATHER THAN DEMOCRATIC RELATIONSHIP TO CONSTITUENTS." SURVEILLANCE MAKES THE PRACTICE OF "MAKING ONE'S VOICE HEARD" BASICALLY REDUNDANT AND DESTROYS ITS LINK TO ANY INTENTION TO ENGAGE IN DELIBERATIVE POLITICS. INSTEAD POLITICS OPERATES AT THE AGGREGATE LEVEL, CONDUCTED BY INSTITUTIONS WITH THE BEST ACCESS TO THE DATABASES. These data sets will be opened to elite researchers and the big universities that can afford to pay for access, Crawford and boyd point out, but EVERYONE ELSE WILL BE MOSTLY LEFT ON THE SIDELINES, unable to produce "real" knowledge. AS A RESULT, INSTITUTIONS WITH PRIVILEGED ACCESS TO DATABASES WILL HAVE ABILITY TO DETERMINE WHAT IS TRUE. This plays out not only with events but also with respect to the self. Just as POLITICS NECESSARILY REQUIRES INTERMINABLE INTERCOURSE WITH OTHER PEOPLE WHO DON'T AUTOMATICALLY SEE THINGS OUR WAY AND WHO LEAST ACKNOWLEDGE ALTERNATE POINTS OF VIEW only after protracted and often painful efforts to spell them out, SO DOES THE SOCIAL SELF. It is not something we declare for ourselves by fiat. I NEED TO NEGOTIATE WHO I AM WITH OTHERS FOR THE IDEA TO EVEN MATTER. ALONE, I AM NO ONE, NO MATTER HOW MUCH INFORMATION I MAY CONSUME. IN RESPONSE TO THIS POTENTIALLY UNCOMFORTABLE TRUTH, WE MAY TURN TO THE SAME BIG DATA TOOLS IN SEARCH OF A SIMPLER AND MORE DIRECTLY ACCESSIBLE "TRUE SELF," just as politicians and companies have done. IDENTITY THEN BECOMES A PROBABILITY, EVEN TO OURSELVES. IT CEASES TO BE SOMETHING WE LEARN TO INSTANTIATE THROUGH INTERPERSONAL INTERACTIONS BUT BECOMES SOMETHING SIMPLY REVEALED WHEN SUFFICIENT DATA EXISTS TO SIMULATE OUR FUTURE PERSONALITY ALGORITHMICALLY. One is left to act without any particular conviction while awaiting report from various recommendation engines on who we really are. In this sense, BIG DATA INCITES WHAT Andrejevic, following ŽIŽEK, CALLS "INTERPASSIVITY," IN WHICH OUR BELIEF IN THE IDEOLOGY THAT GOVERNS US IS AUTOMATED, DISPLACED ONTO A "BIG OTHER" THAT DOES THE BELIEVING FOR US AND ALLEVIATES US OF RESPONSIBILITY FOR OUR COMPLICITY. SURRENDERING THE SELF TO DATA PROCESSORS AND ONLINE SERVICES MAKE IT A PRODUCT TO BE ENJOYED RATHER THAN A CONSCIOUSNESS TO BE INHABITED. THE WORK OF SELFHOOD IS DIFFICULT, DIALECTICAL, REQUIRING not only CONTINUAL SELF-CRITICISM but also an AWARE-NESS OF THE DEGREE TO WHICH THOSE AROUND US SHAPE US IN WAYS WE CAN'T CONTROL. We must engage them, wrestle with one another for our identities, be willing to make the painful surrender of our favorite ideas about ourselves and be vulnerable enough to becoming some of what others see more clearly about us. THE DANGER IS

THAT WE WILL SETTLE FOR THE CONVENIENCE OF TECHNOLOGICAL WORK-AROUNDS AND ABNEGATE THE DUTY TO DEBATE THE NATURE OF THE WORLD WE WANT TO LIVE IN TOGETHER. INSTEAD OF THE COLLECTIVE WORK OF BUILDING THE SOCIAL, WE CAN SETTLE FOR AN AUTOMATICALLY GENERATED TIMELINE AND ALGORITHMICALLY GENERATED PROMPTS FOR WHAT TO ADD TO IT. Data analysts can detect a correlation between two seemingly random points—intelligence and eating curly fries, say, as in a 2012 PNAS research paper by Michal Kosinski, David Stillwell, and Thore Graepel that made the rounds on Tumblr and Twitter in January—and potentially kick off a wave of otherwise inexplicable behavior. “I don’t know why I am eating curly fries all of a sudden, but that shows how smart I am!” ADVERTISERS WON’T NEED A PLAUSIBLE LOGIC TO PERSUADE US TO BE INSECURE; THEY CAN LET SPURIOUS DATA CORRELATIONS SPEAK FOR THEM WITH THE AUTHORITY OF SCIENCE. Unlike the Facebook mood-manipulation paper, the curly-fries paper enjoyed a miniviral moment in which it was eagerly reblogged for its novelty value, with only a mild skepticism, if any, attached. This suggests the seductive entertainment appeal these inexplicable correlations can provide—they tap the emotional climate of boredom to spread an otherwise inane finding that can then reshape behavior at the popular level. We’re much more likely to laugh about the curly fries paper and pass it on than to absorb any health organization’s didactic nutrition information. Our eagerness to share the news about curly fries corresponds with our willingness to accept it as true without being able to understand why. It’s WTF incomprehensibility enhances its reach and thus its eventual predictive power. Likewise, THE WHIMSICAL REBLOGGING OF THE RESULTS FROM PATENTLY RIDICULOUS ONLINE TESTS HINTS AT HOW WE MAY OPT IN TO MORE “ENTERTAINING” SOLUTIONS TO THE PROBLEM OF SELF. If coherent self-presentation that considers the need of others takes work and a willingness to face our own shortcomings, COLLABORATING WITH SOCIAL SURVEILLANCE AND DUMPING PERSONAL EXPERIENCE INTO ANY AND ALL OF THE AVAILABLE COMMERCIAL CONTAINERS IS COMPARATIVELY EASY AND FUN. IT RETURNS TO US AN “OBJECTIVE” SELF THAT IS EMPIRICALLY DEFENSIBLE, AS WELL AS AN EXCITING AND NOVEL OBJECT FOR US TO CONSUME AS ENTERTAINMENT. WE ARE HAPPILY THE AUDIENCE AND NOT THE AUTHOR OF OUR LIFE STORY. THUS THE ALGORITHM BECOMES RESPONSIBLE FOR OUR POLITICAL IMPOTENCE, AN ALIBI FOR IT THAT LETS US ENJOY ITS DUBIOUS FRUITS. BY TRADING NARRATIVES FOR BIG DATA, EMOTIONS ARE LEFT WITH NO BASIS IN ANY BELIEF SYSTEM. You won’t need a reason to feel anything, and feeling can’t serve as a reliable guide to action. Instead we will experience the fluctuation of feeling passively, a spectator to the spectacle of our own emotional life, which is now contained in an elaborate spreadsheet and updated as the data changes. YOU CAN’T KNOW YOURSELF THROUGH INTROSPECTION OR SOCIAL ENGAGEMENT, BUT ONLY BY FINDING TECHNOLOGICAL MIRRORS, WHOSE REFLECTION IS SYSTEMATICALLY DISTORTED IN REAL TIME BY THEIR ADMINISTRATORS. LET’S HOPE WE DON’T LIKE WHAT WE SEE.

Truth testing

Information overload makes testing truth claims impossible – its used as a tool to protect power

McVey 13 (Alex, University of North Carolina at Chapel Hill, Communication Studies and Cultural Studies, Graduate Student, Book Review: Infoglut, http://library.queensu.ca/ojs/index.php/surveillance-and-society/article/viewFile/andrejevic/infoglut_review//Tang)

Mark Andrejevic's Infoglut offers a theoretically rich account of the modern information landscape, examining how the MASSIVE PROLIFERATION OF INFORMATION TRANSFER AND STORAGE THROUGH MODERN TECHNOLOGY IMPACTS OUR UNDERSTANDING OF BOTH COMMUNICATION AND CRITIQUE. The HYPERPROLIFERATION OF INFORMATION in the era of the internet and computer data STORAGE HAS CONTRIBUTED TO A FORM OF INFORMATION OVERLOAD CALLED 'INFOGLUT.' This state of INFORMATION OVERLOAD MARKS WHAT SLAVOJ ZIZEK CALLS THE 'DECLINE OF SYMBOLIC EFFICIENCY,' IN WHICH THE PROLIFERATION AND ACCUMULATION OF COMPETING NARRATIVES AND TRUTH CLAIMS ULTIMATELY CALLS ALL CLAIMS TO TRUTH INTO QUESTION, WHEREAS POWER ONCE OPERATED THROUGH THE ESTABLISHMENT OF A DOMINANT NARRATIVE AND THE SUPPRESSION OF ALTERNATIVE NARRATIVES, THE PERPETUAL AVAILABILITY OF COMPETING CLAIMS TO TRUTH NOW MAKES OLD STRATEGIES OF CONTROLLING INFORMATION IRRELEVANT. Where the task of the powerful was once to prevent new information from circulating that could hurt their interests, THE TASK OF THE POWERFUL IS NOW TO CIRCULATE SO MUCH INFORMATION THAT ANY CLAIM TO TRUTH CAN ULTIMATELY BE CALLED INTO QUESTION BY MOBILIZING ENOUGH DATA. Controlling information no longer requires preventing new information from circulating but rather controlling access to databases and infrastructure capable of storing, monitoring, and analyzing massive quantities of data. CRITICAL PRACTICES OF THE PRE-INFOGLUT ERA, rooted in theories of representation, ARE NOW REDUCED TO CONSPIRACY THEORIES THAT DISPEL ALL CLAIMS TO EXPERTISE AS A FORM OF HIDDEN IDEOLOGY, ALL WHILE POSITING A NEW IDEOLOGICAL CLAIM UNDER THE POSTIDEOLOGICAL GUISE OF PREDICTION OR AFFECTIVE CERTAINTY. Andrejevic sets out to examine how OUR MODERN CONDITION OF INFOGLUT, both changes the relationship between power and knowledge AND CALLS FOR A RE-EXAMINATION OF THE ROLE OF CRITIQUE IN A TIME OF POSTNARRATIVE UNCERTAINTY. A variety of case studies demonstrate that, IN RESPONSE TO THE DECLINE OF SYMBOLIC EFFICIENCY, PRACTICES OF ANALYZING DATA EMERGE THAT DISPLACE COMMUNICATION AND DELIBERATION BY APPEALING EITHER TO THE SUPPOSEDLY VALUE-FREE CALCULATIONS OF AN ALGORITHM OR THE MARKET PLACE OR TO PRE-COGNITIVE AFFECT IN BODY LANGUAGE AND NEUROSCIENCE. Andrejevic looks at the way information is gathered, stored, analyzed, automated and deployed to shine light on the varied landscapes of modern information processing, including the way inequalities manifest in the architectures of data storage and analysis. Andrejevic offers a critique of the democratizing spirit of the internet as a means for the mass distribution of information, arguing that CONSUMERS NOW TAKE PART IN UBIQUITOUS ACTS OF DATA SHARING IN WHICH THEIR BEHAVIORS ARE MONITORED, ANALYZED AND USED BOTH TO PREDICT FUTURE BEHAVIOR AND TO HELP SHAPE FUTURE BEHAVIOR. Looking at the phenomenon of 'digital convergence,' the process by which formerly distinct bodies of digital information converge, Andrejevic points out how ubiquitous information storage is becoming across the social field. By looking at the convergence of data analysis in marketing, politics, surveillance, security, policing and popular culture, Andrejevic mounts a convincing argument for information management as an all-encompassing and quotidian element of modern power. However, Andrejevic is quick to warn readers against reading the decline of symbolic efficiency as a totalizing or all-encompassing fact of modern existence. Far from the perfect crime predicting capacities foretold by the movie Minority Report, Andrejevic reminds readers that there are imperfections and probabilities distributed across these systems. NOT ALL NARRATIVES CAN BE DISTURBED THROUGH THE PROLIFERATION OF COUNTER-INFORMATION, AND THE DECLINE OF SYMBOLIC EFFICIENCY IS FAR FROM COMPLETE. Yet despite this caveat, IT IS POSSIBLE TO DETECT SOME TOTALIZING TENDENCIES IN ANDREJEVIC'S ACCOUNT OF INFORMATION OVERLOAD. For example, in his discussion of data mining, Andrejevic argues THAT MODERN FORMS OF INFORMATION GATHERING HAVE DISPLACED OLD FORMS OF TARGETING AND SURVEILLANCE BECAUSE WHEREAS IN OLD REGIMES THE TARGET HAD TO FIRST BE IDENTIFIED IN ORDER TO BE SURVEYED, IN THE MODERN ERA OF INFOGLUT,

DATA GATHERING AND ANALYSIS OF EVERY POSSIBLE VARIABLE ALLOWS DATA EXPERTS TO PREDICT WHO POTENTIAL SUSPECTS MAY BE. AS A RESULT, Andrejevic argues, 'EMERGING SURVEILLANCE STRATEGIES WILL CONTINUE TO PUSH FOR DATA ACCESS AT THE LEVEL OF ENTIRE POPULATIONS as opposed to, say, that of suspicious (or, from a marketing perspective, desirable) groups or individuals' (36). While Andrejevic is right to argue that surveillance practices have taken on new forms in an era of modern infoglut, it would be a mistake to overemphasize these new forms as a break from previous surveillance strategies. Doing so would miss the way in which SURVEILLANCE STILL WORKS TO DISPROPORTIONATELY TARGET DIFFERENTLY RACIALIZED, GENDERED AND ABLED BODIES. While it is true that more and more members of the population increasingly participate in data transfers that are stored, monitored and analyzed by data experts, racial, gender, class and other values can nevertheless be inscribed into the information processing systems Andrejevic describes. Future scholars should build on Andrejevic's work by pointing to how these axes of difference influence modern conditions of infoglut. Andrejevic's book should likewise be required reading for those attempting to engage in leftist politics in a digital age. Andrejevic argues that THE 'POSTMODERN RIGHT' HAS COOPTED THE PROCESS OF CRITIQUE IN THE NAME OF CONSPIRACY THEORY AND ENCOURAGED THE PROLIFERATION OF MULTIPLE TRUTHS IN ORDER TO SWAMP ANY ATTEMPT TO MAKE A CLAIM TO A TRUTH AGAINST THE RIGHT. EXAMINING, for example, the STRATEGIES OF THE BUSH ADMINISTRATION IN IRAQ. Andrejevic argues that THE POSTMODERN RIGHT RELIES ON WHAT ŽIŽEK CALLS THE 'BORROWED KETTLE' STRATEGY IN ORDER TO DISPEL CRITICISM. In the face of critiques of the Bush's handling of the war in Iraq, THE ADMINISTRATION OFFERS MULTIPLE CONTRADICTORY ACCOUNTS IN ORDER TO PRECLUDE THE POSSIBILITY OF LOCATING ONE AS TRUE AND THUS BEING ABLE TO PIN DOWN THE ADMINISTRATION'S FAILURES. Additionally, Andrejevic looks at Glen Beck's mobilization of conspiracy theories rooted in affective claims to understanding reality that dispel the knowledge of so-called 'experts.' Far from challenging the logic of the postmodern right, STRATEGIES THAT FOCUS ON CRITIQUING THEIR NARRATIVES AND OFFERING COUNTERACTING TRUTH CLAIMS MERELY FEED INTO THE INFORMATION ECONOMY THAT SUSTAINS THE POSTMODERN RIGHT'S EXISTENCE. Additionally, ANDREJEVIC SHOWS HOW THE CONVERGENCE OF DATA WORKS AS A CONDUIT OF BOTH CAPITALISM AND THE STATE, AS A METHOD OF STUDYING POPULATIONS TO PREDICT AND INTERVENE ON HUMAN BEHAVIOR. DATA MINING GATHERS AND STORES MASSIVE AMOUNTS OF CONSUMER DATA, WHICH IN TURN GETS STORED IN DATABASES THAT CAN BE USED FOR POLICE AND SECURITY MEASURES. PREDICTION MARKETS ARE USED TO BYPASS DELIBERATIVE PROCESSES BY DEPICTING THE MARKET AS A NEUTRAL ARBITER CAPABLE OF RISING ABOVE THE CLUTTER OF INFORMATION OVERLOAD, CEMENTING ANTIDEMOCRATIC, CAPITALIST PRACTICES WHILE LABORING UNDER THE BANNER OF A MARKET BASED POPULISM. THESE INTERLOCKING INEQUITIES AND POWER DYNAMICS ARE ALL AT PLAY IN INFOGLUT. Andrejevic similarly offers a fruitful interrogation of the role affect plays in negotiating the decline of symbolic efficiency. IF THE PROLIFERATION OF COMPETING CLAIMS TO TRUTH IN AN AGE OF INFOGLUT MAKES REPRESENTATION UNRELIABLE, AFFECT OFFERS A WAY OF CUTTING THROUGH THE FOG OF DATA BY READING AND ANALYZING THE BODY'S PRE-COGNITIVE PROCESSES OF DECISION MAKING. Andrejevic examines how new social media technologies prompt new ways of attempting to analyze and interpret emotion. Here, AFFECTIVE ECONOMIES ENCOURAGE THE MONITORING OF SOCIAL MEDIA BOTH IN ORDER TO PREDICT AND INTERVENE TO HELP SHAPE POPULAR SENTIMENTS. Chapter four studies how THE LOGIC OF THE MARKET COMES TO FUNCTION AS A SORT OF 'AFFECTIVE FACT' THAT CONTINUES TO FUNCTION EVEN IN THE FACE OF THE FAILURE OF THE MARKETS WHICH DISPEL ITS MAIN NARRATIVE. Andrejevic similarly locates the study of affect in popular culture representations of the reading of body language, such as the TV shows Lie to Me or the World Series of Poker. In all of these case studies, AFFECT OFFERS A MEANS OF BYPASSING THE UNRELIABLE PLANE OF DISCOURSE AND REPRESENTATIONS TO GIVE WAY TO A PREDISCURSIVE UNDERSTANDING OF THE SUBJECT'S DESIRES, FEELINGS, AND BEHAVIORS. While much of Andrejevic's work on affect describes how affect works in a historical context of infoglut, ANDREJEVIC ALSO OFFERS A BOLD THEORETICAL MOVE BY CRITIQUING AFFECT THEORY, WITH ITS FOCUS ON PRE-COGNITIVE INTENSITIES RATHER THAN RATIONALITY AND REASON, AS IMPLICATED IN THE STRATEGIES OF NEUROSCIENCE AND NEUROMARKETING USED BY THE POWERFUL IN RESPONSE TO THE DECLINE OF SYMBOLIC EFFICIENCY. While this theoretical claim is perhaps one of the more interesting in the book, Andrejevic seems rushed to lump the entire theoretical trajectory of affect theory

together with the practices of neuromarketing. While both affect theory and neuroscience share an interest in the precognitive elements of human behavior, it remains to be seen how the particularities of affect theory either permit or challenge the practices of neuromarketing. While Andrejevic ultimately points toward a more nuanced role for affect theory by arguing for a mode of affect that is neither incompatible nor identical with reason, more scholarly work should be devoted to studying the links between affect theory and forms of capitalist advertising and marketing practices that work at the level of affect. Infoglut is an important read for scholars interested in big data, affect theory, psychoanalysis, Surveillance Studies, and the relationship between data and communication studies. This book is a must read for communication scholars because it interrogates the ways that strategies of managing information overload attempt to bypass discourse, representation and deliberation. In the face of an infoglut which thwarts traditional modes of criticism, Andrejevic calls on scholars to 'gain control over the forms of postcomprehension knowledge that promise to populate the databases and contest their displacement of comprehension, models, theories, and narratives' (164). Infoglut begins this project and marks an outstanding move in that direction.

Won't Pass---2AC

Cuba package won't pass – assumes PC – McConnell statements, congressional opposition, election fears with Cuban Americans, and public fear of human rights violations/communism

Cowan 7/12 {Richard, syndicated politics columnist, "Mitch McConnell Thinks Congress Will Block Obama's Efforts to Engage with Cuba," Reuters via the Huffington Post – Politics, 2015, http://www.huffingtonpost.com/2015/07/12/obama-cuba-relations_n_7780432.html#THUR}

THE top U.S. SENATE REPUBLICAN SAID on Sunday that CONGRESS IS likely to block ANY NOMINEE that President Barack OBAMA NAMES AS AMBASSADOR TO CUBA AND RETAIN broad ECONOMIC SANCTIONS, even as **Obama moves to establish diplomatic and economic ties WITH THE COMMUNIST-RUN ISLAND.** Senate Majority Leader Mitch MCCONNELL, interviewed on the "Fox News Sunday" television program, SAID THE SENATE IS unlikely to confirm ANY U.S. AMBASSADOR to Havana NOMINATED BY OBAMA. MCCONNELL ADDED, "THERE ARE SANCTIONS that were imposed BY CONGRESS. I think THE ADMINISTRATION WILL HAVE A hard time GETTING THOSE REMOVED. THIS IS A POLICY THAT THERE IS substantial opposition to IN CONGRESS." Last December, Obama announced he would use his executive powers to move toward more normal relations with Cuba after a five-decade standoff. Those steps have included establishing diplomatic relations, an expansion of some travel from the United States to Cuba, increasing the limit on remittances to Cuban nationals from those living in the United States and expanding some trade in goods and services. But IT WOULD BE up to Congress TO ALLOW NORMAL TRAVEL AND FULL TRADE. REPUBLICANS CONTROL BOTH THE SENATE AND HOUSE of Representatives. Many Republican oppose Obama's moves TOWARD BETTER RELATIONS WITH CUBA, CLAIMING THEY ONLY BOLSTER CUBA'S COMMUNIST LEADERS. REPUBLICANS also fear alienating Cuban Americans in Florida WHO have fled the island nation and ARE SUPPORTERS OF THE REPUBLICAN PARTY. Obama charted a new U.S. path toward Cuba with the support of some Republicans, including freshman Senator Jeff Flake of Arizona. Obama said in March his moves were already paying dividends, saying that since December the Cuban government had begun discussing ways to reorganize its economy. MCCONNELL HAS BEEN A consistent critic OF OBAMA on a range of foreign policy fronts, including Cuba and U.S. participation in multilateral nuclear talks with Iran. "This president has been involved in ... talking to a lot of countries: talk, talk, talk. And Cuba is a good example. He thinks that simply by engaging with them we get a positive result," McConnell said, adding, "I don't see any indication that Cubans are going to change their behavior." HUMAN RIGHTS ADVOCATES HAVE ADMONISHED CUBA FOR ABUSES, including arbitrary imprisonment of political opponents, AND CUBA'S TIGHT CONTROL OF ITS ECONOMY ALSO HAS BEEN a lightning rod for criticism.

Won't Pass---1AR

Won't pass – Congressional controversy and opposition statements

Zampa 7/13 {Peter, syndicated Washington correspondent, B.S. in broadcast journalism (Boston University), "Senators react to re-established relations with Cuba," ABC – WBKO, 2015, <http://www.wbko.com/news/headlines/Senators-react-to-re-established-relations-with-Cuba--314798981.html#THUR>}

The United States is moving towards NORMALIZING RELATIONS IN CUBA and the topic **remains controversial**. President OBAMA'S ANNOUNCEMENT RE-ESTABLISHING DIPLOMATIC TIES in Havana **HAS inspired questions** on Capitol Hill. SOME LAWMAKERS are saying it's about time, others THINK THERE IS STILL MORE WORK TO BE DONE. THE ANNOUNCEMENT CAME DURING An historic yet **polarizing week FOR** President OBAMA, WHAT'S RAISING THE MOST doubts ABOUT RENEWED RELATIONS? THE CASTRO REGIME. Montana Senator Jon Tester (D-MT) thinks the mutual benefits will outweigh the oppressive government. "The people are very good people from my snapshot of when I was in the country," said Tester. "And I think that how you get an oppressive regime in this particular case, and now this is different in different areas of the world, but in this particular case, to be less oppressive, is to show them success." Georgia Senator Johnny ISAKSON (R-GA), A MEMBER ON THE SENATE FOREIGN RELATIONS SUBCOMMITTEE, WOULD'VE LIKED TO SEE IMPROVEMENTS BEFORE THE TWO INTERTWINE once again. "THE PEOPLE WHO HAVE A VESTED INTEREST IN CUBA, the Cuban Americans in South Florida, THOSE who have relatives who are imprisoned in Cuba still to this day, WHOSE CIVIL RIGHTS HAVE BEEN VIOLATED - THEY NEED those ANSWERS FIRST BEFORE WE ESTABLISH THE RELATIONSHIP," SAID ISAKSON. The White House acknowledges the U.S. is still dealing with a Castro regime as it was in 1961, but that it doesn't serve U.S. or Cuban interests pushing the island nation towards collapse. Senate Majority Leader Mitch MCCONNELL SAID in an interview with "Fox News Sunday" that THE PRESIDENT IS going to have a tough time LIFTING ECONOMIC SANCTIONS IN CUBA AS Congress is likely to reject the effort.

Won't pass – it's an "uphill climb" – we have conclusive evidence

Wright 7/12 {Austin, defense reporter for Politico, graduate of the College of William and Mary, "McConnell sees Congress balking at new relations with Cuba," 2015, <http://www.politico.com/story/2015/07/mcconnell-sees-congress-balking-at-new-relations-with-cuba-119994.html#ixzz3fsZ7kMKC#THUR>}

Senate Majority Leader Mitch MCCONNELL SAYS President Barack OBAMA FACES an uphill climb IN GETTING CONGRESS TO GO ALONG WITH HIS PLANS TO NORMALIZE RELATIONS WITH CUBA. Appearing on "Fox News Sunday," the KENTUCKY REPUBLICAN SAID THERE WAS little chance THE SENATE WOULD CONFIRM, a A NEW U.S. AMBASSADOR to Cuba, OR LIFT THE LONG-STANDING ECONOMIC SANCTIONS imposed on the Communist island nation. "HE THINKS THAT SIMPLY BY ENGAGING with them WE GET A POSITIVE RESULT," MCCONNELL SAID of the president. "I DON'T SEE ANY EVIDENCE Cuba's going to change its behavior."

Won't pass until 2018 – GOP backlash and fear of Castro – public sentiment isn't strong enough to counter it

Beatty 7/1 {Andrew, politics correspondent for AFP/Reuters/Economist, B.A. in philosophy (Queen's University Belfast), "U.S., Cuba Agree to Restore Ties, Embassies to Reopen," Digital Journal, 2015,

<http://www.digitaljournal.com/news/world/us-proposes-us-cuba-reopen-embassies-as-of-july-20-havana/article/437226#THUR>

POLLS SHOW A MAJORITY of Americans SUPPORT OBAMA'S EFFORTS to improve ties. **But OPPONENTS COULD YET pose problems FOR FURTHER RAPPROCHEMENT. REPUBLICAN PRESIDENTIAL CANDIDATES** who have ties to Cuba, **INCLUDING** Marco RUBIO AND Ted CRUZ, **have been outspoken in their opposition TO THE THAW.** RUBIO, a senator from Florida, **ACCUSED OBAMA OF GIVING CONCESSIONS** as Cuba continued to stifle democracy. "It is time for our unilateral concessions to this odious regime to end," he said. "**I intend to oppose the confirmation of an ambassador** to Cuba **UNTIL THESE ISSUES ARE ADDRESSED.**" CRUZ, from Texas, SAID HE WOULD "**WORK TO DISAPPROVE ANY NEW FUNDS** for embassy construction in Havana." "**UNLESS AND UNTIL,**" he added, "**THE PRESIDENT CAN DEMONSTRATE** that HE HAS MADE SOME PROGRESS IN ALLEVIATING THE MISERY OF OUR FRIENDS, the people of Cuba." **IF THESE PROCEDURAL HURDLES WILL BE DIFFICULT, LIFTING THE EMBARGO WILL BE AN uphill battle.** ACCORDING TO analyst Diego MOYA-OCAMPOS of IHS Country Risk. "**KEY SANCTIONS ARE unlikely to be fully removed UNTIL THE US CONGRESS LIFTS THE US EMBARGO** on Cuba, **SOMETHING unlikely to take place before 2018 WHEN** incumbent president Raul CASTRO IS EXPECTED TO STEP DOWN," he said.

Won't Pass---1AR---A2: Vote Count

Cuba bills won't pass because of bipartisan opposition and empirics – reject their assertion of a vote count – White House representatives concede it hasn't happened yet

Hanly 7/5 {Ken, politics columnist, former professor, "Obama Faces Opposition to Opening Embassy in Cuba," Digital Journal, 2015, <http://www.digitaljournal.com/news/politics/obama-faces-opposition-to-opening-embassy-in-cuba/article/437566#THUR>}

WHILE CUBA AND THE United States REACHED A DEAL at the end of June TO REOPEN EMBASSIES, OBAMA IS facing opposition TO THE MOVE both from his own party and Republicans. Sen. Robert MENENDEZ, a Democrat from New Jersey CLAIMED THE MOVE IS NOT IN THE U.S. NATIONAL INTEREST. On the Republican side, Sen. Tom COTTON of Arizona CLAIMED THE MOVE TO NORMALIZE relations with Cuba WAS "appeasement of dictators". The speaker of the House of Representatives, Republican John BOEHNER ARGUES that U.S.-Cuba RELATIONS SHOULD NOT BE REVISED AT ALL, let alone normalized. Republican presidential candidate Sen. Lindsey GRAHAM SAID HE WOULD MAKE CLOSING THE EMBASSY HIS top priority IF ELECTED PRESIDENT. In order to normalize relations with Cuba, THE WHITE HOUSE NEEDS CONGRESS TO AGREE TO THE MOVE, APPROVE AN AMBASSADOR, LIFT THE EMBARGO ON CUBA, AND FUND THE EMBASSY. Senator COTTON IS PLANNING, along with supporters in Senate, TO TRY TO block funding for the embassy, and also BLOCK APPROVAL OF anyone NOMINATED AS AMBASSADOR. COTTON SAID HE WOULD CONTINUE TO DO SO "until there is a real, fundamental change THAT GIVES HOPE TO THE OPPRESSED PEOPLE OF CUBA." HIS DEMOCRATIC ALLY Sen. MENENDEZ SAID: "AN ALREADY ONE-SIDED DEAL THAT BENEFITS the CUBAn regime IS BECOMING ALL THE MORE LOPSIDED, THE MESSAGE IS DEMOCRACY AND HUMAN RIGHTS TAKE A BACK SEAT TO A LEGACY INITIATIVE." Opposition to normalization IS NOT NEW as THE HOUSE ALREADY PASSED A MOTION TO KEEP CURRENT TRAVEL RESTRICTIONS on travel by Americans to Cuba, blocking Obama's attempt TO EASE THE RESTRICTIONS. THE MOTION PASSED by a 247-176 vote. IN ANOTHER BILL passed through the House, A BILL FUNDING THE STATE DEPARTMENT at the same time PROHIBITS THE DEPARTMENT FROM USING THE FUNDS TO BUILD A NEW EMBASSY IN CUBA. The Obama administration wants \$6 million to upgrade a current building in Havana in order to turn it into a functioning embassy. A summary of the House bill said: "The bill includes a prohibition on funds for an embassy or other diplomatic facility in Cuba, beyond what was in existence prior to the President's December announcement proposing changes to the U.S.-Cuba policy." A senior State Dept. official criticized the opposition as being counterproductive: "It would be a shame if Congress impeded implementation of some of the very things that we think they – we all agree we want to do, such as better outreach to the Cuban people all over the island or additional. These are the kinds of things that we can do as we move forward in this relationship with a more robust embassy. And I would assume that most on the Hill agree those are a good thing to do." White House press secretary, Josh EARNEST, TOLD REPORTERS THAT HE THOUGHT THAT THERE WAS STRONG SUPPORT FOR LIFTING THE EMBARGO on Cuba although he had not done a "whip count."

*****THUMPER**

Iran---2AC

Iran thumps the DA – Obama pushing hard, it costs mad capital, and it's top of the docket

Kevin **Liptak**, **7/14/15**, Kevin Liptak is the CNN White House Producer, "Now that he has a deal with Iran, Obama must face Congress," <http://www.cnn.com/2015/07/14/politics/iran-nuclear-deal-congress-obama-block/>

Washington (CNN)With a historic deal meant to curb Iran's nuclear ambitions in place, President Barack **OBAMA HAS TICKED OFF ANOTHER LEGACY-MAKING ITEM ON HIS CHECKLIST -- as long as Congress doesn't get in his way.**¶ Early Tuesday, **OBAMA launched a sales pitch TO LAWMAKERS who remain deeply skeptical OF THE NUCLEAR DEAL.** But while Congress retains the ability to nullify Obama's accord with Tehran, the high bar for action on Capitol Hill -- including building veto-proof majorities in just over two months -- will make it difficult for opponents to block the President.¶ In its most simplistic form, the deal means that in exchange for limits on its nuclear activities, Iran would get relief from sanctions while being allowed to continue its atomic program for peaceful purposes. **MANY OF THE MORE TECHNICAL POINTS OF THE DEAL WEREN'T AVAILABLE TUESDAY MORNING, AND specifics could prove to be red flags for skeptical members OF CONGRESS,** many of whom said they were still reviewing the specifics of the plan.¶ **CONGRESS HAS 60 DAYS TO REVIEW THE DEAL, AND IF IT OPPOSES IT CAN PASS A RESOLUTION OF DISAPPROVAL TO BLOCK ITS IMPLEMENTATION. THE ADMINISTRATION NOW HAS FIVE DAYS TO CERTIFY THE AGREEMENT AND FORMALLY PRESENT THE DEAL TO CAPITOL HILL.** The clock on that 60 day period will not start until the official document is delivered to Capitol Hill.¶ **THE REPUBLICAN CONTROLLED HOUSE HAS THE VOTES TO PASS A RESOLUTION, BUT IN THE SENATE REPUBLICANS WOULD NEED TO ATTRACT SUPPORT FROM A HALF A DOZEN DEMOCRATS.¶ BECAUSE PRESIDENT Obama has already pledged to veto any bill to block the deal GOP LEADERS WOULD NEED TO CONVINCE ENOUGH DEMOCRATS TO JOIN WITH THEM TO OVERRIDE HIS VETO -- A HEAVY LIFT.** How the public views the deal will be critical, as Members of Congress will be back home for several weeks this summer before any vote.¶ **WHILE OBAMA ON TUESDAY SAID HE WELCOMED A "robust" debate OVER THE DEAL'S MERITS, HE ISSUED A WARNING TO LAWMAKERS CONSIDERING BLOCKING THE AGREEMENT, BLUNTLY THreatening to veto any measure that would prevent the deal FROM GOING INTO EFFECT.**¶ "Precisely because the stakes are so high, this is not the time for politics," he said in an address from the White House. **"TOUGH TALK FROM WASHINGTON DOES NOT SOLVE PROBLEMS. HARD NOSED DIPLOMACY, LEADERSHIP THAT HAS UNITED THE WORLD'S MAJOR POWERS, OFFERS A MORE EFFECTIVE WAY OF VERIFYING IRAN IS NOT PURSUING A NUCLEAR WEAPON."**¶ Like the completion earlier this month of a diplomatic renewal with Cuba, the deal with Iran provides Obama a tentative foreign policy achievement in the final year-and-a-half of his presidency. Both are built on the premise of engaging traditional U.S. foes, a vow Obama made at the very beginning of his presidency when he declared to hostile nations the United States would "extend a hand if you are willing to unclench your fist."¶ The deal -- which was finalized after almost two years of talks -- provides vindication for an administration that's sought to emphasize diplomacy over military force.¶ Burns: "If we get a deal, we'll have to contain Iranian power" 02:44¶ **PLAY VIDEO**¶ "This deal demonstrates that American diplomacy can bring about real and meaningful change," Obama said Tuesday, adding later that the deal "offers an opportunity to move in a new direction."¶ But even Obama himself has admitted there are risks inherent in striking an accord with a sworn U.S. enemy. Lawmakers, many deeply wary of those risks, now have 60 days to digest the provisions included in the deal with Iran, a two-month review period Congress insisted upon as the negotiations unfolded.¶ Obama was initially resistant to any congressional review of the Iran pact. But **FACED WITH OVERWHELMING SUPPORT AMONG LAWMAKERS FOR SOME KIND OF EVALUATION PERIOD, THE WHITE HOUSE ultimately conceded THAT CONGRESS COULD BE ABLE TO REVIEW THE FINAL DEAL BEFORE IT TAKES FULL EFFECT.**¶ It won't be easy for Congress to inflict damage on the agreement. **THEY MUST ACT QUICKLY -- AND THE TWO-MONTH PERIOD IN WHICH THEY CAN SCUTTLE THE PLAN INCLUDES A MONTH-LONG AUGUST RECESS, AND ONLY A HANDFUL OF WORKING DAYS.**¶ Foreign Relations Committee Chairman Bob **CORKER TOLD**

REPORTERS MONDAY HE EXPECTS TO START HEARINGS **sometime shortly** AFTER THE 60-DAY CLOCK BEGINS -- **which will come sometime in the next five days**, AFTER THE DIRECTOR OF NATIONAL INTELLIGENCE COMPLETES A NUMBER OF CERTIFICATIONS TO CONGRESS ABOUT THE DEAL, INCLUDING THAT IT MEETS U.S. NON-PROLIFERATION OBJECTIVES AND DOES NOT JEOPARDIZE U.S. NATIONAL SECURITY.¶ CORKER SAID HE WANTS FIRST TO ENSURE SENATORS HAVE AMPLE TIME TO READ THE AGREEMENT AND ITS CLASSIFIED ANNEXES SO THEY ARE "WELL VERSED" BEFORE HEARING FROM THE ADMINISTRATION AND ANY OUTSIDE EXPERTS HE PLANS TO CALL TO TESTIFY.¶ CORKER SAID HE WOULD LIKE TO COMPLETE HEARINGS **before the August recess -- WHICH BEGINS AUG. 7 --** SO LAWMAKERS HAVE THE RECESS TO CONSIDER THEIR POSITIONS. Under this scenario, up or down votes on the deal itself would not happen until mid-September, he said.¶ In the House, a similar process and timeframe is also expected.¶ WITHIN THE 60-DAY SPAN, OPPOSITIONS of the measure **MUST RALLY VOTES TO EITHER ENACT NEW SANCTIONS** against Iran, **OR TO DISALLOW OBAMA FROM EASING SANCTIONS** as part of the deal, **measures the President would veto**.¶ OVERRIDING the veto in Congress **WOULD REQUIRE A TWO-THIRDS MAJORITY** -- meaning **IN THE SENATE, Obama must only secure a minimum of 34** votes in order **FOR HIS DEAL TO TAKE EFFECT**. Additional time beyond the 60-day review period is included for Obama to veto any legislation, and for Congress to muster support for an override.¶ If lawmakers fail to pass any new restrictions during the review period -- which ends in mid-September -- the deal will go into place, and sanctions will be lifted in Iran.¶ Obama: Iran's path to nuclear weapons will be cut off¶ Obama: Iran's path to nuclear weapons will be cut off 04:21¶ [PLAY VIDEO](#)¶ But among deeply skeptical senators, who worry about Iran's support for terror groups and incarceration of Americans, even 34 Democratic votes in support of Obama aren't necessarily assured.¶ "

Iran---1AR---A2: No Controversy

Iran causes massive fights – creams PC

Kevin **Liptak**, **7/14/15**, Kevin Liptak is the CNN White House Producer, "Now that he has a deal with Iran, Obama must face Congress," <http://www.cnn.com/2015/07/14/politics/iran-nuclear-deal-congress-obama-block/>

OVER THIS AUGUST RECESS THERE'S GOING TO BE **fast-and-furious lobbying**, and we don't know whether there will be 34 votes," said former Democratic Rep. Jane Harman, who now heads the Woodrow Wilson International Center for Scholars.¶ 'A flawed perspective'¶ In the hours and days before the deal was announced, REPUBLICANS AND DEMOCRATS ALIKE **expressed doubt the plan would be received warmly ON CAPITOL HILL, WHERE LAWMAKERS HAVE BEEN voicing concern** ABOUT OBAMA'S DESIRE TO LIFT SANCTIONS ON IRAN FOR THE ENTIRETY OF THE NEARLY TWO-YEAR NEGOTIATIONS.¶ ON MONDAY, THE OBAMA ADMINISTRATION CLAIMED IT WAS REPUBLICANS WHO WOULD FIND THEMSELVES AT A POLITICAL DISADVANTAGE IF THEY ATTEMPT A TAKEDOWN OF A DEAL THAT COULD END IRAN'S NUCLEAR PROGRAM.¶ "When it comes to a tough sell, I think the tough sell is going to be on the part of Republicans if they try to tank the deal," White House Press Secretary Josh Earnest said Monday.¶ But IN THE AFTERMATH OF THE DEAL'S ANNOUNCEMENT, REPUBLICANS VOWED A **tough examination** OF THE AGREEMENT.¶ "THE COMPREHENSIVE NUCLEAR AGREEMENT ANNOUNCED TODAY **appears to further the flawed elements of April's interim agreement** BECAUSE THE OBAMA ADMINISTRATION APPROACHED THESE TALKS FROM A **flawed perspective**: REACHING THE BEST DEAL ACCEPTABLE TO IRAN, RATHER THAN actually **ADVANCING OUR NATIONAL GOAL OF ENDING IRAN'S NUCLEAR PROGRAM.**" Senate Majority Leader Mitch MCCONNELL SAID in a statement.¶ Arkansas Sen. TOM COTTON, WHO, along with 46 Republican senators, AUTHORED A **controversial** open LETTER TO IRANIAN LEADERS in March that warned them that a nuclear deal could be modified or abandoned by a future President, SAID THE AGREEMENT WAS A "**grievous, dangerous mistake.**"¶ "IT WILL GIVE IRAN TENS OF BILLIONS of dollars **TO FINANCE** (Iran's) sponsorship of **TERRORISM** against the United States and our allies," COTTON SAID in a statement. "IT WILL LIFT EMBARGOES ON CONVENTIONAL WEAPONS AND BALLISTIC-MISSILE SALES to Iran. AND, ULTIMATELY, IT WILL PAVE THE WAY FOR IRAN TO OBTAIN A NUCLEAR WEAPON. IF THIS DEAL IS APPROVED, IT WILL REPRESENT A **historic defeat for the United States.**"¶ CORKER, the Senate Foreign Relations Committee chairman, SAID in a statement that HE BEGINS "FROM A PLACE OF **deep skepticism**" as he prepares to read the agreement, ADDING THAT HIS COMMITTEE "WILL CONDUCT A **rigorous review.**"¶ New Jersey Sen. Robert MENENDEZ, a senior member of the Senate Foreign Relations Committee, HAS LED **Democratic opposition to the administration's Iran plans for months.** On Tuesday, HE TOLD CNN's Joe JOHNS THAT he was **disappointed** in what he said was the deal's lack of "anytime, anywhere inspections," which he "thought was something that was one of our red lines." He added that the agreement still preserves Iran's nuclear infrastructure but held out hope that "there can be an effort to get a better deal."¶ "THE BOTTOM LINE IS: THE DEAL DOESN'T END IRAN'S NUCLEAR PROGRAM -- IT PRESERVES IT," HE SAID later in a statement.¶ Obama admits risk¶ But the potential for Iran to renege on its agreements isn't a concern only of the plan's opponents; Obama himself admitted there were risks to any deal in an interview earlier this year.¶ Israeli anger at Iran nuclear deal¶ Israeli anger at Iran nuclear deal 01:36¶ PLAY VIDEO¶ "Look, 20 years from now, I'm still going to be around, God willing. If Iran has a nuclear weapon, it's my name on this," he told The Atlantic's Jeffrey Goldberg. "I think it's fair to say that in addition to our profound national-security interests, I have a personal interest in locking this down."¶ Obama's stake in the Iran deal may only become more apparent after he leaves office; as in his diplomatic thaw with Cuba, the effects on ordinary citizens in those countries won't be seen for several years.¶ He addressed the long-term prospects of success on Tuesday, saying the person who succeeds him in office -- and even the president after that -- will continue to enjoy the benefits of the deal.¶ "The same options available to me today will be available to any U.S. president in the future," Obama said. "I have no doubt that 10 or 15 years from now, the person who holds this office will be in a far stronger position with Iran further away from a weapon."

Deal causes a swell of backlash – litany of warrants

David E. Sanger and Michael R. Gordon, 7/14/15, David E. Sanger is chief Washington correspondent of The New York Times and Michael R. Gordon writes for the New York Times, “Iran Nuclear Deal ‘Built on Verification,’ Obama Says,” <http://www.nytimes.com/2015/07/15/world/middleeast/iran-nuclear-deal-is-reached-after-long-negotiations.html>

ALMOST AS SOON AS THE AGREEMENT WAS ANNOUNCED, to cheers in Vienna and on the streets of Tehran, ITS harshest critics SAID IT WOULD ULTIMATELY EMPOWER IRAN, rather than limit its capability. Israel’s Prime Minister, Benjamin NETANYAHU, CALLED IT A “historic mistake” THAT WOULD CREATE A “TERRORIST NUCLEAR SUPERPOWER.”¶ A review of the 109-page text of the agreement, which includes five annexes, showed that the United States preserved – and in some cases extended – the nuclear restrictions it sketched out with Iran in early April in Lausanne, Switzerland.¶ Yet, IT LEFT OPEN AREAS THAT ARE SURE TO RAISE fierce objections IN CONGRESS. IT PRESERVES IRAN’S ABILITY TO PRODUCE AS MUCH NUCLEAR FUEL AS IT WISHES AFTER YEAR 15 of the agreement, AND ALLOWS it to conduct RESEARCH ON ADVANCED CENTRIFUGES AFTER THE EIGHTH year. MOREOVER, THE IRANIANS WON THE EVENTUAL LIFTING OF AN EMBARGO ON the import and export of CONVENTIONAL ARMS and ballistic missiles – A STEP the departing chairman of the Joint Chiefs of staff, Gen. Martin E. DEMPSEY, warned about JUST LAST WEEK.¶ American officials said the core of the agreement, secured in 18 consecutive days of talks here, lies in the restrictions on the amount of nuclear fuel that Iran can keep for the next 15 years. The current stockpile of low enriched uranium will be reduced by 98 percent, most likely by shipping much of it to Russia. That limit, combined with a two-thirds reduction in the number of its centrifuges, would extend to a year the amount of time it would take Iran to make enough material for a single bomb should it abandon the accord and race for a weapon — what officials call “breakout time.” By comparison, analysts say Iran now has a breakout time of two to three months.

Iran---1AR---A2: No Obama Push

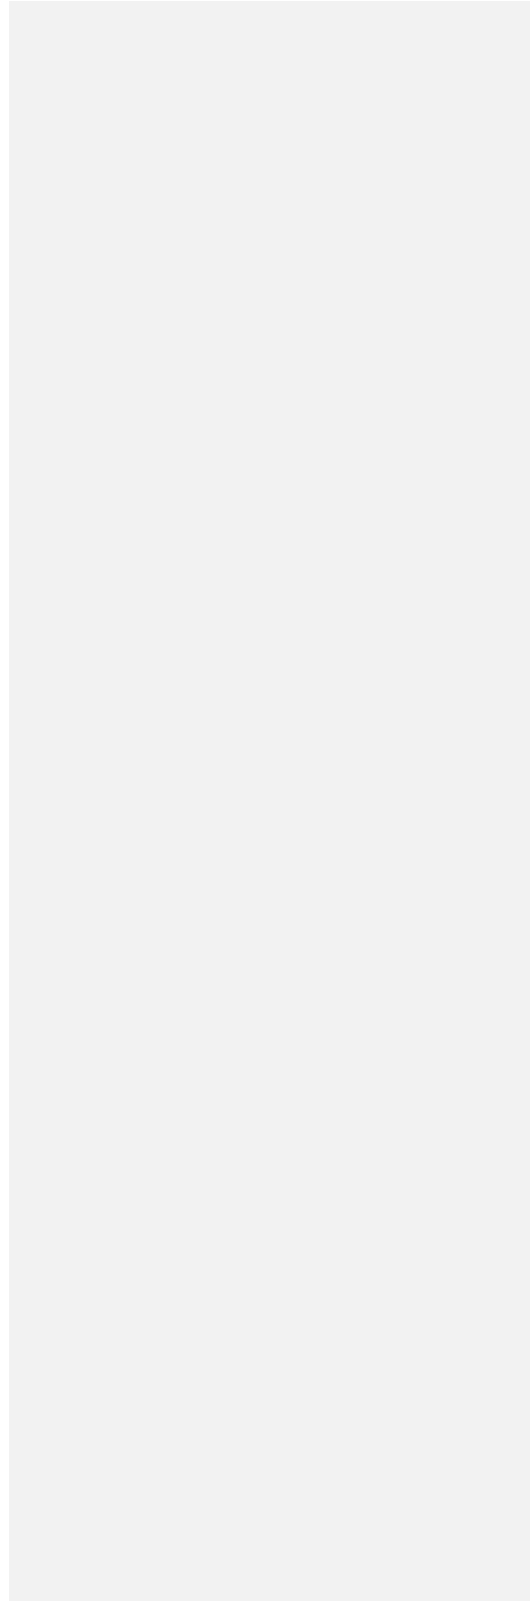

Yes Obama push – statements and veto threat prove

David E. **Sanger** and Michael R. **Gordon**, **7/14/15**, David E. Sanger is chief Washington correspondent of The New York Times and Michael R. Gordon writes for the New York Times, “Iran Nuclear Deal ‘Built on Verification,’ Obama Says,”

<http://www.nytimes.com/2015/07/15/world/middleeast/iran-nuclear-deal-is-reached-after-long-negotiations.html>

VIENNA — Iran and a group of six nations led by the United States said they had reached a historic accord on Tuesday to significantly limit Tehran’s nuclear ability for more than a decade in return for lifting international oil and financial sanctions.¶ THE DEAL CULMINATES 20 MONTHS OF NEGOTIATIONS ON AN AGREEMENT THAT PRESIDENT Obama had long sought AS THE BIGGEST DIPLOMATIC ACHIEVEMENT OF HIS PRESIDENCY. Whether it portends a new relationship between the United States and Iran — after decades of coups, hostage-taking, terrorism and sanctions — remains a bigger question.¶ Mr. OBAMA, IN AN EARLY MORNING APPEARANCE AT THE WHITE HOUSE THAT WAS BROADCAST LIVE IN IRAN, BEGAN WHAT PROMISED TO BE AN arduous effort to sell the deal to Congress and the American public, SAYING THE AGREEMENT IS “NOT BUILT ON TRUST — IT IS BUILT ON VERIFICATION.”¶ President OBAMA SAID he would veto any legislation that would block the nuclear agreement WITH IRAN.¶ Congress to Start Review of Iran Nuclear DealJULY 14, 2015¶ Prime Minister Benjamin NETANYAHU of Israel SAID on Tuesday that THE ACCORD with Iran WOULD ALLOW TEHRAN TO CONTINUE Netanyahu Denounces Iran Nuclear Deal as a ‘Historic Mistake’JULY 14, 2015¶ An oil refinery in Tehran. Iran has the world’s fourth-largest proven reserves of oil, behind Saudi Arabia, Venezuela and Canada.To Tap Iran’s Oil, Companies Face Many Hurdles but an Eventual BoonJULY 14, 2015¶ video I.A.E.A. Head Confirms Iran Nuclear PlanJULY 14, 2015¶ Mr. OBAMA MADE IT ABUNDANTLY CLEAR THAT he would fight TO PRESERVE THE DEAL FROM CRITICS IN CONGRESS WHO ARE BEGINNING A 60-DAY REVIEW, DECLARING, “I will veto any legislation THAT PREVENTS THE SUCCESSFUL IMPLEMENTATION OF THIS DEAL.”¶

*****IMPACT**

Impact Defense---AIDS

No disease impact—intervening actors, empirics, this ain't 1918 yo

Zakaria 9 (Editor of Newsweek, BA from Yale, PhD in pol sci, Harvard. He serves on the board of Yale University, The Council on Foreign Relations, The Trilateral Commission, and Shakespeare and Company. Named "one of the 21 most important people of the 21st Century", Fareed, "The Capitalist Manifesto: Greed Is Good," 13 June 2009, <http://www.newsweek.com/id/201935>)

Note: Laurie Garrett is a science and health writer, winner of the Pulitzer, Polk, and Peabody Prize

It certainly looks like another example of crying wolf. After bracing ourselves for a global pandemic, we've suffered something more like the usual seasonal influenza. Three weeks ago the World Health Organization declared a health emergency, warning countries to "prepare for a pandemic" and said that the only question was the extent of worldwide damage. Senior officials prophesied that millions could be infected by the disease. But as of last week, the WHO had confirmed only 4,800 cases of swine flu, with 61 people having died of it. Obviously, these low numbers are a pleasant surprise, but it does make one wonder, what did we get wrong? Why did the predictions of a pandemic turn out to be so exaggerated? Some people blame an overheated media, but it would have been difficult to ignore major international health organizations and governments when they were warning of catastrophe. I think there is a broader mistake in the way we look at the world. Once we see a problem, we can describe it in great detail, extrapolating all its possible consequences. But we can rarely anticipate the human response to that crisis. Take swine flu. The virus had crucial characteristics that led researchers to worry that it could spread far and fast. They described—and the media reported—what would happen if it went unchecked. But it did not go unchecked. In fact, swine flu was met by an extremely vigorous response at its epicenter, Mexico. The Mexican government reacted quickly and massively, quarantining the infected population, testing others, providing medication to those who needed it. The noted expert on this subject, Laurie Garrett, says, "We should all stand up and scream, 'Gracias, Mexico!' because the Mexican people and the Mexican government have sacrificed on a level that I'm not sure as Americans we would be prepared to do in the exact same circumstances. They shut down their schools. They shut down businesses, restaurants, churches, sporting events. They basically paralyzed their own economy. They've suffered billions of dollars in financial losses still being tallied up, and thereby really brought transmission to a halt." Every time one of these viruses is detected, writers and officials bring up the Spanish influenza epidemic of 1918 in which millions of people died. Indeed, during the last pandemic scare, in 2005, President George W. Bush claimed that he had been reading a history of the Spanish flu to help him understand how to respond. But the world we live in today looks nothing like 1918. Public health-care systems are far better and more widespread than anything that existed during the First World War. Even Mexico, a developing country, has a first-rate public-health system—far better than anything Britain or France had in the early 20th century.

AIDS won't cause extinction

Posner 5 (Senior Lecturer, U Chicago Law. Judge on the US Court of Appeals 7th Circuit. AB from Yale and LLB from Harvard. (Richard, Catastrophe, http://goliath.ecnext.com/coms2/gi_0199-4150331/Catastrophe-the-dozen-most-significant.html)

Yet the fact that Homo sapiens has managed to survive every disease to assail it in the 200,000 years or so of its existence is a source of genuine comfort, at least if the focus is on extinction events. There have been enormously destructive plagues, such as the Black Death, smallpox, and now AIDS, but none has come close to destroying the entire human race.

There is a biological reason. Natural selection favors germs of limited lethality; they are fitter in an evolutionary sense because their genes are more likely to be spread if the germs do not kill their hosts too quickly. THE AIDS VIRUS IS AN EXAMPLE OF A LETHAL VIRUS, WHOLLY NATURAL, THAT BY

LYING DORMANT YET INFECTIOUS IN ITS HOST FOR YEARS MAXIMIZES ITS SPREAD. Yet there is no danger that AIDS will destroy the entire human race. The likelihood of a natural pandemic that would cause the extinction of the human race is probably even less today than in the past (except in prehistoric times, when people lived in small, scattered bands, which would have limited the spread of disease), despite wider human contacts that make it more difficult to localize an infectious disease.

Alt causes to AIDS spread

Brower 3 (Jennifer, science/technology policy analyst, and Peter Chalk, political scientist, Summer Rand Review, Vol. 27, No. 2, "Vectors Without Borders," <http://www.rand.org/publications/randreview/issues/summer2003/vectors.html>)

This year's outbreak of severe acute respiratory syndrome (SARS) in Beijing, Hong Kong, Taipei, and Toronto is only one of the more recent examples of the challenge posed by infectious diseases. Highly resilient varieties of age-old ailments— as well as virulent emerging pathogens—are now prevalent throughout the world. THESE ILLNESSES INCLUDE cholera, pneumonia, malaria, and dysentery in the former case and Legionnaires' disease, ACQUIRED IMMUNE DEFICIENCY SYNDROME (AIDS), Ebola, and SARS in the latter. In the United States, West Nile virus entered New York in 2000 and then spread to 44 states by 2002, and monkey pox struck the Midwest this June. In the latter half of the 20th century, almost 30 new human diseases were identified. The spread of several of them has been expedited by the growth of antibiotic and drug resistance. Globalization, modern medical practices, urbanization, climate change, sexual promiscuity, intravenous drug use, and acts of bioterrorism further increase the likelihood that people will come into contact with potentially fatal diseases.

Impact Defense---AIDS---Ext---No Extinction

AIDS won't kill everyone

Caldwell, 03 (Joseph George, PhD, "The End of the World, and the New World Order", 3-6, <http://www.foundationwebsite.org/TheEndOfTheWorld.htm>)

Disease could wipe out mankind. It is clear that HIV/AIDS will not accomplish this – it is not even having a significant impact on slowing the population explosion in Africa, where prevalence rates reach over thirty percent in some countries. But a real killer plague could certainly wipe out mankind. The interesting thing about plagues, however, is that they never seem to kill everyone – historically, the mortality rate is never 100 per cent (from disease alone). Based on historical evidence, it would appear that, while plagues may certainly reduce human population, they are not likely to wipe it out entirely. This notwithstanding, the gross intermingling of human beings and other species that accompanies globalization nevertheless increases the likelihood of global diseases to high levels.

AIDS will evolve reduced virulence over time

Levin, 96 (Bruce R., Emory University, "The Evolution and Maintenance of Virulence in Microparasites" Emerging Infectious Diseases v. 2 <http://www.cdc.gov/ncidod/eid/vol2no2/levin.htm>)

The predictions that can be made on the basis of the current view of the evolution of virulence differ from predictions that might follow conventional wisdom because the new view allows for natural selection in the parasite population to favor the evolution and maintenance of some level of virulence. Moreover, even when there is a positive association between a parasite's virulence and its transmissibility, under the conditions described in the following paragraph, the predictions of new methods can still converge with those of conventional wisdom. If the density of the sensitive host population is regulated by the parasite, an extension of the enlightened theory predicts that natural selection in the micro parasite population can lead to continuous declines in the level of virulence, possibly to immeasurable values. Although not stated in this general way, the same conclusion about declining virulence can be drawn from models of the epidemiology of HIV/AIDS. During the epidemic phase of a micro parasitic infection, when the host population is composed primarily of susceptible hosts, selection favors parasites with high transmission rates and thus high virulence. As the epidemic spreads, the proportion of infected and immune hosts increases and the density of susceptible hosts declines. As a result, the capacity for infectious transmission becomes progressively less important to the parasite's Darwinian fitness and persistence in the host population. Selection now favors less virulent parasites that take longer to kill their host and, for that reason, are maintained in the host population for more extensive periods. Analogous arguments have been made for the latent period of a bacteriophage infection, the evolution of lysogeny, the tradeoff between vertical and horizontal transmission, and the advantages of micro parasite latency in general.

AIDS won't cause extinction

TNR, 95 (The New Republic, 95 (Malcolm Gladwell, "Plague Year, July, L/N)

Some of the blame for this transformation clearly belongs with aids, the epidemic that has more or less shattered the public's confidence in the power of science. But aids has never been seen as a threat to the entire species. In fact, aids is exactly the opposite of the kind of random, uncontrollable epidemic that seems to have now seized the popular imagination. The truth is that it is very hard to find an adequate explanation for the current American obsession. Joshua Lederberg's comment that we are worse off today than a century ago is proof only that he is a better student of microbiology than of history.

Impact Defense---Nuc Terror

No nuclear terrorism – Theoretical possibilities are irrelevant – too many steps, which make it functionally impossible

Chapman 12 (Stephen, editorial writer for Chicago Tribune, “CHAPMAN: Nuclear terrorism unlikely,” May 22, <http://www.oaoa.com/articles/chapman-87719-nuclear-terrorism.html>)

A layperson may figure it's only a matter of time before the unimaginable comes to pass. Harvard's Graham Allison, in his book “Nuclear Terrorism,” concludes, “On the current course, nuclear terrorism is inevitable.” But remember: Afxter Sept. 11, 2001, we all thought more attacks were a certainty. Yet al-Qaida and its ideological kin have proved unable to mount a second strike. Given their inability to do something simple — say, shoot up a shopping mall or set off a truck bomb — it's reasonable to ask whether they have a chance at something much more ambitious. Far from being plausible, argued Ohio State University professor John Mueller in a presentation at the University of Chicago, “the likelihood that a terrorist group will come up with an atomic bomb seems to be vanishingly small.” The events required to make that happen comprise a multitude of Herculean tasks. First, a terrorist group has to get a bomb or fissile material, perhaps from Russia's inventory of decommissioned warheads. If that were easy, one would have already gone missing. Besides, those devices are probably no longer a danger, since weapons that are not maintained quickly become what one expert calls “radioactive scrap metal.” If terrorists were able to steal a Pakistani bomb, they would still have to defeat the arming codes and other safeguards designed to prevent unauthorized use. As for Iran, no nuclear state has ever given a bomb to an ally — for reasons even the Iranians can grasp. Stealing some 100 pounds of bomb fuel would require help from rogue individuals inside some government who are prepared to jeopardize their own lives. Then comes the task of building a bomb. It's not something you can gin up with spare parts and power tools in your garage. It requires millions of dollars, a safe haven and advanced equipment — plus people with specialized skills, lots of time and a willingness to die for the cause. Assuming the jihadists vault over those Himalayas, they would have to deliver the weapon onto American soil. Sure, drug smugglers bring in contraband all the time — but seeking their help would confront the plotters with possible exposure or extortion. This, like every other step in the entire process, means expanding the circle of people who know what's going on, multiplying the chance someone will blab, back out or screw up. That has heartening implications. If al-Qaida embarks on the project, it has only a minuscule chance of seeing it bear fruit. Given the formidable odds, it probably won't bother. None of this means we should stop trying to minimize the risk by securing nuclear stockpiles, monitoring terrorist communications and improving port screening. But it offers good reason to think that in this war, it appears, the worst eventuality is one that will never happen.

No nuclear retaliation – Obama is different

Babbin 9 (Jed, Editor of Human Events, “How Will Obama Handle Military Challenges?” Human Events, Feb. 2.

http://findarticles.com/p/articles/mi_qa3827/is_20090202/ai_n31362464/pg_7/?tag=content;col1)

If another major terrorist attack causes mass casualties in America, what will Obama do? If al Qaeda, which limits itself to big attacks, manages another, Obama will find himself in the same quandary that Bush did. We have put enormous resources into interrupting terrorist financing and in trying to capture or kill bin Laden and Zawahri, his second in command. Obama will not be able to do more. Obama, like John Kerry before him, does not understand how Presidents have to act on the basis of information that's reliable and not wait for conclusive evidence. Obama wants to focus on domestic issues and let his advisors keep the world at bay. If the source of the attack is disputed, Obama will have to rely on his own judgment and his Clinton-era advisors as well as Defense Secretary Gates and National Security Advisor Jones. But Obama's judgment lacking any context of experience— is a lawyer's judgment, just like Bill Clinton's. It's unimaginable that he would decide to act on evidence that wouldn't hold up in court. If we suffer another major terrorist attack and the source of the attack is unclear, Barack Obama will likely give impassioned speeches, and rely on the UN and other nations to

deal with the perpetrators. The media and Obama himself are trying to paint him as the second coming of Abraham Lincoln. Lincoln chose to do everything and anything to preserve the Union. That commitment and decisiveness are not part of the character of our 44th President.

Impact Defense---Nuc Terror---Ext---No Terror

Risk is overstated – terrorists can't get nukes and don't want them

Hashmi 12 (Muhammad, author of "Nuclear Terrorism in Pakistan: Myth of Reality," and expert in defense and strategic studies, "Difficulties for Terrorists to Fabricate Nuclear RDD/IND Weapons – Analysis," Jan 30, <http://www.eurasiareview.com/30012012-difficulties-for-terrorists-to-fabricate-nuclear-rddind-weapons-analysis/>)

Many believe that these threats of nuclear terrorism are inflated and have been overstated because technical hurdles still prevent terrorists from acquiring or building a nuclear device. Brian McNair argues that the threats of nuclear terrorism have been exaggerated by the world. As the matter stands today, the possibility of nuclear terrorism remains more a fantasy than fact. Furthermore, Shireen Mazari argues that Nuclear weapons would not be a weapon of choice for terrorists. Instead, she claims that "terrorists already have access to enough destructive capabilities with in conventional means, so their need for nuclear weapons is simply not there." Analysts have endorsed the assessment that the threat of nuclear action by terrorists appears to be exaggerated. Similarly, religious cults and left-wing terrorists with their beliefs of certain prohibitions against mass murder are less likely by many estimates to use WMDs in a terrorist activity, even though there is not any guarantee that terrorists will use WMDs. It has also been witnessed that no terrorist group is known to have developed or deployed a nuclear explosive device, and the severity of the threat of nuclear terrorism remains disputed amongst international scholars. So it becomes too early to conclude that how grave the threats of nuclear terrorism are. James Kitfield concludes in an interview from security expert that: Seven years after the September 11, 2001, terrorist attacks, experts and presidential candidates continue to put nuclear terrorism atop their lists of the gravest threats to the United States. Yet Brian Michael Jenkins, a longtime terrorism expert with the Rand Corp., says that the threat lies more in the realms of Hollywood dramas and terrorist dreams than in reality. There has never been an act of nuclear terrorism, he notes, yet the threat is so potentially catastrophic that it incites fear — and that fear fulfills a terrorist's primary goal. In nutshell, we can say that it takes much more than knowledge of the workings of nuclear weapons and access to fissile material to successfully manufacture a usable weapon. Current safety and security systems help ensure that the successful use of a stolen weapon would be very unlikely. Meaning, it remains, thankfully, an incredibly challenging task for terrorists to practice their idea in a successful way to meet their objectives.

Nuclear weapons would run counter to the goals of most terrorist organizations

Kapur 8 (associate professor in the Department of National Security Affairs at the Naval Postgraduate School, 2008, S. Paul. The Long Shadow: Nuclear Weapons and Security in 21st Century Asia. pg. 32)

Before a terrorist group can attempt to use nuclear weapons, it must meet two basic requirements. First, the group must decide that it wishes to engage in nuclear terrorism. Analysts and policy makers often assume that terrorist groups necessarily want to do so (Carter 2004; U.S. Government 2002). However, it is not clear that terrorist organizations would necessarily covet nuclear devices. Although analysts often characterize terrorism as an irrational activity (Laqueur 1999: 4-5), extensive empirical evidence indicates that terrorist groups in fact behave rationally, adopting strategies designed to achieve particular ends (Crenshaw 1995: 4; Pape 2003: 344). Thus whether terrorists would use nuclear weapons is contingent on whether doing so is likely to further their goals. Under what circumstances could nuclear weapons fail to promote terrorists' goals? For certain types of terrorist objectives, nuclear weapons could be too destructive. Large-scale devastation could negatively influence audiences important to the terrorist groups. Terrorists often rely on populations sympathetic to their cause for political, financial, and military support. The horrific destruction of a nuclear explosion could alienate segments of this audience. People who otherwise would sympathize with the terrorists may conclude that in using a nuclear device terrorists had gone too far and were no longer deserving of support. The catastrophic effects of nuclear weapons could also

damage or destroy the very thing that the terrorist group most values. For example, if a terrorist organization were struggling with another group for control of their common homeland, the use of nuclear weapons against the enemy group would devastate the terrorists' own home territory. Using nuclear weapons would be extremely counterproductive for the terrorists in this scenario.

Terrorist can't attain nuclear weapons

Schwartz 3 (US office director of the International Policy Institute for Counter-Terrorism, and Ophir Falk, Vice President of Advanced Security Integration Ltd., 2003 (Yaron and Ophir, "Chemical Biological Radiological Nuclear Terrorism" 5-13-2003 <http://www.ict.org.il/articles/articledet.cfm?articleid=487>)

For a terrorist group to obtain a nuclear weapon, two principal channels exist: build a device from scratch or somehow procure or steal a ready-made one or its key components. *Neither of these is likely.* Of all the possibilities, constructing a bomb from scratch, without state assistance, is the most unlikely. "So remote," in the words of a senior nuclear scientist at the Los Alamos National Laboratory, "that it can be essentially ruled out." The chief obstacle lies not only in producing the nuclear fuel—either bomb-grade uranium or plutonium—but also the requirements for testing and securing safe havens for the terrorists.[16] Unlike uranium, a much smaller quantity of plutonium is required to form a critical mass. Yet to make enough of it for a workable bomb, a *reactor* is needed. Could terrorists buy one? Where would they build it? Could such a structure go undetected by satellites and other intelligence tools? That is all very implausible indeed. If making nuclear-bomb fuel is out of the question, why not just steal it, or buy it on the black market? Consider plutonium: if terrorists did manage to procure some weapon-grade plutonium, would their problems be over? Far from it: plutonium works only in an "implosion"-type bomb, which is about ten times more difficult to build than the more simple uranium bomb used at Hiroshima. Among a litany of specialized requirements is an experienced designer, a number of other specialists and a testing program. Hence, the terrorist's chances of getting an implosion bomb to work are very low. An alternative to stealing plutonium is bomb-grade uranium. The problem with buying bomb-grade uranium is that one would need a great deal of it—around 50kg for a gun-type bomb—and nothing near that amount has turned up in the black market.[17] Even when considering a country like Pakistan, the only possibility for terrorists to lay their hands on that country's uranium would be if its government fell under the control of sympathizers. Given that Pakistan's army is by far the most effective and stable organization in the country, there is not much chance of that happening. Russia, again, is the terrorists' best bet and therefore a potential target. It has tons of bomb-grade uranium left over from the cold war and, in addition to bombs, has used this material to fuel nuclear submarines and research reactors. With a reported history of smuggling attempts, there are definite prospects in Russia. If terrorists could strike the main deposit and get enough uranium for a bomb, they would be on their way. But it would still be a long journey: designing and building the bomb is anything but a trivial undertaking, as is recruiting the suitably skilled technician/s for the task. The main risk for terrorists is getting caught. Finding an isolated location for minimal risk of detection also would not be easy. Stealing or buying a complete bomb would circumvent the aforementioned obstacles. But this option presents other pitfalls which are even greater: all countries, including Russia and Pakistan (with US assistance), make ever greater efforts to safeguard their warheads and materials, and even rogue states—if they should get the bomb (as North Korea appears to staunchly pursue)—would be highly likely to do the same. Countries employ security measures specifically designed to prevent theft. Warheads are typically stored in highly restricted bunkers. Terrorists would have a very hard time trying to take over one of these and even if successful, it would be much harder to leave with the contents in hand.[18]

Nuclear terrorism wrong – tech barriers

Mueller, 10 (John Mueller is Professor of Political Science at Ohio State University and the author of "The Remnants of War. Foreign Policy –JANUARY/FEBRUARY 2010 – http://www.foreignpolicy.com/articles/2010/01/04/think_again_nuclear_weapons?page=0,2)

"Fabricating a Bomb Is 'Child's Play.'" Hardly. An editorialist in Nature, the esteemed scientific journal, did apply that characterization to the manufacture of uranium bombs, as opposed to plutonium bombs, last January, but even that seems an absurd exaggeration. Younger, the former Los Alamos research director, has expressed his amazement at how "self-declared 'nuclear weapons experts,' many of whom have never seen a real nuclear weapon," continue to "hold forth on how easy it is to make a functioning nuclear explosive." Uranium is "exceptionally difficult to machine," he points out, and "plutonium is one of the most complex metals ever discovered, a material whose basic properties are sensitive to exactly how it is processed." Special technology is required, and even the simplest weapons require precise tolerances. Information on the general idea for building a bomb is available online, but none of it, Younger says, is detailed enough to "enable the confident assembly of a real nuclear explosive." A failure to appreciate the costs and difficulties of a nuclear program has led to massive overestimations of the ability to fabricate nuclear weapons. As the 2005 Silberman-Robb commission, set up to investigate the intelligence failures that led to the Iraq war, pointed out, it is "a fundamental analytical error" to equate "procurement activity with weapons system capability." That is, "simply because a state can buy the parts does not mean it can put them together and make them work." For example, after three decades of labor and well over \$100 million in expenditures, Libya was unable to make any progress whatsoever toward an atomic bomb. Indeed, much of the country's nuclear material, surrendered after it abandoned its program, was still in the original boxes.

Impact Defense---Nuc Terror---Ext---No Retaliation

Obama won't use nukes

AP 7 ("Obama says no nuclear weapons to fight terror")

Democratic presidential hopeful Barack Obama said Thursday he would not use nuclear weapons "in any circumstance" to fight terrorism in Afghanistan and Pakistan. "I think it would be a profound mistake for us to use nuclear weapons in any circumstance," Obama said, with a pause, "involving civilians." Then he quickly added, "Let me scratch that. There's been no discussion of nuclear weapons. That's not on the table."

The US would be unlikely to retaliate against a nuclear attack from a non-state actor

Rosen 6 (Stephen Peter, Beton Michael Kaneb Professor of National Security and Military Affairs and Director of the John M. Olin Institute for Strategic Studies at Harvard University, "After Proliferation: What to Do If More States Go Nuclear" Sept/Oct, Foreign Affairs)

During the Cold War, the small number of nuclear states meant that the identity of any nuclear attacker would be obvious. Preparations could thus be made for retaliation, and this helped deter first strikes. In a multipolar nuclear Middle East, however, such logic might not hold. For deterrence to work in such an environment, there would have to be detection systems that could unambiguously determine whether a nuclear-armed ballistic missile was launched from, say, Iran, Turkey, or Saudi Arabia. In earlier decades, the United States spent an enormous amount of resources on over-the-horizon radars and satellites that could detect the origin of missile launches in the Soviet Union. But those systems were optimized to monitor the Soviet Union and may not be as effective at identifying launches conducted from other countries. It may be technically simple for the United States (or Israel or Saudi Arabia) to deploy such systems, but until they exist and their effectiveness is demonstrated, deterrence might well be weak; it would be difficult to retaliate against a bomb that has no clear return address.

The public won't demand retaliation – studies prove

Jenks-Smith and Herron 5 (Hank and Kerry, professor and adjunct professor at George Bush School of Government and Public Service at Texas A&M University, "United States Public Response to Terrorism: Fault Lines or Bedrock?" Review of Policy Research. September. Lexis)

Our final contrasting set of expectations relates to the degree to which the public will support or demand retribution against terrorists and supporting states. Here our data show that support for using conventional United States military force to retaliate against terrorists initially averaged above midscale, but did not reach a high level of demand for military action. Initial support declined significantly across all demographic and belief categories by the time of our survey in 2002. Furthermore, panelists both in 2001 and 2002 preferred that high levels of certainty about culpability (above 8.5 on a scale from zero to ten) be established before taking military action. Again, we find the weight of evidence supporting revisionist expectations of public opinion. Overall, these results are inconsistent with the contention that highly charged events will result in volatile and unstructured responses among mass publics that prove problematic for policy processes. The initial response to the terrorist strikes demonstrated a broad and consistent shift in public assessments toward a greater perceived threat from terrorism, and greater willingness to support policies to reduce that threat. But even in the highly charged context of such a serious attack on the American homeland, the overall public response was quite measured. On average, the public showed very little

propensity to undermine speech protections, and initial willingness to engage in military retaliation moderated significantly over the following year.

Impact Defense---Hotspots

No impact – we’ve survived periods of low readiness

NSN, 8 (National Security Network 8 (May 13, <http://www.nsnetwork.org/node/850>))

Our military is second to none, but eight years of negligence, lack of accountability, and a reckless war in Iraq have left our ground forces facing shortfalls in both recruitment and readiness. Every service is out of balance and ill-prepared. We need a new strategy to give the military the tools it needs for the challenges we face today. And we need leadership that meets our obligations to the men and women who put their lives on the line. Overview The U.S. military is a fighting force second to none. It didn't get that way by accident – it took decades of careful stewardship by civilian as well as military leaders in the Pentagon, the White House, and on Capitol Hill. But eight years of Administration recklessness, and a lack of oversight from conservatives on Capitol Hill, have put the military under enormous strain. Active-duty generals at the highest levels have said that “the current demand for our forces is not sustainable... We can't sustain the all-volunteer force at the pace that we are going on right now” (Army Chief of Staff George Casey, April 2008); that in terms of readiness, many brigades being sent back to Afghanistan and Iraq were “not where they need to be” (Army Vice-Chief of Staff Richard Cody, SASC subcommittee hearing, April 14, 2008); and that “we cannot now meet extra force requirements in places like Afghanistan” (Chairman of the Joint Chiefs of Staff Mullen on National Public Radio, April 2008). Readiness and Response: Two-thirds of the Army – virtually all of the brigades not currently deployed to Afghanistan or Iraq – are rated “not combat ready.” The dramatic equipment shortages of a few years ago have been improved but not completely remedied. Recruitment and Retention: These conditions of service, and the strains they place on military family members, have hindered Army efforts (and to a lesser extent those of the Marine Corps) to recruit and retain the requisite number and quantity of service members. The Army has been forced to lower its educational and moral standards and allow an increasing number of felons into its ranks. It is also struggling to keep junior officers, the brains of the force, who represent the height of the military's investment in its people – and whose willingness to stay on represents a crucial judgment on Administration policies. The Marine Corps, America's emergency 911 force, is under similar strain. The Commandant of the Marine Corps said in February 2008 that the Marines will not be able to maintain a long term presence in both Afghanistan and Iraq. The National Guard and Reserve are already suffering from severe shortages of equipment and available combat personnel. In many states, the Army National Guard would struggle to respond to a natural or man-made disaster – just as the Kansas National Guard struggled to respond to the severe tornados last year. How, and whether, we rebuild our military in the wake of the fiasco in Iraq will likely shape it for the next generation. Too much of our military posture is left over from the Cold War. Our forces are being ground down by low-tech insurgencies in Iraq and Afghanistan, and the most immediate threat confronting the U.S. is a terrorist network that possesses no tanks or aircraft. We must learn the lessons of Iraq and dramatically transform our military into a 21st century fighting force ready to confront the threats of today and tomorrow.

Impact Defense---Hotspots---A2: Africa

African war doesn't escalate

Barrett 5 (Robert, Ph.D. Student in the Centre for Military and Strategic Studies – University of Calgary, “Understanding the Challenges of African Democratization through Conflict Analysis”, 6-1, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=726162)

Westerners eager to promote democracy must be wary of African politicians who promise democratic reform without sincere commitment to the process. Offering money to corrupt leaders in exchange for their taking small steps away from autocracy may in fact be a way of pushing countries into anocracy. As such, world financial lenders and interventionists who wield leverage and influence must take responsibility in considering the ramifications of African nations who adopt democracy in order to maintain elite political privileges. The obvious reason for this, aside from the potential costs in human life should conflict arise from hastily constructed democratic reforms, is the fact that Western donors, in the face of intrastate war would then be faced with channeling funds and resources away from democratization efforts and toward conflict intervention based on issues of human security. This is a problem, as Western nations may be increasingly wary of intervening in Africa hotspots after experiencing firsthand the unpredictable and unforgiving nature of societal warfare in both Somalia and Rwanda. On a cost/benefit

basis, **the West continues to be** somewhat **reluctant to get to get involved in Africa's** dirty **wars**, evidenced by **its** political **hesitation when discussing** ongoing sanguinary grassroots **conflicts in Africa**. Even as the world apologizes for bearing witness to the Rwandan genocide without having intervened, **the U**nited **S**tates, recently using the label 'genocide' in the context of the Sudanese conflict (in September of 2004), has **only proclaimed sanctions against Sudan, while dismissing** any **suggestions at** actual **intervention** (Giry, 2005). Part of **the problem is** that **traditional military** and diplomatic **approaches** at separating combatants and enforcing ceasefires **have yielded little in Africa**. **No powerful nations want to get embroiled** in conflicts they cannot win – especially those conflicts **in which the intervening nation has very little interest**.

Their nuclear escalation claim is empirically denied by dozens of African conflicts

Docking, 7 (Tim Docking, African Affairs Specialist with the United States Institute of Peace, 2007, Taking Sides Clashing Views on African Issues, p. 372)

Nowhere was the scope and intensity of violence during the 1990s as great as in Africa. While the general trend of armed conflict in Europe, Asia, the Americas, and the Middle East fell during the 1989-99 period, the 1990s witnessed an increase in the number of conflicts on the African continent. During this period, 16 UN peacekeeping missions were sent to Africa. (Three countries-Somalia, Sierra Leone, and Angola-were visited by multiple missions during this time.) Furthermore, this period saw internal and interstate violence in a total of 30 sub-Saharan states. **In 1999 alone, the continent was plagued by 16 armed conflicts**, seven of which were wars with more than 1,000 battle-related deaths (Journal of Peace Research, 37:5, 2000, p. 638). In 2000, the situation continued to deteriorate: renewed heavy fighting between Eritrea and Ethiopia claimed tens of thousands of lives in the lead-up to a June ceasefire and ultimately the signing of a peace accord in December; continued violence in the Democratic Republic of Congo (DRC), Sierra Leone, Burundi, Angola, Sudan, Uganda, and Nigeria as well as the outbreak of new violence between Guinea and Liberia, in Zimbabwe, and in the Ivory Coast have brought new hardship and bloodshed to the continent.

Outside powers won't intervene in African conflicts

Docking, 7 (Tim Docking, African Affairs Specialist with the United States Institute of Peace, 2007, Taking Sides Clashing Views on African Issues, p. 376)

SINCE the tragedy in **SOMALIA**, **THE TREND HAS BEEN FOR WESTERN NATIONS TO REFUSE TO SEND TROOPS INTO AFRICA'S HOT SPOTS**. Jordan recently underscored this point when it expressed frustration with the West's

failure to commit soldiers to the UNAMSIL mission as a reason for the withdrawal of its troops from Sierra Leone. America's aversion to peacekeeping in Africa also reflects broader U.S. foreign policy on the continent. AFRICA OCCUPIES A MARGINAL ROLE IN AMERICAN FOREIGN POLICY IN GENERAL (a point highlighted by conference participants).

Impact Defense---Hotspots---A2: Central Asia

No Central Asia impact

Collins and Wohlforth, 4 (Kathleen A. Collins and William C. Wohlforth 03-04, Assistant Professor of Political Science at the University of Notre Dame and Associate Professor of Government at Dartmouth College, ""Central Asia: Defying 'Great Game' Expectations"" Strategic Asia)

The popular great game lens for analyzing Central Asia fails to capture the declared interests of the great powers as well as the best reading of their objective interests in security and economic growth. Perhaps more importantly, it fails to explain their actual behavior on the ground, as well the specific reactions of the Central Asian states themselves. Naturally, there are competitive elements in great power relations. Each country's policymaking community has slightly different preferences for tackling the challenges presented in the region, and the more influence they have the more able they are to shape events in concordance with those preferences. But these clashing preferences concern the means to serve ends that all the great powers share. To be sure, policy-makers in each capital would prefer that their own national firms or their own government's budget be the beneficiaries of any economic rents that emerge from the exploitation and transshipment of the region's natural resources. But the scale of these rents is marginal even for Russia's oil-fueled budget. And for taxable profits to be created, the projects must make sense economically—something that is determined more by markets and firms than governments. Does it matter? The great game is an arresting metaphor that serves to draw people's attention to an oft-neglected region. The problem is that the great-game lens can distort realities on the ground, and therefore bias analysis and policy. For when great powers are locked in a competitive fight, the issues at hand matter less than their implication for the relative power of contending states. Power itself becomes the issue—one that tends to be nonnegotiable. Viewing an essential positive-sum relationship through zero sum conceptual lenses will result in missed opportunities for cooperation that leaves all players—not least the people who live in the region—poorer and more insecure. While cautious realism must remain the watchword concerning an impoverished and potentially unstable region comprised of fragile and authoritarian states, our analysis yields at least conditional and relative optimism. Given the confluence of their chief strategic interests, the major powers are in a better position to serve as a stabilizing force than analogies to the Great Game or the Cold War would suggest. It is important to stress that the region's response to the profoundly destabilizing shock of coordinated terror attacks was increased cooperation between local governments and China and Russia, and—multipolar rhetoric notwithstanding—between both of them and the United States. If this trend is nurtured and if the initial signals about potential SCO-CSTO-NATO cooperation are pursued, another destabilizing shock might generate more rather than less cooperation among the major powers. Uzbekistan, Kyrgyzstan, Tajikistan, and Kazakhstan are clearly on a trajectory that portends longer-term cooperation with each of the great powers. As military and economic security interests become more entwined, there are sound reasons to conclude that "great game" politics will not shape Central Asia's future in the same competitive and destabilizing way as they have controlled its past. To the contrary, mutual interests in Central Asia may reinforce the broader positive developments in the great powers' relations that have taken place since September 11, as well as reinforce regional and domestic stability in Central Asia.

No great powers would get drawn into a conflict

Weitz 6 (Richard, Senior Fellow and Director of the Center for Future Security Strategies at Hudson Institute, Washington Quarterly 29.3, Muse)

Central Asian security affairs have become much more complex than during the original nineteenth-century great game between czarist Russia and the United Kingdom. At that time, these two governments could largely dominate local affairs, but today a variety of influential actors are involved in the region. The early 1990s witnessed a vigorous competition between Turkey and Iran for influence in Central Asia. More recently, India and Pakistan have pursued a mixture of cooperative and competitive policies in the region that have influenced and been affected by their broader relationship. The now independent Central Asian countries also invariably affect the region's

international relations as they seek to maneuver among the major powers without compromising their newfound autonomy. Although Russia, [End Page 155] China, and the United States substantially affect regional security issues, they cannot dictate outcomes the way imperial governments frequently did a century ago. Concerns about a renewed great game are thus exaggerated. The contest for influence in the region does not directly challenge the vital national interests of China, Russia, or the United States, the most important extraregional countries in Central Asian security affairs. Unless restrained, however, competitive pressures risk impeding opportunities for beneficial cooperation among these countries. The three external great powers have incentives to compete for local allies, energy resources, and military advantage, but they also share substantial interests, especially in reducing terrorism and drug trafficking. If properly aligned, the major multilateral security organizations active in Central Asia could provide opportunities for cooperative diplomacy in a region where bilateral ties traditionally have predominated.

Impact Defense---Hotspots---A2: East Asia

No war

Shuo 12 (Wang Shuo, managing editor of Caixin Media: the top English-language magazine covering business and finance in China, 9/12, "Closer Look: Why War Is Not an Option", english.caixin.com/2012-09-12/100436770.html)

It is highly unlikely that China will fight a hot war with any of its neighbors over territorial disputes, but it should still reexamine who its friends really are. There won't be a war in East Asia. The United States has five military alliances in the western Pacific: with South Korea, Japan, Thailand, the Philippines and Singapore, and American battleships are busy patrolling the seas. Without a go-ahead from Washington, there is no possibility of a hot war between battleships of sovereign countries here. As to conflicts between fishing boats and patrol boats, that's not really a big deal. The Chinese have to ponder several questions: If the country has battleship wars with Japan, can it win without using ground-based missiles? Will the war escalate if missiles are deployed? What will happen if the war continues with no victory in sight? In the last few days, one country bought islands, and the other announced the base points and the baselines of its territorial waters. But look closely, China and Japan have at least two things in common in this hostile exchange: At home they fan up nationalism, and in the international arena no activities have exceeded the scope of previous, respective claims on sovereignty. This means there is no possibility of a war in East Asia, not even remotely. From the East Sea to the South Sea, China has reached a new low in relations with Asian neighbors. It's hard to remove the flashpoints in territorial disputes, but the country can surely reduce their impacts. And the key is relations with the United States.

Impact Defense---Hotspots---Ext---No Impact

No terminal impact to low readiness – empirics prove

Huffington Post 8 (Mar 8, http://www.huffingtonpost.com/2008/04/01/senior-army-officials-us_n_94571.html)

Senior Army and Marine Corps leaders said yesterday that the increase of more than 30,000 troops in Iraq and Afghanistan has put unsustainable levels of stress on U.S. ground forces and has put their readiness to fight other conflicts at the lowest level in years. In a stark assessment a week before Gen. David H. Petraeus, the top U.S. commander in Iraq, is to testify on the war's progress, Gen. Richard A. Cody, the Army's vice chief of staff, said that the heavy deployments are inflicting "incredible stress" on soldiers and families and that they pose "a significant risk" to the nation's all-volunteer military.

Impact empirically denied by three years of readiness shortfalls

AP 9 (Feb 20, http://www.lubbockonline.com/stories/022009/nat_395947018.shtml)

For the third consecutive year, a classified Pentagon assessment has concluded there's a significant risk that the U.S. military could not respond quickly and fully to any new crisis. Associated Press has learned. The latest risk assessment, drawn up by Adm. Mike Mullen, chairman of the Joint Chiefs of Staff, comes despite recent security gains in Iraq and plans for troop cuts there. The assessment finds that the U.S. continues to face persistent terrorist threats and the military is still stretched and strained from long and repeated tours to the war front. Senior military officials spoke about the report on condition of anonymity because it is a classified document. Prepared every year and routinely delivered to Congress with the budget, the risk assessment paints a broad picture of security threats and hot spots around the world and the U.S. military's ability to deal with them. Adm. Mullen has delivered it to Defense Secretary Robert M. Gates. Because the threat is rated as significant, Mr. Gates will send an accompanying report to Congress outlining what the military is doing to address the risks. That report has not yet been finished. This year's assessment finds many of the same global security issues as in previous years - ranging from terrorist organizations and unstable governments to the potential for high-tech cyberattacks. It also reflects the Pentagon's ongoing struggle to maintain a military that can respond to threats from other countries while honing newer counterinsurgency techniques to battle more unconventional dangers such as suicide bombers and lethal roadside bombs. Daniel Gouré, vice president of the Lexington Institute, a military-policy research group in Arlington, said the assessment would take into account the strains on the force, the wear and tear on aircraft and other military equipment, and a host of global flashpoints. "This is a chairman who looks around the world and sees - right now, today - immediate, near-term problems like North Korea; the larger questions of Pakistan and its future; Iran and what is going on there; Russia and Georgia; Venezuela, which has a close relationship with Russia and is buying arms all over the place; and Cuba," Mr. Gouré said. While officials are preparing to reduce troop levels in Iraq, they are increasing forces in Afghanistan - giving troops little break from their battlefield tours. The Pentagon has repeatedly stressed ongoing efforts to increase the size of the Army and Marine Corps, but that growth is only now starting to have an impact.

Status Quo Solves

Status quo solves – Embassies already approved, ambassador not key and future Senates can approve DeLaurentis

Crabtree 7/2 {Susan, syndicated politics correspondent for The Hill/Congressional Quarterly/Roll Call, B.S. in broadcast journalism (University of Southern California), "Obama ready to fight over U.S. ambassador to Cuba," The Washington Examiner, 2015, <http://www.washingtonexaminer.com/obama-ready-to-fight-over-u.s.-ambassador-to-cuba/article/2567500#THUR>}

Juan Carlos HIDALGO, A POLICY ANALYST on the Western Hemisphere AT THE CATO INSTITUTE, SAID THE BUDGET for the U.S. mission in Havana, known as the U.S. Interests Section, has already been approved through 2017 so OPENING AN OFFICIAL EMBASSY THERE IS AS simple as changing the signage ON THE BUILDING. LIKEWISE, HE SAID, the current head of the mission, Jeffrey DELAURENTIS, a 24-year veteran of the Foreign Service, HAS BEEN IN HAVANA SINCE AUGUST 2014 and could simply remain IN AN ACTING POSITION with no impact on his role THERE. "I DON'T THINK WE WILL HAVE AN OFFICIAL AMBASSADOR TO CUBA ANYTIME SOON," HE SAID, BUT that doesn't really hurt the embassy's ability to function. DELAURENTIS WILL HAVE all THE CAPABILITIES OF AN ACTING AMBASSADOR EVEN IF HE HAS TO WAIT FOR THE TITLE until Republicans lose the majority IN THE SENATE, HIDALGO SAID.

Highways - AFF

N/U – No Long-Term

No long-term extension which their impact assumes

Politico 7-6-15 [Congress returns for pre-recess highway sprint,
<http://www.politico.com/story/2015/07/congress-returns-highway-sprint-119787.html>]

JUST COMING UP WITH THE \$11 BILLION NEEDED TO KEEP THE FEDERAL HIGHWAY PROGRAM RUNNING
until the end of the year — let alone fully addressing a national infrastructure riddled with crumbling roads and bridges — WILL BE
CHALLENGING, given the need to offset any spending increase with a corresponding cut or revenue increase. BUT FINDING THE
\$90 BILLION LAWMAKERS NEED FOR THE SIX-YEAR HIGHWAY AND TRANSIT BILL THAT CONGRESS
WANTS WILL BE **nearly impossible** FOR A GOP THAT'S STRONGLY AVERSE TO RAISING MONEY WITH
NEW TAXES BUT HAS LITTLE ROOM FOR FURTHER BUDGET CUTS.

N/U – Bipart Fails

Wont' pass - Highway bipartisanship won't be enough – assumes their warrants

Sargent 7-8-15 [Greg, Breaking: Congress starts thinking about maybe funding our infrastructure, <http://www.washingtonpost.com/blogs/plum-line/wp/2015/07/08/breaking-congress-starts-thinking-about-maybe-funding-our-infrastructure/>]

THE NEW PROPOSAL builds on previous ones released by both Congressional Republicans and the White House that would overhaul tax rules for international corporations and bring in a one-time burst in revenues that could be used to temporarily replenish the HTF. The idea picked up some encouraging words today from the White House and from Paul Ryan, the chairman of the House Ways and Means Committee. The proposal COULD “POTENTIALLY UNLOCK A SOLUTION TO OUR HIGHWAY TRUST FUND SHORTFALL,” Ryan said. Obviously there are reasons for extreme pessimism that Congress could finish something like this in four short weeks, particularly since a whole lot of lobbyists are likely to get very worked up about it. But still: right now, it's unclear whether there is any other idea out there to replenish the fund that has the support of both Republicans and Democrats, Obama and Paul Ryan included. MEANWHILE, ANOTHER GLIMMER OF OPTIMISM FROM THE SENATE FINANCE COMMITTEE COULD BE SPOTTED IN THE SERIES OF BIPARTISAN REPORTS from the committee's working groups on how the tax system might be overhauled. One particularly interesting nugget: In the report from the Finance Committee's infrastructure working group, lawmakers concede that corporate repatriation — of the sort that we would get from tax reform — just isn't a long term solution. Instead, the report suggests a Vehicle Miles Traveled tax, which generally taxes users based on how many miles they travel, might be a long term solution to the infrastructure spending problem. “A VMT has the potential to improve the efficiency of highway financing because the tax can be calibrated closely to the costs that vehicles impose in terms of road damage and congestion,” the report says. Michael O'Brien, a spokesman for the Association of Equipment Manufacturers, which is lobbying for more infrastructure spending, tells me he's “particularly encouraged” by the inclusion of a VMT, because it suggests growing “bipartisan and bicameral interest” in funding infrastructure. “It's time for our elected leaders to step up and finally develop a long-term solution to our infrastructure needs, not another stopgap measure that saps our economy of certainty and further delays our ability to build a 21st Century infrastructure,” O'Brien says. WHAT'S PARTICULARLY STRIKING ABOUT ALL OF THIS IS THAT FOR MONTHS, WE WERE TOLD THAT FUNDING OUR INFRASTRUCTURE WAS ONE OF THE VERY FEW AREAS WHERE COMPROMISE BETWEEN THE WHITE HOUSE AND THE NEW GOP CONGRESS WOULD BE POSSIBLE. After all, infrastructure funding should constitute some of the lowest-hanging fruit, politically and ideologically speaking, that one can imagine. MANY LAWMAKERS IN BOTH PARTIES, AND A LARGE RANGE OF OUTSIDE GROUPS ON BOTH SIDES, WANT IT TO HAPPEN FOR THE LONG TERM GOOD OF THE COUNTRY. YET THE IDEA THAT THIS COULD ACTUALLY HAPPEN SEEMS **borderline hallucinatory.**

N/U – Funding

Won't pass – every single funding proposal is too controversial

Fiscal Times 7-8-15 [Why Congress Can't Make a Deal on Highway Spending,

<http://www.thefiscaltimes.com/2015/07/08/Why-Congress-Can-t-Make-Deal-Highway-Spending>]

THE LATEST WORD FROM CAPITOL HILL ON THE FATE OF THE LONG-SUFFERING DRIVE FOR NEW FEDERAL HIGHWAY AND INFRASTRUCTURE LEGISLATION IS NOT ENCOURAGING: REPUBLICAN AND DEMOCRATIC LAWMAKERS ARE VERY LIKELY TO KICK THE CAN DOWN THE ROAD YET AGAIN THIS

SUMMER. Key Republican and Democratic senators -- including Senate Environment and Public Works Chair James Inhofe (R-OK) and ranking Democrat Barbara Boxer of California -- reached a tentative agreement late last month on the broad outlines of a new six-year, roughly \$575 billion transportation bill aimed at addressing the country's crumbling infrastructure and need for more construction jobs. After extending the existing legislation nearly three dozen times before, the Senate and House appeared to be gearing up for finally breaking a nearly two-year impasse by a working deadline of July 31. But Sen. Ron Wyden of Oregon, the ranking Democrat on the Senate Finance Committee, and Sen.

John Hoeven (R-ND) signaled Wednesday during a joint appearance at the Bipartisan Policy Center that **CONGRESS MOST LIKELY** this month **WILL PASS ANOTHER SHORT-TERM EXTENSION** of existing highway legislation through the remainder of the year. That

will keep federal aid flowing for state and local highway, bridge and other infrastructure projects, but **it won't solve the states'**

overarching problem of uncertainty and confusion over future policy. Wyden said the big problem is finding consensus on tax legislation to underwrite a new long-term federal transportation program and prop up the near-bankrupt Highway Trust Fund, which has been largely financed over the years with revenues from the 18.4-cent per gallon federal gasoline tax. He noted that House

Speaker John Boehner (R-OH) and other **GOP leaders have ruled out an increase in the gasoline tax, while an alternative approach to raise money for highways through corporate tax reform is complex and highly**

controversial. Hoeven, a former North Dakota governor and major player on highway issues, agreed that "it will be very difficult to muster the votes to raise the gas tax," especially from lawmakers from the Midwest, where constituents do a lot of driving and would perceive a gas tax hike as directly targeting them. With so many unresolved tax and spending issues, Hoeven and Wyden seemed prepared for further delays in rewriting the nation's transportation laws. "I think the likelihood is that we will probably see an extension to the end of the year, passed before [Congress goes out] this month," Hoeven said. "That can be viewed in one of two ways. That's bad because we would like to get a six year bill right now ... But we're at one of those critical points both in terms of infrastructure and tax policy where I think the pressures are coming together." Inhofe and Boxer last month unveiled comprehensive legislation known as the DRIVE Act that would give state and local governments "the certainty and stability" they need to improve and develop the nation's infrastructure, according to a summary of the bill. There are still many details and spending formulas to work out for the new long-term highway program, but the biggest problem will be

reaching an accord on how to finance the legislation. **BUSINESS AND TRANSPORTATION ADVOCATES, ALONG WITH**

SOME LAWMAKERS AND CONSERVATIVE THINK TANKS, HAVE PROPOSED RAISING THE FEDERAL

GASOLINE tax as a solution for the looming \$10 billion shortfall in the current fiscal year, often noting that the tax hasn't been increased

once during the past two decades. However, House Ways and Means Committee Chair Paul **RYAN** (R-WI), among others, **IS STRONGLY**

OPPOSED TO RAISING THE GAS TAX – AS IS PRESIDENT OBAMA. RYAN AND OBAMA HAVE PREVIOUSLY

FLOATED PROPOSALS FOR FUNDING A NEW, MULTI-YEAR HIGHWAY PROGRAM BY TAXING OVERSEAS

CORPORATE REVENUES – SO-CALLED "REPATRIATION" -- AS PART OF A COMPREHENSIVE REFORM OF

THE FEDERAL TAX CODE. BUT the two have very different approaches in how to raise that additional tax revenue. And

OVERHAULING THE TAX CODE BEFORE THE 2016 PRESIDENTIAL ELECTION WOULD BE A HEAVY LIFT AT

BEST.

GOP and business will reject the new funding proposal

WSJ 7-8-15 [Kristina, Pearson, Senators Pitch Tax Changes on Overseas Profits to Fund Highways, <http://www.wsj.com/articles/senators-pitch-tax-changes-on-overseas-profits-to-fund-highways-1436365801>]

UNDER THE PROPOSAL from Messrs. Schumer and Portman, COMPANIES COULD PAY THE TAX OVER A PERIOD OF YEARS AND WOULD RECEIVE CREDIT FOR TAXES ALREADY PAID TO OTHER JURISDICTIONS on their overseas profits, in line with similar concepts from the president and Mr. Camp. **The idea could face resistance with other Republicans, who are concerned that a tax overhaul benefiting big U.S. multinational corporations might open some of their vulnerable incumbents to populist attack by Democratic opponents next year,** according to aides and others familiar with their thinking. **AND SOME BUSINESSES HAVE WORRIED THAT REWRITING A PIECE OF THE INTERNATIONAL TAX CODE TO FUND THE HIGHWAY BILL COULD JEOPARDIZE THE ABILITY TO DO A LARGER REWRITE OF THE CORPORATE TAX SYSTEM.**

Proposal is too incomplete – causes opposition

The Hill 7-8-15 [Senators roll out international tax plan, <http://thehill.com/policy/finance/247190-senators-roll-out-international-tax-plan>]

But THERE ARE STILL PLENTY OF ROADBLOCKS TO GETTING A DEAL THIS YEAR, AND SCHUMER AND PORTMAN STILL HAVE PLENTY OF GAPS TO FILL IN THEIR PROPOSAL. In their framework, the senators said they were working with congressional scorekeepers on the specifics of a plan. BUSINESS GROUPS AND CORPORATE TAX REFORM COALITIONS HAVE ALREADY OBJECTED TO THE IDEA OF TAXING CORPORATE PROFITS ALREADY OFFSHORE AND USING THE REVENUE FOR ROADS — an idea embraced by Portman and Schumer in their framework. OTHER REPUBLICANS, LIKE SENATE FINANCE CHAIRMAN ORRIN HATCH (UTAH), HAVE ALSO NOT SOUNDED ENTHUSED ABOUT THAT IDEA. And while the corporate community has long pushed for a territorial system, BIG BUSINESS COULD ALSO BE PUT OFF BY SOME OF THE OTHER PROPOSALS FLOATED BY PORTMAN AND SCHUMER.

McConnell opposes and its too infeasible

NYT 7-8-15 [End to U.S. Taxation of Overseas Profit Finds Bipartisan Support, <http://www.nytimes.com/2015/07/09/business/end-to-us-taxation-of-overseas-profit-finds-bipartisan-support.html>]

But **IT FACES stiff opposition from** Senator Mitch **McConnell** of Kentucky, the majority leader, **WHO WANTS ANY CHANGES TO THE INTERNATIONAL TAX SYSTEM TO BE PART OF A COMPREHENSIVE TAX OVERHAUL THAT ALSO HELPS DOMESTIC SMALL BUSINESSES.** The last stopgap law to keep the federal highway trust fund afloat expires at the end of July, and Mr. McConnell is scrambling to find ways to pay for a two-year highway bill, aides say. **AN AMBITIOUS REWRITE OF THE TAX CODE, THEY SAY, IS SIMPLY UNREALISTIC IN SUCH A SHORT PERIOD OF TIME. “THERE HAS BEEN NO DISCUSSION ABOUT USING A DRAFT INTERNATIONAL TAX PLAN THAT NO ONE HAS SEEN AS A MEANS OF PAYING FOR A HIGHWAY BILL IN JULY.”** a Republican leadership aide said.

UQ Overwhelms

Uniqueness overwhelms – its must-pass

The Hill 7-7-15 [Ex-Im vote holds peril for No. 2 House Republican McCarthy,
<http://thehill.com/homenews/house/247013-ex-im-vote-holds-peril-for-mccarthy>]

THE SENATE THIS MONTH IS EXPECTED TO APPROVE A CRITICAL BIPARTISAN HIGHWAY and infrastructure bill that would include an extension of the Ex-Im charter. **Because federal highway funding is set to expire at the end of the month, the measure is considered a must-pass bill.**

No Impact – Highways Fine

No impact – data proves the highways are fine – politicians have incentive to exaggerate

Krol 7-7-15 [Robert, professor of economics at California State University, Northridge, "America's crumbling infrastructure? Read between the lines", <http://tbo.com/list/news-opinion-commentary/americas-crumbling-infrastructure-read-between-the-lines-20150707/>]

So it's no surprise that **MANY PEOPLE THINK** most **ROADS** in the United States **ARE OF POOR QUALITY**. However, **government statistics tell a different story. U.S. roads and bridges are not falling apart.** Each year, state transportation agencies provide the federal government with comprehensive data on highway and bridge conditions. Highway quality is measured by a surface roughness index. The lower the index score, the better the quality of the road. Roads with index scores below 95 are considered to be in good condition, while higher index scores below 170 are acceptable. The most recent data on highway quality is for the year 2012. The percentage of urban highways classified as either good or acceptable was about 80 percent in 2012, down about 5 percentage points from 10 years earlier. **SOME OF THE DECLINE MAY REFLECT A POSTPONEMENT OF MAINTENANCE DURING THE GREAT RECESSION. ALMOST 97 PERCENT OF RURAL HIGHWAYS WERE CLASSIFIED AS EITHER GOOD OR ACCEPTABLE IN 2012. THIS IS ABOUT THE SAME AS 10 YEARS EARLIER. EVEN WITH THE RECENT QUALITY DROP FOR URBAN HIGHWAYS, A HIGH PERCENTAGE OF OUR HIGHWAYS IS IN GOOD OR ACCEPTABLE CONDITION. THESE FIGURES MASK THE VARIATION IN ROAD QUALITY ACROSS STATES.** For example, in 2012, almost 80 percent of Georgia's urban highways were in good condition — the highest in the country — while about 15 percent of California's urban highways were in good condition — the lowest in the country. Obviously, highway usage, weather conditions, and the quality of transportation agencies influence these figures. **USING STATE-LEVEL QUALITY FIGURES, THERE IS NO STATISTICAL CHANGE IN AVERAGE URBAN AND RURAL ROAD QUALITY OVER THE 10-YEAR PERIOD.** Taking a longer-term perspective, **ECONOMISTS AT THE FEDERAL RESERVE BANK OF CHICAGO EXAMINED THE QUALITY OF THE INTERSTATE HIGHWAY SYSTEM** for the period from 1980 to 2006. Using surface roughness index data provided by the government, **THEY FIND THE SYSTEM'S ROAD SURFACE HAS BECOME SMOOTHER AND LESS DETERIORATED SINCE THE MID-1990S.** Transportation agencies report bridges as either structurally deficient or functionally obsolete. A structurally deficient bridge is not considered unsafe, but it does imply a potential reduction in its load-carrying capacity and requires maintenance. A functionally obsolete bridge does not mean it fails to meet current standards. It may simply mean that traffic flows over the bridge are more than expected. **THE QUALITY OF BRIDGES IN THE UNITED STATES HAS IMPROVED. USING THE MOST RECENT DATA, IN 2014, 4.2 PERCENT OF BRIDGES WERE CLASSIFIED AS STRUCTURALLY DEFICIENT, DOWN FROM 5.7 PERCENT 10 YEARS EARLIER.** There has been little change in the percentage of functionally obsolete bridges over this time span. Once again, there is variation across states. In 2014, for example, less than 1 percent of bridges in Texas were structurally deficient — the lowest in the country — while in Rhode Island, almost 24 percent were labelled structurally deficient. Conditions and management vary across states, but our bridges do not appear to be crumbling. If you Google "crumbling highways and bridges" you get quite a few hits. Yet government statistics suggest that our transportation infrastructure is not in bad shape. **PEOPLE'S PERSONAL EXPERIENCE PARTLY EXPLAINS THE DIVERGENCE BETWEEN HYPE AND REALITY. ANOTHER REASON IS THAT OUR elected officials in Washington can capture votes by sending gasoline tax dollars home. They have much to gain by pushing the idea that our highways and bridges are falling apart.**

No Impact – Highway Trust Fund Fails

The highway trust fund support is only an act by congress to gain voters support; the project would end up being poorly run

Siefring, 5-19-15, (Neil, president of the hilltop advocacy, Bailing Out The Highway Trust Fund Won't Fix America's Crumbling Infrastructure Read more: <http://dailycaller.com/2015/05/19/bailing-out-the-highway-trust-fund-wont-fix-americas-crumbling-infrastructure/#ixzz3fKR7Xm9x>, Daily Caller, dailycaller.com/2015/05/19/bailing-out-the-highway-trust-fund-wont-fix-americas-crumbling-infrastructure/, google, 7-8-15)

Federal transportation funding is set to expire at the end of this month when the Highway Trust Fund is slated to end. The House has just voted to extend the fund for two more months, and the Senate is expected to quickly follow suit. Most politicians, staffers, transportation lobbyists and pundits are bemoaning the poor state of our nation's infrastructure. Many of them claim that pouring more money into federal transportation will help the problem. More **FEDERAL FUNDING OF TRANSPORTATION PROJECTS ON THE BACKS OF THE TAXPAYERS WILL ONLY PERPETUATE POOR HIGHWAY INFRASTRUCTURE AND PREVENT STATE, LOCAL, AND FREE MARKET SOLUTIONS TO OUR ROADWAY WOES. THE RESPONSIBILITY FOR TRANSPORTATION NEEDS TO BE RETURNED TO THE STATES.** The Highway Trust Fund was set up in 1956 to build interstate highways. It was part of the plan to make President Eisenhower's dream for a national highway system a reality. It was supposed to be temporary and expire in 1972. **THE FUND'S COFFERS ARE FILLED BY THE GAS TAX AND TAXES ON "OTHER MOTOR FUELS." IN OTHER WORDS, IT IS AN OLD FASHIONED WEALTH TRANSFER. TAXES ARE SPREAD THROUGHOUT THE COUNTRY IN THE FORM OF GRANTS THAT FUND ABOUT A QUARTER OF THE TRANSPORTATION PROJECTS BEING CARRIED OUT NATIONWIDE.** Chris Edwards of the Cato Institute explained that of the transportation projects funded through the fund, a quarter of them aren't even highway related. The fund has proven impossible to sunset, as the legislation setting it up commanded, and continues to be extended by Congress. It just keeps getting extended. Part of the reason for the program's persistence is that politicians like to bring home transportation pork projects, appear at ribbon-cutting ceremonies for them, and issue press releases stating how they got the money for a local transportation project. If the fund is allowed to expire, the federal government loses the ability to influence state and local infrastructure initiatives, and members of the House and Senate lose opportunities to promote their own reelection. That is one of the primary drivers for its continued extension. Rep. Paul Ryan (R-WI), chairman of the House Budget Committee, stated at a committee hearing he chaired in April, 2013, that over the next ten years, "[i]f we continue to do what we have done until last year, we will bail out the Highway [sic] trust fund with more borrowed money, and it would not be the first time. We bailed out the trust fund multiple times over the years to the tune of \$41 billion since 2008, in addition to the \$27.5 billion in the stimulus." So, the fund can operate at a deficit **SINCE CONGRESS WILL ALWAYS BAIL IT OUT. THERE IS NO INCENTIVE FOR THE PROGRAM TO BE RUN WELL SINCE POLITICIANS WHO BENEFIT FROM IT BY BRINGING HOME TRANSPORTATION PROJECTS TO PROVE THEIR WORTH TO VOTERS, WON'T LET IT FAIL. OR BE MEANINGFULLY REFORMED. THE UNREFORMED FEDERAL PROGRAM YOU KNOW IS BETTER THAN THE CONSTITUTIONALLY REFORMED ONE YOU DON'T.** Who knows if reforms would benefit incumbent members of Congress, so why try?

AT: Ex-Im – Won't Be Attached

Attaching Ex-Im to the highway bill will cause Republican backlash – they won't let it pass

Quinn 7/8 [MELISSA, A NEWS REPORTER FOR THE DAILY SIGNAL, "HOW DEMOCRATS HOPE TO REVIVE THE EX-IM," DAILY SIGNAL, [HTTP://DAILYSIGNAL.COM/2015/07/08/HOW-DEMOCRATS-HOPE-TO-REVIVE-THE-EXPORT-IMPORT-BANK/](http://dailysignal.com/2015/07/08/how-democrats-hope-to-revive-the-export-import-bank/), 7-8-2015]

A TRANSPORTATION BILL SHOULD FOCUS ON TRANSPORTATION, NOT REVIVE A CORRUPT FEDERAL PROGRAM that put hardworking taxpayers' money at risk to benefit some of the world's richest corporations," he said in a statement. "ADDING EX-IM WOULD ONLY MAKE IT MORE DIFFICULT TO FIND A WAY FORWARD ON TRANSPORTATION BECAUSE MORE REPUBLICANS OPPOSE THIS BLATANT FORM OF CORPORATE WELFARE." Though legislation extending the Highway Trust Fund with Ex-Im reauthorization attached would likely pass the Senate—if McConnell allows for the amendment—it would face more of a challenge in the House, where conservatives led the charge against reauthorizing Ex-Im. In the lower chamber, more than 90 Republicans oppose the bank, and both House Majority Leader Kevin McCarthy of California and Majority Whip Steve Scalise of Louisiana have come out against reauthorization. The Export-Import Bank's charter expired June 30, and members of Congress—who are home for a week-long recess—have run out of time to reauthorize the bank. IN A CALL WITH REPORTERS THIS AFTERNOON, REP. RAÚL LABRADOR, R-Idaho, WARNED THAT ATTACHING EX-IM'S REAUTHORIZATION TO THE HIGHWAY BILL WOULD "MAKE IT MORE DIFFICULT" FOR THE MORE THAN 40 MEMBERS OF THE CONSERVATIVE HOUSE FREEDOM CAUCUS TO VOTE FOR THE LEGISLATION. "WE'RE GOING TO USE EVERY PROCEDURAL WAY OF TRYING TO SEPARATE BOTH ISSUES," LABRADOR SAID. "THEY SHOULDN'T BE IN THE SAME BILL ANYWAY. THE HIGHWAY BILL HAS NOTHING TO DO WITH EX-IM." "MANY OF THE LEADERSHIP MEMBERS HAVE ALREADY TAKEN A POSITION AGAINST [EX-IM]," HE CONTINUED, "SO THEY NEED TO CONTINUE TO HOLD TRUE TO THAT PROMISE THEY MADE THEIR CONSTITUENTS."

Republicans oppose attaching the bills

Cirilli 7/9 [Kevin, a POLITICO reporter based in Washington D.C. Currently, he covers the nexus of Washington, Wall Street and Main Street, "Rubio: Don't attach Ex-Im to highway bill," <http://thehill.com/policy/finance/247388-rubio-dont-attach-ex-im-to-highway-bill>, 7-9-2015]

Sen. Marco Rubio (R-Fla.) on Thursday said he opposes attaching an amendment that would reauthorize the Export-Import Bank to a transportation funding bill. The Republican presidential candidate has emerged as a top critic of the bank in the Senate, along with Sen. Ted Cruz (R-Texas), another presidential candidate who also opposes attaching Ex-Im to the bill. "I strongly oppose any effort to attach a reauthorization of the Export-Import Bank to a highway bill," Rubio said in a statement. "The bank's charter has expired, and it should stay closed for business. Congress should reject any effort to resuscitate it by attaching a reauthorization to a highway bill or any other 'must pass' bill being considered." The bank's charter expired June 30. Supporters are hoping the bank will be reauthorized as part of a bill that would extend federal highway funding, which will expire at the end of July. The

business community argues that the bank's financing of overseas projects helps sustain jobs.
Conservatives, backed by the Tea Party, say it is a form of "corporate welfare" for big businesses such as Boeing.

AT: Ex-Im – No Impact – No Confidence

No impact – the damage is done – Ex-Im is worthless even if it survives

Smith 7-7-15 [Noah, assistant professor of finance at Stony Brook University, Reinvent the Export-Import Bank, <http://www.bloombergview.com/articles/2015-07-07/u-s-export-import-bank-should-imitate-venture-capitalists>]

THE EXPORT-IMPORT BANK IS PROBABLY DEAD. YES, TECHNICALLY, IT'S ONLY TEMPORARILY OUT OF ACTION because a handful of Republicans are preventing a floor vote on its reauthorization. BUT THE REPUBLICAN CRUSADE AGAINST THE GOVERNMENT-RUN TRADE CREDIT PROVIDER HAS DEMONSTRATED TO U.S. EXPORTERS THAT THEY WON'T BE ABLE TO RELY ON EX-IM FUNDING IN THE FUTURE. THAT MEANS THEY WON'T BUDGET EX-IM FUNDING INTO THEIR PLANS, making the agency somewhat superfluous even if it does manage to survive. Once again, conservatives have managed to smash a U.S. government institution.

AT: Ex-Im – No Impact – Economy

No Impact – Ex-im doesn't matter for exports

Smith 7-7-15 [Noah, assistant professor of finance at Stony Brook University, Reinvent the Export-Import Bank, <http://www.bloombergvew.com/articles/2015-07-07/u-s-export-import-bank-should-imitate-venture-capitalists>]

I'm sad that this has happened, because it shows the power of conservative activists -- and the willingness of some politicians -- to wreck institutions they don't fully understand. But unlike the examples where this destruction really matters -- infrastructure and research funding -- **the Ex-Im bank is small potatoes. FIRST, THE AMOUNT OF TRADE CREDIT THAT EX-IM EXTENDS TO CUSTOMERS OF U.S. EXPORTERS IS MICROSCOPIC COMPARED WITH THE AMOUNT PROVIDED BY, SAY, CHINA.** Even if you believe that Ex-Im cancels out the market distortions created by the Chinese government, **THE U.S.'S \$27 BILLION A YEAR ISN'T GOING TO DO MUCH AGAINST CHINA'S \$400 BILLION. SECOND, THE BANK DOESN'T SUBSIDIZE SERVICE EXPORTS, WHICH ARE AN INCREASINGLY IMPORTANT PART OF THE U.S. TRADE PICTURE. AND THIRD, THE LARGE COMPANIES EX-IM SUBSIDIZES HAVE DEEP-ENOUGH POCKETS THAT THEY CAN PROBABLY MUDDLE THROUGH IN MOST OF THEIR MARKETS WITHOUT EX-IM ASSISTANCE.**

Some of their suppliers will suffer, but many of them are located in other countries.

AT: Competitiveness

No risk of economy or heg decline - competitiveness theory is false Fallows '10

[James, correspondent for *The Atlantic Monthly*, studied economics at Oxford University as a Rhodes Scholar. He has been an editor of *The Washington Monthly* and of *Texas Monthly*, and from 1977 to 1979 he served as President Jimmy Carter's chief speechwriter. His first book, *National Defense*, won the American Book Award in 1981; he has written seven others. "How America Can Rise Again", Jan/Feb edition, <http://www.theatlantic.com/doc/201001/american-decline>]

THE QUESTION that matters IS NOT WHETHER AMERICA IS "FALLING BEHIND" BUT instead something like John Winthrop's original question of WHETHER IT IS FALLING SHORT—or even falling apart. This is not the mainstream American position now, so let me explain. First is the simple reality that one kind of "decline" is inevitable AND THEREFORE NOT WORTH WORRYING ABOUT. CHINA HAS ABOUT four times AS MANY PEOPLE AS AMERICA DOES. SOMEDAY ITS ECONOMY WILL BE LARGER THAN OURS. FINE! A generation ago, its people produced, on average, about one-sixteenth as much as Americans did; now they produce about one-sixth. That change is a huge achievement for China—and a plus rather than a minus for everyone else, because a business-minded China is more benign than a miserable or rebellious one. When the Chinese produce one-quarter as much as Americans per capita, as will happen barring catastrophe, their economy will become the world's largest. This will be good for them but will not mean "falling behind" for us. WE KNOW THAT FOR MORE THAN A CENTURY, THE CONSCIOUSNESS OF DECLINE HAS BEEN A BLIGHT ON BRITISH POLITICS, THOUGH IT HAS INSPIRED SOME MEMORABLE, MELANCHOLY LITERATURE. THERE IS NO REASON FOR AMERICA TO FEEL DEPRESSED ABOUT THE NATURAL EMERGENCE OF CHINA, INDIA, AND OTHERS AS WORLD POWERS. BUT SECOND, AND MORE IMPORTANT, AMERICA MAY HAVE REASONS TO FEEL ACTIVELY OPTIMISTIC ABOUT ITS PROSPECTS IN PURELY RELATIVE TERMS. The Crucial American Advantage Let's start with the more modest claim, that China has ample reason to worry about its own future. Will the long-dreaded day of reckoning for Chinese development finally arrive because of environmental disaster? Or via the demographic legacy of the one-child policy, which will leave so many parents and grandparents dependent on so relatively few young workers? Minxin Pei, who grew up in Shanghai and now works at Claremont McKenna College, in California, has predicted in *China's Trapped Transition* that within the next few years, tension between an open economy and a closed political system will become unendurable, and an unreformed Communist bureaucracy will finally drag down economic performance. AMERICA WILL BE BETTER OFF IF CHINA DOES WELL THAN IF IT FLOUNDERS. A prospering China will mean a bigger world economy with more opportunities and probably less turmoil—and a China likely to be more cooperative on environmental matters. But whatever happens to China, prospects could soon brighten for America. The AMERICAN CULTURE'S PARTICULAR STRENGTHS COULD conceivably be about to ASSUME NEW IMPORTANCE AND GIVE OUR ECONOMY NEW PEP. INTERNATIONAL NETWORKS WILL MATTER MORE with each passing year. As the one truly universal nation, THE UNITED STATES CONTINUALLY REFRESHES ITS CONNECTIONS WITH THE REST OF THE WORLD—through languages, family, education, business—IN A WAY no other nation does, OR WILL. The countries that are comparably open—Canada, Australia—aren't nearly as large; THOSE WHOSE ECONOMIES ARE COMPARABLY LARGE—Japan, unified Europe, eventually China or India—AREN'T NEARLY AS OPEN. The simplest measure of whether a culture is dominant is whether outsiders want to be part of it. At the height of the British Empire, colonial subjects from the Raj to Malaya to the Caribbean modeled themselves in part on Englishmen: Nehru and Lee Kuan Yew went to Cambridge, Gandhi, to University College, London. Ho Chi Minh wrote in French for magazines in Paris. These DAYS THE WORLD IS FULL OF BUSINESSPEOPLE, BUREAUCRATS, AND SCIENTISTS WHO HAVE TRAINED IN THE UNITED STATES.

AT: Nuclear Leadership

Nuclear Leadership Fails – U.S. won't exercise it, agency competition constrains it, and it doesn't cause other states to change behavior

Richard **Cleary 12**, Research Assistant at the American Enterprise Institute, 8/13/12, "Persuading Countries to Forgo Nuclear Fuel-Making: What History Suggests," <http://npolicy.org/article.php?aid=1192&tid=30>

In recent years, THERE HAS BEEN A RESURGENCE OF PROPOSALS DESIGNED TO LIMIT THE SPREAD OF NUCLEAR FUEL-MAKING FACILITIES, with the understanding that ostensibly peaceful technology can allow for the production of the fissile material required for a nuclear weapon. With U.S. proposals ranging from the Global Nuclear Energy Partnership (GNEP) to a revamped, "Gold Standard" bilateral nuclear cooperation agreement, A WIDER ARRAY OF TOOLS HAS BEEN PUT AT THE DISPOSAL OF AMERICAN POLICY MAKERS. PROMINENT MEMBERS OF THE INTERNATIONAL COMMUNITY HAVE BECOME AGITATED ABOUT THE PROSPECT OF THE PROLIFERATION OF FUEL-MAKING TECHNOLOGY as well, with numerous proposals of fuel assurances put forward by such disparate figures as Vladimir Putin and Mohamed ElBaradei. But RENEWED ENTHUSIASM FOR NONPROLIFERATION BEGS QUESTIONS ABOUT HOW NOVEL THE INSTRUMENTS PROPOSED ARE, AND, MOREOVER, HOW EFFECTIVE THEY ARE LIKELY TO BE, PARTICULARLY FOR THE COUNTRY HISTORICALLY AT THE HEAD OF NONPROLIFERATION EFFORTS, THE UNITED STATES. A REVIEW OF THIS HISTORICAL RECORD SUGGESTS THAT OPTIMISM ABOUT THE U.S. ABILITY TO DISSUADE COUNTRIES FROM THIS PATH IS MISPLACED.

THIS ESSAY CONSIDERS SUPPLY SIDE PROPOSALS OF FUEL ASSURANCE, MULTILATERAL FUEL-MAKING, AS WELL AS SPECIFIC INTERVENTIONS ON BOTH THE SUPPLY AND DEMAND SIDES, CONSULTING PARTICULAR CASES in Iran (1974-1978), West Germany-Brazil (1975-1977), South Korea (1974-1976) and Pakistan (1972-1980) TO DRAW LESSONS ABOUT THE EFFECTIVENESS OF U.S. PRACTICES UNDER DIFFERING CIRCUMSTANCES. THE RECORD THESE CASES GIVE IS MIXED, DUE TO TWO PRINCIPAL CAUSES. THE FIRST IS THE FAILURE OF THE U.S. TO CONSISTENTLY PRIORITIZE NONPROLIFERATION EFFORTS GIVEN WASHINGTON'S GLOBAL AND COMPETING INTERESTS, INTERESTS THAT TEND TO BE EMBRACED BY DIFFERENT FACTIONS IN THE FEDERAL GOVERNMENT APPARATUS BUT WHOSE ULTIMATE ARBITER IS THE PRESIDENT (along with his close advisors). THE SECOND IS THE TENDENCY OF DECISIONS ABOUT NUCLEAR FUEL-MAKING BY THE STATE IN QUESTION TO BE INFLUENCED MORE BY FUNDAMENTAL TRENDS OR FACTORS THAN DIPLOMATIC MANEUVERING FROM WASHINGTON; DIPLOMACY IS MOST EFFECTIVE WHEN IT HAS THE POLITICAL, ECONOMIC AND MILITARY BACKING TO IMPLICATE THESE ISSUES. THE MOST IMPORTANT FACTOR IN U.S. EFFORTS HAS TENDED TO BE THE BILATERAL RELATIONSHIP BETWEEN WASHINGTON AND THE COUNTRY AT HAND. DECISION-MAKERS WHO CONSIDER THEIR COUNTRY'S RELATIONSHIP WITH THE U.S. TO BE STRATEGICALLY VITAL—AND BELIEVE THAT FUEL-MAKING WOULD THREATEN THIS RELATIONSHIP—ARE MOST LIKELY TO FORGO ENRICHMENT AND REPROCESSING (ENR) TECHNOLOGY. THIS CALCULUS CAN BE INFORMED BY A RANGE OF DYNAMICS, SOME BEYOND U.S. CONTROL, SUCH AS SECURITY CONCERNS, ISSUES OF PRESTIGE, AND COMMERCIAL AND INDUSTRIAL INTERESTS. DOMESTIC POLITICS AND PUBLIC OPINION, BOTH IN THE UNITED STATES AND IN THE COUNTRY CONSIDERING FUEL-MAKING, CAN BE INFLUENTIAL.

AT: Naval Power

Naval power resilient – no challengers to overwhelming U.S. power

Posen 3 (Barry R., Professor of Political Science – Massachusetts Institute of Technology, “Command of the Commons: The Military Foundation of U.S. Hegemony”, *International Security*, 28(1), Ebsco)

Command of the commons is the military foundation of U.S. political preeminence. It is the key enabler of the hegemonic foreign policy that the United States has pursued since the end of the Cold War. THE MILITARY CAPABILITIES REQUIRED TO SECURE COMMAND OF THE COMMONS ARE THE U.S. STRONG SUIT. THEY LEVERAGE SCIENCE, TECHNOLOGY, AND ECONOMIC RESOURCES. They rely on highly trained, highly skilled, and increasingly highly paid military personnel. ON THE WHOLE, THE U.S. MILITARY ADVANTAGE AT SEA, IN THE AIR, AND IN SPACE WILL BE VERY DIFFICULT TO CHALLENGE—LET ALONE OVERCOME. COMMAND IS FURTHER SECURED BY THE WORLDWIDE U.S. BASE STRUCTURE AND THE ABILITY OF U.S. DIPLOMACY TO LEVERAGE OTHER SOURCES OF U.S. POWER TO SECURE ADDITIONAL BASES AND OVERFLIGHT RIGHTS as needed.

No impact to naval decline

McGrath 2010, Director of Consulting, Studies and Analysis at Delex Systems, Inc, citing Robert Gates, Bryan, “Debate: Do We Need 11 Carrier Groups: Yes”, Atlantic Council, http://www.acus.org/new_atlanticist/debate-do-we-need-11-carrier-groups-yes, KHaze

Next there’s this—and it is a longish clip from the speech: “It is important to remember that, AS MUCH AS THE U.S. BATTLE FLEET HAS SHRUNK SINCE THE END OF THE COLD WAR, THE REST OF THE WORLD’S NAVIES HAVE SHRUNK EVEN MORE. SO, IN RELATIVE TERMS, THE U.S. NAVY IS AS STRONG AS IT HAS EVER been. In assessing risks and requirements even in light of an expanding array of global missions and responsibilities – everything from shows of presence to humanitarian relief – some context is useful:

- THE U.S. OPERATES 11 LARGE CARRIERS, ALL NUCLEAR POWERED. IN TERMS OF SIZE AND STRIKING POWER, NO OTHER COUNTRY HAS EVEN ONE COMPARABLE SHIP.
- THE U.S. NAVY HAS 10 LARGE-DECK AMPHIBIOUS SHIPS THAT CAN OPERATE AS SEA BASES FOR HELICOPTERS AND VERTICAL-TAKEOFF JETS. NO OTHER NAVY HAS MORE THAN THREE, AND ALL OF THOSE NAVIES BELONG TO OUR ALLIES OR FRIENDS. OUR NAVY CAN CARRY TWICE AS MANY AIRCRAFT AT SEA AS ALL THE REST OF THE WORLD COMBINED.
- THE U.S. HAS 57 NUCLEAR-POWERED ATTACK AND CRUISE MISSILE SUBMARINES – AGAIN, MORE THAN THE REST OF THE WORLD COMBINED.
- SEVENTY-NINE AEGIS-EQUIPPED COMBATANTS CARRY ROUGHLY 8,000 VERTICAL-LAUNCH MISSILE CELLS. IN TERMS OF TOTAL MISSILE FIREPOWER, THE U.S. ARGUABLY OUTMATCHES THE NEXT 20 LARGEST NAVIES.
- ALL TOLD, THE DISPLACEMENT OF THE U.S. BATTLE FLEET – A PROXY FOR OVERALL FLEET CAPABILITIES – EXCEEDS, BY ONE RECENT ESTIMATE, AT LEAST THE NEXT 13 NAVIES COMBINED, OF WHICH 11 ARE OUR ALLIES OR PARTNERS.
- AND, AT 202,000 STRONG, THE MARINE CORPS IS THE LARGEST MILITARY FORCE OF ITS KIND IN THE WORLD AND EXCEEDS THE SIZE OF MOST WORLD ARMIES.”

AT: TPP Politics HSS

U Overwhelms/PC not key

Zero chance congress rejects TPP post fast track approval – structural factors
Stoltzfoos, 6/23 -- Rachel, Reporter @ Daily Caller, Daily Caller, 6/23/15,
<http://dailycaller.com/2015/06/23/congress-secures-trade-promotion-authority-for-obama/>

TPA would give Congress more power to shape the trade agreement by defining specific objectives the president must work toward in a deal, and by setting new transparency rules. But ONCE THE PRESIDENT SUBMITS A DEAL TO CONGRESS, TPA GREATLY RESTRICTS THE SENATE'S ABILITY TO BLOCK OR COMPLICATE the deal. Any deal the president submits to Congress in the next six years is almost guaranteed to pass, BECAUSE THE SENATE MUST PROMPTLY APPROVE OR REJECT THE DEAL WITH NO CHANCE TO AMEND IT AND LITTLE TIME FOR DEBATE. AND JUST 51 VOTES WOULD BE REQUIRED FOR PASSAGE — A FAR CRY FROM THE 61 VOTES REQUIRED FOR MAJOR LEGISLATION. (RELATED: Why Are Senate Republicans So Eager To Cede Their Trade Authority To Obama?)What do you think? Obama says HE NEEDS TPA TO CONCLUDE a massive trade deal, the TRANS-PACIFIC PARTNERSHIP, which he is currently negotiating with 11 other countries. And the Republicans who fought for the deal say TPA is key to future free trade agreements that will benefit the U.S. economy.What do you think? CRITICS CONTEND ITS A DANGEROUS CONCESSION OF SENATE POWER to a president that can't be trusted.

Its Guaranteed – even opponents are conceding
Werner, 6/24 – Erica, Reporter @ Associated Press, Boston Herald, 6/24/15,
http://www.bostonherald.com/news_opinion/national/2015/06/senate_vote_moves_obamas_trade_agenda_to_brink_of_enactment

Some ANTI-FREE-TRADE GROUPS, HOWEVER, essentially conceded defeat. "FAST TRACK MAKES IT virtually certain THAT THE Trans-Pacific Partnership (TPP), Trade in Services Agreement (TISA), AND OTHER SECRET TRADE DEALS WILL BECOME LAW," SAID the "Internet-freedom" group FIGHT FOR THE FUTURE. Tuesday's SENATE VOTE WAS AS PAINFUL FOR THE AFL-CIO AND OTHER UNIONS AS IT WAS WELCOMED BY THE WHITE HOUSE. Many corporate, agricultural and manufacturing groups cheered.

Fast Track authority ensures TPP will pass WITH EASE – structural factors, last realistic barrier, and passage was a white flag for deal opponents in congress
Lopez, 6/24 – Laura Barron-Lopez, covers Congress for The Huffington Post. Previously, she reported for The Hill and E&E Publishing's Greenwire, Huffington Post, 6/24/15,
http://www.huffingtonpost.com/2015/06/24/pelosi-backs-taa_n_7654954.html

PELOSI STANDS DOWN On TAA, CLEARING WAY FOR OBAMA'S TRADE AGENDA House Minority Leader Nancy PELOSI (D-Calif.) waved the white flag on Wednesday, TELLING HER CAUCUS SHE WOULD SUPPORT PASSAGE OF A KEY MEASURE tethered to President Barack Obama's broader trade agenda. HER SUPPORT all but guarantees THAT THE MEASURE WILL SUCCEED, THEREBY HANDING OBAMA A MAJOR VICTORY ON TRADE. PELOSI AND HOUSE DEMOCRATS WERE THE last obstacle AGAINST REPUBLICAN AND PRO-TRADE DEMOCRATS'

EFFORTS TO GRANT OBAMA so-called "FAST-TRACK" AUTHORITY TO clear major trade deals, such as the Trans-Pacific Partnership, through Congress with ease. House Democrats succeeded in blocking fast-track nearly two weeks ago when they defeated Trade Adjustment Assistance, which was tied to the fast-track legislation. TAA provides aid to workers who have lost their jobs as a result of trade deals. In response to the defeat of TAA, Obama and Republican leaders crafted a new plan to pass fast-track, also known as Trade Promotion Authority, as a standalone bill without TAA. The clean fast-track bill, already passed by the House, is expected to sail through the Senate later Wednesday and then on to Obama's desk. Next, the Senate will immediately move to pass TAA for workers, which is now attached to an African trade preferences bill, after which it will be sent back to the House. And with Pelosi's support, TAA should have the votes for passage. "I'm disappointed that the TAA bill isn't nearly as robust as it should be in light of a trade agreement that encompasses 40 percent of the global economy," Pelosi wrote in a Dear Colleague letter to House Democrats. "While we may not all vote in the same manner on TAA, I will support its passage because it can open the door to a full debate on TPP." Obama is currently negotiating the **TPP** with 11 Pacific nations. The TPP and two other large trade deals that the administration is working on, together encompass over half of the world's economy. The **PASSAGE** of the agreements **depends on CONGRESS GRANTING HIM FAST-TRACK POWERS**. Pelosi and a majority of House Democrats oppose fast-track, as well as the massive trade deals that the administration is pushing. They argue that such deals fail to protect workers at home, lack sufficiently robust environmental standards and financial regulations, and do nothing to stop unfair currency manipulation. "My standard for any trade agreement is that it must create good-paying 21st century jobs, increase the paychecks of American workers, and it must do so recognizing the relationship between commerce and climate," Pelosi wrote. **WITH FAST-TRACK LEGISLATION** expected to reach Obama's desk Wednesday evening and be **SIGNED INTO LAW, THE PUBLIC WILL HAVE ONLY TWO MONTHS TO READ AND UNDERSTAND** deals such as the **TPP AFTER THEY ARE NEGOTIATED AND BEFORE THE PRESIDENT SIGNS THEM. Congress will have to approve the deals as quickly AS ONE MONTH AFTER THAT, WITH no changes allowed.**

TPP Guaranteed - no filibuster, Dems don't want the fight, TPA passage make political downsides a sunk cost – fights on other issues don't spillover to trade anyway
Weisman, 6/23 – Jonathan, Economic Policy Reporter @ NYT, 6/23/15,
<http://www.nytimes.com/2015/06/24/us/politics/senate-vote-on-trade-bill.html>

President Obama's ambitious trade push is back on track, after several near-death moments, in large measure because top Republicans stood by him. **THE SENATE** on Tuesday narrowly **VOTED TO END DEBATE ON LEGISLATION GRANTING Mr. OBAMA ENHANCED NEGOTIATING POWERS TO COMPLETE A MAJOR PACIFIC TRADE ACCORD, virtually assuring FINAL PASSAGE** Wednesday **OF Mr. OBAMA'S TOP LEGISLATIVE PRIORITY** in his final years in office. The procedural vote of 60 to 37 just reached the minimum needed, but final Senate passage will require only 51 votes. The House approved trade promotion authority last week. Representative Nancy Pelosi, the Democratic leader in the House, criticized the Republicans' approach, saying it would hinder the ability to address climate change and its connection to commerce through the broader trade bill. House Sends Trade Bill Back to Senate in Bid to Outflank Foes **JUNE 18, 2015** People harvesting lychee in Vietnam, which is the only Communist member of the prospective Trans-Pacific Partnership. Failure of Obama's Trans-Pacific Trade Deal Could Hurt U.S. Influence in Asia **JUNE 16, 2015** House Republicans and White House Try to Revive Trade Bill Stalled by Democrats **JUNE 15, 2015** **WITH CONGRESSIONAL SUPPORT FOR "FAST TRACK" AUTHORITY, THE PRESIDENT CAN PRESS FOR FINAL AGREEMENT ON THE TRANS-PACIFIC PARTNERSHIP,** a legacy-defining accord linking 40 percent of the world's economy — from Canada and Chile to Japan and Australia — in a web of rules governing Pacific commerce. His administration can also bear down on a second agreement with Europe — known as the Transatlantic Trade and Investment Partnership — **KNOWING THAT LAWMAKERS WILL BE ABLE TO VOTE FOR OR AGAINST THOSE AGREEMENTS BUT WILL NOT BE ABLE TO AMEND OR FILIBUSTER THEM.** The Atlantic agreement is not expected to be completed until the next administration is in office, but the trade negotiating powers would stretch for six years — well into the next presidency. Together those two accords would put much of the globe under the same trade rules, not only lowering tariffs and other import barriers but also creating new standards for Internet access, intellectual property and investor protections. "This is a very important day for our country," said Senator Mitch McConnell, Republican of Kentucky and the majority leader, whose procedural maneuvering was largely responsible for the outcome. "America is back in the trade business." Most Democrats — along with labor unions, environmental groups and liberal activists — disagreed, saying that such trade agreements had resulted in lost manufacturing jobs and lower wages for American workers. "It is a great day for the big money interests, not a great day for working families," said Senator Bernie Sanders, independent of Vermont, who is seeking the Democratic presidential nomination. But 13 Democrats sided with Republicans to end the debate and get to a final vote on trade promotion authority. Tuesday's vote was the second time the Senate had blocked a filibuster of fast-track authority, but this time the bill was shorn of a separate measure to offer enhanced retraining and educational assistance to workers displaced by international trade accords. That measure also faces a crucial vote on Wednesday. Passage of a stand-alone trade promotion bill will put pressure on House Democrats, who just over a week ago brought down the worker aid provision, known as trade adjustment assistance, when it was linked to the fast-track legislation, in a strategic move they hoped would defeat the entire trade package. But Republican leaders — with support from the White House — found a parliamentary way to corner the Democratic opponents, by separating the two pieces of the bill. By Wednesday evening, **LEGISLATION WILL MOST LIKELY BE ON THE PRESIDENT'S DESK, GIVING HIM THE POWER TO COMPLETE THE TRANS-PACIFIC PARTNERSHIP.** He can sign it whether or not the House passes worker dislocation assistance when it is scheduled to come to a vote late Thursday. Josh Earnest, the White House press secretary, said House Democrats should get on board. "The previous explanation

that we heard from some Democrats who voted against trade adjustment assistance — something that Democrats have steadfastly supported for decades — is that they were doing that in an effort to slow down the advancement of trade promotion authority legislation,” he said. “That will no longer be a factor to consider.”

THE TORTUOUS PATH OF THE TRADE LEGISLATION over the last six months **CREATED THE UNUSUAL ALLIANCE BETWEEN** Mr. **OBAMA AND REPUBLICAN LEADERS, WHO otherwise have worked to thwart him ON**

DOMESTIC AND FOREIGN POLICIES. “Occasionally, even the leader of the Democratic Party, the president of the United States, gets things right,”

said Senator John Cornyn of Texas, the No. 2 Republican. In the end, Mr. **MCCONNELL all but secured THE TOP REMAINING**

LEGISLATIVE PRIORITY OF A PRESIDENT he once vowed to turn out after one term. The Senate is set on Wednesday to give final approval to trade promotion authority, then vote to end debate on a separate bill that attaches worker dislocation assistance to a broadly popular bill extending a trade agreement with several African countries. To attract more votes, Senate leaders added another provision speeding up action against foreign competitors who are found to be “dumping” — selling steel and other products in the United States at artificially low prices in an effort to put domestic manufacturers out of business. Senators would vote on that package on Thursday, and if it is approved, as expected, it would go to the House the same day. This time, if Democrats vote down trade adjustment assistance, they will be effectively killing a worker education and retraining program created during the Kennedy administration and that party members have nurtured ever since, but will still most likely watch Mr. Obama sign the fast-track bill into law. “I don’t think any Democrats voted against T.A.A. last time because they opposed T.A.A.,” said Representative Steny Hoyer of Maryland, the House’s No. 2 Democrat. “I will concede there will be a different context” around the next vote. At the same time, House and Senate negotiators will begin hashing out differences over a separate bill enhancing measures to police trade agreements. Opponents had hoped that trade promotion authority without worker assistance would run into trouble in the Senate. And some Democrats tried to stoke fears that Congress could give the president the power to complete major trade deals without assistance to affected workers. “How shameful is that?” said Senator Sherrod Brown, Democrat of Ohio, who led the opposition to trade promotion authority. “We’re making this decision knowing people will lose their jobs because of our actions. Yet we are not going to pass this assistance.” In the end, though, **DEMOCRATIC SENATORS WHO HAD ALREADY**

VOTED ONCE FOR TRADE PROMOTION AUTHORITY understood they were not going to escape the criticism, ESPECIALLY FROM THE UNIONS. THEY wanted to be done with it. Senate **DEMOCRATS HAD**

already taken a lot of hits IN GETTING TO THIS POINT.” said Senator Ron Wyden of Oregon, the ranking Democrat on the Finance Committee and a co-author of the trade promotion bill.

In 2014, Katrina McFarland, the U.S. Assistant Secretary of Defense for Acquisition, declared that **DUE TO BUDGET CONSTRAINTS “THE PIVOT IS BEING LOOKED AT AGAIN, BECAUSE CANDIDLY IT can’t happen.”**²¹ The next day, MacFarland withdrew her statement, but **THERE ARE GENUINE CONCERNS’s ABOUT U.S. ABILITY TO CONTINUE STRENGTHEN COMMITMENTS TO ASIA WHILE MANAGING OTHER’s WORLDWIDE CRISES AS DEFENSE RESOURCES SHRINK.** For example, despite his many assurances to Asian allies about the rebalance policy, **HAGEL WARNED IN 2014 THAT, IF THE SEQUESTRATION CUTS’s CONTINUED AS PLANNED, THE MILITARY WOULD BECOME A “HOLLOW FORCE. . . NOT CAPABLE OF FULFILLING’s ASSIGNED MISSIONS.”**²² Under current plans, the United States will reduce its military budget by \$487 billion in planned cuts over the next ten years on top of a potential additional \$500 billion in cuts mandated by sequestration.²³ **A FURTHER CONCERN IS THAT THE U.S. MILITARY’s WILL HAVE TO REALLOCATE RESOURCES TO CARRY OUT NEW MISSIONS IN IRAQ, SYRIA, EUROPE, AND OTHER’s LOCATIONS.**²⁴ **ANOTHER IMPORTANT ASPECT OF THE DEFENSE CUT IS THE PLAN TO REDUCE THE OVERALL SIZE OF THE ACTIVE’s DUTY U.S. ARMY TO FEWER THAN 450,000 SOLDIERS, WHICH WOULD BE ITS SMALLEST SIZE SINCE BEFORE’s WWII.**²⁵ **FOR SEOUL, THESE REDUCTIONS ARE OF PARTICULAR CONCERN BECAUSE ANY MAJOR KOREAN CONTINGENCY IN THE EVENT OF A NORTH KOREAN INVASION OR COLLAPSE WOULD REQUIRE**

A MASSIVE GROUND FORCE TO STABILIZE THE PENINSULA, FOR JAPAN AND SOUTH EAST ASIAN COUNTRIES, THE U.S. NAVY PRESENCE IS A MAJOR CONCERN SINCE MUCH OF THE DISPUTED TERRITORY IN THE REGION IS MARITIME. Even if the Navy moves 60 percent of their fleet to the Pacific by 2020, continuing current cuts may result in a smaller force. For example, the 2015 Department of Defense budget reduced funding for U.S. Navy shipbuilding from \$17.9 billion to \$14.4 billion.²⁷ THE U.S. AIR FORCE, WHICH WOULD BE IMPORTANT IN ANY CONFLICT IN THE ASIA-PACIFIC, HAS SUFFERED CRITICAL BUDGET CUTS RELATING TO ITS READINESS, FORCE STRUCTURE, AND MODERNIZATION ACCOUNTS.²⁸ THESE defense CUTBACKS has LED THE HEAD OF U.S. PACIFIC COMMAND, Adm. Locklear, TO STATE THAT "THE ABILITY FOR THE SERVICES TO PROVIDE THE TYPE OF MARITIME COVERAGE, the air coverage of some of the key elements THAT WE'VE HISTORICALLY NEEDED IN THIS PART OF THE WORLD FOR CRISIS RESPONSE, HAVE NOT BEEN AVAILABLE TO THE LEVEL THAT I WOULD CONSIDER ACCEPTABLE RISK [DUE TO RECENT BUDGET CUTBACKS]," a response bound to leave U.S. allies uneasy as tensions remain high in East Asia.²⁹ U.S. efforts to revitalize the U.S. nuclear weapons establishment or develop new non-nuclear technologies, such as through the Pentagon's new Offset Strategy,^a are also constrained by limited funding.

Asia Pivot Thumper - AIIB

Zero influence in Asia now – AIIB proves.

Auslin 3-17. [Michael, resident scholar and the director of Japan Studies at the American Enterprise Institute, "Obama's Asia Policy Flounders" Commentary Magazine -- <https://www.commentarymagazine.com/2015/03/17/obamas-asia-policy-flounders/>]

THE second piece of **EVIDENCE ON THE MISSTEPS OF OBAMA'S ASIA POLICY** is the little-known issue of **THE ASIAN INFRASTRUCTURE INVESTMENT BANK** (AIIB). This is arguably **A** far more serious failure to understand and react to a major foreign initiative than the Burmese example. **IN 2014, THE CHINESE GOVERNMENT PROPOSED A** \$50 billion **LENDING INSTITUTION** for the region. The AIIB is inescapably **AN ALTERNATIVE TO THE WORLD BANK** and the Asian Development Bank, both of which are guided by Western financial principles and ensure the influence of Washington or allied nations, like Japan. As the biggest shareholder, founder, and guiding spirit, **CHINA MOST LIKELY WILL DOMINATE THE AIIB, AND THEREBY INCREASE ITS ECONOMIC AND POLITICAL INFLUENCE EVEN MORE IN ASIA.**^a **THE** founding of the **AIIB MIGHT NOT HAVE BEEN SUCH A BIG DEAL, BUT FOR THE OBAMA ADMINISTRATION'S HAM-FISTED RESPONSE. IN TRYING TO PRESSURE NATIONS NOT TO SIGN ON AS SHAREHOLDERS, OBAMA HAS REVEALED JUST HOW LITTLE GLOBAL INFLUENCE HE HAS. NOT ONLY HAVE MOST ASIAN NATIONS SIGNED ON, BUT AMERICA'S MAIN ALLIES, INCLUDING GREAT BRITAIN, FRANCE, GERMANY, AND ITALY HAVE JOINED, AS WELL, IGNORING U.S. PLEAS TO STAY OUT.** The Financial Times charitably called Washington's abandonment by its allies a "blow" to US foreign policy. But with **THE NEWS THAT STALWART U.S. ALLY AUSTRALIA** has also **JOINED**, veteran and respected Australian commentator Greg Sheridan scathingly **DESTROYS THE FICTION OF AMERICAN STANDING IN ASIA**, writing that **CANBERRA'S DECISION represents a "colossal defeat" for Obama** (the article is behind a pay wall, but excerpts are here).^a **WHY HAS WASHINGTON FALLEN ON HARD TIMES IN ASIA?** In Sheridan's view, **OBAMA IS REAPING THE RESULTS OF YEARS OF "INCOMPETENT, DISTRACTED" DIPLOMACY THAT HAS LEFT HIS ADMINISTRATION WITH "NEITHER THE CONTINUOUS PRESENCE, NOR THE TACTICAL WHEREWITHAL, NOR THE STORE OF GOODWILL OR PERSONAL RELATIONSHIPS" TO CARRY ANYONE ALONG WITH IT.** As if to underscore Sheridan's analysis of Obama's diplomatic crudeness, which includes a reminder that Obama personally insulted Australian Prime Minister Tony Abbott with a "rogue" climate change speech at the G-20 in Brisbane last year, Washington accused London, its closest global ally, of "constant accommodation" of China, after its decision to join the AIIB. Such is the petulant, panicked response of an administration that has failed to understand, anticipate, analyze, and respond to changes that will reshape Asia's financial landscape.^a Now **WITH SOUTH KOREA CONSIDERING JOINING THE AIIB, WASHINGTON WILL BE LEFT ISOLATED** only with its ally Japan as new regional financial relationships are created. Ultimately, either Obama or his successor will likely bow to reality, and find a face-saving way to join the AIIB. Yet it will be clear to everyone in Asia, as well as Europe, that **THE UNITED STATES WAS OUTPLAYED BY CHINA AND FORCED INTO AN IMPOTENT, REACTIVE ROLE.**

---Trade Impact Answers---

trade resilient

Zero risk of protectionism

Ahearn 9 [Raymond, CRS Specialist in International Trade and Finance, “The Global Economic Downturn and Protectionism,” March 23, 2009, <http://www.policyarchive.org/handle/10207/bitstreams/19395.pdf>]

There are a number of reasons why THE THREAT OF A RETURN TO PROTECTIONIST, beggar-thy-neighbor POLICIES COULD BE VASTLY OVERSTATED. UNLIKE THE 1930S, TODAY’S GLOBAL ECONOMY HAS several STRONG FIREWALLS TO PREVENT GOVERNMENTS FROM RAISING TRADE BARRIERS that result in a cycle of retaliation and counter-retaliation. THESE FIREWALLS INCLUDE more institutionalized obstacles to protectionism built into THE WTO SYSTEM, more POLICY INSTRUMENTS TO ADDRESS THE ECONOMIC SLOWDOWN, AND A MORE INTERDEPENDENT and open world ECONOMY THAN EXISTED IN THE 1930S. In addition, some in toDAY’S MEDIA MAY TEND TO OVERSTATE THE THREAT OF PROTECTIONISM BY NOT always DISTINGUISHING BETWEEN PROTECTIONIST ACTIONS AND PROTECTIONIST PRESSURES and/or by equating legitimate forms of protection with protectionism. The fact that there is ample room for increases in trade measures and barriers that are consistent with the rules and obligations of the WTO often may go unappreciated in some press coverage. These trade measures and barriers include increases in applied tariffs to bound rates, and imposition of countervailing and antidumping duties, so-called ‘defensive’ trade measures.⁴ PROTECTION FOR LIMITED PERIODS OF TIME AND UNDER PRESCRIBED CONDITIONS IS BUILT INTO THE RULES OF THE WTO AS A POLITICAL SAFETY VALVE and as a recognition of the human and social costs that are associated with the often wrenching adjustments that accompany increased trade competition. Firewalls Against Protectionism WTO RULES TODAY SERVE TO KEEP A LID ON TRADE BARRIERS of its 153 members through an elaborate set of mutual obligations and dispute settlement procedures. Unlike the 1930s when countries could impose higher trade barriers unilaterally without violating any international agreements or anticipating a foreign reaction, under today’s rules members can take their disputes to the WTO for settlement rather than engaging in reciprocal retaliatory actions. The fact that countries violating WTO obligations can face WTO-sanctioned retaliation helps constrain outbreaks of unilateral actions that could be mutually harmful.⁵ Pressures for protection are also dampened by a world economy that is much more interdependent and integrated than in the 1930s.⁶ LEADING PRODUCERS HAVE BECOME SO INTERNATIONAL IN THEIR PRODUCTION OPERATIONS AND SUPPLY CHAINS THAT THEY HAVE DEVELOPED A VESTED INTEREST IN RESISTING PROTECTIONISM.⁷ Many industries that have faced import competition in the past – such as televisions and semiconductors—have found that international diversification or joint ventures with foreign partners are a more profitable way of coping with global competition than blocking goods at the border. In addition, many domestic industries have less incentive to ask for import restrictions because FOREIGN RIVALS NOW PRODUCE IN THE DOMESTIC MARKET, ELIMINATING THE BENEFITS OF TRADE BARRIERS FOR DOMESTIC FIRMS.⁸ Unlike the early 1930s, when governments took little responsibility for propping up financial institutions and were unable to pursue expansionary monetary policies due to fixed exchange rates under the gold standard, policymakers around the world today are adopting expansionary fiscal and monetary policies. These expansionary policies, in turn, have the capability of dampening protectionist pressures and demands that stem from job losses and related economic hardship with lower interest rates and increased expenditures on unemployment benefits and health

care benefits.⁹ A related consideration is that today's world economy is much more open than the world economy of the 1930s. Average tariffs on world trade have come down from the 50% range in the 1930s, to the 25% range in the 1980s, and to less than 10% today.¹⁰ Under these circumstances, **IT WOULD REQUIRE TREMENDOUS INCREASES IN PROTECTION TO GET THE WORLD BACK TO ANYWHERE NEAR THE CONDITIONS OF THE 1930S**, although a major increase in tariffs (e.g. a doubling) would be disruptive even if it left tariffs well below the 1930s levels. Scorecard of Protective Measures To Date **EMPIRICAL SUPPORT EXISTS FOR THE VIEW THAT EXISTING LEGAL, ECONOMIC, AND POLITICAL FIREWALLS ARE RESTRAINING TODAY'S PROTECTIONIST PRESSURES**. Most importantly, Pascal Lamy, the WTO's Director General, reported in January 2009 that most WTO members have successfully kept domestic protectionist pressures under control "with only limited evidence of increases in trade restricting or trade distorting measures" taken during the last six months of 2008. This assessment was based on the first report of the WTO secretariat on the trade effects of the global economic crisis. The report found only "limited evidence" of an increase in tariffs, non-tariff barriers or trade-remedy actions by member countries, but noted that the most significant actions taken in response to the global crisis have involved "financial support of one kind or another to banks and other financial institutions and to certain industries, notably the automobile industry."¹¹ The WTO report notes tariff increases on selected products being implemented by India, Russia, Ecuador, and Ukraine. Countries adopting non-tariff measures include Indonesia (port of entry barriers) and Argentina (import licensing requirements). Argentina was cited for measures that attempt to boost exports of selected products. But the report indicates that there has been "no dramatic increase" in antidumping investigations in the second half of 2008 compared to first half of 2008, but raised the possibility of increased trade remedy actions in 2009.¹² The World Bank, which has also been monitoring trade restrictions proposed and adopted since the beginning of the financial crisis, reached a conclusion similar to that of the WTO. Its initial report determined that there have been 47 trade restrictive measures imposed since the financial crisis began last summer, including 17 from G-20 countries, but that "these measures have probably had only marginal effects on trade flows to date." In addition to the measures cited by the WTO, the World Bank report cited China's import ban on various food products from the EU, and export subsidies provided by the EU, China, and India. Contrary to the WTO report, the World Bank report determined that "the number of antidumping cases (both investigations initiated and imposition of duties) surged in 2008."¹³

It will never collapse trade

Ikenson 9 (Daniel, associate director for the Center for Trade Policy Studies at the Cato Institute, "A Protectionism Fling: Why Tariff Hikes and Other Trade Barriers Will Be Short-Lived," 3/12, <http://www.freetrade.org/pubs/FTBs/FTB-037.html>)

A Little Perspective, Please **ALTHOUGH SOME GOVERNMENTS WILL DABBLE IN SOME DEGREE OF PROTECTIONISM, THE COMBINATION OF A STURDY RULES-BASED SYSTEM OF TRADE AND THE ECONOMIC SELF INTEREST IN BEING OPEN TO PARTICIPATION IN THE GLOBAL ECONOMY WILL LIMIT THE RISK OF A PROTECTIONIST PANDEMIC**. According to recent estimates from the International Food Policy Research Institute, **IF ALL WTO MEMBERS WERE TO RAISE ALL OF THEIR APPLIED TARIFFS TO THE MAXIMUM BOUND RATES, THE AVERAGE GLOBAL RATE OF DUTY WOULD DOUBLE AND THE VALUE OF GLOBAL TRADE WOULD DECLINE BY 7.7 PERCENT OVER FIVE YEARS**.⁸ That would be a substantial decline relative to the 5.5 percent annual rate of trade growth experienced this decade.⁹ **BUT, TO PUT THAT 7.7 PERCENT DECLINE IN HISTORICAL PERSPECTIVE, THE VALUE OF GLOBAL TRADE DECLINED BY 66 PERCENT BETWEEN 1929 AND 1934, A PERIOD MOSTLY IN THE WAKE OF SMOOT HAWLEY'S PASSAGE IN 1930**.¹⁰ so **THE POTENTIAL DOWNSIDE**

TODAY FROM what Bergsten calls "LEGAL PROTECTIONISM" IS ACTUALLY NOT THAT "MASSIVE," EVEN IF ALL WTO MEMBERS RAISED ALL OF THEIR TARIFFS TO THE HIGHEST PERMISSIBLE RATES. If most developing countries raised their tariffs to their bound rates, there would be an adverse impact on the countries that raise barriers and on their most important trade partners. But most developing countries that have room to backslide (i.e., not China) are not major importers, and thus the impact on global trade flows would not be that significant. OECD countries and China account for the top two-thirds of global import value.¹¹ Backsliding from India, Indonesia, and Argentina (who collectively account for 2.4 percent of global imports) is not going to be the spark that ignites a global trade war. Nevertheless, governments are keenly aware of the events that transpired in the 1930s, and have made various pledges to avoid protectionist measures in combating the current economic situation. In the United States, after President Obama publicly registered his concern that the "Buy American" provision in the American Recovery and Reinvestment Act might be perceived as protectionist or could incite a trade war, Congress agreed to revise the legislation to stipulate that the Buy American provision "be applied in a manner consistent with United States obligations under international agreements." In early February, China's vice commerce minister, Jiang Zengwei, announced that China would not include "Buy China" provisions in its own \$586 billion stimulus bill.¹² But even more promising than pledges to avoid trade provocations are actions taken to reduce existing trade barriers. In an effort to "reduce business operating costs, attract and retain foreign investment, raise business productivity, and provide consumers a greater variety and better quality of goods and services at competitive prices," the Mexican government initiated a plan in January to unilaterally reduce tariffs on about 70 percent of the items on its tariff schedule. Those 8,000 items, comprising 20 different industrial sectors, accounted for about half of all Mexican import value in 2007. When the final phase of the plan is implemented on January 1, 2013, the average industrial tariff rate in Mexico will have fallen from 10.4 percent to 4.3 percent.¹³ And Mexico is not alone. In February, the Brazilian government suspended tariffs entirely on some capital goods imports and reduced to 2 percent duties on a wide variety of machinery and other capital equipment, and on communications and information technology products.¹⁴ That decision came on the heels of late-January decision in Brazil to scrap plans for an import licensing program that would have affected 60 percent of the country's imports.¹⁵ Meanwhile, on February 27, a new free trade agreement was signed between Australia, New Zealand, and the 10 member countries of the Association of Southeast Asian Nations to reduce and ultimately eliminate tariffs on 96 percent of all goods by 2020. WHILE THE MEDIA AND MEMBERS OF THE TRADE POLICY COMMUNITY FIXATE ON HOW VARIOUS PROTECTIONIST MEASURES AROUND THE WORLD MIGHT FORESHADOW A PLUNGE INTO THE ABYSS, THERE IS PLENTY OF EVIDENCE THAT GOVERNMENTS REMAIN INTERESTED IN REMOVING BARRIERS TO TRADE. DESPITE THE OCCASIONAL TEMPTATION TO INDULGE DISCREDITED POLICIES, THERE IS A GROWING BODY OF INSTITUTIONAL KNOWLEDGE THAT WHEN PEOPLE ARE FREE TO ENGAGE IN COMMERCE WITH ONE ANOTHER AS THEY CHOOSE, regardless of the nationality or location of the other parties, THEY CAN LEVERAGE THAT FREEDOM TO ACCOMPLISH ECONOMIC OUTCOMES FAR MORE IMPRESSIVE THAN WHEN GOVERNMENTS ATTEMPT TO LIMIT CHOICES through policy constraints.

Timeframe is decades

IINS 10, India Infoline News Service, "Large-scale trade protectionism unlikely", June 30, <http://www.indiaonline.com/Markets/News/Large-scale-trade-protectionism-unlikely/4872197176>

THE WORLD ECONOMY HAS CHANGED STRUCTURALLY IN THE PAST FEW DECADES, MAKING ANY SERIOUS IMPLEMENTATION OF PROTECTIONIST MEASURES ALMOST IMPOSSIBLE. DEVELOPED COUNTRIES ARE MORE DEPENDENT ON IMPORTS of manufactured goods and services THAN THEY HAVE EVER BEEN. Most DEVELOPED COUNTRIES HAVE ORIENTED THEIR DOMESTIC PRODUCTION CAPACITIES TOWARDS HIGH-END PRODUCTS. Their domestic capacities for manufacturing low-end products are modest at best, SO IT WILL NOT BE EASY FOR THEM TO LAUNCH A FULL-SCALE PROTECTIONIST WAR. SETTING UP LARGE PRODUCTION CAPACITIES TO REPLACE IMPORTS WOULD TAKE years if not DECADES. Besides, RAISING import TARIFFS across-the-board WILL certainly RAISE PRICES FOR DOMESTIC CONSUMERS manifold.

Leaders won't cave to pressure

Ng Baoying 9, Channel NewsAsia, "Mounting pressure on governments to support local economy, but protectionism unlikely", <http://www.channelnewsasia.com/stories/singaporebusinessnews/view/421521/1/.html>

As the world deals with a global recession, there are concerns that some countries will turn to protectionist measures to shield their domestic economies. But observers have said that so far, most **GOVERNMENTS REMAIN COMMITTED TO FREE TRADE** and that global trade flows are not likely to suffer for now. China exports cheap toys to many parts of the world. And **SHOULD COUNTRIES RESTRICT IMPORTS** on its toys, experts said **CHINA CAN EASILY RETALIATE**. For example, it can block hard disk drives from Thailand, which are sent to China for assembly into computers. And this could lead to **A DOWNWARD SPIRAL**. But analysts said this **IS UNLIKELY, AS SUPPLY CHAINS ARE EXTREMELY INTERLINKED** on a global scale. David Cohen, Director of Asian Economic Forecasting, Action Economics, said: "The fact that at these international gatherings they still feel obliged to include **A STATEMENT OPPOSING BROAD PROTECTIONISM** in their communique from their summits, that **SHOULD HELP ALLOW THEM TO RESIST ANY DOMESTIC PRESSURE** for further protectionism. "In the current environment, I think the **LEADERS ARE AWARE THAT THEY WOULD ONLY MAKE THINGS WORSE IF THEY WERE TO START ADOPTING INCREASES IN TARIFFS**; that would choke off world trade more than it has fallen off in the global downturn. "I think they do realise that when **PEOPLE LOOK BACK (TO) THE 1930S**, they identify the protectionist tariffs as having aggravated the downturn, and I think the **LEADERS ARE INTENT THAT THEY ARE NOT GOING TO GO DOWN THAT ROUTE AGAIN**."

No constituency for protectionism

Rodrik 9 [Dani, Rafiq Hariri Professor of International Political Economy at the John F. Kennedy School of Government, Harvard University. "The Myth of Rising Protectionism," http://relooney.fatcow.com/0_New_5973.pdf]

The reality is that **THE INTERNATIONAL TRADE REGIME HAS PASSED ITS GREATEST TEST SINCE THE GREAT DEPRESSION WITH FLYING COLORS**. Trade economists who complain about minor instances of protectionism sound like a child whining about a damaged toy in the wake of an earthquake that killed thousands. **THREE THINGS EXPLAIN THIS REMARKABLE RESILIENCE : IDEAS, POLITICS , AND INSTITUTIONS . ECONOMISTS HAVE BEEN EXTRAORDINARILY SUCCESSFUL IN CONVEYING THEIR MESSAGE TO POLICYMAKERS** – even if ordinary people still regard imports with considerable suspicion. Nothing reflects this better than how **"PROTECTION" AND "PROTECTIONISTS" HAVE BECOME TERMS OF DERISION**. After all, governments are generally expected to provide protection to its citizens. But if you say that you favor protection from imports , you are painted into a corner with Reed Smoot and Willis C. Hawley, authors of the infamous 1930 US tariff bill. But economists' ideas would not have gone very far without significant changes in the underlying configuration of political interests in favor of open trade. **FOR EVERY WORKER AND FIRM AFFECTED ADVERSELY BY IMPORT COMPETITION, THERE IS ONE OR MORE** worker and firm **EXPECTING TO REAP THE BENEFITS OF ACCESS TO MARKETS ABROAD. THE LATTER HAVE BECOME INCREASINGLY VOCAL AND POWERFUL, often REPRESENTED BY LARGE MULTINATIONAL CORPORATIONS**. In his latest book, Paul Blustein recounts how a former Indian trade minister once asked his American counterpart to bring him a picture of an American farmer: "I have never actually seen one," the minister quipped. "I have only seen US conglomerates masquerading as farmers." But the relative docility of rank-and-file workers on trade issues must ultimately be attributed to something else altogether: the safety nets erected by the welfare state. **MODERN INDUSTRIAL SOCIETIES NOW HAVE A WIDE ARRAY OF SOCIAL PROTECTIONS** – unemployment compensation,

adjustment assistance, and other labor-market tools, as well as health insurance and family support – THAT MITIGATE DEMAND FOR CRUDER FORMS OF PROTECTION. The welfare state is the flip side of the open economy. If the world has not fallen off the protectionist precipice during the crisis, as it did during the 1930's, much of the credit must go to the social programs that conservatives and market fundamentalists would like to see scrapped. THE BATTLE AGAINST TRADE PROTECTION HAS BEEN WON – so far. But, before we relax, let's remember that we still have not addressed the central challenge the world economy will face as the crisis eases: the inevitable clash between China's need to produce an ever-growing quantity of manufactured goods and America's need to maintain a smaller current-account deficit. Unfortunately, there is little to suggest that policymakers are yet ready to confront this genuine threat.

no impact - trade

War destroys trade

Reuven **Glick and Taylor 5**, Economic Research Department at Federal Reserve Bank of San Francisco, Alan M. Taylor 5, econ at Cal-Davis, "collateral damage: trade disruption and the economic impact of war", July, <http://www.econ.ucdavis.edu/faculty/amtaylor/papers/w11565.pdf>

In this paper we examine some major indirect costs of war over the period 1870–1997 that have never previously been examined, namely the effect of belligerent conflict on the volume of international trade and consequently on per capita incomes and economic welfare. **USING ECONOMETRIC METHODS WE FIND A VERY STRONG IMPACT OF WAR ON TRADE VOLUMES.** Moreover these effects have two important characteristics. First, they are persistent: **EVEN AFTER CONFLICTS END, TRADE DOES NOT RESUME ITS PRE-WAR LEVEL FOR MANY YEARS, EXACERBATING TOTAL COSTS.** Second, they have a multilateral dimension: unlike the direct costs of war, which largely affect only the belligerents, commercial losses affect neutral parties as well, meaning that **WARS GENERATE A LARGE NEGATIVE EXTERNALITY VIA TRADE DESTRUCTION.** We use these results to make general equilibrium comparative statics estimates of the impact of World Wars I and II on global trade and income. Our paper is part of the renaissance of research activity on the applied economics of international trade. A growing theoretical and empirical literature relates bilateral trade flows to measures of joint economic activity and costs of trade. These so-called gravity models have been utilized as benchmarks from which to assess the trade impact of economic disturbances and policy regimes, such as exchange rate variability (e.g., Thursby and Thursby 1987), preferential trade arrangements (e.g., Frankel, Stein, and Wei 1996), and currency unions (e.g., Rose 2000).¹ On theoretical grounds, wars and other forms of militarized conflict should affect trade among adversaries. **MILITARY CONFLICT between countries IS OFTEN ACCOMPANIED BY THE IMPOSITION OF partial or TOTAL TRADE EMBARGOES** on the exchange of goods. **CONFLICT MAY also REDUCE TRADE FLOWS BY RAISING THE COSTS TO PRIVATE AGENTS OF ENGAGING IN INTERNATIONAL BUSINESS.** However, the relation of aggregate trade to political disturbances and conflict has not received much attention among economists. Among the few extant studies, Blomberg and Hess (2004) analyze the impact on trade of various forms of violence, including war and terrorism, while Martin, Mayer, and Thoenig (forthcoming) estimate the effects of military conflicts on trade. But these analyses focus only on the latter half of the twentieth century; our data span a much longer period including the two great wars of the twentieth century.²

Self-interest means security always trumps trade

Layne 98, Christopher, associate professor at Naval Postgraduate School, Summer, World Policy Journal, p. 8-28

These arguments notwithstanding, **INTERNATIONAL ECONOMIC INTERDEPENDENCE DOES NOT CAUSE PEACE.** In fact, **IT HAS VERY SERIOUS ADVERSE SECURITY CONSEQUENCES** that its proponents either do not understand or will not acknowledge. Economic relations (whether domestic or international) never take place in a vacuum; on the contrary, they occur within a politically defined framework. International

economic interdependence requires certain conditions in order to flourish, including a maximum degree of political order and stability. Just as the market cannot function within a state unless the state creates a stable "security" environment in which economic exchange can occur (by protecting property rights and enforcing contracts), the same is true in international relations. Because there is no world government, it falls to the dominant state to create the conditions under which economic interdependence can take hold (by providing security, rules of the game, and a reserve currency, and by acting as the global economy's banker and lender of last resort). Without a dominant power to perform these tasks, economic interdependence does not happen. Indeed, free trade and interdependence have occurred in the modern international system only during the hegemonies of Victorian Britain and postwar America. INTERNATIONAL ECONOMIC INTERDEPENDENCE GENERALLY OCCURS WHEN STATES FEEL SECURE, WHEN THEY DO NOT HAVE TO WORRY THAT OTHERS WILL TRANSFORM THEIR ECONOMIC GAINS FROM TRADE INTO MILITARY ADVANTAGES. CONVERSELY, WHEN STATES ARE CONCERNED ABOUT THEIR SECURITY, THEY ARE LESS LIKELY TO ENGAGE IN FREE TRADE. When security is at issue, states are always measuring themselves in comparison with their actual, or potential, rivals. WHEN STATES FEEL SECURE, THEY FOCUS ON THE OVERALL GAINS TO GLOBAL WEALTH THAT FLOW FROM TRADE. Under peaceful international conditions, the distribution of this increased wealth is not a matter of high politics: SO LONG AS ALL STATES ARE GETTING WEALTHIER, TRADE IS LOOKED UPON AS A GOOD THING. When security is an issue, however, states become intensely concerned about how the gains from trade are being distributed. When security concerns are paramount, the key question no longer is whether everyone is gaining something but rather who is gaining the most. Because economic power is the cornerstone of military strength, when security is an issue states want their economies to be more vigorous and to grow faster than those of their rivals. Also, WHEN WAR IS REGARDED AS A REAL POSSIBILITY, STATES DELIBERATELY ATTEMPT TO REDUCE THEIR DEPENDENCE ON IMPORTED PRODUCTS AND RAW MATERIALS IN ORDER TO MINIMIZE THEIR VULNERABILITY TO ECONOMIC COERCION BY OTHERS. THIS ALSO IMPAIRS ECONOMIC INTERDEPENDENCE. The bottom line here is this: WHEN SECURITY IN THE INTERNATIONAL SYSTEM IS PLENTIFUL, TRADE FLOURISHES AND, so long as they are getting richer themselves, states are untroubled by the fact that others also are getting wealthier. WHEN SECURITY IN THE INTERNATIONAL SYSTEM IS SCARCE, HOWEVER, TRADE DIMINISHES; states seek to maximize their power (economic and military) over their rivals, and hence attempt to ensure they become richer than their rivals.

Only a small percentage of wealth

John **Mearsheimer 1**, American professor of Political Science at the University of Chicago, Tragedy of Great Power Politics, 370-371

There are problems with this perspective, too." In particular, THERE IS ALWAYS THE POSSIBILITY THAT A SERIOUS ECONOMIC CRISIS IN SOME IMPORTANT REGION, OR IN THE WORLD AT LARGE, WILL UNDERMINE THE PROSPERITY THAT THIS THEORY NEEDS TO WORK. For example, IT IS WIDELY BELIEVED THAT ASIA'S "ECONOMIC MIRACLE" WORKED TO DAMPEN SECURITY COMPETITION IN THAT REGION BEFORE 1997, BUT THAT THE 1997-98 FINANCIAL CRISIS IN ASIA HELPED FOSTER A "NEW GEOPOLITICS."²⁴ It is also worth noting that ALTHOUGH THE UNITED STATES LED A SUCCESSFUL EFFORT TO CONTAIN THAT FINANCIAL CRISIS, IT WAS A CLOSE CALL, AND THERE IS NO GUARANTEE THAT THE

NEXT CRISIS WILL NOT SPREAD ACROSS THE GLOBE. But EVEN IN THE ABSENCE OF A MAJOR ECONOMIC CRISIS, ONE OR MORE STATES MIGHT NOT PROSPER; SUCH A STATE WOULD HAVE LITTLE TO LOSE ECONOMICALLY, AND MAYBE EVEN SOMETHING TO GAIN, BY STARTING A WAR. A KEY REASON THAT IRAQI DICTATOR SADDAM HUSSEIN INVADED KUWAIT in August 1990 WAS THAT KUWAIT WAS EXCEEDING ITS OIL PRODUCTION QUOTAS (set by the Organization of Petroleum Exporting Countries, or OPEC) AND DRIVING DOWN IRAQ'S OIL PROFITS, which the Iraqi economy could ill-afford.²⁵ There are two other reasons to doubt the claim that economic interdependence makes great-power war unlikely. STATES USUALLY GO TO WAR AGAINST A SINGLE RIVAL, AND THEY AIM TO WIN A QUICK AND DECISIVE VICTORY. ALSO, THEY INVARIABLY SEEK TO DISCOURAGE OTHER STATES FROM JOINING WITH THE OTHER SIDE IN THE FIGHT, BUT A WAR AGAINST ONE OR EVEN TWO OPPONENTS IS UNLIKELY TO DO MUCH DAMAGE TO A STATE'S ECONOMY, BECAUSE TYPICALLY ONLY A TINY PERCENTAGE OF A STATE'S WEALTH IS TIED UP IN ECONOMIC INTERCOURSE WITH ANY OTHER STATE. IT IS EVEN POSSIBLE, as discussed in Chapter 5, THAT CONQUEST WILL PRODUCE SIGNIFICANT ECONOMIC BENEFITS. Finally, AN IMPORTANT HISTORICAL CASE CONTRADICTS THIS PERSPECTIVE. As noted above, THERE WAS PROBABLY ABOUT AS MUCH ECONOMIC INTERDEPENDENCE IN EUROPE BETWEEN 1900 AND 1914 AS THERE IS TODAY. THOSE WERE ALSO PROSPEROUS YEARS FOR THE EUROPEAN GREAT POWERS. YET WORLD WAR I BROKE OUT IN 1914. THUS A HIGHLY INTERDEPENDENT WORLD ECONOMY DOES NOT MAKE GREAT-POWER WAR MORE OR LESS LIKELY. GREAT POWERS must be forever vigilant and NEVER SUBORDINATE SURVIVAL TO ANY OTHER GOAL, INCLUDING PROSPERITY.

Trade doesn't solve war

Martin et. al. 8 (Phillipe, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, and Centre for Economic Policy Research; Thierry MAYER, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, CEPPI, and Centre for Economic Policy Research, Mathias THOENIG, University of Geneva and Paris School of Economics, The Review of Economic Studies 75)

DOES GLOBALIZATION PACIFY INTERNATIONAL RELATIONS? The “liberal” view in political science argues that increasing trade flows and the spread of free markets and democracy should limit the incentive to use military force in interstate relations. This vision, which can partly be traced back to Kant's Essay on Perpetual Peace (1795), has been very influential: The main objective of the European trade integration process was to prevent the killing and destruction of the two World Wars from ever happening again.¹ Figure 1 suggests² HOWEVER, that DURING THE 1870–2001 PERIOD, THE CORRELATION BETWEEN TRADE OPENNESS AND MILITARY CONFLICTS IS NOT a CLEAR cut one: THE FIRST ERA OF GLOBALIZATION, at the end of the 19th century, WAS A PERIOD OF RISING TRADE OPENNESS AND MULTIPLE MILITARY CONFLICTS, CULMINATING WITH WORLD WAR I. Then, THE INTERWAR PERIOD WAS CHARACTERIZED BY A SIMULTANEOUS COLLAPSE OF WORLD TRADE AND CONFLICTS. AFTER WORLD WAR II, WORLD TRADE INCREASED RAPIDLY, while the number of conflicts decreased (ALTHOUGH THE RISK OF A GLOBAL CONFLICT WAS OBVIOUSLY HIGH). THERE IS NO CLEAR EVIDENCE THAT THE 1990S, DURING WHICH TRADE FLOWS INCREASED DRAMATICALLY, WAS A PERIOD OF LOWER prevalence of MILITARY CONFLICTS, even taking into account the increase in the number of sovereign states.

Aff – AT Auth. Inevitable/Global Demo Resilient

Global democracy is resilient – the US isn't key – our evidence assumes current trends

Larry **Diamond**, January 2014, [prof. at Stanford], Journal of Current History, vol. 99, "The Next Democratic Century," http://cddrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

This is an odd moment to predict a bright future for democracy. Despite the unprecedented expansion of political freedom during the three decades from 1974, democratic regimes are in trouble worldwide today. The past decade has witnessed democratic breakdowns at a growing pace, and levels of freedom have receded in many places. Autocrats are cooperating and innovating to preempt movements for democratic change. The world's oldest and most esteemed democracies, beginning with the United States, have lost their luster and (it seems) their capacity to function effectively to address their most important public policy challenges. Still, no other broadly legitimate form of government exists today, and authoritarian regimes face profound challenges and contradictions that they cannot resolve without ultimately moving toward democracy. During the past century, democracy went from being a unique feature of the West (and a few Western-leaning Latin American countries) to a system incorporated by a growing number of non-Western countries, most of them former British colonies that reached independence during the first two decades after World War II. But the rise of communism and fascism and the shock of the Great Depression during the interwar period had occasioned what the political scientist Samuel Huntington called a "reverse wave" of democratic breakdowns. From the late 1950s to the mid-1970s, the world wrestled with a second reverse wave, during which military coups swallowed fragile and often deeply polarized democracies in Latin America, Greece, Turkey, and parts of Asia, while elsewhere in Asia and Africa one-party or personal authoritarian regimes came to dominate. A number of factors fed the authoritarian zeitgeist: the spectacular failures of some democracies to govern effectively or maintain order, the successes of East Asian developmental dictatorships, the popularity in poor countries of authoritarian socialist models and ideologies, and the US-Soviet Cold War rivalry that saw each superpower back any dictator who would offer geopolitical support. By the mid-1970s, democracy seemed to many a quaint relic of a liberal past—a model of where the world had been, not where it was headed. Then came Portugal's Revolution of the Carnations in April 1974, overturning nearly half a century of quasi-fascist dictatorship, and a new wave of democratization began. Even with the rise of democracy in Portugal, Spain, and Greece in the subsequent few years, and then the transitions from military to democratic rule in Latin America in the late 1970s and early 1980s, few imagined that a truly global process of transformation was under way. Even the popular protests that toppled Ferdinand Marcos in the Philippines, or the student demonstrations that compelled the military to hand over power in South Korea, did not suggest a global trend. The fall of the Berlin Wall, however, changed everything. Not only did it spark democratic transitions in Central and Eastern Europe; the end of the Cold War unfroze the African landscape and encouraged democratic openings throughout the continent. By the mid-1990s, democracy had become a global phenomenon, accounting for about three of every five states in the world.

Global democratization is consolidating now – the US isn't key

Larry **Diamond**, January 2014, [prof. at Stanford], Journal of Current History, vol. 99, "The Next Democratic Century," http://cddrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

Even so, a surprising number of other emerging democracies have met a litmus test of reasonably "liberal" democracy (garnering one of the two best scores on the seven-point Freedom House scales of both political rights and civil liberties). Forty percent of the world's states and about two-thirds of the world's democracies (or 79 nations in all) now meet this test. And while the number and proportions of liberal democracies have hardly changed in the last seven years, at least they have not declined. Moreover, a number of other emerging market countries have

consolidated a decent level of democracy—in the sense that it is very difficult to imagine another reversal of democracy in these countries. To the extent that they find democratic “consolidation” a useful concept, most scholars of Brazil would put it in this category. The same is true for Mexico, where democracy has survived in the face of widespread violence related to drug trafficking. For all its disturbing levels of corruption, clientelism, paralysis, and dysfunction, it is similarly difficult to imagine democracy being replaced by another type of regime in India. If, after a disappointing second term for President Susilo Bambang Yudhoyono, Indonesia elects a reformist president in 2014 (such as the energetic, progressive governor of Jakarta, Joko Widodo, who is now leading in the polls), Indonesian democracy might also turn in a more liberal and stable direction. South Korea, Brazil, Mexico, India, and Indonesia are among the emerging market members of the Group of 20 industrialized nations. Three other members of that club—Turkey, Argentina, and South Africa—fall into the category of more troubled or embattled democracies, with ruling executives and parties that appear to harbor hegemonic ambitions. Each of the three will hold national elections in 2014 or 2015, during which each could move either in the direction of further democratic decay or toward a more liberal and rooted democracy. Having decimated the old power establishment in suspiciously wide-ranging trials of alleged coup plotters, while also continuing to intimidate and constrain the press, Prime Minister Recep Tayyip Erdogan and his Justice and Development Party (AKP) remain the dominant political force in Turkey. After serving more than a decade as prime minister, Erdogan (whose party’s rules bar him from seeking another term in that post) is trying to change the constitution to create a muscular, French-style semi-presidential system, which would enable him to remain in power for a long time. Turkey will hold its first direct presidential election in August 2014, but it is not at all clear that Erdogan will succeed in amending the constitution to give that post the strong executive powers he seeks. Widespread youth protests in recent months signal the beginning of a societal pushback against the AKP’s autocratic governing style. In Argentina, President Cristina Fernández de Kirchner’s bid to aggrandize her power has already failed. In midterm elections in late October 2013, her party fell far short of the two-thirds majority it would need to amend the constitution to allow her a third term. Political momentum is now shifting from her party due to corruption and economic mismanagement, and Argentines are beginning to look beyond what will be a dozen years of rule by Fernández de Kirchner and her late husband, Néstor Kirchner. In South Africa, while there is little doubt that President Jacob Zuma’s African National Congress will win the 2014 national elections, a viable multiracial opposition is slowly beginning to rise in the form of the Democratic Alliance, the country’s only party to have steadily and significantly increased its share of the vote in each of the four post-apartheid national elections. Led by a savvy and effective institution builder, Western Cape Premier Helen Zille, the Democratic Alliance is gradually expanding from its roots in South Africa’s racial minorities to appeal to black voters dissatisfied with corruption, high unemployment, and poor service delivery—long-standing problems that have only grown worse under Zuma. The fate of democracy outside the West will be shaped disproportionately by what happens in these weighty G-20 countries that could move in either direction—Indonesia, Argentina, Turkey, and South Africa—and by whether Brazil and India can demonstrate the ability of large democracies to generate vigorous, sustainable, and reasonably equitable economic growth. If these countries move even incrementally to entrench democracy and deliver development, the G-20 will have become a strong “club of democracies,” with only Russia, China, and Saudi Arabia holding out.

Global democracy is increasing – liberal values and civil society are trending upwards

Larry Diamond, January 2014, [prof. at Stanford], Journal of Current History, vol. 99, “The Next Democratic Century,” http://cdrrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

There are other reasons for optimism about the future of democracy. Particularly in Asia, economic development in a number of countries is having the predictable effects it had in South Korea and Taiwan, and before that in Spain and Portugal. With rising levels of education and incomes and growing access to information, values are changing. People are becoming more tolerant of diversity, more politically demanding and assertive, and more willing to protest. As Ronald Inglehart of the University of Michigan and Christian Welzel of Leuphana University put it, people’s value priorities are shifting from material gain to “emancipation from authority.” Closely intertwined with this psychological shift is the rise of civil society—of independent organizations and flows of information, opinion, and ideas. These psychological and social changes undermine the legitimacy of authoritarian rule and generate favorable conditions for democratization in Asia—not only in Malaysia and Singapore, where it will probably happen within a decade, but in China itself, where both the decay of communist rule and the rise of a middle-class society are much more advanced than has generally been appreciated. Without major political reforms, it is unlikely that communist rule can survive in China beyond Xi Jinping’s expected two five-year terms as president. And in terms of the pressure for political change, Vietnam is not all that far behind China (particularly given South Vietnam’s earlier experience with more pluralistic politics and more capitalist economics). Factor in as well the incremental progress toward reviving democracy in Thailand, the efforts of reformist President Benigno Aquino to rein in corruption in the Philippines, and a political opening in Myanmar (though it is still far from democracy), and it becomes possible to imagine that one of the most powerful emerging-market trading blocs could be predominantly democratic within a decade.

Aff – AT Growth Unsustainable

Growth is sustainable – innovation constantly increases our carrying capacity

Tsvi Bisk, 2012, World Future Society, “No Limits to Growth,”

https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

When one factors in the growth of the proportion of GDP of services, the picture becomes even less foreboding. Services have become the major drivers of global economic growth. They constitute over 63% of global GDP and well over 70% of GDP in the developed world, and the proportion is increasing. While services such as translation, consulting, planning, accounting, massage therapy, legal advice, etc., also consume some natural resources, the quantity is infinitesimal in relation to the economic value produced. If I manufacture a car for \$10,000 I have consumed a huge amount of natural resources and energy. But if I translate a 100,000-word book for \$10,000 I have consumed merely the electricity necessary to run my computer, and the electricity used to send the translation as an email attachment, and little else that is even measurable. **Consumers and the consumer society are not the problem. The problem lies in the production methods presently used by manufacturing, mining, and agriculture. And the solution lies in the revolutions that are also presently taking place in material science, water engineering, energy harvesting, and food production.** We might speculate that **the world economy can continue to grow indefinitely at 4%-5% a year, while our negative footprint on the planet simultaneously declines. By the end of this century the planet will be able to carry a population of 12 billion people with an American standard of living, and one-tenth the present negative environmental impact.**

Growth is sustainable – innovation will usher in a “no limit to growth” era by 2020

Tsvi Bisk, 2012, World Future Society, “No Limits to Growth,”

https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

But it is **superlight materials** that **have the greatest potential to transform civilization and**, in conjunction with the above, to **usher in the “no limits to growth” era**. I refer, in particular, to carbon nanotubes—alternatively referred to as Buckyballs or Buckypaper (in honor of Buckminster Fuller). Carbon nanotubes are between 1/10,000th and 1/50,000th the width of a human hair, more flexible than rubber and 100-500 times stronger than steel per unit of weight. Imagine the energy savings if planes, cars, trucks, trains, elevators—everything that needs energy to move—were made of this material and weighed 1/100th what they weigh now. Imagine the types of alternative energy that would become practical. Imagine the positive impact on the environment: replacing many industrial processes and mining, and thus lessening air and groundwater pollution. Present costs and production methods make this impractical but that infinite resource—**the human mind—has confronted and solved many problems like this before**. Let us take the example of aluminum. A hundred fifty years ago, aluminum was more expensive than gold or platinum.³⁷ When Napoleon III held a banquet, he provided his most honored guests with aluminum plates. Less-distinguished guests had to make do with gold. When the Washington Monument was completed in 1884, it was fitted with an aluminum cap—the most expensive metal in the world at the time—as a sign of respect to George Washington. It weighed 2.85 kilograms, or 2,850 grams. Aluminum at the time cost \$1 a gram (or \$1,000 a kilogram). A typical day laborer working on the monument was paid \$1 a day for 10-12 hours a day. In other words, today's common soft-drink can, which weighs 14 grams, could have bought 14 ten-hour days of labor in 1884.³⁸ Today's U.S. minimum wage is \$7.50 an hour. Using labor as the measure of value, a soft drink can would cost \$1,125 today (or \$80,000 a kilogram), were it not for a new method of processing aluminum ore. The Hall-Héroult process turned aluminum into one of the cheapest commodities on earth only two years after the Washington Monument was capped with aluminum. Today aluminum costs \$3 a kilogram, or \$3000 a metric ton. The soft drink can that would have cost \$1,125 today without the process now costs \$0.04. Today the average cost of industrial grade carbon nanotubes is about \$50-\$60 a kilogram. This is already far cheaper in real cost than aluminum was in 1884. Yet **revolutionary methods of production are now being developed that will drive costs down even more radically**. At Cambridge University they are working on a new electrochemical production method that could produce 600 kilograms of carbon nanotubes per day at a projected cost of around \$10 a kilogram, or \$10,000 a metric ton.³⁹ This will do for carbon nanotubes what the Hall-Héroult process did for aluminum. **Nanotubes will become the universal raw material of choice**, displacing steel, aluminum, copper and other metals and materials. Steel presently costs about \$750 per metric ton. Nanotubes of equivalent strength to a metric ton of steel would cost \$100 if this Cambridge process (or others being pursued in research labs around the world) proves successful. Ben Wang, director of Florida State's

HighPerformance Materials Institute claims that: "If you take just one gram of nanotubes, and you unfold every tube into a graphite sheet, you can cover about two-thirds of a football field".⁴⁰ Since other research has indicated that carbon nanotubes would be more suitable than silicon for producing photovoltaic energy, consider the implications. Several grams of this material could be the energy-producing skin for new generations of superlight dirigibles—making these airships energy autonomous. They could replace airplanes as the primary means to transport air freight. Modern American history has shown that anything human beings decide they want done can be done in 20 years if it does not violate the laws of nature. The atom bomb was developed in four years; putting a man on the moon took eight years. It is a reasonable conjecture that by 2020 or earlier, an industrial process for the inexpensive production of carbon nanotubes will be developed, and that this would be the key to solving our energy, raw materials, and environmental problems all at once.

Innovation proves there are no limits to growth – advancements are being made now that will quickly reduce our impact on the environment

Tsvi Bisk, 2012, World Future Society, "No Limits to Growth,"
https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

The embryonic revolution in material science, now taking place is the key to "no limits to growth." I refer to "smart" and superlight materials. Smart materials "are materials that have one or more properties that can be significantly changed in a controlled fashion by external stimuli."³² They can produce energy by exploiting differences in temperature (thermoelectric materials) or by being stressed (piezoelectric materials). Other smart materials save energy in the manufacturing process by changing shape or repairing themselves as a consequence of various external stimuli. These materials have all passed the "proof of concept" phase (i.e., are scientifically sound) and many are in the prototype phase. Some are already commercialized and penetrating the market. For example, the Israeli company Innowattech has underlain a one-kilometer stretch of local highway with piezoelectric material to "harvest" the wasted stress energy of vehicles passing over and convert it to electricity.³³ They reckon that Israel has stretches of road that can efficiently produce 250 megawatts. If this is verified, consider the tremendous electricity potential of the New Jersey Turnpike or the thruways of Los Angeles and elsewhere. Consider the potential of railway and subway tracks. We are talking about tens of thousands of potential megawatts produced without any fossil fuels. Additional energy is derivable from thermoelectric materials, which can transform wasted heat into electricity. As Christopher Steiner notes, capturing waste heat from manufacturing alone in the United States would provide an additional 65,000 megawatts: "enough for 50 million homes."³⁴ Smart glass is already commercialized and can save significant energy in heating, airconditioning and lighting—up to 50% saving in energy has been achieved in retrofitted legacy buildings (such as the former Sears Tower in Chicago). New buildings, designed to take maximum advantage of this and other technologies could save even more. Buildings consume 39% of America's energy and 68% of its electricity. They emit 38% of the carbon dioxide, 49% of the sulfur dioxide, and 25% of the nitrogen oxides found in the air.³⁵ Even greater savings in electricity could be realized by replacing incandescent and fluorescent light bulbs with LEDs which use 1/10th the electricity of incandescent and half the electricity of fluorescents. These three steps: transforming waste heat into electricity, retrofitting buildings with smart glass, and LED lighting, could cut America's electricity consumption and its CO₂ emissions by 50% within 10 years. They would also generate hundreds of thousands of jobs in construction and home improvements. Coal driven electricity generation would become a thing of the past. The coal released could be liquefied or gasified (by new environmentally friendly technologies) into the energy equivalent of 3.5 million barrels of oil a day. This is equivalent to the amount of oil the United States imports from the Persian Gulf and Venezuela together.³⁶ Conservation of energy and parasitic energy harvesting, as well as urban agriculture would cut the planet's energy consumption and air and water pollution significantly. Waste-to-energy technologies could begin to replace fossil fuels. Garbage, sewage, organic trash, and agricultural and food processing waste are essentially hydrocarbon resources that can be transformed into ethanol, methanol, and biobutanol or biodiesel. These can be used for transportation, electricity generation or as feedstock for plastics and other materials. Waste-to-energy is essentially a recycling of CO₂ from the environment instead of introducing new CO₂ into the environment. Waste-to-energy also prevents the production, and release from rotting organic waste, of methane—a greenhouse gas 25 times more powerful than CO₂. Methane accounts for 18% of the manmade greenhouse effect. Not as much as CO₂, which constitutes 72%, but still considerable (landfills emit as much greenhouse gas effect, in the form of methane, as the CO₂ from all the vehicles in the world). Numerous prototypes of a variety of waste-to-energy technologies are already in place. When their declining costs meet the rising costs of fossil fuels, they will become commercialized and, if history is any judge, will replace fossil fuels very quickly—just as coal replaced wood in a matter of decades and petroleum replaced whale oil in a matter of years.

Momentum is building in the squo to prevent environmental destruction and warming through democratic channels – there is no need to turn to eco-fascism

Micah **White**, 9/16/2010, The Guardian, “an alternative to the new wave of ecofascism,” <http://www.theguardian.com/commentisfree/cif-green/2010/sep/16/authoritarianism-ecofascism-alternative,mm>

Humanity can avert climate catastrophe without accepting ecological tyranny. However, this will take an immediate, drastic reduction of our consumption. This requires the trust that the majority of people would voluntarily reduce their standard of living once the forces that induce consumerism are overcome.¶ **The future of environmentalism is in liberating humanity from the compulsion to consume.** Rampant, earth-destroying consumption is the norm in the west largely because our imaginations are pillaged by any corporation with an advertising budget. From birth, we are assaulted by thousands of commercial messages each day whose single mantra is "buy". Silencing this refrain is the revolutionary alternative to ecological fascism. **It is a revolution which is already buddin**g and is **marked by** three synergetic campaigns: **the criminalisation of advertising, the revocation of corporate power and the downshifting of the global economy.**¶ **In São Paulo**, the seventh largest city in the world, **outdoor advertising has been banned.** Meanwhile, **artists in New York City and Toronto are launching blitzkrieg attacks on billboards**, replacing commercials with art. Their efforts have put one visual polluter out of business. Grassroots organisers in the US are pushing for an amendment to the constitution that will end corporate personhood while others are fighting to revive the possibility of death penalties for corporations. **The second international conference on degrowth** economics **met** recently **in Barcelona.** In Ithaca, New York a local, time-based currency is thriving. Buy Nothing Day campaign is celebrated in dozens of nations and now Adbusters is upping the ante with a call for seven days of carnivalesque rebellion against consumerism this November. And, most important of all, **across the world everyday people are silently, unceremoniously and intentionally spending less and living more.**¶ **Authoritarian environmentalists** fail to imagine a world without advertising, so they **dream of putting democracy "on hold"**. In Linkola's dystopian vision, the resources of the state are mobilised to clamp down on individual liberty. But **there is no need to suspend democracy if it is returned to the people. Democratic, anti-fascist environmentalism means marshalling the strength of humanity to suppress corporations. Only by silencing the consumerist forces will both climate catastrophe and ecological tyranny be averted.** Yes, **western consumption will be substantially reduced.** But it will be done **voluntarily and joyously.**

Aff - AT Growth Unsustainable – Population

Overpopulation is overblown – global growth will peak at 10 billion and decline to 7 billion by the end of the century

Tsvi Bisk, 2012, World Future Society, “No Limits to Growth,”
https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

One constant refrain of anti-growth advocates is that we are heading towards 12 billion people by the end of the century, that this is unsustainable, and thus that we must proactively reduce the human population to 3 billion-4 billion in order to “save the planet” and human civilization from catastrophe. But recent data indicates that a demographic winter will engulf humanity by the middle of this century. More than 60 countries (containing over half the world’s population) already do not have replacement birth rates of 2.1 children per woman. This includes the entire EU, China, Russia, and half a dozen Muslim countries, including Turkey, Algeria, and Iran. If present trends continue, India, Mexico and Indonesia will join this group before 2030. The human population will peak at 9-10 billion by 2060, after which, for the first time since the Black Death, it will begin to shrink. By the end of the century, the human population might be as low as 6 billion-7 billion. The real danger is not a population explosion, but the consequences of the impending population implosion.⁴⁷ This demographic process is not being driven by famine or disease as has been the case in all previous history. Instead, it is being driven by the greatest Cultural Revolution in the history of the human race: the liberation and empowerment of women. The fact is that even with present technology, we would still be able to sustain a global population of 12 billion by the end of the century if needed. The evidence for this is cited above.

Aff - AT Growth Unsustainable – Warming

Innovation will solve warming in the status quo

Tsvi Bisk, 2012, World Future Society, "No Limits to Growth,"

https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

The goal of mitigating global warming/climate change without changing our lifestyles is not naïve. Using proven Israeli expertise, planting forests on just 12% of the world's semi-arid areas would offset the annual CO₂ output of one thousand 500-megawatt coal plants (a gigaton a year).⁴⁵ A global program of foresting 60% of the world's semi-arid areas would offset five thousand 500-megawatt coal plants (five gigatons a year). Since mitigation goals for global warming include reducing our CO₂ emissions by eight gigatons by 2050, this project alone would have a tremendous ameliorating effect. Given that large swaths of semi-arid land areas contain or border on some of the poorest populations on the planet, we could put millions of the world's poorest citizens to work in forestation, thus accomplishing two positives (fighting poverty and environmental degradation) with one project. Moving agriculture from its current fieldbased paradigm to vertical urban agriculture would eliminate two gigatons of CO₂. The subsequent re-wilding of vast areas of the earth's surface could help sequester up to 50 gigatons of CO₂ a year, completely reversing the trend. The revolution underway in material science will help us to become "self-sufficient" in energy. It will also enable us to create superlight vehicles and structures that will produce their own energy. Over time, carbon nanotubes will replace steel, copper and aluminum in a myriad of functions. Converting waste to energy will eliminate most of the methane gas humanity releases into the atmosphere. Meanwhile, artificial photosynthesis will suck CO₂ out of the air at 1,000 times the rate of natural photosynthesis.⁴⁶ This trapped CO₂ could then be combined with hydrogen to create much of the petroleum we will continue to need. As hemp and other fast-growing plants replace wood for making paper, the logging industry will largely cease to exist. Self-contained fish farms will provide a major share of our protein needs with far less environmental damage to the oceans.

Aff – AT Alt – Worse for Environment

A robust body of research proves that liberal, democratic regimes are better at managing environmental problems than authoritarian regimes

Dan **Shahar**, 2015, Environmental Values, 24(3), “Rejecting eco-authoritarianism, again, 345-366, mm

As Eco-Authoritarianism has re-emerged into contemporary environmental discourse, a number of scholars have begun to pay closer attention to the environmental and political performance of actual authoritarian societies, primarily including but not limited to China. This scrutiny has revealed a largely-mixed track record including some important successes alongside significant shortfalls. Critics of China in particular have questioned the ability of the Communist Party to successfully implement and enforce its high-minded directives,⁴² noting that sometimes “being aggressive has no bearing on being effective.”⁴³ Reservations about the actual effectiveness of authoritarian environmental policies have been echoed in discussions of other regimes in countries like Egypt,⁴⁴ Iran,⁴⁵ and Thailand.⁴⁶ Bolstering these concerns, a recent study by Hanna Bäck and Axel Hadenius has suggested the existence of a more general “J-shaped” relationship between democratization and administrative efficiency across various countries and time periods. According to Bäck and Hadenius, “administrative quality is higher in strongly authoritarian states than in states that are partially democratized; it is highest of all, however, in states of a pronouncedly democratic character.”⁴⁷ They suggest that this may be because highly democratic states can rely on a well-developed civil society for help in making sure that policies are well-calibrated to particular contexts and for constructive feedback on policies once they are implemented.⁴⁸ The authors note that authoritarian governments can sometimes perform better than partially democratized societies with poorly-developed civil societies, but that they have thus far been hard-pressed to find an effective substitute for the genuine citizen participation that enables successful democracies to formulate and implement their policies successfully.⁴⁹ Thus although authoritarian governments may be free from certain policy-making constraints faced by governments in liberal regimes, administrators in even the most successful authoritarian countries have historically failed to match the levels of state capacity enjoyed by citizens of prosperous democratic countries like Finland, New Zealand, and the Netherlands.⁵⁰ The dubious performance of actually existing authoritarian governments may be thought to cast some doubt on the viability of Eco-Authoritarianism as a response to the ecological crisis. Thus Anthony Giddens has recently defended democracy against Shearman and Smith by observing that “Totalitarian states have generally had poor or disastrous environmental records. So also have most of those that have undergone processes of “authoritarian modernization,” such as China, Russia or South Korea.”⁵¹ What Giddens fails to appreciate, however, is the extent to which contemporary Eco-Authoritarians accept his observations. Shearman and Smith, for example, begin The Climate Change Challenge and the Failure of Democracy by announcing, “We agree that existing authoritarian societies, largely based upon Marxist doctrines, have had an appalling environmental record. We accept that there is no example of an existing authoritarian government that does not have a records of environmental abuse.”⁵²

The alt would be far worse for the environment – history shows that democratic societies have better track records at protecting the environment

Jonathon **Adler**, Prof. Law and Dir. Center for Business Law and Regulation – Case Western Reserve U., New Atlantis, “Green Bridge to Nowhere”, Fall, **2008**, <http://www.thenewatlantis.com/publications/green-bridge-to-nowhere>, mm

The first item on his agenda is the replacement of modern capitalism with some undefined “non-socialist” alternative. “The planet cannot sustain capitalism as we know it,” he warns, calling for a fundamental transformation. But he does not understand the system he wants to reform, let alone what he would substitute in its place. According to Speth, “most environmental deterioration is a result of systemic failures of capitalism.” This is an odd claim, as the least capitalist nations of the world also have the worst environmental

records. The ecological costs of economic statism are far worse than those of economic liberty. The environmental record of the various Soviet regimes amply bears this out: The West's ecological nightmares were the Soviet bloc's environmental realities. This is not due to any anomaly of the Soviet system. Nations with greater commitment to capitalist institutions experience greater environmental performance. While Speth occasionally acknowledges pockets of environmental progress, he hardly stops to consider the reasons why some environmental resources have been conserved more effectively than others. Fisheries are certainly declining throughout much of the world—some 75 percent of fisheries are fully or over-exploited—but not everywhere. It is worth asking why. Tropical forests in less-developed nations are declining even as most temperate forests in industrialized nations are rebounding. Recognizing these different trends and identifying the key variables is essential to diagnosing the real causes of environmental deterioration and prescribing a treatment that will work. Speth acknowledges that much of the world is undergoing “dematerialization,” such that economic growth far outpaces increases in resource demand, but seems not to appreciate how the capitalist system he decries creates the incentives that drive this trend. Were it not for market-driven advances in technological capability and ecological efficiency, humanity's footprint on the Earth would be far greater. While modern civilization has developed the means to effect massive ecological transformations, it has also found ways to produce wealth while leaving more of the natural world intact. Market competition generates substantial incentives to do more with less—thus in market economies we see long and continuing improvements in productive efficiency. This can be seen everywhere from the replacement of copper with fiber optics (made from silica, the chief component in sand) and the light-weighting of packaging to the explosion of agricultural productivity and improvements in energy efficiency. Less material is used and disposed of, reducing overall environmental impacts from productive activity. The key to such improvements is the same set of institutional arrangements that Speth so decries: property rights and voluntary exchange protected by the rule of law—that is, capitalism. As research by Wheaton College economist Seth Norton and many others has shown, societies in which property rights and economic freedoms are protected experience superior economic and environmental performance than those societies subject to greater government control. Indeed, such institutions have a greater effect on environmental performance than the other factors, such as population growth, that occupy the attention of Speth and so many other environmental thinkers. Speth complains that capitalism is fundamentally biased against the future; but the marketplace does a far better job of pricing and accounting for future interests than the political alternative. “Future generations cannot participate in capitalism's markets [today],” says Speth. Fair enough, but they cannot vote or engage in the regulatory process either. Thus the relevant policy question is what set of institutions does the best—or least bad—job of accounting for such concerns, and here there is no contest. However present-oriented the marketplace may be, it is better able to look past the next election cycle than any plausibly democratic alternative.

China and Russia prove that eco-authoritarianism fails

Dan **Shahar**, 2015, *Environmental Values*, 24(3), “Rejecting eco-authoritarianism, again, 345-366, mm

In its own way, the early Eco-Authoritarian position made a certain amount of sense: if it were true that an ecological crisis was being caused by excessive autonomy, that democratic market liberal societies would systematically fail to generate the constraints necessary to avoid the crisis, and that authoritarian governments would be able to keep societies away from catastrophe through enlightened central planning, then the relative appeal of authoritarianism would be clear.²¹ The problem with this position, however, was its crucial assumption that authoritarian governments would actually be able to generate better outcomes through central planning. This premise was quickly challenged in the academic literature by critics who argued that authoritarian governments would be hard-pressed to cope successfully with their vastly increased size and complexity while also navigating difficult ecological challenges.²² But the biggest blows to early Eco-Authoritarianism came from the failure of real-world experiments with centralized authoritarianism around the world. With the disintegration of the Soviet Union and thoroughgoing economic reform of the People's Republic of China, it became increasingly untenable in any area of discourse to advocate centralized authoritarianism as a solution to any problem, never mind one requiring highly complex, efficient, and coordinated actions by public agents.

The eco-authoritarian model can't solve – the USSR proves

Matthew **Humphrey, 2007**, Ecological Politics and Democratic Theory: The challenge to the deliberative ideal, p. 140, mm

For all that the problems with which eco-authoritarians struggled were and remain real, the faith they placed in an authoritarian state to resolve these problems was surely misguided. Whilst the inferior ecological record of nondemocratic states in itself proves nothing (how many of these states actually prioritised environmental goals?), the ability of a state to impose its 'green will' on an unwilling and resentful public who see their taken-for-granted freedoms being curtailed is questionable, in the absence of a monstrous architecture of green totalitarianism. Authoritarian states have often not been good at achieving those policy goals that they have prioritised, as the forlorn ambition of the Soviet Union to outstrip the productive capacity of the capitalist West testifies. There is no obvious reason to expect an authoritarian green state to be better than the Soviet Union at overcoming the internal divisions, inefficiencies, corruption, and perverse incentives that plague such states.

Aff – AT Alt – AT Benevolent Leaders

Eco-authoritarianism inevitably collapses into tyrannical despotism – that makes solving the environment impossible

Dan **Shahar**, 2015, Environmental Values, 24(3), “Rejecting eco-authoritarianism, again, 345-366, mm

Traditionally, critics of authoritarianism have worried that unrestrained power granted to government officials could fall into the wrong hands, resulting in a serious potential for tyrannical despotism.⁵³

Despotism is obviously problematic due to the harms it typically generates for citizens living under its rule, but in the current context we may also worry that a despotic regime would end up neglecting to prioritize environmental protection, thereby failing to ameliorate the crisis that would have motivated the shift toward authoritarianism in the first place.

In order to avoid this problem, Eco-Authoritarians would need to provide reason to think that following their prescriptions would mean putting our collective futures not into the hands of injurious despots but rather into those of administrators who possess both the capacity to address an impending environmental crisis effectively and the motivation to do so. This challenge has two interrelated aspects: first, it must be shown that a capable and benevolent “eco-elite” could be generated in the first place to rule over our society; and second, it must be shown that a system of rule by “eco-elites” could be effectively perpetuated over a long period of time. To my knowledge, the only contemporary Eco-Authoritarians who have taken up this challenge are also the most extreme proponents of the view: David Shearman and Joseph Wayne Smith. In *The Climate Change Challenge and the Failure of Democracy*, Shearman and Smith contend that successful Eco-Authoritarianism would require leaders of a caliber far higher than we find in contemporary society, and that producing such leaders would require a radically different system of education. This new system would be built around superior “real universities” that would purportedly “train holistic thinkers in all of the arts and sciences necessary for tough decision making that the environmental crisis confronts us with.”⁵⁴ These products would be “true public intellectuals with knowledge well grounded in ecology,”⁵⁵ who would be charged with preserving “remnants of our civilization when the great collapse comes” as “the new priesthood of the new dark age.”⁵⁶ Perhaps unsurprisingly, the authors give only sketchy details on exactly how “real universities” would achieve these felicitous results. Their main proposals in *The Climate Change Challenge and the Failure of Democracy* seem limited to focusing scholarly research on problems that are important to human well-being,⁵⁷ expanding the role of information sharing among the intellectual community,⁵⁸ and accelerating the development of programs in environmental studies.⁵⁹ Although many of these proposals seem reasonable and even attractive, they hardly seem like the sorts of revolutionary changes that would equip graduating students with the capacities and motivations needed to effectively rule over complex modern societies. Even if a capable and benevolent eco-elite could be produced, a further hurdle for Eco-Authoritarianism would involve demonstrating that the quality of elite rule could be maintained over time. Shearman and Smith do not take up this aspect of the issue in a substantive way, and to my knowledge neither does any other contemporary Eco-Authoritarian. But the challenge of sustaining a capable and benevolent ruling class over time is a notoriously difficult one for an authoritarian regime to overcome. As the eco-anarchist philosopher Alan Carter has quite reasonably worried: Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain power, how can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than those whom they usurp, as the history of many coups attests to.⁶⁰ At the very least, it seems that Eco-Authoritarians owe us some account of how their proposed regimes could predictably avoid corruption over time.

Aff – Perm Solvency

The perm solves best – democracy is reflexive and can resolve environmental problems. The alt alone fails because the public will never get on board.

Bruce Jennings, May 2013, [Jennings is the Director of Bioethics and Editor of Minding Nature at the Center for Humans and Nature], Center for Humans & Nature, “Governance in a Post-Growth Society: An Inquiry into the Democratic Prospect,” <http://www.humansandnature.org/governance-in-a-post-growth-society--an-inquiry-into-the-democratic-prospect-article-136.php>, mm

Ecological authoritarians are exceedingly pessimistic about the current state of ordinary moral sensibility and political judgment in Western society. They rest their assessment and theory of governance on a belief in the widespread cultural dominance of excessive individualism and materialism, and seem to think that consumerism has thoroughly triumphed over every competing cultural or ethical value system. As an account of the logical tendencies at work in a particular form of economic system and society, this argument has validity, but not as a complete empirical description of currently existing culture and politics. It underestimates the remaining moral capital in a growth-oriented society that can be channeled in future degrowth directions, thereby making a different form of democracy compatible with ecological requirements. Many still quite powerfully held values compete with individualism and materialism in the attitudes and motivations of contemporary citizens. Furthermore, it is far from clear that massive numbers of people will withdraw their allegiance from democratic governments even if they fail to produce high levels of economic prosperity. Indeed, it is not at all clear that a democratic system would not be able to survive even a period of considerable austerity, if the need for such measures were clear and if the burdens and hardships were shared in a truly just and equitable way. These are large ifs. The relationship between economics and political legitimation is complex. As a matter of intellectual history, this equating of all forms of democracy with materialism and a narrowly self-interested individualism is overly selective. Even in the modern period, democratic governance has rested on more than simply the ideology of growth and expansive capitalism. While possessive individualism has certainly been one important strand within Western democratic societies, it has not been the only strand, and it has not gone unchallenged from within democratic thought itself.^[20] Thus it is misleading to argue that democratic governance cannot honestly appeal to any sense of public purpose larger than throwaway consumption. Believing that democratic governments could neither call for nor obtain popular support except on the basis of a promise of more economic growth, ecological authoritarianism turns to non-democratic governance out of a sense of despair. But, so far at least, neither the sociological nor their historical arguments of this theory are sufficient to warrant that conclusion.

Aff – Democratic Peace Theory

DEMOCRATIC PEACE THEORY IS EMPIRICAL FACT

McFaul, prof of political science @ Stanford and special assistant to Obama, 2010

(Michael, Advancing democracy abroad: why we should and how we can)

The second concern about democracies being more prone war is also exaggerated.

Democracies do not go to war with each other. More precisely, Bruce Russett, one of the

closest observers of this phenomenon, writes, First, democratically organized political

systems in general operate under restraints that make them more peaceful in their

relations with other democracies. . . . Second, in the modern international system, democracies are

less likely to use lethal violence toward other democracies than toward autocratically governed states or

than autocratically governed states are toward each other. Furthermore, there are no clearcut cases of

sovereign stable democracies waging war with each other in the modern international system.

Reflecting on a vast academic literature on the causes of war, Jack Levy concluded that the

democratic peace theory is "the closest thing we have to empirical law in the study of

international relations."¹⁰⁷ Democracies are not pacifist regimes when dealing with autocracies. But

democracies are peaceful when interacting with other democracies.!

The best empirical data proves that democratic peace theory is a statistical law

Robert Delahunty, law professor, St. Thomas, John Yoo, law professor, Cal Berkeley, Winter 2010,

Chicago Journal of International Law, p. 463

Democracies settle disputes through peaceful dispute settlement processes more often than others. Democracies are more likely to initiate wars against non-democracies than vice-versa. Democracies fight shorter wars with lower costs when they begin the wars.

Transitional democracies are more likely to fight, and larger democracies are less likely to go to war than smaller ones. Critics have questioned whether the findings are statistically robust, or have argued that omitted variables such as the stability of the Cold War are the true explanations. Yet it appears that the democratic peace is as close to a statistical law as anything will be in

international politics.

Rigorous statistical analysis supports democratic peace theory

Robert Delahunty, law professor, St. Thomas, John Yoo, law professor, Cal Berkeley, Winter 2010,

Chicago Journal of International Law, p. 461-2

But before we reach any conclusion on whether American foreign policy ought to promote democracy--even to the point of using force to achieve regime change--we need to understand the roots of the democratic peace. If the peace is only a statistical regularity explained by factors other than domestic political systems, then spreading democracy will not advance American national security and could well be counter-productive. Defining democracy in a narrow way in order to fit the data might make the lessons for real world security more tenuous and even impractical. We need to understand the causal mechanism that makes democracies less warlike with each other before we can link the national security policy of individual states to Kant's larger goal of a league of democratic republics. The "empirical regularity" of the democratic peace thesis is critical to our argument. Rigorous statistical analysis shows that democracies do not wage war with other democracies.

Aff – Nuclear War o/w Environment

Environmental collapse can't cause extinction---nuke war outweighs---magnitude and probability

David **Schweickart 10** is Professor at Loyola University Chicago. He holds a Ph.D. in Mathematics (University of Virginia), and a Ph.D. in Philosophy (Ohio State University). "Is Sustainable Capitalism Possible?" *Procedia Social and Behavioral Sciences* 41 (2010) 6739–6752

It is not true either that the various ecological crises we are facing will bring about "the end of the world." Consider the projections of the Stern Review, the recently released report commissioned by the British Government. If nothing is done, we risk "major disruption to economic and social activity, later in this century and the next, on a scale similar to those associated with the great wars and economic depression of the first half of the 20th century." This is serious. Some sixty million people died in World War Two. The Stern Review estimates as many as 200 million people could be permanently displaced by rising sea level and drought. But this is not "the end of the world." Even if the effects are far worse, resulting in billions of deaths--a highly unlikely scenario--there would still be lots of us left. If three-quarters of the present population perished, that would still leave us with 1.6 billion people--the population of the planet in 1900. I say this not to minimize the potentially horrific impact of relentless environmental destruction, but to caution against exaggeration. We are not talking about thermonuclear war--which could have extinguished us as a species. (It still might.) And we shouldn't lose sight of the fact that millions of people on the planet right now, caught up in savage civil wars or terrorized by U.S. bombers (which dropped some 100,000 lbs. of explosives on a Baghdad neighborhood during one ten-day period in January 2008--the amount the fascists used to level the Basque town of Guernica during the Spanish Civil War), are faced with conditions more terrible than anyone here is likely to face in his or her lifetime due to environmental degradation.

Aff – Environment Impact Defense

No impact to the environment

Easterbrook '95 (Gregg, Distinguished Fellow @ The Fullbright Foundation and Reuters Columnist, "A Moment on Earth," p. 25, 1995)

In the aftermath of events such as Love Canal or the Exxon Valdez oil spill, every reference to the environment is prefaced with the adjective "fragile." "Fragile environment" has become a welded phrase of the modern lexicon, like "aging hippie" or "fugitive financier." But the notion of a fragile environment is profoundly wrong. Individual animals, plants, and people are distressingly fragile. The environment that contains them is close to indestructible. The living environment of Earth has survived ice ages; bombardments of cosmic radiation more deadly than atomic fallout; solar radiation more powerful than the worst-case projection for ozone depletion; thousand-year periods of intense volcanism releasing global air pollution far worse than that made by any factory; reversals of the planet's magnetic poles; the rearrangement of continents; transformation of plains into mountain ranges and of seas into plains; fluctuations of ocean currents and the jet stream; 300-foot vacillations in sea levels; shortening and lengthening of the seasons caused by shifts in the planetary axis; collisions of asteroids and comets bearing far more force than man's nuclear arsenals; and the years without summer that followed these impacts. Yet hearts beat on, and petals unfold still. Were the environment fragile it would have expired many eons before the advent of the industrial affronts of the dreaming ape. Human assaults on the environment, though mischievous, are pinpricks compared to forces of the magnitude nature is accustomed to resisting.

Aff – AT Biodiversity Impact

No impact to biodiversity loss

Sagoff 97 Mark, Senior Research Scholar – Institute for Philosophy and Public policy in School of Public Affairs – U. Maryland, William and Mary Law Review, "INSTITUTE OF BILL OF RIGHTS LAW SYMPOSIUM DEFINING TAKINGS: PRIVATE PROPERTY AND THE FUTURE OF GOVERNMENT REGULATION: MUDDLE OR MUDDLE THROUGH? TAKINGS JURISPRUDENCE MEETS THE ENDANGERED SPECIES ACT", 38 Wm and Mary L. Rev. 825, March, L/N Note – Colin Tudge - Research Fellow at the Centre for Philosophy at the London School of Economics. Fmr Zoological Society of London: Scientific Fellow and tons of other positions. PhD. Read zoology at Cambridge. Simon Levin = Moffet Professor of Art Biology, Princeton. 2007 American Institute of Biological Sciences Distinguished Scientist Award 2008 Istituto Veneto di Scienze Lettere ed Arti 2009 Honorary Doctorate of Science, Michigan State University 2010 Eminent Ecologist Award, Ecological Society of America 2010 Margalef Prize in Ecology, etc... PhD

Although one may agree with ecologists such as Ehrlich and Raven that the earth stands on the brink of an episode of massive extinction, it may not follow from this grim fact that human beings will suffer as a result. On the contrary, skeptics such as science writer Colin Tudge have challenged biologists to explain why we need more than a tenth of the 10 to 100 million species that grace the earth. Noting that "cultivated systems often out-produce wild systems by 100-fold or more," Tudge declared that "the argument that humans need the variety of other species is, when you think about it, a theological one." n343 Tudge observed that "the elimination of all but a tiny minority of our fellow creatures does not affect the material well-being of humans one iota." n344 This skeptic challenged ecologists to list more than 10,000 species (other than unthreatened microbes) that are essential to ecosystem productivity or functioning. n345 "The human species could survive just as well if 99.9% of our fellow creatures went extinct," provided only that we retained the appropriate 0.1% that we need." n346 [*906] The monumental Global Biodiversity Assessment ("the Assessment") identified two positions with respect to redundancy of species. "At one extreme is the idea that each species is unique and important, such that its removal or loss will have demonstrable consequences to the functioning of the community or ecosystem." n347 The authors of the Assessment, a panel of eminent ecologists, endorsed this position, saying it is "unlikely that there is much, if any, ecological redundancy in communities over time scales of decades to centuries, the time period over which environmental policy should operate." n348 These eminent ecologists rejected the opposing view, "the notion that species overlap in function to a sufficient degree that removal or loss of a species will be compensated by others, with negligible overall consequences to the community or ecosystem." n349 Other biologists believe, however, that species are so fabulously redundant in the ecological functions they perform that the life-support systems and processes of the planet and ecological processes in general will function perfectly well with fewer of them, certainly fewer than the millions and millions we can expect to remain even if every threatened organism becomes extinct. n350 Even the kind of sparse and miserable world depicted in the movie Blade Runner could provide a "sustainable" context for the human economy as long as people forgot their aesthetic and moral commitment to the glory and beauty of the natural world. n351 The Assessment makes this point. "Although any ecosystem contains hundreds to thousands of species interacting among themselves and their physical environment, the emerging consensus is that the system is driven by a small number of . . . biotic variables on whose interactions the balance of species are, in a sense, carried along." n352 [*907] To make up your mind on the question of the functional redundancy of species, consider an endangered species of bird, plant, or insect and ask how the ecosystem would fare in its absence. The fact that the creature is endangered suggests an answer: it is already in limbo as far as ecosystem processes are concerned. What crucial ecological services does the black-capped vireo, for example, serve? Are any of the species threatened with extinction necessary to the provision of any ecosystem service on which humans depend? If so, which ones are they? Ecosystems and the species that compose them have changed, dramatically, continually, and totally in virtually every part of the United States. There is little ecological similarity, for example, between New England today and the land where the Pilgrims died. n353 In view of the constant reconfiguration of the biota, one may wonder why Americans have not suffered more as a result of ecological catastrophes. The cast of species in nearly every environment changes constantly-local extinction is commonplace in nature-but the crops still grow. Somehow, it seems, property values keep going up on Martha's Vineyard in spite of the tragic disappearance of the heath hen. One might argue that the sheer number and variety of creatures available to any ecosystem buffers that system against stress. Accordingly, we should be concerned if the "library" of creatures ready, willing, and able to colonize ecosystems gets too small. (Advances in genetic engineering may well permit us to write a large number of additions to that "library.") In the United States as in many other parts of the world, however, the number of species has been increasing dramatically, not decreasing, as a result of human activity. This is because the hordes of exotic species coming into ecosystems in the United States far exceed the number of species that are becoming extinct. Indeed, introductions may outnumber extinctions by more than ten to one, so that the United States is becoming more and more species-rich all the time largely as a result of human action. n354 [*908] Peter Vitousek and colleagues estimate that over 1000 non-native plants grow in California alone; in Hawaii there are 861; in Florida, 1210. n355 In Florida more than 1000 non-native insects, 23 species of mammals, and about 11 exotic birds have established themselves. n356 Anyone who waters a lawn or hoes a garden knows how many weeds desire to grow there, how many birds and bugs visit the yard, and how many fungi, creepy-crawlies, and other odd life forms show forth when it rains. All belong to nature, from wherever they might hail, but not many homeowners would claim that there are too few of them. Now, not all exotic species provide ecosystem services; indeed, some may be disruptive or have no instrumental value. n357 This also may be true, of course, of native species as well, especially because all exotics are native somewhere. Certain exotic species, however, such as Kentucky blue grass, establish an area's sense of identity and place; others, such as the green crabs showing up around Martha's Vineyard, are nuisances. n358 Consider an analogy [*909] with human migration. Everyone knows that after a generation or two, immigrants to this country are hard to distinguish from everyone else. The vast majority of Americans did not evolve here, as it were, from hominids; most of us "came over" at one time or another. This is true of many of our fellow species as well, and they may fit in here just as well as we do. It is possible to distinguish exotic species from native ones for a period of time, just as we can distinguish immigrants from native-born Americans, but as the centuries roll by, species, like people, fit into the

landscape or the society, changing and often enriching it. Shall we have a rule that a species had to come over on the Mayflower, as so many did, to count as "truly" American? Plainly not. When, then, is the cutoff date? Insofar as we are concerned with the absolute numbers of "rivets" holding ecosystems together, extinction seems not to pose a general problem because a far greater number of kinds of mammals, insects, fish, plants, and other creatures thrive on land and in water in America today than in prelapsarian times. n359 The Ecological Society of America has urged managers to maintain biological diversity as a critical component in strengthening ecosystems against disturbance. n360 Yet as Simon Levin observed, "much of the detail about species composition will be irrelevant in terms of influences on ecosystem properties." n361 [*910] He added: "For net primary productivity, as is likely to be the case for any system property, biodiversity matters only up to a point; above a certain level, increasing biodiversity is likely to make little

difference." n362 What about the use of plants and animals in agriculture? There is no scarcity foreseeable. "Of an estimated 80,000 types of plants [we] know to be edible," a U.S. Department of the Interior document says, "only about 150 are extensively cultivated." n363 About twenty species, not one of which is endangered, provide ninety percent of the food the world takes from plants. n364 Any new food has to take "shelf space" or "market share" from one that is now produced. Corporations also find it difficult to create demand for a new product; for example, people are not inclined to eat paw-paws, even though they are delicious. It is hard enough to get people to eat their broccoli and lima beans. It is harder still to develop consumer demand for new foods. This may be the reason the Kraft Corporation does not prospect in remote places for rare and unusual plants and animals to add to the world's diet. Of the roughly 235,000 flowering plants and 325,000 nonflowering plants (including mosses, lichens, and seaweeds) available, farmers ignore virtually all of them in favor of a very few that are profitable. n365 To be sure, any of the more than 600,000 species of plants could have an application in agriculture, but would they be preferable to the species that are now dominant? Has anyone found any consumer demand for any of these half-million or more plants to replace rice or wheat in the human diet? There are reasons that farmers cultivate rice, wheat, and corn rather than, say, Furbish's lousewort. There are many kinds of louseworts, so named because these weeds were thought to cause lice in sheep. How many does agriculture really require? [*911] The species on which agriculture relies are domesticated, not naturally occurring; they are developed by artificial not natural selection; they might not be able to survive in the wild. n366 This argument is not intended to deny the religious, aesthetic, cultural, and moral reasons that command us to respect and protect the natural world. These spiritual and ethical values should evoke action, of course, but we should also recognize that they are spiritual and ethical values. We should recognize that ecosystems and all that dwell therein compel our moral respect, our aesthetic appreciation, and our spiritual veneration; we should clearly seek to achieve the goals of the ESA. There is no reason to assume, however, that these goals have anything to do with human well-being or welfare as economists understand that term. These are ethical goals, in other words, not economic ones. Protecting the marsh may be the right thing to do for moral, cultural, and spiritual reasons. We should do it-but someone will have to pay the costs. In the narrow sense of promoting human welfare, protecting nature often represents a net "cost," not a net "benefit." It is largely for moral, not economic, reasons-ethical, not prudential, reasons- that we care about all our fellow creatures. They are valuable as objects of love not as objects of use. What is good for [*912] the marsh may be good in itself even if it is not, in the economic sense, good for mankind. The most valuable things are quite useless.

Biodiversity loss won't cause extinction

Lomborg 1 (Bjorn Lomborg, associate professor of statistics in the Department of Political Science at the University of Aarhus, Denmark, August 9, 2001, "Environmentalists tend to believe that, ecologically speaking, things are getting worse and worse."

We are all familiar with the litany of our ever-deteriorating environment. It is the doomsday message endlessly repeated by the media, as when Time magazine tells us that "everyone knows the planet is in bad shape", and when the New Scientist calls its environmental overview "self-destruct". We are defiling our Earth, we are told. Our resources are running out. The population is ever-growing, leaving less and less to eat. Our air and water is more and more polluted. The planet's species are becoming extinct in vast numbers - we kill off more than 40,000 each year. Forests are disappearing, fish stocks are collapsing, the coral reefs are dying. The fertile topsoil is vanishing. We are paving over nature, destroying the wilderness, decimating the biosphere, and will end up killing ourselves in the process. The world's ecosystem is breaking down. We are fast approaching the absolute limit of viability. Global warming is probably taking place, though future projections are overly pessimistic and the traditional cure of radical fossil-fuel cutbacks is far more damaging than the original affliction. Moreover, its total impact will not pose a devastating problem to our future. Nor will we lose 25-50% of all species in our lifetime - in fact, we are losing probably 0.7%. Acid rain does not kill the forests, and the air and water around us are becoming less and less polluted. In fact, in terms of practically every measurable indicator, mankind's lot has improved. This does not, however, mean that everything is good enough. We can still do even better. Take, for example, starvation and the population explosion. In 1968, one of the leading environmentalists, Dr Paul R Erlich, predicted in his bestselling book, The Population Bomb, that "the battle to feed humanity is over. In the course of the 1970s, the world will experience starvation of tragic proportions - hundreds of millions of people will starve to death." This did not happen. Instead, according to the UN, agricultural production in the developing world has increased by 52% per person. The daily food intake in developing countries has increased from 1,932 calories in 1961 - barely enough for survival - to 2,650 calories in 1998, and is expected to rise to 3,020 by 2030. Likewise, the proportion of people going hungry in these countries has dropped from 45% in 1949 to 18% today, and is expected to fall even further, to 12% in 2010 and 6% in 2030. Food, in other words, is becoming not scarcer but ever more abundant. This is reflected in its price. Since 1800, food prices have decreased by more than 90%, and in 2000, according to the World Bank, prices were lower than ever before. Erlich's prediction echoed that made 170 years earlier by Thomas Malthus. Malthus claimed that, unchecked, human population would expand exponentially, while food production.

Aff – AT Warming Impact

Warming will be slow and the impact will be small

Ridley 6/19/14, (Matt Ridley is the author of *The Rational Optimist*, a columnist for the Times (London) and a member of the House of Lords. He spoke at Ideacity in Toronto on June 18, "PCC commissioned models to see if global warming would reach dangerous levels this century. Consensus is 'no'", [<http://tinyurl.com/mgyn8ln>], //hss-RJ)

The debate over climate change is horribly polarized. From the way it is conducted, you would think that only two positions are possible: that the whole thing is a hoax or that catastrophe is inevitable. In fact there is room for lots of intermediate positions, including the view I hold, which is that man-made climate change is real but not likely to do much harm, let alone prove to be the greatest crisis facing humankind this century. After more than 25 years reporting and commenting on this topic for various media organizations, and having started out alarmed, that's where I have ended up. But it is not just I that hold this view. I share it with a very large international organization, sponsored by the United Nations and supported by virtually all the world's governments: the Intergovernmental Panel on Climate Change (IPCC) itself. The IPCC commissioned four different models of what might happen to the world economy, society and technology in the 21st century and what each would mean for the climate, given a certain assumption about the atmosphere's "sensitivity" to carbon dioxide. Three of the models show a moderate, slow and mild warming, the hottest of which leaves the planet just 2 degrees Centigrade warmer than today in 2081-2100. The coolest comes out just 0.8 degrees warmer. Now two degrees is the threshold at which warming starts to turn dangerous, according to the scientific consensus. That is to say, in three of the four scenarios considered by the IPCC, by the time my children's children are elderly, the earth will still not have experienced any harmful warming, let alone catastrophe. But what about the fourth scenario? This is known as RCP8.5, and it produces 3.5 degrees of warming in 2081-2100. Curious to know what assumptions lay behind this model, I decided to look up the original papers describing the creation of this scenario. Frankly, I was gobsmacked. It is a world that is very, very implausible. For a start, this is a world of "continuously increasing global population" so that there are 12 billion on the planet. This is more than a billion more than the United Nations expects, and flies in the face of the fact that the world population growth rate has been falling for 50 years and is on course to reach zero - i.e., stable population - in around 2070. More people mean more emissions. Second, the world is assumed in the RCP8.5 scenario to be burning an astonishing 10 times as much coal as today, producing 50% of its primary energy from coal, compared with about 30% today. Indeed, because oil is assumed to have become scarce, a lot of liquid fuel would then be derived from coal. Nuclear and renewable technologies contribute little, because of a "slow pace of innovation" and hence "fossil fuel technologies continue to dominate the primary energy portfolio over the entire time horizon of the RCP8.5 scenario." Energy efficiency has improved very little. These are highly unlikely assumptions. With abundant natural gas displacing coal on a huge scale in the United States today, with the price of solar power plummeting, with nuclear power experiencing a revival, with gigantic methane-hydrate gas resources being discovered on the seabed, with energy efficiency rocketing upwards, and with population growth rates continuing to fall fast in virtually every country in the world, the one thing we can say about RCP8.5 is that it is very, very implausible. Notice, however, that even so, it is not a world of catastrophic pain. The per capita income of the average human being in 2100 is three times what it is now. Poverty would be history. So it's hardly Armageddon. But there's an even more startling fact. We now have many different studies

of climate sensitivity based on observational data and they all converge on the conclusion that it is much lower than assumed by the IPCC in these models. It has to be, otherwise global temperatures would have risen much faster than they have over the past 50 years. As Ross McKittrick noted on this page earlier this week, temperatures have not risen at all now for more than 17 years. With these much more realistic estimates of sensitivity (known as “transient climate response”), even RCP8.5 cannot produce dangerous warming. It manages just 2.1C of warming by 2081-2100. That is to say, even if you pile crazy assumption upon crazy assumption till you have an edifice of vanishingly small probability, you cannot even manage to make climate change cause minor damage in the time of our grandchildren, let alone catastrophe. That’s not me saying this – it’s the IPCC itself. But what strikes me as truly fascinating about these scenarios is that they tell us that globalization, innovation and economic growth are unambiguously good for the environment. At the other end of the scale from RCP8.5 is a much more cheerful scenario called RCP2.6. In this happy world, climate change is not a problem at all in 2100, because carbon dioxide emissions have plummeted thanks to the rapid development of cheap nuclear and solar, plus a surge in energy efficiency. The RCP2.6 world is much, much richer. The average person has an income about 15 times today’s in real terms, so that most people are far richer than Americans are today. And it achieves this by free trade, massive globalization, and lots of investment in new technology. All the things the green movement keeps saying it opposes because they will wreck the planet. The answer to climate change is, and always has been, innovation. To worry now in 2014 about a very small, highly implausible set of circumstances in 2100 that just might, if climate sensitivity is much higher than the evidence suggests, produce a marginal damage to the world economy, makes no sense. Think of all the innovation that happened between 1914 and 2000. Do we really think there will be less in this century? As for how to deal with that small risk, well there are several possible options. You could encourage innovation and trade. You could put a modest but growing tax on carbon to nudge innovators in the right direction. You could offer prizes for low-carbon technologies. All of these might make a little sense. But the one thing you should not do is pour public subsidy into supporting old-fashioned existing technologies that produce more carbon dioxide per unit of energy even than coal (bio-energy), or into ones that produce expensive energy (existing solar), or that have very low energy density and so require huge areas of land (wind). The IPCC produced two reports last year. One said that the cost of climate change is likely to be less than 2% of GDP by the end of this century. The other said that the cost of decarbonizing the world economy with renewable energy is likely to be 4% of GDP. Why do something that you know will do more harm than good?

Warming is slow – no risk of an impact

Michaels and Knappenberger 11/19/13, (*Chip Knappenberger is the assistant director of the Center for the Study of Science at the Cato Institute, and coordinates the scientific and outreach activities for the Center. He has over 20 years of experience in climate research and public outreach, including 10 years with the Virginia State Climatology Office and 15 years as the Research Coordinator for New Hope Environmental Services, Inc, **Patrick J. Michaels is the director of the Center for the Study of Science at the Cato Institute. Michaels is a past president of the American Association of State Climatologists and was program chair for the Committee on Applied Climatology of the American Meteorological Society. He was a research professor of Environmental Sciences at University of Virginia for thirty years. Michaels was a contributing author and is a reviewer of the United Nations Intergovernmental Panel on Climate Change, which was awarded the Nobel Peace Prize in 2007, “With or Without a “Pause” Climate Models Still Project Too Much Warming”, [<http://www.cato.org/blog/or-without-pause-climate-models-still-project-too-much-warming>] //hss-RJ)

A new paper just hit the scientific literature that argues that the apparent pause in the rise in global average surface temperatures during the past 16 years was really just a slowdown. As you may imagine, this paper, by Kevin Cowtan and Robert Way is being hotly discussed in the global warming blogs, with reaction ranging from a warm embrace by the global-warming-is-going-to-be-bad-for-us crowd to revulsion from the human-activities-have-no-effect-on-the-climate clique. The lukewarmers (a school we take some credit for establishing) seem to be taking the results in stride. After all, the “pause” as curious as it is/was, is not central to the primary argument that, yes, human activities are pressuring the planet to warm, but that the rate of warming is going to be much slower than is being projected by the collection of global climate models (upon which mainstream projections of future climate change—and the resulting climate alarm (i.e., calls for emission regulations, etc.)—are based). Under the adjustments to the observed global temperature history put together by Cowtan and Way, the models fare a bit better than they do with the unadjusted temperature record. That is, the observed temperature trend over the past 34 years (the period of record analyzed by Cowtan and Way) is a tiny bit closer to the average trend from the collection of climate models used in the new report from the U.N.’s Intergovernmental Panel on Climate Change (IPCC) than is the old temperature record. Specifically, while the trend in observed global temperatures from 1979-2012 as calculated by Cowtan and Way is 0.17°C/decade, it is 0.16°C/decade in the temperature record compiled by the U.K. Hadley Center (the record that Cowtan and Way adjusted). Because of the sampling errors associated with trend estimation, these values are not significantly different from one another. Whether the 0.17°C/decade is significantly different from the climate model average simulated trend during that period of 0.23°C/decade is discussed extensively below. But, suffice it to say that an insignificant difference of 0.01°C/decade in the global trend measured over more than 30 years is pretty small

beer and doesn't give model apologists very much to get happy over. Instead, the attention is being deflected to "The Pause" – the leveling off of global surface temperatures during the past 16 years (give or take). Here, the new results from Cowtan and Way show that during the period 1997-2012, instead of a statistically insignificant rise at a rate of 0.05°C/decade as is contained in the "old" temperature record, the rise becomes a statistically significant 0.12°C/decade. "The Pause" is transformed into "The Slowdown" and alarmists rejoice because global warming hasn't stopped after all. (If the logic sounds backwards, it does to us as well, if you were worried about catastrophic global warming, wouldn't you rejoice at findings that indicate that future climate change was going to be only modest, more so than results to the contrary?) The science behind the new Cowtan and Way research is still being digested by the community of climate scientists and other interested parties alike. The main idea is that the existing compilations of the global average temperature are very data-sparse in the high latitudes. And since the Arctic (more so than the Antarctic) is warming faster than the global average, the lack of data there may mean that the global average temperature trend may be underestimated. Cowtan and Way developed a methodology which relied on other limited sources of temperature information from the Arctic (such as floating buoys and satellite observations) to try to make an estimate of how the surface temperature was behaving in regions lacking more traditional temperature observations (the authors released an informative video explaining their research which may better help you understand what they did). They found that the warming in the data-sparse regions was progressing faster than the global average (especially during the past couple of years) and that when they included the data that they derived for these regions in the computation of the global average temperature, they found the global trend was higher than previously reported – just how much higher depended on the period over which the trend was calculated. As we showed, the trend more than doubled over the period from 1997-2012, but barely increased at all over the longer period 1979-2012. Figure 1 shows the impact on the global average temperature trend for all trend lengths between 10 and 35 years (incorporating our educated guess as to what the 2013 temperature anomaly will be), and compares that to the distribution of climate model simulations of the same period. Statistically speaking, instead of there being a clear inconsistency (i.e., the observed trend value falls outside of the range which encompasses 95% of all modeled trends) between the observations and the climate model simulations for lengths ranging generally from 11 to 28 years and a marginal inconsistency (i.e., the observed trend value falls outside of the range which encompasses 90% of all modeled trends) for most of the other lengths, now the observations track closely the marginal inconsistency line, although trends of length 17, 19, 20, 21 remain clearly inconsistent with the collection of modeled trends. Still, throughout the entirety of the 35-yr period (ending in 2013), the observed trend lies far below the model average simulated trend (additional information on the impact of the new Cowtan and Way adjustments on modeled/observed temperature comparison can be found here). The Cowtan and Way analysis is an attempt at using additional types of temperature information, or extracting "information" from records that have already told their stories, to fill in the missing data in the Arctic. There are concerns about the appropriateness of both the data sources and the methodologies applied to them. A major one is in the applicability of satellite data at such high latitudes. The nature of the satellite's orbit forces it to look "sideways" in order to sample polar regions. In fact, the orbit is such that the highest latitude areas cannot be seen at all. This is compounded by the fact that cold regions can develop substantial "inversions" of near-ground temperature, in which temperature actually rises with height such that there is not a straightforward relationship between the surface temperature and the temperature of the lower atmosphere where the satellites measure the temperature. If the nature of this complex relationship is not constant in time, an error is introduced into the Cowtan and Way analysis. Another unresolved problem comes up when extrapolating land-based weather station data far into the Arctic Ocean. While land temperatures can bounce around a lot, the fact that much of the ocean is partially ice-covered for many months. Under "well-mixed" conditions, this forces the near-surface temperature to be constrained to values near the freezing point of salt water, whether or not the associated land station is much warmer or colder. You can run this experiment yourself by filling a glass with a mix of ice and water and then making sure it is well mixed. The water surface temperature must hover around 33°F until all the ice melts. Given that the near-surface temperature is close to the water temperature, the limitations of land data become obvious. Considering all of the above, we advise caution with regard to Cowtan and Way's findings. While adding high arctic data should increase the

observed trend, the nature of the data means that the amount of additional rise is subject to further revision. As they themselves note, there's quite a bit more work to be done this area. In the meantime, their results have tentatively breathed a small hint of life back into the climate models, basically buying them a bit more time – time for either the observed temperatures to start rising rapidly as current models expect, or, time for the modelers to try to fix/improve cloud processes, oceanic processes, and other process of variability (both natural and anthropogenic) that lie behind what would be the clearly overheated projections. We've also taken a look at how "sensitive" the results are to the length of the ongoing pause/slowdown. Our educated guess is that the "bit" of time that the Cowtan and Way findings bought the models is only a few years long, and it is a fact, not a guess, that each additional year at the current rate of lukewarming increases the disconnection between the models and reality.

Current reductions in consumption eliminate the need for an eco-authoritarian state

White 10 (Sep. 16, 2010. Micah White is an award winning activists and senior editor at adbusters, an anti-consumerist and pro-environment media organization. "An alternative to the new wave of ecofascism" *The Guardian*
<http://www.theguardian.com/commentisfree/cif-green/2010/sep/16/authoritarianism-ecofascism-alternative> //HS)

It is time to acknowledge that mainstream environmentalism has failed to prevent climate catastrophe. Its refusal to call for an immediate consumption reduction has backfired and its demise has opened the way for a wave of fascist environmentalists who reject democratic freedom. One well-known example of the authoritarian turn in environmentalism is **James Lovelock, the first scientist to discover the presence of ozone-depleting ChloroFluoroCarbonS in the atmosphere.** Earlier this year he **told the Guardian that democracies are incapable of adequately addressing climate change.** "I have a feeling," Lovelock said, "that climate change may be an issue as severe as a war. It may be necessary to put democracy on hold for a while." His words may be disturbing, but **other ecologists have gone much further.** Take for example Pentti Linkola, a Finnish fisherman and ecological philosopher. Whereas Lovelock puts his faith in advanced technology, **Linkola proposes a turn to fascist primitivism.** Their only point of agreement is on the need to suspend democracy. **Linkola has built an environmentalist following by calling for an authoritarian, ecological regime that ruthlessly suppresses consumers.** Largely unknown outside of Finland until the first English translation of his work was published last year, **Linkola represents environmentalism pushed to its totalitarian extreme.** "An ecocatastrophe is taking place on earth," he writes concluding several pages later that "discipline, prohibition, enforcement and oppression" are the only solution. Linkola has a cunning ability to blend reasonable ecological precepts with shocking authoritarian solutions. **His bold political programme includes ending the freedom to procreate, abolishing fossil fuels, revoking all international trade agreements, banning air traffic, demolishing the suburbs, and reforesting parking lots.** As for those **"most responsible for the present economic growth and competition"**, Linkola explains that **they will be sent** to the mountains **for "re-education" in eco-gulags: "the sole glimmer of hope,"** he declares, **"lies in a centralised government and the tireless control of citizens."** Environmentalism is currently marketed as a luxury brand for guilty consumers. **The prevailing assumption is that a fundamental lifestyle change is unnecessary:** being green means paying extra for organic produce and driving a hybrid. **The incumbent political regime remains in power and the same corporations provide new "green" goods; the underlying consumerist ideology is unquestioned.** This brand of environmentalism only emboldens ecofascists who rightly claim that **shopping green can never stop the ecological crisis.** And yet, **ecofascists are wrong to suggest that the suspension of democracy is the only alternative. Humanity can avert climate catastrophe without accepting ecological tyranny.** However, **this will take an immediate, drastic reduction of our consumption.** This requires the trust that the majority of people would voluntarily reduce their standard of living once the forces that induce consumerism are overcome. **The future of environmentalism is in liberating humanity from the compulsion to consume.** Rampant, **earth-destroying consumption is the norm in the west largely because** our imaginations are pillaged by any corporation with an **advertising** budget. From birth, we are assaulted by thousands of commercial messages each day whose single mantra is "buy". **Silencing this refrain is the revolutionary alternative to ecological fascism.** It is a revolution which is already budding and is marked by three synergetic campaigns: **the criminalisation of advertising, the revocation of corporate power and the downshifting of the global economy.** In São Paulo, the seventh largest city in the world, **outdoor advertising has been banned.** Meanwhile, **artists in New York City and Toronto are launching blitzkrieg attacks on billboards, replacing commercials with art.** Their efforts have put one visual polluter out of business. **Grassroots organisers in the US are pushing for an amendment to the constitution that will end corporate personhood while others are fighting to revive the possibility of death penalties for corporations.** The second international conference on degrowth economics met recently in Barcelona. In Ithaca, New York a local, time-based currency is thriving. **Buy**

Nothing Day campaign is celebrated in dozens of nations and now Adbusters is upping the ante with a call for seven days of carnivalesque rebellion against consumerism this November. And, **most important of all, across the world everyday people are silently, unceremoniously and intentionally spending less and living more.** Authoritarian environmentalists fail to imagine a world without advertising, so they dream of putting democracy "on hold". In Linkola's dystopian vision, the resources of the state are mobilised to clamp down on individual liberty. But **there is no need to suspend democracy if it is returned to the people.** Democratic, anti-fascist environmentalism means marshalling the strength of humanity to suppress corporations. **Only by silencing the consumerist forces will both climate catastrophe and ecological tyranny be averted. Yes, western consumption will be substantially reduced. But it will be done voluntarily and joyously.**

Current reductions in consumption eliminate the need for an eco-authoritarian state

White 10 (Sep. 16, 2010. Micah White is an award winning activists and senior editor at adbusters, an anti-consumerist and pro-environment media organization. "An alternative to the new wave of ecofascism" The Guardian <http://www.theguardian.com/commentisfree/cif-green/2010/sep/16/authoritarianism-ecofascism-alternative> //HS)

It is time to acknowledge that mainstream environmentalism has failed to prevent climate catastrophe. Its refusal to call for an immediate consumption reduction has backfired and its demise has opened the way for a wave of fascist environmentalists who reject democratic freedom. One well-known example of the authoritarian turn in environmentalism is James Lovelock, the first scientist to discover the presence of ozone-depleting chlorofluorocarbons in the atmosphere. Earlier this year he told the Guardian that democracies are incapable of adequately addressing climate change. "I have a feeling," Lovelock said, "that climate change may be an issue as severe as a war. It may be necessary to put democracy on hold for a while." His words may be disturbing, but other ecologists have gone much further. Take for example Pentti Linkola, a Finnish fisherman and ecological philosopher. Whereas Lovelock puts his faith in advanced technology, Linkola proposes a turn to fascistic primitivism. Their only point of agreement is on the need to suspend democracy. Linkola has built an environmentalist following by calling for an authoritarian, ecological regime that ruthlessly suppresses consumers. Largely unknown outside of Finland until the first English translation of his work was published last year, Linkola represents environmentalism pushed to its totalitarian extreme. "An ecocatastrophe is taking place on earth," he writes concluding several pages later that "discipline, prohibition, enforcement and oppression" are the only solution. Linkola has a cunning ability to blend reasonable ecological precepts with shocking authoritarian solutions. His bold political programme includes ending the freedom to procreate, abolishing fossil fuels, revoking all international trade agreements, banning air traffic, demolishing the suburbs, and reforesting parking lots. As for those "most responsible for the present economic growth and competition", Linkola explains that they will be sent to the mountains for "re-education" in ecogulags: "the sole glimmer of hope," he declares, "lies in a centralised government and the tireless control of citizens." Environmentalism is currently marketed as a luxury brand for guilty consumers. The prevailing assumption is that a fundamental lifestyle change is unnecessary: being green means paying extra for organic produce and driving a hybrid. The incumbent political regime remains in power and the same corporations provide new "green" goods; the underlying consumerist ideology is unquestioned. This brand of environmentalism only emboldens ecofascists who rightly claim that shopping green can never stop the ecological crisis. And yet, ecofascists are wrong to suggest that the suspension of

democracy is the only alternative. Humanity can avert climate catastrophe without accepting ecological tyranny. However, this will take an immediate, drastic reduction of our consumption. This requires the trust that the majority of people would voluntarily reduce their standard of living once the forces that induce consumerism are overcome. The future of environmentalism is in liberating humanity from the compulsion to consume. Rampant, earth-destroying consumption is the norm in the west largely because our imaginations are pillaged by any corporation with an advertising budget. From birth, we are assaulted by thousands of commercial messages each day whose single mantra is "buy". Silencing this refrain is the revolutionary alternative to ecological fascism. It is a revolution which is already budding and is marked by three synergetic campaigns: the criminalisation of advertising, the revocation of corporate power and the downshifting of the global economy. In São Paulo, the seventh largest city in the world, outdoor advertising has been banned. Meanwhile, artists in New York City and Toronto are launching blitzkrieg attacks on billboards, replacing commercials with art. Their efforts have put one visual polluter out of business. Grassroots organisers in the US are pushing for an amendment to the constitution that will end corporate personhood while others are fighting to revive the possibility of death penalties for corporations. The second international conference on degrowth economics met recently in Barcelona. In Ithaca, New York a local, time-based currency is thriving. Buy Nothing Day campaign is celebrated in dozens of nations and now Adbusters is upping the ante with a call for seven days of carnivalesque rebellion against consumerism this November. And, most important of all, across the world everyday people are silently, unceremoniously and intentionally spending less and living more. Authoritarian environmentalists fail to imagine a world without advertising, so they dream of putting democracy "on hold". In Linkola's dystopian vision, the resources of the state are mobilised to clamp down on individual liberty. But there is no need to suspend democracy if it is returned to the people. Democratic, anti-fascist environmentalism means marshalling the strength of humanity to suppress corporations. Only by silencing the consumerist forces will both climate catastrophe and ecological tyranny be averted. Yes, western consumption will be substantially reduced. But it will be done voluntarily and joyously.

UQ—No Crunch—Models

Ecological Footprint model is wrong- slowing population growth rate and technology solve any risk of ecological crunch

Lomborg 10 (Apr. 16, 2009. Updated Feb. 05, 2010. Bjorn Lomborg is the director of the Copenhagen Consensus Center and an adjunct professor at the Copenhagen Business School. "Forget the Scary Eco-Crunch: This Earth is Enough" *The Globe and Mail*. <http://www.theglobeandmail.com/globe-debate/forget-the-scary-eco-crunch-this-earth-is-enough/article4304957/> //HS)

According to conventional wisdom, we are voraciously using the world's resources and living way beyond Earth's means. This narrative of decline and pessimism underlies much of today's environmental discourse, and is often formulated in a simple fashion: By 2030, we will need two planets to sustain us, owing to higher living standards and population growth. If we all lived at American standards, we'd need almost five planets. But this received wisdom is fundamentally wrong. Environmental campaigners use the "ecological footprint" - how much area each one of us requires from the planet - to make their point. We use cropland, grazing land, forests and fishing grounds to produce our food, fibre and timber, and we need space for our houses, roads and cities. Moreover, we require areas to absorb the waste emitted by our energy use. Translating all these demands into a common unit of physical area gives us an opportunity to compare it with Earth's productive area - and thus get a sense of how sustainable we are. For more than a decade, the World Wildlife Fund and several other conservation groups have performed complicated calculations to determine individual "footprints" on the planet. Their numbers show that each American uses 9.4 hectares of the globe, each European 4.7 hectares, and those in low-income countries one hectare. Adding it all up, we collectively use 17.5 billion hectares. Unfortunately, there are only 13.4 billion hectares available. So, according to the WWF, we're already living beyond Earth's means, using around 30 per cent too much. And it will get worse. The current financial crisis, they tell us, "pales in comparison to the looming ecological credit crunch," which could presage "a large-scale ecosystem collapse." The message has been received loud and clear. We are using up too much of the planet's area. But how can we do that? How can we use more area than there is on Earth? Obviously, any measure that tries to aggregate different aspects of human behaviour will have to simplify the inputs; the ecological footprint is no different. For example, when we talk about American lifestyles needing five planets, we assume that technology is frozen, whereas it's likely that worldwide land-use productivity would increase dramatically. Likewise, organic farming actually leaves a larger footprint than its conventional cousin. Yet, despite such shortcomings, it is clear that areas we use for roads cannot be used for growing food, and that using areas to build our houses takes away from forests. This part of the ecological footprint is a convenient measure of our literal footprint on Earth. Here, we live far inside the available area, using some 60 per cent of the world's available space, and this proportion is likely to drop because the rate at which the Earth's population is increasing is now slowing, while technological progress continues. So no ecological collapse. There is just one factor that keeps increasing: our carbon emissions. It is not at all obvious to anyone how to convert carbon dioxide to area. The WWF and some researchers choose to get around this by defining the area of emissions as the area of forest needed to soak up the extra carbon dioxide. This now makes up more than 50 per cent of the ecological footprint, and will grow to 75 per cent before mid-century. In essence, we're being told we ought to cut emissions to zero, and to plant trees to achieve that, meaning we would have to plant forests today on 30 per cent more than all of the available land, and plant forests on almost two planets by 2030. This is unreasonable. Is it really necessary for us to cut all emissions? Just cutting about half of all emissions would reduce greenhouse-gas concentrations in the medium term. More important, planting forests is one of the least area-efficient technology-intensive ways to cut carbon. Solar cells and wind turbines require less than 1 per cent of the area of forests to reduce carbon dioxide, they become increasingly efficient, and they can often be placed on non-productive land (such as wind turbines at sea and solar panels in deserts).

Measured this way, the scary eco-crunch disappears. Due to technology, the individual demand on the planet has already dropped 35 per cent over the past half-decade, and **the collective requirement will reach its upper limit** before 2020 **without any overdraft.** Translating carbon dioxide into an illogical and inefficient measure of forest cover seems intended mainly to ensure that an alarming message results. In the scientific literature, a leading modeller acknowledges that most modellers regard this method as "hard to defend." **Two other research teams have pointed out that the ecological footprint "itself is nothing more than an important attention-grabbing device,"** and that **"it is less a scientific measure than one designed to raise public awareness and influence politics."** When we really examine the "ecological footprint" calculations, we discover that **the only thing the world is running out of is space to plant a colossal amount of imaginary forest that we wouldn't have planted anyway, to avoid carbon dioxide emissions that we can prevent through much smarter and cheaper means.** That our profligate consumption requires five planets is a catchy story, but it is wrong. The planet we have is more than enough.

Measured this way, the scary eco-crunch disappears. Due to technology, the individual demand on the planet has already dropped 35 per cent over the past half-decade, and the collective requirement will reach its upper limit before 2020 without any overdraft. Translating carbon dioxide into an illogical and inefficient measure of

forest cover seems intended mainly to ensure that an alarming message results. In the scientific literature, a leading modeller acknowledges that most modellers regard this method as "hard to defend." **Two other research teams have pointed out that the ecological footprint "itself is nothing more than an important attention-grabbing device,"** and that **"it is less a scientific measure than one designed to raise public awareness and influence politics."** **When we really examine the "ecological footprint" calculations,** we discover that **the only thing the world is running out of is space to plant a colossal amount of imaginary forest that we wouldn't have planted anyway, to avoid carbon dioxide emissions that we can prevent through much smarter and cheaper means.** That our profligate consumption requires five planets is a catchy story, but it is wrong. The planet we have is more than enough. Malthus was wrong - industrial revolution and technological advancements prove AMID an astonishing surge in food prices, which has sparked riots and unrest in many countries and is making even the relatively affluent citizens of America and Europe feel the pinch, faith in the ability of global markets to fill nearly 7 billion bellies is dwindling. **Given the fear that a new era of chronic shortages may have begun, it is perhaps understandable that the name of Thomas Malthus is in the air.** Yet **if his views were indeed now correct, that would defy the experience of the past two centuries.** Malthus first set out his ideas in 1798 in "An Essay on the Principle of Population". This expounded a tragic twin trajectory for the growth of human populations and the increase of food supply. Whereas the natural tendency was for populations to grow without end, food supply would run up against the limit of finite land. As a result, the "positive checks" of higher mortality caused by famine, disease and war were necessary to bring the number of people back in line with the capacity to feed them. In a second edition published in 1803, Malthus softened his original harsh message by introducing the idea of moral restraint. Such a "preventive check", operating through the birth rather than the death rate, could provide a way to counter the otherwise inexorable logic of too many mouths chasing too little food. If couples married late and had fewer children, population growth could be sufficiently arrested for agriculture to cope. **It was the misfortune of Malthus—but the good luck of generations born after him—that he wrote at an historical turning point. His ideas,** especially his later ones, **were arguably an accurate description of pre-industrial societies,** which teetered on a precarious balance between empty and full stomachs. **But the industrial revolution,** which had already begun in Britain, **was transforming the long-term outlook for economic growth. Economies were starting to expand faster than their populations, bringing about a sustained improvement in living standards. Far from food running out,** as Malthus had feared, **it became abundant as trade expanded and low-cost agricultural producers like Argentina and Australia joined the world economy. Reforms based on sound political economy played a vital role.** too. In particular, **the abolition of the Corn Laws in 1846 paved the way for British workers to gain from cheap food imports. Malthus got his demographic as well as his economic predictions wrong. His assumption that populations would carry on growing in times of plenty turned out to be false.** Starting in Europe, **one country after another underwent a "demographic transformation"** as economic development brought greater prosperity. Both **birth and death rates dropped and population growth eventually started to slow.** The Malthusian heresy re-emerged in the early 1970s, the last time food prices shot up. Then, at least, **there appeared to be some cause for demographic alarm.** Global **population growth had picked up sharply** after the second world war because it took time for high birth rates in developing countries to follow down the plunge in infant-mortality rates brought about by modern medicine. **But once again the worries about overpopulation proved mistaken as the "green revolution" and further advances in agricultural efficiency boosted food supply.** If the world's **population growth was a false concern four decades ago, when it peaked at 2% a year, it is even less so now that it has slowed to 1.2%.** But even though crude demography is not to blame, changing lifestyles arising from rapid economic growth especially in Asia are a new worry. As the Chinese have become more affluent, they have started to consume more meat, raising the underlying demand for basic food since cattle need more grain to feed than humans. **Neo-Malthusians question whether the world can provide 6.7 billion people (rising to 9.2 billion by 2050) with a Western-style diet. Once again the gloom is overdone. There may no longer be virgin lands** to be settled and cultivated, as in the 19th century, **but there is no reason to believe that agricultural productivity has hit a buffer.** Indeed, **one of the main barriers to another "green revolution" is unwarranted popular worries about genetically modified foods,** which is holding back farm output not just in Europe, but in the developing countries that could use them to boost their exports. Political folly increases in a geometrical ratio As so often, governments are making matters worse. Food-export bans are proliferating. Although these may produce temporary relief for any one country, the more they spread the tighter global markets become. Another wrongheaded policy has been America's subsidy to domestic ethanol production in a bid to reduce dependence on imported oil. This misconceived attempt to grow more fuel rather than to curb demand is expected to gobble up a third of this year's maize (corn) crop. **Although neo-Malthusianism naturally has much to say about food scarcity, the doctrine emerges more generally as the idea of** absolute limits on resources and energy, such as the notion of

"peak oil". Following the earlier scares of the 1970s, oil companies defied the pessimists by finding extra fields, not least since higher prices had spurred new exploration. But **even if oil wells were to run dry, economies can still adapt by finding and exploiting other energy sources**. A new form of Malthusian limit has more recently **emerged through the need to constrain greenhouse-gas emissions** in order to tackle global warming. But **this too can be overcome by shifting to a low-carbon economy**. As with agriculture, the main difficulty in making the necessary adjustment comes from poor policies, such as governments' reluctance to impose a carbon tax. There may be curbs on traditional forms of growth, but **there is no limit to human ingenuity. That is why Malthus remains as wrong today as he was two centuries ago.**

Technology proves Malthus wrong

Hoffmans 2011 (Oct. 31, 2011. Lara Hoffmans has written several books on investments and personal finance as well as covered the investment sectors of health care, consumer staples, etc. while analyzing economic and political and sentiment influencing forces. "7 Billion Reasons Malthus Was Wrong" *Forbes*. <http://www.forbes.com/sites/larahoffmans/2011/10/31/7-billion-reasons-malthus-was-wrong/> //HS)

You'd think after 200 years, folks would eventually say, **"That Malthus guy? Kind of wrong."** Yet, with the (projected) birth today of the world's 7 billionth occupant, there's no shortage of media hand-wringing about the dim prospects of our world from here. Thomas **Malthus** is famous (or infamous, depending on your view) for his belief that human population growth would outpace food production—and fast—which would lead to societal ruin. He **was downright dismissive of the idea of "unlimited progress" in food production**. Can there be "unlimited progress" in food production? Not sure. But Malthus would never imagine that, **with 6 billion more people than in his day, we have a holiday dedicated to handing total strangers handfuls of free food. Utterly non-nutritional food at that!** You can't really blame Malthus for getting this so wrong. Long-term forecasts are right devilish. Example, the London Times columnist who predicted in 1894 that by 1950, London would be buried under 9 feet of manure likely died before he could have any egg on his face. (Though, no doubt, he had enough time to surmise that the horse-dropping build-up was going awfully slowly.) There was no way for him to know in a few short years, the combustion engine would make horse-drawn transport a cute relic for honeymooners. And that's how these long-term forecasts go. **The peak oil date certain** (the point at which oil production hits an apex and starts falling) **has come and gone multiple times over the past decades**. Yet, since the concept of "peak oil" was first popularized by Marion Hubbert in 1956, the amount of oil we produce has increased vastly. So too has the amount of known reserves in the ground. **There was just no way for him to predict we'd be drilling in thousands of feet of water—or "fracking"!** (Heck, in 1956, "frack" was still what polite Dads said after their thumbs got in the way of their hammers.) **Or that we'd even have the technology to find the oil (or gas) to deep-water drill (or frack)**. The popular 1968 book **the Population Bomb** posited that in the 1970s, **hundreds of millions would starve to death**. The theory was that if food production is growing at X rate and the population growing at much faster Y rate, that could pose quite a problem. **But then, along came** Norman **Borlaug, who invented high-yielding, disease-resistant dwarf wheat**. (Thank goodness Norman's mom wasn't a Malthusian.) Now, dwarf wheat may make those who shun "frankenfoods" mad, but it also meant the emerging world's burgeoning populations didn't all starve. (Not to mention that sticky question, if you buy whole-hog into Malthus's [long-disproven] concept, of how exactly you get the population to that lower, appropriate level. Let's move on.) I don't care what it's on—economies, capital markets, wheat yields, hemline trends—long-term forecasts are fraught with peril. And ones that underestimate humanity's ingenuity and ability to problem-solve are particularly faulty. Yes, pockets of the world face famine—usually in regions with corrupt, despotic governments. But **overall, the world hasn't outgrown its ability to feed itself**. **Someone invented the steel plow, the tractor, the threshing machine, better fertilizers**. Handily, **someone also discovered penicillin, the pasteurization process, the Polio vaccine and DDT so we have a better shot at getting past age 5**. (And the iPhone too, so we can live, not starve and be entertained all the while.) **Malthus didn't think about the iPhone anymore than he thought about dwarf wheat or the MMR vaccine**. That doesn't make him a bad person, just rather unimaginative. And **while global population has grown, life expectancies keep increasing, quality of life keeps improving, and per capita GDP keeps expanding**, so **bring on number 8 billion! (Malthus will still be wrong then.)**

UQ—No Crunch—Debt

Malthus was wrong- the rise of debt has fostered human growth

Tverberg 12 (Dec. 12, 2012. Gail Tverberg is an actuary, one who analyzes risk, who has taken interest in sustainability issues and has written extensively on the subject. “Why Malthus got His Forecast Wrong” *Our Finite World*. <http://ourfiniteworld.com/2012/12/12/why-malthus-got-his-forecast-wrong//HS>)

Most of us have heard that Thomas Malthus made a forecast in 1798 that the world would run short of food. He expected that this would happen because in a world with limited agricultural land, food supply would fail to rise as rapidly as population. In fact, at the time of his writing, he believed that population was already in danger of outstripping food supply. As a result, he expected that a great famine would ensue. Most of us don't understand why he was wrong. A common misbelief is that the reason he was wrong is that he failed to anticipate improved technology. My analysis suggests that there were really two underlying factors which enabled the development and widespread use of technology. These were (1) the beginning of fossil fuel use, which ramped up immediately after his writing, and (2) a ramp up in non-governmental debt after World War II, which enabled the rapid uptake of new technology such as the sale of cars and trucks. Without fossil fuels, availability of materials such as metal and glass (needed for most types of technology) would have been severely restricted. Without increased debt, common people would not have been able to afford the new types of high-tech products that businesses were able to produce. This issue of why Malthus's forecast was wrong is relevant today, as we grapple with the issues of world hunger and of oil consumption that is not growing as rapidly as consumers would like—certainly it is not keeping oil prices down at historic levels. What Malthus Didn't Anticipate Malthus was writing immediately before fossil fuel use started to ramp up. Figure 1. World Energy Consumption by Source, Based on Vaclav Smil estimates from Energy Transitions: History, Requirements and Prospects and together with BP Statistical Data on 1965 and subsequent Figure 1. World Energy Consumption by Source, Based on Vaclav Smil estimates from Energy Transitions: History, Requirements and Prospects and together with BP Statistical Data on 1965 and subsequent The availability of coal allowed more and better metal products (such as metal plows, barbed wire fences, and trains for long distance transport). These and other inventions allowed the number of farmers to decrease at the same time the amount of food produced (per farmer and in total) rose. On a per capita basis, energy consumption rose (Figure 2) allowing farmers and others more efficient ways of growing crops and manufacturing goods. Figure 2. Per capita world energy consumption, calculated by dividing world energy consumption (based on Vaclav Smil estimates from Energy Transitions: History, Requirements and Prospects together with BP Statistical Data for 1965 and subsequent) by population estimates, based on Angus Maddison data. Figure 2. Per capita world energy consumption, calculated by dividing world energy consumption (based on Vaclav Smil estimates from Energy Transitions: History, Requirements and Prospects together with BP Statistical Data for 1965 and subsequent) by population estimates, based on Angus Maddison data. If it hadn't been for the fossil fuel ramp up, starting first with coal, Malthus might in fact have been right. As it was, population was able to ramp up quickly after the addition of fossil fuels. Figure 3. World Population, based on Angus Maddison estimates, interpolated where necessary. Figure 3. World Population, based on Angus Maddison estimates, interpolated where necessary. A person can see that there was a particularly steep rise in population, right after World War II, in the 1950s and 1960s (Figure 3). This is when oil consumption mushroomed (Figure 2, above), and when oil enabled better transport of crops to market, use of tractors and other farm equipment, and medical advances such as antibiotics. The Green Revolution allowed agricultural production to expand greatly during this period. It used fossil fuels (particularly oil and natural gas) to enable the synthetic fertilizers, irrigation, hybrid seed, herbicides and pesticides, allowing increased food production. It is likely that increased consumer and business debt following World War II (Figure 4) also played a role in the post-World War II ramp up. Figure 4. US Debt excluding Federal Debt as Ratio to GDP, based on Z1 Debt data of the Federal Reserve and GDP from the US Bureau of Economic Analysis. Figure 4. US Debt excluding Federal Debt as Ratio to GDP, based on Z1 Debt data of the Federal Reserve and GDP from the US Bureau of Economic Analysis. The reason I say that debt likely played a role in this ramp is because at the end of World War II, people were, on average, pretty poor. The United States had recently been through the Depression. Many were soldiers coming back from war, without jobs. Without a ramp up in factory work and related employment, many would be unemployed. A ramp up in debt fixed several problems at once: Allowed low-paid workers funds to buy new products, such as cars, that used oil Allowed entrepreneurs funds to set up factories Allowed pipelines to be built, and other support for ramped up oil extraction Provided jobs for many coming home from the war effort The debt ramp up, and the resulting increase in oil production, raised living standards. Figure 2 shows that the increase in per capita energy consumption was far

greater in the 1950 to 1970 period when oil production was ramped up than in the coal ramp-up between 1840 and 1920. The long coal ramp-up period does not appear to have been accompanied by such a big ramp-up in non-governmental debt. Tentative Conclusion A tentative conclusion might be that **as long as we can keep ramping up availability of energy products and debt, Malthus's views are not very relevant.**

Fails – Impossible

Infeasible to monitor and check individual behavior

Kuh 12 – Kuh is an Associate Professor of Law, Maurice A. Dean School of Law at Hofstra University [Katrina Kuh, “WHEN GOVERNMENT INTRUDES: REGULATING INDIVIDUAL BEHAVIORS THAT HARM THE ENVIRONMENT” VOLUME 61; Number 6, March 2012, Accessed 7-25-15, <http://scholarship.law.duke.edu/cgi/viewcontent.cgi?article=1529&context=dlj>] hk

The existing literature’s relative inattention to direct mandates on environmentally significant individual behaviors stems from the perception that applying mandates to most environmentally significant individual behaviors **would simply be infeasible**. Two justifications are usually offered for this position:²² First, enforcing mandates against individuals would be difficult because individuals are numerous and spread out and because they frequently engage in environmentally significant behaviors in private. Detection and enforcement against individuals would be of questionable technical and administrative feasibility and would perhaps be prohibitively expensive.²³ Second, even if mandates could be enforced in a cost-effective manner, they would trigger insurmountable intrusion objections, as **individuals would not accept government constraints**, or the measures required to enforce them, in the context of environmentally significant individual behaviors.²⁴

Fails—No Fly Zone

Regs don't solve – no fly zone

Kuh 12 – Kuh is an Associate Professor of Law, Maurice A. Dean School of Law at Hofstra University [Katrina Kuh, “WHEN GOVERNMENT INTRUDES: REGULATING INDIVIDUAL BEHAVIORS THAT HARM THE ENVIRONMENT” VOLUME 61; Number 6, March 2012, Accessed 7-25-15, <http://scholarship.law.duke.edu/cgi/viewcontent.cgi?article=1529&context=dlj>] hk

Perhaps most interesting are the ways in which prior experience regulating environmentally significant individual behaviors departs from, or at least complicates, the intrusion objection. Although nowhere fully developed or explained, the intrusion objection is frequently articulated as the idea that direct regulation of environmentally significant individual behaviors would require unacceptably intrusive enforcement—measures that would be too invasive of privacy and civil liberties¹⁵⁶ or, as the intrusion objection is occasionally characterized, that would constitute government overreaching.¹⁵⁷ This objection suggests that a government “no fly” zone exists, in which regulation of individuals is per se unacceptable. It also suggests that direct regulation of environmentally significant individual behaviors would be of limited utility because it would so frequently transgress that no-fly zone. The American experience with direct regulation of environmentally significant individual behaviors complicates this view.

Econ Turn – Stifling Effect

Top down environmental regulation style control of the digital economy will stifle innovation and development of the industry

Hirsch 2006 (Fall 06. Dennis D. Hirsch is an environmental lawyer who teaches at Capital University Law School. He also serves as counsel to PorterWright, a national law firm. Hirsch graduated from Columbia University and then went on to graduate from Yale Law School. "Protecting the Inner Environment: What Privacy Regulation can Learn From Environmental Law" *Georgia Law Review*. <http://users.law.capital.edu/dhirsch/articles/HirschPrivacyArticle.pdf> //HS)

The environmental experience suggests that those who oppose regulation of the digital economy are largely correct in contending that traditional command-and-control laws should not be employed. As developed in the first generation of federal environmental laws,¹⁸¹ the command-and-control method begins with government officials designating the industry that must curtail its emissions.¹⁸² Next, regulators identify the best currently existing technology for controlling pollution in that industry (known as the "reference technology").¹⁸³ Finally, government officials either direct all facilities in the industry to install the chosen technology (this is known as a "design standard")¹⁸⁴ or require that they not exceed the rate of pollution that they would emit if they had installed the reference technology (this is known as a "rate-based standard").¹⁸⁵ In theory, rate-based standards allow facilities to come up with their own control method. In practice, almost all choose the reference technology so as to avoid any misunderstandings about compliance.¹⁸⁶ Command-and-control regulation thus either requires, or strongly pushes, firms to adopt the control technology that the government has chosen for them.¹⁸⁷ This approach has the advantage of being easy to monitor and enforce.¹⁸⁸ If assurance of pollution reduction is the top priority—as it is, for example, when toxic emissions are being released into the environment—then command-and-control might well be the method of choice.¹⁸⁹ Yet, the environmental experience shows that the method also possesses some significant weaknesses.¹⁹⁰ To begin with, it is expensive. It requires all facilities in a given category to achieve the same emissions rate, even where the cost of pollution control varies significantly from plant to plant.¹⁹¹ A system under which those who could reduce pollution at the least cost made the bulk of the reductions would save "tens of billions" of dollars annually.¹⁹² Command-and-control also deters innovation in pollution prevention and locks in the current state of pollution control technology.¹⁹³ By requiring firms to meet the best existing level of control technology, it gives them no incentive to exceed this level.¹⁹⁴ Finally, the method is too slow for rapidly evolving industries.¹⁹⁵ By the time government regulators have promulgated a technology standard, they may have been "lapped" by changes in the industry.¹⁹⁶ These attributes do not mesh well with the digital economy. Command regulation's chief strength—its ability to assure results—is not as critical with respect to personal information as it is with respect to the release of toxic emissions. Assurance of results does not so easily trump regulatory cost. To the contrary, the digital economy, in which global competition is fierce and profit margins slim, highly prizes regulatory efficiency.¹⁹⁷ Command-and-control regulation, which often forgoes the most cost-effective means in favor of the most reliable one, is not the best choice.¹⁹⁸ The method's deterrence of innovation also poses a problem. Enhanced privacy protection will depend on the development of new technologies. This development will require regulatory methods that encourage innovation, not those that constrain it.¹⁹⁹ "[P]rivacy mandates—especially if they are written too prescriptively—could impede the development of even better technologies than those now available to give consumers greater power over their information without, at the same time, impeding the flow of information that now facilitates commerce."²⁰⁰ Finally, the digital economy is driven by technological change and evolves at a far faster rate than most smokestack industries.²⁰¹ Command-and-control regulation does not function well in such fast-changing business sectors²⁰² where its technology requirements cannot keep pace with new developments. For example, assume that the government had tried to protect clickstream data by limiting the use of "cookies." The industry would have leapfrogged "cookies" with new technologies, such as "web bugs"²⁰³ or "spyware,"²⁰⁴ that achieve the same result.²⁰⁵ The environmental experience suggests that command-and-control regulation would not be a good choice for the digital economy.²⁰⁶

Right to privacy key to economy

Loukidelis 08 (Mar. 2008. David Loukidelis was the information and privacy commissioner for British Columbia from 1999-2010. He dealt with over 200 instances of freedom of information and privacy appeals during this time and worked on an international committee between Canada and Asia discussing privacy rights. He also has extensive experience teaching privacy and freedom of information law. "The Importance of Privacy" – from a submission of the Office of the Information and Privacy Commissioner to a special committee to review the Personal Information Protection Act. [//HS](http://library.royalroads.ca/copyright-office/privacy-information-basics-students-and-researchers/importance-privacy))

A pernicious yet enduring myth is that privacy matters only to those who have something illegal or wrong to hide. Most of us have nothing to hide, yet still attach great value to our individual privacy. Privacy matters because we all have the right to maintain a private life, separate and apart from our public life. We negotiate our identity in the world and choose to share pieces of ourselves with those we trust. More than this, the essence of liberty in a democratic society is the right of individuals to autonomy, to be generally free from state and corporate interference in their lives. The freedom of citizens to choose, subject to demonstrably necessary and carefully tailored limits, what information they share with others is one of the fundamental differences between totalitarian states and free society. Privacy matters, in other words, because it restrains the appetite of governments and law enforcement agencies, but also private sector actors: People who have no rights of privacy are vulnerable to limitless intrusions by governments, corporations, or anyone else who chooses to interfere in your personal affairs. Imagine a world where government had an unfettered right to demand information from you, or to remove money from your bank account, or even to enter your house. The tragic history of many of the world's countries shows us that a nation denied the right of privacy is invariably denied all other freedoms and rights.² Privacy matters because our physical and emotional well-being requires it. Imagine going to your doctor, dentist, family counsellor, priest or employee assistance counsellor without any confidence that the information you supplied during those sessions would remain private. Privacy also matters because our economy depends on it. Imagine going to a bank for a loan, to a lawyer to draw up a will, to a financial planner, to a property management company to rent an apartment, or to the internet to purchase a book online without any guarantees that the information you provided would be respected and kept confidential. As recent years have shown, the costs of fraud, identity theft and other misuse of our personal information are real, substantial and mounting. These losses harm individuals, but they can also harm economic activity and growth.

AT: Wolves Impact

Wolf populations are high- even all out hunting didn't collapse the population

Hart 14 (David, Writer for Petersen's hunting, "Why Anti-Hunters Are Dead Wrong About Wolves", Feb 14th, <http://www.petersenshunting.com/galleries/anti-hunters-dead-wrong-about-wolves/>)CDD

Wolf populations are booming in the Great Lakes, too. They were removed from the Endangered Species List in Michigan, Wisconsin, and Minnesota in 2011, and all three states have held at least one hunt since then. An estimated 3,700 wolves live in the northern Great Lakes region. That's not good enough, either. The Humane Society of the United States is suing the USFWS over the Great Lakes region delisting. Defenders of Wildlife declared a "national wolf emergency," calling the current USFWS proposal to delist wolves nationwide a "disaster." Defenders continue to refer to the managed wolf hunts as "slaughters," and the Sierra Club also urged its members to "help stop the wolf slaughter" on a Web page that conveniently solicits donations. The "slaughter" both anti-hunting groups are referring to involves carefully managed, highly regulated, closely monitored hunts, such as the one in Wisconsin. The 2013 season was closed when hunters and trappers reached the established quota of 251 in just a few weeks. "Our state management plan calls for a minimum population of 350 animals. The population is somewhere between 809 and 839," says Wisconsin Department of Natural Resources large carnivore specialist Dave MacFarland. "The U.S. Fish and Wildlife Service set a minimum threshold of 100 wolves between Michigan and Wisconsin. There is no risk we would ever drop below that number and a very low risk we would fall below our state management objective." He adds that the DNR sold just 2,510 wolf tags, and all successful hunters are required to report their kill within 24 hours. "We close each unit once the quota is met for that unit," he says. "We have more information on wolves than any other animal in the state." So does Minnesota, which has an estimated 2,200 wolves. The hunter success rate last year was just seven percent. Nearly 20,500 Montana hunters and trappers, including 247 non-residents, bought wolf tags in 2012. They killed 225 wolves, the quota set by Montana Fish, Wildlife and Parks. Wolf populations have declined slightly. That may be good news for Western big-game hunters, but populations continue to rise in Oregon and Washington, which do not have a regulated hunting season—at least not yet. Neither state had a confirmed resident wolf as recently as 2008. Now they have 89 wolves between them, a number that is certain to rise, even if the proposed nationwide de-listing allows both states to adopt a managed wolf hunt. Despite continued fear-mongering from anti-hunting groups, carefully controlled hunts are gradually becoming ingrained in state wildlife management agency programs. The general public is also comfortable with regulated wolf hunts. A Wisconsin survey found that more residents supported the state's hunt than opposed it with a large majority of those living in wolf country supporting it. Two-thirds of Michigan residents support wolf hunting.

No threat of extinction from American poachers- Grey wolves live in Canada and Mexico too

Defenders 15 (Defenders of Wildlife leads the pack when it comes to protecting wild animals and plants in their natural communities, "BASIC FACTS ABOUT GRAY WOLVES", <http://www.defenders.org/gray-wolf/basic-facts/>)CDD

Gray wolves were once common throughout all of North America, but were exterminated in most areas of the United States by the mid 1930s. Today, their range has been reduced to Canada, Alaska, the Great Lakes, northern Rockies and Pacific Northwest. Thanks to the reintroduction of wolves in 1995, Yellowstone National Park is one of the most favored places to see and hear wolves in their native habitat. Wolves require large areas of contiguous habitat that can include forests and mountainous terrain, and Mexican gray wolves can thrive in desert and brush in the southwest. Suitable habitat must have sufficient access to prey, protection from excessive persecution, and areas for denning and taking shelter.

Drones can't solve- too costly

Wall 14 (Matthew, business reporter for BBC, "Can drones help tackle Africa's wildlife poaching crisis?", July 21st, <http://www.bbc.com/news/business-28132521>)CDD

But drones are not the whole answer, most experts agree. "They're not a silver bullet," says Mr Breare. "Trying to find the small shape of a poacher in a 90,000-acre park is still difficult, even with high-spec night time and thermal imaging." Mr Downey also admits that developing an airframe that is both light

and strong enough to withstand Africa's rugged landscapes is still a challenge, especially when cost will be an issue for many game reserves. While the "brains" of the drone weigh just 100g, the batteries required to power it for long-duration surveillance missions are heavy, meaning the airframe has to be bigger, and therefore more costly. Smaller, cheaper drones come with a typical battery life of 30-90 minutes, but large game reserves "really need drones that can fly for six to eight hours," says Mr Breare. Airware's Mr Downey estimates that drones for anti-poaching will ultimately cost \$50,000-\$70,000.

AT: Oil Impact

Oil shocks have no impact—innovation corrects and stabilizes

Ro 14 (Jun. 30, 2014. Sam Ro is the deputy editor of *Business Insider*. He has been published on Forbes and other market related publications. "Oil Price Shocks Aren't As Harmful As They Used To Be" *Business Insider*. [//HS](http://www.businessinsider.com/impact-of-oil-price-shock-2014-6))

Oil is a critical source of energy. In the past, a major oil price shock meant devastation for economic growth. "Our obsession with oil prices comes with good reason," writes Morgan Stanley economist Ellen Zentner. "Abrupt and sharp increases in oil prices have played a key role in precipitating recessions in 1973-75, 1980-81, 1990-91, 2001 and 2008-09." Recent turmoil in Iraq has sent oil prices much higher. But economists aren't ready to freak out just yet. "**Over time, however, those shocks to the relative price of oil have spurred innovations that have led to a more efficient use of energy inputs,**" continued Zentner. "Alongside growing use of other energy inputs, **those innovations have reduced the world economy's dependence on oil.**" Zentner presented this chart showing how a decreasing amount of energy has been needed to generate a dollar's worth of GDP in the world. It may not be immediately intuitive how this could be. Zentner offers a more micro level example that anyone who's been in a car can appreciate. US households have also adjusted consumption patterns over time. When gasoline prices rise, drivers tend to reduce mileage in response and/or seek out more fuel efficient vehicles. This altered behavior, coupled with shifting demographic factors and a slow labor market recovery since the financial crisis, has weighed on vehicle miles driven and lessens the aggregate impact of price increases at the pump. In the 12 months ended May 2014, average vehicle miles driven remained below the previous peak (reached in November 2007) for a 76th straight month. In 1990, consumers devoted 3.8% of total consumption to motor fuels. By 2013, that share had fallen to 2.3% (Exhibit 3).

Aff—Internet Module

Econ/Innovation Turn

Shift in behavior creates a detrimental impact on the online economy – this stifles innovation and economic growth

Masnick 14 – Masnick is the founder and CEO of Floor64 and editor of the Techdirt blog [Mike Masnick, “Nearly Half Of Americans Claim They've Changed Their Behavior Due To NSA”, 4-3-14, Accessed 7-13-15,

<https://www.techdirt.com/articles/20140402/18091226783/nearly-half-americans-claim-theyve-changed-their-behavior-due-to-nsa.shtml>] hk

The folks at the NSA and their defenders used to use the argument that we were on the verge of a “cyber pearl harbor” in their constant attempts to change laws to give the NSA and others in law enforcement and intelligence more powers to spy on everyone (the argument being that they would do this in order to “protect” us). But... it's beginning to look like the “cyber pearl harbor” wasn't an attack from foreign hackers... but from the NSA itself. Eric Schmidt recently noted that the NSA's actions were a hostile “attack” and it appears that many Americans agree. A new poll found that nearly half of American adults who responded have changed some form of online behavior because of the NSA stories, and they think a lot more carefully about where they go, what they say and what they do online. We've pointed out (since the Snowden revelations began) that this was going to have a negative impact on the tech industry, but much of the concerns was from overseas users. However, it's clear that it's impacting how Americans view their online habits as well: When it comes to specific Internet activities, such as email or online banking, this change in behavior translates into a worrying trend for the online economy: over one quarter of respondents (26%) said that based on what they have learned about secret government surveillance, they are now doing less banking online and less online shopping. This shift in behavior is not good news for companies that rely on sustained or increased use of the Internet for their business model. Importantly, the study also found that, contrary to the claims of many, the Snowden revelations aren't just being followed by security-obsessed techies. While the general public may not be keeping tabs on all the details, they are getting the basics. And in case anyone is tempted to think that this is a narrow issue of concern only to news junkies and security geeks, let me be clear: according to this latest survey, 85% of adult Americans are now at least somewhat familiar with the news about secret government surveillance of private citizens' phone calls, emails, online activity, and so on. Once again, it appears that the federal government, and the NSA in particular, have created a huge cost for innovation and economic growth, while having almost no real benefit to show for it.

INSERT ECON !

No Behavioral Change—AT: Pew Studies

People don't change their behaviors online – multiple reasons

Eggo 14 – Eggo has a master in communications [Sarah Eggo, "ONLINE BEHAVIOUR UNDER SURVEILLANCE", 5-26-14, Accessed 7-13-15,

https://gupea.ub.gu.se/bitstream/2077/36332/1/gupea_2077_36332_1.pdf] hk

The studies made about online behaviour and the view of online privacy show that in most of the cases **the actors don't act according to their concerns about privacy**. Even if a concern about privacy exists, there are no actions done as consequences. Debatin et al. (2009) for example, made a study about Facebook and privacy settings, as well as about how young people behave online. The results of the study stated that young **people aren't concerned about their own privacy** as long as they weren't exposed to profile hacking. **Most of the participants in the study claimed that they were a little concerned about their privacy, but they didn't change their privacy settings on Facebook, so the concern didn't lead to a protective behaviour**. Different factors could be found why people don't act, even if they are concerned about their online privacy - **The "third-person-effect" which states that the Facebook users think that privacy assaults happen only to other, not to themselves**. So people didn't think something bad could happen to them. - The benefit of using Facebook is seen as bigger than threats of privacy. **Participants who have been attacked by hackers several times, still went back to Facebook do not lose their friends. They were afraid to become an outsider when they don't use Facebook. - Finally they concluded by saying that the bigger part of the users didn't realize how much data they provided to Facebook, even if their privacy settings are on only visible for friends**. (Debatin et al., 2009) Young et al. (2013) could define similar factors about online privacy and behaviour. They found out that the people believe negative things are more likely to happen to someone else than to them. This was, according to them, due to the comparative optimism, one compares her with other individuals and thinks that her knowledge about privacy is bigger. The consequence of that assumption is that she didn't feel that the privacy was in danger. **Even the participants were concerned about their privacy; they didn't change their behaviour because they thought they know more about online privacy than the others and therefore don't become a target of privacy violation**. (Young et al., 2013)

No Behavioral Change-- AT: Social Behaviors

Surveys don't take into account actual behavior – leads to biased answers
Chambers 3-18 - Chambers is a professor of cognitive neuroscience at the school of psychology, Cardiff University [Chris Chambers, "The psychology of mass government surveillance: How do the public respond and is it changing our behaviour?", 3-18-15, Accessed 7-13-15, <http://www.theguardian.com/science/head-quarters/2015/mar/18/the-psychology-of-mass-government-surveillance-how-do-the-public-respond-and-is-it-changing-our-behaviour>] hk

Polls can be useful for gauging public views and (very) basic psychology, **but they don't give much insight into cognition and actual behaviour**. Even where surveillance doesn't seem to have much effect, such as in curbing government criticism, there could still be more subtle effects that people aren't willing or able to report. In the same way, we don't know to what extent some people are really changing their access to health or relationship advice, or even whether they answered the questions honestly - surveys can be prone to eliciting socially desirable answers. Despite these limitations, these results do raise a number of important questions that could be studied in future research. Why do countries seem to differ so much in their public perceptions of surveillance? Is surveillance really changing online search behaviour? Does surveillance influence risk-taking or other aspects of cognition, such as reasoning or creativity? I've written previously on this blog about the psychological risks posed by mass surveillance – evidence that under certain conditions, being systematically monitored can impair mental health, promote distrust, encourage social conformity, and even undermine a leader's authority. We now have data suggesting that surveillance is generally unpopular and that it could be changing some aspects of our behaviour. As the UK begins revising its surveillance laws, policy makers may do well to heed such evidence.

Their evidence is only a snapshot of the status quo – must have continuous records of behaviors to actually measure the effect of the new revelations
Preibusch 15 – Preibusch is a user experience researcher at Google, Mountain View, CA, and was at Microsoft Research, Cambridge, U.K [Sören Preibusch, "Privacy Behaviors After Snowden", May 2015 Vol. 58, No. 5, Accessed 7-13-15, <http://cacm.acm.org/magazines/2015/5/186025-privacy-behaviors-after-snowden/fulltext>] hk

Mass media is able to set the public agenda through increased coverage of a topic.¹² However, **little is known about how media salience of privacy might steer public opinion and behavior** toward caring more about privacy. Previous media analyses suffered from unreliable and temporarily sparse measures of privacy concern¹⁷ or simply ignored the public's response²¹ The PRISM revelations blurred the distinction between privacy in state/citizen and company/customer relationships, as corporations were revealed to be accomplices in government surveillance. Some citizens reacted by modulating their consumption of Web-based services. Mistrust by German Internet users of government and corporate data processing increased by nine percentage points in 2013 over 2011, but only a minority reported they had changed how they manage their personal data.² Google Trends suggested a chilling effect that varied by country on users' propensity to issue search queries that might "get them into trouble" with the U.S. government.¹¹ However, such public-opinion snapshots derived through ad hoc surveys were unable to capture consumers' volatile and ephemeral reactions. Annual polls provide only coarse temporal resolution, when continuous records of behaviors are needed to measure the effect of an event like the PRISM revelation. Privacy surveys also suffer from such shortcomings as respondents' lack of commitment, leading to post hoc rationalizations and socially desirable but unreliable answers. **Acquiring data on user behavior is difficult**,⁴ and companies rarely disclose usage statistics of their Web-based services. When

the Web search engine DuckDuckGo, which advertises its superior privacy practices, attributed a rise in its daily queries to the PRISM revelation, it did not include user counts.^{3,20}

UQ – No Regulation

Regulations are ignored by companies and are becoming more lax in the squo

Porter 12 (Jul. 10, 2012. Eduardo Porter is an economic reporter for The New York Times. He has over two decades experience writing about the economy and economic issues. "The Spreading Scourge of Corporate Corruption" *The New York Times*. http://www.nytimes.com/2012/07/11/business/economy/the-spreading-scourge-of-corporate-corruption.html?_r=0 //HS)

Perhaps the most surprising aspect of the Libor scandal is how familiar it seems. Sure, for some of the world's leading banks to try to manipulate one of the most important interest rates in contemporary finance is clearly egregious. But is that worse than packaging billions of dollars worth of dubious mortgages into a bond and having it stamped with a Triple-A rating to sell to some dupe down the road while betting against it? Or how about forging documents on an industrial scale to foreclose fraudulently on countless homeowners? **The misconduct of the financial industry no longer surprises most Americans**. Only about one in five has much trust in banks, according to Gallup polls, about half the level in 2007. And it's not just banks that are frowned upon. **Trust in big business overall is declining**. Sixty-two percent of Americans believe corruption is widespread across corporate America. According to Transparency International, an anticorruption watchdog, nearly three in four Americans believe that corruption has increased over the last three years. We should be alarmed that corporate wrongdoing has come to be seen as such a routine occurrence. Capitalism cannot function without trust. As the Nobel laureate Kenneth Arrow observed, "Virtually every commercial transaction has within itself an element of trust." **The parade of financiers accused of misdeeds, booted from the executive suite and even occasionally jailed, is undermining this essential element**. Have corporations lost whatever ethical compass they once had? Or does it just look that way because we are paying more attention than we used to? This is hard to answer because fraud and corruption are impossible to measure precisely. Perpetrators understandably do their best to hide the dirty deeds from public view. And public perceptions of fraud and corruption are often colored by people's sense of dissatisfaction with their lives. Last year, the economists Justin Wolfers and Betsey Stevenson from the University of Pennsylvania published a study suggesting that trust in government and business falls when unemployment rises. "Much of the recent decline in confidence — particularly in the financial sector — may simply be a standard response to a cyclical downturn," they wrote. And waves of mistrust can spread broadly. After years of dismal employment prospects, Americans are losing trust in a broad range of institutions, including Congress, the Supreme Court, the presidency, public schools, labor unions and the church. Corporate wrongdoing may be cyclical, too. **Fraud is probably more lucrative, as well as easier to hide, amid the general prosperity of economic booms. And the temptation to bend the rules is probably highest toward the end of an economic upswing, when executives must be the most creative to keep the stream of profits rolling in**. The most toxic, no-doc, reverse amortization, liar loans flourished toward the end of the housing bubble. And we typically discover fraud only after the booms have turned to bust. As Warren Buffett famously said, "**You only find out who is swimming naked when the tide goes out**." **Company executives are paid to maximize profits, not to behave ethically**. Evidence suggests that they behave as corruptly as they can, within whatever constraints are imposed by law and reputation. In 1977, the United States **Congress passed the Foreign Corrupt Practices Act, to stop the rampant practice of bribing foreign officials**. Business by American multinationals in the most corrupt countries dropped. **But they didn't stop bribing**. And American companies have been lobbying against the law ever since. **Extrapolating from frauds that were uncovered during and after the dot-com bubble, the economists** Luigi Zingales and Adair Morse of the University of Chicago and Alexander Dyck of the University of Toronto **estimated conservatively that in any given year a fraud was being committed by 11 to 13 percent of the large companies in the country**. Yet it may be wrong to shrug off the latest boomlet of corporate crimes and misdemeanors as a mere reflection of the business cycle. **Americans appear to believe that corruption has become more prevalent over the years. And some indicators suggest they may be right**. In 2001, Transparency International's Corruption Perceptions Index **ranked the United States as the 16th least-corrupt country. By last year, the nation had fallen to 24th place**. **The World Bank also reports a weakening of corruption controls in the United States since the late 1990s**, so that it is falling behind most other developed nations. The most pointed evidence that breaking the rules has become standard behavior in the corporate world is how routine the wrongdoing seems to its participants. "Dude. I owe you big time!... I'm opening a bottle of Bollinger," e-mailed one Barclays trader to a colleague for fiddling with the rate and improving the apparent profit of his derivatives book. It's difficult to know why **corruption may be spreading**. But there are a few plausible explanations. **From**

globalization to rising income inequality to the growing role of corporate money in political campaigns, political and economic dynamics may have increased both the scope of corporate wrongdoing and the incentives for business executives to bend, or break, the rules. Just consider the scale of recent wrongdoing. Labor is one of the most important rates in the economy. It determines the return on the savings of millions of people, as well as the rate they pay on their mortgage and car loans. It is the benchmark for hundreds of trillions of dollars worth of financial contracts. Bigger markets allow bigger frauds. Bigger companies, with more complex balance sheets, have more places to hide them. And banks, when they get big enough that no government will let them fail, have the biggest incentive of all. A 20-year-old study by the economists Paul Romer and George Akerlof pointed out that the most lucrative strategy for executives at too-big-to-fail banks would be to loot them to pay themselves vast rewards — knowing full well that the government would save them from bankruptcy. Globalization can encourage corruption, as companies compete tooth and claw for new markets. And the furious rush of corporate cash into the political process — which differs from bribery in that companies pay politicians to change laws rather than bureaucrats to ignore them — is unlikely to foment ethical behavior. The inexorable rise of income inequality is also likely to encourage fraud, fostering resentment and undermining trust in capitalism's institutions and rules. Economic research shows that participants in contests in which the winner takes all are much more likely to cheat. **And the United States is becoming a winner-takes-all economy.** It's hard to fathom the broader social implications of corporate wrongdoing. But its most long-lasting impact may be on Americans' trust in the institutions that underpin the nation's liberal market democracy.

UQ – No Regulation – International Report

International report proves- US has least regulations on business

Rapoza 11 (Oct. 20, 2011. Kenneth Rapoza covers business and investing in emerging markets for Forbes. "US Businesses Not Being Strangled By Regulation And Taxation, World Bank Says" *Forbes* <http://www.forbes.com/sites/kenrapoza/2011/10/20/us-businesses-not-being-strangled-by-regulation-and-taxation-world-bank-says/> //HS)

With the economies of the U.S. and Europe sputtering along on fumes, politicians are quick to blame regulation and taxation as the main cause of a lackluster business environment. Yet, according to the World Bank's 212 page "Doing Business 2012" report, released on Wednesday, there is less red tape for setting up shop in the U.S. than there is in all of Europe, Latin America, Africa and most of Asia. The World Bank uses indicators such as time spent to set up a business to getting credit, among other things, in benchmarking the 183 countries it ranks in "Doing Business". The report measures and tracks changes in the regulations applied to domestic companies in 11 areas in their life cycle—such as investors rights, taxation, cross border transactions, legality and enforcement of contracts and bankruptcy law. A fundamental premise of doing business is that economic activity requires good rules that are transparent and accessible to all, not just big business. Such regulations should be efficient, the World Bank states, striking a balance between safeguarding some important aspects of the business environment and avoiding distortions that impose unreasonable costs on businesses. "Where business regulation is burdensome and competition limited, success depends more on whom you know than on what you can do. But where regulations are relatively easy to comply with and accessible to all who need to use them, anyone with talent and a good idea should be able to start and grow a business (legally)," the World Bank said. Where does the supposed regulation and taxation crippled U.S. stand in the rankings? It is number four, trailing behind New Zealand (3), Hong Kong (2) and Singapore (1). What it looks like from the research desks at one of the most powerful and elite multilateral institutions on the planet is a U.S. that does not have the government in its way, but a U.S. whose government is more out of the way than it is in every other major economy on earth, including mainland China. An economy's ranking on the ease of doing business does not tell the whole story about its business environment. The underlying indicators do not account for all factors important to doing business, such as macroeconomic conditions, market size, workforce skills and security, all factors where the U.S. would outperform the three countries that are ahead of it in the rankings. What the rankings of the World Bank do examine are the key aspects of the regulatory and institutional environment that matter for companies. The top 20 economies on the list have implemented effective, yet streamlined procedures for regulatory processes such as starting a business and dealing with construction permits as well as strong legal protections of property rights. They also periodically review and update business regulations as part of a broader competitiveness agenda and take advantage of new technologies through e-government initiatives, the World Bank says. According to the study, the U.S. is No. 1 in large advanced economies for simple regulations and a general low cost of doing business, contrary to what many politicians say about what troubles the U.S. economy. While taxation remains an issue, it is not enough to make the U.S. a difficult place to conduct business. The U.S. tax code is cumbersome and puts the U.S. behind most of its peers in the Organization of Economic Cooperation & Development, or OECD. The data shows the average tax that a medium-size American company must pay or withhold in a given year, as well as measures of the administrative burden in paying taxes, equates to 46.7% of total profits in the U.S. compared with 42.7% in the OECD despite having less number of taxes to pay than its advanced economy rivals (11 for U.S. vs 13 different taxes for OECD). U.S. companies also spend more time preparing for taxes than its peers, averaging 187 hours compared to 186 hours. When it comes to paying taxes, the U.S. ranks with Taiwan, while Hong Kong and Singapore are in the top four. The U.S. ranked no. 13 in ease of starting a business, ahead of all the nations of Europe, but Hong Kong and Singapore again, as well as Canada, Australia and New Zealand. Overall, however, the ease of doing business in the U.S. remained unchanged at No. 4 worldwide even as Washington complains that the regulatory and tax burden is making matters worse.

Turn—Econ

Turn – surveillance constrains innovation which hurts the market economy

Nick **Sorrentino 13**, political and communications consultant with clients across the political spectrum, his work has been featured at Breitbart, Reason.com, NPR.com, Townhall, The Daily Caller, and many other publications. A graduate of Mary Washington College, “How NSA Mass Surveillance is Hurting the US Economy”, November 26, 2013, <http://www.againstcronycapitalism.org/2013/11/how-nsa-mass-surveillance-is-hurting-the-us-economy/>, AB)

We’ve written about this in the past. The most important industry in the USA, also the least regulated (go figure) is tech. Technology companies thrive on innovation and beating each other to market. Historically tech, based on the other side of the country from Washington DC, has been a fairly free market. There is a reason why the price of computing comes down every single month and the quality goes up. The power the average person holds in his or her hand when they glance down at their iPhone is well beyond what a computer the size of a city block could do a generation ago. This is because of a relatively free market and very limited government influence. But those days began to end in the wake of September 11th 2001. The government descended on the tech with a vengeance and it has burrowed itself further and further into the industry with each passing year. To be fair most companies likely had no choice but to go along with the government over the last decade. But technology customers are not interested in government spyware embedded in their tools. Many countries and companies are starting to pass on American tech as it is widely believed (whether true or not) that the US government has back door access to these products. That is not good news for the American economy. Of course it could all be solved simply if the 4th Amendment was adhered to. You know the 4th Amendment of the Constitution.

AT: Rights Malthus UTNIF

No Crunch

No Resource Scarcity

Malthus is wrong – no resource scarcity

Krautkraemer 5 [Jeffrey, former professor of economics in the College of Business and Economics, Washington State University, Pullman, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 66]

Other major natural resource sectors show increasing productivity and declining prices. Malthus's prediction about population and food supply was inaccurate: food production has exceeded population growth. For much of the last two centuries, the increase in food production was the result of bringing more land under cultivation and farming existing land more intensively. The substitution of tractor power for draft animals made more agricultural production available for human consumption; in the 1920s, the production from about one-quarter of U.S. cropland was used to feed draft animals (Johnson 2002). Corn yield per hectare was relatively constant from 1800 to 1930, when hybrid corn was introduced. Corn yield had increased about 50 percent by 1950; it tripled between 1950 and 1984. Wheat yields per acre in the United States were relatively constant from 1800 to 1950 and then more than doubled between 1950 and 1984 (Johnson 2002). Average cereal grain yields in the United States from 1996 to 1998 were 22 percent higher than from 1986 to 1988; the increase in cereal grain yields for the world was a little lower, at 17 percent (WRI 2000). The increases in agricultural productivity have increased food availability and lowered prices. The prices of maize, rice, soybeans, wheat, and beef are about one-half of their 1960 levels (WRI 1998). See Table 3-2 and Figure 3-7. Worldwide fiber production from forests has increased 50 percent since 1960. Timber production in North America and Europe is primarily from secondary-growth forests, and the forested area in developed countries has actually increased in the last two decades (WRI 2000). Forest products have not show the same general downward price trend, but neither is there a significant upward trend. See Table 3-2 and figure 3-8. Marine fishery production has increased six-fold since 1950, primarily through extending fishing to relatively unexploited areas, although aquaculture has increased to more than 20 percent of the total fish harvest (WRI 2000). But many older fisheries are producing much less as a result of overfishing; it is estimated that 75 percent of fisheries have been overharvested. One sign of this is the increase in the catch of low-value species while the catch of some high-value species has declined. The prospects for increasing harvest from existing fisheries are not good (WRI 2000). The harvest from capture fisheries has reached a peak, and growing production from aquaculture threatens capture fisheries, as feedstocks are diverted from natural to commercial production.

No Population Spike

Population will peak in 2055 and hit replacement rate by 2025.

CNBC 13 [news outlet, "World population to peak by 2055: report", <http://www.cnbc.com/id/101018722>]

The world population will peak at 8.7 billion people in 2055 and then decline to 8 billion by 2100, according to new research by Deutsche Bank. Its projections contrast drastically with previous forecasts by the United Nations (UN), which sees world population continuing to rise until 2100. "the world is approaching a major turning point in its demographic trajectory and we think that the shift is likely to be sooner and sharper than mainstream projections suggest." said Deutsche's global strategist, Sanjeev Sanyal. (Read more: [China rethinks one-child policy as it ages rapidly](#)) The latest numbers from the UN put the world population at 7.2 billion. While the UN forecasts the global population will reach 10.9 billion in 2100, Deutsche Bank believes it will be only 8 billion. Sanyal said that while developed countries have long had low birth rates, developing countries like China, Russia, South Korea and Brazil now have the largest declines in fertility. He argued that poorer countries needed a higher total fertility rate (TFR) -- the average number of live births per woman over her lifetime -- to maintain a stable population, due to higher levels of infant mortality. He estimated that women in less developed countries needed to have an average of 2.3 babies for a stable population in the long-term. In contrast, most it is often said that an average of 2.1 babies per woman is enough to sustain a country's population, and does not adjust this according to wealth. (Read more: [Zafran: Betting on the population boom](#)) Sanyal said that fertility rates were well below replacement level in many developed countries, with Germany and Japan having TFRs of 1.4. But levels were also low in countries like South Korea, where TFR had fallen from 5 in the 1950s to 1.3 today, and Brazil, where TFR had dropped from 6.2 in the 1950s to 1.8 today. "Given the above trends, we feel that the world's overall fertility rate will fall to replacement rate by 2025. In other words, reproductively speaking, our species will no longer be expanding -- a major turning point in history," he said. In particular, he forecast a large decline in the Chinese workforce, irrespective of the removal of the one-child policy. "Due to a skewed gender ratio, we found that China no longer has enough child-bearing age women to stabilize its population," he said.

Democracy Solves

Democracy solves the environment better than authoritarianism- accountability, empirics, public involvement, and international treaties.

Ortmann 9 [Stephan, Faculty member at City University of Hong Kong, "Environmental Governance under Authoritarian Rule: Singapore and China", Sep 25 2009, https://www.academia.edu/1000215/Environmental_Governance_under_Authoritarian_Rule_Singapore_and_China]

During the 1970s, there was much disagreement over whether democracy or authoritarianism is better suited for averting the environmental crisis. However, while statistical research showed that the environment fares much better under democracy than it does under authoritarian rule, the search for a political system that best meets the ever growing environmental threats continued. First of all, I want to state the arguments that have been made in favor of democracy. Then I will continue with the problems of modern liberal democracies. This criticism has led to the argument that a special kind of authoritarian regime is needed in order to successfully manage the environmental crisis. Today, most academics agree that democracy is better capable of protecting the environment than authoritarianism. For instance, Winslow (2005) summarizes the following reasons from the academic literature. First of all, democracy restricts the possibilities for power centralization and therefore limits the small number of people who may benefit from environmental degradation. This also means that elected leaders are, in contrast to those in closed authoritarian regimes, accountable to the electorate. They cannot as easily profit from environmental destruction. Furthermore, the participation of the public in policy making can draw attention to environmental problems. This is enhanced through greater access to information, which is aided by freedom of speech, and which allows people to get aware of environmental problems in their neighborhood. In addition, democracies generally are more transparent. For instance, a Freedom of Information Act, which has been enacted in 85 countries, allows citizens access to unclassified governmental information. Another aspect of democratic rule, Winslow argues, is the existence of a truly independent and sometimes confrontational environmental movement. Environmental non-governmental organizations (NGOs), which are allowed to freely operate, can not only draw attention to environmental problems but also able to drive the public agenda. Another important aspect of democracies is the legal system, which allows individuals to sue the polluters through civil litigation. Finally, from an international perspective, the sharing of information between democracies and the development of international treaties also benefit the protection of the environment.

Democratic societies exhibit less environmental issues-public feedback

Neumayer, 03 [Eric, Professor of Environment and Development at the London School of Economics and Political Science, "Do democracies exhibit stronger international environmental commitment? A cross-country analysis", Journal of Peace Research, 39, pp. 142-146]

Taken together, the results reported in the last section provide strong evidence in favour of our hypothesis that democracies exhibit stronger international environmental commitment than non-

democracies. This result appears to be relatively robust with respect to our different measures of environmental commitment. For the great majority of these proxies of environmental commitment the democracy variables not only have the expected sign, but are also statistically significant. It is also quite robust with respect to our different measures of democracy. No single measure of democracy provides systematically different estimates in terms of sign of coefficients and their statistical significance from the other three.²¹ Equally satisfying is that the coefficients and their significance remain roughly the same whether developed countries are included in the full sample or excluded in the restricted sample. In other words, the results are not simply triggered by the presence of developed democratic countries. Almost throughout we observe that the coefficients for the FREE-low, POLIT-low and GOV-low countries indicate less environmental commitment at

stronger statistical significance than the coefficients for the FREE-mid, POLIT-mid and GOV-mid countries. **In other words, clearly undemocratic countries exhibit even less environmental commitment than countries in the middle group and we can be more certain that their commitment differs significantly from clear democracies than we can be for the group in between. This was to be expected of course. In conclusion, this study provides a positive message: Democracies clearly show stronger environmental commitment than non-democracies. All other things equal, therefore, a more democratic world will also be a world with stronger environmental commitment.** This need not translate into better environmental outcomes, however, at least 31 not immediately. Theory predicts a stronger link of democracy with environmental commitment than with outcomes. Gleditsch & Sverdrup (1995: 8) suspect this much when they write that 'the crucial point is that regardless of what harm democracies may do to the environment, they are more likely to make corrective action'. **As democracy spreads around the world, so will environmental commitment. More environmental commitment will help preventing environmental scarcities from leading to extreme outcomes like violent conflict. There is thus another avenue through which democracy can foster peace. Interestingly, it is really democracy or political freedom that matters.** Pre-testing rejected economic freedom as a relevant variable. Just because a country limits its interference in the economic system and allows its people to engage freely in doing business, does not render it environmentally committed. But **allowing its people to receive independent information, to voice and organize their concerns and to dis-elect policy makers for failure to address citizens' preferences leads to enhanced environmental commitment**

Democracy is directly needed to change individual mindsets. Their pessimism ignores human capability to change and protect the environment.

Purdy 9 [Jedediah Purdy, Robinson O. Everett Professor of Law at Duke, The Politics of Nature: Climate Change, Environmental Law, and Democracy, the yale law journal 119:1122 2010]

How much of the grounds for pessimism is in fact hard-wired and how much is open to change? On its face, climate change does appear unique in its capacity to outstrip the self-correcting resources of human choice. It is, therefore, all the more important to appreciate that those resources include the power to change the very grounds of our choices. This Article approaches that issue by emphasizing an aspect of human decisionmaking distinct from our propensity (or failure) to pursue maximum satisfaction of our preferences. It begins from the premise that human action pervasively responds to the experience of strong and qualitative values. Human beings are self-conscious creatures; we experience ourselves as making decisions not at random, but for reasons: we act in ways we think more just than the alternatives, or more dignified, or more consistent with the ideals of our own character.²⁶ That is to say, we act always under descriptions of our setting and our alternatives, and these descriptions are not idiosyncratic, but are shaped by shared ideas about people, social relations, and the natural world.²⁷ Moreover, these descriptions and ideas vary across place and time, frequently changing endogenously through human engagement with the very experience of value that structures our experience.²⁸ In complement to microeconomists' interest in the formal structure of human choice, and to interest-based theorists' usual assumption that individuals seek wealth and power, this approach concentrates on the source and character of the diverse substantive ends that people pursue. This Article focuses on democratic politics for two reasons. First, democracy is one of the arenas in which people can change their own reasons for acting: in struggling to persuade one another of the meaning of central but overdetermined ideas such as liberty, equality, and nature, democratic citizens change the range of potential meanings that these values carry, eliminating some and generating new alternatives. Second, values expressed in the register of democratic politics carry a special burden, that of justifying

to other citizens proposed uses of the power of the state and imprimatur of the polity. Because the stakes of political argument are high, there is particular motive to make basic commitments and urgent innovations intelligible in this register. Tracking changes in environmental public language, the language of democratic citizens at grips with ideas of nature, means writing not just a history of what people have thought and said, but of what they have been able to assert to one another in the special business of laying claims on the political community. Note that the point here is not to oppose high-minded values to low-built interests, but to insist on their interpenetration. On the individual level, one's interests are substantially in those things one has come to value; as this Article shows, coming to value the natural world in new ways has been a major theme of American experience. Moreover, in political argument, those interests one can legitimately and persuasively assert are limited by the commitments that define the polity. Thus, to anticipate a later argument, the mainly elite conservationists of the early Wilderness Society did indeed have an interest in preserving large tracts of public land for solitary trekking; but this interest was an artifact of more than a half-century of cultural and political ferment, and turning it into legislative action required introducing a new way of valuing the natural world into the heart of American political debate.²⁹ A focus on the self-transforming effect of political argument highlights the depth of past change and implies that the future, too, might see very different governing values. History is full of reforms that were cogently argued to be as impossible as addressing climate change can seem today. The abolition of slavery, sexual equality, and democracy itself are among these.³⁰ Such pesimistic arguments have in common that their cogency depends on taking "human nature"—people's characteristic motives—as a permanent fact, at least for practical purposes. When those arguments have failed, it has been partly because "human nature" has changed, not randomly, but as democratic politics has drawn people's motives in a relatively egalitarian direction.³¹ Sometimes, then, human nature is as good (or bad) as permanent, and sometimes it is not. This is at least partly because one permanent feature of that nature is also the basis of its impermanence: people create their own reasons for acting by reinterpreting the personalities, communities, traditions, and natural world in which they live.³² By doing so in the forum of democratic politics, they can expand the set of viable alternatives, the range of paths a country might take. There is, of course, no guarantee that Americans will do so in connection with climate change. But we might. That act of democratic freedom would change the grounds of the debate.

Democracy solves warming-gives voices to those in affected areas.

Goreeba, 12 [Akash, student of environmental politics at Westminster University, "Environmental Democracy: Does Anyone Really Care?" <http://www.e-ir.info/2012/10/26/environmental-democracy-does-anyone-really-care/>]

Issues of the environment have taken centre stage within recent years. With issues such as climate change, global warming, environmental degradation, pollution, highly publicised documentaries such as Al Gore's the inconvenient truth, and even Hollywood movies such as Avatar, it is hardly surprising. Major companies are showcasing their environmental policies, brands such as Cadbury, Staples and Costa Coffee are showing off their Rainforest Alliance credentials and many major supermarkets are ditching the age old plastic bag. All in the name of the environment, arguably. **With issues of the environment of such importance it was inevitable that issues of environmental democracy and justice would also come under scrutiny.** Both environmental Democracy and justice will be discussed in this paper. We will start by looking at and defining democracy briefly, before identifying how individuals and communities can benefit, or access the democratic playing field. **We will then look at some of the issues concerned with environmental democracy illustrated with some examples.** Later in the paper we will look at environmental justice in a similar fashion to environmental democracy. We will highlight some of the issues with examples and look at whether issues of Environmental democracy and justice are easier to deal with a localised level. We will conclude by arguing that **both justice and democracy are essential when the environment is concerned.** This is not to say that they are not problematic. **However in a time**

where we are all witnessing environmental degradation and problems globally, both justice and democracy are a necessity. A token yet generally received definition of democracy comes from Dahl 1991, that is democracy as “a political system in which opportunity to participate in decisions is widely shared among all adult citizens” (Dahl 1991, p.6). Mason is correct when he states in relation to these opportunities that “the more significant and comprehensive these opportunities are, the greater the level of democracy attached to a political system” (Mason 1991, p.22). It is fair to say we are in the era of liberal democracy. One which defends the rights and liberties of the individual, albeit in the majority of the world via representation. Whilst it is fair to say that this has been accepted over the ancient Athenian model of direct democracy, it is not to say that some, namely radical greens have not called for a return to a small scale version of the Athenian model. Mason correctly argues that “the distinction between representative democracy and direct democracy highlights a central dilemma of modern governance: the functional need for effective political decision making – achieved in increasingly complex societies through representative, often remote structures – threatens to undermine the accepted conditions for democratic justification: that affected interests have had a fair opportunity to influence the relevant decisions giving them good reason to support democratic norms” (Mason 1991, p.22). Dunn expresses this frankly “we have all become democrats in theory at just the stage in history at which it has become impossible for us in practice to organise our social life in a democratic fashion any longer” (Dunn 1993, p.29) **Whether this is the case or not it is clear that issues of the environment involve individuals, communities, schools, workers, and governments alike. As will become clear further in this paper, democracy is essential in safeguarding the rights and liberties of all individuals not only at the local level but globally. “Although scientific consensus has not been reached, there is ample evidence to suggest that race and class are importance determinants of the location of environmental pollution, degradation, and associated health risks”** (Jones and Rainey 2006, p.473) (see also Bullard, 1990; Cable, Hastings, & Mix 2002; Foster, 1993; Goldman, 1994; Jones, 1998 as discussed in Jones and Rainey 2006). **Hence why it is essential that all voices are heard even if this is via representation. As noted above, issues of environmental democracy concern all**, Susan Hazen of the UNEP agrees the “new term ‘environmental democracy’, now taking hold, reflects increasing recognition that environmental issues must be addressed by all those affected by their outcome, not just by governments and industrial sectors. **It captures the principle of equal rights for all those in the environment debate – including the public, community groups, advocates, industrial leaders, workers, governments, academics and health care professionals.** **For those whose daily lives reflect the quality of their environment, participation in environmental decision-making is as important as in education, health care, finance and government”** (Hazen, UNEP p.1). Thankfully we are in an era where we all have the ‘the right to know’ or freedom of information (although not surprisingly this is sometimes limited). **This allows us to at least attempt to make informed decisions concerning the environment. Access to environmental information for all who choose to participate in such decision-making is integral to the concept of environmental democracy”** (Ibid). More recently questions of how to allow individuals and communities access to environmental decision making has taken centre stage. **With initiatives such as the TAI (The Access Initiative) governments are arguably aiming to provide a more accountable, transparent and democratic government where the environment is concerned. “Environmental democracy is about government being transparent, accountable, and involving people in decisions that affect their environment. The Access Initiative (TAI) network are expanding their work to promote environmental democracy. Here is a summary of what’s ahead in 2008 and beyond. Local TAI partners work with their governments to reform transparency laws and train government officers to involve people in development planning. They also build the awareness among judges and in the media about the public’s ability to influence decisions that affect the environment”** (Kerdeman 2008, p.1). (See fig .1 for a list of countries in the TAI and examples of some successes) Today environmental democracy is taking centre stage. Whether this is from the abundance of websites championing equal rights to the risks and benefits associated with the environment, movies such as the recent Avatar being championed for its environmental message (whether intentional or not) or the highly publicized case of Robert Lovelace in 2008 who was jailed following his campaign against a uranium mining company in Ontario. **Another more recent development in the media linked to the ‘right to know’ or freedom of information we discussed above which highlights the availability of access to environmental democracy, as well as the ease of access to information via the internet is that, “European citizens will soon be able to find out about pollution in their local areas at the click of a mouse and lodge complaints under a new international agreement,** the UN said. Dubbed a tool for “environmental democracy” by its supporters, the Kiev Protocol obliges authorities to keep a public register of

pollution incidents or emissions from sources such as chemical plants, power stations, oil and gas refineries, mines and waste dumps" (AFP 04/2010, p.1) Jan Kubis, executive secretary of the UN Economic Commission for Europe argued that **"It will enable ordinary citizens, simply using the Internet, to find out about the major sources of polluting emissions in their immediate neighbourhoods"** (Ibid). Another recent and worrying example is the oil spill threatening to cause an environmental catastrophe. Questions of who should be held accountable were inevitable, and with speculation that President Obama is under pressure to act quickly following calls for answers by local communities, it would hardly be surprising if BP (already having claimed responsibility for the spill) would have to pay for the cleanup. **We have looked at environmental democracy and its significance and importance. With some examples which highlight the necessity of democracy where environmental issues are concerned. We will now look at environmental justice and injustice, which often goes hand in hand with environmental democracy.** Many of the examples above can be described as either an environmental justice or injustice. In a similar discussion of environmental democracy above, we will now look at environmental justice highlighting its importance and some of the problems with it. Let us firstly look at a briefing produced by the ESRC (Economic and Social Research Council) entitled "Environmental Justice, rights and means to a healthy environment for all" 2001. The paper was developed following a seminar including the likes of Friends of The Earth, the London School of Hygiene and Tropical Medicine on Environmental Justice. The paper does well to illustrate the links between social injustice and environmental problems, it works on the two basic premises of environmental justice that is, "that everyone should have the right and be able to live in a healthy environment, with access to enough environmental resources for a healthy life, and second, that it is predominantly the poorest and least powerful people who are missing these conditions" (ESRC 2001, P.3). Its main aim is to "research the extent of linkages between environmental and social injustice, and ask whether it is possible to tackle both social exclusion and environmental problems through integrated policies and developments" (ESRC 2001, P.3). **As noted, whilst the ESRC recognizes the links between social injustice and environmental problems, they also recognize that although recently, the government as well as individuals and communities, particularly as a result of the efforts of researchers in the United States have been able to benefit from a new set of tools better allowing them to produce effective policies in accordance with environmental justice.** In the ESRC's words, "there is an emerging toolkit for governments, individuals and communities to use to implement environmental justice. New assessment techniques, policies, and laws now allow the more transparent establishment of rights and responsibilities, and this in turn brings new legal, reputational and financial risks for those acting in an irresponsible way" (ESRC 2001, P.3). What is useful for us when looking at the report here is the problems which arise when seeking to administer environmental justice, these can be seen throughout the 28 page document. Some of the more noticeable examples are, firstly the question of how to define a victim or victims of environmental injustice. For example should we or should we not consider the unborn when considering victims of environmental injustice, and what if the victim cannot express themselves "it remains unclear how to accord victim status in law when, for example, the victim cannot speak for themselves, such as an unborn child or a person whose intellectual abilities have been severely damaged by the harm they have suffered, such as radiation" (ESRC 2001, P.6). Secondly, though there is now a great quantity of literature discussing the effects of environmental justice and injustice it is fair to say that most of these place more importance on localised areas. Arguably we should better consider injustices of large scale geographic areas, take the Chernobyl crisis as prime example. Another notable example provided by Sandeu 2000 is the case of the Inuit people "the Inuit people's staple diet of fish contains high levels of polychlorinated biphenyl, by-products of industrial processes far from their country, concentrated gradually through the food chain" (Sandeu 2000 in EDT ESRC 2001, p.6). There are many other examples of cases where the few have benefited from economic benefits whilst the large have suffered grave economic as well as social disbenefits. Another particularly difficult example is time and space. That is as we can clearly argue, **environmental justice is not only a national issue but a global one. The effects of climate change perhaps being the most obvious example. " For example, people in African countries and future generations are likely to be badly affected by climatic changes caused by fossil fuel burning, which has been caused predominantly by people in non-African countries, in this and previous generations "**(Boyle and Anderson 1996 in ed. ESRC 2001 P.6). **Another prime example is the responsibility of us all. That is simply, human race and our responsibility to maintain the earth's existing bio diversity.** Dobson makes note of this point well "no theory of justice can henceforth be regarded as complete if it does not take into account the possibility of extending the community of justice beyond the realm of present generation human beings" (Dobson 1998, p.244-245). From the above it is clear that **environmental justice is not just a local issue but a global one, an inter-generational one, and undoubtedly a problematic one. This should be a concern of not only the few, but all countries. It is also clear from the above that identifying environmental injustices is often a difficult task.** As Frosch and others have noted, "environmental justice offers researchers new insights into the juncture of social inequality and public health and provides a framework for policy discussions on the impact of discrimination on the environmental health of diverse communities... Yet, causally linking the presence of potentially hazardous facilities or environmental pollution with adverse health effects is difficult, particularly in situations in which diverse populations are exposed to complex chemical mixtures" (Frosch et al 2002, P.

149). Let us look now at the problems of environmental justice. In relation to the UK, Agyeman believes that "to many people in the UK, environmental justice is quite simply someone else's problem. To them, the words 'environmental' and 'justice' do not sit easily together. At best, their combination evokes a memory of some distant news report or documentary of how communities of colour and poor communities in the US face a disproportionate toxic risk when compared with white middle class communities, and at worst the combination fails to register a signal" (Agyeman & Evans 2004, p.157). However it is clear that within the last 20 years at least, the effects of environmental injustices have become of increasing importance. Whether this is due to climate change, global warming, or disproportionate pollution, we have seen an increase in NGO's and in some cases MP's who are addressing environmental injustices and pushing the issues off of the sidelines and into the mainstream in Britain and indeed British government. As predicted by Cutter the issue of environmental justice in "other regions will intensify in the years to come as nations implement international accords for sustainable development" (Cutter 1995, 111). Not just within the UK but within Europe we have seen the EU adopt a set of initiatives aimed towards environmental justice through 'Just Sustainability'. Just sustainability as defined by Jacobs is understood as "the egalitarian conception of sustainable development" (Jacobs 1999, p.32). To further this it is, "the need to ensure a better quality of life for all, now and into the future, in a just and equitable manner, whilst living within the limits of supporting ecosystems" (Agyeman, et al., 2003, p.5). Guidelines for EU policy implementation sets out that "all policies must have sustainable development as their core concern. In particular, forthcoming reviews of Common Policies must look at how they can contribute more positively to sustainable development" (Commission of the European Commission 2002, p.12). It is not surprising that EU policy has placed emphasis on just sustainability a year after and EU governance white paper was produced (2001). In this White Paper, **"the modernization of European governance is seen as a necessary precondition for European integration through a process of decentralization, combating the impact of globalization, and a restoration of faith in democracy through wider involvement in decision making"** (Agyeman & Evans 2004, p.162). We have seen from the above the problematic of environmental justice. It is arguably particularly difficult when considered in the global context. It is not surprising that attempts to safeguard and provide environmental justice have now taken a small scale dimension. An example of a more small scale attempt at addressing the effects on environmental justice/injustice is the Environmental Justice Showcase Community by the EPA (environmental protection agency). **Recently it was announced that the State of Jacksonville USA had been selected for the pilot scheme which would see a cash injection of over \$100,000 by the EPA which would go towards addressing the environmental issues suffered by low income and minority communities. "EPA Administrator Lisa Jackson announced that, under the initiative, Jacksonville will be one of the national models for EPA's commitment to EJ* [Environmental Justice] efforts. EJ refers to the disproportionate environmental burdens placed on low-income and minority communities" (EPA News Release, 04/2010). The project aims at working with the likes of schools, community organisations, local residents, as well as federal agencies. Greg Strong, Florida Department of Environmental Protection's Northeast District Director stated that "we can achieve much more collectively, when we combine and leverage our resources, than as stand-alone organizations working independently... This kick-off event is an excellent way for us to find new opportunities to work collaboratively with our partners in order to benefit the local community and further improve human health and the environment" (EPA News Release, 04/2010). Those such as the EJF (Environmental Justice Foundation) have already done well to illustrate the usefulness of small scale local and community projects aimed at addressing environmental injustices, the EJF essentially operates via providing film and advocacy training and empowering "local" communities.** Some notable examples where this has been successful include the Cambodian Fisheries Action Coalition Team, or (FACT). The Team aimed to resolve conflicts over freshwater fisheries, in short the EJC "trained and equipped FACT with essential cameras, computer equipment, internet access and GPS systems. And thereby helped FACT gather essential information and testimonies and co-produced 'Feast or Famine', which was launched at a meeting hosted by the UK Ambassador to Cambodia and attended by World Bank, IMF and other representatives of the donor community, helping to put the issues firmly on the political agenda" (EJF 2010). Other examples include the EJF's "educating on nature in Vietnam", "CEDAC" aimed at reducing the use of deadly pesticides in Cambodia, and "JALA" aimed at combating illegal fishing and helping poor fisherman in Sumatra. All the examples above have in common that they operated in the "local" communities. Perhaps it is the case that both democracy and justice are best implemented at a local level. We have looked at the importance as well as the problematic nature of environmental democracy and justice. As problematic as the two are, their importance are undeniable. **There are numerous organisations and NGO's that are dedicated to ensuring environmental democracy and justice, some of which have been discussed above. In a world where we are witnessing environmental degradation and problems globally, effective democracy and justice is a necessity. Good environmental governance equates to good environmental democracy/justice.** We have seen how minorities have suffered disproportionate environmental dis-benefits. In a supposed free world it is only fair that everyone should be allowed to experience both the risks and benefits associated with the environment, as well as future generations to come. And whilst from the above it is clear that environmental democracy/justice has a long way to go, it has done well so far to deal with many environmental issues globally, usually small scale and local. But it is undoubtedly the case that small scale localised efforts are most effective. It remains to be seen whether implementation of small scale localised agendas "globally" will prove fruitful. And whilst the likes of Agyeman above, have argued that the

majority of environmental issues 'fail to register a signal', this is undeniably changing. **Thanks to the efforts of the many who go out of their way to make consideration for the environment a key part of modern life.**

Democracy Solves Tech***

Tech only solves if we have deliberation through democracy – current ineffective implementation and multiple ethical and political concerns

Machin 6/10/15 [Amanda, works at the Zeppelin University, Karl Mannheim Chair for Cultural Studies as a Post-Doc, Den Haag 2015, "Rethinking Political Contestation over Climate Change", Working Paper 10]

Perhaps the dominant approach to climate change is the turn to technology for a solution. Scientists and engineers are expected to conjure up a timely invention or an artful innovation that can deftly ward off the dangers of rising greenhouse gases, without demanding any dramatic sacrifice in lifestyle. Renewable energy from wind, solar thermal, photovoltaic, geothermal, tidal and hydropower sources, nuclear fission and nuclear fusion, biofuels, carbon sequestration and solar radiation management are all championed as possible technological saviours from a future of environmental catastrophe. This turn to technology can perhaps most clearly be seen in the apparent emergence of 'climate engineering' or 'geoengineering' as a serious option in climate policy discussions (Hamilton 2014). Geoengineering can be defined as "the deliberate, large-scale intervention in the Earth's climate system" (Grolle 2013). David Keith, a professor of applied physics and social policy, is an advocate of such deliberate intervention in the climate, arguing for a form of 'solar geoengineering' in which the injection of reflective particles of sulphuric acid creates a 'sunshade' for the earth below. He claims that "the underlying science is sound and the technological developments are real" and therefore such solar geoengineering is "a cheap tool that could green the world"(Keith 2013). To be sure, Keith admits that the use of such technology is a hard choice; it is an "extraordinarily powerful tool yet it is also dangerous". Still, he offers a qualified endorsement: "If research shows that these technologies have benefits that greatly exceed the costs, then we should in fact start relatively soon, albeit carefully and with small steps" (Grolle 2013). Such technical fixes are attractive in part at least because they do not demand any sacrifice or drastic change in lifestyle. For if we can develop and implement the right technology, then surely we can sustain our cake while we continue to eat it. It is exactly this assumption that we find in politicians speeches. For example, in 2007 George W. Bush stated: "By developing new low-emission technologies, we can meet the growing demand for energy and at the same time reduce air pollution and greenhouse gas emissions. As a result, our nations have an opportunity to [...] reach a consensus on the way forward." (Bush 2007). In 2014, at the UN Climate Change summit, President Barack Obama makes a similar claim: "We cannot condemn our children, and their children, to a future that is beyond their capacity to repair. Not when we have the means – the technological innovation and the scientific imagination – to begin the work of repairing it right now [...] Within a decade, our cars will go twice as far on a gallon of gas, and already, every major automaker offers electric vehicles..." (Obama 2014). The vision of tomorrow conjured up by this approach is of a familiar world, where the vehicles on the motorway may be less polluting, the food may be more organic, the power-stations may be 'greener', but the lifestyles of the affluent consumer remain largely unchanged. The picture projected here is a shiny utopian vision in which tackling climate change is a matter of developing and implementing new technologies. No mention is made at all to a fundamental (or even a superficial) rethinking of the Western 'way of life'. Scientists and engineers thus are given a heavy double burden: they are not only expected to provide accurate predictions about an uncertain future climate, but also to proffer the equipment to be able to cope with it. Scientists themselves warn, however, that no particular technology is able to offer a simple, single 'silver bullet' (Shepherd 2009). Moreover, the

development and deployment of 'green' technologies involve political and ethical questions. This is perhaps most obviously the case with climate engineering; some technologies, for example, can actually reduce levels of greenhouse gases in the atmosphere, generating questions of what the 'right' level of atmospheric concentration might be and who might legitimately make such a decision? (Barrett 2008). If the effects of climate engineering technique have a differentiated impact upon different parts of the world then might not those who control it be tempted to implement it in a way that suits themselves but not necessarily others? (Hamilton 2014). The Royal Society, in its widely cited report on geo-engineering, notes that while there are many scientific difficulties and uncertainties "the greatest challenges to the successful deployment of geoengineering may be social, ethical, legal and political issues associated with governance, rather than scientific and technical issues" (Shepherd 2009). Making decisions about climate engineering is not however simply a matter of bringing a plethora of different sorts of experts into the discussion to come to an agreement, for it is likely to involve a "multiplicity and incommensurability of different views and ontologies" (Szerszynski and Galarraga 2013). The very tendency of proponents of climate engineering to project the possibility of a 'global solution' forgets the local differentiation of the issue that is likely to produce disagreement (Hulme 2014). 'Multiplicity and incommensurability' is also exemplified in the deployment of other sorts of technologies. Nuclear power, for example, has been held up as an example of the best means of addressing climate change and, simultaneously, as an example of the worst (Greenpeace). Renewable energy developments such as wind farms have also been the subject of intense, on-going and often entirely legitimate opposition (Aitken 2012). Such opposition and disagreement should not always be seen as a problem. Alternative perspectives and different types of knowledge can contribute key insights into the deployment and problems of technology. Furthermore, without political negotiation between opposing viewpoints, a strong and legitimate collective decision that could underpin technological innovation is missing from the outset. Technology can no doubt play a key role in responding to climate change and we should be hopeful that a package of various innovative technologies might be helpful in stabilising or even reducing the atmospheric concentration of greenhouse gases with few ill side-effects. But perfect global solutions do not emerge cleanly from sterile laboratories, unsullied by the sticky complications of political disagreement. Indeed, political disagreement is needed to release the potential 'magic' of technology.

Democracy Solves Other Things

Democracy is a key component for solving a myriad of problems from sustainability to structural racism because of bottom-up, grassroots movements

Stirling 14 [Andrew Stirling, Professor of Science & Technology Policy at the Sussex university, Emancipating Transformations: From controlling 'the transition' to culturing plural radical progress STEPS Working Paper 64, Brighton: STEPS Centre, 2014]

Current global environmental policy reverberates with talk of a new 'Anthropocene epoch' defined by 'human domination', in which a 'perfect storm' of catastrophic threats is forcing a singular 'great transition' towards 'planetary management'. Under growing 'environmental authoritarianism', democracy is increasingly seen as a 'failure', a 'luxury', or even 'an enemy of nature'. If charge is to be taken of the 'control variables of the Earth', some say democracy must be 'put on hold'. One way of seeing this trend, is that scientific and policy knowledges are becoming increasingly imprinted by the preoccupations of incumbent power with rhetorics of control. Under this growing political mood, it seems there is 'no alternative' but compliance, or irrational denial and existential doom. Yet there are alternative ways to address the gravity of current ecological and social imperatives. It can be recognised, for instance, that democratic struggle is the principal means by which knowledges and practices of Sustainability were shaped in the first place. In this view, concentrated power and fallacies of control are more problems than solutions. Here, history can show that the greatest ongoing forms of transformative progress (like release from colonialism, racism or patriarchy), owe more to plural knowledges and values and unruly hope-inspired agonistic contention, than to single orderly technical 'transitions' based on formally-integrated science or fear-driven structured control. Like other great progressive struggles of history, radical shifts in grassroots culture and anarchically choreographed flocking behaviours in nature, the most effective modes for radical change often lie in spontaneous collective bottom-up 'culturings' of knowing and doing. These do not depend on rigidly disciplined 'integrated science' and monolithically-structured 'planetary management'. Instead, real hope of radically progressive social transformation may lie more in the mutualities of caring, than in the hierarchies of control. And among the greatest obstacles to this, are ideologies of technocratic transition. Perhaps the deepest necessity lies in emancipating 'transformation' itself?

Prefer Our Authors

Their criticism is a form of fearmongering that gives more ammunition to conservative pundits and discredits their cause at large.

Lewis 14 [Martin, Senior lecturer at Stanford, "Eco-Authoritarian Catastrophism: The Dismal and Deluded Vision of Naomi Oreskes and Erik M. Conway", Geocurrents Oct 9 2014, <http://www.geocurrents.info/physical-geography/eco-authoritarian-catastrophism-dismal-deluded-vision-naomi-oreskes-erik-m-conway>]

As with so many other hot-button debates, the climate change controversy leaves me repelled by the clamoring extremists on both sides. Global-warming denialists, as some are aptly called, regard the scientific establishment with such contempt that they abandon the realm of reason. In comment after comment posted on on-line articles and blogs, self-styled skeptics insist that carbon dioxide is such a scant component of the atmosphere that it could not possibly play any climatic role, while castigating mainstream climatologists as malevolent conspirators dedicated to destroying civilization. Yet on the equally aptly named alarmist side of the divide, reasonable concerns often yield to dismal fantasies of the type so elegantly described by Pascal Bruckner in The Fanaticism of the Apocalypse, upheld by exaggeration to the point of absurdity. More alarmingly, climate activism seems to be veering in an unabashedly authoritarian direction. In such a heated atmosphere, evenhanded positions are at the risk of being flooded out by a rising sea of mutual invective and misinformation. This essay addresses only one side of this spectrum, that of the doomsayers who think we must forsake democracy and throttle our freedoms if we are to avoid a planetary catastrophe. Although it may seem paradoxical, my focus on the green extreme stems precisely from my conviction that anthropogenic climate change is a huge problem that demands determined action. Yet a sizable contingent of eco-radicals, I am convinced, consistently discredit this cause. By insisting that devastating climate change is only a few years away, they will probably undermine the movement's public support, given the vastly more likely chance that warming will be gradual and punctuated. By engaging in mendacious reporting and misleading argumentation, they provide ample ammunition for their conspiracy-minded opponents. And by championing illiberal politics, they betray the public good that they ostensibly champion. It is a sad day indeed when an icon of liberalism such as Robert Kennedy Jr. can plausibly be deemed an "aspiring tyrant" for wanting to punish global-warming deniers.

Prefer our evidence – their authors lack scientific credibility

Pielke 13 [ROGER, Professor of environmental studies at the University of Colorado, More authoritarian politics is not the solution to climate change, DAGENS NYHETER, September 27th 2013]

On Thursday the Intergovernmental Panel on Climate Change presented the first of four assessments, this one taking stock of the physical science of the climate system. The report's reception and promotion highlight challenges that arise when expertise meets politics. The temptation to use the conclusions to forward different political agendas will be abundant. And rightly so, the initial idea behind the IPCC report was to provide an assessment of science that could be used by policymakers. This is clearly not a problem when politicians, activists or lobbyists use the report in an open debate on how to address climate change. We should expect advocates to pick and choose among the report's findings to find those bits that fit best with their agenda. That is how interests operate in democracies. We see however for us a worrying tendency among some scientists to use climate and other environmental science reports to advocate for more authoritarian political systems and a call for an emergency order by emphasising the worst case scenarios of these reports as a "trump card" in political debates. Yvo de Boer, the former secretary general of the United Nations Framework Convention on Climate Change, argued almost a year ago that "the next IPCC will scare the wits out of everyone. I am confident that those scientific findings will create a new political momentum." The problem with fear-motivated decision-making is that it has not worked so well in environmental policymaking. We can just see how much the climate scare has changed societies so far: very little, if at all. The global greenhouse gas emissions continue to rise and carbon-free energy still has the same proportion in the energy mix as when the whole climate debate started in

earnest twenty years ago. Not only are appeals to fear ineffective, but they can also be dangerous for democracy and the role of experts within it. Frustrated scientists who argue that they alone have the right political solution to the climate crisis start advocating for expert control. A recent example - one of several we could provide - is the Global Challenges Foundation who argued in an Op Ed in Dagens Nyheter that risk of a significant temperature increase requires "effective global decision-making bodies". In their mission statement, they argue that "we are unable to manage the environmental crisis in the current political system". They go on to identify that a core problem is that politicians have to worry about reelection, media solely focused on probable and short-term damages and a lulled public. Instead the organisation wants to create a new political order with a legally binding efficient, rational and equitable global legal system, which in line with their reasoning, would not worry about up-coming re-elections. But re-elections are precisely the essence of a democracy where the public can decide with a regular reoccurrence how we want society to be governed. It is evident from the organisation's presentations that the experts believe that the public does not know their own good. Political systems based upon such an assumption are necessarily authoritarian. We believe the solution is not to argue for taking political power from the public, and putting the power in the hands of experts. First, which experts should make the call? Scientist are hardly in consensus on social and economic politics. Is it the one advocating restricted economic growth or the one advocating accelerated economic growth focused on innovation? Second, history gives us many examples where experts argue they have the right cure to a pending catastrophe, where we today may be relieved they were not in decision-making power. Take for instance Sweden's famous food scientist Georg Borgström who argued that sterilization after the third child would be as natural as getting a vaccination or Garrett Hardin's call for a life boat ethics where it was better to let millions die than the whole humanity perish. The track record of experts demanding political authority is not so good. Rather than tackling ineffective climate policies by restricting democratic systems, we believe we should open up debate to other solutions. There are many alternative pathways to accelerating energy innovation and climate adaptation that would pose credible alternatives to those tried so far. These include, for example, the rapidly growing interest in nationally appropriate mitigation actions, integrating mitigation efforts and national development goals and thus facilitating public and political support; investment in low carbon energy innovation, which would need to be at least doubled in order to stimulate alternatives; and carbon taxes, which would likely be more effective than emissions trading in many countries. If we look beyond the state, there are a variety of initiatives, such as cities collaborating on climate action, business and civil society partners on voluntary environmental standards and an enormous number of other initiatives that can be stimulated, and which together can bear fruit. Ideally, upcoming IPCC reports on mitigation alternatives will illustrate just how many expert opinions there are for the voters to consider. Scientists and other experts must become more attuned to the different roles that they play in broader society, especially what it means to be facilitators of democracy, not usurpers of it. In practice this means recognizing that the main function of expert advisory bodies is not to tell the public what should be done, but rather what could be done. Experts who claim to speak for "science" and who campaign too aggressively place at risk their own credibility and that of science more broadly in public debates. Ultimately, a commitment to democratic governance means accepting that power rests with the people, and not the experts.

Movements Solve

Movements have been happening to address these problems and will continue to grow in effectiveness. Our personal engagement inside macropolitical deliberation is key to their effectiveness

Purdy 9 [Jedediah Purdy, Robinson O. Everett Professor of Law at Duke, The Politics of Nature: Climate Change, Environmental Law, and Democracy, the yale law journal 119:1122 2010]

What is the nature of the persuasion? In addressing this question, I am mainly concerned with how the leaders I spoke with understood their own participation and that of the people they recruited. Their opponents offered familiar arguments that local climate action can only be futile, and in their advocacy, the leaders developed a concrete sense of how to engage those arguments. First, local climate activists appreciate that they are engaged in a symbolic politics made possible by the country's adoption of environmental commitments in the 1970s and earlier.²⁴⁷ Before the 2008 presidential election, which brought a new emphasis on climate change to the White House, their actions invoked those commitments when the national government was seen as neglecting them. The activists sought to announce that the commitments remained vital, and, in doing so, contribute to the truth of the assertion. These symbolic actions reflect the existence of environmental commitments as national values; by adopting nominal emission limits, cities make a public argument that the federal government should do the same. Second, these initiatives are intended as existence proofs that coordinated action can succeed in reducing greenhouse gas emissions, at least within a locality (ignoring for the moment the prospect of emitting activities fleeing to other jurisdictions).²⁴⁸ A successful experiment is a powerful form of persuasion, establishing a concrete option for others with salience that a merely hypothetical alternative is unlikely to command.²⁴⁹ Third, local climate initiatives are attempts to reframe the cultural valence of climate change from an ideological flashpoint associated with left-liberal attitudes to a rallying point of pragmatic effort. Studies of public opinion on climate change show that views of both the severity of the problem and the human power to address it conform to the hypothesis that people assess facts based on whether the truth or falsehood of those facts would confirm or undercut the bases of their social status and moral vision of the world.²⁵⁰ Those who regard the problem as serious and profess to believe that people can do something about it are also proregulatory economic and political egalitarians.²⁵¹ Those who profess to think that the threat is negligible and beyond human influence in any case (two views that would not seem inherently aligned but for their affinity in the cultural-meaning register) fall on the other side of those larger markers of worldview. Strategists for local initiatives emphasize practical local vulnerability to climate change. The paradigm case is Seattle's dependence on the Cascade snowpack for water and hydroelectric power, which figured importantly in the local argument for leading the conference of Mayors Agreement initiative.²⁵² This argument is available across the snowpack- dependent West, as is the danger of drought for already water-stressed regions in the Southwest and, in some recent droughts, the Southeast.²⁵³ If it succeeds, like nineteenth-century arguments tying forest conservation to erosion prevention and future timber harvests, this effort will have made climate change a different kind of problem. This sort of change relies on both empirical knowledge and democratic self-interpretation. Finally, the activists aim to create new norms of climate regulation within small and rather insular populations at a time when such norms have little purchase in the larger society. Ultimately, local initiatives aim to make lowcarbon conduct conventional—part of a practice of membership and mutual respect.²⁵⁴ As a starting place, the

initiatives take advantage of small and dense networks, such as mayors, city officials, and environmental activists. This is an attempt to create a practice among members of a limited public, rather as the Sierra Club once created a limited public in which the Romantic experience of nature was widely shared and explored as a public language.²⁵⁵ The unifying aim of this activism is persuasion: to give a broader class of people reasons to believe climate change is both real and susceptible to action. Local climate initiatives engage the questions of: (1) what reasons exist to address climate change; (2) who has those reasons; and (3) what reasons would be sufficient to spur collective action. At least for their activist core of proponents, local initiatives are acts of defiance against the idea that politics is futile—against the pessimistic account of climate change and collective action sketched earlier.²⁵⁶ If they were merely defiant, they would count only as expressive, in just the vein of a chanted slogan. The burden of the argument here is that local climate initiatives are intended rather as efforts at persuasive politics, bearing on the reasons for action that operate in the political community and its subcommunities. Those who work for local climate initiatives understand the argument that their action is necessarily futile. Proving otherwise is a project motivated precisely by an understanding of the argument and a wish to change the terms on which it rests.

Tech Solves

Tech solves – empirics prove.

Krautkraemer 5 [Jeffrey, former professor of economics in the College of Business and Economics, Washington State University, Pullman, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 58-59]

In the “race” between technological progress and diminishing marginal returns in a finite natural world, the prospects for future generations depend upon which trend is proceeding at a faster pace. Many issues, then, boil down to a seemingly simple empirical question of whether technological progress can overcome diminishing marginal returns. Over the years, there have been technological pessimists and optimists, and that pattern continues to this day. The empirical evidence to date for natural resources commodities is largely in favor of technological progress. The many predictions of impending doom have not come true – at least not year. The discovery and development of new reserves, the substitution of capital, and technological progress in resource extraction and commodity production have led to generally downward sloping price trends for many natural resource commodities. If there is any systematic bias to past predictions of the future, it is an underestimation of the ability of technological progress to overcome natural resource scarcity. For example, petroleum supply forecasts have persistently overestimated the future price of oil and underestimated oil production (Lynch 2002). The picture is less clear for the amenity goods and services derived from the natural environment. Resource Commodities Three economic measures have been used as indicators of resource scarcity: price, extraction cost, and user cost. These three indicators are related through a basic first order condition for optimal resource extraction: $P = Cq + A$ where P denotes the extracted resource price Cq denotes marginal extraction cost A denotes the user cost The user cost captures the nonextractive economic cost of current depletion, including the forgone regeneration for a renewable resource and the forgone future use of a nonrenewable resource. It also includes any contribution of the resource stock itself to the net benefit of extraction-for example, a more abundant resource stock may decrease extraction or harvest cost. Barnett and Morse (1963) focus primarily on extraction cost. Extraction cost is computed as the amount of labor and capital needed to produce a unit of output. This measure is founded on the classical economics view that with diminishing marginal returns and finite natural resources, the cost of natural resource use should increase as demand increases and depletion occurs. The tendency toward increasing extraction cost can be offset by technological progress. Data from the United States for the period 1870-1958 for agriculture, minerals, forestry, and commercial fishing are examined. During this period, population increased by a factor of 4, annual output increased 20 times, and the output of the extractive industries increased about 6 times. This period of rapid population and economic growth should furnish a good test of the relative impacts of diminishing marginal returns and technological progress. Agricultural output increased four times over this period, and the unit cost declined by one-half when both capital and labor are included and by one-third when only labor is included. The cost measure for agricultural production actually declines more rapidly after 1920. The economy became more mineral intensive over this period, with mineral resource use increasing 40 times. Even so, the unit extraction cost measure for minerals production declined significantly, with an increase in the rate of decline after 1920. Commercial fishing also saw a decrease in extractive cost. Only forestry unit extraction cost increased, although both output and unit cost tended to level out after 1920. The conclusion is that the data do not support the strong scarcity hypothesis of increasing resource scarcity (Barnett and Morse 1963).

Innovation solves scarcity and output costs.

Krautkraemer 5 [Jeffrey, former professor of economics in the College of Business and Economics, Washington State University, Pullman, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 64-65]

The significant decline in the mineral resource intensity of total output after the mid-1970s provides evidence of the ability to substitute away from inputs that become more costly (Tilton 1989). The development of the solvent extraction-electrowinning (SX-EW) method for refining copper ore is one example of the effect of technological progress. This process reduces costs greatly by eliminating smelting and refining, and this allows the economical use of much lower grade copper ore, including material that was left behind by previous mining operations (Tilton and Landsberg 1999; Bunel 2001). The price of copper increased in the late 1980s but has since declined substantially to well below its 1979 level, overcoming previous concerns about the future demand for and cost of extracting copper (Brobst 1979; GoeUer, 1979). The real prices of fossil fuels also

declined from peaks in the early 1980s (see Figure 3-6). Petroleum is particularly instructive. Consumption and consumption per capita declined in North America and Europe in the early 1980s following the oil price spike of 1979. Consumption increased slowly after the mid-1980s as real oil prices fell, but consumption per capita remains below its 1980 level in both the United States and Europe. Total consumption in North America is now slightly above its previous peak in 1978, while European total consumption is still below its previous peak in 1979. Consumption declines in the developed world were offset by increasing consumption in the Asian Pacific region, particularly by a doubling of consumption in China in the 1990s. Developments in computer technology and directional drilling, neither of which was predicted in Scarcity and Growth Reconsidered, have substantially lowered exploration and development costs and enhanced recovery from existing reserves. Discovery and development costs in the United States are one-third of what they were 20 years ago (Economist 2001). World proved petroleum reserves increased from 660 billion barrels at the end of 1990 to 1,009 billion barrels at the end of 1999. Even though consumption from 1991 to 2000 were approximately 250 billion barrels, proved reserves at the end of 2000 stood at 1,046 billion barrels. The United States produced 28 billion barrels of oil in the 1990s, but its proved reserves dropped by only 4.1 billion barrels (British Petroleum 2001).

AT: Authoritarianism Inevitable

Authoritarianism is not inevitable – four reasons

Jones 98 [Sean M. Lynn-, Editor of International Security at the Belfer Center of Harvard's Kennedy School, Why the United States Should Spread Democracy, Center for Science and International Affairs, http://belfercenter.ksg.harvard.edu/publication/2830/why_the_united_states_should_spread_democracy.html]

The Argument: A second criticism of the logic of the democratic peace argues that democracies cannot enjoy a perpetual peace among themselves because there is always a possibility that a democratic state will become nondemocratic. This possibility means that even democracies must be concerned about the potential threat posed by other democracies. John Mearsheimer argues that: "Liberal democracies must therefore worry about relative power among themselves, which is tantamount to saying that each has an incentive to consider aggression against the other to forestall future trouble."⁷⁷ In other words, the realist logic of anarchy, which posits that states exist in a Hobbesian world of fear, suspicion and potential war, applies even to relations between democracies.⁷⁸ There are four reasons for rejecting claims that fears of democratic backsliding compel democracies to treat other democracies as they would treat any nondemocratic state. First, the historical record shows that mature, stable democracies rarely become autocracies.⁷⁹ Second, democracies are able to recognize and respond to states that are making a transition from democracy to authoritarianism. Democratic states thus can pursue a policy of accommodation toward other democracies, hedge their bets with more cautious policies toward unstable or uncertain democracies, and abandon accommodation when democracies turn into nondemocracies. There is no reason to assume that democracies will become autocracies overnight and then immediately launch attacks on democracies. Third, like some other realist arguments, the claim that states must give priority to preparing for an unlikely dangerous future development rests on flawed logic. It assumes that states must base their foreign policies almost entirely on worst-case scenarios. Similar logic would imply that, for example, citizens in any country should act on the basis of the assumption that domestic law and order might collapse into anarchy and violence. Fourth, the claim that democracies must worry about the relative power of other democracies (which may become autocracies) relies on the same shaky logic that predicts that states cannot cooperate because they need to worry about the relative gains achieved by other states. The relative-gains argument holds that in international politics, cooperation is rare because it often gives greater gains to one state, and these relative disparities in gains can be turned into advantages in power than can be used to threaten the state that gains less.⁸⁰ The relative-gains argument sometimes assumes that states have high and constant concerns about relative gains. In practice, however, relative-gains concerns vary and are often almost nonexistent.⁸¹

Perm Solvency

An intermediate approach is key- people's rights be limited, but this must be done through democratic means.

Daniel 12 [Charles, undergrad at the University of Leeds, "To what extent is democracy detrimental to the current and future aims of environmental policy and technologies? ", POLIS Journal Vol. 7 Summer 2012, <http://www.polis.leeds.ac.uk/assets/files/students/student-journal/ug-summer-12/charles-daniel.pdf>]

Is it therefore possible to conclude that democracy is indeed detrimental to the current and future aims of environmental policy and technologies? The resounding answer is 'no', as the alternative options proposed in the paper do not offer viable and comprehensive methods of being able to direct policy in ways that democracy is unable. What can be acknowledged though is that as our planet becomes more over-crowded, over-developed and over-dependent on financial instruments, so too does the window of opportunity to secure a sustainable planet for future generations. Tim Flannery is right in asserting that 'our fate is in our own hands' and whilst the need to be optimistic and to put faith in the ability of our future as stewards of the Earth is important, one cannot ignore our inclination as a species to behave in a selfish manner. Not only is it a political and cultural reality, it is also a biological one (Flannery 2010). Our instinct to survive will not go away. Unfortunately, that survival has become so contingent on the systematic exploitation of our natural world. It has, I believe, reached a point where something needs to be done. Progressive politics through raising awareness encouraging good practices is vital for the survival of our planet. We cannot, however, wait for people to slowly adjust their lifestyles and hope that environmental consciousness 'just happens'. I believe some level of intervention is required, a higher one that is currently present in our domestic and global politics. We need to accept, at some point, that limitations on our economic and social freedoms may be necessary in order to ensure that 'Gaia's' future is secured. As I have suggested in Chapter 3, this has to be a two-tiered process. Firstly individuals have to accept limitations on their freedom. This has to be acknowledged by national governments that, in turn, would make the same sacrifice and relinquish certain aspects of their authoritative freedoms to supranational institutions. This process would require high levels of trust in global governance models that have, as such, been fairly ineffective in influencing the actions of powerful nations. However, we must not lose faith in these processes and retreat to policies of economic isolation and suspicion. James Lovelock is correct in affirming that our planet is old and frail. It is up to those in power to ensure that it does not wither away

Alt Fails

Authoritarianism Doesn't Solve

Authoritarianism fails – domination only results in delinquency from populations, trust between parties and consideration of social conditions is key.

Smulders 5 [Sjak, economics professor at the Tilburg School of Economics and Management, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 258-259]

Public policy toward technological development and risk can seek simply to mitigate problems by controlling the delinquency levels of populations in conditions of alienation and fatalism. Or it might seek to repair, revitalize and rebuild damaged communities, and to engage people in dialogues about their own interests and futures. In either case, technology and (fossil) energy are only about 1 percent of the resource scarcity problem. In times of stress, for evaluating the prospects for a society, the symbolic and emotional "residual" dominates everything. Trust is the willingness of a person, group, or community, to make themselves vulnerable in the expectation or hope of a benefit from association with others. Trust in governments, as in commercial enterprise, as in science and technology, depends on hopes for meaningful benefits and on confidence in the capacity and will of society's leaders and innovators to assure the sharing-symbolic as well as material-of those benefits. People do not only seek material comfort and security; they also pursue intangibles, like status, honor, and dignity. It is hardly surprising to find doubt about the benefits of new technologies, to see people using technology in a "delinquent" way to show alienation, to see technology used to challenge and disrupt the structures of authority, if they believe they are held in contempt or disdain. It is therefore rare that new technology solves the problems that old technology has created. For the most part, technology alone is not what creates the problems; the focus should be on the social conditions and purposes underlying the mobilization of technology. The resource scarcity is not only material; it is just as much imaginative, moral, and symbolic. Many anthropologists would suggest that, even if conflict in various forms is inevitable, the specificity of human culture is the emergence of conventions and symbolic systems that regulate the forms that are acceptable in a given society. If an objective in public policy is to mitigate violence within and between societies, a big part of the needed imaginative capacity would be to develop new means to interpret "technological risks" in terms of the symbolic, cultural, and emotional dimensions of people's relations to each other. There might, in this respect, be a high return on investment in investigating and remedying some of the social and economic factors – commonly called intolerance, prejudice, and injustice – that contribute to social delinquency. People become desperate, mistrustful, aggressive, and the like partly in a complex cumulative causation process within society. The emergence of "rogue states" might well be, as John Kenneth Galbraith (1968) pointed out (in his little book 171, Triumph), at least partly a dialectical outcome of other states' shortsightedness and obsession with hegemony. None of the great economists – such as Adam Smith John Stuart Mill, .M. Keynes – ever pictured people as self-interested automata; Smith referred to moral sentiments that, in his perception, revolved around a form of vanity. Mill affirmed a type of sympathy as the affective basis of civilized liberal society. Keynes referred to the animal passions. At the macro scale, identity and relations are not summed up in aggregate demand for goods. They are codified in complex societal institutions: and symbols, including religions, conventions of justice, tribal identities, informal networks of exploitation and solidarity, community belonging, and so on. These are all important terrain for economists who want to contribute to environmental and technology policy issues.

Alt fails – economic elite corrupt political solutions.

Lopez 5 [Ramon, professor of economics at University of Maryland and University of Chile, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 261-263]

Let us look at certain aspects of the mechanics of public policy generation in developing countries. First we need to introduce some greater precision in terminology. The "elites" are those who are able to influence public policy through influence peddling, corrupting government officials, political campaign contributions, and so on. Their political power is derived from their economic power. But these are only the most obvious ways by which these groups influence public policy. There are more subtle means that are likely to become more important as democracy and democratic institutions evolve. "Think tanks" and other organizations funded by organized power groups, and media controlled and funded by the same groups, are important instruments in promoting a certain ideology: namely, whatever is good for the elites is also good for economic development. Regardless of the means used, influencing public policy is costly; given the usual imperfections in capital markets, mainly wealthy individuals who can access capital markets or have enough wealth to directly finance such investment can do it. Buying public policy is an investment like any other; to be attractive, it needs a rate of return equal to or greater than that of other investments. The potential rate of return on investing in influencing public policy is presumably much greater for wealthier individuals than for poor individuals. Collectively the poor may have even greater stakes in public policy than the rich, but as Olson (1965) pointed out, collective action to influence government is greatly facilitated when the lobby groups are small and homogenous. The fact that the poor are many and the wealthy are few means that collective action on the part of the poor to influence public policy is rare, and collective action by the wealthy is the norm. Control by the elites often induces governments to undersupply public goods, including environmental protection, for the sake of providing private goods or subsidies to the elites (López 2004).⁴ Moreover, beyond direct budgetary subsidies – credit subsidies, irrigation subsidies, outright financial transfers, and others – another important subsidy mechanism is the giveaway to the wealthy of the usufruct of fishing, water use, and other resources often not amenable to private property rights. Almost unlimited polluting rights may be given away to powerful economic interests, especially in rural areas where monitoring by civil authorities is more difficult (Ascher 1999; Myers and Kent 2001).⁵ Policy Traps The greater the concentration of wealth, other things being equal, the more concentrated the dominance of the state and the more biased the policies in favor of a smaller elite. Biased policies, by increasing economic benefits to the wealthy, perpetuate the historical concentration of wealth, which, in turn, causes the policy biases to remain in place. Thus a policy trap arises. Even governments that seem ideologically committed to wealth redistribution have not been able to significantly change the old policies, much less to alter historical wealth distribution. Chile and Brazil over the last decade constitute important examples of the policy trap in resource-rich countries: democratic and seemingly "progressive" regimes have consistently failed to significantly alter the old policies, originated under dictatorship, while at the same time they have not been able to improve their wealth distribution, among the worst in the world. On Natural Resource Endowments and Policies Wealth tends to be more concentrated in natural resource-rich countries than in resource-poor countries. Resource-rich countries in Latin America and Africa, oil-rich nations, and the United States generally have much greater concentration of income than the resource-poor countries of Asia, Europe, or Japan. Rents for resources affected by ill-defined property rights (which the poor can have access to) are either greatly dissipated or are fully captured by the few who control highly capital-intensive resource extraction activities, such as oil, minerals, large forests, and agricultural plantations, where property rights often become well defined. Thus natural resource-rich countries, which also tend to be the depository of most significant natural habitats around the world, are precisely those that are prone to have the most egregious anti-environment (and generally anti-poor) policies. As a consequence of the policy trap discussed above, they are also the least likely to reform them⁶ Sustainability and the Economic Elites: The Role of Substitution A public policy agenda dictated/by the economic elites affects the likelihood of environmental sustainability and, therefore, of intergenerational equity. The (short-run) benefits of environmentally unsustainable growth disproportionately go to the economic elites, while the (medium- and long-term) burden of environment degradation is mostly shouldered by everyone else. In general the ability of an individual to pollute and to extract natural resources is directly proportional to their capital endowment; therefore, charging user costs or pollution taxes is proportionally more expensive to those with larger capital endowment. Equivalently, the benefits of allowing greater environmental degradation accrue to wealthy individuals. The cost of environmental degradation is lower for wealthy individuals because they can afford to substitute natural environmental services with human made services (through, for example, defensive expenditures) while the poor generally cannot (Antoci and Bartolini 2002).⁵ Moreover, the cost of substitution is lower when only a small segment of society attempts it than when a larger portion makes efforts to

substitute environmental services with human-made services. If a large segment of society demands more human-made services that substitute for lost natural services, the prices of such human-made services increase. So, in countries with a concentrated wealth distribution, a majority of the population remains excluded from the market for defensive goods. This means that the costs of substitution for those that can afford it tend to remain low. The net implication of all this is that the (private) "optimum" pollution and environmental degradation is likely to be higher for the elite households than for everyone else. The degree of environmental "unsustainability" therefore, is likely to be higher the more the economic elites are able to dictate public policy. To the extent that the descendants of the wealthy have a high probability of also being wealthy (especially when "death taxes" are nonexistent or easily bypassed, as in most developing countries and in at least one prominent developed one), intergenerational considerations are not likely to alter this conclusion. The rich know that their children will have the same advantages that they have, or perhaps more because of technological change, and will be able to continue substituting the loss of the services produced by the natural environment with more human-made services.

Authoritarian principles lead to environmental harm-lack of public feedback

Shahar, 12 [Dan, Ph.D. student of Philosophy at the University of Arizona, "Rejecting Eco Authoritarianism, Again", pp. 22-23]

History seems to teach us that the only reliable way to achieve true autonomy from citizens' demands is through an active and sustained commitment to suppressing would-be dissenters and to imposing policies without compromise.

For both the Soviet Union and People's Republic of China, the price of political openness was the risk of instability and political upheaval when citizens came to disapprove of their leaders' actions, and there is good reason to think that this outcome was not a coincidence. 66 It is only by preventing robust civil discourse and open dissent from emerging in the first place through consistent repression that authoritarian governments have been able to retain and exercise their power with relative impunity.67 The good news for Eco-Authoritarians' position is that when pursued consistently, political repression does seem to work quite well at achieving its purposes: suppressive, uncompromising authoritarian regimes have demonstrated an often-terrifying ability to insulate themselves from the wills of their constituents.

However, such regimes have also been notoriously incapable of formulating and implementing policies to actually make their nations better-off.

I contend that this fact should not surprise us: suppressive, uncompromising authoritarian regimes face serious challenges that more open, politically sensitive administrations do not. For one thing, an absence of free and open public discourse makes it easy for administrators to get locked into narrow, rigid ways of thinking that impede their ability to make good decisions. A fearful and uninvolved citizenry is also not likely to provide the sort of honest, informative, and critical feedback that would enable administrators to calibrate policies to the details of local circumstances, detect their own mistakes, and catch misbehaving officials who undermine the pursuit of public goals. Thus bureaucrats who are insulated from public opinion through the naked exercise of state coercion may quickly find themselves operating in a bubble, making it difficult to formulate and implement good policies regardless of their own personal virtues as administrators.

It is partly for this reason that some real-world authoritarian regimes have recently been moving in the direction of greater interaction with the public rather than less. In 2002, Larry Diamond memorably hailed an "unprecedented growth in the number of regimes that are neither clearly democratic nor conventionally authoritarian," noting that while many nations have embraced certain avenues for public participation in politics, they have not gone so far as to adopt the full raft of reforms normally associated with liberal democracy including "not only democratic elections but solid protection of civil liberties under a strong rule of law."68 Such "hybrid" regimes have become particularly prevalent in Southeast Asia, leading some commentators to suggest that these structures may represent not "halfway houses"69 between authoritarianism and liberal democracy but rather genuine political alternatives of their own. Although these movements toward public inclusion have been driven in part by popular and international demands for democratization, one should not overlook an increasing recognition by authoritarian governments that state agendas may be better. Promoted by fostering citizen involvement rather than excluding it. **For example,** as Elizabeth Economy has argued at length, the People's Republic of China has deliberately become increasingly dependent on efforts by non-governmental organizations, local constituencies, and the media to ensure the successful formulation and implementation of its environmental policies, particularly on matters of ecological conservation, urban renewal, and pollution prevention.

Authoritarian systems of government do not have environmental concerns.

Democracy solves best

Ward 08 [Howard, government professor at the University of Essex, Liberal democracy and sustainability, Environmental Politics, <http://dx.doi.org/10.1080/09644010802055626>]

Viewed from a rational choice perspective, authoritarian rulers do not have incentives to adopt, or to stick with, sustainable policies. They prioritise rapid economic development to gain legitimacy and to bolster external security, as the Soviet regime did (Porritt 1984, p. 48). Their control of a high fraction of society's resources encourages them to pay off members of their relatively small support coalition by allowing them to pillage the ecosystem, as there is less political advantage in providing public goods such as environmental quality (Bueno de Mesquita et al. 2003). They under-regulate environmental harm because, as controllers of a bigger share of national income, they would disproportionately pay the costs of tighter rules (Congleton 1992, p. 416). They tend to ignore the interests of future generations, because their control of power is often precarious (Congleton 1992, p. 417). Wars are often environmentally devastating, and democracies fight each other less (Russett and Oneal 2001). Authoritarian systems are more prone to civil wars, and civil wars may also be associated with the 'looting' of renewable and non-renewable resources (Collier and Hoeffler 2004). In contrast to these rational choice arguments, the case for liberal democracy is often based on arguments about deliberation and discourse. Concerned citizens can influence political outcomes through the ballot box, pressure groups, social movement activity, the free media and through local political structures, but these channels are to a greater or lesser extent closed in autocracies (Payne 1995). To a limited extent virtuous circles exist in liberal democracies between ecological modernisation, active involvement of citizens and international bargaining (Eckersley 2004). Democratisation gives political voice to the poor, and if this helps to alleviate poverty it may aid sustainability (UNDP 2003, p. 17).

Authoritarianism fails – bad decision-making processes

Ward 08 [Howard, government professor at the University of Essex, Liberal democracy and sustainability, Environmental Politics, <http://dx.doi.org/10.1080/09644010802055626>]

Viewed from a rational choice perspective, authoritarian rulers do not have incentives to adopt, or to stick with, sustainable policies. It is up to those in power to ensure that it does not wither away.

Eco-authoritarianism is worse for the environment – future usurpers cause backsliding

Carter 13 [Alan, Professor of Philosophy at University of Glasgow, A Radical Green Political Theory pg 5-6 Routledge publishing, https://books.google.com/books?id=1DxdAgAAQBAJ&pg=PA25&lpg=PA25&dq=ophuls+environment+authoritarianism&source=bl&ots=r7M8u_gAt8&sig=-U8c8U6ONL2oLY-yA-zTKeAMqgc&hl=en&sa=X&ei=jq1LVaWpBYq_sAWju4HgBw&ved=0CCgQ6AEwBA#v=onepage&q=%22given%20the%20justified%22&f=false]

If we are to stand up to such a serious environmental threat as many insist we currently face, and if we need to respond to it quickly, isn't some highly authoritarian, centralized state that can enforce strict environmental policies the obvious solution? At its most attractive, eco-authoritarianism presents itself as a form of benevolent dictatorship - an environmentally benevolent dictatorship, as it were. Unfortunately, as obvious a solution as eco-authoritarianism appears to be, its flaws seem equally obvious. As with any benevolent dictatorship, how can it be guaranteed that it will remain benevolent?

It is difficult to see how whatever structures empower an authoritarian, centralized leadership to exercise power effectively will, at the same time, inhibit exercises of that power which take a non-benevolent form; unless it is the people themselves who constrain such a leadership. But then, why is a leader necessary in the first place? If a leader is necessary, it must be because he or she has real power, and now can its exercise be guaranteed to remain benevolent? Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain it. How can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, seem to make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than that of those whom they usurp, as the history of many coups can be argued to attest to. In short, all of the arguments that have been rehearsed against ostensibly benevolent dictatorships appear equally pertinent to environmentally benevolent ones. If an autocrat wished to use his or her power to protect the environment, the structures which enabled that power to be exercised could, presumably, just as easily be used by his or her successors to degrade the planet further, or even at an accelerated rate, for their short-term or localized enjoyment. In fact, there is a powerful argument that can be deployed which seems to establish that any authoritarian response to the mounting environmental crises will accelerate them rather than provide a solution. But because of the theoretical assumptions underpinning that argument, it will have to wait until Chapter 6 before being presented, and until Chapter 7 before being deployed against eco-authoritarianism. Suffice it to say that we already have some reason to think that an effective long term response to the ecological threat which environmentalists claim to have identified would require an alternative political theory to that propounded by eco-authoritarians 2.2

Alt = Elitist

Strong democratic institutions are key to check elite abuse of environment.

Lopez 5 [Ramon, professor of economics at University of Maryland and University of Chile, Scarcity and Growth Revisited: Natural Resources and the Environment in the New Millennium, Resources for the Future, pp. 264-265]

The new as well as the old literature on endogenous government policies emphasizes competition among groups to influence public policy (Grossman and Helpman 1994). Although subgroups of the elites unquestionably have conflicting interests that often trigger competition among them to steer public policy in different directions, they also have certain common goals on which they are able to act with a significant degree of coherence. The real conflict is between the wealthy elites and the rest of society, not among subgroups within the elites. Well established democratic rules, the influence of that part of the intellectual class not contaminated by the ideology of the elites (writers, scientists, and social scientists, but generally few economists), and the political organization of the nonelites are the only possible mechanisms that can at least in part offset the enormous power of the economic elites (who usually count orthodox economists among their most valuable intellectual allies). Respect for democratic institutions is all-important. Only if broader civil society participates in ejecting and monitoring political authorities is it possible to counter at least the most primitive forms of lobby, especially those influencing public policy through corruption and other illicit tactics. Unfortunately, the more evolved mechanisms – those adapted to more perfected forms of democracy – used by the elites to influence public opinion are harder to counteract through civil participation. Control of the media and other important institutions is a particularly effective mechanism used by the economic elites to continue exerting their political power even under relatively perfected forms of democracy. The breaking of the policy trap needs not only perfected democratic institutions but also outside help or a great deal of luck (in the form of chance conditions that dramatically incline the pendulum in favor of policy reform). The economically powerful groups generally win, although, depending on the strength of the offsetting democratic conditions, they are occasionally forced to make concessions. The resulting policies in most developing countries, and even some industrial economies are, however, likely to be closer to those demanded by the economic elites than those that benefit the large majorities. Implications Because policies are endogenous, what is the point of bringing up these issues in this forum, especially when the ideas presented here are fairly simple, perhaps obvious? The point I hope to make is that we economists have ignored these issues for too long and, indeed, more often than not have been part of the problem. By empirically understanding the political motivation of environmental and certain economy-wide policies we (the economic profession) could incline the balance a bit more (perhaps a lot more) in favor of the vast majorities instead of continuing to tacitly support the public policy dominance of the powerful elites. We could contribute to both intra- and intergenerational equity and increase the likelihood of environmental sustainability. It seems absurd to study sustainability in a social and political vacuum. It is also absurd to attribute government policy failures to "mistakes" and ignorance instead of recognizing that most such failures are the logical outcome when governments serve the economic elites instead of all society.

Alt = Nazism

Not only is eco-authoritarianism not feasible, but even under a green dictatorship there are still implementation issues

Daily Kos, 2013 [an American political blog that publishes news and opinions, Nov. 13, Why a "green dictatorship" will not solve the global warming problem, <http://www.dailykos.com/story/2013/11/13/1255008/-Why-a-green-dictatorship-will-not-solve-the-global-warming-problem>]

As I understand them, dictatorships (and authoritarian governments in general) are mostly about process. Fundamentally, they are about two processes which can be queried as follows: 1) what does it take to become a dictator? and 2) what does it take to maintain a dictatorship? Generally dictatorships thrive on mechanisms of power: total surveillance, militarization of everyday life, persecution of dissidents, placation of the masses, ideological propaganda, and so on. We have plenty of that throughout the world even though it coexists with "democracy" quite well. Consumer products are good things for a dictatorship, because the masses can be bribed with them. Accept our tyranny, the regime says, because most of you will get a cheap toaster oven. Capitalism is also good for authoritarian governance, because that way you can have "leaders" who take responsibility for official actions, and moneyed power behind the scenes directing everything with massive infusions of cash. Voting is good for dictatorship maintenance. Voting is especially good when you have an oligarchic system, with two major parties. The dictators can switch positions now and then, and the electoral system can endlessly promote "voter choice" even when the outcomes are similar in many respects regardless of who wins. (The idea that "the Republicans are worse," although true, does not contradict this reality.) Dictatorship is not contradicted by voting; the Soviets voted. Real democracy is when the public will makes policy decisions -- it's not "American Fascism" or "inverted totalitarianism" or "no functioning democracy." Thus the word "democracy" -- "demos" = the people, "cratein" = to rule. The masses are going to need some amount of hope, and global warming is not going to give them hope, so I don't see how the coming eco-dictatorship is going to supply people with hope. I suppose they could feed everyone a bunch of false hope while pursuing a green agenda, but who is going to buy into that? And where is the truth when everyone is lying? Apparently the Chinese want to pursue green energy to a much greater extent than they do, but they still keep burning enormous quantities of coal nonetheless, having thrown their lot in with the ideological hopes of capitalist growth. And even so, ecology appears to be on the side of rebellion in China, which has experienced no shortage of despairing anti-pollution protests in the past few decades (at least if you believe the economist Minqi Li). Dictatorships typically arise on the crest of an ideological wave. The Nazis had Nazism, which was created before their takeover in 1933; Mussolini's autobiography boasts that he had parlayed the culture of the people into a position of power, and the Soviets combined Czarist brutality with a cultural communism which had already been part of Russian culture by the time 1917 rolled around. So why would green-thinking people want to trust a dictatorship to remold the world today? Groupthink thrives in dictatorships. Even if our favored dictatorship's groupthink were the "right" groupthink -- for instance, you'd want everyone to agree that something needs to be done about global warming -- you'd still run into implementation problems. We'll need creative solutions to the food problem, for instance, as the global food transportation system is partially dismantled in favor of local food production/ consumption. Climate change is the sort of problem that requires creativity, and creativity is hindered when everyone is following orders or going along with official directives.

State Bad

The state can never solve for the environment – cooperation, less local pushback, and clearer framework

Gilley 12 [Bruce, Division of Political Science, Mark O. Hatfield School of Government, Portland State University, USA, “Authoritarian environmentalism and China’s response to climate Change”, Environmental Politics Vol. 21, No. 2, March 2012, 287–307]

Would a feasible democratic process have led to better policy outputs? Li and Miao (2011) believe that, because of the tradition of state domination, China’s authoritarian approach is the only one feasible. However, this ignores the legal and institutional foundations for participatory environmentalism sketched above. While public opinion as a whole remained relatively unconcerned about climate change, a broadening of the ‘eco-elites’ beyond state actors to include environmentally informed and motivated social elites could have led to a discussion of an absolute emissions target, as advocated by several environmental policy groups (Lo et al. 2010). As to the coherence and clarity of the policy outputs, Marks (2010, p. 979) notes that the enthusiasm for rapid-fire regulations and laws led to a system of ‘vague or overly complex’ policies that left much room for interpretation. More than 40 different regulations were issued between 2005 and 2008 to enforce energy intensity cuts (Zhou et al. 2010). Aizawa and Yang (2010, pp. 136–137) describe the tendency to ‘layer one policy instrument over another’ rather than creating a coherent regulatory framework. For instance, the ‘green credit policy’ under which banks are rewarded for lending to ESER projects and penalised for lending to poor ones, competed with rival policies that encouraged banks to lend to employment-intensive sectors to stimulate growth. As to implementation and monitoring, the central state’s decision to delegate tasks to provincial and local governments made sense within China’s devolved unitary state. However, when combined with the complex layering of the regulatory framework, it exacerbated the well-known problems of local pushback against central directives (Edin 2003, Whiting 2004). Local governments view central policies ‘as a drag on GDP growth and a weight around the neck of local development plans’ according to one NDRC official in charge of the policy, citing internal meetings (Chandler and Wang 2009, p. 4, fn.3). While there are positive incentives for compliance operating through technology development, energy savings, pollution reduction, CDMs, and foreign assistance (Koehn 2008), these compete against far stronger perceptions that the policies will undermine growth and employment, something that the central government itself believes. As Qi and colleagues wrote: ‘Local governments neither feel pressure to act on climate change from the public nor do they have to deal with international pressures’ (Qi et al. 2008, pp. 393, 394). One result is that local officials regularly fabricate their energy use reports.⁴ Coal production (and consumption) statistics – two thirds of energy use – are notoriously under-reported (Tu 2007). Responding to the problems, the National Bureau of Statistics established a new Department of Energy Statistics in 2008 to provide its own survey-based evidence as part of a broader shift from administrative to measurement, reporting, and verification (MRV) enforcement. However, there is no means for third parties (like NGOs) to monitor the reported results. Even where implementation was left in the hands of central authorities, compliance has been weak. For instance, the rushed passage of the Renewable Energy Law in 2005 led to resistance among power companies to buying (more expensive) renewable energy. The law ‘has not been strictly followed’, according to NDRC officials (Xinhua News Agency 2010). In 2009, the law was amended mandating the companies to purchase all available renewables and putting enforcement power into the hands of the cabinet and national power regulator (rather than the NDRC which had conflicting interests). Further

additional administrative measures were promulgated in 2010. Thus the problems with policy outputs – their incoherence, their misalignment with local government incentives, and their being premised on a growth versus emissions assumption – have undermined policy implementation. The head of the country's scientific advisory body on climate change notes that 'China's administrative authority in charge of climate change remains weak and lacking capability' (Wang 2009, p. 11). Again, one must ask whether a more democratic policy process would have yielded more coherent policies and thus better implementation and outcomes. While rapid-fire regulations would have been slowed by a more participatory processes, whether this would have led to a more coherent policy framework cannot be reasonably surmised. As to implementation, it is possible that greater policy legitimacy, especially from the point of view of local governments and social activists, would improve compliance. Wang (2010) cites the eruption of popular protests over experimental carbon dioxide capture and storage (CCS) sites in Shanxi, Liaoning, and Xinjiang as a result of the lack of consultation and poor compensation for the land requisitions. Only 43% of Chinese citizens surveyed in 2009 supported CCS even after being told that it was part of national government policy on climate change, while 13% opposed and 44% expressed ambivalence (Duan 2010, p. 5286).

AT: Impacts

AT: Environment Impact

The environment is resilient – it has withstood ridiculous amounts of destruction

Easterbrook 95 (Gregg, Writer and editor of both The New Republic and The Atlantic Monthly, "A Moment on Earth", pg 25)

IN THE AFTERMATH OF EVENTS SUCH AS LOVE CANAL OR THE In the Aftermath Exxon Valdez oil spill, every reference to the environment is prefaced with the adjective "fragile." "Fragile environment" has become a welded phrase of the modern lexicon, like "aging hippie" or "fugitive financier." But the notion of a fragile environment is profoundly wrong. Individual animals, plants, and people are distressingly fragile. The environment that contains them is close to indestructible. The living environment of Earth has survived ice ages; bombardments of cosmic radiation more deadly than atomic fallout; solar radiation more powerful than the worst-case projection for ozone depletion; thousand-year periods of intense volcanism releasing global air pollution far worse than that made by any factory; reversals of the planet's magnetic poles; the rearrangement of continents; transformation of plains into mountain ranges and of seas into plains; fluctuations of ocean currents and the jet stream; 300-foot vacillations in sea levels; shortening and lengthening of the seasons caused by shifts in the planetary axis; collisions of asteroids and comets bearing far more force than man's nuclear arsenals; and the years without summer that followed these impacts. Yet hearts beat on, and petals unfold still. Were the environment fragile it would have expired many eons before the advent of the industrial affronts of the dreaming ape. Human assaults on the environment, though mischievous, are pinpricks compared to forces of the magnitude nature is accustomed to resisting.

Environmental impacts are blown out of proportion – They are easy to bounce back from compared to natural forces

Gordon '95 (Richard, Professor of mineral economics at Pennsylvania State University, "Ecorealism Exposed," <http://object.cato.org/sites/cato.org/files/serials/files/regulation/1995/7/v18n3-9.pdf>)

-We do not endorse Gordon's use of gendered language

Easterbrook's argument is that although environmental problems deserve attention, the environmental movement has exaggerated the threats and ignored evidence of improvement. His discontent causes him to adopt and incessantly employ the pejoratively intended (and irritating) shorthand "enviros" to describe the leading environmental organizations and their admirers. He proposes-and overuses-an equally infelicitous alternative phrase, "ecorealism," that seems to mean that most environmental initiatives can be justified by more moderate arguments. Given the mass, range, and defects of the book, any review of reasonable length must be selective. Easterbrook's critique begins with an overview of environmentalism from a global perspective. He then turns to a much longer (almost 500- page) survey of many specific environmental issues. The overview section is a shorter, more devastating criticism, but it is also more speculative than the survey of specific issues. In essence, the overview argument is that human impacts on the environment are minor, easily correctable influences on a world

affected by far more powerful forces. That is a more penetrating criticism than typically appears in works expressing skepticism about environmentalism. Easterbrook notes that ~~man~~humankind's effects on nature long predate industrialization or the white colonization of America, but still have had only minor impacts. We are then reminded of the vast, often highly destructive changes that occur naturally and the recuperative power of natural systems.

The environment is resilient and recovers quickly

McDermott 9 [Mat, Editor for Business and Energy sections; Master Degree from NYU's Center for Global Affairs in environment and energy policy, "Good News: Most Ecosystems Can Recover in One Lifetime from Human-Induced or Natural Disturbance"; <http://www.treehugger.com/natural-sciences/good-news-most-ecosystems-can-recover-in-one-lifetime-from-human-induced-or-natural-disturbance.html>)]

There's a reason the phrase "let nature take its course" exists: New research done at the Yale University School of Forestry & Environmental Science reinforces the idea that ecosystems are quiet resilient and can rebound from pollution and environmental degradation. Published in the journal PLoS ONE, the study shows that most damaged ecosystems worldwide can recover within a single lifetime, if the source of pollution is removed and restoration work done. The analysis found that on average forest ecosystems can recover in 42 years, while it takes only about 10 years for the ocean bottom to recover. If an area has seen multiple, interactive disturbances, it can take on average 56 years for recovery. In general, most ecosystems take longer to recover from human-induced disturbances than from natural events, such as hurricanes. To reach these recovery averages, the researchers looked at data from peer-reviewed studies over the past 100 years on the rate of ecosystem recovery once the source of pollution was removed. Interestingly, the researchers found that it appears that the rate at which an ecosystem recovers may be independent of its degraded condition: Aquatic systems may recover more quickly than, say, a forest, because the species and organisms that live in that ecosystem turn over more rapidly than in the forest. As to what this all means, Oswald Schmitz, professor of ecology at Yale and report co-author, says that this analysis shows that an increased effort to restore damaged ecosystems is justified, and that: Restoration could become a more important tool in the management portfolio of conservation organizations that are entrusted to protect habitats on landscapes. We recognize that humankind has and will continue to actively domesticate nature to meet its own needs. The message of our paper is that recovery is possible and can be rapid for many ecosystems, giving much hope for a transition to sustainable management of global ecosystem

Ecosystem collapse won't cause human extinction

Raudsepp-Hearne et al. 10 (Ciarra, PhD in the Department of Geography, "Untangling the Environmentalist's Paradox: Why Is Human Well-being Increasing as Ecosystem Services Degrade?"; <http://www.aibs.org/bioscience-press-releases/resources/Raudsepp-Hearne.pdf>)

Although many people expect ecosystem degradation to have a negative impact on human well-being, this measure appears to be increasing even as provision of ecosystem services declines. From George Perkins Marsh's *Man and Nature* in 1864 to today (Daily 1997), scientists have described how the deterioration of the many services provided by nature, such as food, climate regulation, and recreational areas, is endangering human well-being. However, the Millennium Ecosystem Assessment (MA), a comprehensive study of the world's resources, found that declines in the majority of ecosystem services assessed have been accompanied by steady gains in human well-being at the global scale (MA 2005). We argue that to understand this apparent paradox, we need to better understand the ways in which ecosystem services are important for human well-being, and also whether human well-being can continue to rise in the future despite projected continued declines in ecosystem services. In this article, we summarize the roots of the paradox and assess evidence relating to alternative explanations of the conflicting trends in ecosystem services and human well-being. The environmentalist's expectation could be articulated as: "Ecological degradation and simplification will be followed by a decline in the provision of ecosystem services, leading to a decline in human well-being." Supporters of this hypothesis cite evidence of unsustainable rates of resource consumption, which in the past have had severe impacts on human well-being, even causing the collapse of civilizations (e.g., Diamond 2005). Analyses of the global ecological footprint have suggested that since 1980, humanity's footprint has exceeded the amount of resources that can be sustainably produced by Earth (Wackernagel et al. 2002). Although the risk of local and regional societies collapsing as a result of ecological degradation is much reduced by globalization and trade, the environmentalist's expectation remains: Depletion of ecosystem services translates into fewer benefits for humans, and therefore lower net human well-being than would be possible under better ecological management. By focusing on ecosystem services—the benefits that humans obtain from ecosystems—the MA set out specifically to identify and assess the links between ecosystems and human well-being (MA 2005). The MA assessed ecosystem services in four categories: (1) provisioning services, such as food, water, and forest products; (2) regulating services, which modulate changes in climate and regulate floods, disease, waste, and water quality; (3) cultural services, which comprise recreational, aesthetic, and spiritual benefits; and (4) supporting services, such as soil formation, photosynthesis, and nutrient cycling (MA 2003). Approximately 60% (15 of 24) of the ecosystem services assessed by the MA were found to be in decline. Most of the declining services were regulating and supporting services, whereas the majority of expanding ecosystem services were provisioning services, such as crops, livestock, and fish aquaculture (table 1). At the same time, consumption of more than 80% of the assessed services was found to be increasing, across all categories. In other words, the use of most ecosystem services is increasing at the same time that Earth's capacity to provide these services is decreasing. The MA conceptual framework encapsulated the environmentalist's expectation, suggesting tight feedbacks between ecosystem services and human well-being. However, the assessment found that aggregate human well-being grew steadily over the past 50 years, in part because of the rapid conversion of ecosystems to meet human demand for food, fiber, and fuel (figure 1; MA 2005). The MA defined human well-being with five components: basic materials, health, security, good social relations, and freedom of choice and actions, where freedom of choice and actions is expected to emerge from the other components of well-being. Although the MA investigated each of the five components of well-being at some scales and in relation to some ecosystem services, the assessment of global trends in human well-being relied on the human

development index (HDI) because of a lack of other data. The HDI is an aggregate measure of life expectancy, literacy, educational attainment, and per capita GDP (gross domestic product) that does not capture all five components of well-being (Anand and Sen 1992).

AT: Environment Impact – Invisible Threshold

No environment invisible threshold – new technology allows us to revive extinct species

Ridley 12 (Matt, 2007 Davis Award winner for the History of Science, "Reversing extinction", <http://www.rationaloptimist.com/blog/reversing-extinction.aspx>)

The fruit of a narrow-leaved campion, buried in permafrost by a ground squirrel 32,000 years ago on the banks of the Kolyma river in Siberia, has been coaxed into growing into a new plant, which then successfully set seed itself in a Moscow laboratory. Although this plant species was not extinct, inch by inch scientists seem to be closing in on the outrageous goal of bringing a species back from the dead. I don't expect to live to see a herd of resurrected mammoths roaming the Siberian steppe, but I think my grandchildren just might. The mammoth is the best candidate for resurrection mainly because flash-frozen ones with well-preserved tissues are regularly found in the Siberian permafrost. Occasionally these have been fresh enough to tempt scientists to cook and eat them, usually with disappointing results. Just last week a Chinese paleontologist in Canada, Xing Lida, filmed himself frying and eating what he said was a small mammoth steak. Cells from such carcasses have been recovered, encouraging a rivalry between Japanese and Russian scientists to be the first to revive one of these huge, elephant-like mammals by cloning. Four years ago the mammoth genome was sequenced, so we at least now know the genetic recipe. The news of the resurrected flower does, apparently, remove one obstacle. After 32,000 years the plant's DNA had not been so damaged by natural radioactivity in the soil as to make it unviable, which is a surprise. Mammoth carcasses are often much younger - the youngest, on Wrangel Island, being about 4,700 years old, contemporary with the Pharaohs. So the DNA should be in even better shape. However, plants are much better at cloning themselves from any old cutting. Coaxing an elephant cell into becoming an embryo is not at all easy; though, as Dolly the sheep showed, not impossible. To do the same for a mammoth cell would be harder still. And then there is the problem of how to get the embryo to grow. Implanting it into the womb of an Indian elephant (its closest living relative) is the best bet, but experiments with implanting rare embryos into other species' wombs have been mostly unsuccessful. For example, a rare form of wild ox, the gaur, was going to have its embryos reared in cattle wombs, but it did not work. So do not book the Siberian mammoth safari trip just yet. Equally, don't bet against it eventually coming off. Which other species might follow? One that only recently went extinct (last seen in 1936) is the marsupial carnivore called the thylacine, or "Tasmanian tiger". A few years ago, genes from a dead thylacine were injected into a mouse and "expressed" in its tissue. The great auk, the dodo and other creatures that died out before the invention of refrigeration are going to be much harder to revive. Perhaps fortunately, Neanderthals, dead for 28,000 years, unfrozen and not very closely related to their likely surrogate parent (you and me), would be harder still, though their DNA sequence is now known. And as for the dinosaurs - 65 million years dead - forget it. Although come to think of it, re-engineering a chicken until it looks like a dinosaur cannot be ruled out, once people learn to play genetics well enough. The real significance of the Siberian flower, though, is that it makes future extinctions potentially reversible. So long as we can flash-freeze seeds and tissues from threatened species (a disused mine in a frozen mountain in Spitsbergen already holds a seedbank of rare plant varieties), then we can give posterity the chance to resurrect them. Combine this with the

news that extinction rates, at least of birds and mammals, have been falling in recent decades, and there are grounds for a glimmer of ecological optimism. The great spasm of extinction caused by humans - mainly when we spread our rats, weeds and bugs to oceanic islands - may be coming to an end. Far more significant than the reversal of extinction, however, is the revival of wild ecosystems. Ecologists are finding that wild habitats can be put back together more easily than they thought. A marine reserve off Mexico is now teeming with large fish again. Yellowstone Park's ecological revival following the introduction of the wolf is remarkable: by cutting the numbers of elk, wolves have brought back aspen trees and long grass and hence beavers, rodents and hawks. In Costa Rica, a rainforest rich in tree species is now thriving on what was, in 1993, exhausted farmland. Once a canopy of sun-loving trees was planted, hundreds of other tree species moved in naturally. One commentator says: "The accepted belief is that once destroyed, tropical rainforests could never be restored. But is that really the case or just a myth?" Environmentalists will worry that such optimism breeds complacency about habitat destruction. But it might instead breed ambition to restore habitats and revive rare species. Over the past 50 years, agricultural yields have risen and, in real terms, food prices have fallen, with the result that marginal land has been released from growing food worldwide. Forest cover has increased in most of Europe and North America; nature reserves have expanded even in the tropics. So here's an image of the future. With much of the world's meat grown, brain-free and legless, in factories, and much of its fruit and vegetables in multi-storey urban farms lit with cheap fusion power, there will again be vast steppes, savannahs, prairies and rain forests, teeming with herds of wild game. Perhaps even a few woolly mammoths among them.

AT: Resource Wars

Empirics and studies are conclusive – resource wars don't happen

Salehyn 07 [Idean, Professor of Political Science at the University of North Texas, "The New Myth About Climate Change Corrupt, tyrannical governments—not changes in the Earth's climate—will be to blame for the coming resource wars.", http://www.foreignpolicy.com/articles/2007/08/13/the_new_myth_about_climate_change]

First, aside from a few anecdotes, there is little systematic empirical evidence that resource scarcity and changing environmental conditions lead to conflict. In fact, several studies have shown that an abundance of natural resources is more likely to contribute to conflict. Moreover, even as the planet has warmed, the number of civil wars and insurgencies has decreased dramatically. Data collected by researchers at Uppsala University and the International Peace Research Institute, Oslo shows a steep decline in the number of armed conflicts around the world. Between 1989 and 2002, some 100 armed conflicts came to an end, including the wars in Mozambique, Nicaragua, and Cambodia. If global warming causes conflict, we should not be witnessing this downward trend. Furthermore, if famine and drought led to the crisis in Darfur, why have scores of environmental catastrophes failed to set off armed conflict elsewhere? For instance, the U.N. World Food Programme warns that 5 million people in Malawi have been experiencing chronic food shortages for several years. But famine-wracked Malawi has yet to experience a major civil war. Similarly, the Asian tsunami in 2004 killed hundreds of thousands of people, generated millions of environmental refugees, and led to severe shortages of shelter, food, clean water, and electricity. Yet the tsunami, one of the most extreme catastrophes in recent history, did not lead to an outbreak of resource wars. Clearly then, there is much more to armed conflict than resource scarcity and natural disasters.

Environmental degradation and resource scarcity has empirically shown little to no relation with incentivizing conflict

Goldstone 02 [Jack, professor of public policy at George Mason University, "Population and Security: How Demographic Change Can Lead to Violent Conflict.", JOURNAL OF INTERNATIONAL AFFAIRS, Fall2002, Vol. 56, p. 123]

For example, Wenche Hauge and Tanja Ellingsen, in the most comprehensive global test of the environmental-scarcity-leads-to-violence hypothesis with recent data (1980–92), found that while deforestation, land degradation and low freshwater availability were positively correlated with the incidence of civil war and armed conflict, the magnitude of their effects was tiny. By themselves, these factors raised the probability of civil war by 0.5 to under 1.5 percent. These factors did have a slightly higher impact on the probability of lesser kinds of armed conflict (causing increases in the chances of such conflict by from 4 percent to 8 percent); but their influence paled compared to the impact of such traditional risk factors as poverty, regime type and current and prior political instability. In addition, Günther Baechler's extensive study of the relationships between environmental change and violent conflict found that while environmental degradation could be a background or triggering factor in ethnic

or political conflicts, most such conflicts were local and peacefully resolved by government regulation or negotiations. Whether or not such conflicts “pass[ed] the threshold of violence definitely depends on sociopolitical factors and not on the degree of environmental degradation as such.” A third study, undertaken by an academic Task Force on State Failure sponsored by the US governmenty deliberately sought environmental causes for a wide range of violent conflict events, including authoritarian coups, revolutionary wars, ethnic wars and genocides. However, trade, no direct impact of environmental variables could be found.

Resource conflicts settled by negotiation and compromise, not war

Goldstone 02 [Jack, professor of public policy at George Mason University, “Population and Security: How Demographic Change Can Lead to Violent Conflict.”, JOURNAL OF INTERNATIONAL AFFAIRS, Fall2002, Vol. 56, p. 123]

Should we therefore dismiss the environment as a cause of conflict? No, although I believe we can be free of the fear that environmental decay will unleash wars and revolutions across the globe. Rather, what research has shown is that although environmental issues do cause international and domestic conflicts, they are of the kind that are generally settled by negotiation and compromise and do not lead to taking up arms. The reason for that is straightforward. Where the problem faced by two groups, or two nations, is over the degradation or depletion of an environmental resource, war neither solves the problem (it cannot make more of the resource) nor is it an economically efficient way to redistribute the resource (the costs of war almost invariably far outweigh the cost of gaining alternative resources or paying more for a share of the resource). For example, if two nations have a conflict over sharing river water—such as India and Bangladesh over the Ganges, Israel and Jordan over the river Jordan or Hungary and Slovakia over the Danube they may threaten violence but in fact are most likely to produce non-violent resolution through negotiation or arbitration rather than war (and indeed all of these conflicts led to treaties or international arbitration. The reason is that for one party to insist on all the water would in fact be a casus belli; and to risk a war to simply increase one’s access to water is economically foolhardy. Throughout the world, the main use of freshwater (over three-quarters) is for irrigation to produce food. A reduction in water can be compensated either by adopting more efficient means of irrigation (drip rather than ditch); by switching to less water-intensive crops (dry grains rather than rice; tree crops rather than grains); or by importing food rather than producing it. All of these steps, though costly, are far, far, less costly than armed conflict. Thus for both the country with the ability to take more water and the country dependent on downstream flows, the issue will be how to use and negotiate use of the resource most efficiently; resort to war would inevitably be more costly than any gains that could be made from increased access to the resource. No nations have ever gone to war strictly over access to water; nor are any likely to do so in the future.

AT: Resource Wars – Doesn't escalate

On the low chance a resource war breaks out, it stays as an internal conflict

Kahl 02 [Colin H., PhD and Associate Professor in Georgetown University, , INTERNATIONAL AFFAIRS, Fall 2002, p. 257]

There is less contemporary debate over the prospects for resource wars between countries. With the possible exception of potential conflicts over oil and fresh water, both neo-Malthusians and neo-classical economists view international resource wars as much less likely than internal wars. See, for example, Thomas F. Homer-Dixon, *Environment, Scarcity, and Violence* (Princeton, NJ: Princeton University Press, 1999) pp. 138-41; and Daniel H. Deudney, "Environmental Security: A Critique," in Daniel H. Deudney and Richard A. Matthew, *Contested Grounds* (Albany, N.Y.: State University of New York Press, 1999) pp. 202–210.

AT: Disease Impact

Disease doesn't cause extinction – new studies prove species resistance as a biological function

Amherst College, 8/25/10, Faculty Stories, "Disease Likely Not a Common Cause of Species Extinction, New Amherst Study Finds",
<<https://www.amherst.edu/aboutamherst/news/faculty/node/222637>>

Challenging the widespread belief that rare and endangered plants and animals are unhealthy, a new study has found they in fact harbor a lower number and diversity of disease-causing parasites than non-threatened, close relatives of the same family, according to Amherst College biology professor Michael Hood and his research team. The dark spores of anther smut on *Silene alba*. "We still have much more to study to fully understand this discovery, but this certainly contradicts the widely held notion that disease is a major accelerant of species decline," said Hood of the group's findings, which were published by the journal *Oikos* on its website. "Combined with the loss of habitat, it is probably other 'extinction vortex' factors—such as loss of genetic diversity or disruption of reproduction processes—that cause many species to die out, not disease." Using information from the collections in natural history museums around the world, the U.S. Department of Agriculture databases and their own field work, Hood, former student Amanda K. Gibson '08 and postdoctoral fellow Jorge Mena-Ali analyzed data from more than 42,000 flowering plants in the *Silene* genus for the destructive "anther smut" fungus. Anther smut, said Hood, is a model disease to study, because it is easy to see—it replaces the plant's pollen with dark fungal spores—and because it is widely distributed in natural plant communities. In addition, it is harmless to humans and agriculture and safe for Hood and his team to handle. The group's major finding was surprising: Naturally occurring anther smut disease was significantly less frequent in threatened species than in non-threatened species of *Silene*. What's more, looking across all endangered U.S. plant species, the team found fewer pathogens and parasites, making endangered species as a group less diseased overall.

Infectious diseases can't cause extinction – population density mitigates virulence through resistance

Wynne Parry, 2/2/11, Live Science Staff Writer, "Article: Theory About Mammals and Fungus Explains Bat Plague", <<http://www.livescience.com/11705-theory-mammals-fungus-explains-bat-plague.html>>

Even highly virulent infectious disease does not cause extinctions – because as population density decreases, so does transmission, and the remaining individuals are more resistant. In addition, at the end of the Cretaceous, dinosaurs weren't the only ones to be decimated. Marine animals were affected, as were many species of flowering plant, according to Douglas Robertson, of the Cooperative Institute for Research in Environmental Sciences at the University of Colorado. "It is not even vaguely plausible that all these extinctions, let alone just the various dinosaur species extinctions, were all caused by some pathogen," Robertson wrote in an e-mail.

AT: Food Scarcity Impact

Food scarcity doesn't cause conflict because the third world doesn't have the resources to go to war

Miles, 76 [Rufus E., Writer that was nominated for the National Book Award for Contemporary Thought, *Awakening from the American Dream: The Social and Political Limits to Growth*, Universe Books New York, 1967]

It is commonly believed that massive famine conditions not adequately relieved by food shipments from the developed world will bring on large-scale international wars between the "have-not" nations and the "haves"—in other words, starving people will do anything as a last resort to stay alive, including organized attack upon those who have food. This assertion, upon examination, seems to have little or no evidence or logic to support it. The poor nations have very little military capability. They are separated from the modernized and wealthy nations by thousands of miles. They have no navies worthy of name, no means of transporting armies over great distances, and generally limited air power. There is no conceivable way they could use conventional military means to obtain more food than they could obtain through diplomacy—an amount that will almost surely be insufficient. There remains only one other way starving nations might possibly apply sufficient leverage on the well-to-do nations—especially the United States since it is the richest of all and has the most food—and that is nuclear blackmail. Conceivably, an activist group within a nation suffering from severe famine might threaten to blow up a large segment of New York or Washington by detonating a smuggled atomic bomb if the United States did not agree to ship large amounts of food. Richard Falk, Robert Heilbroner, and others have discussed nuclear blackmail against the United States as more than a long-shot possibility during the remainder of the 20th century, not merely to obtain food, but to achieve a transfer of wealth. It seems difficult to imagine how such blackmail could achieve its intended purpose. Much more likely, it seems, would be nuclear explosions of "suitcase bombs" by terrorists as acts of overwhelming frustration and hostility with no necessary expectation that a compensating benefit would result for any nation. It is for this very reason, as I discussed in Chapter VIII, that such a strong alarm has been sounded concerning the prospect of proliferating nuclear reactors—especially breeder reactors—around the globe from which plutonium could readily be extracted to make such bombs.

The water war hypothesis is outdated and historically inaccurate - nations turn to cooperation more than conflict

Deen 7 [Thalif, Inter Press Service News Agency [<http://ipsnews.net/news.asp?idnews=34465>], Title: "Water Wars" a Myth, Say Experts]

"Despite the potential problem, history has demonstrated that cooperation, rather than conflict, is likely in shared basins," UNESCO concludes. The Stockholm International Water Institute (SIWI) says that 10- to 20-year-old arguments about conflict over water are still being recycled. "Such arguments ignore massive amounts of recent research which shows that water-scarce states that share a water body tend to find cooperative solutions rather than enter into violent conflict," the institute says. SIWI says that during the entire "intifada" -- the ongoing Palestinian uprising against Israel in the occupied territories of West Bank and Gaza -- the only thing on which the two warring parties continued to cooperate at a basic level was their shared waters. "Thus, rather than reaching for arguments for the 'water war hypotheses,' the facts seem to support the idea that water is a uniting force and a potential source of peace rather than violent conflict." SIWI said. Ghosh, co-author of the UNDP study, pointed out several agreements which were "models of cooperation", including the Indus Waters Treaty, the Israel-Jordan accord, the Senegal River Development Organisation and the

Mekong River Commission. A study sponsored by the Washington-based Woodrow Wilson International Centre for Scholars points that **despite newspaper headlines screaming "water wars are coming!", these apocalyptic warnings fly in the face of history. "No nations have gone to war specifically over water resources for thousands of years. International water disputes -- even among fierce enemies -- are resolved peacefully, even as conflicts erupt over other issues."** it says. The study also points out instances of cooperation between riparian nations -- countries or provinces bordering the same river -- that outnumbered conflicts by more than two to one between 1945 and 1999. Why? "**Because water is so important, nations cannot afford to fight over it. Instead, water fuels greater interdependence. By coming together to jointly manage their shared water resources, countries can build trust and prevent conflict,**" argues the study, jointly co-authored by Aaron Wolf, Annika Kramer, Alexander Carius and Geoffrey Dabelko.

No water wars – Malthus is wrong

Allouche 11 [Jeremy, Institute of Development Studies, UK, January 2011, "The sustainability and resilience of global water and food systems: Political analysis of the interplay between security, resource scarcity, political systems and global tradestar, open," Food Policy, Volume 36, Supplement 1, January 2011, Pages S3-S8, <http://www.sciencedirect.com/science/article/pii/S0306919210001272>]

The question of resource scarcity has led to many debates on whether scarcity (whether of food or water) will lead to conflict and war. The underlining reasoning behind most of these discourses over food and water wars comes from the Malthusian belief that there is an imbalance between the economic availability of natural resources and population growth since while food production grows linearly, population increases exponentially. Following this reasoning, neo-Malthusians claim that finite natural resources place a strict limit on the growth of human population and aggregate consumption; if these limits are exceeded, social breakdown, conflict and wars result. Nonetheless, it seems that most empirical studies do not support any of these neo-Malthusian arguments. Technological change and greater inputs of capital have dramatically increased labour productivity in agriculture. More generally, the neo-Malthusian view has suffered because during the last two centuries humankind has breached many resource barriers that seemed unchallengeable.

Util Bad

Util limits our ability to have a clear sense of values and goals

Freyfogle, 93 [Eric T., Professor and Swanlund Chair at the University of Illinois at Urbana-Champaign, Justice and the Earth: Images for our Planetary Survival, The Free Press, 84]

According to utilitarian thinking, our environmental problem has come about because we have made mistakes in calculating the best way for us to live. We have eroded our soil, exterminated species, and polluted our streams, all because we have miscalculated the net consequences-by overstating the good, understating the bad, or both. At a superficial level utilitarian thinking has a great deal of appeal. It tells us that we need to look closely into the consequences of our conduct and make sure that the net effects are as good as they can be. We've undoubtedly calculated poorly in the past, and a closer look could well lead to better, more sensitive decisions. To understand the value of utilitarianism, however, we need to keep aware of its rather considerable limits. One of the problems with utilitarian thinking is that it can quickly get us bogged down in very complicated calculations. In order to determine the rightness or wrongness of an action, we need first to identify its consequences. 'This undertaking, however, often requires a great deal of knowledge, far more in many instances than we have or are likely ever to possess. We uncovered this problem when looking at the externalities image that economists offer. We can throw an object into the swirling physical world of motion and energy and very soon lose all track of its indirect effects. We fill a wetland and put in a factory: who can enumerate all the consequences? When we plow the prairie and put in wheat, who knows all that will happen? Indeed, can I even know fully what the effects will be if I plant a birch in my front yard instead of a hickory? At its best, utilitarian theory would function like a large, magic computer, one with sufficient calculating power to make even the most complex calculations quickly, one with an underlying data base that includes not just the entire realm of human knowledge but vast amounts that remain unknown to us as well. We do not, of course, have a computer like this, nor are we likely to develop one. And even if we did, one risk of utilitarianism would remain: this is, given its appetite for facts and figures, it could (and does) encourage us to cast off our intuitive sense of right and wrong and rely solely on long chains of facts and logic in deciding what to do. We spot a factory belching fumes skyward and must pause before we criticize. Without the magic calculator, who knows what is right or wrong? We sense trouble, but maybe our calculations are simply incomplete. We need more information and must sit still until we get it. Part of the job of this magic computer would be to help figure out when a consequence is good and when it is not. Utilitarians do this now by figuring out whether a consequence does or does not add to aggregate human good (whether defined in terms of happiness, the satisfaction of human preferences, or in other ways). But this calculation proves challenging, even if we accept the standard of measure. When Robert Ciampitti fills his wetland, his happiness and the happiness of those who move into his new houses will go up. But there is human unhappiness as well that comes about because of the wetland loss and the ecological damage that it brings. Because it is spread widely and thinly in time and space, this unhappiness will be hard to trace and aggregate. So we are left with the question-is the transformation from wetland to houses a good consequence or a bad one? Another important uncertainty in our calculations lies in the discount rate-the rate at which we discount future harms before we compare them with present-day gains. If we fill the wetland today, the benefits will come soon; many of the costs will be much delayed. As we noted in discussing economic images, one of the most grave problems in protecting the environment is that commonly used discount rates are all sufficiently high that the future-even as little as twenty or thirty years out-s-counts for almost nothing. In using the utilitarian's magic calculator we will want, in all likelihood, to program in a discount rate; the calculator itself cannot help us pick one. We must decide for ourselves how much we want to value future healthful planetary life and somehow incorporate that valuation into our calculations. Perhaps the most important limit of utilitarianism is that, like the economists' free market, this line of thinking is morally neutral in environmental terms. Utilitarianism seeks to give people the most of what they want. If people want to live in a healthy natural environment, it can help them achieve that. If people are made happy by soiling and consuming the Earth, the magic calculator can help at that as well. Although these limitations on utilitarianism are all important, the cost-benefit thinking inherent in utilitarian-ism will certainly be a part of any good ethical approach to planetary health. Before using it, however, we need a clear sense of values and goals, a clear vision or image of what we want to achieve in terms of lasting land health. Once we gain a vision of sustainable life, we can use the calculator, programmed as well as we can, to help work out the details, to add up as best we can the positive and negative impacts of alternative acts and help choose the best one. Even the most healthful images of life on earth will supply only an outline of the good life; well aimed by a sense of planetary health, utilitarian thinking can help flesh out the needed details.

Utilitarianism is inherently flawed – logic of Nazism

Peikoff, 82 [Leonard, former professor of Philosophy at New York University, *The Ominous Parallels*, pp. 119]

“The greatest good for the greatest number” is one of the most vicious slogans ever foisted on humanity. **This slogan has no concrete, specific meaning. There is no way to interpret it benevolently,** but a great many ways in which it can be used to justify the most vicious actions. What is the definition of “the good” in this slogan? None, except: whatever is good for the greatest number. **Who, in any particular issue, decides what is good for the greatest number? Why, the greatest number. If you consider this moral, you would have to approve of the following examples, which are exact applications of this slogan in practice: fifty-one percent of humanity enslaving the other forty-nine; nine hungry cannibals eating the tenth one; a lynching mob murdering a man whom they consider dangerous to the community. There were seventy million Germans in Germany and six hundred thousand Jews. The greatest number (the Germans) supported the Nazi government which told them that their greatest good would be served by exterminating the smaller number (the Jews) and grabbing their property. This was the horror achieved in practice by a vicious slogan accepted in theory. But, you might say, the majority in all these examples did not achieve any real good for itself either? No. It didn’t. Because “the good” is not determined by counting numbers and is not achieved by the sacrifice of anyone to anyone.**

Utilitarianism is manipulated to justify any atrocity – it condones mass slaughter and results in nuclear conflict

Holt 95 [Jim, Commentator and writer who reports about philosophy and politics, New York Times, “Morality, Reduced To Arithmetic,”]

Can the deliberate massacre of innocent people ever be condoned? The atomic bombs dropped on Hiroshima and Nagasaki on Aug. 6 and 9, 1945, resulted in the deaths of 120,000 to 250,000 Japanese by incineration and radiation poisoning. Although a small fraction of the victims were soldiers, the great majority were noncombatants – women, children, the aged. Among the justifications that have been put forward for President Harry Truman’s decision to use the bomb, only one is worth taking seriously -- that it saved lives. The alternative, the reasoning goes, was to launch an invasion. Truman claimed in his memoirs that this would have cost another half a million American lives. Winston Churchill put the figure at a million. Revisionist historians have cast doubt on such numbers. Wartime documents suggest that military planners expected around 50,000 American combat deaths in an invasion. Still, when Japanese casualties, military and civilian, are taken into account, the overall invasion death toll on both sides would surely have ended up surpassing that from Hiroshima and Nagasaki. Scholars will continue to argue over whether there were other, less catastrophic ways to force Tokyo to surrender. But given the fierce obstinacy of the Japanese militarists, Truman and his advisers had some grounds for believing that nothing short of a full-scale invasion or the annihilation of a big city with an apocalyptic new weapon would have succeeded. Suppose they were right. Would this prospect have justified the intentional mass killing of the people of Hiroshima and Nagasaki? In the debate over the question, participants on both sides have been playing the numbers game. Estimate the hypothetical number of lives saved by the bombings, then add up the actual lives lost. If the first number exceeds the second, then Truman did the right thing; if the reverse, it was wrong to have dropped the bombs. That is one

approach to the matter -- the utilitarian approach. According to utilitarianism, a form of moral reasoning that arose in the 19th century, the goodness or evil of an action is determined solely by its consequences. If somehow you can save 10 lives by boiling a baby, go ahead and boil that baby. There is, however, an older ethical tradition, one rooted in Judeo-Christian theology, that takes a quite different view. The gist of it is expressed by St. Paul's condemnation of those who say, "Let us do evil, that good may come." Some actions, this tradition holds, can never be justified by their consequences; they are absolutely forbidden. It is always wrong to boil a baby even if lives are saved thereby. Applying this absolutist morality to war can be tricky. When enemy soldiers are trying to enslave or kill us, the principle of self-defense permits us to kill them (though not to slaughter them once they are taken prisoner). But what of those who back them? During World War II, propagandists made much of the "indivisibility" of modern warfare: the idea was that since the enemy nation's entire economic and social strength was deployed behind its military forces, the whole population was a legitimate target for obliteration. "There are no civilians in Japan," declared an intelligence officer of the Fifth Air Force shortly before the Hiroshima bombing, a time when the Japanese were popularly depicted as vermin worthy of extermination. The boundary between combatant and noncombatant can be fuzzy, but the distinction is not meaningless, as the case of small children makes clear. Yet is wartime killing of those who are not trying to harm us always tantamount to murder? When naval dockyards, munitions factories and supply lines are bombed, civilian carnage is inevitable. The absolutist moral tradition acknowledges this by a principle known as double effect: although it is always wrong to kill innocents deliberately, it is sometimes permissible to attack a military target knowing some noncombatants will die as a side effect. The doctrine of double effect might even justify bombing a hospital where Hitler is lying ill. It does not, however, apply to Hiroshima and Nagasaki. Transformed into hostages by the technology of aerial bombardment, the people of those cities were intentionally executed en masse to send a message of terror to the rulers of Japan. The practice of ordering the massacre of civilians to bring the enemy to heel scarcely began with Truman. Nor did the bomb result in casualties of a new order of magnitude. The earlier bombing of Tokyo by incendiary weapons killed some 100,000 people. What Hiroshima and Nagasaki did mark, by the unprecedented need for rationalization they presented, was the triumph of utilitarian thinking in the conduct of war. The conventional code of noncombatant immunity -- a product of several centuries of ethical progress among nations, which had been formalized by an international commission in the 1920's in the Hague -- was swept away. A simpler axiom took its place: since war is hell, any means necessary may be used to end, in Churchill's words, "the vast indefinite butchery." It is a moral calculus that, for all its logical consistency, offends our deep-seated intuitions about the sanctity of life -- our conviction that a person is always to be treated as an end, never as a means. Left up to the warmakers, moreover, utilitarian calculations are susceptible to bad-faith reasoning: tinker with the numbers enough and virtually any atrocity can be excused in the national interest. In January, the world commemorated the 50th anniversary of the liberation of Auschwitz, where mass slaughter was committed as an end in itself -- the ultimate evil. The moral nature of Hiroshima is ambiguous by contrast. Yet in the postwar era, when governments do not hesitate to treat the massacre of civilians as just another strategic option, the bomb's sinister legacy is plain: it has inured us to the idea of reducing innocents to instruments and morality to arithmetic.

Utilitarianism bad-Gives an individual too much power

Neider, 12 [Mark, Assistant Professor in the Department of Psychology at the University of Central Florida, "Why Utilitarianism Does Not Work" <http://liberty-rationality.blogspot.com/2012/01/why-utilitarianism-does-not-work.html>]

It only takes one firm counter-example to disprove any theory, or at least send it back for retooling. In this post **I will attempt to give a number of examples that beyond a doubt show that utilitarianism can lead to very undesirable results and therefore should be rejected as a complete decision making model.** My first scenario requires a simple assumption that people assign wildly different values to many different things. As such, **following a utilitarian decision model may result in many decisions being made by the people who care the most.** In fact, **utilitarianism rewards the emotionally unstable. A person to whom everything is a life or death decision is weighted far more heavily than a person who takes everything in stride and makes the best of it. This is a perverse incentive system,** and to me enough to disprove utilitarianism. **Taking utilitarian thought to the extreme, one can imagine a situation where a minority becomes a slave to the majority. In fact, if a small number of people were able to be happy in spite of being enslaved, the utilitarian would almost be compelled to enslave them.** While I would say that happiness in spite of misfortune is a virtue, utilitarianism punishes it. Utilitarianism is also a huge threat to Constitutional rights. While almost all of us believe in freedom of speech, we do not realize the threat that majority rule poses to this and all basic rights. Many will object to the speech of others, but in order to have true freedom of speech, all forms must be protected. If a majority were asked to vote against allowing racist speech, I would guess they would. In this way freedom of speech and in a similar fashion a great many other freedoms are eroded. **If we believe in majority rule, then the majority has all of the power and could use it at the expense of the few. We better watch out, because majority rule can be a slippery slope of oppressing the minority.**

Utilitarianism bad- takes value away from human life

Moreland, 9 [J.P, Ph.D. in Philosophy, "Ethics Theories: Utilitarianism Vs. Deontological Ethics", <http://www.equip.org/article/ethics-theories-utilitarianism-vs-deontological-ethics/>]

There are two major ethics theories that attempt to specify and justify moral rules and principles: utilitarianism and deontological ethics. Utilitarianism (also called consequentialism) is a moral theory developed and refined in the modern world in the writings of Jeremy Bentham (1748-1832) and John Stuart Mill (1806-1873). There are several varieties of utilitarianism. But basically, a utilitarian approach to morality implies that no moral act (e.g., an act of stealing) or rule (e.g., "Keep your promises") is intrinsically right or wrong. Rather, the rightness or wrongness of an act or rule is solely a matter of the overall nonmoral good (e.g., pleasure, happiness, health, knowledge, or satisfaction of individual desire) produced in the consequences of doing that act or following that rule. In sum, **according to utilitarianism, morality is a matter of the nonmoral good produced that results from moral actions and rules, and moral duty is instrumental, not intrinsic. Morality is a means to some other end; it is in no way an end in itself. Space does not allow for a detailed critique of utilitarianism here. Suffice it to say that the majority of moral philosophers and theologians have found it defective. One main problem is that utilitarianism, if adopted, justifies as morally appropriate things that are clearly immoral. For example, utilitarianism can be used to justify punishing an innocent man or enslaving a small group of people if such acts produce a maximization of consequences.** But these acts are clearly immoral regardless of how fruitful they might be for the greatest number. For this and other reasons, many thinkers have advocated a second type of moral theory, deontological ethics. Deontological ethics is in keeping with Scripture, natural moral law, and intuitions from common sense. The word "deontological" comes from the Greek word deon which means "binding duty." Deontological ethics has at least three important features. First, duty should be done for duty's sake. **The rightness or wrongness of an act or rule is, at least in part, a matter of the intrinsic moral features of that kind of act or rule. For example, acts of lying, promise breaking, or murder are intrinsically wrong and we have a duty not to do these things. This does not mean that consequences of acts are not relevant for assessing those acts.** For example, a doctor may have a duty to benefit a patient, and he or she may need to know what medical consequences would result from various treatments in order to determine what would and would not benefit the patient. But consequences are not what make the act right, as is the case with utilitarianism. Rather, at best, consequences help us determine which action is more in keeping with what is already our duty. Consequences help us find what is our duty, they are not what make something our duty. Second, **humans should be treated as objects of intrinsic moral value; that is, as ends in themselves and never as a mere means to some other end (say, overall happiness or**

welfare). As we will see in Part Two, this notion is very difficult to justify if one abandons the theological doctrine of man being made in the image of God. **Nevertheless, justified or unjustified, deontological ethics imply that humans are ends in themselves with intrinsic value.** Third, **a moral principle is a categorical imperative that is universalizable; that is, it must be applicable for everyone who is in the same moral situation.** Moral statements do not say, "If you want to maximize pleasure vs. pain in this instance, then do such and such." Rather, moral statements are imperatives or commands that hold for all examples of the type of act in consideration, such as truth telling. Moral statements say, "keep your promises," "do not murder," and so forth.

Utilitarianism Bad-too demanding for regular people

Berthald, 14 [Daniel, Professor of Philosophy at Bard college, "Why I Am Not a Utilitarian"
<http://blog.practicaethics.ox.ac.uk/2014/11/why-i-am-not-a-utilitarian/>]

Utilitarianism is a widely despised, denigrated and misunderstood **moral theory**. Kant himself described it as a morality fit only for English shopkeepers. (Kant had much loftier aspirations of entering his own "noumenal" world.) The adjective "utilitarian" now has negative connotations like "Machiavellian". **It is associated with "the end justifies the means" or using people as a mere means or failing to respect human dignity, etc.** For example, consider the following negative uses of "utilitarian." "Don't be so utilitarian." "That is a really utilitarian way to think about it." **To say someone is behaving in a utilitarian manner is to say something derogatory about their behaviour. When Jeremy Bentham introduced utilitarianism in the 1700s, it was a radical, revisionary and welcome new moral theory. Its core was human equality: each is to count for one and none for more than one. Until that point, princes counted for more than paupers.** But utilitarians such as Bentham argued that every person's well-being and life counted equally. The right act is the act which maximises well-being, impartially considered. The basic idea of utilitarianism is straightforward – the common currency of ethics is human well-being. What matters to each of us is how our lives go. **Morality is about treating everyone equally, that is, considering their well-being equally. Utilitarianism had its heyday until about 50 years ago when it started to be pushed aside for neoKantian, feminist and virtue theories.** There has been a resurgence of interest in the last decade following the pioneering work of Joshua Greene which was used to suggest that utilitarians made moral decisions in a more rational deliberative manner. To test whether people are utilitarians or not, Greene used an old dilemma first described by Philippa Foot called the "trolley dilemma". This has become a cottage industry of its own (see Dave Edmond's recent book "Would You Kill the Fat Man"). One of Greene's (and other recent researchers') prime tests of whether you are a utilitarian is whether you think it is right to push a fat man in front of a trolley to stop it and save 5 workers' lives who are further down the track. In a paper just out yesterday, Guy Kahane, Jim Everett, Brian Earp, Miguel Farias and I present data that suggest that this decision alone needn't really reflect a utilitarian psychology, but rather can reflect psychopathic and egoist tendencies. **People have reported such an association with psychopathy before. We are thus adding to an existing literature, and although the correlation is fairly strong and significant, of course not everyone saying you should push the fat man will be higher on psychopathy – that is just one factor.** Conversely, and more importantly, we found that people who tended to think that the fat man should be pushed to his death to save five did not, in more familiar contexts, show any great altruist concern for the greater good of all, or more willing to make sacrifices to prevent great harm to distant others. Here is a quote from the discussion from an earlier draft: **"A great deal of recent research has focused on hypothetical moral dilemmas in which one person needs to be sacrificed in order to save the lives of a greater number. It is widely assumed that these far-fetched sacrificial scenarios can shed new light on the fundamental opposition between utilitarian and non-utilitarian approaches to ethics** (Greene et al. 2004; Greene, 2008; Singer, 2005). **However, such sacrificial dilemmas are merely one context in which utilitarian considerations happen to conflict with opposing moral views** (Kahane & Shackel, 2011). To the extent that 'utilitarian' judgments in sacrificial dilemmas express concern for the greater good—that is, the utilitarian aim of impartially maximizing aggregate welfare—then we would expect such judgments to be associated with judgments and attitudes that clearly express such concern in other moral contexts. **The set of studies presented here directly tested this prediction by investigating the relationship between so-called 'utilitarian' judgments in classical sacrificial dilemmas and a genuine, impartial concern for the greater good. Across four experiments**

employing a wide range of measures and investigations of attitudes, behavior and moral judgments, we repeatedly found that this prediction was not borne out: a tendency to endorse the violent sacrifice of one person in order to save a greater number was not (or even negatively) associated with paradigmatic markers of utilitarian concern for the greater good. These included identification with humanity as a whole; donation to charities that help people in need in other countries; judgments about our moral obligations to help children in need in developing countries, and to prevent animal suffering and harm to future generations; and an impartial approach to morality that does not privilege the interests of oneself, one's family, or one's country over the greater good. **This lack of association remained even when the utilitarian justification for such views was made explicit and unequivocal.** By contrast, **many** (though not all) **of these markers of concern for the greater good were inter-correlated.** In fact, responses designated as 'utilitarian' in the current literature were strongly associated with traits, attitudes and moral judgments (primary psychopathy, rational egoism, and a lenient attitude toward clear moral transgressions) that are diametrically opposed to the impartial concern for the greater good that is at the heart of utilitarian ethics" As we argue, **Utilitarianism is a comprehensive moral doctrine with wide ranging impact. In fact it is very demanding. Few people if any have ever been anything like a perfect utilitarian. It would require donating one of your kidneys to a perfect stranger. It would require sacrificing your life, family and sleep to the level that enabled you to maximise the well-being of others.** Because you could improve the lives of so many, so much, utilitarianism requires enormous sacrifices. People have donated large parts of their wealth and even a kidney, but this still does not approach the sacrifice required by Utilitarianism. **For these reasons, one criticism of utilitarianism is that it is too demanding.** Bernard Williams, a famous critic of Utilitarianism, once infuriated Dick Hare, a modern father of Utilitarianism, in a TV interview by asking him, **"If a plane had crashed and you could only rescue your own child or two other people's children, which would you rescue?" Utilitarians should rescue the two strangers rather than their own child. People think I am a utilitarian but I am not. I, like nearly everyone else, find Utilitarianism to be too demanding.** I try to live my life according to "easy rescue consequentialism" – you should perform those acts which are at small cost to you and which benefit others greatly. Peter Singer, the greatest modern utilitarian, in fact appeals to this principle to capture people's emotions – his most famous example is that of a small child drowning in a pond. **You could save the child's life by just getting your shoes wet. He argues morality requires that you rescue the child. But this is merely an easy rescue. Utilitarianism requires that you sacrifice your life to provide organs to save 7 or 8 lives.** Easy rescue consequentialism is, by contrast, a relaxed but useful moral doctrine. I was discussing the Trolley type dilemmas with my wife. She said that the right thing to do was to throw yourself in front of the trolley to save the 5 people. That is clearly what utilitarians would do, but not psychopaths or egoists. What about ordinary people? They had a range of utilitarian tendencies that often came apart. **For example, our study did use one dilemma that involved self-sacrifice** (it's reported in the supp. materials.). **The majority of ordinary people they should sacrifice themselves** (whether or not they actually would) but think it's wrong to push the fat man. When my wife suggested the right answer to the Trolley dilemma was to sacrifice yourself, I objected that this was too demanding. You should experience great but temporary pain to save the five, perhaps lose a finger but not your whole life to save the five. That would be a difficult, not easy rescue. Her reply, which has shaken my moral world, was, "But surely the right thing to do is to sacrifice your life for the five others." **After all, if morality is meant to be impartial, perhaps the right thing to do is to be utilitarians. It is just that we are too selfish and self-absorbed. Indeed, if morality is impartial, both I and the folk have intuitions which are difficult to justify.** I have argued that it is right to sacrifice the one to save the five, but easy rescue consequentialism suggests I should not sacrifice my life to save the five. If morality is impartial, it should follow that it is also wrong to sacrifice the one to save the five. Likewise, the folk believe it is right to sacrifice their own life, but wrong to sacrifice the fat man. Again, these should be symmetrical if morality is impartial. Either it is right to sacrifice both yourself and the fat man, or it is wrong. Morality has no eye to who is involved in a moral dilemma. Perhaps another great utilitarian philosopher, Henry Sidgwick, has a solution to this apparent dilemma. Sidgwick argued that there are two reasons for action that can conflict: Prudence and Morality. Prudence is about what is good for you (self-interest) and Morality is about what is good for everyone, impartially considered. Sidgwick argued that there was no clear way balance these against each other. In my case, I appear to be giving greater weight to Prudence than to Morality. The folk, on the other hand, appear to give greater weight to Morality, though they may have a non-consequentialist view of morality. At any rate I won't be sacrificing my own life for the 5 on the track. But maybe I am just not as moral as I could be. As Peter Singer once said, it is not as if morality should be easy. Perhaps we very often fail to do what morality requires. **Maybe the reason I am not a utilitarian is that I am just not good enough.**

Util Bad – AT: Future Generations

It's unreasonable to bring future generations into Utilitarian calculus

Freyfogle, 93 [Eric T., Professor and Swanlund Chair at the University of Illinois at Urbana-Champaign, Justice and the Earth: Images for our Planetary Survival, The Free Press, 85-86]

If the animal rights rhetoric tends at first to put us off, the rhetoric that we hear about duties to future generations is likely to have an opposite effect. Talk of future generations strikes responsive chords, for many people hold a strong sense that we should leave the Earth in good condition for those who come later. The image of future generations, depending on us to do what is right, is a powerful and moving one, perhaps the most forceful in the arsenal. Future generations can attract our moral interest whatever method we use in the ethics-building task. If we think in utilitarian terms, we can expand our calculations to consider the utility of those who will come after us. If we think in intrinsic-worth terms, we can include future humans in the favored circle, or at least create for them a separate category among the morally worthy. If our ethics scheme is rooted more heavily in intuitions and sentiments, we can easily sense the rightness of offering to our descendants a clean and healthy place to call home. Serious philosophers, however, have encountered grave troubles incorporating future generations into their complex calculations. We cannot talk to those not born and therefore cannot hear their preferences. There is no one to speak for them and hence to enforce their entitlements. Another problem is that as we look further ahead to generation after generation, we quickly reach the point where the unborn vastly outnumber the living, and the total preferences of the living slip into insignificance. In a numbers game like the one utilitarians play, this is a special cause for alarm. For the living to count in a rights-based scheme, we must weigh the interests of future generations less heavily, perhaps on some scale that discounts their interests more severely the further we progress into the future. But if future generations are less important than the living, who is to say how much less? A third problem—probably the most worrisome for most philosophers—is that what we do on Earth today will inevitably affect the identities and preferences of those who come later. What we leave behind will in some degree condition who they are, what they expect and what they want. If we leave behind beautiful wilderness areas, they will likely value them; if we destroy the wilderness (so the argument goes), future generations might value it very little. If future generations all grow up in crowded urban areas full of noise and congestion, they may or may not attach value to open spaces, quiet, and privacy; because we don't know whether they will, we should not worry about the matter today. The last problem is one that will likely strike non-philosophers as exaggerated, one that stems from a slavish search for accuracy in a calculation that is inevitably based on guesswork. Future generations will be happier, surely, if we leave them more species and wild habitats rather than fewer, to say nothing of clean air and water. Wilderness areas will always inspire and move those who visit them, and quiet, serenity, and privacy will never become mere fads. We cannot prove these assumptions, of course, but they seem as true and right as any other element in our logical construct. We may not be able to look after special or unusual needs that future humans might have, but we can take into account the needs that have been common to all humans up to this point.

Human Rights Outweighs

Human Rights are of the utmost importance and must take priority

Woods 10 [Kerri (lecturer in political theory at the University of Leeds), Human Rights and Environmental Sustainability, pp 129-132, December 20th 2010]

Ophuls, writing in 1974, predicted 'the inevitable coming of scarcity to societies predicated on abundance', and with this, 'almost equally inevitable, will be the end of political democracy and a drastic reduction in personal liberty' (Ophuls 1974, p. 47). Ophuls has been understood as claiming that we can either have democracy and individual freedom, or we can have sustainability, but we cannot have both. Pursuing both would lead to the destruction of the environment to the degree where scarcity caused societal breakdown and a return to authoritarianism as a matter of necessity. Taking a similarly apocalyptic tone, Hardin laments 'the tragedy of freedom in a commons' (Hardin 2005, p. 28). The freedom he has in mind is mostly economic, and, in particular, procreative freedom. In this regard, he specifically attacks the UDHR right to found a family, which is proclaimed in Article 16.1. Writing much later, Beckerman argues that, rather than trying to predict future environmental demands and protect resources accordingly, 'our most important obligation to future generations is to bequeath to them a "decent society" in which there is respect for basic human rights' (Beckerman 2000, p. 22). The detail of the argument put forward by Ophuls and Hardin is not quite the apology for environmental authoritarianism that has sometimes been presented. Neither embraces authoritarian government as a good way to live. Rather, they both hold that an absence of individual moral responsibility makes authoritarianism necessary. Indeed, Hardin states that 'The only kind of coercion I recommend is mutual coercion, mutually agreed upon by the majority of the people affected' (Hardin 2005, p. 34). It is Hardin's and Ophuls's pessimism about the likelihood of self-motivated social change and the advent of a morally driven environmental citizenry that leads them to conclude that authoritarianism's, if not desirable, certainly inevitable. The arguments regarding democracy and citizenship discussed in the previous chapter suggest a greater degree of optimism among more contemporary green theorists. Nevertheless, it is worth considering the argument that either environmental sustainability or human rights should be prioritized, looking firstly at the idea that the former should be prioritized over the latter. What this might mean in practice is that democratic rights to elect representatives who would have a say in deciding environmental policies might be waived, or the right to protest against unwanted policies might be denied both in terms of freedom of speech and of association, or perhaps it would become acceptable for governments to detain without charge or trial individuals thought likely to impede environmental sustainability in some way. Would this deliver environmental sustainability? Perhaps, if governments were led by environmental philosopher-kings, but I suspect that few environmental activists would feel confident in surrendering the means of holding governments to account on environmental policy. Just as human rights can rest on a consensus underpinned by power (see Chapter 3), so too can a particular model of sustainability reflect power relations, and serve to entrench disparities in power. Martinez Alier's (2002) work on 'the environmentalism of the poor' suggests that defending the civil and political rights of marginalized groups is key to protecting the environment. His work shows that an important part of the conflict over how sustainability should be conceptualized is a conflict over terms of value. The relevant question is, therefore, 'who has the power to impose particular languages of valuation?' (Martinez-Alier 2002, p. viii). For example, we can see an exclusionary tendency at work in the powerful consensus around the idea of environmental sustainability as environmental preservation that prevailed in the 1980s and 1990s. This resulted in the creation of wildlife parks which secured the habitats of endangered species, but also justified the exclusion and displacement of indigenous populations from their lands, on the grounds that these people did not conform to an externally determined notion of environmentally appropriate behavior (O'Neill 2007). In such circumstances, claims to use of the land that do not rest on preserving it as a wilderness space have been excluded because wilderness preservation has been determined to be the appropriate way of valuing the land in question. John O'Neill (2007) compares this prioritization of one set of values over another with the logic of colonialism, also justified with reference to externally determined standards. The emphasis on inclusiveness in the green literature on deliberative democracy and citizenship runs counter to this exclusive tendency. But what this example suggests is that human rights can provide important safeguards against a particular conception of environmental sustainability being imposed to the disadvantage of some groups. For ecocentrists, of course, human rights represent a competing and antithetical language of valuation to environmentalist discourses. But the critical approach to human rights pursued here suggests that this need not be the case. Models of inclusive citizenship, whereby individuals are said to have rights that follow the contours of risk, or of ecological footprints, suggest the possibility of individual (or perhaps community) rights against foreign governments. These rights, I noted, were problematic, in that they might compromise rights to self-determination, which, in view of the possibility of 'environmental colonialism', seem also to be important. One possible solution to such conflicts is suggested in the idea of 'appropriateness' as to the level of political decision making, which further calls into question the norm of state sovereignty. Human rights have also been said to represent a challenge to the sovereignty-based international order (Donnelly 2003), yet to date states have mostly been unwilling to challenge the sovereign authority of governments in the name of

humanitarian intervention. Indeed many regard the contemporary international human rights regime as being embedded firmly within the sovereignty-based international order. A crucial element of the response to these criticisms is to note that human rights are neither fixed nor given. Alternatives to the contemporary human rights regime might better facilitate environmental sustainability. In this regard, a number of greens have proposed the idea of environmental human rights. If Jack Donnelly (2007) is correct in arguing that human rights are necessary tools for protecting human dignity, then it seems plausible to suggest that a new model of human rights ought to take account of contemporary threats to human dignity. It follows that if my argument regarding the environmental impact of economic globalization is valid, then an adequate theory of human rights would be one that could take account of the environmental threats to human dignity. In short, there would seem to be a need for environmental human rights. A number of scholars make reference to the idea of environmental human rights. Within the field of human rights Stammers (1999) identifies environmental human rights, along with women's rights, as one of the areas in which there is debate about how the International Bill of Rights should be extended, while Anthony J. Langlois (2001) speculates on the possibility of there being a human right to an adequate environment'.

Rights absolute – can't infringe on one person's rights to increase well-being of others.

Gewirth 94 [Alan, professor of philosophy at the University of Chicago, "Are There Any Absolute Rights?" Absolutism and its Consequentialist Critics, pg: 137-138]

Ought Abrams to torture his mother to death in order to prevent the threatened nuclear catastrophe? Might he not merely pretend to torture his mother, so that she could then be safely hidden while the hunt for the gang members continued? Entirely apart from the fact that the gang could easily pierce this deception, the main objection to the very raising of such questions is the moral one that they seem to hold open the possibility of acquiescing and participating in an unspeakably evil project. To inflict such extreme harm on one's mother would be an ultimate act of betrayal; in performing or even contemplating the performance of such an action the son would lose all self-respect and would regard his life as no longer worth living. A mother's right not to be tortured to death by her own son is beyond any compromise. It is absolute. This absoluteness may be analyzed in several different interrelated dimensions, all stemming from the supreme principle of morality. The principle requires respect for the rights of all persons to the necessary conditions of human action, and this includes respect for the persons themselves as having the rational capacity to reflect on their purposes and to control their behaviour in the light of such reflection. The principle hence prohibits using any person merely as a means to the well-being of other persons. For a son to torture his mother to death even to protect the lives of others would be an extreme violation of this principle and hence of these rights, as would any attempt by others to force such an action. For this reason, the concept appropriate to it is not merely 'wrong' but such others as 'despicable', 'dishonorable', 'base', 'monstrous'. In the scale of moral modalities, such concepts function as the contrary extremes of concepts like the supererogatory. What is supererogatory is not merely good or right but goes beyond these in various ways; it includes saintly and heroic actions whose moral merit surpasses what is strictly required of agents. In parallel fashion, what is base, dishonourable or despicable is not merely bad or wrong but goes beyond these in moral demerit since it subverts even the minimal worth or dignity both of its agent and of its recipient and hence, the basic presuppositions of morality itself. Just as the supererogatory is superlatively good, so the despicable is superlatively evil and diabolic, and its moral wrongness is so rotten that a morally decent person will not even consider doing it. This is but another way of saying that the rights it would violate must remain absolute.

Even if environmental collapse dooms human rights, authoritarianism is not the solution

De Schutter '12 (Olivier De Schutter Tuesday 24 April 2012 03.00 EDT UN Special Rapporteur on the right to food Olivier De Schutter (LL.M., Harvard University ; Ph.D., University of Louvain (UCL)), the UN Special Rapporteur on the right to food since May 2008, is a Professor at the Catholic University of Louvain and at the College of Europe (Natolin). He is also a Member of the Global Law School Faculty at New York University and is Visiting Professor at Columbia University. April
<http://www.theguardian.com/environment/2012/apr/24/climate-change-human-rights-issue> // 6-27-15 // MC)

Global climate-change talks often resemble the scene of a traffic accident. Multiple voices shout each other down in a bid to tell their own version of events. What is the real damage, how quickly must it be repaired, and who should foot the bill? But the real concern is not that the debate is congested and gridlocked; it is that the current clamour masks a deeper failing, namely to identify an honest starting point. In Prosperity Without Growth, the economist Tim Jackson convincingly expounds the myth of "absolute decoupling" of emissions from economic growth. The growth of emissions can be slowed, relative to the growth rate of the economy. However, emissions cannot conceivably be stalled or reversed while the economy continues to expand, however great the carbon-saving technologies of the coming years. If our political processes cannot conceive of a non-growth future, and yet a fundamental rethink of growth is the only honest starting point for the fight against climate change, then those political processes are clearly not fit for purpose. Does this mean that democracy has failed, and must be sacrificed for authoritarian solutions? The solution may in fact be the polar opposite. A system where failing governance procedures are forced to think long-term does not necessarily require anti-democratic "climate tzars". Instead, this revolution can be hyper-democratic and guided by human rights. Climate change represents an enormous threat to a whole host of human rights: the right to food, the right to water and sanitation, the right to development. There is therefore huge scope for human rights courts and non-judicial human rights bodies to treat climate change as the immediate threat to human rights that it is. Such bodies could therefore take government policy to task when it is too short-sighted, too unambitious, or too narrowly focused on its own constituents at the expense of those elsewhere. Fossil fuel mining, deforestation, the disturbance of carbon sinks, and the degradation of the oceans are developments that can be blocked on human rights grounds. Human rights bodies can, and must, increasingly play this reactive role at the local level, in order to ward off the multitude of developments that simultaneously violate human rights and aggravate climate change. But that will not suffice. They must also become proactive and holistic in warding off human rights violations, and by extension, the advance of climate change at the global level. Where human rights deficits are detected, governments are required to put monitoring systems in place. They must also improve coordination within government, encourage the participation of all stakeholders – especially the most vulnerable – and define the responsibilities of institutions and set deadlines by which the human right in question must be met. In short, they must adopt multi-year strategies towards the fulfilment of human rights and increase the political cost of not moving fast enough. This approach is, in fact, also ideal for tackling climate change...

Soviet Union proves authoritarianism fails- corruption and resentful public mean environmental goals cannot be met

Humphrey 7 (Mathew Humphrey is a professor at the University of Nottingham. Ecological Politics And Democratic Theory: the Challenge to the Deliberative Ideal. London: Routledge, 2007. Page 140)

For all that the problems with which eco-authoritarians struggled were and remain real, the faith they placed in an authoritarian state to resolve these problems was surely misguided. Whilst the inferior ecological record of non- democratic states in itself proves nothing (how many of these states actually prioritised environmental goals?), the ability of a state to impose its 'green will' on an unwilling and resentful public who see their taken-for-granted freedoms being curtailed is questionable, in the absence of a monstrous architecture of green totalitarianism. Authoritarian states have often not been good at achieving those policy goals that they have prioritised, as the forlorn ambition of the Soviet Union to outstrip the productive capacity of the capitalist West testifies. There is no obvious reason to expect an authoritarian green state to be better than the Soviet Union at overcoming the internal divisions, inefficiencies, corruption, and perverse incentives that plague such states.

Democracy more sustainable than authoritarianism- transition not inevitable

Davis 15 (Davis, Michael C has an LLM from Yale and teaches at the University of Hong Kong. "East Asia After the Crisis: Human Rights, Constitutionalism, and State Reform." Human Rights Quarterly 26.1 (2004): 126-51. ProQuest. Web. 29 June 2015.)

In assessing the debates over political and economic reform, it becomes apparent that constitutionalism has a central role to play. Studies in the political economy literature appear to verify that regime type ultimately matters in the achievement of economic development goals.⁹⁶ While authoritarianism with proper developmental institutions can do reasonably well at early-stage development, this is not invariably so. Furthermore, as economic development proceeds the developmental potential of the authoritarian model may be exhausted. Recent studies have shown that the developmental achievement of authoritarian regimes in East Asia is not uniformly positive. Latent costs are just now being appreciated. In addition to the deficiencies of authoritarian practices in respect to democracy, human rights, and the rule of law, there have also been high levels of corruption. Corruption appears to be a consequence of both early predatory practices and a lack of transparency, and subsequent incapacity of authoritarian regimes to respond to the interests that economic development creates. Rent-seeking evolves from a top-down predatory behavior in the authoritarian period when the state is strong, to a bottom-up predatory behavior in the early stages of democracy as business becomes stronger and the state weaker. Corruption may serve as a substitute for adequate state institutions. Democratic consolidation will aim to curb corruption by affording greater transparency and stable institutions for checks and balances. Greater dispersal and open competition in the society should accompany this consolidation. Local institutions shape investor confidence. Either extreme concentrations of power or extreme dispersal appears to have worked poorly; the former is too volatile and the latter too rigid. Liberal constitutionalism, including democracy, human rights and the rule of law, appears to provide the tools to engender the degree of public engagement and political reliability needed for sustained development. Finding the proper institutional balance is by no means an easy task. The constitutional fundamentals are essential. Minimally maintaining the protections embodied in human rights and the rule of law is important to achieving transparency and accountability, while sustaining confidence in political and legal institutions. Constitutional institutions must be shaped to the

local condition. This reality is demonstrated by the varied consequences of importing similar institutions into different countries. Constitutional systems deeply influenced by the American model work very differently in Japan, the Philippines, and the United States. Getting the fit just right is the challenge of local politics.

Authoritarianism and the power grab causes ACCELERATION of environmental crises

Carter, 13, professor of philosophy

(Alan, [A Radical Green Political Theory](https://books.google.com/books?id=1DxdAgAAQBAJ&pg=PA25&lpg=PA25&dq=ophuls+environment+authoritarianism&source=bl&ots=r7M8u_gAt8&sig=-U8c8U6ONL2oLY-yA-zTKeAMqgc&hl=en&sa=X&ei=jq1LVaWpBYq_sAWju4HgBw&ved=0CCgQ6AEwBA#v=onepage&q=%22given%20the%20justified%22&f=false) pg 5-6 Routledge publishing,

If we are to stand up to such a serious environmental threat as many insist we currently face, and if we need to respond to it quickly, isn't some highly authoritarian, centralized state that can enforce strict environmental policies the obvious solution? At its most attractive, eco-authoritarianism presents itself as a form of benevolent dictatorship - an environmentally benevolent dictatorship, as it were. Unfortunately, as obvious a solution as eco-authoritarianism appears to be, its flaws seem equally obvious. As with any benevolent dictatorship, how can it be guaranteed that it will remain benevolent? It is difficult to see how whatever structures empower an authoritarian, centralized leadership to exercise power effectively will, at the same time, inhibit exercises of that power which take a non-benevolent form; unless it is the people themselves who constrain such a leadership. But then, why is a leader necessary in the first place? If a leader is necessary, it must be because he or she has real power, and now can its exercise be guaranteed to remain benevolent? Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain it. How can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, seem to make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than that of those whom they usurp, as the history of many coups can be argued to attest to. In short, all of the arguments tinted have been rehearsed against ostensibly benevolent dictatorships appear equally pertinent to environmentally benevolent ones. If an autocrat wished to use his or her power to protect the environment, the structures which enabled that power to be exercised could, presumably, just as easily be used by his or her successors to degrade the planet further, or even at an accelerated rate, for their short-term or localized enjoyment. In fact, there is a powerful argument that can be deployed which seems to establish that any authoritarian response to the mounting environmental crises will accelerate them rather than provide a solution. But because of the theoretical assumptions underpinning that argument, it will have to wait until Chapter 6 before being presented, and until Chapter 7 before being deployed against eco-authoritarianism. Suffice it to say that we already have some reason to think that an effective long term response to the ecological threat which environmentalists claim to have identified would require an alternative political theory to that propounded by eco-authoritarians 2.2

Eco-Authoritarian problems are resolved by expanding democracy, not abolishing of it

Humphrey 7 (Mathew Humphrey is a professor at the University of Nottingham. Ecological Politics And Democratic Theory: the Challenge to the Deliberative Ideal. London: Routledge, 2007. Page 11)

Knowledge of eco-authoritarian literature is essential for understanding what came in its wake, which was, to a large degree, a reaction to the anti-democratic despair that the survivalists expressed. I want to emphasise in this chapter elements of this literature which give it continuing relevance today. One

such element is the specific analysis of democracy that underpinned the politics of eco-authoritarianism. Whilst the authoritarian solutions suggested in this literature are widely criticised, the conception of democracy that underpinned the (often reluctant) advocacy of non-democratic politics is less frequently considered. As we shall see, there was a strong Schumpeterian strain to the eco-authoritarians' understanding of democracy. In particular, the view that ordinary citizens are politically incompetent, especially at times of crisis, was deeply held. In this regard I want to draw an important distinction between the eco-authoritarian analysis of the relationship between ecological problems and democracy on the one hand, and their prescriptive political solutions on the other. I will argue that in many respects the analysis of the problems of collective action involved in environmental politics is accurate and well-judged,1 but that the conclusions that were drawn from it were certainly not the only logically compelling ones. In fact they were conclusions that were more likely to compound the problems than resolve them. The questions that the survivalists raise are difficult and profound, but it will be the ultimate argument of this book that these problems show the need for more, and more radical forms, of democracy rather than less of it.

Authoritarianism's racial and patriarchal structure promotes structural violence in the form of gendered violence and racial profiling- Hungary proves

McRobie '14 (novelist, journalist, co-editor of openDemocracy 50.50, and editor of the Oxford Human Rights Hub. She is completing a PhD on the 2011 Egyptian revolution at Oxford University and holds an MA focusing on Balkan studies from the University of Sarajevo. Her latest book Literary Freedom: a Cultural Right to Literature was published in December 2013
<https://www.opendemocracy.net/5050/heather-mcrobie/it-takes-broken-bones-authoritarianism-and-violence-against-women-in-hungary> // 6-26-15 // MC)

Authoritarianism is never good news for women – as citizens or as the structurally more marginalised gender – and Hungary's continued shift away from democracy and upholding human rights under the right-wing Fidesz government is mirrored by its regressive backsliding on gender equality. Last week, Hungarian feminist groups spoke out to condemn a public service announcement made by a Hungarian police department that blamed women for 'inviting' sexual violence. In a shockingly misguided attempt to mark the International Day for the Elimination of Violence against Women, the video showed young women drinking, dancing and flirting before cutting to what looked like the aftermath of a sexual assault. The video ended with the warning "it's your responsibility", implying that women invite sexual violence through 'irresponsibility'. Compounding the erroneous messages the Hungarian public are given on violence against women, another Hungarian police department issued a statement last week on 'rape prevention' that claimed "flirting by young women can often elicit violence." This isn't the first time in recent years that Hungarian officials and government departments have communicated victim-blaming messages on the subject of violence against women, erroneously shifting the blame away from the responsibility of the perpetrator. In 2012, MP Istvan Varga, from the ruling Fidesz party claimed that domestic violence could be solved if women fulfilled their natural role and gave birth to several children. (The "logic" being that if women fulfilled their societal duty and reproduced, their partners would respect them more and therefore stop beating them). The popular protests and campaigns by Hungarian feminist groups in the face of this statement were part of what pushed the parliament to agree to legally demarcate domestic violence as a specific offence in the new criminal code. Previously, abusers could only be prosecuted for individual acts of assault and there was no legal recognition of the wider violence and oppression of abusive relationships. However, an extensive Human Rights Watch report in

November 2013, 'Unless Blood Flows', documented both the gaps in the new legal provisions for domestic violence, and the inadequate implementation of existing laws and lack of funding and provisions for violence against women. It pointed both to the lack of political will to address violence against women, and to entrenched patriarchal norms as barriers to combatting violence against women and achieving gender equality in both the private and public spheres. Hungarian women's rights organisations pointed out that, although the rates of domestic violence and violence against women are in keeping with the (lamentable) European average, Hungary lagged behind other European countries in terms of both legal and societal recognition of this abuse: "it takes broken bones" for a case of domestic violence to be brought to court, both preventing catching domestic violence at an earlier stage (in light of the fact that domestic abuse often operates on an escalating dynamic) and sending a message that it is not taken seriously by legal and governmental institutions. Screenshot of 2014 'anti-rape' video made by Hungarian police. The Fidesz party spent the last four years gutting independent media and social provisions, and won a second term by a landslide in the elections of April this year, in which the far-right, anti-immigrant and anti-Semitic Jobbik party also won 20% of the votes. Fidesz has brought with it a plethora of bizarre and reactionary policies and statements from government officials, most recently the widely-protested proposed Internet tax. And the right-wing discourse dominating politics weaves into it a regressive construction of gender relations, in which Fidesz and other right-wing political voices trade on the concept of "family values" in which women are reduced solely to their supposedly 'natural' role as mothers and submissive wives. Such a conception of gender relations constructed by right-wing authoritarianism and exclusivist nationalism – in which women are seen as mere vessels for childbearing and subordinate units within the all-important traditional "family – delegates women to the 'private sphere' whilst giving men dominance within both the public and the private spheres. In such a conception, domestic violence becomes a matter both of "no-one else's business" and "she was probably asking for it." One instance of violence against women did, however, become a public issue – when last November Fidesz politician Jozsef Balogh admitted to beating his wife, yet refused to resign from public office. Hungary's chief prosecutor found that Mr Balogh's wife had been struck in the face with "more than medium force", dragged by her hair, and suffered facial fractures after being assaulted by her husband when the couple returned home from a wedding party. Although Mr Balogh was expelled from the Fidesz party in the wake of public outcry over his violence, his behaviour seemed not far removed from the official message communicated by the government: the patriarchal family with its dominating male 'head' is all-important, and domestic violence is a private matter which concerns neither society nor government. The continued lack of government funding for domestic violence shelters – and the victim-blaming "public service announcements" – communicate the same message, that violence against women is both a trivial and a private matter for which the abused can be blamed. Hungary's right-ward shift and slide away from liberal democracy is bad news for women, not because liberal democracy "guarantees" the decline of violence against women (the cases of several Scandinavian countries show that even high levels of "gender equity" in public life, and gender-sensitive welfare provisions, can coexist with high levels of domestic violence and violence against women in the private sphere) but because, under the current prevailing ideology in Hungary women are sidelined as all structurally marginalised groups are sidelined – if not targeted. Over the same period as the rise of Fidesz and the far-right Jobbik party, Hungary has slipped down the World Economic Forum's ranking on gender-equity, from 55th place in 2006 to 93 in 2014 (although the number of ranked countries expanded from 115 to 142 in the same period). The alarming rise (or resurgence) of anti-Semitism and anti-Roma sentiment shows the corrosive right-wing discourse eating at Hungary's society as anyone

who occupies the marginal position – as an ethnic minority, or immigrant, or on the grounds of their gender or sexual orientation – is sidelined, demonised and targeted, as if in a Nietzschean reading of social order enacting a sociopathic mindset in which the structurally weaker are punished for “being weak”. The public service announcement telling women “it is your responsibility” to prevent sexual assault by 'not flirting and drinking' is in keeping with the regressive worldview of rightwing discourse swirling in Hungarian political life, with its fetishisation of the patriarchal family and its increasing persecution of minorities and the structurally disadvantaged. In such a climate, violence against women is both a “private” issue of the exalted family-unit and a “natural” situation in which the dominant enacts its will on the disadvantaged. And so the structural and social violence the Hungarian state is waging upon its marginalised is enacted again, as if in aftershock, over and over upon the bodies of women.

squo cap solves warming – tech developments

Starck, PhD, Feb 2015, (Walter, "The Climate Scam's Meltdown" Ausmarine 37.4: 26-27. Proquest. search.proquest.com/docview/1666284048?pq-origsite=gscholar)

Capitalism will find a way With or without any agreement or government initiatives, economics, technological developments and demographic changes will in due course **inevitably reduce the demand for fossil fuels and replace them with other and cleaner sources of energy.** Thorium- and fusion-reactor developments are showing increasing promise of providing effectively unlimited cheap and clean energy within a few decades. For domestic use, solar voltaic technology is beginning to become competitive with mains electricity, with further gains in cost effectiveness near certain in the near future. Major advances in storage technology are also well underway and expected to become Commercially available within a few years. Better, cheaper solar technology to power homes and vehicles is likely to drive the beginning of mass uptake within a decade. This will be impelled by cost effectiveness, with subsidies unnecessary. Indeed, such support risks doing more harm than good if it diverts development and uptake from the best and most efficient technologies emerging from a complex, rapidly changing and impossible-to-predict scientific frontier.

There is no impact to warming- trends prove no disasters

Kreutzer 3/31

(David Kreutzer [the senior research fellow in energy economics and climate change at The Heritage Foundation's Center for Data Analysis], 3/31/15, "Five Myths About Extreme Weather and Global Warming," The Daily Signal, dailysignal.com/2014/03/31/five-myths-extreme-weather-global-warming/, MX)

There is broad (though not unanimous) agreement, even among skeptic scientists, that the earth has warmed moderately over the past 60 years and that some portion of that warming can be attributed to anthropogenic carbon dioxide emissions. However, despite the hoopla surrounding the recent report on the economic impacts of global warming from the U.N.'s Intergovernmental Panel on Climate Change (IPCC), there is no consensus that temperatures are increasing at an accelerating rate or that we are headed to a climate catastrophe. In fact, far from increasing at an accelerating rate, the best measures of world average temperatures indicate that there has been no significant warming for the past 15 years—something that the IPCC's climate models are unable to explain. Perhaps frustrated by the climate's unwillingness to follow the global-warming script, the hard-core advocates for costly, energy-killing programs now point to every weather event as the wages of carbon-emitting sins. However, the numbers tell a different

story: Upward trends for extreme weather events just aren't there. Myth #1: Hurricanes are becoming more frequent. Even the IPCC notes there is no trend over the past 100 years. Here's what the IPCC says in its latest science report: Current data sets indicate no significant observed trends in global tropical cyclone frequency over the past century and it remains uncertain whether any reported long-term increases in tropical cyclone frequency are robust, after accounting for past changes in observing capabilities.... No robust trends in annual numbers of tropical storms, hurricanes and major hurricanes counts have been identified over the past 100 years in the North Atlantic basin. [Emphasis added.] Some people will make a big deal about an increase in North Atlantic hurricanes since the 1970s. As the IPCC chart below (Panel b) shows, the 1970s had the lowest frequency of landfalling hurricanes in the past 100 years. Hurricane Sandy seems to be an argument in a class by itself. It should be noted that Sandy became an extratropical cyclone before it made landfall. Here is what the IPCC says about historical trends in extratropical cyclones: "In summary, confidence in large scale changes in the intensity of extreme extratropical cyclones since 1900 is low." Also, data from the National Oceanic and Atmospheric Administration (NOAA) covering the years 1851—2004 show that hurricanes made a direct hit on New York State about every 13 years on average. Over the period, there were a total of 12 hurricanes that made landfall along the New York coastline. Five of them were major hurricanes. Myth #2: Tornadoes are becoming more common. The experts at the National Climatic Data Center (part of NOAA) say: To better understand the variability and trend in tornado frequency in the United States, the total number of EF-1 and stronger, as well as strong to violent tornadoes (EF-3 to EF-5 category on the Enhanced Fujita scale) can be analyzed. These tornadoes would have likely been reported even during the decades before Doppler radar use became widespread and practices resulted in increasing tornado reports. The bar charts below indicate there has been little trend in the frequency of the stronger tornadoes over the past 55 years. [Emphasis added.] That is, once we account for the apparent increase in tornado counts that are due to much improved technology for identifying them, tornadoes occur no more frequently now than in the past. Even more striking is the history of F3 and stronger tornadoes (shown below), which were even less likely to be missed before Doppler radar. That trend is actually down compared to the 1955–1975 period: Myth #3: Droughts are becoming more frequent and more severe. In the recent science report, even the IPCC finds little evidence to support the myth regarding droughts, and it backs off from its support in a previous report. Here is a quote from the AR5: In summary, the current assessment concludes that there is not enough evidence at present to suggest more than low confidence in a global-scale observed trend in drought or dryness (lack of rainfall) since the middle of the 20th century, owing to lack of direct observations, geographical inconsistencies in the trends, and dependencies of inferred trends on the index choice. Based on updated studies, AR4 conclusions regarding global increasing trends in drought since the 1970s were probably overstated. Myth #4: Floods are becoming more frequent and severe. The IPCC's science report states, In summary, there continues to be a lack of evidence and thus low confidence regarding the sign of trend in the magnitude and/or frequency of floods on a global scale. For the U.S., the story is the same. Some places will always be drier and some wetter in comparison to an earlier period. However, for the U.S. overall, there has been no trend. The chart below of the Palmer Hydraulic Drought Index (PHDI) shows no trend for increasing droughts (represented by bars with negative values). From 1930 to 1941, the PHDI was consistently negative and set annual records that have not been matched.

N/U- Democracy Solves Now

Squo Solves

Environmental authoritarianism isn't uniquely key in solving ecocide, status quo can solve with the right efforts.

White, 10 (Micah, Senior editor at Adbusters and an award-winning activist, "An alternative to the new wave of ecofascism", <http://www.theguardian.com/commentisfree/cif-green/2010/sep/16/authoritarianism-ecofascism-alternative>)

Environmentalism is currently marketed as a luxury brand for guilty consumers. The prevailing assumption is that a fundamental lifestyle change is unnecessary: being green means paying extra for organic produce and driving a hybrid. The incumbent political regime remains in power and the same corporations provide new "green" goods; the underlying consumerist ideology is unquestioned. This brand of environmentalism only emboldens ecofascists who rightly claim that shopping green can never stop the ecological crisis. And yet, **ecofascists are wrong to suggest that the suspension of democracy is the only alternative. Humanity can avert climate catastrophe without accepting ecological tyranny. However, this will take an immediate, drastic reduction of our consumption. This requires the trust that the majority of people would voluntarily reduce their standard of living once the forces that induce consumerism are overcome.** The future of environmentalism is in liberating humanity from the compulsion to consume. Rampant, earth-destroying consumption is the norm in the west largely because our imaginations are pillaged by any corporation with an advertising budget. From birth, we are assaulted by thousands of commercial messages each day whose single mantra is "buy". Silencing this refrain is the revolutionary alternative to ecological fascism. It is a revolution which is already budding and is marked by three synergetic campaigns: the criminalisation of advertising, the revocation of corporate power and the downshifting of the global economy. In São Paulo, the seventh largest city in the world, outdoor advertising has been banned. Meanwhile, artists in New York City and Toronto are launching blitzkrieg attacks on billboards, replacing commercials with art. Their efforts have put one visual polluter out of business. Grassroots organisers in the US are pushing for an amendment to the constitution that will end corporate personhood while others are fighting to revive the possibility of death penalties for corporations. The second international conference on degrowth economics met recently in Barcelona. In Ithaca, New York a local, time-based currency is thriving. Buy Nothing Day campaign is celebrated in dozens of nations and now Adbusters is upping the ante with a call for seven days of carnivalesque rebellion against consumerism this November. And, most important of all, across the world everyday people are silently, unceremoniously and intentionally spending less and living more. Authoritarian environmentalists fail to imagine a world without advertising, so they dream of putting democracy "on hold". In Linkola's dystopian vision, the resources of the state are mobilised to clamp down on individual liberty. **But there is no need to suspend democracy if it is returned to the people. Democratic, anti-fascist environmentalism means marshalling the strength of humanity to suppress corporations. Only by silencing the consumerist forces will both climate catastrophe and ecological tyranny be averted. Yes, western consumption will be substantially reduced. But it will be done voluntarily and joyously.**

Democracy solves better than Authoritarianism

***Eco-Authoritarian problems are resolved by expanding democracy, not abolishing of it**

Humphrey 7 (Mathew Humphrey is a professor at the University of Nottingham. Ecological Politics And Democratic Theory: the Challenge to the Deliberative Ideal. London: Routledge, 2007. Page 11)

Knowledge of eco-authoritarian literature is essential for understanding what came in its wake, which was, to a large degree, a reaction to the anti-democratic despair that the survivalists expressed. I want to emphasise in this chapter elements of this literature which give it continuing relevance today. One such element is the specific analysis of democracy that underpinned the politics of eco-authoritarianism. Whilst the authoritarian solutions suggested in this literature are widely criticised, the conception of democracy that underpinned the (often reluctant) advocacy of non-democratic politics is less frequently considered. As we shall see, there was a strong Schumpeterian strain to the eco-authoritarians' understanding of democracy. In particular, the view that ordinary citizens are politically incompetent, especially at times of crisis, was deeply held. In this regard I want to draw an important distinction between the eco-authoritarian analysis of the relationship between ecological problems and democracy on the one hand, and their prescriptive political solutions on the other. I will argue that in many respects the analysis of the problems of collective action involved in environmental politics is accurate and well-judged,¹ but that the conclusions that were drawn from it were certainly not the only logically compelling ones. In fact they were conclusions that were more likely to compound the problems than resolve them. The questions that the survivalists raise are difficult and profound, but it will be the ultimate argument of this book that these problems show the need for more, and more radical forms, of democracy rather than less of it.

Democracies are key to solving climate change- environmentalists movements lead to legislation

Carbonell and Allison 15 (Joel Carbonell and Juliann Allison both have PhD's from the University of California Los Angeles. "Democracy And State Environmental Commitment To International Environmental Treaties." International Environmental Agreements: Politics, Law & Economics 15.2 (2015): 79-104. GreenFILE. Web. 26 June 2015.

In light of the democratic institutional argument, Midlarsky (1998) identifies five democratic influences on environmental policy-making (Midlarsky 1998, 344): 1. "In contrast to authoritarian states, democracies respect individual rights. Thus, environmentalists are able to freely market their ideas and transform them into environmental legislation. 2. Democratic governments are inherently more responsive to their citizenry. 3. Freely flowing information in democracies allows for a form of political learning. 4. Democratic states tend to cooperate with each other within international environmental agencies. 5. Because all democracies also have free-market economies, businesses in the marketplace can be subject both to environmental incentives and sanctions," (Midlarsky 1998, 344). These five environmental characteristics of democracy parallel the current liberal institutional measures of democracy identified by Freedom House, such as freedom of speech, competitive elections, protections of human rights, freedoms of media and assembly (see Methodology section for operational definition

of democracy through Freedom House Methodology on Civil Liberties and Political Rights measures, Freedom House 2000).

Liberalism cannot exist without democracy

Plattner '98 (Marc F. Marc F. Plattner is founding coeditor of the Journal of Democracy, vice-president for research and studies at the National Endowment for Democracy (NED), and co-chair of the Research Council of the International Forum for Democratic Studies. NED's director of program from 1984 to 1989. During the 2002–2003 academic year, he was a visiting professor at the Robert Schuman Centre for Advanced Studies at the European University Institute in Florence, Italy. Fellow at the National Humanities Center in Research Triangle Park, North Carolina; advisor on Economic and Social Affairs at the United States Mission to the United Nations ; program officer at the Century Foundation; and managing editor of the Public Interest, a quarterly journal on public policy. Graduated Summa Cum Laude at Yale University and received his Ph.D. in government from Cornell University, where his principal area of study was political philosophy. He is the author of Democracy Without Borders? Global Challenges to Liberal Democracy (2008) and Rousseau's State of Nature (1979), a study of the political thought of Jean Jacques Rousseau. His articles on a wide range of international and public policy issues have appeared in numerous books and journals. Democratization and Authoritarianism in the Arab World (2014); Will China Democratize? (2013, also with Andrew J. Nathan); Democracy in East Asia: A New Century (2013, also with Yun-Han Chu); Liberation Technology; and Poverty, Inequality, and Democracy (2012, also with Francis Fukuyama).[// 6-26-15// MC](https://www.foreignaffairs.com/articles/1998-03-01/liberalism-and-democracy-cant-have-one-without-other))

Today the two strands of liberal democracy, interwoven in the Western political fabric, are coming apart in the rest of the world. Democracy is flourishing; constitutional liberalism is not." Drawing upon this distinction, Zakaria recommends that Western policymakers not only increase their efforts to foster constitutional liberalism but diminish their support for elections, and suggests that "liberal autocracies" are preferable to illiberal democracies. DECONSTRUCTING DEMOCRACY The basic distinction made by all these authors is both valid and important. Liberal democracy-which is what most people mean today when they speak of democracy-is indeed an interweaving of two different elements, one democratic in a stricter sense and the other liberal. As its etymological derivation suggests, the most basic meaning of the word "democracy" is the rule of the people. As the rule of the many, it is distinguished from monarchy (the rule of one person), aristocracy (the rule of the best), and oligarchy (the rule of the few). In the modern world, where the sheer size of states has rendered impossible the direct democracy once practiced by some ancient republics, the election of legislative representatives and other public officials is the chief mechanism by which the people exercise their rule. Today it is further presumed that democracy implies virtually universal adult suffrage and eligibility to run for office. Elections, then, are regarded as embodying the popular or majoritarian aspect of contemporary liberal democracy. The word "liberal" in the phrase liberal democracy refers not to the matter of who rules but to the matter of how that rule is exercised. Above all, it implies that government is limited in its powers and its modes of acting. It is limited first by the rule of law, and especially by a fundamental law or constitution, but ultimately it is limited by the rights of the individual. The idea of natural or inalienable rights, which today are most commonly called "human rights," originated with liberalism. The primacy of individual rights means that the protection of the private sphere, along with the plurality and diversity of ends that people seek in their pursuit of happiness, is a key element of a liberal political order. The fact that democracy and liberalism are not inseparably linked is proven by the historical existence both of nonliberal democracies and of liberal nondemocracies. The democracies of the ancient world, although their citizens were incomparably more involved in governing themselves than we are today, did not provide freedom of speech or religion, protection of private property, or constitutional government.

AT: Democracy = enviro destruction

History shows democracies solve environmental problems and cooperate with environmental treaties better than authoritarian regimes

Wilks-Heeg 14 (Stuart Wilks-Heeg has a PhD and works at the University of Liverpool. "The politics of sustainability: Democracy and the Limits of Policy Action." H. Atkinson and R. Wade (eds) (2014) *The Challenge of Sustainability: Linking Politics, Learning and Education*, Bristol: Policy Press. www.academia.edu/6264139/The_Politics_of_Sustainability_Democracy_and_the_Limits_of_Policy_Action_2014_) *Neumayer has a PhD from the University of London

Political theory is one thing. But do democracies ever live up to the ideal type put forward by Payne? Evidence on the benefits of democracy for environmental outcomes is mixed (Winslow, 2005; Li and Reuveny, 2006; Ward, 2008), but certainly strong enough to confirm that democracies generally outperform non-democracies in environmental protection. An array of quantitative studies have identified that democracy has a positive effect with respect to a range of environmental policy commitments and outcomes. Neumayer (2002, p 155) finds that democracy is positively associated with making environmental data available and with ensuring a higher percentage of land is subject to special environmental protection. Both Torras and Boyce (1998) and Barrett and Graddy (2000) find that higher levels of political and civil rights lead to lower levels of air and water pollution. Harbaugh et al. (2002) and Gleditsch and Svedrup (2002) produce similar findings with regard to the positive effect of democracy on, respectively, sulphur dioxide and carbon dioxide emissions. Li and Reuveny (2006) reaffirm these findings with respect to sulphur dioxide and carbon dioxide, as well as finding that democracy is associated with lower levels of organic water pollution, deforestation and land degradation. There is also evidence to suggest that democracies play a more constructive role in attempts to forge international cooperation to tackle cross-border environmental problems. Gleditsch and Sverdrup (2002) find a positive correlation between democracy and the ratification of environmental treaties. Similarly, Neumayer (2002) finds that, among both developed and less developed countries, there is strong evidence that democracies are more likely to sign and ratify environmental agreements, take part in multilateral environmental organisations. With regard to international cooperation generally, it has also been demonstrated that democracies rarely, if ever, go to war with one another (Dorussen and Ward, 2008; Inglehart and Welzel, 2009).

And international environmental treaties effectively change state behavior

Carbonell and Allison 15 (Joel Carbonell and Juliann Allison both have PhD's from the University of California Los Angeles. "Democracy And State Environmental Commitment To International Environmental Treaties." *International Environmental Agreements: Politics, Law & Economics* 15.2 (2015): 79-104. GreenFILE. Web. 26 June 2015.

First, the traditional international institutional argument that formal international organizations affect state environmental commitment and compliance is supported in the two-stage simultaneous equation model. The empirical results indicate that countries that are members of international environmental organizations are more likely to comply with international environmental treaties and agreements. These international environmental organizations matter in shaping state behavior toward international environmental protection; here, international environmental institutions may be able to compel and

constrain states through resource distribution, technology transfer, rules enforcement, information sharing, and reduction in pollution control costs to facilitate state commitment and compliance behaviors

Authoritarianism fails

Power Abuse

***Soviet Union proves authoritarianism fails- corruption and resentful public mean environmental goals cannot be met**

Humphrey 7 (Mathew Humphrey is a professor at the University of Nottingham. Ecological Politics And Democratic Theory: the Challenge to the Deliberative Ideal. London: Routledge, 2007. Page 140)

For all that the problems with which eco-authoritarians struggled were and remain real, the faith they placed in an authoritarian state to resolve these problems was surely misguided. Whilst the inferior ecological record of non- democratic states in itself proves nothing (how many of these states actually prioritised environmental goals?), the ability of a state to impose its 'green will' on an unwilling and resentful public who see their taken-for-granted freedoms being curtailed is questionable, in the absence of a monstrous architecture of green totalitarianism. Authoritarian states have often not been good at achieving those policy goals that they have prioritised, as the forlorn ambition of the Soviet Union to outstrip the productive capacity of the capitalist West testifies. There is no obvious reason to expect an authoritarian green state to be better than the Soviet Union at overcoming the internal divisions, inefficiencies, corruption, and perverse incentives that plague such states.

Threshold for power abuse in eco-authoritarian societies high

Shahar '15, (Dan Coby, PhD student in the University of Arizona's Department of Philosophy and a fellow at the Arizona Center for the Philosophy of Freedom. www.ericademon.co.uk/EV/papers/Shahar.pdf // 6-25-15//))

Traditionally, critics of authoritarianism have worried that unrestrained power granted to government officials could fall into the wrong hands, resulting in a serious potential for tyrannical despotism.⁵³ Despotism is obviously problematic due to the harms it typically generates for citizens living under its rule, but in the current context we may also worry that a despotic regime would end up neglecting to prioritize environmental protection, thereby failing to ameliorate the crisis that would have motivated the shift toward authoritarianism in the first place. In order to avoid this problem, Eco-Authoritarians would need to provide reason to think that following their prescriptions would mean putting our collective futures not into the hands of injurious despots but rather into those of administrators who possess both the capacity to address an impending environmental crisis effectively and the motivation 53 Locke 1764 [1689]: Bk. II, ch. 19; Hume, 1987 [1741]; Madison, 2001 [1788]. to do so. This challenge has two interrelated aspects: first, it must be shown that a capable and benevolent "eco-elite" could be generated in the first place to rule over our society; and second, it must be shown that a system of rule by "eco-elites" could be effectively perpetuated over a long period of time. To my knowledge, the only contemporary Eco-Authoritarians who have taken up this challenge are also the most extreme proponents of the view: David Shearman and Joseph Wayne Smith. In The Climate Change Challenge and the Failure of Democracy, Shearman and Smith contend that successful Eco-Authoritarianism would require leaders of a caliber far higher than we find in contemporary society, and that producing such leaders would require a radically different system of education. This new system would be built around superior "real universities" that would purportedly "train holistic thinkers in all of the arts and sciences necessary for tough decision making that the environmental crisis confronts us with."⁵⁴ The products would be "true public intellectuals with knowledge well grounded in ecology,"⁵⁵ who would be charged

with preserving “remnants of our civilization when the great collapse comes” as “the new priesthood of the new dark age.”⁵⁶ Perhaps unsurprisingly, the authors give only sketchy details on exactly how “real universities” would achieve these felicitous results. Their main proposals in *The Climate Change Challenge* and *The Failure of Democracy* seem limited to focusing scholarly research on problems that are important to human well-being,⁵⁷ expanding the role of information sharing among the intellectual community,⁵⁸ and accelerating the development of programs in environmental studies.⁵⁹ Although many of these proposals seem reasonable and even attractive, they hardly seem like the sorts of revolutionary changes that would equip ⁵⁴ Shearman and Smith, 2007: 133. ⁵⁵ Ibid.: 133-134. ⁵⁶ Ibid.: 152. ⁵⁷ Ibid.: 143-147. ⁵⁸ Ibid.: 147-149. ⁵⁹ Ibid.: 151. This theme is developed further in Smith et al., 2007: 152-170. graduating students with the capacities and motivations needed to effectively rule over complex modern societies. Even if a capable and benevolent eco-elite could be produced, a further hurdle for Eco-Authoritarianism would involve demonstrating that the quality of elite rule could be maintained over time. Shearman and Smith do not take up this aspect of the issue in a substantive way, and to my knowledge neither does any other contemporary EcoAuthoritarian. But the challenge of sustaining a capable and benevolent ruling class over time is a notoriously difficult one for an authoritarian regime to overcome. As the eco-anarchist philosopher Alan Carter has quite reasonably worried: Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain power, how can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than those whom they usurp, as the history of many coups attests to.⁶⁰ At the very least, it seems that Eco-Authoritarians owe us some account of how their proposed regimes could predictably avoid corruption over time.

Authoritarianism fails – environmental leaders will never give up their power

Woods, PhD 10 [lecturer of political theory at Leeds]

(Kerri, January, Human Rights and Environmental Sustainability, Edward Elgar publishing, p 129-130)

Nevertheless, it is worth considering the argument that either environmental sustainability or human rights should be prioritized, looking firstly at the idea that the former should be prioritized over the latter. What this might mean in practice is that democratic rights to elect representatives who would have a say in deciding environmental policies might be waived, or the right to protest against unwanted policies might be denied both in terms of freedom of speech and of association, or perhaps it would become acceptable for governments to detain without charge or trial individuals thought likely to impede environmental sustainability in some way. Would this deliver environmental sustainability? Perhaps, if governments were led by environmental philosopher-kings, but I suspect that few environmental activists would feel confident in surrendering the means of holding governments to account on environmental policy.

Authoritarianism only works on the small scale- large states have too many levels of administration and prioritize the economy

Ortmann 9 (Dr. Stephan Ortmann has a PhD in Political Science. "Environmental Governance under Authoritarian Rule: Singapore and China" September 25 2009. *Vergleichende K dtatur- Und Extremismusforschung*. p. 19

www.academia.edu/1000215/Environmental_Governance_under_Authoritarian_Rule_Singapore_and_China)

In summary, while an authoritarian model of environmental protection can work in a small place with a committed leadership, it is very unlikely that such a model would work in much greater states with multiple levels of administration. Generally speaking, liberal democracy, despite its problems, has a much better chance of conducting sound environmental governance. That is due to the fact that even a technocratic regime such as Singapore is primarily motivated by economic concerns and not the environment. It is therefore unlikely that environmental concerns will trump in authoritarian regimes when they are in opposition to economic goals.

Authoritarianism False

Popular pressure gets tanked by eco-authoritarian reliance on false claims

Lewis '14 (Martin W., October 9th, 2014 Martin W. Lewis has taught college-level geography for 20 years, and is currently a senior lecturer at Stanford University. Source: <http://www.geocurrents.info/about/martin-lewis#ixzz3eO80OzAT> www.geocurrents.info/physical-geography/eco-authoritarian-catastrophism-dismal-deluded-vision-naomi-oreskes-erik-m-conway // 6-28-15 // MC)

As with so many other hot-button debates, the climate change controversy leaves me repelled by the clamoring extremists on both sides. Global-warming denialists, as some are aptly called, regard the scientific establishment with such contempt that they abandon the realm of reason. In comment after comment posted on on-line articles and blogs, self-styled skeptics insist that carbon dioxide is such a scant component of the atmosphere that it could not possibly play any climatic role, while castigating mainstream climatologists as malevolent conspirators dedicated to destroying civilization. Yet on the equally aptly named alarmist side of the divide, reasonable concerns often yield to dismal fantasies of the type so elegantly described by Pascal Bruckner in The Fanaticism of the Apocalypse, upheld by exaggeration to the point of absurdity. More alarmingly, climate activism seems to be veering in an unabashedly authoritarian direction. In such a heated atmosphere, evenhanded positions are at the risk of being flooded out by a rising sea of mutual invective and misinformation. This essay addresses only one side of this spectrum, that of the doomsayers who think we must forsake democracy and throttle our freedoms if we are to avoid a planetary catastrophe. Although it may seem paradoxical, my focus on the green extreme stems precisely from my conviction that anthropogenic climate change is a huge problem that demands determined action. Yet a sizable contingent of eco-radicals, I am convinced, consistently discredit this cause. By insisting that devastating climate change is only a few years away, they will probably undermine the movement's public support, given the vastly more likely chance that warming will be gradual and punctuated. By engaging in mendacious reporting and misleading argumentation, they provide ample ammunition for their conspiracy-minded opponents. And by championing illiberal politics, they betray the public good that they ostensibly champion. It is a sad day indeed when an icon of liberalism such as Robert Kennedy Jr. can plausibly be deemed an "aspiring tyrant" for wanting to punish global-warming deniers.

Transition Impossible

the neg's dichotomy of democracy and totalitarianism is utopian and totalizing –fails

Bluhdorn, Phd, 12 [Reader in Politics/Political Sociology at the University of Bath]

(Ingolfur, December 13, Friedrich Ebert Stiftung Sustainability "Opening the discursive arena - struggling for an innovative debate" www.fes-sustainability.org/en/nachhaltigkeit-und-demokratie/democracy-and-sustainability)

Common questions which, in addition to the ones cited at the beginning of this essay, figure prominently in the current debate include: How does the eco-political performance of democratic systems compare to that of authoritarian systems? Will our democratic systems collapse under the pressure of the environmental crisis? May the achievement of sustainability necessitate a change of political regime? Like those cited earlier, these questions make a range of implicit assumptions which are themselves not subjected to any critical enquiry. They **pre-structure the debate** in ways that, from the outset, preclude certain lines of investigation. For example, such questions, in a simplifying and generalising manner, juxtapose democratic and authoritarian systems. However, given that both democratic and autocratic systems come in a large variety of shapes and that, furthermore, contemporary democracies are, as outlined above, rapidly acquiring expertocratic-authoritarian features, while authoritarian systems like China are experimenting with strategies of decentralisation and local empowerment, such a simplistic binary distinction is manifestly unhelpful – if not outright ideological. It ignores factual political developments and instead focuses public attention on a **hypothetical alternative**. In fact, if there is any truth in the diagnosis of a post-political condition, democratic and autocratic modes of government might find themselves located on the same side of the new cleavage between the political formulation and implementation of competing visions of societal organisation and development and the purely managerial execution of systemic imperatives which are non-negotiable, self-legitimizing and allow for no alternative. In any case, the alleged choice between democratic and authoritarian policy approaches does not occur in practical day-to-day politics. And given that in eco-political matters democratic and autocratic forms of government both have a frighteningly poor performance record, ecologists may feel they are being offered the choice between a rock and a hard place.

These observations also raise doubts about the ever renewed academic efforts to compare the eco-political performance of democratic systems to that of autocracies. Prima facie, these efforts are triggered by demands for eco-authoritarian policy approaches which some environmentalists had already articulated in the 1970s and which have regularly been reiterated ever since. Studies undertaking such comparisons commonly specify a number of performance indicators (e.g. resource preservation, land use, biodiversity protection, renewable energy), undertake an elaborate comparative analysis and then, more or less predictably, come to the conclusion that claims about the eco-political effectiveness of authoritarian policy approaches are unfounded and that democratic systems, whilst displaying undeniable weaknesses, are performing better than non-democratic systems. However, such studies not only run into problems regarding the factual hybridisation of democracy and its assumed counterpart, but their eco-political confirmation of the Churchill Hypothesis may, as indicated above,

also not be particularly helpful, if the sustainability crisis is really becoming as alarmingly acute as many have suggested. Moreover, such comparisons are problematic in that they cannot easily account for the massive externalisation of ecological as well as social costs (e.g. relocation of energy- and resource-intensive industries) which in the era of global interconnectedness is endemic – and which is an integral part of western (democratic) strategies of ecological modernisation. Thus one may wonder what exactly such comparisons between democratic and non-democracy systems actually achieve. More than anything they may serve to provide reassurance that western capitalist democratic post-industrial societies are, at least in principle, on the right track, and just need to fine-tune their democratic institutions and policy instruments so as to fully realise the untapped sustainability-potentials of the established order.

Turn- Authoritarianism hurts enviro

Transition to authoritarianism bad

***Authoritarianism and the power grab causes ACCELERATION of environmental crises**

Carter, 13, professor of philosophy

If we are to stand up to such a serious environmental threat as many insist we currently face, and if we need to respond to it quickly, isn't some highly authoritarian, centralized state that can enforce strict environmental policies the obvious solution? At its most attractive, eco-authoritarianism presents itself as a form of benevolent dictatorship - an environmentally benevolent dictatorship, as it were. Unfortunately, as obvious a solution as eco-authoritarianism appears to be, its flaws seem equally obvious. As with any benevolent dictatorship, how can it be guaranteed that it will remain benevolent? It is difficult to see how whatever structures empower an authoritarian, centralized leadership to exercise power effectively will, at the same time, inhibit exercises of that power which take a non-benevolent form; unless it is the people themselves who constrain such a leadership. But then, why is a leader necessary in the first place? If a leader is necessary, it must be because he or she has real power, and now can its exercise be guaranteed to remain benevolent? Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain it. How can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, seem to make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than that of those whom they usurp, as the history of many coups can be argued to attest to. In short, all of the arguments that have been rehearsed against ostensibly benevolent dictatorships appear equally pertinent to environmentally benevolent ones. If an autocrat wished to use his or her power to protect the environment, the structures which enabled that power to be exercised could, presumably, just as easily be used by his or her successors to degrade the planet further, or even at an accelerated rate, for their short-term or localized enjoyment. In fact, there is a powerful argument that can be deployed which seems to establish that any authoritarian response to the mounting environmental crises will accelerate them rather than provide a solution. But because of the theoretical assumptions underpinning that argument, it will have to wait until Chapter 6 before being presented, and until Chapter 7 before being deployed against eco-authoritarianism. Suffice it to say that we already have some reason to think that an effective long term response to the ecological threat which environmentalists claim to have identified would require an alternative political theory to that propounded by eco-authoritarians 2.2

AT: Rights=Enviro destruction

Human rights are key to combatting climate change

Cameron and Limon 12 (Edward Cameron and Marc Limon. "Restoring The Climate By Realizing Rights: The Role Of The International Human Rights System." Review Of European Community & International Environmental Law 21.3 (2012): 204-219. Academic Search Complete. Weeb. 28 June 2015.)

As a result, for many years, this approach represented a high-risk and often unwelcome strategy. However, five years on from the Male' Declaration, the tables have turned. Professor Daniel Magraw, former President of the Center for International Law and one of the earliest proponents of the link between human rights and climate change, has said that when this nexus was first mooted 'people laughed at the very thought; but no one is laughing now'.¹⁶ Today human rights are seen as a legitimate and powerful element of a wider climate change regime complex, stretching across a wide range of multilateral processes.¹⁷ Rather than being shunned, the succession of Human Rights Council resolutions, the explosion of academic and civil society output on this issue, and the increasing call to human rights norms within the UNFCCC suggest that human rights is increasingly viewed as a potentially transformational part of tackling the climate challenge.¹⁸ The climate justice narrative has become a powerful advocacy tool for civil society organizations and vulnerable countries, which is helping to evolve our analysis of socioecological thresholds and is enhancing political processes both internationally and domestically to better account for the experience of vulnerable populations.

Authoritarianism worse- violence

Structural Violence

***Authoritarianism's racial and patriarchal structure promotes structural violence in the form of gendered violence and racial profiling- Hungary proves**

McRobie '14 (novelist, journalist, co-editor of openDemocracy 50.50, and editor of the Oxford Human Rights Hub. She is completing a PhD on the 2011 Egyptian revolution at Oxford University and holds an MA focusing on Balkan studies from the University of Sarajevo. Her latest book Literary Freedom: a Cultural Right to Literature was published in December 2013

<https://www.opendemocracy.net/5050/heather-mcrobie/it-takes-broken-bones-authoritarianism-and-violence-against-women-in-hungary//6-26-15//MC>

Authoritarianism is never good news for women – as citizens or as the structurally more marginalised gender – and Hungary's continued shift away from democracy and upholding human rights under the right-wing Fidesz government is mirrored by its regressive backsliding on gender equality. Last week, Hungarian feminist groups spoke out to condemn a public service announcement made by a Hungarian police department that blamed women for 'inviting' sexual violence. In a shockingly misguided attempt to mark the International Day for the Elimination of Violence against Women, the video showed young women drinking, dancing and flirting before cutting to what looked like the aftermath of a sexual assault. The video ended with the warning "it's your responsibility", implying that women invite sexual violence through 'irresponsibility'. Compounding the erroneous messages the Hungarian public are given on violence against women, another Hungarian police department issued a statement last week on 'rape prevention' that claimed "flirting by young women can often elicit violence." This isn't the first time in recent years that Hungarian officials and government departments have communicated victim-blaming messages on the subject of violence against women, erroneously shifting the blame away from the responsibility of the perpetrator. In 2012, MP Istvan Varga, from the ruling Fidesz party claimed that domestic violence could be solved if women fulfilled their natural role and gave birth to several children. (The "logic" being that if women fulfilled their societal duty and reproduced, their partners would respect them more and therefore stop beating them). The popular protests and campaigns by Hungarian feminist groups in the face of this statement were part of what pushed the parliament to agree to legally demarcate domestic violence as a specific offence in the new criminal code. Previously, abusers could only be prosecuted for individual acts of assault and there was no legal recognition of the wider violence and oppression of abusive relationships. However, an extensive Human Rights Watch report in November 2013, 'Unless Blood Flows', documented both the gaps in the new legal provisions for domestic violence, and the inadequate implementation of existing laws and lack of funding and provisions for violence against women. It pointed both to the lack of political will to address violence against women, and to entrenched patriarchal norms as barriers to combatting violence against women and achieving gender equality in both the private and public spheres. Hungarian women's rights organisations pointed out that, although the rates of domestic violence and violence against women are in keeping with the (lamentable) European average, Hungary lagged behind other European countries in terms of both legal and societal recognition of this abuse: "it takes broken bones" for a case of domestic violence to be brought to court, both preventing catching domestic violence at an earlier stage (in light of the fact that domestic abuse often operates on an escalating dynamic) and sending a message that it is not taken seriously by legal and governmental institutions. Screenshot of 2014 'anti-rape' video made by Hungarian police. The Fidesz party spent the last four years gutting independent media and social provisions, and won a second term by a landslide in the elections of April this year, in which the far-

right, anti-immigrant and anti-Semitic Jobbik party also won 20% of the votes. Fidesz has brought with it a plethora of bizarre and reactionary policies and statements from government officials, most recently the widely-protested proposed Internet tax. And the right-wing discourse dominating politics weaves into it a regressive construction of gender relations, in which Fidesz and other right-wing political voices trade on the concept of “family values” in which women are reduced solely to their supposedly ‘natural’ role as mothers and submissive wives. Such a conception of gender relations constructed by right-wing authoritarianism and exclusivist nationalism – in which women are seen as mere vessels for childbearing and subordinate units within the all-important traditional “family – delegates women to the ‘private sphere’ whilst giving men dominance within both the public and the private spheres. In such a conception, domestic violence becomes a matter both of “no-one else’s business” and “she was probably asking for it.” One instance of violence against women did, however, become a public issue – when last November Fidesz politician Jozsef Balogh admitted to beating his wife, yet refused to resign from public office. Hungary’s chief prosecutor found that Mr Balogh’s wife had been struck in the face with “more than medium force”, dragged by her hair, and suffered facial fractures after being assaulted by her husband when the couple returned home from a wedding party. Although Mr Balogh was expelled from the Fidesz party in the wake of public outcry over his violence, his behaviour seemed not far removed from the official message communicated by the government: the patriarchal family with its dominating male ‘head’ is all-important, and domestic violence is a private matter which concerns neither society nor government. The continued lack of government funding for domestic violence shelters – and the victim-blaming “public service announcements” – communicate the same message, that violence against women is both a trivial and a private matter for which the abused can be blamed. Hungary’s right-ward shift and slide away from liberal democracy is bad news for women, not because liberal democracy “guarantees” the decline of violence against women (the cases of several Scandinavian countries show that even high levels of “gender equity” in public life, and gender-sensitive welfare provisions, can coexist with high levels of domestic violence and violence against women in the private sphere) but because, under the current prevailing ideology in Hungary women are sidelined as all structurally marginalised groups are sidelined – if not targeted. Over the same period as the rise of Fidesz and the far-right Jobbik party, Hungary has slipped down the World Economic Forum’s ranking on gender-equity, from 55th place in 2006 to 93 in 2014 (although the number of ranked countries expanded from 115 to 142 in the same period). The alarming rise (or resurgence) of anti-Semitism and anti-Roma sentiment shows the corrosive right-wing discourse eating at Hungary’s society as anyone who occupies the marginal position – as an ethnic minority, or immigrant, or on the grounds of their gender or sexual orientation – is sidelined, demonised and targeted, as if in a Nietzschean reading of social order enacting a sociopathic mindset in which the structurally weaker are punished for “being weak”. The public service announcement telling women “it is your responsibility” to prevent sexual assault by ‘not flirting and drinking’ is in keeping with the regressive worldview of rightwing discourse swirling in Hungarian political life, with its fetishisation of the patriarchal family and its increasing persecution of minorities and the structurally disadvantaged. In such a climate, violence against women is both a “private” issue of the exalted family-unit and a “natural” situation in which the dominant enacts its will on the disadvantaged. And so the structural and social violence the Hungarian state is waging upon its marginalised is enacted again, as if in aftershock, over and over upon the bodies of women.

Authoritarian governmental practices promote violence against vestiges of its social contract – including minorities, women, and people in poverty

Giroux '15 (Henry A., Global TV Network Chair Professor at McMaster University in the English and Cultural Studies Department and a Distinguished Visiting Professor at Ryerson University
www.counterpunch.org/2015/03/30/terrorism-violence-and-the-culture-of-madness/ // 6-26-15 // MC)

George Orwell's nightmarish vision of a totalitarian society casts a dark shadow over the United States. The consequences can be seen clearly in the ongoing and ruthless assault on the social state, workers, unions, higher education, students, poor minorities and any vestige of the social contract. Free market policies, values, and practices with their emphasis on the privatization of public wealth, the elimination of social protections, and the deregulation of economic activity now shape practically every commanding political and economic institution in the United States. Public spheres that once offered at least the glimmer of progressive ideas, enlightened social policies, non-commodified values, and critical dialogue and exchange have been increasingly militarized—or replaced by private spaces and corporate settings whose ultimate fidelity is to increasing profit margins. Citizenship is now subsumed by the national security state and a cult of secrecy, organized and reinforced by the constant mobilization of fear and insecurity designed to produce a form of ethical tranquilization and a paralyzing level of social infantilism. Chris Hedges crystalizes this premise in arguing that Americans now live in a society in which "violence is the habitual response by the state to every dilemma," legitimizing war as a permanent feature of society and violence as the organizing principle of politics.[1] Under such circumstances, malevolent modes of rationality now impose the values of a militarized neoliberal regime on everyone, shattering viable modes of agency, solidarity, and hope. Amid the bleakness and despair, the discourses of militarism, danger and war now fuel a war on terrorism "that represents the negation of politics—since all interaction is reduced to a test of military strength war brings death and destruction, not only to the adversary but also to one's side, and without distinguishing between guilty and innocent."[2]

Authoritarian ecological practices make the government vulnerable to racist, right-wing policies – empirics

Zimmerman '14 (Michael E., June 3, 2014 Michael E. Zimmerman is Professor of Philosophy and Director of the Center for Humanities and the Arts at CU, Boulder.
www.colorado.edu/philosophy/paper_zimmerman_ecofascism.pdf // 6-28-15 // MC)

Some environmentalists regard the takings issue as spurious, whereas others agree that it has some merit. Almost all environmentalists, however, claim that the charge of ecofascism is the ludicrous creation of anti-environmental corporations and extractive industries. Even though this evaluation may be accurate, I argue that the threat of ecofascism cannot be dismissed out of hand. True, ecofascism is unlikely to occur in the United States any time soon, but environmentalists need to be aware that ecofascism was a component of German National Socialism, and that even today neo-fascists and members of far right-wing groups in Europe and the United States put to dark uses concepts drawn from the environmental movement. Twenty years ago, far right-wing groups in Germany were already linking their anti-immigrationist platform to the mainstream concern about the environmental impacts of human population growth and population density. These days, even mainstream German politicians link immigration to environmental concerns, only now in the context of the renewal of anti-Semitism.² Far

right-wing groups in the United States have begun to tie public concern about urban sprawl and environmental pollution to immigrants from countries that 2 allegedly fail to respect the natural environment. In the current global situation, environmentalists should continue to promote their agenda, but should also be prepared to dissociate themselves from those who might exploit aspects of it for their own ends. Before beginning my discussion of ecofascism, let me make some comments about how I depict positions on the political spectrum. I distinguish between right-wing and far right-wing. Ron Arnold's political views are right-wing, insofar as he strongly endorses limited government and affirms the primacy of individual liberty. His views on these point are consistent with neo-classical liberalism, which is often described as "conservatism" these days, and which is to be distinguished from the "welfare" liberalism that most people now identify as liberalism. The latter favors some state intervention to level the playing field and to provide a safety net for people with economic and social problems. Most Americans, including welfare liberals, have strong commitments to some variety of individualism, and most Americans also support a significant role for government in many domains of life. Despite what right-wing commentators like Arnold may say, there is not a strong left-wing presence in American politics, if left-wing is understood to mean socialist or communist. Far right-wingers demand that the state take very strong measures to save "the people" from alleged danger. Upon taking power, far right-wingers would "temporarily" suspend constitutional freedoms in order to have a free hand to destroy "the enemy within." Limited individual "freedom" may eventually be restored, but only to those who are sufficiently like those who are in power. Whereas American right-wing individualists are suspicious of the state and its coercive powers, many far right-wingers seek to use such powers to suppress or eradicate those whose politics, economic status, race, class, religion, or national origin are regarded as unacceptably "different." The far right-wing becomes fascist when it describes the state itself in semi-religious terms, for example, as the life-giving organism whose organs are constituted by the people. The fascist state controls everything; individuals have no status apart from what the state permits. In requiring that individuals sacrifice their own "selfish" interests for the higher interests of the social 3 whole, fascism is similar to communism. This similarity explains why someone like Ron Arnold describes radical environmentalists now as communists, now as ecofascists.

Nuclear War

Authoritarian leaders lash out with nukes.

Holdorf, 10 (Polly M. Holdorf, MA in International Security and a BA in International Studies, **Limited Nuclear War in the 21st Century**, http://csis.org/files/publication/110916_Holdorf.pdf)

There are four specific objectives that nuclear-armed regional adversaries might seek to achieve through the use of nuclear weapons. They might seek to deter the United States from intervening in a conflict or projecting military power into the region by threatening escalation. If the United States is not deterred by threats of escalation, the adversary might consider using its nuclear weapons to limit or defeat U.S. military operations. The adversary might seek to intimidate U.S. allies or friends within the region, or to split regional political coalitions apart. Certainly the adversary would attempt to limit U.S. objectives in the confrontation and try to dissuade the United States from seeking to impose regime change. For authoritarian or despotic leaders, nuclear weapons may be seen as a means of survival. These types of leaders may be preoccupied with the survival not just of their regimes, but of their own personal survival. Regional adversaries facing a confrontation with the United States would know beyond any doubt that they faced an opponent with vastly superior military forces and resources. Adversarial leaders may not be prepared to face the disastrous consequences of a military defeat, particularly one that would result in their removal from power. Such leaders may feel that their only hope for survival would be to attempt to stave off, or at least delay, a defeat by employing a nuclear weapon against U.S. forces. It is also possible that an adversary, knowing that it cannot and will not prevail, may wish to “go out with a bang”; or they may wish to be remembered as the leader who stood up to the United States by utilizing nuclear weapons. A number of factors exist that could serve as catalysts for future nuclear use. Latent conflicts within a regional setting could ignite and nuclear threats may be signaled by one or both sides in order to influence the opposing states’ actions. A nuclear state on the verge of losing a conventional war might employ its nuclear weapons in order to avert defeat. Small nuclear states which harbor feelings of isolation (such as North Korea) could perceive the actions of others as threatening and therefore be intimidated into employing nuclear weapons as a means to protect their interests. Traditional means of deterrence may not work the same way between small states as they did with the United States and the Soviet Union during the Cold War. Strategic discourse between two small nuclear-armed states may be lacking, thus elevating the prospect for the collapse of deterrence at the regional level. Small nuclear states may have flawed or incomplete intelligence regarding their relative positions in a conflict. A misperception regarding an adversary’s intentions could compel a country to conduct a preemptive strike on the opponent’s nuclear arsenal or conventional military forces. There is also the possibility that a small nuclear armed state may have a deficient command and control structure, increasing the risk of an accidental or unauthorized nuclear launch. The use of nuclear weapons in a regional setting could support a range of objectives including coercion, war termination, regime preservation or even revenge. Some states could view the use of nuclear weapons as a means-of-last resort, while others may view them as the only viable means to alter the status quo or to remedy a deteriorating regional security situation. In some circumstances a state may view the use of nuclear weapons as the best, or the “least bad,” option available to them. The fear of regime change may be a compelling reason for a nuclear-armed regional adversary to consider employing nuclear weapons during a conflict. For leaders who are concerned about their ability to remain in power in the event of a

war with a superiorly armed adversary, nuclear weapons could be viewed as a valuable tool to have in their arsenal. "If an attack by a U.S.-led coalition would pose a significant threat to your regime and your nation cannot afford conventional forces capable of deterring or defeating such an attack, you may regard nuclear weapons as the answer." One can be certain that the overthrow of the Taliban in 2001 and Saddam Hussein in 2003 are still very fresh, particularly in the minds of the Iranian and North Korean regimes. These regimes are also aware that they have been identified as security threats to the United States.

AT: Warming Impact

No Impact

***squo cap solves warming – tech developments**

Starck, PhD, Feb 2015, (Walter, "The Climate Scam's Meltdown" Ausmarine 37.4: 26-27. Proquest. search.proquest.com/docview/1666284048?pq-origsite=gscholar)

Capitalism will find a way With or without any agreement or government initiatives, economics, technological developments and demographic changes will in due course inevitably reduce the demand for fossil fuels and replace them with other and cleaner sources of energy. Thorium- and fusion-reactor developments are showing increasing promise of providing effectively unlimited cheap and clean energy within a few decades. For domestic use, solar voltaic technology is beginning to become competitive with mains electricity, with further gains in cost effectiveness near certain in the near future. Major advances in storage technology are also well underway and expected to become Commercially available within a few years. Better, cheaper solar technology to power homes and vehicles is likely to drive the beginning of mass uptake within a decade. This will be impelled by cost effectiveness, with subsidies unnecessary. Indeed, such support risks doing more harm than good if it diverts development and uptake from the best and most efficient technologies emerging from a complex, rapidly changing and impossible-to-predict scientific frontier.

***There is no impact to warming- trends prove no disasters**

Kreutzer 3/31

(David Kreutzer [the senior research fellow in energy economics and climate change at The Heritage Foundation's Center for Data Analysis], 3/31/15, "Five Myths About Extreme Weather and Global Warming," The Daily Signal, dailysignal.com/2014/03/31/five-myths-extreme-weather-global-warming/, MX)

There is broad (though not unanimous) agreement, even among skeptic scientists, that the earth has warmed moderately over the past 60 years and that some portion of that warming can be attributed to anthropogenic carbon dioxide emissions. However, despite the hoopla surrounding the recent report on the economic impacts of global warming from the U.N.'s

Intergovernmental Panel on Climate Change (IPCC), there is no consensus that temperatures are increasing at an accelerating rate or that we are headed to a climate catastrophe. In fact, far from increasing at an accelerating rate, the best measures of world average temperatures indicate that there has been no significant warming for the past 15 years—something that the IPCC's climate models are unable to explain. Perhaps frustrated by the climate's unwillingness to follow the global-warming script, the hard-core advocates for costly, energy-killing programs now point to every weather event as the wages of carbon-emitting sins. However, the numbers tell a different story: Upward trends for extreme weather events just aren't there. Myth #1: Hurricanes are becoming more frequent. Even the IPCC

notes there is no trend over the past 100 years. Here's what the IPCC says in its latest science report: Current data sets indicate no significant observed trends in global tropical cyclone frequency over the past century and it remains uncertain whether any reported long-term increases in tropical cyclone frequency are robust, after accounting for past changes in observing capabilities.... No robust trends in annual numbers of tropical storms, hurricanes and major hurricanes counts have been identified over the past 100 years in the North Atlantic basin. [Emphasis added.] Some people will make a big deal about an increase in North Atlantic hurricanes since the 1970s. As the IPCC chart below (Panel b) shows, the 1970s had the lowest frequency of landfalling hurricanes in the past 100 years. Hurricane Sandy seems to be an argument in a class by itself. It should be noted that Sandy became an extratropical cyclone before it made landfall. Here is what the IPCC says about historical trends in extratropical cyclones: "In summary, confidence in large scale changes in the intensity of extreme extratropical cyclones since 1900 is low." Also, data from the National Oceanic and Atmospheric Administration (NOAA) covering the years 1851—2004 show that hurricanes made a direct hit on New York State about every 13 years on average. Over the period, there were a total of 12 hurricanes that made landfall along the New York coastline. Five of them were major hurricanes. Myth #2: Tornadoes are becoming more common. The experts at the National Climatic Data Center (part of NOAA) say: To better understand the variability and trend in tornado frequency in the United States, the total number of EF-1 and stronger, as well as strong to violent tornadoes (EF-3 to EF-5 category on the Enhanced Fujita scale) can be analyzed. These tornadoes would have likely been reported even during the decades before Doppler radar use became widespread and practices resulted in increasing tornado reports. The bar charts below indicate there has been little trend in the frequency of the stronger tornadoes over the past 55 years. [Emphasis added.] That is, once we account for the apparent increase in tornado counts that are due to much improved technology for identifying them, tornadoes occur no more frequently now than in the past. Even more striking is the history of F3 and stronger tornadoes (shown below), which were even less likely to be missed before Doppler radar. That trend is actually down compared to the 1955–1975 period: Myth #3: Droughts are becoming more frequent and more severe. In the recent science report, even the IPCC finds little evidence to support

the myth regarding droughts, and it backs off from its support in a previous report. Here is a quote from the AR5: In summary, the current assessment concludes that there is not enough evidence at present to suggest more than low confidence in a global-scale observed trend in drought or dryness (lack of rainfall) since the middle of the 20th century, owing to lack of direct observations, geographical inconsistencies in the trends, and dependencies of inferred trends on the index choice. Based on updated studies, AR4 conclusions regarding global increasing trends in drought since the 1970s were probably overstated. Myth #4: Floods are becoming more frequent and severe. The IPCC's science report states, "In summary, there continues to be a lack of evidence and thus low confidence regarding the sign of trend in the magnitude and/or frequency of floods on a global scale." For the U.S., the story is the same. Some places will always be drier and some wetter in comparison to an earlier period. However, for the U.S. overall, there has been no trend. The chart below of the Palmer Hydrologic Drought Index (PHDI) shows no trend for increasing droughts (represented by bars with negative values). From 1930 to 1941, the PHDI was consistently negative and set annual records that have not been matched.

Newest study shows that warming predictions are greatly exaggerated - erroneous feedback assumptions Woollaston 1/21

(Victoria Woollaston [Deputy Science and Technology Editor], 1/21/15, "Is climate change really that dangerous? Predictions are 'very greatly exaggerated', claims study," Daily Mail, www.dailymail.co.uk/sciencetech/article-2920311/Is-climate-change-really-dangerous-Predictions-greatly-exaggerated-claims-study.html, MX)

Since 1990, scientists have used complex models to predict how climate change and manmade greenhouse emissions will affect the world. But a team of experts - including an astrophysicist, statistician, and geography professor - has claimed these models 'very greatly exaggerate' the effects of global warming. Using a simpler, solar-based model, the researchers arrived at figures that are more than half those previously predicted. The paper, "Why models run hot: results from an irreducibly simple climate model", was written by Lord Christopher Monckton of Brenchley, astrophysicist and geoscientist Willie Soon, Professor of Geography at the University of Delaware David Legates, and statistician Dr Matt Briggs. It has been peer reviewed and is published in the journal Science Bulletin. Mathematical equations used for large climate model typically require supercomputers that perform calculations quickly - some make more than 80 million calculations an hour. Sophisticated climate models take into account the amounts of animals and plants, or biosphere, the hydrosphere's oceans and other bodies of water, sea ice and ice sheets in the cryosphere, and the geosphere, that measures tectonic variations such as volcanic eruptions and moving continents. By comparison, the team's simple model looked at temperatures caused by so-called anthropogenic radiative forcings and consequent 'temperature feedbacks' over a given timeframe. Anthropogenic radiative forcings, put simply, are measured by the difference between the amount of sunlight absorbed by Earth, and the energy that is radiated back to space. A temperature feedback is created by albedo - the amount of shortwave radiation from solar energy reflected by Earth. Ice and snow is highly reflective, so has a high albedo, for example. This means the majority of sunlight that hits snow is sent back towards space. When ice and snow melts, as temperatures rise, the darker soil or grass lowers the albedo. This increases the ground's temperature, causing more snow to melt, leading to a further rise in temperature. Temperature feedbacks can also be affected by water vapour and cloud cover. Both of these measurements can be used to suggest global temperatures, radiation and energy levels in the atmosphere and the Earth. The researchers tested their so-called 'simple' model and its global warming predictions against the complex models used by climate scientists. In particular, those complex models involved in the UN and World Meteorological Organization's (WMO) Intergovernmental Panel on Climate Change (IPCC) report. They also compared their predictions against real-world temperature changes. The paper claims that the measured, real-world rate of global warming over the past 25 years, equivalent to less than 1.4° C per century, is 'half the IPCC's central prediction in 1990." In 1990, the UN's climate panel predicted with 'substantial confidence' that the world would warm at twice the rate that has been observed since. According to the study, another error made by the complex climate models, include the assumption that 'temperature feedbacks' would double or triple direct manmade greenhouse warming. The simple model instead found that feedbacks could reduce warming. Also, modellers are said to have failed to cut their estimate of global warming in line with a new, lower feedback estimate from the IPCC. They still predict 3.3°C of warming per CO2 doubling, when on this ground alone they should only be predicting 2.2°C - about half from direct warming and half from feedbacks,' said the researchers. "Though the complex models say there is 0.6°C manmade warming "in the pipeline" even if we stop emitting greenhouse gases, the simple model - confirmed by almost two decades without any significant global warming - shows there is no committed but unrealised manmade warming still to come." Once these errors are corrected, the researchers predict that the most likely global warming in response to a doubling of CO2 is not 3.3°C, but 1°C or less. And, even if all available fossil fuels were burned, less than 2.2°C warming would result, they claim. Author Dr Willie Soon, an solar physicist at the Harvard-Smithsonian Centre for Astrophysics, said: "Our work suggests that man's influence on climate may have been much overstated." "The role of the sun has been undervalued. Our model helps to present a more balanced view." "A high-school student with a pocket scientific calculator can now use this model and obtain credible

estimates of global warming simply and quickly, as well as acquiring a better understanding of how climate sensitivity is determined,' added statistician and co-author Dr Matt Briggs. As a statistician, I know the value of keeping things simple and the dangers in thinking that more complex models are necessarily better. 'Once people can understand how climate sensitivity is determined, they will realise how little evidence for alarm there is.' While Lord Monckton said: 'Our irreducibly simple climate model does not replace more complex models, but it does expose major errors and exaggerations in those models. 'For instance, take away the erroneous assumption that strongly net-positive feedback triples the rate of manmade global warming and the imagined climate crisis vanishes.'

Climate activism is filled with non-factual rhetoric- there is no real impact Heartland Institute 3/13

(The Heartland Institute, 3/13/15, "Naomi Klein Showcases What's Wrong With Climate Alarmism," https://www.heartland.org/sites/default/files/ier-naomi_klein_showcases_whats_wrong_with_climate_alarmism.pdf, MX)

In an extended essay for the Guardian excerpted from her new book, Naomi Klein showcases everything wrong with climate activism. First, she slings out a string of dire warnings that are preposterous, going far beyond what the "consensus science" of the latest IPCC report says. Then, after terrifying her readers with bogus warnings, Klein then calls for massive government action on the scale of the "Marshall Plan" in order to achieve all sorts of progressive goals, including a more equal society. Klein's essay shows that she too—just like outgoing IPCC chief Rajendra Pachauri—views climate activism not merely as a scientific endeavor, but as a secular religion. Naomi Klein's Preposterous Warnings Here are some examples of the absurd rhetoric in Klein's essay: Faced with a crisis that threatens our survival as a species, our entire culture is continuing to do the very thing that caused the crisis... [T]he global economy is juggling the ante from conventional sources of fossil fuels to even dirtier and more dangerous versions – bitumen from the Alberta tar sands, oil from deepwater drilling, gas from hydraulic fracturing (fracking), coal from detonated mountains, and so on. Meanwhile, each supercharged natural disaster produces new irony laden snapshots of a climate increasingly inhospitable to the very industries most responsible for its warming. Like the 2013 historic floods in Calgary that forced the head offices of the oil companies mining the Alberta tar sands to go... Or the drought that hit the Mississippi river one year earlier, pushing water levels so low that barges loaded with oil and coal were unable to move for days... Living with this kind of cognitive dissonance is simply part of being alive in this jarring moment in his tory, when a crisis we have been studiously ignoring is hitting us in the face – and yet we are doubling down on the stuff that is causing the crisis in the first place... [W]e look but try to be hyper-rational about it ("dollar for dollar it's more efficient to focus on economic development than climate change, since wealth is the best protection from weather extremes") – as if having a few more dollars will make much difference when your city is underwater... We know that if we continue on our current path of allowing emissions to rise year after year, climate change will change everything about our world. Major cities will very likely drown, ancient cultures will be swallowed by the seas, and there is a very high chance that our children will spend a great deal of their lives fleeing and recovering from vicious storms and extreme droughts. [Bold added.] I hope I don't have to even argue that our species, Homo sapiens is not threatened by climate change in even the most extreme scenarios studied in the literature. Yes, it is theoretically possible that runaway climate change could wipe out our species, just as it's theoretically possible that emitting radio waves will alert hostile aliens to our presence and lead to the destruction of humanity. That is hardly an argument for banning radios. Regarding sea level rise, the latest IPCC report (the Fifth Assessment Report or AR5) says that in a business-as-usual scenario—meaning governments don't take drastic new measures to restrict carbon dioxide emissions—concludes that the likely sea level rise by the year 2100 will be between 26 and 82 centimeters. It is true that some experts warn policymakers that they should prepare for a "worst case" scenario of 190 centimeters. But these outcomes are hardly a given, contrary to Naomi Klein's casual references to major cities being underwater. And even in those circumstances—again contrary to Klein—many analysts think the rational thing to do would be to continue using efficient, affordable energy in order to develop these coastal regions and fortify them against rising sea levels. Remember, the type of drastic emission cutbacks Klein has in mind would literally cost the world many trillions of dollars in forfeited economic output. That estimate comes not from skeptical groups who are pro-business, but rather from William Nordhaus's own modeling. (See the "abatement costs" of various policies in Table 4 of my journal article here.) Humanity is very resourceful and can do a lot with many trillions of dollars and 85 years to prepare, especially if we're talking about what even the IPCC's own computer models consider to be an unlikely threat. Regarding extreme weather events, here too the actual published science doesn't support Klein's rhetoric. As I explained in this previous IER post, the latest IPCC report doesn't support the claims that many current extreme weather events are due to manmade climate change. Here are some excerpts from the IPCC's Working Group I (AR5) report: "Overall, the most robust global changes in climate extremes are seen in measures of daily temperature, including to some extent, heat waves. Precipitation extremes also appear to be increasing, but there is large spatial variability." There is limited evidence of changes in extremes associated with other climate variables since the mid-20th century. Current datasets indicate no significant observed trends in global tropical cyclone frequency over the past century ... No robust trends in annual numbers of tropical storms, hurricanes and major hurricanes counts have been identified over the past 100 years in the North Atlantic basin." "In summary, there continues to be a lack of evidence and thus low confidence regarding the sign of trend in the magnitude and/or frequency of floods on a global scale." "In summary, there is low confidence in observed trends in small-scale severe weather phenomena such as hail and thunderstorms because of historical data inhomogeneities and inadequacies in monitoring systems." "In summary, the current assessment concludes that there is not enough evidence at

present to suggest more than low confidence in a global-scale observed trend in drought or dryness (lack of rainfall since the middle of the 20th century..." Finally, regarding Klein's claims that our children will be threatened by the ravages of climate change: She is apparently unaware that according to one of the three climate models selected by the Obama Administration to estimate the "social cost of carbon," manmade global warming will confer net benefits on humanity through the year 2065 or so.[1] (See my treatment of Claim #3 in this earlier IER post for the details.) I don't know how old Klein's children are, but I can say that one of the leading computer models predicts that my son will be around 60 years old at the point when human carbon dioxide emissions stop helping humanity on net and turn into a nuisance. Is the general public getting this aspect of the "consensus science" on climate change? Would the average person have any idea that one of the Obama Administration's own computer models contains this prediction? Klein Reveals the Real Driver of Climate Alarmism Later in her essay, Klein unwittingly reveals why she is so unconcerned with the actual facts, and instead relies on over-the-top rhetoric to scare her readers into action. Just look at these amazing quotations:

Data Manipulation

The warming pause is real -don't trust other research - it manipulates data Lott 6/10

(Maxim Lott [Writer for FoxNews.com and producer for John Stossel], 6/10/15, "Climate scientists criticize government paper that erases 'pause' in warming," Fox News, www.foxnews.com/science/2015/06/10/climate-scientists-criticize-government-paper-that-erases-pause-in-warming/, MX)

Until last week, government data on climate change indicated that the Earth has warmed over the last century, but that the warming slowed dramatically and even stopped at points over the last 17 years. But a paper released May 28 by researchers at the National Oceanic and Atmospheric Administration has readjusted the data in a way that makes the reduction in warming disappear, indicating a steady increase in temperature instead. But the study's readjusted data conflict with many other climate measurements, including data taken by satellites, and some climate scientists aren't buying the new claim. "While I'm sure this latest analysis from NOAA will be regarded as politically useful for the Obama administration, I don't regard it as a particularly useful contribution to our scientific understanding of what is going on," Judith Curry, a climate science professor at Georgia Tech, wrote in a response to the study. And in an interview, Curry told FoxNews.com that the adjusted data doesn't match other independent measures of temperature. "The new NOAA dataset disagrees with a UK dataset, which is generally regarded as the gold standard for global sea surface temperature datasets," she said. "The new dataset also disagrees with ARGO buoys and satellite analyses." The NOAA paper, produced by a team of researchers led by Tom Karl, director of the agency's National Climatic Data Center, found most of its new warming trend by adjusting past measurements of sea temperatures. Global ocean temperatures are estimated both by thousands of commercial ships, which record the temperature of the water entering their engines, and by thousands of buoys – flotation devices that sit in the water for years. The buoys tend to get cooler temperature readings than the ships, likely because ships' engines warm the water. Meanwhile, in recent years, buoys have become increasingly common. The result, Karl says, is that even if the world's oceans are warming, the unadjusted data may show it not to be warming because more and more buoys are being used instead of ships. So Karl's team adjusted the buoy data to make them line up with the ship data. They also double-checked their work by making sure that the readjusted buoy readings matched ships' recordings of nighttime air temperatures. The paper came out last week, and there has not been time for skeptical scientists to independently check the adjustments, but some are questioning it because of how much the adjusted data vary from other independent measurements. First, it disagrees with the readings of more than 3,000 "ARGO buoys," which are specifically designed to float around the ocean and measure temperature. Some scientists view their data as the most reliable. The ARGO buoy data do not show much warming in surface temperature since they were introduced in 2003. But Karl's team left them out of their analysis, saying that they have multiple issues, including lack of measurements near the Arctic. In an email, Karl told FoxNews.com that the ARGO buoy readings may be added to his data "if scientific methods can be found to line up these two types of temperatures together ... (of course after correcting the systematic offsets) ... This is part of the cumulative and progressive scientific process." Karl's study also clashes with satellite measurements. Since 1979, NOAA satellites have estimated the temperature of Earth's atmosphere. They show almost no warming in recent years and closely match the surface data before Karl's adjustments. The satellite data is compiled by two separate sets of researchers, whose results match each other closely. One team that compiles the data includes Climate Professors John Christy and Roy Spencer at the University of Alabama in Huntsville, both of whom question Karl's adjusted data. "The study is one more example that you can get any answer you want when the thermometer data errors are larger than the global warming signal you are looking for," Spencer told FoxNews.com.

Scientists manipulate data to suit their "trends" Tracinski 6/8

(Robert Tracinski [a senior writer at The Federalist. He studied philosophy at the University of Chicago and for more than 20 years has written about politics, markets, and foreign policy], 6/8/15, "Global Warming: The Theory that Predicts Nothing and Explains Everything," The Federalist, thefederalist.com/2015/06/08/global-warming-the-theory-that-predicts-nothing-and-explains-everything/, MX)

A lot of us have been pointing out one of the big problems with the global warming theory: a long plateau in global temperatures since about 1998. Most significantly, this leveling off was not predicted by the theory, and observed temperatures have been below the lowest end of the range predicted by all of the computerized climate models. So what to do if your theory doesn't fit the data? Why, change the

data, of course! Hence a blockbuster new report: a new analysis of temperature data since 1998 “adjusts” the numbers and magically finds that there was no plateau after all. The warming just continued. Starting in at least early 2013, a number of scientific and public commentators have suggested that the rate of recent global warming has slowed or even stopped. The phenomena has been variably termed a “pause,” a “slowdown,” and a “hiatus.”... But as a team of federal scientists report today in the prestigious journal Science, there may not have been any “pause” at all. The researchers from the National Oceanic and Atmospheric Administration’s National Centers for Environmental Information (NCEI) adjusted their data on land and ocean temperatures to address “residual data biases that affect a variety of measurements, such as those taken by ships over the oceans. And they found that “newly corrected and updated global surface temperature data from NOAA’s NCEI do not support the notion of a global warming ‘hiatus.’” How convenient. It’s so convenient that they’re signaling for everyone else to get on board. One question raised by the research is whether other global temperature datasets will see similar adjustments. One, kept by the Hadley Center of the UK Met Office, appears to support the global warming “hiatus” narrative—but then, so did NOAA’s dataset up until now. Before this update, we were the slowest rate of warming,” said Karl. “And with the update now, we’re the leaders of the pack. So as other people make updates, they may end up adjusting upwards as well.”

This is going to be the new party line. “Hiatus”? What hiatus? Who are you going to believe, our adjustments or your lying thermometers? The new adjustments are suspiciously convenient, of course. Anyone who is touting a theory that isn’t being borne out by the evidence and suddenly tells you he’s analyzed the data and by golly, what do you know, suddenly it does support his theory—well, he should be met with more than a little skepticism. If we look, we find some big problems. The most important data adjustments by far are in ocean temperature measurements. But anyone who has been following this debate will notice something about the time period for which the adjustments were made. This is a time in which the measurement of ocean temperatures has vastly improved in coverage and accuracy as a whole new set of scientific buoys has come online. So why would this data need such drastic “correcting”? As climatologist Judith Curry puts it: The greatest changes in the new NOAA surface temperature analysis is to the ocean temperatures since 1998. This seems rather ironic, since this is the period where there is the greatest coverage of data with the highest quality of measurements—ARGO buoys and satellites don’t show a warming trend. Nevertheless, the NOAA team finds a substantial increase in the ocean surface temperature anomaly trend since 1998. NOAA corrected the ocean temperature measurements to be more consistent with a previous set of measurements. But those older measurements were known to be a problem. Scientists relied on measurements from merchant vessels, which had slowly switched from measuring water in buckets dipped over the side to measuring it on its way through intake ports for cooling the ship’s engines. But that meant that water temperatures were more likely to be increased by contact with the ship, producing an artificial warming. Hence the objection made by Patrick Michaels, Richard Lindzen, and Chip Knappenberger: As has been acknowledged by numerous scientists, the engine intake data are clearly contaminated by heat conduction from the engine itself, and as such, never intended for scientific use. On the other hand, environmental monitoring is the specific purpose of the buoys. Adjusting good data upward to match bad data seems questionable. That’s putting it mildly. They also point to another big change in the adjusted data: projecting far northern land temperatures out to cover gaps in measurement over the Arctic Ocean. Yet the land temperatures are likely to be significantly warmer than the ocean temperatures. I realize the warmists are desperate, but they might not have thought through the overall effect of this new “adjustment” push. We’ve been told to take very, very seriously the objective data showing global warming is real and is happening—and then they announce that the data has been totally changed post hoc. This is meant to shore up the theory, but it actually calls the data into question. Anthony Watts, one of the chief questioners of past “adjustments,” points out that to make the pause disappear, they didn’t just increase temperatures since 1998. They also adjusted downward the temperatures immediately before that. Starting from a lower base of temperature makes the “adjusted” increase look even bigger. That’s a pattern that invariably shows up in all these adjustments: the past is always adjusted downward to make it cooler, the present upward to make it warmer—an amazing coincidence that guarantees a warming trend. All of this fits into a wider pattern: the global warming theory has been awful at making predictions about the data ahead of time. But it has been great at going backward retroactively reinterpreting the data and retrofitting the theory to mesh with it. A line I saw from one commenter, I can’t remember where (update: it was David Burge), has been rattling around in my head: “once again, the theory that predicts nothing explains everything.” There is an important difference between prediction before the fact and explanation after the fact. Prediction requires that you lay down a marker about what the data ought to be, to be consistent with your theory, before you actually know what it is. That’s something that’s very hard to get right. If your theory is going to be able to consistently predict data before it is gathered, it has got to be pretty darned good. Global warming theories have a wretched track record at making predictions. But explanations of data after the fact are a lot easier. As they say, hindsight is 20/20. It’s a lot easier to tweak your theory to make it a better fit to the data, or in this case, to tweak the way the data is measured and analyzed in order to make it better fit your theory. And then you proclaim how amazing it is that your theory “explains” the data. The whole political cause of global warming is based on the theory’s claim to make predictions before the fact. If this difference between prediction and explanation seems merely technical, remember that the whole political cause of global warming is based on the theory’s claim to make predictions before the fact—way before the fact, projecting temperatures for the next century. We’re supposed to base the whole organization of our civilization, at a cost of many trillions of dollars, on those ultra-long-term predictions. So exulting that they can readjust the data for the last few years to jibe with their theory after the fact is not exactly the reassurance we need. Anyone with the slightest familiarity with science ought to be immediately skeptical of this new claim, so naturally mainstream media “science reporters” repeat it with complete credulity and even pre-emptively inoculate us against the sin of doubt. The Washington Post

report/press-release-transcription has a nice little passive-aggressive twist, sneering that "The details of the data adjustments quickly get complicated—and will surely be where global warming doubters focus their criticism." Those global warming doubters, always finding something to kvetch about! What are you gonna do? Worse, the Post ends by passing along a criticism of mainstream scientists for even discussing the global warming pause before now. Harvard science historian Naomi Oreskes recently co-authored a paper depicting research on the "hiatus" as a case study in how scientists had allowed a "seepage" of climate skeptic argumentation to affect the formal scientific literature. Of the new NOAA study, she said in an e-mail: "I hope the scientific community will do a bit of soul searching about how they got pulled into this framework, which was clearly a contrarian construction from the start." Remember that everybody's data was showing a plateau in global temperatures, and many of the studies focused on this were attempting to uphold the global warming theory in the face of that evidence. Yet now some of the theory's own supporters are going to be thrown under the bus for showing too much faith in the data and too little faith in the cause. They will get the message stated bluntly by

Oreskes: science must never be contaminated by skepticism. That gives us a pretty good idea of what is going on here. Because any field where people say this sort of thing is by that very fact not a field of science any longer.

climate change is a scam – alarmists are unqualified and self interested

Starck, PhD, Feb 2015, (Walter, "The Climate Scam's Meltdown" Ausmarine 37.4: 26-27. Proquest. search.proquest.com/docview/1666284048?pq-origsite=gscholar)

"A conspiracy does not require secret planning"

An argument is often made that the climate-change threat must be real because a conspiracy involving an overwhelming majority of the world's scientists is simply not credible. This is disingenuous in that the climate threat, as exemplified by the IPCC's scare machine, is far from representing a scientific consensus, even a majority. Global scientific opinion on this matter is highly mixed with the alarmist position concentrated in Europe and the Anglosphere. Even here thousands of dissenters exist, including many highly qualified and respected researchers with very relevant expertise. The core alarmist proponents only comprise a few dozen, mostly third-rate, academics whose scientific reputations are minimal outside of climate alarmism. They co-opted the niche, little known interdisciplinary field of climatology, proclaimed themselves to be the world authorities, declared a global crisis, received lavish funding to research it and gained global attention. They have been aided and abetted by sundry fellow travellers who see advantage for various other agendas. A conspiracy does not require secret planning. It can be implemented just as easily with a wink and a nod when the aims and methods are apparent to all the participants. It is time to recognise the climate scam for what it is: a conspiracy to defraud on a monumental scale. Although climate itself is presenting its irrefutable opposing argument, failed prophets never willingly concede defeat until their mouths are stopped with the dust of reality. In this instance gob-stopping reality seems likely to take the form of severe winter weather leading to a widespread collapse of electrical power in an overloaded grid suffering from underinvestment, malinvestment, restraints and neglect. All these stem from years of misguided climate policies. Until the crunch comes, the rent-seekers and their useful idiots in the press will rant and rage without pause, their livelihoods and careers hanging on their ability to perpetuate the hoax they foisted on the rest of us. As so often, Shakespeare said it best: "A tale, told by an idiot, full of sound and fury, signifying nothing."

Doesn't Justify authoritarianism

Using warming to justify authoritarianism encourages additional denial Oreskes 6/16

(Naomi Oreskes [professor of the history of science and affiliated professor of earth and planetary sciences at Harvard University], 6/16/15, "The Hoax of Climate Denial," Huffington Post, www.huffingtonpost.com/naomi-oreskes/the-hoax-of-climate-denial_b_7595154.html, MX)

Many Republicans resist accepting the overwhelming scientific evidence of climate change because they fear it will be used as an excuse to expand big government. Here's what should give them pause: by delaying action on reducing global carbon emissions for more than two decades, we have already significantly increased the likelihood that disruptive global warming will lead to the kinds of government interventions they most fear and seek to avoid. Climate change is, in fact, already causing an increase in the sorts of extreme weather events – particularly floods, extreme droughts, and heat waves – that almost always result in large-scale government responses. The longer we wait, the more massive the required intervention will be. In the future, as the devastating effects of climate change unfold here in the United States, natural disasters will result in a greater reliance on government -- especially the federal government. (Of course, our grandchildren will not call them "natural" disasters, because they will know all too well who caused them.) What this means is that the work climate deniers are now doing only helps ensure that we will be less ready for the full impact of climate change, which means greater government interventions to come. Put another way, climate deniers are now playing a crucial role in creating the nightmare they most fear. They are guaranteeing the very future they claim to want to avoid. And not just at home. As climate change unfolds around the globe, climate disasters will give undemocratic forces the justification they seek to commandeer resources, declare martial law, interfere with the market economy, and suspend democratic processes. This means that Americans who care about political freedom shouldn't hold back when it comes to supporting climate scientists and acting to prevent the threats they have so clearly and fulsomely documented.

Warming is a rationalization for authoritarianism Trujillo 4/30

(Aaron Trujillo, 4/30/15, [Writer], "Will: 'Global Warming Is Socialism by the Back Door'," The Daily Signal, dailysignal.com/2014/04/30/will-global-warming-socialism-back-door/, MX)

George Will said recently global warming is socialism by the back door. In an interview with The Daily Caller's Jamie Weinstein, Will points out that progressives use warming to rationalize "more and more power in Washington" to "micromanage the lives of the American people—our shower heads, our toilets, our bathtubs, our garden hoses." Watch:

Political lies

Global warming is a liberal lie - they're all commies McFarlane 6/19

(Bonnie McFarlane, 6/19/15, [Totally serious standup comedian], "Global warming is totally a lie liberals tell to distract us from their commie agendas," The Guardian, www.theguardian.com/environment/commentisfree/2015/jun/19/global-warming-lie-liberals-tell-distract-us, MX)

Everybody is talking about global warming. Clearly, it's got a great publicist. My guess is it's the same one that Amy Schumer uses. However, unlike Schumer – whom I have on good authority is real – Global Warming is a big fat lie. Now, before you spit out your fair trade coffee and start yelling about carbon emissions, let me assure you that this is not a conclusion that came easily to me. I thought about it a lot. Just this morning I was in the shower for a good two hours debating the pros and cons of dating someone with a giant global footprint. Once the water went cold and I dried myself off with a hair dryer, I knew I had my answer. This so-called "environmental Armageddon" is a fictitious construction cooked up by the left so we'll spend all our time (or at least a half hour a week) changing out our light bulbs and flattening cardboard and completely overlooking their pinko/commie/socialist agendas.

I'm on to you, liberals! You're trying to be heroes to humanity. You want everyone to pat you on the back and say, "Oh, look who saved the planet!" Well, I have news for you. The planet doesn't need saving. After all, it's been around for almost 2,000 years. It was fine before you got here, and it'll be fine after the apocalypse destroys most of humankind for the sins of homosexuality and shellfish consumption. God hates Shrimp Scampi, but He doesn't seem to have a problem with littering. (Leviticus 10:10) I wish people would stop incessantly asking, "Don't we care what kind of planet we're going to leave our children?" First of all, I'm pretty sure any child psychologist would agree that leaving a whole planet to a kid is an appalling idea. I wouldn't dream of spoiling my daughter with an entire planet. You don't have to give your kids the world; just spend some time with them once in a while. That's what they really want. That, and a Mercedes SUV for their sweet 16. I wish scientists would stop blaming us humans for causing global warming. This is patently false, since global warming is not real! If the fact that we've just experienced the coldest spring on record isn't enough to sway you, I've got other anecdotal evidence that should be plenty convincing. For example: my sister went to Greenland and never saw any polar bears stranded on tiny ice floes. In fact, my sister didn't see any live polar bears at all, so there. But the most telling sign that global warming is not an actual threat is this: the Republican presidential candidates aren't trying to scare us with the prospect that we're all doomed to die from toxic air and scorching temperatures. And Republican presidential candidates love scaring the public. It's their passion. If they could put a gun to each of our heads individually and say, "Vote for me or else you die", I think they would. That's why, despite the numerous scientific claims and all those hockey-stick graphs showing the sharp rise in temperatures, I don't think there's any truth to this whole global warming thing. At the very least, the declarations are exaggerated and we have nothing to worry about for at least a decade.

Climate change is a fraud

Starck, PhD, Feb 2015, (Walter, "The Climate Scam's Meltdown" Ausmarine 37.4: 26-27. Proquest. search.proquest.com/docview/1666284048?pq-origsite=gscholar)

The rent-seekers, opportunists, third-rate academics, carbon-market scam artists and peddlers of catastrophic prophecy can see the alarmist bubble deflating, so they're trying harder than ever to sustain the scare. Problem is, Mother Nature isn't cooperating. This doesn't mean the climate change "debate" will stop, the news media will cease reporting weather as a dire threat, or that the true believers will no longer be obsessed by it. However, the ultimate arbiter, climate itself, has made clear its decision by ceasing to warm for over 18 years. Despite the ongoing use of fossil fuels, a proclaimed 95 per cent certainty of 97 per cent of scientists and Jhg high-poyyered projections of the world's most advanced climate models, the climate has refused to pay the slightest heed. Contrary to all the confidence and* predictions of alleged experts, storms are no more intense nor frequent, while droughts, floods and sea levels have declined to confirm alarmists' barely concealed hopes of disasters.

The simple fact is that the alleged experts and their high-powered models were wrong. The climate has ceased to warm and, with little or no greenhouse warming, the entire theory of Catastrophic Anthropogenic Global Warming (CAGW), aka Climate Change (CC), aka Global Warming, aka Extreme Weather, is left with no basis. "All who disagreed were deemed to be fools" The debate over CC has been unique in the history of science in that its proponents have largely abandoned the primacy of evidence and openly declared methodology in favour of self-proclaimed authority backed by their own confidential methods and models. It is also unique in that the alarmists refuse to directly address their arguments, preferring to ignore, censor and personally denigrate them. In a few instances in the early part of the public debate, the proponents attempted direct debate with their critics but came away looking decidedly second-best and they soon refused any further direct discussion. With no convincing answers to the uncertainties and conflicting evidence raised by their opponents they simply chose to ignore them, declare the váence "settled" and anoint themselves as the only experts. All who disagreed were deemed to be fools, knaves and/or in the pay and pocket of Big Energy. With a naive and compliant news media steeped in the same politically correct, left wing academic indoctrination as the researchers, the latter enjoyed a near monopoly on favourable news coverage. Self-serving publicity releases were regurgitated undigested? beneath the by-lines of environmental "reporters", who eagerly reduced themselves to unquestioning stenographers. Yet even as the alarmists' received kidglove treatment in the mainstream media, the Internet has been a very different story. Not only did the climate alarmists have no advantage online, the thinking public was increasingly looking to the Web as their primary source for news. This digital realm was outside any particular control or influence, open to the airing of opposing argument and evidence. It was also a forum for the exposure of malpractice, regularly producing exposés that would shatter the façade of scientific expertise and propriety the alarmists had erected around themselves. Think here of how Wattsupwiththat demolished the charlatan Michael Mann and his infamous hockey stick, and the Climategate emails revealed the lengths professional warmists are prepared to go in order to silence sceptics, not least by debasing the conventions of the peer-review process. Fiddling the temperature record In retreat, climate alarmists are now trying to deny the lack of warming while 3 fiddling the temperature record in an effort to "prove* it is continuing. Their ever-more imaginative explanations - the heat is hiding at the bottom of the ocean; trade winds are skewing sea-temperature readings - increasingly smack of desperation. Making matters worse for the alarmists, there is increasing evidence that the global climate has not only ceased to warm but may || actually be starting to cool. Severe, often! record-breaking* winter, weather demanding J more and more undeclared "adjustments" | to the temperature record are being! exposed. Overwhelmingly these serve to (fa reduce past temperatures and increase more^K . recent ones without which the lack of warpiav would be mör&rtwtous1*^

AT: Util

Focus on environmental util doesn't solve alt causes to inequality – sole focus fails

Davidson, 6-4-15, [faculty member in the science department at the Universiteit van Amsterdam] (Marc D. "Climate Change and the ethics of discounting" WIREs Climate Change, Wiley Online Library, onlinelibrary.wiley.com/doi/10.1002/wcc.347/full)

A common criticism of the utilitarian approach is that it would be **overdemanding** to treat other people's happiness as being fully on par with one's own and would alienate people from their personal projects and commitments (see e.g., Ref [50]; Ref [69], p. 277; Ref [70]; see Ref[71] for a defense of the demands of utilitarianism). If applied across the board in intergenerational policy making, i.e., beyond climate policy as well, it would require governments to tax away present consumption to the benefit of future consumption; see e.g., Refs [7, 41, 72-75]; Ref [26], p. 155; Ref [76], p. 47. If applied across the board in intra-generational policy, utilitarianism would require a **massive redistribution** from the currently **rich** to the currently **poor**. However, if the utilitarian approach is restricted to climate policy, it may be queried whether such an approach is coherent (see e.g., Ref [9], p. 230). The objection is not that utilitarianism does not correspond to revealed public preferences, an objection refuted in the section on the prescriptive-descriptive debate, but that it is incoherent if the same government advocates fundamentally different moral principles in different policy areas.

AT: Transition Inevitable

***Democracy more sustainable than authoritarianism- transition not inevitable**

Davis 15 (Davis, Michael C has an LLM from Yale and teaches at the University of Hong Kong. "East Asia After the Crisis: Human Rights, Constitutionalism, and State Reform." Human Rights Quarterly 26.1 (2004): 126-51. ProQuest. Web. 29 June 2015.)

In assessing the debates over political and economic reform, it becomes apparent that constitutionalism has a central role to play. Studies in the political economy literature appear to verify that regime type ultimately matters in the achievement of economic development goals.⁹⁶ While authoritarianism with proper developmental institutions can do reasonably well at early-stage development, this is not invariably so. Furthermore, as economic development proceeds the developmental potential of the authoritarian model may be exhausted. Recent studies have shown that the developmental achievement of authoritarian regimes in East Asia is not uniformly positive. Latent costs are just now being appreciated. In addition to the deficiencies of authoritarian practices in respect to democracy, human rights, and the rule of law, there have also been high levels of corruption. Corruption appears to be a consequence of both early predatory practices and a lack of transparency, and subsequent incapacity of authoritarian regimes to respond to the interests that economic development creates. Rent-seeking evolves from a top-down predatory behavior in the authoritarian period when the state is strong, to a bottom-up predatory behavior in the early stages of democracy as business becomes stronger and the state weaker. Corruption may serve as a substitute for adequate state institutions. Democratic consolidation will aim to curb corruption by affording greater transparency and stable institutions for checks and balances. Greater dispersal and open competition in the society should accompany this consolidation. Local institutions shape investor confidence. Either extreme concentrations of power or extreme dispersal appears to have worked poorly; the former is too volatile and the latter too rigid. Liberal constitutionalism, including democracy, human rights and the rule of law, appears to provide the tools to engender the degree of public engagement and political reliability needed for sustained development. Finding the proper institutional balance is by no means an easy task. The constitutional fundamentals are essential. Minimally maintaining the protections embodied in human rights and the rule of law is important to achieving transparency and accountability, while sustaining confidence in political and legal institutions. Constitutional institutions must be shaped to the local condition. This reality is demonstrated by the varied consequences of importing similar institutions into different countries. Constitutional systems deeply influenced by the American model work very differently in Japan, the Philippines, and the United States. Getting the fit just right is the challenge of local politics.

Democracy inevitable- More sustainable than authoritarian regimes

Slater and Bennis 90 (Philip Slater and Warren Bennis "Democracy is Inevitable" Harvard Business review. THE SEPTEMBER–OCTOBER 1990 ISSUE.

Democracy has been so widely embraced not because of some vague yearning for human rights but because under certain conditions it is a more "efficient" form of social organization. (Our concept of

efficiency includes the ability to survive and prosper.) It is not accidental that those nations of the world that have endured longest under conditions of relative wealth and stability are democratic, while authoritarian regimes have, with few exceptions, either crumbled or eked out a precarious and backward existence. Despite this evidence, even so acute a statesman as Adlai Stevenson argued in a New York Times article on November 4, 1962, that the goals of the Communists are different from ours. "They are interested in power," he said, "we in community. With such fundamentally different aims, how is it possible to compare communism and democracy in terms of efficiency?" Democracy (whether capitalistic or socialistic is not at issue here) is the only system that can successfully cope with the changing demands of contemporary civilization. We are not necessarily endorsing democracy as such; one might reasonably argue that industrial civilization is pernicious and should be abolished. We suggest merely that given a desire to survive in this civilization, democracy is the most effective means to this end.

Democracy is the only system capable of adapting to change- that makes it sustainable

Slater and Bennis 90 (Philip Slater and Warren Bennis "Democracy is Inevitable" Harvard Business review. THE SEPTEMBER–OCTOBER 1990 ISSUE.

And here we come to the point. For the spirit of inquiry, the foundation of science, to grow and flourish, there must be a democratic environment. Science encourages a political view that is egalitarian, pluralistic, liberal. It accentuates freedom of opinion and dissent. It is against all forms of totalitarianism, dogma, mechanization, and blind obedience. As a prominent social psychologist has pointed out, "Men have asked for freedom, justice, and respect precisely as science has spread among them." 2 In short, the only way organizations can ensure a scientific attitude is to provide the democratic social conditions where one can flourish. In other words, democracy in industry is not an idealistic conception but a hard necessity in those areas where change is ever present and creative scientific enterprise must be nourished. For democracy is the only system of organization that is compatible with perpetual change.

Democracy is the most sustainable- history proves- if we choose to stay committed, it will expand over the next century

Diamon 3 (Diamond, Larry. "Universal Democracy?" Policy Review.119 (2003): 3. ProQuest. Web. 29 June 2015.)

The fully global triumph of democracy is far from inevitable, yet it has never been more attainable. If we manage to sustain the process of global economic integration and growth while making freedom at least an important priority in our diplomacy, aid, and other international engagements, democracy will continue to expand in the world. History has proven that it is the **best form of government.** Gradually, more countries will become democratic while fewer revert to dictatorship. If we retain our power, reshape our strategy, and **sustain our commitment,** eventually - not in the next decade, but certainly by mid-century - every country in the world can be democratic.

Globe and Mail '15

Globe editorial – “The end of US ‘bulk telephony collection,’ and the lessons for Canada” - The Globe and Mail - Jun. 14, 2015 - <http://www.theglobeandmail.com/globe-debate/editorials/the-end-of-us-bulk-telephony-collection-and-the-lessons-for-canada/article24948261/>

For a few days, there was a happily yawning gap in the U.S. National Security Agency's ability to surveil American citizens. Congress could not agree on how – or whether – to renew the section of the foolishly named Patriot Act that had allowed the government to scoop up and hold all the metadata (identifying both callers and addressees) of all cellphone calls in the U.S. The Foreign Intelligence Surveillance Court would then grant or, at least sometimes, not grant, access to the actual contents of the conversations – in other words, a search warrant. The upshot – under the new U.S.A. Freedom Act (officially, the “Uniting and Strengthening America by Fulfilling Rights and Ensuring Effective Discipline Over Monitoring Act of 2015”) – is that phone companies, not the NSA and the FBI, will record and store all the metadata for all phone calls. Those agencies will no longer be able to get at that kind of data at will, indiscriminately. The security agencies will have to apply to the FISC court for metadata, too. That's progress, though FISC may be a bit of a rubber stamp. There is, by the way, no sign that terrorists attacked the United States in the unsurveilled interval between the Patriot Act section and the Freedom Act.

US losing the war on terror

Miller '15

Internally quoting Director of National Intelligence James R. Clapper Jr. - Greg Miller - Intelligence reporter for the Washington Post; former national security correspondent for the Los Angeles Times and co-author of The Interrogators: Inside the Secret War against al Qaeda - “In campaign against terrorism, U.S. enters period of pessimism and gloom” – Washington Post - March 7 - http://www.washingtonpost.com/world/national-security/in-campaign-against-terrorism-us-enters-period-of-pessimism-and-gloom/2015/03/07/ca980380-c1bc-11e4-ad5c-3b8ce89f1b89_story.html

In congressional testimony recently, Director of National Intelligence James R. Clapper Jr. went beyond the usual litany of threats to say that terrorism trend lines were worse “than at any other point in history.” Maj. Gen. Michael Nagata, commander of U.S. Special Operations forces in the Middle East, told participants on a counter-terrorism strategy call that he regarded the Islamic State as a greater menace than al-Qaeda ever was. Speaking at a New York police terrorism conference, Michael Morell, former deputy director of the CIA, said he had come to doubt that he would live to see the end of al-Qaeda and its spawn. “This is long term,” he said. “My children's generation and my grandchildren's generation will still be fighting this fight.” The assessments reflect a pessimism that has descended on the U.S. counterterrorism community over the past year amid a series of discouraging developments. Among them are the growth of the Islamic State, the ongoing influx of foreign fighters into Syria, the collapse of the U.S.-backed government in Yemen and the downward spiral of Libya's security situation. The latest complication came Saturday, when the terrorist group Boko Haram in Nigeria carried out a series of suicide bombings and reportedly declared its allegiance to the Islamic State. Unlike the waves of anxiety that accompanied the emergence of new terrorist plots over the past decade, the latest shift in mood seems more deep-seated. U.S. officials depict a bewildering landscape in which al-Qaeda and the brand of Islamist militancy it inspired have not only survived 14 years of intense counterterrorism operations but have also spread. Officials emphasize that their campaign has accomplished critical goals. In particular, most officials and experts now see the risk of a Sept. 11-scale attack as infinitesimal, beyond the reach of al-Qaeda and its scattered affiliates. Still, the adjusted outlook contrasts sharply with the surge of optimism that followed the killing of Osama bin Laden in 2011 and the dawn of the Arab Spring, which was initially seen as a political awakening across the Middle East that might render al-Qaeda and its archaic ideology irrelevant. Within months of bin Laden's death, then-Defense Secretary Leon E. Panetta said he was convinced “that we're within reach of strategically defeating al-

Qaeda." President Obama echoed that view in subsequent years by saying that al-Qaeda was on "a path to defeat" and, more recently, that the then-nascent Islamic State was analogous to a junior varsity sports team. Such **upbeat characterizations have all but evaporated.**

Turn – Arab-American coop:

- mass surveillance kills law enforcement coop with US-Arab Americans – that's key to check terror.

Risen '14

(Internally quoting Vanda Felbab-Brown, a senior fellow on foreign policy at the Brookings Institution. Tom Risen is a reporter for U.S. News & World Report. "Racial Profiling Reported in NSA, FBI Surveillance" - U.S. News & World Report - July 9, 2014 - <http://www.usnews.com/news/articles/2014/07/09/racial-profiling-reported-in-nsa-fbi-surveillance>)

The National Security Agency and the FBI have reportedly been overzealous trying to prevent terrorist attacks to the point that anti-Islamic racism in those agencies led to the surveillance of prominent Muslim-Americans revealing a culture of racial profiling and broad latitude for spying on U.S. citizens. An NSA document leaked by former agency contractor Edward Snowden to reporter Glenn Greenwald shows 202 Americans targeted among the approximately 7,485 email addresses monitored between 2002 and 2008, Greenwald's news service The Intercept reports. To monitor Americans, government agencies must first make the case to the Foreign Intelligence Surveillance Court that there is probable cause that the targets are terrorist agents, foreign spies or "are or may be" abetting sabotage, espionage or terrorism. Despite this filter The Intercept identified five Muslim-Americans with high public profile including civil rights leaders, academics, lawyers and a political candidate. Racial profiling of Muslims by security officers has been a controversy since the terrorist attacks of 2001 spiked fears about al-Qaida trainees preparing more attacks. The New York Police Department has disbanded its unit that mapped New York's Muslim communities that designated surveillance of mosques as "terrorism enterprise investigations" after pressure from the Justice Department about aggressive monitoring by police. A 2005 FBI memo about surveillance procedures featured in The Intercept story uses a fake name "Mohammed Raghead" for the agency staff exercise. This latest report about email surveillance of successful Muslim-Americans is akin to "McCarthyism" that fed paranoia about communist spies during the Cold War, says Reza Aslan, a professor at the University of California, Riverside. **The notion that these five upstanding American citizens, all of them prominent public individuals, represent a threat to the U.S. for no other reason than their religion is an embarrassment to the FBI** and an affront to the constitution," Aslan says. **There is a risk of radicalization among citizens Americans,** evidenced by some who have gone to fight jihads in Syria and Somalia, but mass shootings carried out by U.S. citizens of various racial backgrounds occurs much more often, **says Vanda Felbab-Brown, a senior fellow on foreign policy at the Brookings Institution.** Since 1982, there have been at least 70 mass shootings across the U.S. **We have seen very little domestic terrorism in the U.S.,** Felbab-Brown says. **This lack of terrorism is due in part to the willingness of the Islamic community to cooperate with law enforcement to identify possible radical threats** out of gratitude that the U.S. is a stable, secure country compared with the Middle East, she says. **That could go sour if law enforcement becomes too aggressive, too extreme,** she says.

The turn's unique – relations are low now. We also control the vital internal link: Ramirez '4

(et al; Deborah A. Ramirez, Professor of Law at Northeastern University. She holds a JD from Harvard University, "Developing partnerships between law enforcement and American Muslim, Arab, and Sikh communities: a promising practices guide" (2004). Partnering for Prevention & Community Safety Initiative Publications. Paper 4. <http://hdl.handle.net/2047/d20004127>)

For all these reasons, in a post-September 11th world, **it is critical for law enforcement and the Muslim, Arab, and Sikh communities in this country to strengthen their relationships.** Historically, **these relationships have not existed in any significant way.** Prior to September 11th, law enforcement primarily focused their community policing efforts on other communities of color – Latinos, Asians, African-Americans, etc. Similarly, hate crime enforcement efforts mostly focused on crimes against the gay community, Jews, Latinos, Asians and African-Americans. Consequently few state, local or federal law enforcement agencies had any significant contact with the Arab, Muslim, or Sikh communities prior to September of 2001. It is the premise of the Partnering for Prevention and Community Safety Initiative that **Americans will only truly be safe from terrorist attacks when law**

enforcement agencies adopts a strategy focused on building trust and strengthening relationships with the Muslim, Arab, and Sikh communities. This paradigm is not only more consistent with our constitutional ideals, it also represents our best hope for securing our homeland.

Current surveillance techniques are unsuccessful – ISIS is beginning to evade them

Dale 14 (Helle Dale, a senior fellow in public diplomacy focusing on US outreach to foreign countries, published on the Daily Signal, "ISIS Is Getting Smarter About Avoiding U.S. Surveillance," <http://dailysignal.com/2014/11/21/isis-getting-smarter-avoiding-u-s-surveillance/>, November 21st, 2014) aj

Social media can be a double-edged sword for terrorists groups such as ISIS, a fact that its leadership appears to be aware of. According to recent reports, the group's top cadre has curtailed electronic communications, hoping to shrink its footprint and exposure to western intelligence agencies. A terrorist group of the 21st century, ISIS is adept at the use of social media, producing "cruelly effective" propaganda, as retired Marine Corps Gen. John Allen has put it. Yet, that same propaganda also has provided a wealth of information for the U.S. and other governments. As reported by The Daily Beast's Shane Harris, who cited U.S. intelligence sources, ISIS is changing its "communications strategy." It is encrypting its electronic communications, limiting its online presence and using services that delete messages as soon as they are sent. Its top cadre uses couriers rather than electronic devices to deliver orders, making them elusive in the U.S.-led surveillance campaign. As human intelligence is hardly available on the ground, especially in Syria, and the number of unmanned drones is limited, cyber surveillance has been a key tool in the fight against ISIS. Yet, although ISIS leadership may be wise to its cyber vulnerabilities, its followers are not as easy to control in the electronic sphere. The group disseminates its grisly propaganda on social media, and its thousands of followers and recruits continue to post pictures and information on their social media accounts. According to reports by communications expert James Farwell published by the London-based Institute for International Strategic Studies, "advances in technology may eventually leave the group vulnerable to cyber attacks, similar to those reportedly urged by U.S. intelligence sources to intercept and seize funds controlled by Mexican drug cartels." Communications strategy must be a critical component in combatting this latest form of violent Islamism, which itself uses propaganda so effectively to magnify its own image of invulnerability. Most effectively, writes Farwell, would be a message that shows the opposite, that the United States and its allies are powerful and determined to win. (Though unfortunately that has hardly been forthcoming yet.) Communications strategy is currently in the hands of Rick Stengel, undersecretary of state for public diplomacy. Stengel recently attended a meeting with Arab nations in Kuwait to discuss precisely this issue and encourage their participation in the communications battle. It is clear though, as Farwell writes, that information warfare should be seamless with military tactics, allowing Gen. Allen to coordinate the resources of the whole of the U.S. government. Strategic communication is as important today as at any time during the Iraq and Afghan wars.

No link – targeted warrants, which plan allows, solve the terror disad just as well.

Wyden '14

(et al; This amicus brief issued by three US Senators - Ron Wyden, Mark Udall and Martin Heinrich. Wyden and Udall sat on the Senate Select Committee on Intelligence and had access to the meta-data program. "BRIEF FOR AMICI CURIAE SENATOR RON WYDEN, SENATOR MARK UDALL, AND SENATOR MARTIN HEINRICH IN SUPPORT OF PLAINTIFF-APPELLANT, URGING REVERSAL OF THE DISTRICT COURT" – Amicus Brief for *Smith v. Obama* – before the United States Ninth Circuit Court of Appeals - Appeal from the United States District Court District of Idaho The Honorable B. Lynn Winmill, Chief District Judge, Presiding Case No. 2:13-cv-00257-BLW – Sept 9th, 2014 – This Amicus Brief was prepared by CHARLES S. SIMS from the law firm PROSKAUER ROSE LLP. Amici" means "friend of the court" and – in this context - is legal reference to Wyden, Udall, etc. This pdf can be obtained at: <https://www.eff.org/document/wyden-udall-heinrich-smith-amicus>)

As members of the Senate Select Committee on Intelligence, amici Senators Wyden and Udall have for years participated in the oversight of government surveillance conducted under the Patriot Act that they knew would astonish most Americans. They sought to warn the public about those activities as best they could without disclosing classified information. They also co-sponsored an amendment to the Patriot Act's reauthorization that sought to address the problem of government officials "secretly reinterpret[ing] public laws and statutes" and "describ[ing] the execution of these laws in a way that misinforms or misleads the public." See 157 Cong. Rec. S3360 (daily ed. May 25, 2011) (introducing SA 384 to S. 990, 112th Cong. § 3 (2011)); see also 157 Cong. Rec. S3386 (daily ed. May 26, 2011) (statement of Sen. Wyden) ("The fact is anyone can read the plain text of the PATRIOT Act. Yet many Members of Congress have no idea how the law is being secretly interpreted by the executive branch."); 157 Cong. Rec. S3258 (daily ed. May 24, 2011) (statement of Sen. Udall) ("Congress is granting powers to the executive branch that lead to abuse, and, frankly, shield the executive branch from accountability"). Now that the government's bulk call-records program has been documented and exposed, the executive branch has retreated from frequently repeated claims about its necessity and expressed an intent to end government bulk collection under section 215. Press Release, FACT SHEET: The Administration's Proposal for Ending the Section 215 Bulk Telephony Metadata Program (Mar. 27, 2014), <http://www.whitehouse.gov/the-press-office/2014/03/27/fact-sheet-administration-s-proposal-ending-section-215-bulk-telephony-m> ("White House Press Release"). While Senators Udall, Heinrich and Wyden broadly support a policy aimed at ending the government's indiscriminate collection of telephony metadata, they share a concern that there is no plan to suspend the bulk collection of Americans' phone records in the absence of new legislation, which is not necessarily imminent. Meanwhile, the government continues to defend its bulk call-record collection program vigorously against statutory and constitutional challenges in the courts. Amici submit this brief to respond to the government's argument that its collection of bulk call records is necessary to defend the nation against terrorist attacks. Amici make one central point: as members of the committee charged with overseeing the National Security Agency's surveillance, amici have reviewed this surveillance extensively and have seen no evidence that the bulk collection of Americans' phone records has provided any intelligence of value that could not have been gathered through means that caused far less harm to the privacy interests of millions of Americans. The government has at its disposal a number of authorities that allow it to obtain the call records of suspected terrorists and those in contact with suspected terrorists. It appears to amici that these more targeted authorities could have been used to obtain the information that the government has publicly claimed was crucial in a few important counterterrorism cases.

USA Freedom Act n/u the DA

Shear 6/4 (Michael Shear – White House correspondent, NYTimes, "In Pushing for Revised Surveillance Program, Obama Strikes His Own Balance" http://www.nytimes.com/2015/06/04/us/winning-surveillance-limits-obama-makes-program-own.html?ref=topics&_r=0) // CW

Mr. Obama entered the Oval Office with what he called "a healthy skepticism" about the system of surveillance at his command. But Ms. Monaco said that, in part because of his often grim daily intelligence briefing, the president was also "very, very focused on the threats" to Americans. "He weighs the balance every day," she said. The compromise on collections of telephone records may end up being too restrictive for the president's counterterrorism professionals, as some Republicans predict. Or, as others vehemently insisted in congressional debate during the past week, it may leave in place too much surveillance that can intrude on the lives of innocent Americans. Either way, Mr. Obama's signature on the law late Tuesday night ensures that he will deliver to the next president a method of hunting for terrorist threats despite widespread privacy concerns that emerged after Edward J. Snowden, a former N.S.A. contractor, revealed the existence of the telephone program. "He owned it in 2009," said Michael V. Hayden, a former N.S.A. director under President George W. Bush, who oversaw the surveillance programs for years. "He just didn't want anyone to know he owned it." Jameel Jaffer, the deputy legal director of the American Civil Liberties Union, called the USA Freedom Act "a step forward in some respects," but "a very small step forward." He said his organization would continue to demand that the president and Congress scale back other government surveillance programs. "Obama has been presented with this choice: Are you going to defend these programs or are you going to change them?" Mr. Jaffer said. "Thus far, we haven't seen a lot of evidence that the president is willing to spend political capital changing those programs." In the case of the telephone program, Mr. Obama's preferred compromise was originally the brainchild of his N.S.A. officials, who embraced it as a way to satisfy the public's privacy concerns without losing the agency's ability to conduct surveillance more

broadly. In the lead-up to last week's congressional showdown, Mr. Obama and his national security team insisted that broad surveillance powers were vital to tracking terrorist threats, while admitting that the new approach to data collection would not harm that effort.

Bioterror risk is low and wouldn't kill many people anyway.

Keller 13

(Rebecca, 7 March 2013, Analyst at Stratfor, "Bioterrorism and the Pandemic Potential," Stratfor, <http://www.stratfor.com/weekly/bioterrorism-and-pandemic-potential>)

The risk of an accidental release of H5N1 is similar to that of other infectious pathogens currently being studied. Proper safety standards are key, of course, and experts in the field have had a year to determine the best way to proceed, balancing safety and research benefits. Previous work with the virus was conducted at biosafety level three out of four, which requires researchers wearing respirators and disposable gowns to work in pairs in a negative pressure environment. While many of these labs are part of universities, access is controlled either through keyed entry or even palm scanners. There are roughly 40 labs that submitted to the voluntary ban. Those wishing to resume work after the ban was lifted must comply with guidelines requiring strict national oversight and close communication and collaboration with national authorities. The risk of release either through accident or theft cannot be completely eliminated, but given the established parameters the risk is minimal. The use of the pathogen as a biological weapon requires an assessment of whether a non-state actor would have the capabilities to isolate the virulent strain, then weaponize and distribute it. Stratfor has long held the position that while terrorist organizations may have rudimentary capabilities regarding biological weapons, the likelihood of a successful attack is very low. Given that the laboratory version of H5N1 -- or any influenza virus, for that matter -- is a contagious pathogen, there would be two possible modes that a non-state actor would have to instigate an attack. The virus could be refined and then aerosolized and released into a populated area, or an individual could be infected with the virus and sent to freely circulate within a population. There are severe constraints that make success using either of these methods unlikely. The technology needed to refine and aerosolize a pathogen for a biological attack is beyond the capability of most non-state actors. Even if they were able to develop a weapon, other factors such as wind patterns and humidity can render an attack ineffective. Using a human carrier is a less expensive method, but it requires that the biological agent be a contagion. Additionally, in order to infect the large number of people necessary to start an outbreak, the infected carrier must be mobile while contagious, something that is doubtful with a serious disease like small pox. The carrier also cannot be visibly ill because that would limit the necessary human contact.

Terrorist can't obtain and correctly deploy bioweapons

Ouagrham-Gormley 14

Sonia Ben Ouagrham-Gormley is Assistant Professor of Public and International Affairs at George Mason University. She worked for a decade at the Monterey Institute for International Studies. She was for two years research director of the James Martin Center for Nonproliferation Studies office in Kazakhstan and was founding editor of the International Export Control Observer, Cornell University Press, November 2014, "Barriers to Bioweapons", <http://www.cornellpress.cornell.edu/book/?GCOI=80140100857780>

In both the popular imagination and among lawmakers and national security experts, there exists the belief that with sufficient motivation and material resources, states or terrorist groups can produce bioweapons easily, cheaply, and successfully. In Barriers to Bioweapons, Sonia Ben Ouagrham-Gormley challenges this perception by showing that bioweapons development is a difficult, protracted, and expensive endeavor, rarely achieving the expected results whatever the magnitude of investment. Her findings are based on extensive interviews she conducted with former U.S. and Soviet-era bioweapons scientists and on careful analysis of archival data and other historical documents related to various state and

terrorist bioweapons programs. Bioweapons development relies on **living organisms** that **are sensitive to their environment** and **handling conditions, and therefore behave unpredictably. These features place a greater premium on specialized knowledge.** Ben Ouagrham-Gormley posits that **lack of access to** such **intellectual capital constitutes the greatest barrier to the making of bioweapons.** She integrates theories drawn from economics, the sociology of science, organization, and management with her empirical research. The resulting theoretical framework rests on the idea that the pace and success of a bioweapons development program can be measured by its ability to ensure the creation and transfer of scientific and technical knowledge. **The specific organizational, managerial, social, political, and economic conditions necessary for success are difficult to achieve, particularly in covert programs where the need to prevent detection imposes** managerial and organizational **conditions that conflict with knowledge production.**

1AR – US losing the war on terror now

() US is losing the war on terror – current strategy has increased ISIS recruitment

Bucci '15

(Steven, director of the Allison Center for Foreign Policy Studies – Heritage Foundation, "The White House Is Not Being Serious About Defeating ISIS", , 6/16/'15 <http://dailysignal.com//2015/06/16/the-white-house-is-not-being-serious-about-defeating-isis/>)

Secretary of Defense Ashton Carter and Martin Dempsey, chairman of the Joint Chiefs of Staff, could be in for a rough ride when they go before the House Armed Services Committee this week to explain the Obama administration's strategy toward Iraq. There is a widespread and growing criticism that the "No Boots on the Ground Plus Light Airstrikes" approach has failed to drive ISIS back from its gains in Iraq and has enabled the radical Islamist terror group to achieve record recruiting. The administration is under pressure to change its failing strategy for Iraq and to at least articulate a more effective approach. So far, President Obama has refused to go beyond the use of trainers (no combat role), some equipping and air support seemingly disconnected from the local actions on the ground. There is a responsible middle ground between the fairly "thin" investment made by Obama and a full reinvasion of Iraq, and some in Congress are ready to explore that. The Heritage Foundation has outlined one such approach, modeled on the successful operations in Afghanistan from late 2001 through early 2002. Heritage has called for embedding American and allied Special Operations forces with local ground units (Iraqi, Kurdish, and eventually Syrian), supported by heavy airpower controlled by the Special Operations embeds. This model drove the Taliban from power and has the potential to do the same to ISIS. Instead, ISIS continues to take territory, including Ramadi last month. The limited U.S. air campaign and the 3,100 non-combat advisers have done little to slow its march. The terrorists have been stopped in some areas, but not all, and very few towns have been "liberated." They now recruit from across the Muslim World, including the West. And until America summons the will to defeat them, they will continue to win the propaganda war. Much more must be done. Last week, the administration approved 450 more advisers, but it essentially doubled down on the current failed plan. The new advisers still are prohibited from combat operations or from being embedded with frontline units. This is not a game changer, and in fact only 50 of the 450 are advisers. The others will provide logistical support and security for the 50. Clearly, the administration is not being serious about defeating ISIS. The White House spokesman even has tried to portray this fight as solely an Iraqi issue, rather than the threat to U.S. national interests it truly is. ISIS is pushing the entire region toward a potentially disastrous Sunni-vs.-Shia conflagration as well as greatly increasing transnational terrorism.

Current US measures have been ineffective in halting ISIS threat

Engel 6/16 (Pamela Engel - reporter for Business Insider, 6/16/15, "ISIS is gaining momentum in the worst possible way" <http://www.businessinsider.com/isis-is-gaining-momentum-in-the-worst-possible-way-2015-60> // CW

In the year since the Islamic State militant group tore through the Middle East and took control of Iraq's second-largest city, the US has been scrambling to come up with an effective strategy to defeat the militants. Meanwhile, the Islamic State (also known as ISIS, ISIL, or Daesh) is winning by successfully settling in as Iraq and Syria crumble. "A year after the Islamic State seized Mosul, and 10 months after the United States and its allies launched a campaign of airstrikes against it, the jihadist group continues to dig in, stitching itself deeper into the fabric of the communities it controls," Ben Hubbard of The New York Times reports. The Times, citing interviews with residents, notes that ISIS is offering reliable, if harsh, security; providing jobs in decimated economies; and projecting a rare sense of order in a region overwhelmed by conflict." And by doing so, the group is increasingly winning over reluctant civilians. "It is not our life, all the violence and fighting and death," a laborer from Raqqa told The Times. "But they got rid of the tyranny of the Arab rulers." As ISIS further entrenches itself in the areas it controls, it is

becoming clear that the US isn't anywhere close to eliminating the group. 'They've clearly got the best battle plan' After a US general insisted in December that ISIS was on the defensive, the militants seized Ramadi, the provincial capital of the Sunni-dominated Anbar province, successfully crippling Iraqi security forces that significantly outnumbered ISIS fighters. The group then went on to take Palmyra, a strategically and historically significant town in Syria, from the regime of Syrian dictator Bashar Assad. "People inside D.C. are hanging on to the myth that ISIS isn't that good, but they're missing that what ISIS has done shows an extraordinary capability to conduct integrated military operations," Christopher Harmer, a senior naval analyst at the Institute for the Study of War, told Business Insider. Harmer noted that ISIS has proved it can coordinate military activity across multiple fronts, moving fighters within and between Syria and Iraq, transporting vehicles across borders, sharing expertise in how to build improvised explosive devices, and coordinating even small battles from the top down. "They've clearly got the best battle plan, and nobody that's fighting against them has a logical plan on how to defeat them." Harmer said. "It is beyond obvious to any observer of what's happening that ISIS' strategy is clearly more effective than the American strategy to defeat it." The Soufan Group said in a note this week that three key assumptions the Obama administration had modeled its anti-ISIS strategy around had not held up very well over the past year. The Iraqi army is still incapable of beating back ISIS and retaking Mosul, the Shia-dominated government in Baghdad has been reluctant to arm and train Sunni fighters in Iraq out of fear they will later rise up against Baghdad, and the US hasn't been able to effectively counter ISIS' online propaganda that lures thousands of foreign fighters into the group's ranks.

Obama's expansion of the US strategy won't solve ISIS

Engel 6/16 (Pamela Engel - reporter for Business Insider, 6/16/15, "ISIS is gaining momentum in the worst possible way" <http://www.businessinsider.com/isis-is-gaining-momentum-in-the-worst-possible-way-2015-60> // CW

'Baghdad and Iran are opposed to us training Sunnis' President Barack Obama recently announced an expansion of the US strategy in the Middle East, pledging to send 450 more troops to Iraq in a push to train the country's battered security forces to retake Ramadi. But Michael Pregent, a terrorism analyst and former US Army intelligence officer in Iraq, told Business Insider earlier this week why this strategy was most likely doomed to fail. He recently wrote that while the Obama administration is correct to think that arming and training Sunnis to defend their own territory is the only viable way to beat back advances by ISIS, a Sunni extremist group, the political situation in Baghdad (not to mention Syria) is obstructing the plan. The Shia-led government in Baghdad is vetting the recruits who want to join the Iraqi security forces, and it has been looking for any connections to Sunni political leaders and Baathists who formerly supported dictator Saddam Hussein. Iran, which is contributing Shiite militias to the ground fight against ISIS while engaging in negotiations with the US over a nuclear deal, also opposes the arming of Iraqi Sunnis. Sunnis crossing a bridge on the outskirts of Baghdad on May 24. "You can send more American advisers, but until they're training Sunnis, they're not going to make a difference in the fight against ISIS," Pregent told Business Insider. "Baghdad and Iran are opposed to us training Sunnis, and the president cares about the nuke deal." Obama acknowledged earlier this week that the US did not have a "complete strategy" to beat ISIS. This is especially clear when looking at Syria. Assad's regime is staunchly backed by Iran and largely ignored by the Obama administration while

Obama pursues a "once in a lifetime opportunity" to finalize a nuclear deal with Iran. The US-led anti-ISIS coalition has been carrying out airstrikes in Iraq and Syria and training Iraqi security forces, but this hasn't been enough to win the ground fight against the militants.

1AR – “Turn – Arab-American coop”

Coop with Arab-American communities is key to solving the war on terror.

Ramirez ‘4

(et al; Deborah A. Ramirez, Professor of Law at Northeastern University. She holds a JD from Harvard University, "Developing partnerships between law enforcement and American Muslim, Arab, and Sikh communities: a promising practices guide" (2004). Partnering for Prevention & Community Safety Initiative Publications. Paper 4. <http://hdl.handle.net/2047/d20004127>)

At the same time law enforcement recognized that **the tools used prior to September 11th were inadequate** to the new post-September 11th task. Although traditional investigative tools had been useful in achieving a quick and thorough response to September 11th, **law enforcement needed enhanced tools to effectively prevent future acts of terror.** Specifically, September 11th reinforced the idea that for law enforcement agencies to effectively prevent future acts of terrorism, **it would require the cooperation and assistance of the American Muslim, Arab, and Sikh communities. Embedded within these communities are the linguistic skills, information, and cultural insights necessary to assist law enforcement in its efforts to identify suspicious behavior. In order to have access to these critical tools** and information, **law enforcement recognized the need to build the bridges** required for effective communication with these groups.

Arab-American coop is significantly hampered by federal intelligence gathering

Achtenberg ‘14

(et al; Roberta Achtenberg - currently serves as a Commissioner on the United States Commission on Civil Rights. She served as Assistant Secretary of the U.S. Department of Housing and Urban Development, becoming the first openly lesbian or gay public official in the United States whose appointment to a federal position was confirmed by the United States Senate. U.S. COMMISSION ON CIVIL RIGHTS – “FEDERAL CIVIL RIGHTS ENGAGEMENT WITH ARAB AND MUSLIM AMERICAN COMMUNITIES - POST 9/11” – September – available via google search)

The **goals of constructive “partnership” engagement and “aggressive” intelligence gathering are prone to work at cross purposes.** As the Commission found, “[f]ederal programs which intertwine civil rights protections with other policy and legal priorities undermine efforts to reduce prejudice and discrimination against American Arabs and Muslims.”² The Commission also identified as a Key Issue the fact that **investigatory/enforcement techniques used by some federal agencies have had excessive overlap with those same agencies’ community engagement activities. This has made numerous Arab and Muslim Americans feel that they were being harassed and denied civil rights, and for some, lessened their trust in the very federal agencies that were in part supposed to be protecting them.**

The turn’s unique – federal policy hampers this coop now.

Waxman ‘9

Matthew C. Waxman - Associate Professor, Columbia Law School; Member of the Hoover Institution Task Force on National Security and Law; Adjunct Senior Fellow, Council on Foreign Relations – “Police and National Security: American Local Law Enforcement and Counterterrorism After 9/11” - JOURNAL OF NATIONAL SECURITY LAW & POLICY - Vol. 3:377 - http://jnslp.com/wp-content/uploads/2010/08/09_Waxman-Master-12-7-09-.pdf

In general, this means that federal coordination efforts and offers of assistance to state and local agencies can alter local police priorities from what the local political “market” might produce, but only to a point. **A key question** is what **happens when federal national security priorities are too greatly misaligned from local political preferences.** Some of the **consequences of misalignment are illustrated in** two frequently cited **examples of local-federal tension in combating terrorism**: Detroit’s response to federal requests to interview certain immigrants, and Portland, Oregon’s withdrawal from the FBI’s regional JTTF. In November 2001, **the Justice Department requested that local police departments assist in interviewing** 5,000 foreign **men of Middle Eastern origin** residing in their communities **to determine whether any** of them posed a terrorist threat or **had useful information about possible terrorists.** **The Detroit Police Chief** and local officials **worried** that **these interviews** might violate of state law and **could alienate Arab-Americans. They therefore refused to participate in the federal initiative.**⁷⁸ In 2005, Portland became the first city to remove its law enforcement agencies from the FBI-led JTTF. Key members of the city government worried that the JTTF’s surveillance activities might, while complying with federal law, not meet more stringent state law standards despite FBI assurances. Nor, due to secrecy rules, could city government leaders oversee whether city police officers participating in the JTTF were abiding by agreed-upon guidelines.⁷⁹ In both Detroit and Portland, pressures stemming from local accountability systems forced municipal agencies to opt out of the federal effort.⁸⁰ **The Detroit greater metropolitan area is home to an especially large Arab-American community. Arab-American leaders voiced concern about the interview initiative, and the local police had worked hard over recent years to build a relationship of trust with the Arab-American community, a relationship the police feared could fray as a result of heavyhanded federal efforts.**⁸¹ Portland, is an area known for its generally liberal orientation (in 2003 the city council publicly criticized and called for major changes in the USA PATRIOT Act, enacted by Congress soon after September 11 to expand domestic law enforcement and intelligence powers), and city officials were probably particularly sensitive about aggressive federal counterterrorism efforts after a Portland-area lawyer and convert to Islam was erroneously linked by the FBI to terrorist bombings in Madrid.

1AR – targeted warrants solve just as well

Even if the info's useful – it doesn't have to be collected in bulk". Targeted and narrow alternatives solve their link.

Wyden '14

(et al; This amicus brief issued by three US Senators - Ron Wyden, Mark Udall and Martin Heinrich. Wyden and Udall sat on the Senate Select Committee on Intelligence and had access to the meta-data program. "BRIEF FOR AMICI CURIAE SENATOR RON WYDEN, SENATOR MARK UDALL, AND SENATOR MARTIN HEINRICH IN SUPPORT OF PLAINTIFF-APPELLANT, URGING REVERSAL OF THE DISTRICT COURT" – Amicus Brief for *Smith v. Obama* – before the United States Ninth Circuit Court of Appeals - Appeal from the United States District Court District of Idaho The Honorable B. Lynn Winmill, Chief District Judge, Presiding Case No. 2:13-cv-00257-BLW – Sept 9th, 2014 – This Amicus Brief was prepared by CHARLES S. SIMS from the law firm PROSKAUER ROSE LLP. Continues to Footnote #6 – no text omitted. Amici" means "friend of the court" and – in this context - is legal reference to Wyden, Udall, etc. This pdf can be obtained at: <https://www.eff.org/document/wyden-udall-heinrich-smith-amicus>)

The government possesses a number of legal authorities with which it may obtain the call records of suspected terrorists and those in contact with suspected terrorists. Amici have consistently argued that the bulk phone-records program needlessly tramples on Americans' privacy rights, particularly in light of the authorities available to the government that can also be used to acquire call records of suspected terrorists and those in contact with suspected terrorists in a targeted manner. See Press Release, Sen. Martin Heinrich, Udall, Heinrich Back Effort To End Dragnet Collection of Phone Data & Add Meaningful Oversight of Surveillance Programs (Oct. 29, 2013), <http://1.usa.gov/182XcHE>; Press Release, Sen. Mark Udall, Surveillance Reform Package Ends Bulk Collection of Phone Records, Creates Constitutional Advocate for Secret Court (Sept. 25, 2013), <http://1.usa.gov/1bBGLku> ("Udall Reform Release"). Even the valid claims by intelligence officials about certain useful information obtained through the bulk phone records program fail to explain why the government could not have simply obtained this information directly from phone companies using more calibrated legal instruments. A number of legal authorities would have allowed the government to do so. For example, the Stored Communications Act permit, the government to obtain precisely the same call records that are now acquired through bulk collection under section 215 when they are "relevant and material to an ongoing criminal investigation." 18 U.S.C. § 2703 (d) Individualized orders for phone records, as opposed to orders authorizing bulk collection, can also be obtained under section 215. 50 U.S.C. § 1861. National security letters, which do not require a court order, can also be used by the government to obtain call records for intelligence purposes. See 18 U.S.C. § 2709. The government can also acquire telephony metadata on a real-time basis by obtaining orders from either regular federal courts or the FISC for the installation of pen registers or trap-and-trace devices. See 18 U.S.C. §§ 3122, 3125; 50 U.S.C. § 1842. And the government may also seek call records using standard criminal warrants based on probable cause. See 18 U.S.C. § 2703 (c)(A); Fed. R. Crim. P. 17(c). The government can use many of these authorities without any more evidence than what is currently required to use the bulk phone-records database, with less impact on the privacy interests of innocent Americans.

Turns

Cooperation Turn 2.0

Turn — Community Cooperation.

A) Surveillance creates support for terrorism and undermines investigations — it stigmatizes Muslim communities and undermines global credibility.

El-Said 15 — Hamid El-Said, Professor of International Relations at Manchester Metropolitan University, Advisor to the UN Counter-Terrorism Task Force, Ph.D. in Political Economy from the University of Jordan, BSc in Business and Demographic Studies from the University of Jordan, M.A. in Middle Eastern Studies from the University of London, M.A. in Development Studies from the University of Manchester, 2015 (“In Defence of Soft Power: Why a “War” on Terror Will Never Win,” *The New Statesman*, February 4th, accessible online at <http://www.newstatesman.com/politics/2015/02/defence-soft-power-why-war-terror-will-never-win>, accessed on 6-17-15)

Although the EU and UN’s “soft” approaches, which called for “addressing the conditions conducive to the spread of terrorism” in the first place, held great potential, they were watered down by the continued prevalence of hard military approach worldwide. The United States, for instance, has never bought into the “soft” approach and continued to follow a military strategy, despite noticeable change in terminology. As a report by the Bipartisan Policy Center’s National Security Preparedness Group concluded in 2001, the US government has shown little interest in “soft” counter radicalisation and de-radicalisation policies.

This is despite the fact that home-grown terrorism has become more prominent in America. The American government has also ironically been active in promoting “soft” de-radicalisation programmes abroad (such as in Afghanistan and Iraq), as well as the establishment of several regional centres and forums allegedly aimed at countering the global rise in violent extremism through “soft” power. This contradiction has undermined the credibility of the US as a genuine leader of, and believer in, the role of “soft” power in countering violent extremism, including the upholding of the rule of law, freedom of expression, and respect for human rights.

Even globally, the “soft” power approach remains the exception, not the rule. A report by the United Nations Counter Terrorism Implementation Task Force in late 2009 showed that no more than 30 out of 192 UN Member States injected some form of “soft” powers into their counter terrorism strategies. The rest continue to rely on a kinetic approach that is only capable of creating more hostilities and antagonism. Many of those countries are close allies of the US in its so-called war on terror.

Neither in Europe nor in North America did de-radicalisation (an extensive form of rehabilitation of violent extremist detainees) receive sufficient attention. The practice has been either to “deport” the “terrorists” or to detain them “forever” in individual cells. The value of rehabilitating the detainees to prepare them for peaceful reintegration into their societies with a minimum risk was lost. Many academics and observers, including the author, have repeatedly warned that the benefits of effective de-radicalisation policies go beyond prison bars to affect the whole community from whence the detainees came. No heed was paid. The upshot has been the kind of attacks that we recently experienced in Paris and Copenhagen, both of which were accomplished by former un-rehabilitated convicts.

Europe and America however showed more interest in counter radicalisation policies that seek to stem the rise of violent extremism at a societal level. Such policies included, among others, community engagement and community policing. Rather than “winning hearts and minds” by solving problems and showing interest, these were intelligence-led, causing them to be perceived by most Muslims as no more than spying-tools targeting their communities. This undermined trust between Muslim communities and the police, a prerequisite for successful collaboration and effective community engagement in countering radicalisation in society.

As a report by the Equality and Human Rights Commission Research concluded, counter radicalisation measures have turned “Muslims [into] . . . the new suspect community.” This, the report added, has stigmatised whole Muslim communities, fuelled resentment and even bolstered “support for terrorist movements.”

It is against this background that the recent rise in Islamophobia in Europe and North America should be understood. Islamophobia is reflected in an alarming increase in anti-Islamism in Western societies and rise in fatal attacks against Muslims, which hardly receive the attention they deserve from the Western media, and state officials, especially when compared to incidents when the victims are Westerners and the perpetrators are “Muslims”.

Some Western countries have recently ramped up security measures in response to some terrorist acts. This will neither make us safer nor answer the important, still unanswered question of what led some individuals to choose a nihilistic view of life in Western societies. Arresting somebody or cancelling his or her passports will also not prevent new attacks, nor will it explain why such attacks were attempted in the first place. As Rep. Tulsi Gabbard (D.-Hawaii), and an Iraq combat veteran, stated: “This war cannot be won, this enemy and threat cannot be defeated unless we understand what’s driving them, what is their ideology.” That we have not done.

In sum, despite the much talked about role of “soft” counter de-radicalisation policies in countering violent extremism, such policies have never been given a genuine opportunity to succeed. It is not surprising therefore that the main aim of the current White House summit, which is taking place in Washington DC between 18-20 March, is to combat violent extremism through the “search for strategies that go beyond only military action for countering terrorists”. Let’s hope that the summit will provide an opportunity to reverse our misguided military approach to countering the phenomenon of “terrorism”. Although it is doubtful.

B) Muslim reporting is key to stopping terrorism — they provide critical intel for counter-terrorism.

Esman 11 — Abigail Esman, contributor to Forbes with 20 years’ experience writing for national and international magazines including Salon.com, Vogue, Esquire, and more, 2011 (“Should New York Muslims Cooperate With the Police - Or With The Terrorists?,” *Forbes*, November 21st, accessible online at <http://www.forbes.com/sites/abigailsman/2011/11/21/should-new-york-muslims-cooperate-with-the-police-or-with-the-terrorists/2/>, accessed on 6-17-15)

There is a lot behind terrorism cases that police cannot disclose for fear of revealing investigative techniques or intelligence sources.

The truth is, much of what counterterrorism officials have learned over the years has been gleaned from members of the Muslim community who have spoken out to expose radicalism in their midst.

(According to the Chattanooga Times Press, "A recent study by North Carolina's Triangle Center on Terrorism and Homeland Security credited tips from Muslim Americans with thwarting 48 of 120 terrorism cases allegedly involving Muslim Americans over the past 10 years.") Without their assistance, our safety is far less certain.

But that is exactly what Muslim activists now urge fellow Muslims to do: resist cooperation with law enforcement, putting national security greatly at risk. According to the AP, at a "Know your Rights" session for Muslims based on the recent allegations, Ramzi Kassem, a professor of law (of all things!) at the City University of New York, advised, "Most of the time it's a fishing expedition, so the safest thing you can do for yourself, your family, and for your community, is not to answer."

Not to answer? If you see something, keep your mouth shut? It is safer, if you know that there is a good chance someone in your community plans to set off a bomb in Times Square, or near your own place of business, or your child's school, or your father's office in Manhattan, to say nothing? Is he kidding?

Apparently not. And this is what he and CAIR and others are entreating their fellow Muslims to do. Stand by the ummah, the Muslim community. Defend even the terrorists. Know where your loyalty stands.

Frightening stuff.

Certainly these are tender issues. But the fact is, we face, now, quandaries and threats our founding fathers couldn't possibly have imagined. It's been only ten years since the World Trade Center attacks, which, in the grand scheme of history, isn't very long. We are clearly still stumbling here, and likely will be for a while yet, with reconciling balances between security and freedom, and ten years simply is not enough time for us to resolve the conflicts that exist between them.

1AR — Key to Counter-Terror

Mass surveillance kills law enforcement cooperation with US-Arab Americans – that’s key to check terror.

Risen 14 — Tom Risen, Reporter for U.S. News & World Report — Internally quoting Vanda Felbab-Brown, Senior Fellow in the Center for 21st Century Security and Intelligence at the Brookings Institute, 2014 (“Racial Profiling Reported in NSA, FBI Surveillance,” *U.S. News & World Report*, July 9th, accessible online at <http://www.usnews.com/news/articles/2014/07/09/racial-profiling-reported-in-nsa-fbi-surveillance>, accessed on 6-17-15)

The National Security Agency and the FBI have reportedly been overzealous trying to prevent terrorist attacks to the point that anti-Islamic racism in those agencies led to the surveillance of prominent Muslim-Americans, revealing a culture of racial profiling and broad latitude for spying on U.S. citizens.

An NSA document leaked by former agency contractor Edward Snowden to reporter Glenn Greenwald shows 202 Americans targeted among the approximately 7,485 email addresses monitored between 2002 and 2008, Greenwald’s news service The Intercept reports.

To monitor Americans, government agencies must first make the case to the Foreign Intelligence Surveillance Court that there is probable cause that the targets are terrorist agents, foreign spies or “are or may be” abetting sabotage, espionage or terrorism. Despite this filter The Intercept identified five Muslim-Americans with high public profile including civil rights leaders, academics, lawyers and a political candidate.

Racial profiling of Muslims by security officers has been a controversy since the terrorist attacks of 2001 spiked fears about al-Qaida trainees preparing more attacks. The New York Police Department has disbanded its unit that mapped New York’s Muslim communities that designated surveillance of mosques as “terrorism enterprise investigations” after pressure from the Justice Department about aggressive monitoring by police.

A 2005 FBI memo about surveillance procedures featured in The Intercept story uses a fake name “Mohammed Raghead” for the agency staff exercise. This latest report about email surveillance of successful Muslim-Americans is akin to “McCarthyism” that fed paranoia about communist spies during the Cold War, says Reza Aslan, a professor at the University of California, Riverside.

“The notion that these five upstanding American citizens, all of them prominent public individuals, represent a threat to the U.S. for no other reason than their religion is an embarrassment to the FBI and an affront to the constitution,” Aslan says.

There is a risk of radicalization among citizens Americans, evidenced by some who have gone to fight jihads in Syria and Somalia, but mass shootings carried out by U.S. citizens of various racial backgrounds occurs much more often, says Vanda Felbab-Brown, a senior fellow on foreign policy at the Brookings Institution. Since 1982, there have been at least 70 mass shootings across the U.S.

“We have seen very little domestic terrorism in the U.S.,” Felbab-Brown says.

This lack of terrorism is due in part to the willingness of the Islamic community to cooperate with law enforcement to identify possible radical threats, out of gratitude that the U.S. is a stable, secure country compared with the Middle East, she says.

1AR — Kills Cooperation

Surveillance creates hostility that undermines investigations — targeted surveillance undermines community cooperation.

Argomaniz and Lynch 15 — Orla Lynch, Professor of International Relations at the The Handa Centre for the Study of Terrorism and Political Violence at the University of St. Andrews — Javier Argomaniz, Lecturer in International Relations at St. Andrews University, 2015 (“Victims of Counter-Terrorism,” *International Perspectives on Terrorist Victimisation: An Interdisciplinary Approach*, Published by Palgrave MacMillan, ISBN: 9781137347114, pgs. 235-236)

Loss of Community Intelligence and Reduced Cooperation from Muslim Communities

Another significant problem for the NYPD as a result of its targeted counter-terrorism programme has been the increased reluctance of Muslim community members to work with police, including reduced willingness to provide community intelligence and cooperate with investigations of terrorism and day-to-day crimes. Numerous post-9/11 empirical studies of Muslim communities have now documented the negative impact of measures on cooperation and the flow of community intelligence to police (Spalek et al., 2009; Huq et al., 2011a; Huq et al., 2011b; Choudhury and Fenwick, 2011). Because police rely on public cooperation and community-generated information to solve crimes, a decline in Muslim community cooperation is detrimental from the perspective of police effectiveness. Post-9/11 empirical studies of Muslim communities in New York and the United Kingdom show that communities are much more willing to provide tips and community intelligence when they trust police and view police activities as fair (Spalek et al., 2009; Tyler et al., 2010; Tyler, 2011; Huq et al., 2011a; Huq et al., 2011b). Conversely, where Muslim communities do not trust police and do not see their actions as fair, these studies show that community members become much less inclined to report crimes, cooperate with police investigations and provide tips that might aid criminal or terrorism investigations (Spalek et al., 2009; Tyler et al., 2010; Huq et al., 2011a; Huq et al., 2011b).

In New York City, the post-9/11 downward spiral of distrust between Muslim American communities and the NYPD has led to reduced Muslim community cooperation, community tips and other community intelligence (Associated Press, 2011). Rights group Human Rights Watch asserts that the NYPD's counter-terrorism programme targeting Muslim communities “is likely to have a negative impact on cooperation from members of affected communities who will have reason to view law enforcement officials with suspicion” (Human Rights Watch, 2012). Indeed, unease about the NYPD's counter-terrorism programme has led some Muslim American leaders to advise community members not to cooperate with police. Khader Abuassab, for example, a leader of the Arab-American Civic Organization in Paterson, New Jersey, has said: “I would tell people not to cooperate. I can't promise people they will be safe or not be spied on again” (Adely, 2012). Similarly, Ramzi Kassem, a law professor at City University of New York, has suggested non-cooperation, arguing that because the NYPD often conducts 'fishing expeditions' when contacting Muslim community members, 'the safest thing you can do for yourself, your family and for your community, is not to answer' (Associated Press, 2011). And even law enforcement officials have warned of the negative consequences where Muslim community members reduce cooperation in criminal and terrorism investigations.

They Say: “Takes Advantage of Muslim Communities”

Efforts can be genuine — the first step is curtailing surveillance.

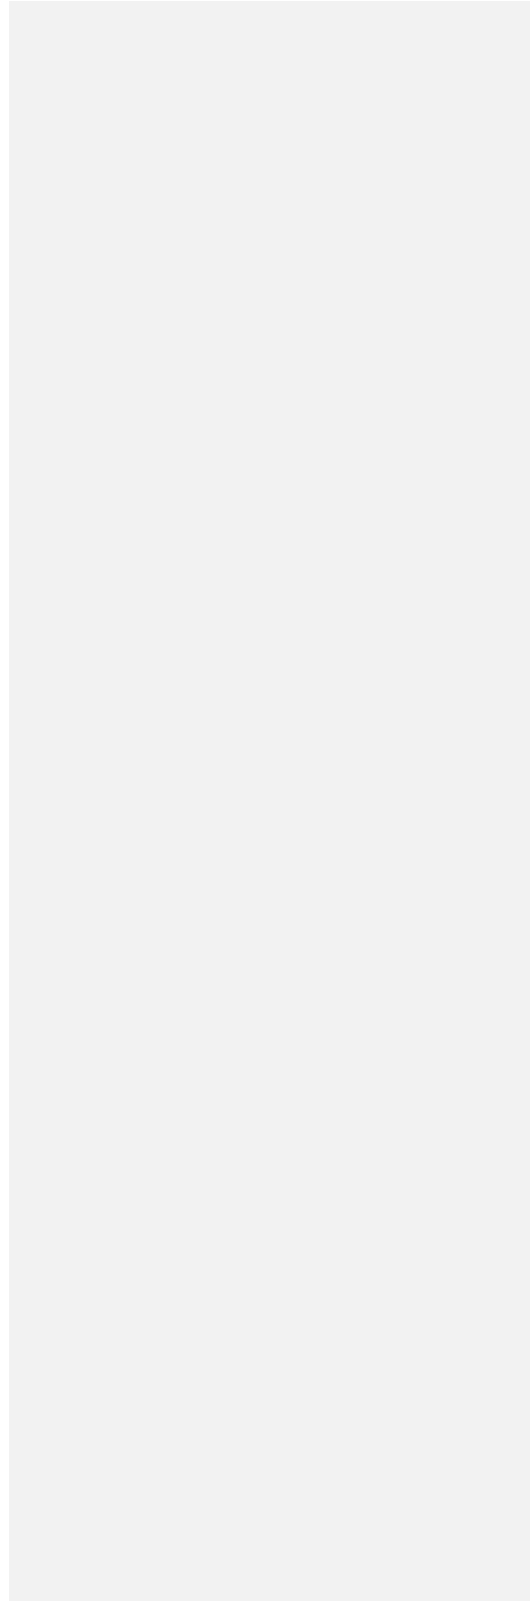

Argomaniz and Lynch 15 — Orla Lynch, Professor of International Relations at the The Handa Centre for the Study of Terrorism and Political Violence at the University of St. Andrews — Javier Argomaniz, Lecturer in International Relations at St. Andrews University, 2015 (“Victims of Counter-Terrorism,” *International Perspectives on Terrorist Victimisation: An Interdisciplinary Approach*, Published by Palgrave MacMillan, ISBN: 9781137347114, pgs. 239-240)

A second challenge to local police implementation of soft power counter-terrorism approaches is the negative perceptions from Muslim communities. Some critics argue that soft power counter-terrorism efforts to gain the trust of Muslim communities are inevitably exploitative and inauthentic (Kundnani, 2009; Muslim American Civil Liberties Coalition, 2013). Critics argue that soft power counter-terrorism approaches with Muslim communities are simply a veneer for the hard power approaches already being carried out by police (Kundnani, 2009). Other scholars, however, offer a more nuanced criticism, recognizing the importance of both hard and soft power measures in counter-terrorism (Quinlan et al., 2013).

One practical question is whether local police have the ability to engage in hard power approaches to identify, disrupt and deter al-Qaeda-inspired terrorism threats while simultaneously engaging in soft power approaches with Muslim communities like voluntary community engagement and law enforcement-community partnership (Spalek et al., 2011; Quinlan et al., 2013). Given some of the practical challenges of balancing these contrasting approaches, one solution discussed in intelligence circles is for local police to focus primarily on engaging in soft power approaches with Muslim communities, while intelligence services and federal policing agencies primarily focus on engaging in hard power approaches to disrupt al-Qaeda-inspired terrorism threats (Marks, 2010). Such an approach would remove many counter-terrorism covert intelligence-gathering powers from local police like the NYPD, which would be extremely difficult to achieve politically.

Challenges to the implementation of soft power counter-terrorism approaches in Muslim communities notwithstanding, at the end of the day, local policing agencies like the NYPD are more effective in terrorism prevention over the long term if they can implement soft power measures without exploiting Muslim communities (Spalek et al., 2011; Choudhury and Fenwick, 2011; Quinlan et al., 2013). By building voluntary trust and cooperation with Muslim communities, local police like the NYPD can achieve desirable terrorism prevention benefits without many of the negative consequences associated with hard power approaches discussed throughout this chapter. Indeed, it is by now clear that an NYPD counter-terrorism approach which exclusively relies on hard power tactics is not only outdated, but also harmful both to Muslim communities and the NYPD.

AT: Rollback

Generic

No rollback — no increase in fear and the public doesn't trust the government. Boston bombing proves.

Hayes 13 — Danny Hayes, associate professor of political science at George Washington University, focusing on political communication and political behavior; co-author of *Influence from Abroad*, a book about Americans' views toward U.S. foreign policy, 2013 ("Why the Boston Marathon bombing won't erode civil liberties," Wonkblog, The Washington Post, April 28th, Available Online at <http://www.washingtonpost.com/blogs/wonkblog/wp/2013/04/28/why-the-boston-maraton-bombing-wont-erode-civil-liberties/>, Accessed 06-21-2013)

From the moment that Boston bombing suspect Dzhokhar Tsarnaev was pulled out of a boat in Watertown, Mass., the debate over civil liberties and domestic anti-terrorism policies, largely dormant in recent years, was reignited.

Noting that "the homeland is the battlefield," Sen. Lindsey Graham (R-S.C.) urged the Obama administration to designate Tsarnaev, an American citizen, as an enemy combatant. Civil liberties groups then objected when authorities decided not to read Miranda rights to the Boston Marathon bombing suspect, invoking a public safety exception. Speculation also arose that police might now find it easier to persuade the public to support the use of surveillance technology and domestic drones. "After Boston," Ryan Gallagher wrote this week in Slate, "the balance in the struggle between privacy and security may swing back in their favor."

But research conducted shortly after 9/11, combined with some recent polling data, suggests that Americans may be unlikely to trade civil liberties for a greater sense of security as a result of the bombing. That's because the attack hasn't made the public significantly more fearful of future domestic terrorism, and because trust in government is low.

After 9/11, concern over terrorism skyrocketed. In a Gallup survey fielded in the days before the attack, less than one-half of one percent of Americans said terrorism was the country's most important problem. But in October 2001, 46 percent did. These worries boosted support for legislation, such as the USA PATRIOT Act, that expanded law enforcement's power to investigate suspected terrorism, even as those measures were criticized for eroding civil liberties protections.

In a survey conducted between November 2001 and January 2002, political scientists Darren Davis and Brian Silver designed a series of questions to explore the tradeoffs between security and civil liberties. They began by asking people whether they agreed more with the statement that "in order to curb terrorism in this country, it will be necessary to give up some civil liberties" or that "we should preserve our freedoms above all, even if there remains some risk of terrorism." Forty-five percent of Americans chose the first option, indicating a willingness to give up some freedoms in exchange for greater security.

When respondents were asked about the tradeoffs involving specific measures, there was wide variation. Davis and Silver found that very few Americans — eight percent — believed that the government should have the power to investigate people who participate in nonviolent protests. And just 18 percent said they supported racial profiling. But when asked, for instance, whether they agreed that "high school teachers have the right to criticize America's policies toward terrorism" or that "high

school teachers should defend America's policies in order to promote loyalty to our country," 60 percent said teachers should back the government.

Perhaps not surprisingly, the biggest influence on whether people were willing to offer pro-security over pro-civil liberties responses was their fear of a second attack. Respondents who believed another terrorist act was imminent were more likely to support tradeoffs in favor of security. Importantly, Davis and Silver found that the relationship was strongest among people who expressed high levels of political trust: People who believe the government typically does the right thing and who were fearful of another terrorist attack were the most willing to relinquish civil liberties protections.

Those findings are consistent with a series of studies by Stanley Feldman, Leonie Huddy and their colleagues at Stony Brook University. In one survey conducted between October 2001 and March 2002, the researchers found that 86 percent of Americans said they were "very" or "somewhat" concerned about another domestic terrorist act. The greater the concern, the more likely respondents were to support the use of government-issued ID cards and allowing authorities to monitor phone calls and e-mail.

But in contrast to 9/11, polling since the Boston Marathon suggests that the bombing has made Americans only slightly more fearful of future terrorist attacks than they were beforehand. Fifty-eight percent of respondents in a Pew poll conducted April 18-21 said they were "very" or "somewhat" worried about another attack on the United States. That was no higher, however, than when the same question was asked in November 2010. And it was significantly lower than the 71 percent who said they were worried in October 2001.

A slightly different question in a Washington Post poll taken April 17-18 found that 69 percent of Americans said that the possibility of a major terrorist attack worried them either "a great deal" or "somewhat." That figure was only a few percentage points higher than when the same question was asked in 2007 and 2008.

In addition, political trust is lower today than it was in 2001, when public confidence in government rose sharply after the terrorist attacks. If Davis and Silver's findings are correct, then greater skepticism of government – produced in part by the struggling economy – should limit the public's willingness to give law enforcement more latitude.

Ultimately, the scope of the Boston tragedy was smaller than 9/11, which could help explain its limited effect on the public. It may also be that because Americans believe terrorist attacks are now a fundamental part of life in the United States, any single event will have a more muted effect on public opinion. And because the Tsarnaev brothers have not been connected to any known terrorist organizations, Americans may feel less under siege than they did when al-Qaeda and Osama bin Laden were identified as the perpetrators of the 2001 attacks.

Regardless of the reason, all of this suggests that policymakers are likely to face a more difficult task than they did after 9/11 in persuading the public to support additional security measures that infringe on Americans' freedoms.

AT: Ratchet Effect

The ratchet effect is unproven.

Givens 13 – Austen D. Givens, a PhD student in the Department of Political Economy at King’s College London, 2013 (“The NSA Surveillance Controversy, How the Ratchet Effect can Impact Anti-Terrorism Laws,” Harvard Law School National Security Journal, July 2nd, available online at <http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/>, accessed 6/19/15, J.L.)

The ratchet effect is a unidirectional change in some legal variable that can become entrenched over time, setting in motion a process that can then repeat itself indefinitely.[1] For example, some scholars argued that anti-terrorism laws tend to erode civil liberties and establish a new baseline of legal “normalcy” from which further extraordinary measures spring in future crises.[2] This process is consistent with the ratchet effect, for it suggests a “stickiness” in anti-terrorism laws that makes it harder to scale back or reverse their provisions. Each new baseline of legal normalcy represents a new launching pad for additional future anti-terrorism measures. There is not universal consensus on whether or not the ratchet effect is real, nor on how powerful it may be. Posner and Vermeule call ratchet effect explanations “methodologically suspect.”[3] They note that accounts of the ratchet effect often ring hollow, for they “fail to supply an explanation of such a process...and if there is such a mechanism [to cause the ratchet effect].

Freedom Act

Domestic Surveillance isn't k2 curtail terrorism – USA Freedom Act proves

Christopher 6/1 (Tommy Christopher - White House Correspondent and Political Analyst “Don't Blame Rand Paul For Our Next Terrorist Attack” <http://thedailybanter.com/2015/06/dont-blame-rand-paul-for-our-next-terrorist-attack/>) // CW

The hysteria over the NSA's bulk collection of telephone metadata climaxed this weekend with a last-ditch effort to extend provisions of the Patriot Act that expired at midnight on Sunday. That effort was primarily, and vocally, blocked by Senator Rand Paul (R-KY), who correctly note that the United States can fight terrorism without collecting data on all Americans' phone calls, but also opposes the USA Freedom Act bill that reforms that program. Along the way, Paul took the extraordinary step of accusing his opponents of secretly wishing for a terrorist attack: “Some of them, I think, secretly want there to be an attack on the United States so they can blame it on me. One of the people in the media, the other day, came up to me and said, ‘oh, when there's a great attack, aren't you going to feel guilty you caused this attack?’ It's like the people who attack us are responsible for attacks on us. Do we blame the police chief for the attack of the Boston bombers? The thing is that there can be attacks even if we use the constitution, but there have been attacks while collecting your bulk data. So the ones who say when an attack occurs it's going to be all your fault, are any of them willing to accept the blame, we have bulk collection now, are any of them willing to accept the blame for the Boston bombing, for the recent shooting in Garland? No, but they'll be the first to point fingers and say, ‘Oh, yeah it's all your fault, we never should have given up on this great program.’” Paul has a point, because without a terrorist attack to blame on him, how can his presidential juggernaut be stopped? Personally, I'm secretly rooting for the Rapture to occur next summer, so the Democrats can take back the House and the Senate. At Monday's White House daily briefing, Daily Mail White House Correspondent Francesca Chambers shopped Paul's remarks to Press Secretary Josh Earnest, whose response was noteworthy for what it didn't say: It's possible that Earnest didn't understand the question even on second reading, but Chambers didn't stutter, and Earnest most certainly did not say that Rand Paul, or anyone else who blocked these provisions, should not be blamed for some future terrorist attack. Twisted egotism aside, Paul is right that if there is another terrorist attack, there will be blame. Rand Paul will certainly be a major recipient of that blame, but Earnest seems perfectly happy to spread that out to all of the Republicans in the Senate. With regard to the Patriot Act provisions, Earnest is absolutely right. Rand Paul blocking extension of the Patriot Act has nothing to do with the failure of the USA Freedom Act, which was opposed by 42 Republicans and Angus King, and which would reform the NSA program with an idea that has been kicking around for several years. More broadly, these are the facts of life of politics, and the only thing Rand Paul is doing here is diverting some of the blame that would otherwise have gone to, and will certainly still be heaped on, President Obama. Practically speaking, though, I don't buy that anything in the Patriot Act, or the almost-as-derpily-named USA Freedom Act, is so crucial to our safety that its absence will invite catastrophe. Fox's Kevin Corke astutely asked Earnest if his reluctance to say that Americans are less safe today is an indication that these programs really aren't all that crucial (Earnest punted).

Freedom Act doesn't solve terror attacks

Nelson 6/2 (Steven Nelson, a reporter at U.S. News & World Report, “Senate Passes Freedom Act, Ending Patriot Act Provision Lapse,” <http://www.usnews.com/news/articles/2015/06/02/senate-passes-freedom-act-ending-patriot-act-provision-lapse>) aj

The phone-record collection began under President George W. Bush, with administration attorneys persuading the Foreign Intelligence Surveillance Court that Section 215 allowed the dragnet. When whistleblower Edward Snowden exposed the program in June 2013 by leaking one of the court's orders, Patriot Act author Rep. James Sensenbrenner, R-Wis., insisted his law did not authorize the collection. Sensenbrenner was instrumental in passing the Freedom Act. Obama, who once supported and for years oversaw the secret bulk call record collection, pivoted in early 2014 after two executive branch review panels found the program was not essential to preventing terror attacks. He urged lawmakers to end the program, but declined to make the change himself. Officials have identified no terror attack prevented solely by the call record program, and the most significant publicly cited success is the detection of a California taxi driver who sent money to a Somali terror group. Jameel Jaffer, American Civil Liberties Union deputy legal director, said the Freedom Act is "the most important surveillance reform bill since 1978, and its passage is an indication that Americans are no longer willing to give the intelligence agencies a blank check." The ACLU was publicly neutral on the bill. "Still, no one should mistake this bill for comprehensive reform," Jaffer said in a statement. "The bill leaves many of the government's most intrusive and overbroad surveillance powers untouched, and it makes only very modest adjustments to disclosure and transparency requirements." Snowden, speaking via video feed with Amnesty International UK interviewers shortly before the vote, said the Freedom Act was "a first step and an important step" and heralded the phone program's demise as a significant victory in pushing back on government claims to need enhanced powers. The bill does not include some popular reforms, such as a ban on "backdoor" searches of American Internet records, which passed the House by a veto-proof majority last year. Though many privacy advocates and organizations are celebrating passage of the Freedom Act, its success threatens lawsuits from the ACLU and others that seek not only an end of the program but also a landmark Supreme Court ruling expending privacy rights to information shared by customers with companies. The government currently considers such information fair game for taking without a warrant. Last month, a panel of the U.S. Court of Appeals for the 2nd Circuit ruled in favor of the ACLU, finding the collection is not authorized by Section 215. The appeals judges did not answer claims that it violates First, Fourth and Fifth Amendment rights. In December 2013, however, U.S. District Judge Richard Leon ruled in a separate lawsuit the "almost Orwellian" program almost certainly violates the Fourth Amendment. Appeals judges in the ACLU case and several legal experts on mootness say legislation ending the collection puts the privacy lawsuits at risk of dismissal. The Freedom Act reauthorizes without alteration the other two provisions that temporarily expired. One provision, allowing tracking of "lone wolf" targets not associated with a terror group, has never been used. The other allows "roving wiretaps" of sometimes unnamed targets who communicate with multiple devices. The Freedom Act does not revise some of the most significant legal authorities the government uses to conduct surveillance, such as Section 702 of the Foreign Intelligence Surveillance Act, which is used for vast Internet surveillance, and Executive Order 12333, which governs collection of intelligence overseas and, according to whistleblower John Napier Tye, could be used to override many congressional reforms without court oversight. Section 702 will expire without congressional reauthorization in 2017.

Data Collection

Domestic data mining and metadata solve foreign terror intelligence

Ahmed 14 (Nafeez, British author, investigative journalist, and international security scholar, "How the Pentagon Exploits ISIS to Kill Surveillance Reform and Re-Occupy Iraq," Counterpunch Weekend Edition September 26th-28th, <http://www.counterpunch.org/2014/09/26/how-the-pentagon-exploits-isis-to-kill-surveillance-reform-and-re-occupy-iraq/>) aj

If Minerva research is not really about addressing a non-existent gap in assessing threats in the Middle East, what is it about? According to Fitzgerald, as reported by Tucker: "In contrast to data-mining system development or intelligence analysis, Minerva-funded basic research uses rigorous methodology to investigate the 'why' and 'how' of phenomena such as influence, conflict escalation and societal resilience." The reality is different. As my detailed investigation showed, including my interviews with senior US intelligence experts, **Minerva is attempting to develop new tools capable of assessing social movements through a wide range of variables many of which can be derived from data-mining of social media posts, as well as from analysis of private metadata – all informed by sociological modeling with input from subject-area social science experts.** Contrary to Fitzgerald's statement to Tucker, and to information on the Minerva website, private Minerva email communications I disclosed in the Guardian showed that the data-mining research pursued at Arizona State University would be used by the Pentagon "to develop capabilities that are deliverable quickly" in the form of "models and tools that can be integrated with operations." Prof Steve Corman, a principal investigator for the ASU project on 'radical and counter radical Muslim discourses', told his ASU research staff that the Pentagon is looking to "feed results" into "applications." He advised them to shape research results "so they [DoD] can clearly see their application for tools that can be taken to the field."

AT: terror Impacts

Impact = Hype

2AC

Terror threat assessments are biased.

Zenko, Douglas Dillon Fellow – Center for Preventive Action @ CFR, 2/25/14

(Michael, "When Terrorism (That Never Happened) Made Headlines in Sochi," Foreign Policy)

In the lead-up to the Winter Olympics, a fear-mongering media merely listened to alarmist policymakers and privileged the aspirational statements of marginalized terrorist groups. By irresponsibly providing little context for such threatening language, the media conditioned citizens to assume that violent attacks against innocent people were a near certainty.

It all started on Jan. 19, when Vilayat Dagestan, an affiliate of insurgent group Ansar al-Sunna, released a video statement in which two Islamist militants announced an intention to carry out jihadi attacks throughout Russia and promised a "present" for Russian President Vladimir Putin at the Olympics. This video came three weeks after two suicide attacks at a train station and on a trolley bus -- 400 miles from the Olympic Village in Volgograd -- that collectively killed 34 and injured up to 104.

Congressional members, purportedly relying on classified briefings, subsequently made the case that Sochi was not at all secure. Rep. Mike Rogers, chair of the House Permanent Select Committee on Intelligence, said "We can only hope that they'll find those individuals before they're able to penetrate any of the rings. And I don't believe that the terrorists think they have ... to have a terrorist attack on a particular venue. They just have to have some disruptive event somewhere." Rep. Peter King warned: "I cannot give [U.S. athletes] 100 percent guarantee. The fact is that these are going to be very much threatened Olympics." Rep. Michael McCaul, chair of the House Homeland Security Committee, even went so far as to say that canceling the games should have been considered, saying, "I think there's a high degree of probability that something will detonate, something will go off." The list of policymakers goes on. In short, they chose sound bites over a balanced communication of the risks posed to Americans traveling to Sochi.

News reports repeated and amplified this narrative by warning about the proliferation of "black widows," women seeking revenge for husbands or family members killed by security forces: "Urgent Search for 'Black Widow' Suicide Bomber, May Be Already in Sochi" was one headline. During the six months leading up to the opening ceremony, the New York Times ran 72 articles about the Olympics that mentioned the threat of terrorism. USA Today reported that most of the major sponsors of the Winter Games had prepared "ads of compassion and support that could air following any incidents of terrorism." Unsurprisingly, in a CNN/ORC poll conducted during the week prior to the opening ceremony, 57 percent of Americans surveyed believed that a terrorist attack of some sort was likely at the Olympics.

Politicians and the media could have handled this more responsibly by communicating not only the probability of a terrorist attack at Sochi, but by reporting the true extent of terrorism throughout Russia.

Historically, Russia has suffered greatly from terrorism. In the 20-year period between 1992 and 2012, the country ranked seventh in the world for total terrorist attacks and related deaths, according to the

National Consortium for the Study of Terrorism and Responses to Terrorism. However, this statistic does not reveal the whole story of terrorism in Russia or the threat posed in Sochi specifically.

The group also reports that Russia was not among the top 10 countries for total attacks in 2012. Moreover, the frequency of attacks decreased during the first half of 2013, and fewer than 50 percent of these resulted in one or more fatalities. (Data is not yet available for all of 2013.) Since 1992, more than 70 percent of attacks have occurred in Chechnya, Dagestan, and Ingushetia, and only eight attacks -- fewer than 0.5 percent -- have taken place in Krasnodar Krai, where Sochi is located. Moreover, while it is estimated that Chechen groups carried out 17 percent of the attacks between 1992 and 2012, the remaining attacks were carried out by other active groups in Russia. According to the Russian government, half of terrorist incidents in 2012 targeted local law enforcement and security forces, not civilians.

Thus, while a terrorist attack is always a possibility in Russia -- as well as in the 80 other countries where terrorism is present -- an attack against civilians in Sochi was always highly unlikely.

Moreover, congressional leaders could have pointed out that Chechen militant groups are losers. All three respected data sets that evaluate the successes of terrorist organizations found that Chechen groups largely failed to achieve their political or territorial objectives. What Vilayat Dagestan achieved by releasing a video was instant credibility, and the sort of free promotional airtime that is invaluable.

In 1975, terrorism scholar Brian Jenkins observed, "Terrorists want a lot of people watching, not a lot of people dead." The media obviously needs people watching or reading, no matter what the issue. Inflating the probability and severity of terrorism is unfortunately a reliable way to achieve this. Thankfully, there were no terrorism incidents during the Winter Olympics. But with the World Cup kicking off in 107 days in Brazil, the media has plenty of time to yet again worry about the worst outcomes and emphasize the (implausible) potential threats to increase viewership.

1AR

Terror isn't a war-level threat.

Diab 15 – Robert Diab is an Assistant Professor in the Faculty of Law at Thompson Rivers University, and specializes in Canadian and US national security law, criminal, and constitutional law, author of *The Harbinger Theory: How the Post-9/11 Emergency Became Permanent and the Case for Reform*, 2015 (“Has ISIS become the new pretext for curtailing our civil liberties?,” Oxford University Press’s Academic Insights for the Thinking World, June 1st, available online at <http://blog.oup.com/2015/06/isis-new-pretext-curtailing-civil-liberties/>, accessed 6/21/2015, J.L.)

A series of measures put in place in the years following 9/11 have now become a fixture of Western government: mass warrantless surveillance, longer periods of detention without charge, and greater state secrecy without accountability. The United States finds itself at the vanguard of this movement with its embrace of executive authority to carry out targeted killing of its own citizens. Many of these measures arose in part as an over-reaction to the threat of al Qaeda. But they were also due in part to a plausible concern that terrorism had come to pose a threat of a much greater magnitude than was previously thought possible. For many, terrorism had become closer in nature to war than to crime, justifying a host of invasive measures. Almost 15 years later, the continuing argument for those measures rests on the belief that terrorism still poses a threat tantamount to war. In the wake of recent attacks in Paris, Ottawa, and Sydney, governments have sought to make this argument by linking the threat of domestic terrorism to ISIS. The link is necessary because ISIS is now the only entity capable of serving as a plausible basis for the claim that jihadist terrorism continues to be potentially war-like in scale. The need to see terrorism on this scale to justify extraordinary measures points to an earlier shift in perceptions of terror. Prior to 9/11, terror on domestic soil was seen as a criminal act, regardless of its scale. Conventional prosecutions followed the Oklahoma City and Air India bombings, and earlier events involving the IRA and other political groups. After 9/11, terrorism in much of the West came to be understood in terms of what can be called the harbinger theory. This was a belief that 9/11 was not an anomaly in the history of terrorism, but the harbinger of a new order of terror — one in which future attacks on the part of al Qaeda or an analogous group would soon occur in a major Western city on a similar or greater scale, possibly involving weapons of mass destruction. It now seemed plausible that terrorism could involve tens or hundreds of thousand of casualties, even millions, the threat was comparable to war. As a consequence, for Dershowitz, Posner, and others, the conventional limits on state power in constitutional and human rights were no longer tenable. In the United States, the harbinger theory still forms a crucial basis for national security policy. Following the Snowden revelations, for example, President Obama defended the continuing use of bulk metadata surveillance by asserting: “the men and women at the NSA know that if another 9/11 or massive cyberattack occurs, they will be asked by Congress and the media why they failed to connect the dots.” A bill before Congress purporting to overhaul the Patriot Act has been lauded for ending bulk data collection by the NSA. But to appease concerns about “another 9/11,” it will retain the practice of bulk data collection by shifting it to third parties. The evidence of domestic terrorism in Western nations in recent years runs directly contrary to the harbinger theory. As Mueller and Stewart and others have shown, the future of terrorism is likely to be more like the pre-9/11 past: lone-wolves or small, disparate groups with more limited capabilities. Recent attacks in Paris, Ottawa, and Sydney confirm this. One of the principals in the Charlie Hebdo killings had received training from an al Qaeda affiliate in Yemen in 2011, but little more. The men involved in the Ottawa and Sydney events were known to police and acted alone. Security. CCO

via Pixabay. Security. CCO via Pixabay. Yet, in keeping with the harbinger theory, governments have been quick to draw a connection between recent terror and ISIS, a large transnational entity with greater capacity. In the wake of the attack on Parliament, Canada's Prime Minister Stephen Harper asserted: "The international jihadist movement has declared war..." The epicenter of the threat is the "entire jihadist army that is now occupying large parts of Iraq and Syria." The US and French governments have also tied ISIS to the prospect of further domestic terror, ignoring ample evidence that ISIS is, as Ahmed Rashid put it, "not waging a war against the West." Despite the tenuousness of a link to ISIS, Canada, France, and Australia have sought to justify significant new measures in light of it. Canada's bill C-51 gives security intelligence service the unprecedented power to seek a warrant to breach any Charter right — not only those protecting against unreasonable search and seizure — if believed to be necessary to thwart a terror plot. France is debating a mass surveillance bill, while Australia will likely adopt a law that strips terror suspects of citizenship. In each case we have to ask: What will the new powers accomplish? Would they have prevented attacks in Sydney, Ottawa, or Paris? Looking back, it's hard to see how. Even with full surveillance, it would likely have been impossible to know how far along the path of radicalization certain individuals were prepared to go, until they got there. Yet by maintaining the perception of domestic terrorism as part of a larger war, questions of cause and effect become moot, and de facto emergency powers persist.

Terror-threat discourse is based in irrational fear sustained by corporate and government profit

Greenwald 12

(Glenn, JD in Constitutional Law and recipient of the first annual I.F. Stone Award for Independent Journalism and winner of the 2010 Online Journalism Association Award and author of three New York Times Bestselling books and named as one of the 25 most influential political commentators in the nation, "The sham "terrorism expert" industry" Aug 15, 2012, Salon)

Shortly prior to the start of the London Olympics, there was an outburst of hysteria over the failure to provide sufficient security against Terrorism, but as Harvard Professor Stephen Walt noted yesterday in Foreign Policy, this was all driven, as usual, by severe exaggerations of the threat: "Well, surprise, surprise. Not only was there no terrorist attack, the Games themselves came off rather well." Walt then urges this lesson be learned:

[W]e continue to over-react to the "terrorist threat." Here I recommend you read John Mueller and Mark G. Stewart's The Terrorism Delusion: America's Overwrought Response to September 11, in the latest issue of International Security. Mueller and Stewart analyze 50 cases of supposed "Islamic terrorist plots" against the United States, and show how virtually all of the perpetrators were (in their words) "incompetent, ineffective, unintelligent, idiotic, ignorant, unorganized, misguided, muddled, amateurish, dopey, unrealistic, moronic, irrational and foolish." They quote former Glenn Carle, former deputy national intelligence officer for transnational threats saying "we must see jihadists for the small, lethal, disjointed and miserable opponents that they are," noting further that al Qaeda's "capabilities are far inferior to its desires."

In the next paragraph, Walt essentially makes clear why this lesson will not be learned: namely, because **there are too many American interests vested in the perpetuation of this irrational fear:**

Mueller and Stewart estimate that expenditures on domestic homeland security (i.e., not counting the wars in Iraq or Afghanistan) have increased by more than \$1 trillion since 9/11, even though the annual risk of dying in a domestic terrorist attack is about 1 in 3.5 million. Using conservative assumptions and conventional risk-assessment methodology, they estimate that for these expenditures to be cost-effective “they would have had to deter, prevent, foil or protect against 333 very large attacks that would otherwise have been successful every year.” Finally, they worry that **this exaggerated sense of danger has now been “internalized”**: even when politicians and “terrorism experts” aren’t hyping the danger, the public still sees the threat as large and imminent. As they conclude:

... Americans seems to have internalized their anxiety about terrorism, and politicians and policymakers have come to believe that they can defy it only at their own peril. **Concern about appearing to be soft on terrorism has replaced concern about seeming to be soft on communism**, a phenomenon that lasted far longer than the dramatic that generated it ... **This** extraordinarily **exaggerated and delusional response may prove to be perpetual**.”

Which is another way of saying that you should be prepared to keep standing in those pleasant and efficient TSA lines for the rest of your life, and to keep paying for far-flung foreign interventions designed to “root out” those nasty jihadis.

Many of the benefits from keeping Terrorism fear levels high are obvious. **Private corporations suck up** massive amounts of **Homeland Security cash as long as that fear persists, while government officials** in the National Security and Surveillance State **can claim unlimited powers, and operate with unlimited secrecy and no accountability**. In sum, **the private and public entities that shape government policy and drive political discourse profit far too much in numerous ways** to allow rational considerations of the Terror threat.

Terror threat-discourse is based in flawed scholarship driven by profit – it shuts down rational thought and political debate in favor of horrible atrocities

Greenwald 12

(Glenn, JD in Constitutional Law and recipient of the first annual I.F. Stone Award for Independent Journalism and winner of the 2010 Online Journalism Association Award and author of three New York Times Bestselling books and named as one of the 25 most influential political commentators in the nation, “The sham “terrorism expert” industry” Aug 15, 2012, Salon)

In a recently published journal article in International Security, entitled “The Terrorism Delusion,” **Professors John Mueller and Mark G. Stewart** (cited by Walt) **extensively document what a fraud the concept of “Terrorism” has become over the last decade**. Specifically, **“the exaggerations of the threat presented by terrorism and then on the distortions of perspective these exaggerations have inspired—distortions that have in turn inspired a determined and expensive quest to ferret out, and even to create, the nearly nonexistent.”**

Richard Jackson is a Professor at the The National Centre for Peace and Conflict Studies in New Zealand. He has written volumes on the fraud of “terrorism expertise” and the propagandistic purpose of this field of discipline. He has documented that most self-proclaimed “terrorism experts” simply ignore the primary cause of the violence they claim to study: “most terrorism scholars, politicians and the media don’t seem to ‘know’ that terrorism is most often caused by military intervention overseas, and not religion, radicalization, insanity, ideology, poverty or such like” — even though “the Pentagon has known it for years.” In one article entitled “10 Things More Likely to Kill You Than Terrorism,” he notes that “The chances of you dying in a terrorist attack are in the range of 1 in 80,000, or about the same chance of being killed by a meteor,” and that bathtubs, vending machines, and lightning all pose a greater risk of death.

In a book critiquing the “terrorism expert” field, Jackson argued that “most of what is accepted as well-founded ‘knowledge’ in terrorism studies is, in fact, highly debatable and unstable.” He therefore scorns almost four decades of so-called Terrorism scholarship as “based on a series of ‘virulent myths’, ‘half-truths’ and contested claims” that are plainly “biased towards Western state priorities.” To Jackson, terrorism is “a social fact rather than a brute fact” and “does not exist outside of the definitions and practices which seek to enclose it, including those of the terrorism studies field.” In sum, it means whatever the wielder of the term wants it to mean: something that cannot be the subject of legitimate “expertise.” * * * * * There is no term more potent in our political discourse and legal landscape than “Terrorism.” It shuts down every rational thought process and political debate the minute it is uttered. It justifies torture (we have to get information from the Terrorists); due-process-free-assassinations even of our own citizens (Obama has to kill the Terrorists); and rampant secrecy (the Government can’t disclose what it’s doing or have courts rule on its legality because the Terrorists will learn of it), and it sends people to prison for decades (material supporters of Terrorism). It is a telling paradox indeed that this central, all-justifying word is simultaneously the most meaningless and therefore the most manipulated. It is, as I have noted before, a word that simultaneously means nothing yet justifies everything. Indeed, that’s the point: it is such a useful concept precisely because it’s so malleable, because it means whatever those with power to shape discourse want it to mean. And no faction has helped this process along as much as the group of self-proclaimed “terrorism experts” that has attached itself to think tanks, academia, and media outlets. They enable pure political propaganda to masquerade as objective fact, shining brightly with the veneer of scholarly rigor. The industry itself is a fraud, as are those who profit from and within it.

Terror = No Extinction

2AC

Terror's not existential --- their ev is rhetoric

Mearsheimer 11 (2/16, John, the R. Wendell Harrison Distinguished Service Professor of Political Science and the co-director of the Program on International Security Policy at the University of Chicago and PhD in Political Science from Cornell University, "Imperial by Design," Published in the Jan-Feb Issue of the National Interest, <http://nationalinterest.org/article/imperial-by-design-4576?page=2>, pg. 4, DA: 2/2/2011//JLENART)

In the aftermath of 9/11, terrorism was described as an existential threat. President Bush emphasized that virtually every terrorist group on the planet—including those that had no beef with Washington—was our enemy and had to be eliminated if we hoped to win what became known as the global war on terror (GWOT). The administration also maintained that states like Iran, Iraq and Syria were not only actively supporting terrorist organizations but were also likely to provide terrorists with weapons of mass destruction (WMD). Thus, it was imperative for the United States to target these rogue states if it hoped to win the GWOT—or what some neoconservatives like Norman Podhoretz called World War IV. Indeed, Bush said that any country which "continues to harbor or support terrorism will be regarded by the United States as a hostile regime." Finally, the administration claimed that it was relatively easy for groups like al-Qaeda to infiltrate and strike the homeland, and that we should expect more disasters like 9/11 in the near future. The greatest danger for sure would be a WMD attack against a major American city. This assessment of America's terrorism problem was flawed on every count. It was threat inflation of the highest order. It made no sense to declare war against groups that were not trying to harm the United States. They were not our enemies; and going after all terrorist organizations would greatly complicate the daunting task of eliminating those groups that did have us in their crosshairs. In addition, there was no alliance between the so-called rogue states and al-Qaeda. In fact, Iran and Syria cooperated with Washington after 9/11 to help quash Osama bin Laden and his cohorts. Although the Bush administration and the neoconservatives repeatedly asserted that there was a genuine connection between Saddam Hussein and al-Qaeda, they never produced evidence to back up their claim for the simple reason that it did not exist. The fact is that states have strong incentives to distrust terrorist groups, in part because they might turn on them someday, but also because countries cannot control what terrorist organizations do, and they may do something that gets their patrons into serious trouble. This is why there is hardly any chance that a rogue state will give a nuclear weapon to terrorists. That regime's leaders could never be sure that they would not be blamed and punished for a terrorist group's actions. Nor could they be certain that the United States or Israel would not incinerate them if either country merely suspected that they had provided terrorists with the ability to carry out a WMD attack. A nuclear handoff, therefore, is not a serious threat. When you get down to it, there is only a remote possibility that terrorists will get hold of an atomic bomb. The most likely way it would happen is if there were political chaos in a nuclear-armed state, and terrorists or their friends were able to take advantage of the ensuing confusion to snatch a loose nuclear weapon. But even then, there are additional obstacles to overcome: some countries keep their weapons disassembled, detonating one is not easy and it would be difficult to transport the device without being detected. Moreover, other countries would have powerful incentives to work with Washington to find the weapon before it could be used. The obvious implication is that we should work with other states to improve nuclear security, so as to make this slim possibility even more unlikely. Finally, the ability of terrorists to strike the American homeland has been blown out of all proportion. In the nine years since 9/11, government officials and terrorist experts have issued countless warnings that another major attack on American soil is probable—even imminent. But this is simply not the case. The only attempts we have seen are a few failed solo attacks by individuals with links to al-Qaeda like the "shoe bomber," who attempted to blow up an American Airlines flight from Paris to Miami in December 2001, and the "underwear bomber," who tried to blow up a Northwest Airlines flight from Amsterdam to Detroit in December 2009. So, we do have a terrorism problem, but it is hardly an

existential threat in fact, it is a minor threat. Perhaps the scope of the challenge is best captured by Ohio State political scientist John Mueller's telling comment that "the number of Americans killed by international terrorism since the late 1960s . . . is about the same as the number killed over the same period by lightning, or by accident-causing deer, or by severe allergic reactions to peanuts."

1AR

This is common sense

Buchanan, Analyst – MSNBC, 9/21/'7

(Patrick, http://www.realclearpolitics.com/articles/2007/09/is_terrorism_a_mortal_threat.html)

Terrorism, said Powell, is not a mortal threat to America. "What is the greatest threat facing us now?" Powell asked. "People will say it's terrorism. But are there any terrorists in the world who can change the American way of life or our political system? No. Can they knock down a building? Yes. Can they kill somebody? Yes. But can they change us? No. Only we can change ourselves. So what is the great threat we are facing?" History and common sense teach that Powell speaks truth. Since 9-11, 100,000 Americans have been murdered -- as many as we lost in Vietnam, Korea and Iraq combined. Yet, not one of these murders was the work of an Islamic terrorist, and all of them, terrible as they are, did not imperil the survival of our republic. Terrorists can blow up our buildings, assassinate our leaders, and bomb our malls and stadiums. They cannot destroy us. Assume the worst. Terrorists smuggle an atom bomb into New York harbor or into Washington, D.C., and detonate it. Horrible and horrifying as that would be -- perhaps 100,000 dead and wounded -- it would not mean the end of the United States. It would more likely mean the end of Iran, or whatever nation at which the United States chose to direct its rage and retribution. Consider. Between 1942 and 1945, Germany and Japan, nations not one-tenth the size of the United States, saw their cities firebombed, and their soldiers and civilians slaughtered in the millions. Japan lost an empire. Germany lost a third of its territory. Both were put under military occupation. Yet, 15 years later, Germany and Japan were the second and third most prosperous nations on Earth, the dynamos of their respective continents, Europe and Asia. Powell's point is not that terrorism is not a threat. It is that the terror threat must be seen in perspective, that we ought not frighten ourselves to death with our own propaganda, that we cannot allow fear of terror to monopolize our every waking hour or cause us to give up our freedom. For all the blather of a restored caliphate, the "Islamofascists," as the neocons call them, cannot create or run a modern state, or pose a mortal threat to America. The GNP of the entire Arab world is not equal to Spain's. Oil aside, its exports are equal to Finland's.

Not an existential risk – threats declining

Burke, The Guardian, '13 [Jason Burke, The Guardian, 1/28/13, "Al-Qaida: how great is the terrorism threat to the west now?" <http://www.guardian.co.uk/world/2013/jan/29/al-qaida-terrorism-threat-west>, accessed 7/11/13, JTF]

Of course a threat remains. But the big attacks – those that could potentially pose something a little closer to "an existential threat" – are unlikely. These would need to be in a major European or US city or involve at least one passenger jet. If British intelligence, despite having a team devoted for months to checking and rechecking every possible potential lead, could not come up with a single credible threat to the London Olympics last year and their US counterparts were confident enough to declare a similar lack of immediate danger during the recent presidential campaign, it appears fair to assume that bombs in London or New York are a fairly distant prospect for the moment. The biggest threat to airplanes comes from a single highly proficient bombmaker in the Yemen.

Seriously

Cassidy 13 (John, 22 April 2013, Staff Writer – New Yorker, cites John Muller—Professor of Political Science at Ohio State University, “AFTER BOSTON, A FEW FACTS ABOUT TERRORISM,” <http://www.newyorker.com/online/blogs/johncassidy/2013/04/after-boston-a-few-facts-about-terrorism.html>)

According to “Terrorism Since 9/11: The American Cases,” a new book edited by John Mueller, a political scientist at Ohio State University, since the World Trade Center attacks there have been fifty-two alleged Islamic plots to stage attacks on American soil or on planes bound for the United States. If Boston is added to the list, the total is fifty-three. Most of these plots **only got to the stage of talking** (often with disguised federal agents) **before the authorities broke them up**, but some went further than that, **and a few—all shootings rather than bombings—led to fatalities**. At Los Angeles International Airport, in 2002, an Egyptian national filled with a hatred of Israel killed two people at the El Al ticket counter. At a Little Rock military recruitment center, in 2009, an American convert to Islam killed a soldier. The same year, at Ford Hood, in Texas, the U.S. Army major Nidal Malik Hasan, a military psychiatrist, killed thirteen people. In total, **sixteen people were killed in these attacks**. Adding the three fatalities in **Boston, the total comes to nineteen**. As with the Boston killings, each of these murders robbed a person of his or her life and left a family devastated. But **compared to other types of violent deaths, the numbers are small**. In 2010, to take a year at random, **there were 11,078 firearm homicides in the United States, and 19,392 firearm suicides**. In the same year, **there were 544 homicides by suffocation and 89 by fire, plus 79 intentional poisonings and 52 intentional drownings**. Statistically speaking, people in America had a **higher chance of being killed by malaria than by terrorists**. (These figures come from the Centers for Disease Control.) The **small number of successful attacks on the United States reflects the country’s geographic isolation and the efforts of domestic law-enforcement authorities**, but it also demonstrates the **decline of Al Qaeda in the face of a prolonged U.S. military onslaught**. “We have Al Qaeda core in the crosshairs—and they know it,” Matthew Olsen, the director of the National Counterterrorism Center, which the Bush Administration set up, **said in a speech last year**. “Bin Laden knew it when he complained of ‘disaster after disaster’ in the documents seized from his compound. In short, the intelligence picture shows that Al Qaeda core is a shadow of its former self.” In the past few years, **the number of terrorist attacks worldwide has been steadily declining, and so has the number of terrorism fatalities**. In 2007, according to a report from the Counterterrorism Center, **there were 14,415 terrorist attacks** of all kinds around the globe, **which resulted in 22,720 deaths**. In 2011, the most recent year for which figures are available, **there were 10,283 attacks, and 12,533 deaths**. (Much of the decline is accounted for by the changing situation in one country, Iraq, where the number of attacks declined from 6,210 in 2007 to 2,265 in 2011.)

No retaliation

2AC

Public won't demand retaliation – even if they do they'll demand we establish guilty targets first

Smith and Herron 5, *Professor, University of Oklahoma, * University of Oklahoma Norman Campus, (Hank C. Jenkins-Smith, Ph.D., and Kerry G., "United States Public Response to Terrorism: Fault Lines or Bedrock?" Review of Policy Research 22.5 (2005): 599-623, <http://works.bepress.com/cgi/viewcontent.cgi?article=1000&context=hjsmith>)

Our final contrasting set of expectations relates to the degree to which the public will support or demand retribution against terrorists and supporting states. Here our data show that support for using conventional United States military force to retaliate against terrorists initially averaged above midscale, but did not reach a high level of demand for military action. Initial support declined significantly across all demographic and belief categories by the time of our survey in 2002. Furthermore, panelists both in 2001 and 2002 preferred that high levels of certainty about culpability (above 8.5 on a scale from zero to ten) be established before taking military action. Again, we find the weight of evidence supporting revisionist expectations of public opinion.

Overall, these results are inconsistent with the contention that highly charged events will result in volatile and unstructured responses among mass publics that prove problematic for policy processes. The initial response to the terrorist strikes demonstrated a broad and consistent shift in public assessments toward a greater perceived threat from terrorism, and greater willingness to support policies to reduce that threat. But even in the highly charged context of such a serious attack on the American homeland, the overall public response was quite measured. On average, the public showed very little propensity to undermine speech protections, and initial willingness to engage in military retaliation moderated significantly over the following year.

Perhaps most interesting is that the greatest propensity to change beliefs between 2001 and 2002 was evident among the best-educated and wealthiest of our respondents— hardly the expected source of volatility, but in this case they may have represented the leading edge of belief constraints reasserting their influence in the first year following 9/11. This post-9/11 change also reflected an increasing delineation of policy preferences by ideological and partisan positions. Put differently, those whose beliefs changed the most in the year between surveys also were those with the greatest access to and facility with information (the richest, best educated), and the nature of the changes was entirely consistent with a structured and coherent pattern of public beliefs. Overall, we find these patterns to be quite reassuring, and consistent with the general findings of the revisionist theorists of public opinion. Our data suggest that while United States public opinion may exhibit some fault lines in times of crises, it remains securely anchored in bedrock beliefs.

1AR

No retaliation – forensics fails

Erwin and Magnuson 9 (Sandra I. Erwin, editor of National Defense Magazine, Stew Magnuson, journalist and former foreign correspondent, 7 Deadly Myths About Weapons of Terror, June, <http://www.nationaldefensemagazine.org/archive/2009/June/Pages/7Deadly.aspx>)

Under the nightmare scenario of a nuclear bomb exploding in a U.S. city, the implied assumption is that the nation's leaders would immediately be able to fire back. That would be the case under the Cold War rules of nuclear retaliation, but the situation is far more complicated when nuclear attacks are perpetrated by non-state actors such as terrorist organizations. Unless the weapon is delivered by a missile, immediate retaliation is not realistic, experts said. It could take weeks or months to figure out where the nuclear materials came from or how the explosive device was built. No state or terrorist group would choose to launch a nuclear weapon by missile because we would know the origin, said Evan Montgomery, of the Center for Strategic and Budgetary Assessments. The more likely means to execute a nuclear attack would be to smuggle the materials and build the bomb on U.S. soil, or steal a bomb and somehow manage to bring it into the United States. Either way, U.S. nuclear experts may not be able to quickly determine the origin of the weapon once it's detonated. Forensics can take weeks or months, said Charles Blair, director of the Center for Terrorism and Intelligence Studies and co-author of a recently published book titled, "Jihadists and Weapons of Mass Destruction." "None of the systems we have now are very quick," he said. "Government officials and the public would have to be willing to wait a while before we retaliate." Nuclear forensics usually is based on fallout and debris. Within hours, U.S. authorities could determine that it was a nuclear explosion. It would take up to a couple of days to determine if there was uranium, plutonium or a mix of the two in the weapon. It's known that eight nations have plutonium bombs, and six others have enough plutonium to build a bomb. If there were a nuclear explosion of a plutonium based weapon, it could be traced to one of 14 countries. With uranium-based weapons, it's more complicated. There are 40 countries that have enough uranium to build at least one bomb. That would take longer to track, said Blair. "You can take debris samples and compare them against known tests. You can within several weeks trace the design to known designs." Nuclear forensics would be far easier if there were a single global database that listed all known methods of creating uranium or plutonium, and catalogued the weapon designs, Blair said. But such a database is unlikely to ever materialize. States prefer to not reveal information about the fissile materials they use or their methods for constructing a weapon. The world's largest nuclear powers, the United States and Russia, both go to great lengths to protect their top secret data on the isotopic composition of their weapons grade plutonium. Even for the United States it's been a challenge to keep track of its own plutonium. Ola Dahlman, a nuclear physicist and advisor to the Swedish Ministry of Foreign Affairs, said there is one cubic meter of plutonium that the United States cannot account for. "Nobody is really concerned," he told National Defense. "But it shows how hard it is to keep track of things." Because plutonium is not a naturally occurring substance, it can only be made in reactors. Identifying the origin in this case would be somewhat easier because reactors have identifiable signatures. With uranium weapons the situation gets more complex because experts would have to figure out how it was enriched. "It doesn't leave many traces," said Blair. Considering how many nuclear

weapons still exist on the planet, it may be shocking to many that nuclear forensics is a vanishing science in the United States. The nation currently has only 40 to 45 scientists who are nuclear forensics experts working at national laboratories, said Blair. “Most are pretty old and will be dying soon.” Only seven universities in the United States offer graduate degrees in radiochemistry, which is one of the primary drivers of nuclear forensics, says Blair. Of those seven programs, four are staffed by just one faculty member. “The U.S. doesn’t really have the brainpower right now to really attack this,” said Blair. It’s also worth noting that no single U.S. government agency is entirely responsible for nuclear attribution. The Department of Homeland Security’s Domestic Nuclear Detection Office comes the closest. It operates a nuclear forensic center that coordinates the work of seven agencies. But the lines of responsibility are blurred, Blair said. If an attack occurred, the FBI would probably step in right away to investigate but the national labs would want to preserve the evidence untouched so they could collect debris, Blair said. There would be turf battles within the government, which would complicate the forensics work.

Multiple options besides nuclear retal—they’re more likely

Neely 13 (Meghan, research intern for the Project on Nuclear Issues, 21 March 2013, “Doubting Deterrence of Nuclear Terrorism,” CSIS, <http://csis.org/blog/doubting-deterrence-nuclear-terrorism>)

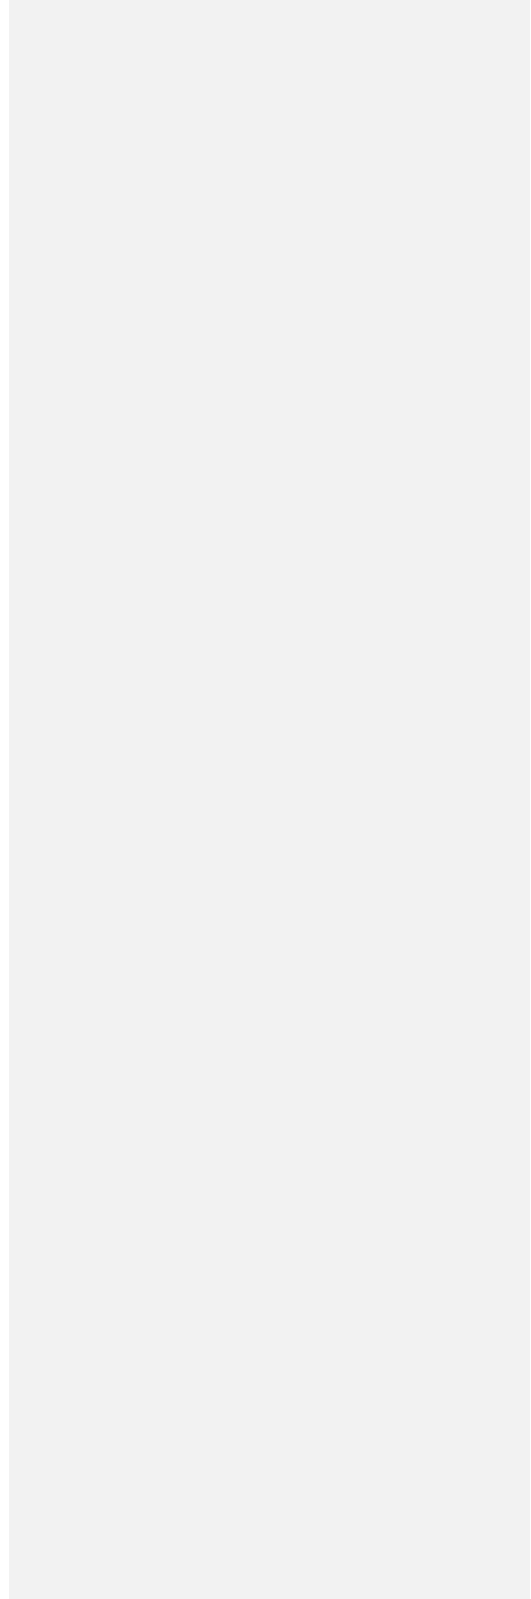

Yet, let’s think about the series of events that would play out if a terrorist organization detonated a weapon in the United States. Let’s assume forensics confirmed the weapon’s origin, and let’s assume, for argument’s sake, that country was Pakistan. Would the United States then retaliate with a nuclear strike? If a nuclear attack occurs within the next four years (a reasonable length of time for such predictions concerning current international and domestic politics), it seems unlikely. Why? First, there’s the problem of time. Though nuclear forensics is useful, it takes time to analyze the data and determine the country of origin. Any justified response upon a state sponsor would not be swift. Second, even if the United States proved the country of origin, it would then be difficult to determine that Pakistan willingly and intentionally sponsored nuclear terrorism. If Pakistan did, then nuclear retaliation might be justified. However, if Pakistan did not, nuclear retaliation over unsecured nuclear materials would be a disproportionate response and potentially further detrimental. Should the United States launch a nuclear strike at Pakistan, Islamabad could see this as an initial hostility by the United States, and respond adversely. An obvious choice, given current tensions in South Asia, is for Pakistan to retaliate against a U.S. nuclear launch on its territory by initiating conflict with India, which could turn nuclear and increase the exchanges of nuclear weapons. Hence, it seems more likely that, after the international outrage at a terrorist group’s nuclear detonation, the United States would attempt to stop the bleeding without a nuclear strike. Instead, some choices might include deploying forces to track down those that supported the suicide terrorists that detonated the weapon, pressuring Pakistan to exert its sovereignty over fringe regions such as the Federally Administered Tribal Areas, and increasing the number of drone strikes in Waziristan. Given the initial attack, such measures might understandably seem more of a concession than the retaliation called for by deterrence models, even more so by the American public.

Extremely low threshold for this argument---any doubt holds back a strike

Neely 13 (Meghan, research intern for the Project on Nuclear Issues, 21 March 2013, “Doubting Deterrence of Nuclear Terrorism,” CSIS, <http://csis.org/blog/doubting-deterrence-nuclear-terrorism>)

Instead, I question the presumed American response that is promulgated by deterrence advocates. By looking at possibilities for a U.S. response to nuclear terrorism, a situation in which we assume that deterrence has failed, we cast doubt on the likelihood of a U.S. retaliatory nuclear strike and hence cast doubt on the credibility of a U.S. retaliatory nuclear strike as a deterrent. Would the United States launch a nuclear weapon now unless it was sure of another state's intentional sponsorship of nuclear terrorism? **Any reasonable doubt** of sponsorship might **stay the United States' nuclear hand**. Given the opaqueness of countries' intentions, **reasonable doubt** over sponsorship is **inevitable** to some degree. Other countries are probably aware of U.S. hesitance in response to terrorists' use of nuclear weapons. If this thought experiment is true, then the communication required for credible retaliatory strikes under deterrence of nuclear terrorism is missing.

Electric Grid

2AC

It's impossible to take out the grid.

Perera 14 – David Perera, a cybersecurity reporter for POLITICO Pro, author of “Inside Guide to the Federal IT Market, 2014 (“U.S. grid safe from large-scale attack, experts say,” POLITICO Pro, September 10th, available online at <http://www.politico.com/story/2014/09/power-grid-safety-110815.html#ixzz3dkDaEAQ9>, accessed 6/21/2015, J.L.)

The specter of a large-scale, destructive attack on the U.S. power grid is at the center of much strategic thinking about cybersecurity. For years, Americans have been warned by a bevy of would-be Cassandras in Congress, the administration and the press that hackers are poised to shut it down. But in fact, the half-dozen security experts interviewed for this article agreed it's virtually impossible for an online-only attack to cause a widespread or prolonged outage of the North American power grid. Even laying the groundwork for such a cyber operation could qualify as an act of war against the U.S. — a line that few nation-state-backed hacker crews would wish to cross.

Continue Reading Text Size --reset Latest on POLITICO Longtime Rep. Phil Crane dies at 84 Cantor: Obama 'incendiary' on immigration Obama's big trade moment Obama: 'The buck stops right here' Airstrikes target ISIL leaders in Iraq DWS pledges party review None denied that determined hackers could penetrate the networks of bulk power providers. But there's a huge gap between that and causing a civilization-ending sustained outage of the grid. Electrical-grid hacking scenarios mostly overlook the engineering expertise necessary to intentionally cause harm to the grid, say experts knowledgeable about the power generators and high voltage transmission entities that constitute the backbone of the grid — what's called the bulk power system. There's also the enormity of the grid and diversity of its equipment to consider. "The grid is designed to lose utilities all the time," said Patrick Miller, founder and director of the Energy Sector Security Consortium. "I'm not trying to trivialize the situation, but you're not really able to cause this nationwide cascading failure for any extended duration of time," he added. "It's just not possible." ICS security in a nutshell Controlling the boilers, fans, valves and switches and other mechanical devices that turn raw inputs and high-voltage transmission into flip-of-a-switch electricity is a class of computers known as industrial control systems. Supervisory Control and Data Acquisition Systems, or SCADA, is a type of ICS. ICSs aren't general purpose computers like desktops. At the level of direct control over electromechanical processes — via a device often classified as a Programmable Logic Controller — 55 is mainly done in specialized languages on obscure operating systems. Even just accessing a PLC requires particular software. Hiding malware in field devices is difficult to impossible. Many of the devices "aren't running multi-thread, multi-tasking operations like our laptops," noted Chris Blask, chair of the Industrial Control System Information Sharing and Analysis Center. And penetration is just a starting point. "Just hacking into the system, and even taking complete control of a computer or crashing a bunch of computers, won't necessarily bring down the bulk electric system," said Dale Peterson, founder of Digital Bond, an industrial control system cybersecurity consultancy. For example, hackers could cause a SCADA system to crash, causing grid operators to lose system visibility — decidedly not a good thing. But the grid doesn't need the SCADA system to continue operating. "There has to be an understanding that simply taking out the cyber assets doesn't cause a blackout," Peterson said. What Project Aurora proved Exhibit A in the cyber-Cassandra's arsenal is Project Aurora, a Homeland Security Department test undertaken in 2007 at the Idaho National Laboratory. The object was to hack a working, 2.25-megawatt, grid-connected diesel power generator. Seeing on CNN the resulting grainy video of smoke pouring from the jolting 27-ton machine was the moment that convinced many their worst fears could come true. Seven years later, however, Project Aurora's status as a thunderclap of warning has been undermined by questions about the test and its real-life applicability. "That was a contrived test in a contrived environment," said Miller, also a former Western Electricity Coordinating Council manager of audits and investigation. The Aurora attack consisted of rapidly opening and closing circuit breakers, knocking the generator out of phase with the grid — a state that engineers have long known causes physical damage through accumulation of excessive torque inside the generator's spinning parts. Even at the time, the odds of an Aurora attack occurring in the wild were very low, said

David Whitehead, vice president of research and development at Schweitzer Engineering Laboratories, a power relay manufacturer. Whitehead participated in a mitigation working group formed after the test. "There were a lot of ideal conditions that had to be in place before the actual rapid cycling and opening of a circuit breaker could occur," he said. "For it to work, all the stars have to line up." An Aurora attack is possible, he allowed — but "the probability of it happening in my lifetime is pretty small." Of course, it's perfectly possible that other cyber-physical attacks await discovery. "I think it would be naive to think that there are no more," said Perry Pederson, a former DHS Control Systems Security Program director who oversaw the test. But even the possible existence of additional vulnerabilities doesn't necessarily mean the grid is highly vulnerable. "I tend to think the grid is a little more robust than what we give it credit for. It's not quite so fragile," he added. Is the grid rigged? Undergirding the widespread perception of a power system fragile to hackers' touch is a belief that foreign states have already penetrated the grid system and left behind malware ready for activation at any time. It's a statement that pushes the envelope of technical and geopolitical realities — although it's not impossible. "I think the U.S. is doing it, I assume Russia is doing it, I assume China is doing it," said Peterson, also a former National Security Agency official, although not here claiming any direct knowledge. No such implanted code has been discovered, he acknowledged — at least, "not that I'm aware of, and it might not exist." Planting power-grid malware, as opposed to hacking for purposes of reconnaissance, also "comes too close, and may even cross, a threshold that no one has been willing to cross," asserted cybersecurity strategic thinker Jim Lewis. The electric grid will be a target for cyberattack during a future conflict, he said in a 2010 paper — but governments also have international norms of behavior to consider, and planting malware in a foreign nation's grid could be considered an act of war. Terror groups aren't bound by international norms nor necessarily deterred by U.S. military might. But absence of an attack against the grid to date suggests to many that they lack of the ability to launch one.

1AR

Grid attacks fail – symmetrical and asymmetrical warfare, too tech dependent, and institutional resistance

Blash 3 [Lt. Col. Edmund C. Blash, USAR, military intelligence officer currently serving with U.S. Central Command in support of operations Enduring Freedom and Noble Eagle, May 2003, "Network-Centric Warfare Requires A Closer Look"
http://www.afcea.org/signal/articles/templates/SIGNAL_Article_Template.asp?articleid=234&zoneid=62 SS]

An antagonist employing a mathematical, symmetrical battle match can still overwhelm superior technology. This poses a problem to the United States' ability to interdict militarily in the future in southwest Asia where the military's order of battle, logistics and technology will be severely tested.

Doctrinal breakthroughs are manifested and proven when operational commanders take advantage of developed or emerging technologies and use them to their operational advantage. Germany's use of wireless radios, tanks, air power, motorized infantry and artillery in the Blitzkrieg is an example of this principle. The U.S. Army's Training and Doctrine Command is key to future combat developments to a certain degree, yet the operational commanders will be key to its implementation and execution on the battlefield. **Successful use of information age technology for warfare is predicated on maintaining the strengths of previous ages of development: agricultural, maritime, industrial, aeronautical and electrical. The United States does not maintain hegemony in all of these infrastructure areas, and a weakness or deficiency in any area will impact another infrastructure area, including the information infrastructure.** The comparison between civilian and military use of emerging technologies is too simplistically insufficient in scope to serve as a viable measurement. The extrapolation of network and information age commercial applications does not readily equate with either the capabilities, complexities, variables or functions that military units will face in the future dynamic battlespace. **To a large degree, network-centric warfare is fires, sensor and information oriented; yet the tenets of mass, speed and maneuver are eclipsed.** Survivability now shifts and is engineered through distributed modularity, not an inherent platform. System and platform independence is eliminated under the concept. Consequently, if the system is defeated, sensor or fire platforms are compromised. **In network-centric warfare, technology has become a substitute for sufficient, rapid logistical support. For the past 150 years, the national logistics base has been the premise to fight and win all of the United States' wars and engagements. There is no proof that technology alone will suffice for a weak or insufficient logistical capability.** In addition, **network-centric warfare is not optimized for asymmetric warfare. Rather, it is optimized for a lighter logistical "tail" component.** While this is fine for some forms of warfare, it is not optimal for others. **The concept of network-centric warfare has additional shortcomings. It is still inherently vulnerable to the mathematical concept of warfare. Throw enough assets and chaos at the network, and it becomes vulnerable to enemy exploitation. Network-centric warfare will require a new type of combat leader, one who can master technology and information then make rapid and correct decisions. There may be a bureaucratic inertia against the concept's implementation and its optimal implementation once it is fielded in its objective configuration. Institutional resistance has often terminated viable programs in the past.**

FERC preventing cyber-attacks in the squo

Savaenije 3/24/14 (Davide Savenije – senior editor, “Could terrorists really black out the power grid?” UtilityDrive <http://www.utilitydive.com/news/could-terrorists-really-black-out-the-power-grid/241192/>)
// CW

Earlier this month, FERC directed the North American Electric Reliability Corporation (NERC) to develop reliability standards requiring bulk-power system owners and operators to address risks due to physical security threats and vulnerabilities. The new standards will target specific facilities that if damaged could lead to blackouts or other major problems. But some, like FERC Commissioner John Norris, are worried that FERC may be overreacting. “My concern is that we don’t shift our focus and our resources,” Norris said. “The rush to do this seems to be based on a very incomplete set of facts about what happened.” The National Academy of Sciences (NAS) has other ideas. In its report prepared for Homeland Security on terrorism and the grid, the academy noted that high-voltage transformers, like the 17 that were shot up at the PG&E substation, are of particular concern. These transformers are massive, hard to move and usually custom built. NAS recommends the U.S. make and store a set of universal transformers that could be used in emergencies. “There are probably less than 100 critical high voltage substations on our grid in this country that need to be protected from a physical attack,” former FERC Chairman Jon Wellinohoff told the Wall Street Journal. “It is neither a monumental task, nor is it an inordinate sum of money that would be required to do so.” In November, NERC held a two-day exercise to see if the grid could withstand a massive physical and cyber attack. There were more than 2,000 participants from across North America, more than twice as many as the previous exercise. No one has publicly revealed detailed results from the exercise.

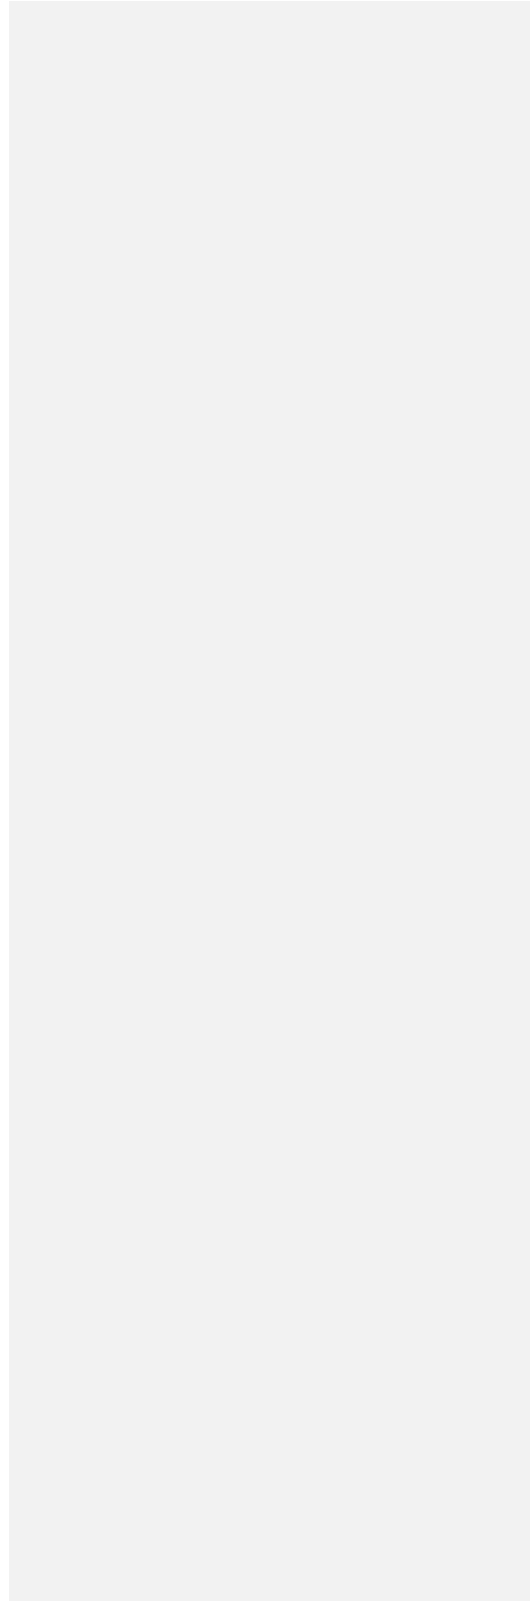

Squo solves - utilities working to prevent cyber terror

David 14 (Javier David – CNBC's weekend homepage editor. He joined the site as a writer in 2012, covering energy, markets and general business/financial topics. Prior to CNBC, he covered foreign exchange and macroeconomics for Dow Jones and The Wall Street Journal, where he on occasion covered top Federal Reserve officials. He got his first start in journalism reporting on Forex/macro, capital markets and corporate governance at Reuters, also covering global policymakers, 9/11/14, “Protecting America's power grid: Calls for action” CNBC, <http://www.cnbc.com/id/101992466>) // CW

For their part, utilities and regulators insist they are on the case, especially in the wake of two separate physical breaches at a Pacific Gas & Electric (PG&E) Silicon Valley substation that have heightened security fears within the industry. A PG&E spokesman told CNBC that the utility company plans to spend \$100 million over the next three years “to enhance security at our critical facilities.” The Energy Policy Act of 2005 granted the Federal Energy Regulatory Commission (FERC) responsibility to work in tandem with power companies to improve the grid's reliability, and enforce standards to keep the power flowing in the event of any contingency. In response to an inquiry from CNBC, Cheryl LeFleur of FERC said her agency “works continuously with the electric industry to assess and respond to the threats posed by physical attacks, cyber-intrusions, and severe weather,” using mandates and voluntary initiatives. “I look at any vector of attack as troublesome,” said Scott Aaronson, senior director of national security policy at the Edison Electric Institute, the association for all publicly traded electric companies. “Given that you have all digital equipment helping to operate the grid ... all threats are taken very seriously,” Aaronson said in an interview. “But if you mandate a 10-foot wall, our adversaries will try to bring a 12-foot ladder.” However, he said that grid security has been on the industry's radar “for decades”—despite

headlines that have only recently given the subject of technological breaches more attention. "Our standards on cybersecurity were first drafted in 2007, before the urge to follow the shiniest object or Chicken Little with movie-script scenarios," he said. "We're making sure people get the right intelligence at the right time, and that threats are mitigated in near-real time," he said, even as he acknowledged utilities aren't "pretending we can protect everyone from everything."

Nuclear terrorism

2AC

No risk of nuclear terrorism Mearsheimer 14

John Mearsheimer, IR Prof at UChicago, National Interest, January 2, 2014, "America Unhinged", <http://nationalinterest.org/article/america-unhinged-9639?page=show>

Am I overlooking the obvious threat that strikes fear into the hearts of so many Americans, which is terrorism? Not at all. Sure, the United States has a terrorism problem. But it **is a minor threat**. There is no question we fell victim to a spectacular attack on September 11, but it did not cripple the United States in any meaningful way and another attack of that magnitude is highly unlikely in the foreseeable future. Indeed, there has not been a single instance over the past twelve years of a terrorist organization exploding a primitive bomb on American soil, much less striking a major blow. Terrorism—most of it arising from domestic groups—was a much bigger problem in the United States during the 1970s than it has been since the Twin Towers were toppled.

What about the possibility that a terrorist group might obtain a nuclear weapon? Such an occurrence would be a game changer, but **the chances of that happening are virtually nil**. No nuclear-armed state is going to supply terrorists with a nuclear weapon because it would have no control over how the recipients might use that weapon. Political turmoil in a nuclear-armed state could in theory allow terrorists to grab a loose nuclear weapon, but the United States already has detailed plans to deal with that highly unlikely contingency.

Terrorists might also try to acquire fissile material and build their own bomb. But that scenario is extremely unlikely as well: there are significant obstacles to getting enough material and even bigger obstacles to building a bomb and then delivering it. More generally, virtually every country has a profound interest in making sure no terrorist group acquires a nuclear weapon, because they cannot be sure they will not be the target of a nuclear attack, either by the terrorists or another country the terrorists strike. Nuclear terrorism, in short, **is not a serious threat**. And to the extent that we should worry about it, the main remedy is to encourage and help other states to place nuclear materials in highly secure custody.

1AR

No scenario for nuclear terror---consensus of experts

Matt **Fay '13**, PhD student in the history department at Temple University, has a Bachelor's degree in Political Science from St. Xavier University and a Master's in International Relations and Conflict Resolution with a minor in Transnational Security Studies from American Military University, 7/18/13, "The Ever-Shrinking Odds of Nuclear Terrorism",

For over a decade now, one of the most oft-repeated threats raised by policymakers—the one that in many ways justified the invasion of Iraq—has been that of nuclear terrorism. Officials in both the Bush and Obama administrations, including the presidents themselves, have raised the specter of the atomic terrorist. But beyond mere rhetoric, how likely is a nuclear terrorist attack really? While pessimistic estimates about America's ability to avoid a nuclear terrorist attack became something of a cottage industry following the September 11th attacks, a number of scholars in recent years have pushed back against this trend. Frank Gavin has put post-9/11 fears of nuclear terrorism into historical context (pdf) and argued against the prevailing alarmism. Anne Stenersen of the Norwegian Defence Research Establishment has challenged the idea that al Qaeda was ever bound and determined to acquire a nuclear weapon. John Mueller ridiculed the notion of nuclear terrorism in his book Atomic Obsessions and highlighted the numerous steps a terrorist group would need to take—all of which would have to be successful—in order to procure, deliver, and detonate an atomic weapon. And in his excellent, and exceedingly even-handed, treatment of the subject, On Nuclear Terrorism, Michael Levi outlined the difficulties terrorists would face building their own nuclear weapon and discussed how a "system of systems" could be developed to interdict potential materials smuggled into the United States—citing a "Murphy's law of nuclear terrorism" that could possibly dissuade terrorists from even trying in the first place. But what about the possibility that a rogue state could transfer a nuclear weapon to a terrorist group? That was ostensibly why the United States deposed Saddam Hussein's regime: fear he would turnover one of his hypothetical nuclear weapons for al Qaeda to use. Enter into this discussion Keir Lieber and Daryl Press and their article in the most recent edition of International Security, "Why States Won't Give Nuclear Weapons to Terrorists." Lieber and Press have been writing on nuclear issues for just shy of a decade—doing innovative, if controversial work on American nuclear strategy. However, I believe this is their first venture into the debate over nuclear terrorism. And while others, such as Mueller, have argued that states are unlikely to transfer nuclear weapons to terrorists, this article is the first to tackle the subject with an empirical analysis. The title of their article nicely sums up their argument: states will not turn over nuclear weapons terrorists. To back up this claim, Lieber and Press attack the idea that states will transfer nuclear weapons to terrorists because terrorists operate of absent a "return address." Based on an examination of attribution following conventional terrorist attacks, the authors conclude: Neither a terror group nor a state sponsor would remain anonymous after a nuclear attack. We draw this conclusion on the basis of four main findings. First, data on a decade of terrorist incidents reveal a strong positive relationship between the number of fatalities caused in a terror attack and the likelihood of attribution. Roughly three-quarters of the attacks that kill 100 people or more are traced back to the perpetrators. Second, attribution rates are far higher for attacks on the U.S. homeland or the territory of a major U.S. ally—97 percent (thirty-six of thirty-seven) for incidents that killed ten or more people. Third, tracing culpability from a guilty terrorist group back to its state sponsor is not likely to be difficult: few countries sponsor terrorism; few terrorist groups have state sponsors; each sponsor terrorist group has few sponsors (typically one); and only one country that sponsors terrorism, has nuclear weapons or enough fissile material to manufacture a weapon. In sum, attribution of nuclear terror incidents would be easier than is typically suggested, and passing weapons to terrorists would not offer countries escape from the constraints of deterrence. From this analysis, Lieber and Press draw two major implications for U.S. foreign policy: claims that it is impossible to attribute nuclear terrorism to particular groups or potential states sponsors undermines deterrence; and fear of states transferring nuclear weapons to terrorist groups, by itself, does not justify extreme measures to prevent nuclear proliferation. This is a key point. While there are other reasons nuclear proliferation is undesirable, fears of nuclear terrorism have been used to justify a wide-range of policies—up to, and including, military action. Put in its proper perspective however—given the difficulty in constructing and transporting a nuclear device and the improbability of state transfer—nuclear terrorism hardly warrants the type of exertions many alarmist assessments indicate it should.

Zero risk of acquisition – miniaturization and enrichment are too difficult – even Al Qaeda sucks at it after years of trying

Khan, 13

Adnan Khan 9-13-2013; lecturer on political and Islamic issues. The initial founder and editor-in-chief of The Revolution Observer. Debunking the Myths of Nuclear Terrorism
<http://www.revolutionobserver.com/2013/09/debunking-myths-of-nuclear-terrorism.html>

Contrary to their popular portrayal in Hollywood, nuclear bombs are actually both difficult to manufacture and challenging to effectively deploy, making it virtually impossible for terrorist groups to acquire them. Nuclear devices initiate nuclear chain reactions, and these reactions generate roughly a million times more energy than comparable chemical reactions. The enrichment of Uranium is probably the most complex aspect of building a nuclear device; It presents numerous challenges for any nation in developing a nuclear programme. The concept requires separating a heavier isotope (atoms of the same element having a different number of neutrons) of uranium from a lighter isotope of uranium in order to enrich or purify the stock to higher than 80% of U235 - sufficient for use in weapons. Achieving this separation on a suitably refined level differentiated by only a few subatomic particles is an extremely complicated process. A series of centrifuges carry out the delicate task of separating isotopes, these are finely tuned machine components, able to spin at high speeds while fully containing and separating highly corrosive gas. It is the combination of appropriate calibration and rotational speed that allow for enrichment to take place, low-quality bearings just would not do the job. Thereafter fabricating fissile material and developing either a gun-type device or implosion device is a process only 9-10 nations in the world have accomplished. South Africa has since renounced it, whilst North Korea is still working on it.[2] Today nuclear warheads sit in missiles and this would be another challenge any nation would face, i.e. delivering a bomb to its intended target. The components of the bomb that actually initiate a nuclear explosion must be miniaturized in order to be placed in a missile. Modern missiles are smaller than a human being weighing only a few hundred pounds. Actually getting a warhead down to this size is no simple exercise, it requires, among other things, precision manufacturing, exceptional quality control and a good understanding of nuclear physics. All of this would be after decades of testing to ensure detonation upon delivery. Building a Nuclear weapon requires a comprehensive commitment from any nation for its national resources to be deployed in such a manner. It is not just about one facility, it needs an industrial base. A nuclear program requires long term facilities, which are very energy intensive, years of experimentation, fissionable material and high grade industrial machinery. All of this is beyond most countries let alone terrorist groups. In the case of al Qaeda, even after immense security, sanctuary and financial backing they have been unable to produce a crude nuclear device in any meaningful way.

No risk of nuclear terror

Mueller 10 (John, professor of political science at Ohio State, Calming Our Nuclear Jitters, Issues in Science and Technology, Winter, <http://www.issues.org/26.2/mueller.html>)

Politicians of all stripes preach to an anxious, appreciative, and very numerous choir when they, like President Obama, proclaim atomic terrorism to be “the most immediate and extreme threat to global security.” It is the problem that, according to Defense Secretary Robert Gates, currently keeps every senior leader awake at night. This is hardly a new anxiety. In 1946, atomic bomb maker J. Robert Oppenheimer ominously warned that if three or four men could smuggle in units for an atomic bomb, they could blow up New York. This was an early expression of a pattern of dramatic risk inflation that

has persisted throughout the nuclear age. In fact, although expanding fires and fallout might increase the effective destructive radius, the blast of a Hiroshima-size device would “blow up” about 1% of the city’s area—a tragedy, of course, but not the same as one 100 times greater. In the early 1970s, nuclear physicist Theodore Taylor proclaimed the atomic terrorist problem to be “immediate,” explaining at length “how comparatively easy it would be to steal nuclear material and step by step make it into a bomb.” At the time he thought it was already too late to “prevent the making of a few bombs, here and there, now and then,” or “in another ten or fifteen years, it will be too late.” Three decades after Taylor, we continue to wait for terrorists to carry out their “easy” task. In contrast to these predictions, terrorist groups seem to have exhibited only limited desire and even less progress in going atomic. This may be because, after brief exploration of the possible routes, they, unlike generations of alarmists, have discovered that the tremendous effort required is scarcely likely to be successful. The most plausible route for terrorists, according to most experts, would be to manufacture an atomic device themselves from purloined fissile material (plutonium or, more likely, highly enriched uranium). This task, however, remains a daunting one, requiring that a considerable series of difficult hurdles be conquered and in sequence. Outright armed theft of fissile material is exceedingly unlikely not only because of the resistance of guards, but because chase would be immediate. A more promising approach would be to corrupt insiders to smuggle out the required substances. However, this requires the terrorists to pay off a host of greedy confederates, including brokers and money-transmitters, any one of whom could turn on them or, either out of guile or incompetence, furnish them with stuff that is useless. Insiders might also consider the possibility that once the heist was accomplished, the terrorists would, as analyst Brian Jenkins none too delicately puts it, “have every incentive to cover their trail, beginning with eliminating their confederates.” If terrorists were somehow successful at obtaining a sufficient mass of relevant material, they would then probably have to transport it a long distance over unfamiliar terrain and probably while being pursued by security forces. Crossing international borders would be facilitated by following established smuggling routes, but these are not as chaotic as they appear and are often under the watch of suspicious and careful criminal regulators. If border personnel became suspicious of the commodity being smuggled, some of them might find it in their interest to disrupt passage, perhaps to collect the bounteous reward money that would probably be offered by alarmed governments once the uranium theft had been discovered. Once outside the country with their precious booty, terrorists would need to set up a large and well-equipped machine shop to manufacture a bomb and then to populate it with a very select team of highly skilled scientists, technicians, machinists, and administrators. The group would have to be assembled and retained for the monumental task while no consequential suspicions were generated among friends, family, and police about their curious and sudden absence from normal pursuits back home. Members of the bomb-building team would also have to be utterly devoted to the cause, of course, and they would have to be willing to put their lives and certainly their careers at high risk, because after their bomb was discovered or exploded they would probably become the targets of an intense worldwide dragnet operation. Some observers have insisted that it would be easy for terrorists to assemble a crude bomb if they could get enough fissile material. But Christoph Wirz and Emmanuel Egger, two senior physicists in charge of nuclear issues at Switzerland’s Spiez Laboratory, bluntly conclude that the task “could hardly be accomplished by a subnational group.” They point out that precise blueprints are required, not just sketches and general ideas, and that even with a good blueprint the terrorist group would most certainly be forced to redesign. They also stress that the work is difficult, dangerous, and extremely exacting, and that the technical requirements in several fields verge on the unfeasible. Stephen Younger, former director of

nuclear weapons research at Los Alamos Laboratories, has made a similar argument, pointing out that uranium is “exceptionally difficult to machine” whereas “plutonium is one of the most complex metals ever discovered, a material whose basic properties are sensitive to exactly how it is processed.” Stressing the “daunting problems associated with material purity, machining, and a host of other issues,” Younger concludes, “to think that a terrorist group, working in isolation with an unreliable supply of electricity and little access to tools and supplies” could fabricate a bomb “is farfetched at best.” Under the best circumstances, the process of making a bomb could take months or even a year or more, which would, of course, have to be carried out in utter secrecy. In addition, people in the area, including criminals, may observe with increasing curiosity and puzzlement the constant coming and going of technicians unlikely to be locals. If the effort to build a bomb was successful, the finished product, weighing a ton or more, would then have to be transported to and smuggled into the relevant target country where it would have to be received by collaborators who are at once totally dedicated and technically proficient at handling, maintaining, detonating, and perhaps assembling the weapon after it arrives. The financial costs of this extensive and extended operation could easily become monumental. There would be expensive equipment to buy, smuggle, and set up and people to pay or pay off. Some operatives might work for free out of utter dedication to the cause, but the vast conspiracy also requires the subversion of a considerable array of criminals and opportunists, each of whom has every incentive to push the price for cooperation as high as possible. Any criminals competent and capable enough to be effective allies are also likely to be both smart enough to see boundless opportunities for extortion and psychologically equipped by their profession to be willing to exploit them. Those who warn about the likelihood of a terrorist bomb contend that a terrorist group could, if with great difficulty, overcome each obstacle and that doing so in each case is “not impossible.” But although it may not be impossible to surmount each individual step, the likelihood that a group could surmount a series of them quickly becomes vanishingly small. Table 1 attempts to catalogue the barriers that must be overcome under the scenario considered most likely to be successful. In contemplating the task before them, would-be atomic terrorists would effectively be required to go through an exercise that looks much like this. If and when they do, they will undoubtedly conclude that their prospects are daunting and accordingly uninspiring or even terminally dispiriting. It is possible to calculate the chances for success. Adopting probability estimates that purposely and heavily bias the case in the terrorists’ favor—for example, assuming the terrorists have a 50% chance of overcoming each of the 20 obstacles—the chances that a concerted effort would be successful comes out to be less than one in a million. If one assumes, somewhat more realistically, that their chances at each barrier are one in three, the cumulative odds that they will be able to pull off the deed drop to one in well over three billion. Other routes would-be terrorists might take to acquire a bomb are even more problematic. They are unlikely to be given or sold a bomb by a generous like-minded nuclear state for delivery abroad because the risk would be high, even for a country led by extremists, that the bomb (and its source) would be discovered even before delivery or that it would be exploded in a manner and on a target the donor would not approve, including on the donor itself. Another concern would be that the terrorist group might be infiltrated by foreign intelligence. The terrorist group might also seek to steal or illicitly purchase a “loose nuke” somewhere. However, it seems probable that none exist. All governments have an intense interest in controlling any weapons on their territory because of fears that they might become the primary target. Moreover, as technology has developed, finished bombs have been outfitted with devices that trigger a non-nuclear explosion that destroys the bomb if it is tampered with. And there are other security techniques: Bombs can be kept disassembled with the component parts

stored in separate high-security vaults, and a process can be set up in which two people and multiple codes are required not only to use the bomb but to store, maintain, and deploy it. As Younger points out, “only a few people in the world have the knowledge to cause an unauthorized detonation of a nuclear weapon.” There could be dangers in the chaos that would emerge if a nuclear state were to utterly collapse; Pakistan is frequently cited in this context and sometimes North Korea as well. However, even under such conditions, nuclear weapons would probably remain under heavy guard by people who know that a purloined bomb might be used in their own territory. They would still have locks and, in the case of Pakistan, the weapons would be disassembled. The al Qaeda factor The degree to which al Qaeda, the only terrorist group that seems to want to target the United States, has pursued or even has much interest in a nuclear weapon may have been exaggerated. The 9/11 Commission stated that “al Qaeda has tried to acquire or make nuclear weapons for at least ten years,” but the only substantial evidence it supplies comes from an episode that is supposed to have taken place about 1993 in Sudan, when al Qaeda members may have sought to purchase some uranium that turned out to be bogus. Information about this supposed venture apparently comes entirely from Jamal al Fadl, who defected from al Qaeda in 1996 after being caught stealing \$110,000 from the organization. Others, including the man who allegedly purchased the uranium, assert that although there were various other scams taking place at the time that may have served as grist for Fadl, the uranium episode never happened. As a key indication of al Qaeda’s desire to obtain atomic weapons, many have focused on a set of conversations in Afghanistan in August 2001 that two Pakistani nuclear scientists reportedly had with Osama bin Laden and three other al Qaeda officials. Pakistani intelligence officers characterize the discussions as “academic” in nature. It seems that the discussion was wide-ranging and rudimentary and that the scientists provided no material or specific plans. Moreover, the scientists probably were incapable of providing truly helpful information because their expertise was not in bomb design but in the processing of fissile material, which is almost certainly beyond the capacities of a nonstate group. Kalid Sheikh Mohammed, the apparent planner of the 9/11 attacks, reportedly says that al Qaeda’s bomb efforts never went beyond searching the Internet. After the fall of the Taliban in 2001, technical experts from the CIA and the Department of Energy examined documents and other information that were uncovered by intelligence agencies and the media in Afghanistan. They uncovered no credible information that al Qaeda had obtained fissile material or acquired a nuclear weapon. Moreover, they found no evidence of any radioactive material suitable for weapons. They did uncover, however, a “nuclear-related” document discussing “openly available concepts about the nuclear fuel cycle and some weapons-related issues.” Just a day or two before al Qaeda was to flee from Afghanistan in 2001, bin Laden supposedly told a Pakistani journalist, “If the United States uses chemical or nuclear weapons against us, we might respond with chemical and nuclear weapons. We possess these weapons as a deterrent.” Given the military pressure that they were then under and taking into account the evidence of the primitive or more probably nonexistent nature of al Qaeda’s nuclear program, the reported assertions, although unsettling, appear at best to be a desperate bluff. Bin Laden has made statements about nuclear weapons a few other times. Some of these pronouncements can be seen to be threatening, but they are rather coy and indirect, indicating perhaps something of an interest, but not acknowledging a capability. And as terrorism specialist Louise Richardson observes, Statements claiming a right to possess nuclear weapons have been misinterpreted as expressing a determination to use them. This in turn has fed the exaggeration of the threat we face.” Norwegian researcher Anne Stenersen concluded after an exhaustive study of available materials that, although “it is likely that al Qaeda central has considered the option of using non-conventional weapons,” there is “little evidence

that such ideas ever developed into actual plans, or that they were given any kind of priority at the expense of more traditional types of terrorist attacks.” She also notes that information on an al Qaeda computer left behind in Afghanistan in 2001 indicates that only \$2,000 to \$4,000 was earmarked for weapons of mass destruction research and that the money was mainly for very crude work on chemical weapons. Today, the key portions of al Qaeda central may well total only a few hundred people, apparently assisting the Taliban’s distinctly separate, far larger, and very troublesome insurgency in Afghanistan. Beyond this tiny band, there are thousands of sympathizers and would-be jihadists spread around the globe. They mainly connect in Internet chat rooms, engage in radicalizing conversations, and variously dare each other to actually do something. Any “threat,” particularly to the West, appears, then, principally to derive from self-selected people, often isolated from each other, who fantasize about performing dire deeds. From time to time some of these people, or ones closer to al Qaeda central, actually manage to do some harm. And occasionally, they may even be able to pull off something large, such as 9/11. But in most cases, their capacities and schemes, or alleged schemes, seem to be far less dangerous than initial press reports vividly, even hysterically, suggest. Most important for present purposes, however, is that any notion that al Qaeda has the capacity to acquire nuclear weapons, even if it wanted to, looks farfetched in the extreme. It is also noteworthy that, although there have been plenty of terrorist attacks in the world since 2001, all have relied on conventional destructive methods. For the most part, terrorists seem to be heeding the advice found in a memo on an al Qaeda laptop seized in Pakistan in 2004: “Make use of that which is available ... rather than waste valuable time becoming despondent over that which is not within your reach.” In fact, history consistently demonstrates that terrorists prefer weapons that they know and understand, not new, exotic ones. Glenn Carle, a 23-year CIA veteran and once its deputy intelligence officer for transnational threats, warns, “We must not take fright at the specter our leaders have exaggerated. In fact, we must see jihadists for the small, lethal, disjointed, and miserable opponents that they are.” al Qaeda, he says, has only a handful of individuals capable of planning, organizing, and leading a terrorist organization, and although the group has threatened attacks with nuclear weapons, “its capabilities are far inferior to its desires.” Policy alternatives The purpose here has not been to argue that policies designed to inconvenience the atomic terrorist are necessarily unneeded or unwise. Rather, in contrast with the many who insist that atomic terrorism under current conditions is rather likely— indeed, exceedingly likely—to come about, I have contended that it is hugely unlikely. However, it is important to consider not only the likelihood that an event will take place, but also its consequences. Therefore, one must be concerned about catastrophic events even if their probability is small, and efforts to reduce that likelihood even further may well be justified. At some point, however, probabilities become so low that, even for catastrophic events, it may make sense to ignore them or at least put them on the back burner; in short, the risk becomes acceptable. For example, the British could at any time attack the United States with their submarine-launched missiles and kill millions of Americans, far more than even the most monumentally gifted and lucky terrorist group. Yet the risk that this potential calamity might take place evokes little concern; essentially it is an acceptable risk. Meanwhile, Russia, with whom the United States has a rather strained relationship, could at any time do vastly more damage with its nuclear weapons, a fully imaginable calamity that is substantially ignored. In constructing what he calls “a case for fear,” Cass Sunstein, a scholar and current Obama administration official, has pointed out that if there is a yearly probability of 1 in 100,000 that terrorists could launch a nuclear or massive biological attack, the risk would cumulate to 1 in 10,000 over 10 years and to 1 in 5,000 over 20. These odds, he suggests, are “not the most comforting.” Comfort, of course, lies in the viscera of those to be

comforted, and, as he suggests, many would probably have difficulty settling down with odds like that. But there must be some point at which the concerns even of these people would ease. Just perhaps it is at one of the levels suggested above: one in a million or one in three billion per attempt.

It's too hard – groups will use other methods

Weiss 15 – Leonard Weiss is a visiting scholar at the Center for International Security and Cooperation at Stanford University, USA, and a member of the National Advisory Board of the Center for Arms Control and Non-Proliferation in Washington, DC. For more than two decades, he was staff director of the US Senate Committee on Governmental Affairs and its Subcommittee on Energy and Nuclear Proliferation, during which time he wrote major legislation on nuclear nonproliferation and led investigations of nuclear programs of other countries. He is a former professor of applied mathematics and engineering at Brown University and the University of Maryland, “On fear and nuclear terrorism,” Bulletin of the Atomic Scientists, Vol. 71(2) 75–87

The bottom line on the risk of
nuclear terrorism

There is clearly some risk of nuclear terrorism via theft of weapons, **but the risk is low**, and a successful theft of a nuclear weapon would likely require a team of insiders working within an otherwise highly secure environment. There is also some risk that a nuclear-armed country might use a terrorist group to launch a nuclear attack on an adversary. **This possibility is also of low probability**, because the sponsor country would almost inevitably risk nuclear annihilation itself. Finally, a terrorist group might try to design and build its own weapon, possibly with the help of disaffected persons from a weapon state who might provide them with nuclear know-how and/or materials. Given all the steps needed to achieve a weapon that is workable with high probability—without being discovered and without suffering an accident—this scenario is also fraught with risk for the terrorists. As a result, **terrorists are much more likely to try to achieve their aims using conventional weapons**, which are cheaper, safer, and technically more reliable. Thus, while no one can discount completely the acquisition by a terrorist group of a nuclear explosive weapon, such an event appears to be of very low probability over the next decade at least, and can be made still lower using techniques or policies that do not require constitutionally problematic steps by the federal government or an optional war whose death rate could match or exceed what the terrorists are capable of. **There is a tendency on the part of security policy advocates to hype security threats to obtain support for their desired policy outcomes.** They are free to do so in a democratic society, and most come by their advocacy through genuine conviction that a real security threat is receiving insufficient attention. But there is now enough evidence of how such advocacy has been distorted for the purpose of overcoming political opposition to policies stemming from ideology that careful public exposure and examination of data on claimed threats should be part of any such debate. Until this happens, the most appropriate attitude toward claimed threats of nuclear terrorism, especially when accompanied by advocacy of policies intruding on individual freedom, should be one of skepticism.

WMD use would be a disaster for terrorists

Forest 12 (James, PhD and Director of Terrorism Studies and an associate professor at the United States Military Academy, "Framework for Analyzing the Future Threat of WMD Terrorism," Journal of Strategic Security, Volume 5, Number 4, Article 9, Winter 2012, <http://scholarcommons.usf.edu/cgi/viewcontent.cgi?article=1193&context=jss>) **NOTE---CBRN weapon = chemical, biological, radiological or nuclear weapon

The terrorist group would additionally need to consider whether a WMD attack would be counterproductive by generating, for example, condemnation among the group's potential supporters. This possible erosion in support, in turn, would degrade the group's political legitimacy among its constituencies, who are viewed as critical to the group's long-term survival. By crossing this WMD threshold, the group could feasibly undermine its popular support, encouraging a perception of the group as deranged mass murders, rather than righteous vanguards of a movement or warriors fighting for a legitimate cause.¹⁶ The importance of perception and popular support—or at least tolerance—gives a group reason to think twice before crossing the threshold of catastrophic terrorism. A negative perception can impact a broad range of critical necessities, including finances, safe haven, transportation logistics, and recruitment. Many terrorist groups throughout history have had to learn this lesson the hard way; the terrorist groups we worry about most today have learned from the failures and mistakes of the past, and take these into consideration in their strategic deliberations. Furthermore, a WMD attack could prove counterproductive by provoking a government (or possibly multiple governments) to significantly expand their efforts to destroy the terrorist group. Following a WMD attack in a democracy, there would surely be a great deal of domestic pressure on elected leaders to respond quickly and with a massive show of force. A recognition of his reality is surely a constraining factor on Hezbollah deliberations about attacking Israel, or the Chechen's deliberations about attacking Russia, with such a weapon.

No motivation for nuke terror

Mauroni 12

Al Mauroni, Air Force senior policy analyst, "Nuclear Terrorism: Are We Prepared?", Homeland Security Affairs, <http://www.hsaj.org/?fullarticle=8.1.9>

The popular assumption is that terrorists are actively working with "rogue nations" to exploit WMD materials and technology, or bidding for materials and technology on some nebulous global black market. They might be buying access to scientists and engineers who used to work on state WMD programs. The historical record doesn't demonstrate that. An examination of any of the past annual reports of the National Counterterrorism Center reveals that the basic modus operandi of terrorists and insurgents is to use conventional military weapons, easily acquired commercial (or improvised) explosives, and knives and machetes.⁸ It is relatively easy to train laypersons to use military firearms, such as the AK-47 automatic rifle and the RPG-7 rocket launcher. These groups have technical experts who develop improvised explosive devices using available and accessible materials from the local economy. Conventional weapons have known weapon effects and minimal challenges in handling and storing. Terrorists get their material and technology where they can. They don't have the time, funds, or interests to get exotic. It's what we see, over and over again.

Catastrophic terrorism is not going to happen—robust defenses regardless—past decade prove

Peter **Bergen**, CNN National Security Analyst, 2/26/14, [Forecasts of terrorist apocalypse? Never mind, edition.cnn.com/2014/02/26/opinion/bergen-sochi-terrorism-predictions/index.html](http://edition.cnn.com/2014/02/26/opinion/bergen-sochi-terrorism-predictions/index.html)

It's tough to make predictions, especially about the future" is an aphorism attributed to the great baseball player Yogi Berra.

But one topic where pundits, politicians and prognosticators of every persuasion don't have any problem about making pessimistic predictions is terrorism.

The Winter Olympics in Sochi, Russia, was an Olympic-level example of this. In the lead-up to the Games, the airwaves were filled with glum predictions that Sochi would be the 1972 Munich Olympics on steroids.

Rep. Michael McCaul, R-Texas, chairman of the U.S. House Homeland Security Committee, told Fox News, "There's a high degree of probability that something will detonate, something will go off. ... But I do think it's probably, most likely going to happen outside the 'ring of steel' at the Olympic Village."

Similarly, Michael G. Grimm, co-chair of the House Russian Caucus, issued a press release headlined, "Sochi Olympics Cannot Become a Benghazi Nightmare." The New York Republican warned, "We cannot sweep these threats under the rug, like we did with Benghazi or the warnings from Russia on the Tsarnaev brother behind the Boston Marathon bombing. Each time we fail to recognize these threats, we not only risk the lives of innocent Americans, but appear weaker and vulnerable in the eyes of the enemy."

Bill Rathburn, who directed security for the 1996 Summer Olympics in Atlanta, in an interview with Yahoo News predicted of Sochi, "It's not a matter of whether there will be some incident, it's just a matter of how bad it's going to be."

No wonder that two days before the Sochi Olympics, more than half of Americans believed a terrorist attack on the Games was likely, according to a CNN/ORC poll.

Now cue up the swarms of "black widows" descending on Sochi to kill themselves along with many Olympic spectators.

And then the Games were held and ... **nothing happened**

It turned out that the most terrifying image from Sochi was the look of disgust on the face of American figure skater Ashley Wagner when she learned of her lower-than-expected score.

Sochi is only the most recent example of the hyperventilating hyperbole of the doomsday terrorism prognosticators. Because so many folks were caught flat-footed by 9/11, some seem to overcompensate by keeping up a steady drumbeat of dire terror warnings.

In November, House Intelligence Committee Chairman Mike Rogers, R-Michigan, told CNN that al Qaeda "poses a bigger threat to attack inside the U.S. right now than it did before 9/11."

Rogers' statement defies common sense.

Before 9/11, al Qaeda had an entire county, Afghanistan, as a safe haven; its training camps there churned out thousands of militants every year; it had access to funding substantial enough so that it could spend several hundred thousand dollars on the 9/11 plot. It was a formidable enemy.

Now al Qaeda's safe haven is long gone; the group hasn't mounted any successful attack in the States since 9/11 or, for that matter, anywhere in the West since the London transportation system bombings in 2005.

On 9/11, the United States had never used armed drones in combat. Since then, the CIA has launched 370 drone strikes at suspected militant targets in Pakistan. During President Barack Obama's tenure alone, those drone strikes have killed more than 30 of al Qaeda's leaders in Pakistan.

Not only that: The United States is a much harder target than it was on 9/11. Then there were 16 people on the U.S. "no fly" list.

Today there are more than 20,000. In 2001, there were 32 Joint Terrorism Task Force "fusion centers," where multiple law enforcement agencies worked together to chase down leads and build terrorism cases. Now there are 103.

The U.S. intelligence budget also grew dramatically after 9/11. In 2010, the United States spent more than \$80 billion on intelligence collection and other covert activities, much of it directed at terrorist groups -- more than three times what the country spent in 1998.

At the time of the 9/11 attacks, the U.S. Department of Homeland Security, the National Counterterrorism Center and the Transportation Security Administration all didn't exist. All these new post-9/11 institutions make it much harder for terrorists to operate in the United States.

The gloom and doom about terrorism becomes much worse when the specter of terrorists deploying chemical, biological, radiological or nuclear weapons is added to the mix.

Graham Allison, the respected political scientist and founding dean of Harvard's Kennedy School of Government, published a book in 2004 titled "Nuclear Terrorism, which garnered considerable attention with its prediction that "on the current path, a nuclear terrorist attack on America in the decade ahead is more likely than not."

Of course, now we are a decade later, and nothing of the sort has happened.

Indeed, a striking finding of a database of every jihadist terrorism case in the United States since 9/11 maintained by the New America Foundation is that not one of the more than 200 individuals who were indicted or convicted of a jihadist terrorism crime acquired, manufactured or deployed chemical, biological or radiological weapons, let alone a nuclear device.

It's relatively easy to say the sky is always falling. Indeed, given the human capacity for evil, bad things are, indeed, going to happen. But when the sky doesn't fall, which is much of the time when it comes to terrorism, the doomsday prognosticators are rarely held to account. In any event, they are too busy warning of the next catastrophe.

Statistically impossible

Mueller 9 - John Mueller, Woody Hayes Chair of National Security Studies, Mershon Center
Professor of Political Science 30 April 2009 "THE ATOMIC TERRORIST?" http://www.icnnd.org/research/Mueller_Terrorism.pdf

In an article on the prospects for atomic terrorism, Bill Keller of *The New York Times* suggests that "the best reason for thinking it won't happen is that it hasn't happened yet," and that, he worries, "is terrible logic."³³ However, "logic" aside, there is another quite good reason for thinking it won't happen: the task is incredibly difficult. I have arrayed a lengthy set of obstacles confronting the would-be atomic terrorist. Those who warn about the likelihood of a terrorist bomb contend that a terrorist group could, if often with great difficulty, surmount each obstacle—that doing so in each case is "not impossible."³⁴ But it is vital to point out that, while it may be "not impossible" to surmount each individual step, the likelihood that a group could surmount a series of them quickly becomes vanishingly small. Even the very alarmed Matthew Bunn and Anthony Wier contend that the atomic terrorists' task "would clearly be among the most difficult types of attack to carry out" or "one of the most difficult missions a terrorist group could hope to try." But, stresses the CIA's George Tenet, a terrorist atomic bomb is "possible" or "not beyond the realm of possibility."³⁵ Accordingly, it might be useful to take a stab at estimating just how "difficult" the atomic terrorists' task, in aggregate, is—that is, how far from the fringe of the "realm of possibility" it might be. Most discussions of atomic terrorism deal in a rather piecemeal fashion with the subject—focusing separately on individual tasks such as procuring HEU or assembling a device or transporting it. However, as the Gilmore Commission, a special advisory panel to the President and Congress, stresses, setting off a nuclear device capable of producing mass destruction presents not only "Herculean challenges," but it requires that a whole series of steps be accomplished: obtaining enough fissile material, designing a weapon "that will bring that mass together in a tiny fraction of a second," and figuring out some way to deliver the thing. And it emphasizes that these merely constitute "the minimum requirements." If each is not fully met, the result is not simply a less powerful weapon, but one that can't produce any significant nuclear yield at all or can't be delivered.³⁶ Following this perspective, an approach that seems appropriate is to catalogue the barriers that must be overcome by a terrorist group in order to carry out the task of producing, transporting, and then successfully detonating an improvised nuclear device. Table 1 attempts to do this, and it arrays some 20 of these—all of which must be surmounted by the atomic aspirant. Actually, it would be quite possible to come up with a longer list: in the interests of keeping the catalogue of hurdles down to a reasonable number, some of the entries are actually collections of tasks and could be divided into two or three or more. For example, number 5 on the list requires that heisted highly-enriched uranium be neither a scam nor part of a sting nor of inadequate quality due to insider incompetence; but this hurdle could as readily be rendered as three separate ones. In contemplating the task before them, would-be atomic terrorists effectively *must* go through an exercise that looks much like this. If and when they do so, they are likely to find their prospects daunting and accordingly uninspiring or even terminally dispiriting. Assigning and calculating probabilities

The discussion thus far has followed a qualitative approach: synthesizing a considerable amount of material to lay out the route a terrorist group must take to acquire and detonate an atomic bomb in the most likely scenario. It seems to me that this exercise by itself suggests the almost breathtaking enormity of the difficulties facing the would-be atomic terrorist. This conclusion can be reinforced by a quantitative assessment. Assigning a probability that terrorists will be able to overcome each barrier is, of course, a tricky business, and any such exercise should be regarded as rather tentative and exploratory, or perhaps simply as illustrative—though it is done all the time in cost/benefit analysis. One might begin a quantitative approach by adopting probability estimates that purposely, and heavily, bias the case in the terrorists' favor. In my view, this would take place if it is assumed that the terrorists have a fighting chance of 50 percent of overcoming each of the 20 obstacles displayed in Table 1, though for many barriers, probably almost all, the odds against them are surely much worse than that. Even with that generous bias, the chances that a concerted effort would be successful comes out to be less than one in a million, specifically 1,048,576. If one assumes, somewhat more realistically, that their chances at each barrier are one in three, the cumulative odds they will be able to pull off the deed drop to one in well over three billion—specifically 3,486,784,401. What they would be at the (still entirely realistic) level of one in ten boggles the mind. Moreover, all this focuses on the effort to deliver a single bomb. If the requirement were to deliver several, the odds become, of course, even more prohibitive.

Decades-long motive disproves capability

Bruce **Hoffman**, senior fellow at the U.S. Military Academy's Combating Terrorism Center, and a professor and director of the Center for Security Studies at Georgetown University, April 2014, Low-Tech Terrorism, nationalinterest.org/print/article/low-tech-terrorism-9935

Fortunately, the report's most breathless prediction concerning the likelihood of terrorist use of weapons of mass destruction (WMD) has not come to pass. But this is not for want of terrorists trying to obtain such capabilities. Indeed, prior to the October 2001 U.S.-led invasion of Afghanistan, Al Qaeda had embarked upon an ambitious quest to acquire and develop an array of such weapons that, had it been successful, would have altered to an unimaginable extent our most basic conceptions about national security and rendered moot debates over whether terrorism posed a potentially existential threat. But just how effective have terrorist efforts to acquire and use weapons of mass destruction actually been? The September 11, 2001, attacks were widely noted for their reliance on relatively low-tech weaponry—the conversion, in effect, of airplanes into missiles by using raw physical muscle and box cutters to hijack them. Since then, efforts to gain access to WMD have been unceasing. But examining those efforts results in some surprising conclusions. While there is no cause for complacency, they do suggest that terrorists face some inherent constraints that will be difficult for them to overcome. It is easier to proclaim the threat of mass terror than to perpetrate it. THE TERRORIST ATTACKS

attacks on September 11 completely recast global perceptions of threat and vulnerability. Long-standing assumptions that terrorists were more interested in publicity than in killing were dramatically swept aside in the rising crescendo of death and destruction. The butcher's bill that morning was without parallel in the annals of modern terrorism. Throughout the entirety of the twentieth century no more than fourteen terrorist incidents had killed more than a hundred people, and until September 11 no terrorist operation had ever killed more than five hundred people in a single attack. Viewed from another perspective, more than twice as many Americans perished within those excruciating 102 minutes than had been killed by terrorists since 1968—the year widely accepted as marking the advent of modern, international terrorism. So massive and consequential a terrorist onslaught naturally gave rise to fears that a profound threshold in terrorist constraint and lethality had been crossed. Renewed fears and concerns were in turn generated that terrorists would now embrace an array of deadly nonconventional weapons in order to inflict even greater levels of death and destruction than had occurred that day. Attention focused specifically on terrorist use of WMD, and the so-called Cheney Doctrine emerged to shape America's national-security strategy. The doctrine derived from former vice president Dick Cheney's reported statement that "if there's a one percent chance that Pakistani scientists are helping Al Qaeda build or develop a nuclear weapon, we have to treat it as a certainty in terms of our response." What the "one percent doctrine" meant in practice, according to one observer, was that "even if there's just a one percent chance of the unimaginable coming due, act as if it's a certainty." Countering the threat of nonconventional-weapons proliferation—whether by rogue states arrayed in an "axis of evil" or by terrorists who might acquire such weapons from those same states or otherwise develop them on their own—thus became one of the central pillars of the Bush administration's time in office. In the case of Al Qaeda, at least, these fears were more than amply justified. That group's interest in acquiring a nuclear weapon reportedly commenced as long ago as 1992—a mere four years after its creation. An attempt by an Al Qaeda agent to purchase uranium from South Africa was made either late the following year or early in 1994 without success. Osama bin Laden's efforts to obtain nuclear material nonetheless continued, as evidenced by the arrest in Germany in 1998 of a trusted senior aide named Mamdouh Mahmud Salim, who was attempting to purchase enriched uranium. And that same year, the Al Qaeda leader issued a proclamation in the name of the "International Islamic Front for Fighting the Jews and Crusaders." Titled "The Nuclear Bomb of Islam," the proclamation declared that "it is the duty of Muslims to prepare as much force as possible to terrorize the enemies of God." When asked several months later by a Pakistani journalist whether Al Qaeda was "in a position to develop chemical weapons and try to purchase nuclear material for weapons," bin Laden replied: "I would say that acquiring weapons for the defense of Muslims is a religious duty." Bin Laden's continued interest in nuclear weaponry was also on display at the time of the September 11 attacks. Two Pakistani nuclear scientists named Sultan Bashiruddin Mahmood and Abdul Majeed spent three days that August at a secret Al Qaeda facility outside Kabul. Although their discussions with bin Laden, his deputy Ayman al-Zawahiri and other senior Al Qaeda officials also focused on the development and employment of chemical and biological weapons, Mahmood—the former director for nuclear power at Pakistan's Atomic Energy Commission—claimed that bin Laden's foremost interest was in developing a nuclear weapon. The movement's efforts in the biological-warfare realm, however, were far more advanced and appear to have begun in earnest with a memo written by al-Zawahiri on April 15, 1999, to Muhammad Atef,

then deputy commander of Al Qaeda's military committee. Citing articles published in Science, the Journal of Immunology and the New England Journal of Medicine, as well as information gleaned from authoritative books such as Tomorrow's Weapons, Peace or Pestilence and Chemical Warfare, al-Zawahiri outlined in detail his thoughts on the priority to be given to developing a biological-weapons capability. One of the specialists recruited for this purpose was a U.S.-trained Malaysian microbiologist named Yazid Sufaat. A former captain in the Malaysian army, Sufaat graduated from the California State University in 1987 with a degree in biological sciences. He later joined Al Gamaa al-Islamiyya (the "Islamic Group"), an Al Qaeda affiliate operating in Southeast Asia, and worked closely with its military operations chief, Riduan Isamuddin, better known as Hambali, and with Hambali's own Al Qaeda handler, Khalid Sheikh Mohammed—the infamous KSM, architect of the September 11 attacks. In January 2000, Sufaat played host to two of the 9/11 hijackers, Khalid al-Midhar and Nawaf Alhazmi, who stayed in his Kuala Lumpur condominium. Later that year, Zacarias Moussaoui, the alleged "twentieth hijacker," who was sentenced in 2006 to life imprisonment by a federal district court in Alexandria, Virginia, also stayed with Sufaat. Under KSM's direction, Hambali and Sufaat set up shop at an Al Qaeda camp in Kandahar, Afghanistan, where their efforts focused on the weaponization of anthrax. Although the two made some progress, biowarfare experts believe that on the eve of September 11 Al Qaeda was still at least two to three years away from producing a sufficient quantity of anthrax to use as a weapon. Meanwhile, a separate team of Al Qaeda operatives was engaged in a parallel research-and-development project to produce ricin and ~~chemical-warfare~~ agents at the movement's Derunta camp, near the eastern Afghan city of Jalalabad. As one senior U.S. intelligence officer who prefers to remain anonymous explained, "Al Qaeda's WMD efforts weren't part of a single program but rather multiple compartmentalized projects involving multiple scientists in multiple locations." The Derunta facility reportedly included laboratories and a school that trained handpicked terrorists in the use of chemical and biological weapons. Among this select group was Kamal Bourgass, an Algerian Al Qaeda operative who was convicted in British courts in 2004 and 2005 for the murder of a British police officer and of "conspiracy to commit a public nuisance by the use of poisons or explosives." The school's director was an Egyptian named Midhat Mursi—better known by his Al Qaeda nom de guerre, Abu Kebab—and among its instructors were a Pakistani microbiologist and Sufaat. When U.S. military forces overran the camp in 2001, evidence of the progress achieved in developing chemical weapons as diverse as hydrogen cyanide, chlorine and phosgene was discovered. Mursi himself was killed in 2008 by a missile fired from a U.S. Predator drone. Mursi's death dealt another significant blow to Al Qaeda's efforts to develop nonconventional weapons—but it did not end them. In fact, as the aforementioned senior U.S. intelligence officer recently commented, "Al Qaeda's ongoing procurement efforts have been well-established for awhile now . . . They haven't been highlighted in the U.S. media, but that isn't the same as it not happening." In 2010, for instance, credible intelligence surfaced that Al Qaeda in the Arabian Peninsula—widely considered the movement's most dangerous and capable affiliate—was deeply involved in the development of ricin, a bioweapon made from castor beans that the FBI has termed the third most toxic substance known, behind only plutonium and botulism. Then, in May 2013, Turkish authorities seized two kilograms of sarin nerve gas—the same weapon used in the 1995 attack on the Tokyo subway system—and arrested twelve men linked to Al Qaeda's Syrian affiliate, Al Nusra Front. Days later, another set of sarin-related arrests was made in Iraq of Al Qaeda operatives based in that country who were separately overseeing the production of sarin and mustard blistering agents at two or more locations. Finally, Israel admitted in November 2013 that for the past three years it had been holding a senior Al Qaeda operative whose expertise was in biological warfare. "The revelations over his alleged biological weapons links," one account noted of the operative's detention, "come amid concerns that Al Qaeda affiliates in Syria are attempting to procure bioweapons—and may already have done so." Indeed, Syria's ongoing civil war and the prominent position of two key Al Qaeda affiliates—Al Nusra Front and the Islamic State of Iraq and the Levant—along with other sympathetic jihadi entities in that epic struggle, coupled with the potential access afforded to Bashar al-Assad's chemical-weapons stockpiles, suggest that we have likely not heard the last of Al Qaeda's ambitions to obtain nerve agents, poison gas and other harmful toxins for use as mass-casualty weapons. NONETHELESS, A fundamental paradox appears to exist so far as terrorist capabilities involving chemical, biological and nuclear weapons are concerned. As mesmerizingly attractive as these nonconventional weapons remain to Al Qaeda and other terrorist organizations, they have also mostly proven frustratingly disappointing to whoever has tried to use them. Despite the extensive use of poison gas during World War I, for instance, this weapon accounted for only 5 percent of all casualties in that conflict. Reportedly, it required some sixty pounds of mustard gas to produce even a single casualty. Even in more recent times, chemical weapons claimed the lives of less than 1 percent (five thousand) of the six hundred thousand Iranians who died in the Iran-Iraq war. The Japanese cult Aum Shinrikyo succeeded in killing no more than thirteen people in its attack on the Tokyo underground in 1995. And, five years earlier, no fatalities resulted from a Tamil Tigers assault on a Sri Lankan armed forces base in East Kiran that employed chlorine gas. In fact, the wind changed and blew the gas back into the Tigers' lines, thus aborting the attack. Biological weapons have proven similarly difficult to deploy effectively. Before and during World War II, the Imperial Japanese Army carried out nearly a dozen attacks using a variety of germ agents—including cholera, dysentery, bubonic plague, anthrax and paratyphoid, disseminated through both air and water—against Chinese forces. Not once did these weapons decisively affect the outcome of a battle. And, in the 1942 assault on Chekiang, ten thousand Japanese soldiers themselves became ill, and nearly two thousand died, from exposure to these agents. "The Japanese program's

principal defect, a problem to all efforts so far," the American terrorism expert David Rapoport concluded, was "an ineffective delivery system." The challenges inherent in using germs as weapons are borne out by the research conducted for more than a decade by Seth Carus, a researcher at the National Defense University. Carus has assembled perhaps the most comprehensive database of the use of biological agents by a wide variety of adversaries, including terrorists, government operatives, ordinary criminals and the mentally unstable. His exhaustive research reveals that no more than a total of ten people were killed and less than a thousand were made ill as a result of about two hundred incidents of bioterrorism or biocrime. Most of which, moreover, entailed the individual poisoning of specific people rather than widespread, indiscriminate attacks. The formidable challenges of obtaining the material needed to construct a nuclear bomb, along with the fabrication and dissemination difficulties involving the use of noxious gases and biological agents, perhaps account for the operational conservatism long observed in terrorist tactics and weaponry. As politically radical or religiously fanatical as terrorists may be, they nonetheless to date have overwhelmingly seemed to prefer the tactical assurance of the comparatively modest effects achieved by the conventional weapons with which they are familiar, as opposed to the risk of failure inherent in the use of more exotic means of death and destruction. Terrorists, as Brian Jenkins famously observed in 1985, thus continue to "appear to be more imitative than innovative." Accordingly, what innovation does occur tends to take place in the realm of the clever adaptation or modification of existing tactics—such as turning hijacked passenger airliners into cruise missiles—or in the means and methods used to fabricate and detonate explosive devices, rather than in the use of some new or dramatically novel weapon. THE TERRORISTS have thus functioned mostly in a technological vacuum: either aloof or averse to the profound changes that have fundamentally altered the nature of modern warfare. Whereas technological progress has produced successively more complex, lethally effective and destructively accurate weapons systems that are deployed from a variety of air, land, sea—and space—platforms, terrorists continue to rely, as they have for more than a century, on the same two basic "weapons systems": the gun and the bomb. Admittedly, the guns used by terrorists today have larger ammunition capacities and more rapid rates of fire than the simple revolver the Russian revolutionary Vera Zasulich used in 1878 to assassinate the governor-general of St. Petersburg. Similarly, bombs today require smaller amounts of explosives that are exponentially more powerful and more easily concealed than the sticks of TNT with which the Fenian dynamiters terrorized London more than a century ago. But the fact remains that the vast majority of terrorist incidents continue to utilize the same two attack modes.

It was easier in the 90s and they still couldn't do it

Zenko and Cohen 12 *Fellow in the Center for Preventive Action at the Council on Foreign Relations, *Fellow at the Century Foundation, (Micah and Michael, "Clear and Present Safety," March/April, Foreign Affairs, www.foreignaffairs.com/articles/137279/micah-zenko-and-michael-a-cohen/clear-and-present-safety

In the past decade, Cheney and other one-percenters have frequently warned of the danger posed by loose nukes or uncontrolled fissile material. In fact, the threat of a nuclear device ending up in the hands of a terrorist group has diminished markedly since the early 1990s, when the Soviet Union's nuclear arsenal was dispersed across all of Russia's 11 time zones, all 15 former Soviet republics, and much of eastern Europe. Since then, cooperative U.S.-Russian efforts have resulted in the substantial consolidation of those weapons at far fewer sites and in comprehensive

security upgrades at almost all the facilities that still possess nuclear material or warheads, making the possibility of theft or diversion unlikely. Moreover, the lessons learned from securing Russia's nuclear arsenal are now being applied in other countries, under the framework of Obama's April 2010 Nuclear Security Summit, which produced a global plan to secure all nuclear materials within four years. Since then, participants in the plan, including Chile, Mexico, Ukraine, and Vietnam, have fulfilled more than 70 percent of the commitments they made at the summit.

Pakistan represents another potential source of loose nukes. The United States' military strategy in Afghanistan, with its reliance on drone strikes and cross-border raids, has actually contributed to instability in Pakistan, worsened U.S. relations with Islamabad, and potentially increased the possibility of a weapon falling into the wrong hands. Indeed, Pakistani fears of a U.S. raid on its nuclear arsenal have reportedly led Islamabad to disperse its weapons to multiple sites, transporting them in unsecured civilian vehicles. But even in Pakistan, the chances of a terrorist organization procuring a nuclear weapon are infinitesimally small. The U.S. Department of Energy has provided assistance to improve the security of Pakistan's nuclear arsenal, and successive senior U.S. government officials have repeated what former Secretary of Defense Robert Gates said in January 2010: that the United States is "very comfortable with the security of Pakistan's nuclear weapons."

Too many barriers---have to answer each to win an impact

Friedman 12 (George, January 2012, PhD in Government from Cornell University and founder of Stratfor, *The Next Decade: Empire and Republic in a Changing World*, pgs. 81-82)

The simple answer is that while constructing and deploying a WMD is easy to imagine, it is very difficult to execute. Existing weapons are relatively few, heavily guarded, difficult to move, and likely to kill the terrorist well before the terrorist gets a chance to kill anyone else. There have been many reports of Soviet-era nuclear weapons, and biological and chemical weapons, being available on the black market, but most of the offers were made by intelligence agencies trying to lure terrorists into a trap. If you were a terrorist offered a suitcase nuke by a former Soviet Colonel, how could you possibly tell whether what you were looking at was the real thing or just a box stuffed with wires and blinking lights? The same uncertainty would have to hold for chemical and biological weapons as well. Intelligence services don't have to know who is selling real WMDs in order to scare away the customers, and the allure of acquiring these weapons contracted considerably when the number of intelligence officers offer them for sales as entrapment outnumbered legitimate offers by one hundred to one. There is, of course, the option of making such a weapon yourself, and every year some undergraduate posts a diagram of how to build a nuclear device. Between that sketch and success are the following steps: acquiring the fissile material, along with all of the necessary circuitry and casings; acquiring the machine needed to machine the fissile material to the precise tolerances needed in order to detonate it; engaging the experts who could actually do these things once you had the material and the equipment; finding a very secure facility where the experts could work and live, and so on. The chances of being detected are compounded at each stage of this tortuous process. Even if you could acquire the highly guarded fissile material, the machines needed for producing a nuclear weapon are highly specialized, and their manufacturers are few and far between. When a private individual shows up with his American Express card to order one of these machines, the chances that he will be detected are very good indeed. With biological and chemical weapons, you add to these the same risks the likelihood that the only person you'll kill will be yourself and your immediate accomplices. Chemical and biological weapons carry an extra layer of complexity in that they have to be dispersed. When a Japanese group released sarin, an extremely deadly nerve gas, in a Tokyo subway, the contamination remained localized and only a few people were killed, not the substantial numbers the terrorists had hoped for. People always speak of how a speck of this or that could wipe out an entire city. Certainly – but first you have to figure out how to spread it around. Only one country ever produced a nuclear weapon from scratch, and that was the United States. The British got their nukes in compensation for their contribution to the American research effort. The French also acquired the technology from the Americans, which they then regifted to Israel. The Russians stole the knowledge from the Americans, then transferred it to both the Chinese and the Indians. The Chinese gave the technology to the Pakistanis. The point is, the development of these weapons through an independent research program is enormously difficult, which is why Iran is still struggling and North Korea has never gotten it quite right.

No threat – weak leadership and no recent attacks

Zenko and Cohen 12. *Fellow in the Center for Preventive Action at the Council on Foreign Relations, *Fellow at the Century Foundation, (Micah and Michael, "Clear and Present Safety," March/April, Foreign Affairs, www.foreignaffairs.com/articles/137279/micah-zenko-and-michael-a-cohen/clear-and-present-safety)

NONE OF this is meant to suggest that the United States faces no major challenges today. Rather, the point is that the problems confronting the country are manageable and pose minimal risks to the lives of the overwhelming majority of Americans. None of them -- separately or in combination -- justifies the alarmist rhetoric of policymakers and politicians or should lead to the conclusion that Americans live in a dangerous world.

Take terrorism. Since 9/11, no security threat has been hyped more. Considering the horrors of that day, that is not surprising. But the result has been a level of fear that is completely out of proportion to both the capabilities of terrorist organizations and the United States' vulnerability. On 9/11, al Qaeda got

tragically lucky. Since then, the United States has been preparing for the one percent chance (and likely even less) that it might get lucky again. But al Qaeda lost its safe haven after the U.S.-led invasion of Afghanistan in 2001, and further military, diplomatic, intelligence, and law enforcement efforts have decimated the organization, which has essentially lost whatever ability it once had to seriously threaten the United States.

According to U.S. officials, al Qaeda's leadership has been reduced to two top lieutenants: Ayman al-Zawahiri and his second-in-command, Abu Yahya al-Libi. Panetta has even said that the defeat of al Qaeda is "within reach." The near collapse of the original al Qaeda organization is one reason why, in the decade since 9/11, the U.S. homeland has not suffered any large-scale terrorist assaults. All subsequent attempts have failed or been thwarted, owing in part to the incompetence of their perpetrators. Although there are undoubtedly still some terrorists who wish to kill Americans, their dreams will likely continue to be frustrated by their own limitations and by the intelligence and law enforcement agencies of the United States and its allies.

Can't steal a bomb---global nuclear security is increasing---stops terror

NTI 13 (Nuclear Threat Initiative, 30 January 2013, "Global Nuclear Security Gains: NTI Nuclear Materials Security Index, One-Year Progress Report," <http://www.nti.org/analysis/articles/global-nuclear-security-gains-nti-nuclear-materials-security-index-one-year-progress-report/>)

In January 2012, the Nuclear Threat Initiative (NTI) released the NTI Nuclear Materials Security Index, a first-of-its-kind public assessment of nuclear materials security conditions in 176 countries – 32 with one kilogram or more of weapons-usable nuclear materials and 144 with less than one kilogram of weapons-usable materials. An updated version of the NTI Index will be released in early 2014. In the meantime, since the completion of the inaugural NTI Index, [1] dozens of countries have taken or pledged to take key steps to strengthen their own nuclear security conditions, diminish opportunities for terrorist access to nuclear materials, and enhance nuclear security around the world. Progress on Reducing the Availability of Nuclear Materials Eliminating weapons-usable nuclear materials is, of course, the most significant step a country can take toward ensuring that terrorists can't get access to the materials needed to build a nuclear bomb. Since release of the NTI Index: Three countries – Austria, Mexico, and Ukraine – have completely eliminated all weapons-usable nuclear material from their territories. Five more countries – Kazakhstan, Poland, South Africa, Sweden, and Uzbekistan – have reduced their stockpiles of weapons-usable nuclear material. As a result of these actions, now only 28 states have one kilogram or more of these materials, instead of the 32 countries profiled in the 2012 NTI Index. When the second edition of the Index is released in 2014, Austria, Mexico, Ukraine, and Sweden [2] will move off the list of countries with more than one kilogram of weapons-usable nuclear material. This progress builds on steps taken following President Obama's April 2009 speech in Prague when he initially announced a four-year effort to secure all vulnerable nuclear material worldwide. In addition to the three countries that have eliminated all weapons-usable nuclear material listed above, Chile, Libya, Romania, Serbia, and Turkey as well as Taiwan have eliminated their stocks of weapons-usable nuclear material since April 2009. As a result, there are nine fewer states with weapons-usable nuclear material than in 2009, demonstrating significant, measurable progress in the global effort to prevent nuclear terrorism. Additional near-term progress is possible. Vietnam, the Czech Republic, Hungary, and Poland have committed to eliminating their remaining weapons-usable nuclear material, and Australia and Italy pledged at the 2012 Nuclear Security Summit in Seoul, South Korea to further reduce their nuclear material stockpiles. New Commitments and Actions The NTI Index also assessed countries' commitments to global norms, including participation in two key treaties to prevent nuclear terrorism: the Convention on the Physical Protection of Nuclear Material (CPPNM) and the International Convention on the Suppression of Acts of Nuclear Terrorism (ICSANT). Since the completion of the first NTI Index: Côte d'Ivoire and Vietnam acceded to the

CPPNM, an agreement vital to enacting security standards for materials in transit. Twelve new countries are now party to the 2005 Amendment to the CPPNM, which obligates state parties to enact standards for nuclear materials in use, in storage, or in transit domestically and requires countries to take criminal action against nuclear thieves, smugglers, and saboteurs. Argentina, Belgium, Georgia, Ghana, Greece, Israel, Lesotho, Luxembourg, Macedonia, Mexico, Sweden, and Vietnam have all taken this important step since the 2012 NTI Index was completed. [3] Five new countries – Australia, Côte d'Ivoire, Malta, Nigeria, and Turkey – are now party to the International Convention on the Suppression of Acts of Nuclear Terrorism (ICSANT), which commits states to criminalize acts of nuclear terrorism and promotes cooperation among countries on investigations and extraditions. NTI anticipates more progress before the release of the 2014 NTI Index, as France has pledged to complete ratification of ICSANT and the 2005 Amendment to the CPPNM and Norway has pledged to ratify ICSANT. In addition to progress in the international legal arena, several countries have taken other steps to enhance global nuclear security: China and India for the first time contributed to the IAEA's Nuclear Security Fund, which assists states in preventing, detecting, and responding to nuclear terrorism. Kazakhstan, Mexico, and Ukraine joined the G8 Global Partnership Against the Spread of Weapons of Mass Destruction. Japan formed a new independent regulatory agency to address nuclear safety and security, a substantial policy reform.

No risk

Chapman 12 (Stephen, columnist and editorial writer for the Chicago Tribune, "CHAPMAN: Nuclear terrorism unlikely," 22 May 2012, <http://www.oaoo.com/articles/chapman-87719-nuclear-terrorism.html>)

Given their inability to do something simple — say, shoot up a shopping mall or set off a truck bomb — it's reasonable to ask whether they have a chance at something much more ambitious. Far from being plausible, argued Ohio State University professor John Mueller in a presentation at the University of Chicago, "the likelihood that a terrorist group will come up with an atomic bomb seems to be vanishingly small." The events required to make that happen comprise a multitude of Herculean tasks. First, a terrorist group has to get a bomb or fissile material, perhaps from Russia's inventory of decommissioned warheads. If that were easy, one would have already gone missing. Besides, those devices are probably no longer a danger, since weapons that are not maintained quickly become what one expert calls "radioactive scrap metal." If terrorists were able to steal a Pakistani bomb, they would still have to defeat the arming codes and other safeguards designed to prevent unauthorized use. As for Iran, no nuclear state has ever given a bomb to an ally — for reasons even the Iranians can grasp. Stealing some 100 pounds of bomb fuel would require help from rogue individuals inside some government who are prepared to jeopardize their own lives. Then comes the task of building a bomb. It's not something you can gin up with spare parts and power tools in your garage. It requires millions of dollars, a safe haven and advanced equipment — plus people with specialized skills, lots of time and a willingness to die for the cause. Assuming the jihadists vault over those Himalayas, they would have to deliver the weapon onto American soil. Sure, drug smugglers bring in contraband all the time — but seeking their help would confront the plotters with possible exposure or extortion. This, like every other step in the entire process, means expanding the circle of people who know what's going on, multiplying the chance someone will blab, back out or screw up. That has heartening implications. If al-Qaida embarks on the project, it has only a minuscule chance of seeing it bear fruit. Given the formidable odds, it probably won't bother.

Low chance---weapons are dispersed

Cohen & Zenko 12 (Michael and Micah, Fellow at the Century Foundation AND Fellow in the Center for Preventive Action at the Council on Foreign Relations, "Clear and Present Safety," Foreign Affairs, Vol. 91, Iss. 2, EBSCO)

Pakistan represents another potential source of loose nukes. The United States' military strategy in Afghanistan, with its reliance on drone strikes and cross-border raids, has actually contributed to instability in Pakistan, worsened U.S. relations with Islamabad, and potentially increased the possibility of a weapon falling into the wrong hands. Indeed, Pakistani fears of a U.S. raid on its nuclear arsenal have reportedly led Islamabad to disperse its weapons to multiple sites, transporting them in unsecured civilian vehicles. But even in Pakistan, the chances of a terrorist organization procuring a nuclear weapon are infinitesimally small. The U.S. Department of Energy has provided assistance to improve the security of Pakistan's nuclear arsenal, and successive senior U.S. government officials have repeated what former Secretary of Defense Robert Gates said in January 2010: that the United States is "very comfortable with the security of Pakistan's nuclear weapons."

Russian nuclear security has improved---their ev assumes Cold War posturing

Cohen & Zenko 12 (Michael and Micah, Fellow at the Century Foundation AND Fellow in the Center for Preventive Action at the Council on Foreign Relations, "Clear and Present Safety," Foreign Affairs, Vol. 91, Iss. 2, EBSCO)

In the past decade, Cheney and other one-percenters have frequently warned of the danger posed by loose nukes or uncontrolled fissile material. In fact, the threat of a nuclear device ending up in the hands of a terrorist group has diminished markedly since the early 1990s, when the Soviet Union's nuclear arsenal was dispersed across all of Russia's 11 time zones, all 15 former Soviet republics, and much of eastern Europe. Since then, cooperative U.S.-Russian efforts have resulted in the substantial consolidation of those weapons at far fewer sites and in comprehensive security upgrades at almost all the facilities that still possess nuclear material or warheads, making the possibility of theft or diversion unlikely. Moreover, the lessons learned from securing Russia's nuclear arsenal are now being applied in other countries, under the framework of Obama's April 2010 Nuclear Security Summit, which produced a global plan to secure all nuclear materials within four years. Since then, participants in the plan, including Chile, Mexico, Ukraine, and Vietnam, have fulfilled more than 70 percent of the commitments they made at the summit.

No state would give terrorists a nuke

Lieber & Press 13 (Keir and Daryl, Associate Professor in the Edmund A. Walsh School of Foreign Service and the Department of Government at Georgetown University AND Associate Professor of Government at Dartmouth College, "Why States Won't Give Nuclear Weapons to Terrorists," International Security, Vol. 38, No. 1, Summer 2013, EBSCO)

Some analysts are skeptical about such sponsored nuclear terrorism, arguing that a state may not be willing to deplete its small nuclear arsenal or stock of precious nuclear materials. More important, a state sponsor would fear that a terrorist organization might use the weapons or materials in ways the state never intended, provoking retaliation that would destroy the regime.¹⁴ Nuclear weapons are the most powerful weapons a state can acquire, and handing that power to an actor over which the state has less than complete control would be an enormous, epochal decision—one unlikely to be taken by regimes that are typically obsessed with power and their own survival. Perhaps the most important reason to doubt the nuclear-attack-by-proxy scenario is the likelihood that the ultimate source of the weapon might be discovered.¹⁵

One means of identifying the state source of a nuclear terrorist attack is through “nuclear forensics”—the use of a bomb’s isotopic fingerprints to trace the missile material device back to the reactors, enrichment facilities, or uranium mines from which it was derived. In theory, the material that remains after an explosion can yield crucial information about its source: the ratio of uranium isotopes varies according to where the raw uranium was mined and how it was processed, and the composition of weapons-grade plutonium reveals clues about the particular reactor used to produce it and how long the material spent in the reactor.¹⁶ The possibility that the covert plot could be discovered before being carried out also acts as a deterrent. For these and other reasons, some analysts argue that nuclear terrorism is unlikely.

No handoff

Leonard **Weiss** is a visiting scholar at the Center for International Security and Cooperation at Stanford University, USA, and a member of the National Advisory Board of the Center for Arms Control and Non-Proliferation in Washington, DC. For more than two decades, he was staff director of the US Senate Committee on Governmental Affairs and its Subcommittee on Energy and Nuclear Proliferation, during which time he wrote major legislation on nuclear nonproliferation and led investigations of nuclear programs of other countries. He is a former professor of applied mathematics and engineering at Brown University and the University of Maryland, “On fear and nuclear terrorism,” *Bulletin of the Atomic Scientists* ‘15, Vol. 71(2) 75–87

Acquiring nukes as a gift. Following the shock of 9/11, government officials and the media imagined many scenarios in which terrorists obtain nuclear weapons; one of those scenarios involves a weapon state using a terrorist group for delivery of a nuclear weapon. There are at least two reasons why this scenario is unlikely: First, once a weapon state loses control of a weapon, it cannot be sure the weapon will be used by the terrorist group as intended. Second, the state cannot be sure that the transfer of the weapon has been undetected either before or after the fact of its detonation (see Lieber and Press, 2013). The use of the weapon by a terrorist group will ultimately result in the transferring nation becoming a nuclear target just as if it had itself detonated the device. This is a powerful deterrent to such a transfer, making the transfer a low-probability event. Although these first two ways in which terrorists might obtain a nuclear weapon have very small probabilities of occurring (there is no available data suggesting that terrorist groups have produced plans for stealing a weapon, nor has there been any public information suggesting that any nuclear weapon state has seriously considered providing a nuclear weapon to a sub-national group), the probabilities cannot be said to be zero as long as nuclear weapons exist.

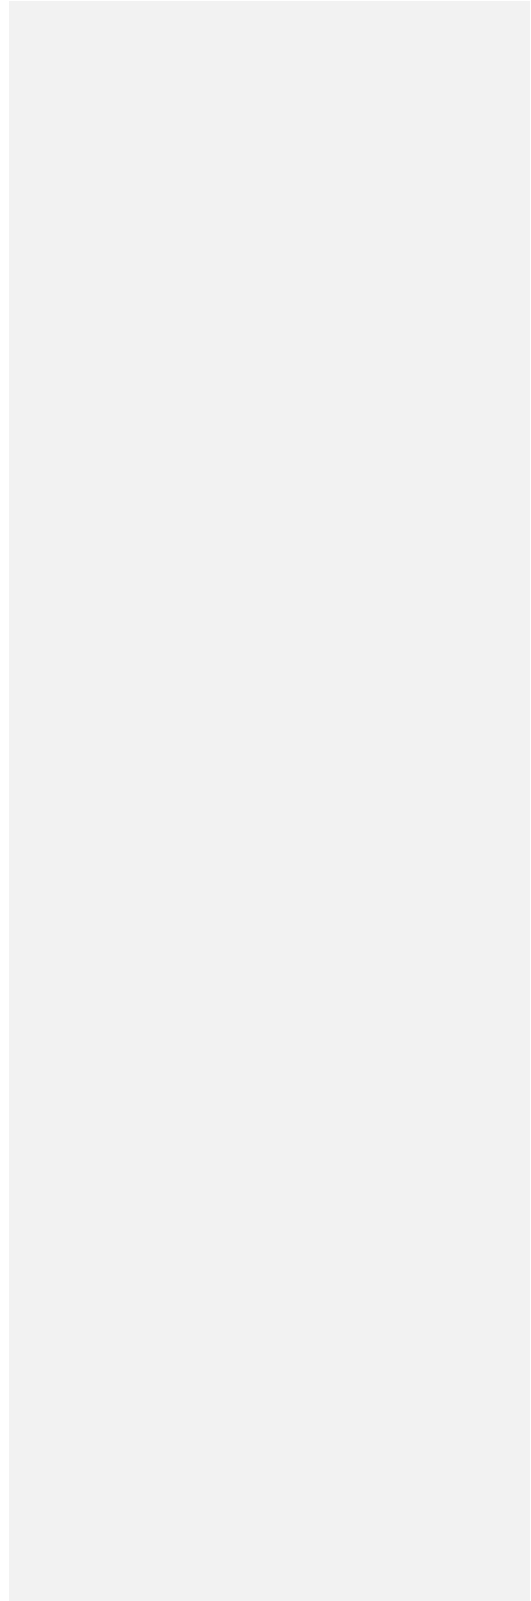

Iran won’t give terrorists a nuke

Walt 12 (Stephen M. Walt is the Robert and Renée Belfer professor of international relations at Harvard University., 6/26/2012, “Should we give Iran the bomb?”, http://walt.foreignpolicy.com/posts/2012/06/26/waltz_weights_in_on_iran)

Walt maintains that this pattern has generally applied in other nuclear contexts, whether one looks at U.S.-Soviet relations during the Cold War, China’s acquisition of the bomb in the 1960s, or the troubled relationship between India and Pakistan, which fought major wars before

each got the bomb but have fought only relatively minor skirmishes since. He also reminds his readers that there is no evidence that Iran's leaders are irrational (and certainly no more irrational than ours), and no good reason to think they would ever use a nuclear weapon for offensive purposes or give one away to terrorists. (This latter possibility is especially absurd: Why would any country devote millions of dollars and decades of effort to get a few bombs, and then blithely give them away to people over whom they had little control?)

Bioterror

2AC

No risk of bioterror

Keller 13 (Rebecca, 7 March 2013, Analyst at Stratfor, "Bioterrorism and the Pandemic Potential," Stratfor, <http://www.stratfor.com/weekly/bioterrorism-and-pandemic-potential>)

The risk of an accidental release of H5N1 is similar to that of other infectious pathogens currently being studied. Proper safety standards are key, of course, and experts in the field have had a year to determine the best way to proceed, balancing safety and research benefits. Previous work with the virus was conducted at biosafety level three out of four, which requires researchers wearing respirators and disposable gowns to work in pairs in a negative pressure environment. While many of these labs are part of universities, access is controlled either through keyed entry or even palm scanners. There are roughly 40 labs that submitted to the voluntary ban. Those wishing to resume work after the ban was lifted must comply with guidelines requiring strict national oversight and close communication and collaboration with national authorities. The risk of release either through accident or theft cannot be completely eliminated, but given the established parameters the risk is minimal. The use of the pathogen as a biological weapon requires an assessment of whether a non-state actor would have the capabilities to isolate the virulent strain, then weaponize and distribute it. Stratfor has long held the position that while terrorist organizations may have rudimentary capabilities regarding biological weapons, the likelihood of a successful attack is very low. Given that the laboratory version of H5N1 -- or any influenza virus, for that matter -- is a contagious pathogen, there would be two possible modes that a non-state actor would have to instigate an attack. The virus could be refined and then aerosolized and released into a populated area, or an individual could be infected with the virus and sent to freely circulate within a population. There are severe constraints that make success using either of these methods unlikely. The technology needed to refine and aerosolize a pathogen for a biological attack is beyond the capability of most non-state actors. Even if they were able to develop a weapon, other factors such as wind patterns and humidity can render an attack ineffective. Using a human carrier is a less expensive method, but it requires that the biological agent be a contagion. Additionally, in order to infect the large number of people necessary to start an outbreak, the infected carrier must be mobile while contagious, something that is doubtful with a serious disease like small pox. The carrier also cannot be visibly ill because that would limit the necessary human contact.

1AR

No bioweapons

Ouagrham-Gormley 14

Sonia Ben Ouagrham-Gormley is Assistant Professor of Public and International Affairs at George Mason University. She worked for a decade at the Monterey Institute for International Studies. She was for two years research director of the James Martin Center for Nonproliferation Studies office in Kazakhstan and was founding editor of the International Export Control Observer, Cornell University Press, November 2014, "Barriers to Bioweapons", <http://www.cornellpress.cornell.edu/book/?GCOI=80140100857780>

In both the popular imagination and among lawmakers and national security experts, there exists the belief that with sufficient motivation and material resources, states or terrorist groups can produce bioweapons easily, cheaply, and successfully. In Barriers to Bioweapons, Sonia Ben Ouagrham-Gormley challenges this perception by showing that bioweapons development is a difficult, protracted, and expensive endeavor, rarely achieving the expected results whatever the magnitude of investment. Her findings are based on extensive interviews she conducted with former U.S. and Soviet-era bioweapons scientists and on careful analysis of archival data and other historical documents related to various state and terrorist bioweapons programs.

Bioweapons development relies on living organisms that are sensitive to their environment and handling conditions, and therefore behave unpredictably. These features place a greater premium on specialized knowledge. Ben Ouagrham-Gormley posits that lack of access to such intellectual capital constitutes the greatest barrier to the making of bioweapons. She integrates theories drawn from economics, the sociology of science, organization, and management with her empirical research. The resulting theoretical framework rests on the idea that the pace and success of a bioweapons development program can be measured by its ability to ensure the creation and transfer of scientific and technical knowledge. The specific organizational, managerial, social, political, and economic conditions necessary for success are difficult to achieve, particularly in covert programs where the need to prevent detection imposes managerial and organizational conditions that conflict with knowledge production.

No bioweapons proliferate – tacit knowledge gap and organization failure – assumes new tech advances

Ouagrham-Gormley 12

Sonia Ben, Assistant Professor in the Biodefense Program at George Mason University, "Barriers to Bioweapons," International Security, Vol. 36, No. 4 (Spring 2012), pp. 80–114

Conclusion The U.S. and Soviet bioweapons programs offer valuable insights for assessing future bioweapons proliferation threats. Certainly, the globalization of the pharmaceutical and biotechnology industries has enabled an increasingly widespread diffusion of information, materials, and equipment

that could prove beneficial to states or terrorist groups interested in developing biological weapons. But although such inputs are necessary, they are hardly sufficient to produce a significant weapons capability. As demonstrated in the U.S. and Soviet cases, such intangible factors as organizational makeup and management style greatly affect the use of acquired knowledge, the creation of tacit knowledge, and its transfer within the organization to enable ultimate success. Importantly, these intangible elements are local in character and cannot be easily transferred among individuals or from one place to another. Although the effects of intangible factors are more pronounced in large-scale bioweapons programs, given the increasing complexity introduced by the need to produce a tested weapon with repeatable results, they also affect smaller-scale state and terrorist group programs, as illustrated by South Africa's and Aum Shinrikyo's programs. Even programs with more modest ambitions need to acquire the expertise required to handle, manipulate, and disseminate the agents selected, create an environment conducive to teamwork and learning, integrate the acquired knowledge into the existing knowledge base, and adapt the technology to their environment. These are complex and time-consuming tasks for programs operating in a stable environment. For covert programs fearful of detection, the task is made more challenging as the imperatives of maintaining covertness directly contradict the requirement of efficient knowledge use and production. The revolution in biotechnology has not reduced the importance of the intangible factors that shape bioweapons program outcomes. Although new breakthroughs in biotechnology can frequently accelerate progress in laboratory work, these new techniques still depend heavily on teams of scientists and technicians developing new sets of skills through extensive experimentation. Only in this way can they demonstrate the utility of these new breakthroughs for particular applications. Thus, by taking into account the intangible dimension of proliferation, intelligence and policy officials can understand more holistically how a state or terrorist group can actually use the tangible resources they may have acquired. Ideally, developing a more thorough understanding of a program's existing research and knowledge base, as well as how the program is organized and managed, will provide intelligence and policy officials with a better analytical basis for determining the time required for the program to achieve its goal. This in turn will help policymakers fashion interventions that are most appropriate to respond to specific threats. Gathering information about these intangible factors is dependent on intelligence efforts, and this article provides insights into how better collection and analysis on WMD threats might be accomplished. However, actions against a suspected program can beneficially be implemented even in the absence of detailed information about its knowledge base and organizational makeup. A policy aimed at frustrating the acquisition of skills, the collective interpretation and integration of data and individual knowledge, and the accumulation of knowledge can delay progress in a suspected program and possibly cause its failure.

They can't turn the basic science into effective weapons **Ouagrham-Gormley 14**

Sonia Ben Ouagrham-Gormley is Assistant Professor of Public and International Affairs at George Mason University. She worked for a decade at the Monterey Institute for International Studies. She was for two years research director of the James Martin Center for Nonproliferation Studies office in Kazakhstan and was founding editor of the International Export Control Observer, Shannon R. Fye, Public Policy @ GMU, *Frontiers of Public Health*, September 24, 2014, "Restricted Science", <http://journal.frontiersin.org/Journal/10.3389/fpubh.2014.00158/full>

The NSABB's initial decision to edit the H5N1-related article before its publication was followed by the Dutch government's decision to impose export-control restrictions on the Dutch team's article. Dutch authorities claimed that the research fell under European Council Regulation EC 428/2009, which attempts to prevent the spread of nuclear, chemical, and biological weapons by requiring an export

license before publication (10). These moves are based on the assumption that innovations achieved in the laboratory can be easily fashioned into a harmful agent or a bioweapon. **Yet, past bioweapons work shows** that transforming a scientific concept developed in the laboratory into a product that has a specific, applied purpose, and functions reliably and effectively can take several decades and require a variety of expertise. Specifically, the passage from laboratory concept to specific application faces the challenge of scaling-up fragile microorganisms for large-scale production **and developing a delivery mechanism that will protect the agents** from environmental degradation when released as a weapon. For example, within the Soviet bioweapons program, the development of an antibiotic-resistant strain of the bacterium that causes plague took 20 years to achieve and involved teams at three institutes. Scaling-up anthrax and smallpox weapons took Soviet researchers about 5 years to achieve and required the involvement of large teams of scientists, including the designers of the original strains. And within the U.S. bioweapons program, scientists discovered that the botulinum toxin weapon they had produced eventually lost some of its toxicity upon aerosol release. These examples demonstrate that laboratory successes do not necessarily lead to successful application to a specific purpose. Instead, specialized skills honed over years of practice in production and weaponization work are critical to success (11).

Expertise barriers are too high

van Rijn 14

Saskia van Rijn is an Infection Preventionist and a Hospital Epidemiologist at Phoenix Children's Hospital who specializes in Biodefense, preparedness, bio-surveillance, and emerging infectious diseases, certified in Infection Control and currently serves as an external expert for the European Centre for Disease Control on infectious diseases, Global Biodefense, May 20, 2014, "Capabilities Analysis of Bioterrorism: Roadblocks Facing Non-State Actors' Use of Bioweapons", <http://globalbiodefense.com/2014/05/20/bioterrorism-roadblocks-facing-non-state-actors-use-of-bioweapons/>

Professional Expertise

The technical knowledge and experience necessary for isolating, cultivating, and weaponizing pathogens for bioweapons is a particular hurdle that has prevented several terrorist organizations from being successful. Given the technical difficulty in housing, cultivating, and weaponizing an agent, the need for persons trained in virology, pathology, or microbiology is crucial. The mental degradation of Aum Shinrikyo members through drug use and paranoia is suggested to have severely reduced their ability to continue such technically proficient work (Tucker, 2000). While drug use and paranoia was rampant in Aum, these matters were coupled with general **technical hurdles** that **required substantial scientific experience** to solve the issues. Aum's head microbiologist and bioweapons specialist, Seiichi Endo, was unable to cultivate a lethal strain of botulism, which most likely was a result of his inexperience in microbiology (Rosenau, 2001). Endo was trained as a molecular biologist, not a microbiologist, so as their head of bioweapons he significantly lacked the necessary technical expertise.

The Amerithrax attacks highlight the **extensive expertise** that is **needed for large-scale, complex biological attacks**. Anthrax, as previously discussed, **is extremely volatile and difficult to weaponize**, which is why the suspect was believed to be an extremely experienced microbiologist with years of experience not just in the field, but also with that particular organism. Acquiring a lethal strain of anthrax or botulinum is especially difficult as there are several strains that can be harmless. Only an experienced researcher or laboratory microbiologist would know how to isolate and cultivate the lethal strains. The Rajneeshees were able to easily acquire *S. typhirium* (arriving on bactrol disks) and grow the bacteria in larger quantities as a result of an experienced laboratory technician who also manufactured it into liquid form (Carus, 2002). The ability to transfer and grow bacteria, especially salmonella, is far easier than that of botulinum or anthrax, but still requires a basic understanding of the laboratory practices.

Knowledge and skills to use the equipment is also **a considerable hurdle**. Laboratory equipment, especially that needed to isolate and weaponize mass quantities of bacteria or virus, is extremely complex and can be dangerous. Equipment misuse or poor technique can be devastating to the individual working on the experiment. Tucker found that “because of sloppy laboratory practices, members of the Aum Shinrikyo cult reportedly became infected with Q-fever, a rickettsial disease they were prepping as a biological weapon. Even cult leader Shoko Asahara is believed to have acquired the debilitating illness” (Tucker, 2000).

Attacks don't escalate van Rijn 14

Saskia van Rijn is an Infection Preventionist and a Hospital Epidemiologist at Phoenix Children's Hospital who specializes in Biodefense, preparedness, bio-surveillance, and emerging infectious diseases, certified in Infection Control and currently serves as an external expert for the European Centre for Disease Control on infectious diseases, Global Biodefense, May 20, 2014, “Capabilities Analysis of Bioterrorism: Roadblocks Facing Non-State Actors' Use of Bioweapons”, <http://globalbiodefense.com/2014/05/20/bioterrorism-roadblocks-facing-non-state-actors-use-of-bioweapons/>

RESPONSE MEASURES

Unusual or deadly pathogens raise a red flag in public health and healthcare, which triggers downstream efforts to investigate and isolate. The U.S. public health system has surveillance and response protocols in place to identify and respond to cases of disease, whether endemic (naturally occurring) or epidemics (large cases of diseases beyond the normal case-load). Surveillance While most do not know the intricacies of its methods, **disease surveillance provides a substantial strategy for diminishing the impact of bioterrorist events.** Disease surveillance is the systematic collection and analysis of data to identify and monitor patterns within disease distribution. Public health is designed to provide disease surveillance and epidemiological response in cases of disease outbreaks. While not all countries have the same level of surveillance capability, governments, both nationally and through international agreements, have created public health organizations to prevent and control the spread of disease. In the U.S., the Centers for Disease Control and Prevention (CDC), the National Institutes of Health (NIH), and the Department of Health and Human Services (DHHS), work to provide public health support at a

national level. Beyond these organizations, each U.S. state has a health department, as do their counties. Disease surveillance is performed either actively or passively. Active surveillance entails going out and collecting the information, while passive surveillance employs counterparts (such as hospitals, clinics, and universities) to collect data and pass it along. Most public health systems are passive unless there is an outbreak, mostly as a result of lack of resources. (Buehler, 2004). Disease surveillance in the United States starts with a healthcare facility receiving a patient and obtaining labs or physician diagnosis that can confirm illness. Larger hospitals will have their own microbiology department that is capable of running extensive laboratory work from blood cultures to respiratory viral panels. State laboratories are commonly used for rare or complex tests that other facilities are unable to process. These tests tend to involve uncommon pathogens such as shiga-toxin producing Escherichia coli (the E.coli strain that was notorious for causing national outbreaks and associated deaths) and botulism. Once test results are reported, hospitals are required to report certain diseases to their county health departments. Each state has a list of “reportable communicable diseases” that range from anthrax, to plague, and syphilis (ADHS, n.d.). Hospitals and state laboratories both report these cases with patient information to county health departments, who then report them to state health departments. Rare cases like measles or botulism would prompt communication with the CDC. Disease surveillance from specimen collection to county health department response can take a day in some cases. Specific diseases on reportable lists (those of the Category A, B, or C) require immediate phone calls, versus faxing or electronically reporting within a period of business days (ADHS, n.d.). Hospitals, state health departments, and county health departments all work very closely and in many cases are in communication on a daily basis. Disease surveillance in the U.S. **is taken very seriously at a health care level**. It is very common for public health departments to do in-service education with emergency department physicians annually for training on uncommon diseases or “zebras”. After the Amerithrax attacks, there was a heightened awareness and education regarding bioweapon pathogens, so much so that physicians began to include them on differential diagnoses (initial triage diagnosis prior to any confirmatory lab work), which may have led to physician hypersensitivity regarding bioweapon issues. There was a wave of eagerness to identify these pathogens after Amerithrax, leading to a hypersensitivity towards Category A agents (Cosgrove, 2005; Leitenberg, 2005). Jokingly coined “zebras”, these pathogens are rarely seen, but continuous education is provided to first responders. While there are gaps in any chain, the level of disease surveillance that occurs within the U.S. would very quickly pick up an usual agent and initiate response in a quick manner (NNDSS, n.d.). This continuous education and reinforced disease reporting make it harder for bioweapons to go undetected. During large gatherings like sporting events and concerts, public health departments will touch base with health care facilities to remind them of the risk for outbreaks, and will **perform active surveillance during the event**. Syndromic surveillance has become increasingly common. This form of surveillance involves data collection regarding over-the-counter medications from drug stores, as well as emergency room visits involving chief complaints matching certain criteria (Henning, 20004). Syndromic surveillance uses logic-based software to detect large groups of people purchasing medication and/or seeking medical care for the same illness in a geographical area or time frame. There is also continuous development of more sensitive, real-time surveillance methods, which **makes bioterrorism that much more difficult to carry out**. Identification Once patients enter a healthcare facility, whether that of a primary care physician or a hospital emergency department, their symptoms are assessed and specimens are often taken. Since the Amerithrax attacks, several studies have addressed the knowledge gaps in the ability of physicians (especially emergency) to identify “zebras” or Category A agents

(Cosgrove, 2005; Moye, 2007). As a result of these studies, extensive education has been enforced so that emergency and primary care physicians, as the first diagnosticians, would be able to more accurately identify or pick up on the symptoms associated with such illnesses. Physicians that see large patient populations are more exposed to a wide range of diseases, thus honing their diagnostic abilities. In areas where certain diseases are endemic (Y. pestis, plague, is endemic in states like Arizona and New Mexico, so physicians in these states are more familiar with the clinical signs and symptoms) or in patient populations where a disease occurs randomly (botulism in children or prisons), these diagnostic tools continuously are tested (Nania, 2013). Overall, the gap in diagnostic capabilities has been identified and attention to bioterrorism and the commonly associated pathogens have been reinforced in the medical community. Healthcare workers from nurses to infection preventionists are educated at workshops and through federally funded training with the Department of Homeland Security Center for Domestic Preparedness (CDP), are better able to respond and handle epidemics and bioterrorism events (CDP, n.d.). Identification, while sensitive to human error, has become much stronger since the Amerithrax attacks, making bioterrorism a center stage topic for physicians. The increased education and capabilities to identify rare pathogens, especially those commonly used in bioterrorism, would likely prevent bioterrorism events from growing. Treatment and Vaccination Measures While many consider bioweapons to be unstoppable or without response measures, there are treatment methodologies in place to respond to their use. Vaccination and treatment techniques pose a severe hurdle for bioterrorists to overcome. For example, there are treatment protocols in place for all six Category A agents. Plague, anthrax, and tularemia are all treated with IV antibiotics, while botulism is treated with an antitoxin. Viral hemorrhagic fevers (VHF) are trickier: although Ribavirin, an antiviral, has shown efficacy against certain viruses, others can only be combatted with supportive care measures (Nania, September 2, 2013). Smallpox is perhaps the most difficult, as there is currently no treatment for it, but immediate vaccination following exposure has been shown to be an effective response measure. Supportive care measures are also used in the case of smallpox. While smallpox and VHF may seem like effective bioweapons, they present difficulties. Both agents are viruses, making them difficult to handle and weaponize, and more importantly, both are extremely rare. No documented cases of smallpox have occurred in almost 40 years, and VHF occurs infrequently through small outbreaks in Africa. These two pathogens are so unique and so feared in the health community that even one case triggers massive response measures (Smallpox, 2007). Treatment for Category B agents is also available through certain common antibiotics, protocols, and methods like IV vasopressors if ricin is ingested (Category Agents, n.d.; Nania, 2013). Overall, treatment for bioweapon agents is highly available and in the U.S. and some other countries, poses a substantial roadblock for terrorist goals that might include large outbreaks. The U.S. and other industrialized nations (such as Australia and those countries in the European Union) are constantly improving response measures for bioweapons, while health response systems in developing countries are still very rudimentary (Global infectious disease factsheet. 2013). Efforts within the U.S. also focus on improving responses to international health crises and emerging infectious diseases, as borders do not constrict health disasters. Continued efforts to treat and even vaccinate against these pathogens will only make this more of a barrier for potential bioterrorists. Vaccination capacity in the U.S. is also a considerable hurdle facing some forms of bioterrorism. Smallpox and anthrax both have vaccination programs available that could be mass distributed within several days through the Strategic National Stockpile (SNS). There is also work on vaccine for plague that could be applied (Titball, 2001). Vaccination programs are effective and can be rolled out quickly with Point of Distributions (PODs). PODS are specialized units used to quickly and effectively distribute vaccinations and prophylaxis to

large populations. Recent response to pandemic influenza like H1N1 (“swine flu”) made public health systems even more effective in the art of mass vaccination, education, and response measures. After the Amerithrax attacks, President Bush initiated a mass smallpox vaccination program that was later halted, but the effect nonetheless showed that national vaccination production and distribution can occur (Cohen, 2004). Mass vaccination can halt the transmission of disease and prevent the further spreading of infections, as done with polio and smallpox. Mass Response Measures Public health preparedness is by no means a new concept, but since the Amerithrax attacks it **has attracted more funding and resources. The U.S. public health system has become more attuned to the realistic threats that bioweapons and infectious diseases pose.** Federal funding has supplied health departments and related organizations with more personnel training capacity (Koenig, 2007). Public health preparedness and response to bioterrorism and pandemics are common components in public health and healthcare education. DHS’s Center for Domestic Preparedness offers dozens of fully funded certification courses for first responders and public health personnel. Some may view the recent H1N1 outbreak as an over-hyped pandemic, but the response that took place helped mitigate the spread of the virus (Cressey, 2010). The education that came from H1N1 allowed the public health system to review and change their plans to be more effective and adaptable. Response measures employed in public health emergencies such as pandemics and bioterrorism events involve isolation, quarantine, mass vaccination or prophylaxis (treatment to prevent disease), and education. Because the presence of public health as a component of preparedness has considerably advanced since the Amerithrax attacks, **non-state actors looking to pursue bioterrorism in the U.S. face formidable challenges. The use of PODs, isolation procedures, and mass education will likely reduce the efficacy of such attacks.** Earlier attacks like Amerithrax, the Rajneeshees, and small, criminal based attacks such as lab technicians poisoning doughnuts with salmonella, have increased both the awareness and understanding of what a biological attack entails and the tools needed to carry out an attack. The media attention (television and social media) that the Amerithrax attacks received provided a substantial amount of information to individuals outside the public health system. Current and future response measures are moving away from control methodologies and are now focusing on prevention like syndromic surveillance, creating additional deterrents that can mitigate the impact that bioterrorism events cause (Buehler, 2004; Henning, 2004). **The growing ability to quickly identify and respond to outbreaks of disease has the potential to greatly minimize the force of bioweapon attacks.**

Empirics

Ouagrham-Gormley 14

Citing Sonia Ben Ouagrham-Gormley is Assistant Professor of Public and International Affairs at George Mason University. She worked for a decade at the Monterey Institute for International Studies, Scientific American, December 6, 2014, “Taping over the red button”, Factiva

Her fascinating book, Barriers to Bioweapons, also shows that **anyone wanting to develop biological weapons faces a raft of other difficulties. Of the five main bioweapons programmes to date, their key feature has been their failures, not their successes.** In a forensic and compelling analysis, she describes

how the Soviet Union, the US, South Africa and the Japanese terrorist group Aum Shinrikyo, all fell well short, despite spending billions of dollars over decades. Then there's Iraq, where the government spent \$80 million over 20 years on bombs that its scientists knew would not deliver most of the anthrax and other toxins they contained, but simply destroy them on impact. The living microorganisms at the heart of these programmes are fragile and unpredictable, and the main barrier to producing bioweapons isn't access to materials and technologies, but the practical and organisational difficulties of actually getting devices to work. These weaknesses should be exploited to stem bioweapons development, she says. Present policy, stressing how easy it is to make bioweapons, only encourages terrorists.

Response industry inflates the threat

Reynolds, senior fellow – Cato, former director of economic research – Hudson Institute, 3/11/'10

(Alan, "Anthrax and the WMD Fear Lobby," <http://original.antiwar.com/alan-reynolds/2010/03/10/anthrax-and-the-wmd-fear-lobby/>)

Nuclear warfare is still counted as WMD, yet the WMD Commission is more afraid of anthrax or Botox. Weapons of Mass Destruction used to include chemical warfare, but no longer. Fretting about nerve gas turned out to be a less lucrative fear-mongering industry than lobbying for juicy biological research grants, and for mountainous stockpiles of vaccines and antiviral drugs.

"Especially troubling," says the Commission, "is the lack of priority given to the development of... new vaccines, drugs, and production processes required to meet the modern threats from man-made and naturally occurring epidemics." Priority means an extra \$17 billion of deficit spending over five years. But notice how "naturally occurring epidemics" were snuck into a report ostensibly dealing with terrorist weapons.

Alleged sources of a bioterrorist threats "include the bacteria that cause anthrax and plague, the viruses that cause smallpox and Ebola hemorrhagic fever, and poisons of natural origin such as ricin and botulinum toxin."

The Commission knows those agents are far less credible terrorist weapons than bombs, guns, airplanes and arson. (Anyone who tries to kill you with Ebola would die trying).

So they are stuck with anthrax, claiming "a bioterrorist attack involving anthrax bacterial spores [is] the most likely near-term biological threat to the United States." Billions were wasted because of anthrax in 2001, and the Commission is determined to waste billions more. For those receiving federal loot, Bruce Ivins was a gift that keeps on giving.

The Commission report said, "The 2001 anthrax mailings were not the first incident of bioterrorism in the United States. In 1984, the Rajneeshees, a religious cult in Oregon, sought to reduce voter turnout and win control of the county government in an upcoming election by temporarily incapacitating local residents with a bacterial infection. In . . . September 1984, cult members contaminated 10 restaurant salad bars in a town in Oregon with salmonella, a common bacterium that causes food poisoning. The attack sickened 751 people, some seriously." Sickened seriously! If that isn't WMD, what is?

"A decade later," the report goes on, "members of a Japanese doomsday cult called Aum Shinrikyo released anthrax bacterial spores from the roof of a building in Tokyo. Fortunately, this attack failed. . . Had Aum succeeded in acquiring a virulent strain and delivered it effectively, the casualties could have been in the thousands." That is illiterate nonsense. There is no effective way of dispersing anthrax from the roof of a building.

Lacking evidence, the WMD lobby dreams up scenarios. The report tells us White House insecurity experts "created a chilling scenario of how terrorists could launch an anthrax attack in the United States [with] a single aerosol attack in one city delivered by a truck using a concealed improvised spraying device." This "chilling scenario" is science fiction.

In "WMD Doomsday Distractions," an April 2005 column available at Cato.org, I explained that, "Scenario spinners speculate about mixing anthrax with water and somehow spraying it (without detection) from trucks, crop dusters or unmanned aircraft. But to die from anthrax, you need to inhale thousands of spores. Those spores clump together and mix with dust, yet they must end up neither too large nor too small, or else they would be sneezed out, coughed up or swallowed. Even if enough particles of the perfect size could be sprayed into the breezes, the odds are extremely low of infecting more than few dozen people that way. And none would die if they took Cipro promptly."

Tallying up all of the world's bioterrorism attacks to date, the final score is five killed from anthrax, plus one Bulgarian assassinated by being injected with ricin. That brings the world total of bioterrorist fatalities up to half a dozen — a bizarre concept of "mass destruction," and a feeble excuse for dispensing billions more federal dollars to those using scare tactics to raid the empty Treasury.

No anthrax terror and antibiotics solve

Sharav & Nass 13

(Dr. Meryl Nass – world leading expert on the anthrax vaccine and Vera Sharav -- MD & President of AHRP, "Government Fear Mongering: Phony Anthrax Threat" 02/27/2013, The Patriots)

The Obama Administration led by Kathleen Sebelius, Secretary of Health and Human Services (DHHS), is engaging in fear mongering promoting the specious claim that children are less safe than adults in the unlikely event of a bioterrorist anthrax attack. **Lacking any credible evidence of an anthrax risk, Secretary Sebelius** —a political appointee—is invoking fictional scenarios of a simulated anthrax attack to override hard-won Federal statutes that were enacted over the last 35 years to protect children from medical experiments that put them at risk with no benefit. "Secretary Sebelius asked the [Presidential] Commission for ethical advice on the development of medical countermeasures for children. The question that sparked this broad charge from Secretary Sebelius to the Commission is how to treat children who have been exposed to anthrax; it was a question that arose during a Homeland Security exercise" <http://bioethics.gov/cms/pressrelease1> **Simulated exercises** (or "War Games") **are NOT evidence-based!** The safety hazards of BioThrax are substantiated by documented evidence. FACT: **There is no credible evidence of an impending anthrax threat: no government official has ever cited any evidence of such a threat.** FACT: FDA has not licensed BioThrax for use following exposure to anthrax spores. The BioThrax label warns: "The safety and efficacy of BioThrax in a post-exposure setting have not been established." FACT: Antibiotics—not the anthrax vaccine—are the proven protection against anthrax.

Antibiotics proved to be 100% effective for people exposed to anthrax-laced letters in 2001. The FBI concluded that the sender was a US military scientist—who is dead. FACT: If ever children were exposed to anthrax spores, they would be given antibiotics, such as Ciprofloxacin or Doxycycline, which have been FDA-approved for pediatric use against anthrax—and recommended by CDC.

No smallpox and new drugs solve

McNeil 13

(Donald, science and health reporter specializing in plagues and pestilences. He covers diseases of the world's poor, AIDS, malaria, avian flu, SARS, mad cow disease and so on, "Wary of Attack With Smallpox, U.S. Buys Up a Costly Drug" March 12, 2013, New York Times)

The United States government is buying enough of a new smallpox medicine to treat two million people in the event of a bioterrorism attack, and took delivery of the first shipment of it last week. But the purchase has set off a debate about the lucrative contract, with some experts saying the government is buying too much of the drug at too high a price. A small company, Siga Technologies, developed the drug in recent years. Whether the \$463 million order is a boondoggle or a bargain depends on which expert is talking. The deal will transform the finances of Siga, which is controlled by Ronald O. Perelman, a billionaire financier, philanthropist and takeover specialist. Smallpox was eradicated by 1980, and the only known remaining virus is in government laboratories in the United States and Russia. But there have long been rumors of renegade stocks that could be sprayed in airports or sports stadiums. Experts say the virus could also be re-engineered into existence in a sophisticated genetics lab. As part of its efforts to prepare for a possible bioterrorism attack, the government is paying more than \$200 for each course of treatment. Siga argues that the price is a fair return on years of investment. And Robin Robinson, director of the Biomedical Advanced Research and Development Authority, part of the Department of Health and Human Services, the overseer of the contract for the drug, Arestvyr, defended the size of the order and the price paid. He said that two million doses was the amount analysts predicted would be needed to contain a smallpox outbreak in a large city and that the whole country would require 12 million, along with vaccines. The price, he said, was arrived at through federal purchasing guidelines and was "fair and reasonable" compared with the price of other commercial antiviral drugs, which he said ranged from \$108 to \$7,364. But when stockpiling a smallpox drug was first proposed in 2001 after the Sept. 11 and anthrax attacks, it was expected to cost only \$5 to \$10 per course, said Dr. Donald A. Henderson, who led a government advisory panel on biodefense in the wake of those attacks. Dr. Henderson was a leader in the eradication of smallpox in the 1960s and is now at the Center for Biosecurity at the University of Pittsburgh Medical Center. Dr. Richard H. Ebright, a bioweapons expert at Rutgers University, said there was little need for so much Arestvyr since the country has raised its stockpile of smallpox vaccine to 300 million doses now, up from only 15 million in 2001. "Is it appropriate to stockpile it? Absolutely," he said. "Is it appropriate to stockpile two million doses? Absolutely not. Twenty thousand seems like the right number." Vaccines are normally given before an infection to prevent a disease, while antivirals like Arestvyr are given after virus infections, to treat them. Smallpox has such a long incubation period that the vaccine can prevent disease even if it is given as late as three days after infection. Arestvyr may also prevent infection if given early enough, but that has not been proven. Dr. Eric A. Rose, the president of Siga and a vice president of Mr. Perelman's holding company, MacAndrews & Forbes, acknowledged that the drug cost little to make, but said the price being charged for a patented drug was a bargain compared with AIDS antiretrovirals that cost \$20,000 a year and cancer drugs that cost more than \$100,000 a year. Asked about the size of the purchase, he compared it with a flu drug. "There are 80 million courses of Tamiflu in the strategic national stockpile," he said. "Smallpox is just as contagious and has 30 times the mortality. By measures like that, I'd say 2 million is on the low end." He also said that Mr. Perelman had invested \$80 million in the company through years of research with no sales. Without a profit potential, no company would take up smallpox, Ebola and other lethal but very rare diseases, he said. And Dr. Isaac B. Weisfuse, who was formerly head of pandemic planning for the New York City health department and is now Siga's medical policy director, said that plans calling for tens of million Americans to be vaccinated within days of a major smallpox outbreak were unrealistic and that Arestvyr could save lives. Arestvyr — which until November was known as ST-246 or tecovirimat — prevents the virus from forming the double outer envelope that lets it break out of the first cells it infects and spread throughout the body. A 14-day course can be taken in combination with smallpox vaccine, offering double protection, which Dr. Henderson called "quite amazing." Arestvyr is not approved by the Food and Drug Administration except for use in emergencies. It has never

been tested on smallpox in humans because the disease was eradicated. However, it has prevented death in dozens of monkeys injected with what would normally have been lethal doses of smallpox or a related virus, monkey pox. It also appears to have helped several humans suffering from potentially lethal reactions to smallpox vaccine, which is itself a live smallpox-related virus but is normally harmless. They included a child near death after catching his father's vaccination virus, a soldier vaccinated just before discovering he had leukemia, and a woman whose immune system was suppressed by steroids and who was infected by touching bait meant for raccoons that contained a combined rabies/smallpox vaccine. However, those patients were also given immune globulin, other drugs and hospital care, so it is hard to know exactly what worked. Bioterrorism experts say the need for Arestvyr has declined since the United States increased its stockpile of smallpox vaccine, which was once given to people routinely before the disease was brought under control, including a less potent but less risky backup vaccine for those who cannot tolerate the standard one. The word "smallpox" still strikes fear. John Grabenstein, a retired colonel and a top biodefense adviser to the Defense Department after the 2001 attacks, recalled reports of refrigerated Soviet warheads loaded with the virus that could, in theory, aerosolize it over large areas. Others have envisioned a few infected terrorists mingling in crowds. Left untreated, smallpox kills a third of victims. But prominent experts say the danger is overblown. Because it can take up to two weeks before an infected person becomes seriously ill, and up to five more days before he or she begins to infect others, there is time to respond, they said. Also, they said, by the time smallpox victims reach the infectious stage, when their pox are erupting, they are too sick to wander around. That is why outbreaks in schools or factories were nearly unheard of. Smallpox was eradicated by "ring vaccination" — finding each case and vaccinating just the 50 to 200 people closest to it. If there were a large-scale bioterrorism attack using smallpox, health officials could move quickly, some experts say. "If we had to, we could vaccinate the entire country in three days," said Dr. William H. Foegen, another leader of the smallpox eradication effort who now advises the Bill & Melinda Gates Foundation. This vaccine does not use a syringe, but a forked pin that Dr. Foegen said he could "train anyone to use in 10 minutes." In a true emergency, he argued, schoolteachers, police officers, firefighters and others would all be vaccinators. Other experts think that is overoptimistic, since an attack would cause panic. Also, Dr. Rose of Siga pointed out, there are only an estimated 700 million doses of smallpox vaccine in a world of 7 billion people, so the United States might use its vaccine and Arestvyr stockpile to help other countries. (Only the United States, Japan and Israel are believed to have enough doses for their entire populations, experts said.)

Cyber

2AC

Cyberattacks impossible – empirics and defenses solve

Rid 12 (Thomas Rid, reader in war studies at King's College London, is author of "Cyber War Will Not Take Place" and co-author of "Cyber-Weapons.", March/April 2012, "Think Again: Cyberwar", <http://www.foreignpolicy.com/articles/2012/02/27/cyberwar?page=full>)

"Cyberwar Is Already Upon Us." No way. "Cyberwar is coming!" John Arquilla and David Ronfeldt predicted in a celebrated Rand paper back in 1993. Since then, it seems to have arrived -- at least by the account of the U.S. military establishment, which is busy competing over who should get what share of the fight. Cyberspace is "a domain in which the Air Force flies and fights," Air Force Secretary Michael Wynne claimed in 2006. By 2012, William J. Lynn III, the deputy defense secretary at the time, was writing that cyberwar is "just as critical to military operations as land, sea, air, and space." In January, the Defense Department vowed to equip the U.S. armed forces for "conducting a combined arms campaign across all domains -- land, air, maritime, space, and cyberspace." Meanwhile, growing piles of books and articles explore the threats of cyberwarfare, cyberterrorism, and how to survive them. **Time for a reality check: Cyberwar is still more hype than hazard.** Consider the definition of an act of war: It has to be potentially violent, it has to be purposeful, and it has to be political. The cyberattacks we've seen so far, from Estonia to the Stuxnet virus, simply don't meet these criteria. Take the dubious story of a Soviet pipeline explosion back in 1982, much cited by cyberwar's true believers as the most destructive cyberattack ever. The account goes like this: In June 1982, a Siberian pipeline that the CIA had virtually booby-trapped with a so-called "logic bomb" exploded in a monumental fireball that could be seen from space. The U.S. Air Force estimated the explosion at 3 kilotons, equivalent to a small nuclear device. Targeting a Soviet pipeline linking gas fields in Siberia to European markets, the operation sabotaged the pipeline's control systems with software from a Canadian firm that the CIA had doctored with malicious code. No one died, according to Thomas Reed, a U.S. National Security Council aide at the time who revealed the incident in his 2004 book, *At the Abyss*; the only harm came to the Soviet economy. But did it really happen? After Reed's account came out, Vasily Pchelintsev, a former KGB head of the Tyumen region, where the alleged explosion supposedly took place, denied the story. There are also no media reports from 1982 that confirm such an explosion, though accidents and pipeline explosions in the Soviet Union were regularly reported in the early 1980s. Something likely did happen, but **Reed's book is the only public mention of the incident and his account relied on a single document.** Even after the CIA declassified a redacted version of Reed's source, a note on the so-called Farewell Dossier that describes the effort to provide the Soviet Union with defective technology, the agency did not confirm that such an explosion occurred. The available evidence on the Siberian pipeline blast is so thin that it shouldn't be counted as a proven case of a successful cyberattack. Most other commonly cited cases of cyberwar are even less remarkable. Take the attacks on Estonia in April 2007, which came in response to the controversial relocation of a Soviet war memorial, the Bronze Soldier. The well-wired country found itself at the receiving end of a massive distributed denial-of-service attack that emanated from up to 85,000 hijacked computers and lasted three weeks. The attacks reached a peak on May 9, when 58 Estonian websites were attacked at once and the online services of Estonia's largest bank were taken down. "What's the difference between a blockade of harbors or airports of sovereign states and the

blockade of government institutions and newspaper websites?" asked Estonian Prime Minister Andrus Ansip. Despite his analogies, the attack was no act of war. It was certainly a nuisance and an emotional strike on the country, but the bank's actual network was not even penetrated; it went down for 90 minutes one day and two hours the next. The attack was not violent, it wasn't purposefully aimed at changing Estonia's behavior, and no political entity took credit for it. The same is true for the vast majority of cyberattacks on record. Indeed, there is no known cyberattack that has caused the loss of human life. No cyberoffense has ever injured a person or damaged a building. And if an act is not at least potentially violent, it's not an act of war. Separating war from physical violence makes it a metaphorical notion; it would mean that there is no way to distinguish between World War II, say, and the "wars" on obesity and cancer. Yet those ailments, unlike past examples of cyber "war," actually do kill people. "A Digital Pearl Harbor Is Only a Matter of Time." Keep waiting. U.S. Defense Secretary Leon Panetta delivered a stark warning last summer: "We could face a cyberattack that could be the equivalent of Pearl Harbor." Such alarmist predictions have been ricocheting inside the Beltway for the past two decades, and some scaremongers have even upped the ante by raising the alarm about a cyber 9/11. In his 2010 book, *Cyber War*, former White House counterterrorism czar Richard Clarke invokes the specter of nationwide power blackouts, planes falling out of the sky, trains derailing, refineries burning, pipelines exploding, poisonous gas clouds wafting, and satellites spinning out of orbit -- events that would make the 2001 attacks pale in comparison. But the empirical record is less hair-raising, even by the standards of the most drastic example available. Gen. Keith Alexander, head of U.S. Cyber Command (established in 2010 and now boasting a budget of more than \$3 billion), shared his worst fears in an April 2011 speech at the University of Rhode Island: "What I'm concerned about are destructive attacks," Alexander said, "those that are coming." He then invoked a remarkable accident at Russia's Sayano-Shushenskaya hydroelectric plant to highlight the kind of damage a cyberattack might be able to cause. Shortly after midnight on Aug. 17, 2009, a 900-ton turbine was ripped out of its seat by a so-called "water hammer," a sudden surge in water pressure that then caused a transformer explosion. The turbine's unusually high vibrations had worn down the bolts that kept its cover in place, and an offline sensor failed to detect the malfunction. Seventy-five people died in the accident, energy prices in Russia rose, and rebuilding the plant is slated to cost \$1.3 billion. Tough luck for the Russians, but here's what the head of Cyber Command didn't say: The ill-fated turbine had been malfunctioning for some time, and the plant's management was notoriously poor. On top of that, the key event that ultimately triggered the catastrophe seems to have been a fire at Bratsk power station, about 500 miles away. Because the energy supply from Bratsk dropped, authorities remotely increased the burden on the Sayano-Shushenskaya plant. The sudden spike overwhelmed the turbine, which was two months shy of reaching the end of its 30-year life cycle, sparking the catastrophe. If anything, the Sayano-Shushenskaya incident highlights how difficult a devastating attack would be to mount. The plant's washout was an accident at the end of a complicated and unique chain of events. Anticipating such vulnerabilities in advance is extraordinarily difficult even for insiders; creating comparable coincidences from cyberspace would be a daunting challenge at best for outsiders. If this is the most drastic incident Cyber Command can conjure up, perhaps it's time for everyone to take a deep breath. "Cyberattacks Are Becoming Easier." Just the opposite. U.S. Director of National Intelligence James R. Clapper warned last year that the volume of malicious software on American networks had more than tripled since 2009 and that more than 60,000 pieces of malware are now discovered every day. The United States, he said, is undergoing "a phenomenon known as 'convergence,' which amplifies the opportunity for disruptive cyberattacks, including against physical infrastructures." ("Digital convergence" is a snazzy term for a simple thing:

more and more devices able to talk to each other, and formerly separate industries and activities able to work together.) Just because there's more malware, however, doesn't mean that attacks are becoming easier. In fact, potentially damaging or life-threatening cyberattacks should be more difficult to pull off. Why? Sensitive systems generally have built-in redundancy and safety systems, meaning an attacker's likely objective will not be to shut down a system, since merely forcing the shutdown of one control system, say a power plant, could trigger a backup and cause operators to start looking for the bug. To work as an effective weapon, malware would have to influence an active process -- but not bring it to a screeching halt. If the malicious activity extends over a lengthy period, it has to remain stealthy. That's a more difficult trick than hitting the virtual off-button. Take Stuxnet, the worm that sabotaged Iran's nuclear program in 2010. It didn't just crudely shut down the centrifuges at the Natanz nuclear facility; rather, the worm subtly manipulated the system. Stuxnet stealthily infiltrated the plant's networks, then hopped onto the protected control systems, intercepted input values from sensors, recorded these data, and then provided the legitimate controller code with pre-recorded fake input signals, according to researchers who have studied the worm. Its objective was not just to fool operators in a control room, but also to circumvent digital safety and monitoring systems so it could secretly manipulate the actual processes. Building and deploying Stuxnet required extremely detailed intelligence about the systems it was supposed to compromise, and the same will be true for other dangerous cyberweapons. Yes, "convergence," standardization, and sloppy defense of control-systems software could increase the risk of generic attacks, but the same trend has also caused defenses against the most coveted targets to improve steadily and has made reprogramming highly specific installations on legacy systems more complex, not less.

1AR

Defenses are improving and the threat is decreasing

Libicki 13

MARTIN C. LIBICKI is a Senior Management Scientist at the RAND Corporation and a Visiting Professor at the U.S. Naval Academy, Foreign Affairs, August 16, 2013, "Don't Buy the Cyberhype: How to Prevent Cyberwars From Becoming Real Ones", <http://www.foreignaffairs.com/articles/139819/martin-c-libicki/dont-buy-the-cyberhype>

These days, most of Washington seems to believe that a major cyberattack on U.S. critical infrastructure is inevitable. In March, James Clapper, U.S. director of national intelligence, ranked cyberattacks as the greatest short-term threat to U.S. national security. General Keith Alexander, the head of the U.S. Cyber Command, recently characterized "cyber exploitation" of U.S. corporate computer systems as the "greatest transfer of wealth in world history." And in January, a report by the Pentagon's Defense Science Board argued that cyber risks should be managed with improved defenses and deterrence, including "a nuclear response in the most extreme case."

Although the risk of a debilitating cyberattack is real, the perception of that risk is far greater than it actually is. No person has ever died from a cyberattack, and only one alleged cyberattack has ever crippled a piece of critical infrastructure, causing a series of local power outages in Brazil. In fact, a major cyberattack of the kind intelligence officials fear has not taken place in the 21 years since the Internet became accessible to the public.

Thus, while a cyberattack could theoretically disable infrastructure or endanger civilian lives, its effects would unlikely reach the scale U.S. officials have warned of. The immediate and direct damage from a major cyberattack on the United States could range anywhere from zero to tens of billions of dollars, but the latter would require a broad outage of electric power or something of comparable damage. Direct casualties would most likely be limited, and indirect casualties would depend on a variety of factors such as whether the attack disabled emergency 911 dispatch services. Even in that case, there would have to be no alternative means of reaching first responders for such an attack to cause casualties. The indirect effects might be greater if a cyberattack caused a large loss of confidence, particularly in the banking system. Yet scrambled records would probably prove insufficient to incite a run on the banks.

Officials also warn that the United States might not be able to identify the source of a cyberattack as it happens or in its immediate aftermath. Cyberattacks have neither fingerprints nor the smell of gunpowder, and hackers can make an intrusion appear legitimate or as if it came from somewhere else. Iran, for example, may not have known why its centrifuges were breaking down prematurely before its officials read about the covert cyber-sabotage campaign against the country's nuclear program in The New York Times. Victims of advanced persistent threats -- extended intrusions into organization networks for the purpose of espionage -- are often unaware for months, or even years, that their servers have been penetrated. The reason that such attacks go undetected is because the removal of information does not affect the information in the system, so nothing seems amiss. The exfiltration of information can also be easily hidden, such as in the daily flow of web traffic from an organization.

But since everything is becoming increasingly dependent on computers, could levels of damage impossible today become inevitable tomorrow? As it happens, all of the trend lines -- good and bad -- in cyberspace are rising simultaneously: the sophistication of attackers, but also that of the defenders; the salience of cyberattacks as weapons, but also the awareness of the threat they pose; the bandwidth available for organizing larger attacks, but also the resources to ward them off. It is bad news that Iran is beginning to see cyberwar as a deniable means of exploiting easy targets. And it is good news that software companies are now rethinking the architectural features of their systems that permit such vulnerabilities to exist in the first place.

Countermeasures solve

Bailey, science correspondent – Reason Magazine, 1/18/'11

(Ronald, <http://reason.com/archives/2011/01/18/cyberwar-is-harder-than-it>)

Brown and Sommer observe that the Internet and the physical telecommunications infrastructure were designed to be robust and self-healing, so that failures in one part are routed around. “You have to be cautious when hearing from people engaging in fear-mongering about huge blackouts and collapses of critical infrastructures via the Internet,” says University of Toronto cyberwarfare expert Ronald Deibert in the January/February 2011 issue of the *Bulletin of the Atomic Scientists*. “There is a lot of redundancy in the networks; it’s not a simple thing to turn off the power grid.” In addition, our experience with current forms of malware is somewhat reassuring. Responses to new malware have generally been found and made available within days and few denial of service attacks have lasted more than a day. In addition, many critical networks such as those carrying financial transactions are not connected to the Internet requiring insider information to make them vulnerable.

They don’t have the expertise

Lindsay 13

Jon R. Lindsay is an assistant research scientist with the University of California Institute on Global Conflict and Cooperation (IGCC), located at UC San Diego. He holds a PhD in political science from the Massachusetts Institute of Technology, an MS in computer science from Stanford University, and he has served as an officer in the US Navy, Security Studies, August 1, 2013, "Stuxnet and the Limits of Cyber Warfare", <http://www.tandfonline.com/doi/pdf/10.1080/09636412.2013.816122>

Stuxnet therefore suggests that the asymmetry argument of the Cyber Revolution thesis has it backward. Cyber warfare is not a weapon of the weak. Weaker actors face steep barriers to weaponization for causing meaningful damage, and they are vulnerable to punishing retaliation if they somehow do succeed in injuring the strong. Strong states, by contrast, have the resources and risk tolerance to wage cyber warfare against relatively weaker targets like Iran. These barriers to entry will tend to price weaker actors out of strategic cyber warfare. The technically and organizationally sophisticated level of play required for cyber warfare is generally beyond the capacity of a lone hacker, a small group of amateurs, or even organized criminals, some of the favorite bogeymen of cyberwar discourse.⁷⁵ There are cheaper and more reliable ways for resource-poor terrorists or states to cause

damage. While the potential global reach of cyber warfare would appear attractive for limiting the exposure of terrorists, that same distance forms a formidable barrier for intelligence preparation and operational control of targeted destructive attacks, without which the risks of operational failure become a serious liability for the weak. This emphatically does not mean that weak actors are priced out of irritant attacks for criminal gain, espionage, or political expression; on the contrary, the desirability of maintaining ability to engage in sub rosa exploitation is a big reason to avoid more severe forms of cyber attack that would mobilize unwanted attention. The difference in scale between strategic cyber warfare and cheaply available cyber irritants will become more apparent in the matter of offense dominance.

Cyber is too hard for terrorists

Ditz 13

Jason Ditz is news editor at Antiwar.com, March 14, 2013, "Cyberwar Expert: Al-Qaeda 'Too Stupid' to Launch Cyber Attacks", <http://news.antiwar.com/2013/03/14/cyberwar-expert-al-qaeda-too-stupid-to-launch-cyber-attacks/>

British cyberwar expert Dr. Thomas Rid testified to the British Public Accounts Committee today, downplaying the chances of a sabotage cyber-attack from abroad.

"Al-Qaeda are too stupid and China doesn't want to do it," Rid said, noting that China is almost entirely interested in cyber espionage, not trying to damage overseas infrastructure just because it can.

As for al-Qaeda, Rid claims the group lacks the formal book-learning to actually use potential exploits to not only get in to internet connected infrastructure but actually do it serious harm.

"It requires intelligence about the targets you are trying to penetrate," Rid noted, though whether al-Qaeda can gain that capability remains an open question, and one that is likely to be used to justify ongoing spending hikes on "cyber defense."

Alternatives are easier

Jarvis, senior lecturer in International Security – University of East Anglia, Macdonald, professor of law – Swansea University, Nouri, political and cultural studies – Swansea, '14

(Lee, Stuart, and Lella, "The Cyberterrorism Threat: Findings from a Survey of Researchers," *Studies in Conflict & Terrorism* Vol. 37, Issue 1, p. 68-90)

One of the reasons offered for the argument that "pure" cyberterrorism constitutes a relatively less significant risk is that cyberattacks are comparatively unattractive to terrorists. In addition to the fact that they lack theatricality,³⁵ Giacomello, for example, offers a cost/benefit analysis of cyberterrorism to argue that traditional methods of terrorism and weapons remain more effective at killing people, and thereby growing the desired political capital.³⁶ These accounts frequently contrast the possibility of cyberattack with other terrorist uses of information technology that are regarded as a pressing and largely overlooked threat. Attention, then, should be given to the wider use of the Internet by terrorists, including for "recruitment, financing, networking information gathering [and] sharing information"³⁷ all

of which enhance the efficiency and reach of terrorist groups.³⁸ On this view, the nightmare scenarios associated with cyberterrorism should be replaced by a focus on this broad spectrum of activities, with a range of political, policing, and civil society stakeholders having a role in countering them.³⁹

The impact is hype

Valeriano 13

BRANDON VALERIANO is Lecturer in Social and Political Sciences at the University of Glasgow, RYAN MANESS is a Ph.D. candidate at the University of Illinois at Chicago, The Ducks of Minerva, January 29, 2013, " Perceptions and Opinions of the Cyber Threat", <http://www.whiteoliphant.com/duckofminerva/2013/01/perceptions-and-opinions-of-the-cyber-threat.html>

Cyberwar is a pressing international security problem. The news media breathlessly covers any potential attack before the facts are in. Policy briefs and reports are produced on all levels of government and private industry. It would then behoove us to take a step back and examine opinions about the cyber security threat according to perceptions among policymakers, academics, and cyber security experts in order to understand how the threat emanating from the cyber security realm is constructed in the public discourse. Each constituency has its own view on the issue and how these views manifest is critical to perceptions about the wider societal threat coming from cyberspace.

According to Allison's bureaucratic model of politics, where you sit in government determines where you stand or what opinions you have. Through surveys we can see that process play out. It is in the interest of cyber security experts to inflate the cyber threat. It is also in the interests of the news media to breathlessly hype up cyber fears to gain more page views. The threat of cyberwar is a real and pressing threat, but constrained by institutions and systems that limit the damage the tactic can do. Just how serious this threat is perceived can be predicted by one's institutional setting and standard operating procedures.

On January 30, 2012, technological experts from around the globe were surveyed by McAfee and the Security and Defense Agenda (SDA) about the issue of cyberwar. Fifty-seven percent of these practitioners believe that states are currently engaged in a cyber "arms race." It is unclear what a cyber arms race really is in this context (the raw data from the survey is not online) but the general idea is that capabilities and the threat from this issue area are increasing at all levels. Other findings in the survey are just as troubling and mystifying. Forty-three percent believe the worst case scenario, damage and disruption to a state's critical infrastructure is also the most likely. A further forty five percent believe that cyber-security is just as pressing an issue as border security. Apparently, the great powers such as the US, UK, and Germany are lacking in their "cyber-readiness" when compared to smaller states such as Israel and Sweden mainly because they fail to share information internally rather than having any specific deterrent capabilities, at least according to the McAfee report.

With these opinions in mind, the SDA asked respondents which actions should be taken to curb this newest threat to international security. Opinions on the next course of action are just as troubling as the survey results. Apparently, a "global information sharing network should be established by states." This is an odd perspective in that cyber threats are not uniform across states and centralizing the network

could put states in a more vulnerable position. The next idea is to provide “financial incentives for improvements in security in both the private and public sectors.” An interesting proposal advocating bribery to improve networks much in the same way a parent bribes a child to do their homework. Finally, “diplomats need to start addressing this issue with more urgency,” with the help of cyber security experts (the subjects of the survey) of course. I would guess the next step is for a color coded cyber terror warning indicator (I suggest the highest threat be the color of Mountain Dew in order to honor the true cyber warriors – teenage hackers and computer programmers).

Why would the majority of cyber security practitioners argue for such expensive, expansive, and urgent measures when the biggest attack, arguably Stuxnet, required a physical injection of software to take effect? Clearly there is an interest to promote this threat in the cyber security community.

In contrast, the TRIP survey asked a sample of academics from U.S. universities “What are the top foreign policy problems facing the United States?” They were pitted against practitioners within the U.S. government who work within the national security apparatus (PDF). Academics deemed cybersecurity the least pressing foreign policy problem with only eight percent suggesting it is a top problem. This falls right behind the fear of oil reliance (12%) and global poverty (12%). Policymakers rank cybersecurity nearly as low as academics with 17 percent finding this a top foreign policy problem right above the issue of climate change (eight percent), global poverty (three percent), and oil reliance (four percent).

Academics find cybersecurity one of the least pressing threats in the system and policymakers tend to agree generally. So why is cybersecurity such a pressing issue according to the news media and cyber security practitioners? One might argue that cyber security practitioners know the reality better than academics and policymakers; suggesting their warnings about the coming cyber threat is just a harbinger to the future. Using the bureaucratic politics model, others might conclude that the cyber security industry is a biased party whose interests lie in promoting the cyber threat. The news media just parrots these perspectives because the quotes come easy and the news stories prey on the fear the average citizen holds towards technology. The danger in declaring cyberwar a ‘top threat’ comes from distracting our attention from more pressing problems like collapsing states, human rights abuses, the proliferation of terrorism and WMDs, and internal violence in the form of civil war. Cyberwar is a dangerous issue in contemporary security politics, but it is nowhere near the top threat facing the United States.

Their authors are biased

Rid 13

Thomas Rid, Reader in War Studies at King's College London, His most recent book is Cyber War Will Not Take Place, also a non-resident fellow at the Center for Transatlantic Relations in the School for Advanced International Studies, Johns Hopkins University, PhD in political science from Humboldt University of Berlin, OC Register, March 15, 2013, "Thomas Rid: Hype, fear-mongering hurts cyberwar", <http://www.ocregister.com/articles/systems-499977-cyber-control.html>

LONDON – The White House likes a bit of threat. In his State of the Union address, Barack Obama wanted to nudge Congress yet again into passing meaningful legislation. The president emphasized that America's enemies are "seeking the ability to sabotage our power grid, our financial institutions and our air traffic control systems." After two failed attempts to pass a cybersecurity act in the past two years,

he added swiftly: "We cannot look back years from now and wonder why we did nothing in the face of real threats to our security and our economy."

Fair enough. A bit of threat to prompt needed action is one thing. Fear-mongering is something else: counterproductive. Yet too many a participant in the cybersecurity debate reckon that puffery pays off.

The Pentagon, no doubt, is the master of razzmatazz. Leon Panetta set the tone by warning again and again of an impending "cyber Pearl Harbor." Just before he left the Pentagon, the Defense Science Board delivered a remarkable report, "Resilient Military Systems and the Advanced Cyber Threat." The paper seemed obsessed with making yet more drastic historical comparisons: "The cyber threat is serious," the task force wrote, "with potential consequences similar to the nuclear threat of the Cold War." The manifestations of an all-out nuclear war would be different from cyberattack, the Pentagon scientists helpfully acknowledged. But then they added, gravely, that "in the end, the existential impact on the United States is the same." A reminder is in order: The world has yet to witness a single casualty, let alone fatality, as a result of a computer attack. Such statements are a plain insult to survivors of Hiroshima. After all, a bit of fear helps to claim – or keep – scarce resources when austerity and cutting seems out-of-control. The report recommended allocating the stout sum of \$2.5 billion for its top two priorities alone, protecting nuclear weapons against cyberattacks and determining the mix of weapons necessary to punish all-out cyber-aggressors.

Then there are private computer security companies. Such firms, naturally, are keen to pocket some of the government's money earmarked for cybersecurity. And hype is the means to that end. Which leads to the next point: The media want to sell copy through threat inflation. "In Cyberspace, New Cold War," the headline writers at the Times intoned in late February. "The U.S. is not ready for a cyberwar," shrieked the Washington Post earlier this week. Instead of calling out the above-mentioned Pentagon report, the paper actually published two supportive articles on it and pointed out that a major offensive cyber capability now seemed essential "in a world awash in cyber-espionage, theft and disruption."

The Post should have reminded its readers that the only military-style cyberattack that has actually created physical damage – Stuxnet – was actually executed by the United States government.

Finally, the intelligence community tags along with the hype because the NSA and CIA are still traumatized by missing 9/11. Missing a "cyber 9/11" would be truly catastrophic for America's spies, so erring on the side of caution seems the rational choice.

This means that the quality of the public debate suffers, as experts as well as journalists have no choice but to rely on industry reports of sometimes questionable quality or anonymous informants whose veracity is hard to assess.

Military networks are safe

Manzo 13

Vincent Manzo is a Fellow in the Defense and National Security Group at the Center for Strategic and International Studies, The National Interest, April 3, 2013, "A Cyber-Survivable Military", <http://nationalinterest.org/commentary/cyber-survivable-military-8296>

Whether the threat warrants this tradeoff is unclear. The DSB's analysis raises questions about whether a disarming cyber strike, synchronized with other combat operations just as a war erupts, is feasible. An adversary would need to infiltrate and study secure U.S. military networks as well as the communication, intelligence, and weapons systems they connect and operate. Then the attacker must customize code to manipulate them, and for air-gapped targets, covertly gain physical access.

Even if adversaries succeed in planting cyber weapons throughout U.S. systems, their goal would be to affect the targets only when a war is imminent, so they would not have the luxury of attacking immediately. Weeks, months or years could pass before a conflict, during which time U.S. officials might detect and remove the virus, upgrade to more effective security software, or reconfigure their network architectures. Ensuring that deployed cyber weapons are poised for wars that will start at an unspecified time in the future would require consistent surveillance.

Affiliates

2AC

AQ Central's destruction means affiliates fail

Celso, associate professor of security studies – Angelo State University, '12

(Anthony N., "Al Qaeda's Post-9/11 Organizational Structure and Strategy: The Role of Islamist Regional Affiliates," Mediterranean Quarterly Vol. 23, No. 2, Spring)

Al Qaeda Central's fortunes, in contrast, are dismal. Faced with declining support and harassed by CIA drone attacks that have killed hundreds of mid-level leaders and cadres, al Qaeda's future is suspect. The killing of bin Laden and mass prodemocracy movements across the Arab world have compounded [End Page 37] the terror organization's problems. Both are viewed as potentially presaging al Qaeda's disintegration.

Al Qaeda's Post – bin Laden Future and the Strategic Challenge of the Arab Spring

Published before bin Laden's death, Peter Bergen's The Longest War presents a defeated and demoralized al Qaeda weakened by its disastrous Iraq campaign and harried by international police and military action.¹⁵ Within the past ten years, many al Qaeda leaders and cadres have been either killed or imprisoned.

Al Qaeda, most significantly, has failed to launch another 9/11-style attack against the Western far enemy, and it has not been able to overthrow any near enemy Arab regime. CIA Predator drone strikes have hollowed the ranks of mid-level al Qaeda agents and their Taliban allies along the Pakistan-Afghanistan frontier.

Within this context, the strategic importance of killing bin Laden cannot be overemphasized. His May 2011 death at the hands of US Navy Seals in his Abbottabad, Pakistan, hideout shattered his myth of invincibility. He was long the personification of the terror organization's jihadist struggle against the West, and no other leader has his charisma or moral authority.

As long as bin Laden remained alive, 9/11's memory would be seared into America's consciousness and the country's quest for revenge unfulfilled. His death is an important strategic, psychological, and moral victory for the United States. The Obama administration's refusal to publically release photos of his dead body, reinforced by his ignominious burial at sea, diminishes his importance and legacy. Representing a critical victory in the war on terror, his death is crippling for al Qaeda's morale and is furthering the terror organization's unraveling. Despite the recent selection of Zawahiri to replace bin Laden, al Qaeda is splintered and is plagued by internal struggles. The most notable of these are the fissures between al Qaeda Central in Pakistan and AQAP and al Qaeda's Somali and Maghreb affiliates.

Despite his historic importance within al Qaeda, Zawahiri lacks charisma [End Page 38] and is widely disliked. Zawahiri has many enemies in the terror organization.¹⁶ His penchant for infighting, his bitterness, and his alienation of the Saudi and Yemeni branches is undermining the organization's ability to act cohesively and decisively.

Al Qaeda's continued fragmentation is likely to reduce its capability to mount operations against Arab and Western governments. If AQAP, AQIM, and al Shabaab were fairly autonomous prior to bin Laden's death, what little organizational unity that existed is now gone.

The fall of the Tunisian and Egyptian governments to prodemocracy movements employing civil disobedience campaigns underscores, for many, al Qaeda's irrelevance.¹⁷ Since its 1998 formation, al Qaeda had campaigned for violent revolutionary actions against pro-American Arab "apostate" regimes and has mounted repeated terror strikes against Saudi and Egyptian interests.

Within a few months, prodemocracy protesters were able to achieve what al Qaeda was incapable of doing in more than a decade of attacks. The Arab Spring, for many, is a direct repudiation of al Qaeda's ideology and strategy.¹⁸ The secular liberal ideology of Arab youth in Cairo's Tahrir Square contrasted with al Qaeda's authoritarian Salafist ideology and religious fanaticism. From this vantage point, al Qaeda is clearly losing the war of ideas and the hearts and minds of Arab youth.

Al Qaeda's demise in the wake of the Arab Spring, however, depends on the protest movement's ability to implant stable democratic institutions. This is a very difficult task and depends on the development of Arab civil culture compatible with the rule of law and respect for individual rights. Victory is anything but guaranteed.

Al Qaeda's rejuvenation in the short term, ironically, may hinge on the instability created by the Arab Spring. Washington's relations with Arab states have been transformed by the fall of pro-American Egyptian and Tunisian regimes, which has severed intelligence and military cooperation. [End Page 39] Thousands of political prisoners, many radical jihadists, have been released, emergency laws in these countries have been repealed, and internal security services have been reorganized. The ranks of potential recruits for al Qaeda and its capacity to act decisively may be furthered by these developments. Violent populist revolts in Yemen, Libya, and Syria may produce lawless fractured societies ideal for terror sanctuaries and the organization and financing of terrorist actions.

Al Qaeda's greatest possibility for regeneration lies in Yemen. The exodus of pro-American president Ali Abdullah Saleh, two insurgencies, and al Qaeda's integration into the tribal structure of Yemeni society point to national dismemberment. AQAP growth could be facilitated by a Yemeni failed state, ideal for terrorist recruitment and organization.¹⁹

The social, economic, and demographic context is favorable for al Qaeda's growth. Surveys of Yemen's population indicate that al Qaeda enjoys high prestige and support.²⁰ Yemen may be the next front in the war on terror. Revenge for the death of bin Laden and greater operational capability in Yemen may join to give the terror organization one last chance to strike out against the West with another 9/11-style attack. Such an event, however, is unlikely.

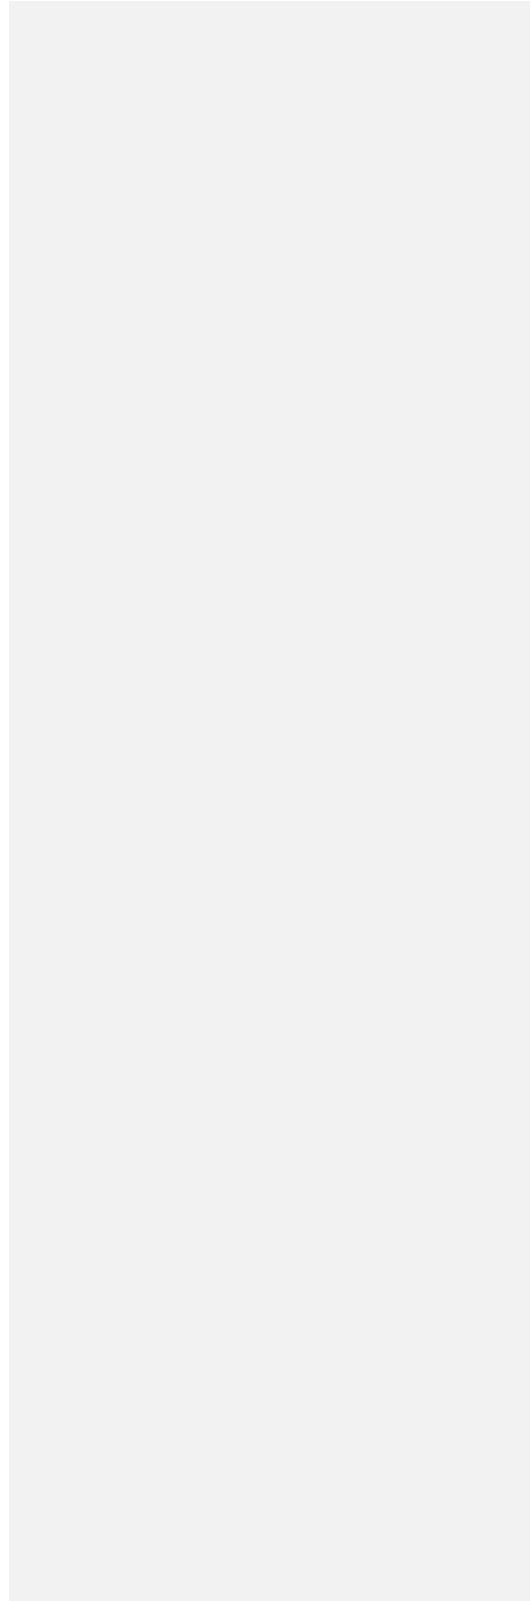

Western governments and intelligence agencies are better prepared. Their targeting of AQAP has resulted in the death of top leaders, including Awlaki. Al Qaeda's cells in Europe and North America have been uprooted, and its members along the Pakistan-Afghanistan border have been devastated by drone attacks. Internal divisions, its unpopular Salafist ideology, and its loss of prestige in the Muslim world have added to its organizational weakness.

Even if the Arab Spring fails and produces more lawlessness, al Qaeda still would be acting at the margins of these societies. Its leaders and cadres will continue to be harassed even if affiliates control substantial territory.

Despite al Shabaab's control of south-central Somalia, its Taliban-like policies and its harassment of international famine relief efforts are deeply unpopular.²¹ The foreign fighters in its organization are resented by the local [End Page 40] population, and their presence has prompted international and regional actions, with al Shabaab cadres harassed by African Union troops and US Predator drone strikes.

Under the best of circumstances, al Qaeda may inspire terror operations by "lone wolves," homegrown cells, or affiliated groups that could cause damage equal to that at Fort Hood or in London. Faced with internal enemies, confronted with the prominence of secular liberal ideology among Arab youth, and facing Western commitment toward its annihilation, however, al Qaeda's long-term future looks grim.
[End Page 41]

Al Qaeda

2AC

AQ collapsed, affiliates are hype, and homegrown & lone wolves are a joke—none can execute mass casualty attacks

John **Mueller**, political scientist at Ohio State, 1/8/14, Has the Threat from Terrorism Been Exaggerated?, www.cato.org/publications/commentary/has-threat-terrorism-been-exaggerated

Two years after the raid on Osama bin Laden’s hideaway, terrorism alarmists remain in peak form explaining that although al-Qaeda has been weakened it still manages to present a grave threat.

Various well-honed techniques are applied to support this contention. One is to espionage and assess various “linkages” or “connections” of “ties” or “threads” between and among a range of disparate terrorists or terrorist groups, most of which appear rather gossamer and of only limited consequence on closer examination.

Another is to exaggerate the importance and effectiveness of the “affiliated groups” linked to al-Qaeda central. In particular, alarmists point to the al-Qaeda affiliate in chaotic Yemen, ominously hailing it as the “deadliest” and the “most aggressive” of these and a “major threat.”

Yet its chief efforts at international terrorism have failed abysmally: an underwear bomb and laser printer bombs on cargo planes. With that track record, the group may pose a problem or concern, but it scarcely presents a “major threat” outside of war zones.

More generally, “al-Qaeda is its own worst enemy,” as Robert Grenier, a former top CIA counterterrorism official, notes. “Where they have succeeded initially, they very quickly discredit themselves.”

Any terrorist threat within the developed world seems even less impressive. The Boston terrorists of 2013 were the first in the United States since 9/11 in which Islamist terrorists actually were able to assemble and detonate bombs — albeit very primitive ones. But except for that, they do not seem to have been more competent than most of their predecessors.

Amazingly, they apparently thought they could somehow get away with their deed even though they chose to set their bombs off at the most-photographed spot on the planet at the time. Moreover, they had no coherent plan of escape and, as commonly found, no ability to explain how killing a few random people would advance their cause.

While the scope of the tragedy in Boston should not be minimized, it should also be noted that if the terrorists’ aim was to kill a large number of people, their bombs failed miserably. As recent cases in Colorado and Connecticut sadly demonstrate, far more fatalities have been inflicted by gunmen.

Before Boston, some 16 people had been killed by Islamist terrorists in the United States in the years since 2001, and all of these were murdered by people who were essentially acting alone. By contrast, in the 1970s, organized terrorists inflicted hundreds of attacks, mostly bombings, in the United States, killing 72.

As concern about organized attacks has diminished, fear of "lone wolf" attacks has grown in recent years, and one official assessment contends that "lone offenders currently present the greatest threat."

This is a reasonable observation, but those concerned should keep in mind that, as analyst Max Abrahms has noted, while lone wolves may be difficult to police, they have carried out only two of the 1,900 most deadly terrorist attacks over the last four decades.

The key question, at least outside of war zones, is not, "are we safer?" but "how safe are we?"

At current rates, an American's chance of becoming a victim of terrorism in the U.S., even with 9/11 in the calculation, is about 1 in 3.5 million per year. In comparison, that same American stands a 1 in 22,000 yearly chance of becoming a homicide victim, a 1 in 8,000 chance of perishing in an auto accident, and a 1 in 500 chance of dying from cancer.

These calculations are based, of course, on historical data. However, alarmists who would reject such history need to explain why they think terrorists will suddenly become vastly more competent in the future.

But no one seems to be making that argument. Indeed, notes one reporter, U.S. officials now say that al-Qaeda has become less capable of a large attack like 9/11. But she also says that they made this disclosure only on condition of anonymity out of fear that "publicly identifying themselves could make them a target" of terrorists.

In contrast, one terrorism specialist, Peter Bergen, has observed in heroic full attribution mode that, "The last terror attack (in the West) was seven years ago in London," that there "haven't been any major attacks in the U.S.," and that "they are recruiting no-hopers and dead-enders."

Terrorists do, of course, exist — as they have throughout history. They may even get lucky again sometime. Thus, concern and watchfulness about terrorism is justified. But counterterrorism expenditures that are wildly disproportionate to the limited hazard terrorism presents are neither wise nor responsible.

1AR

AQ is decimated

Porter 14

Dr. Patrick Porter is a reader in War and International Security and Leverhulme Research Fellow at the University of Reading, and a fellow of the UK Chief of the Defence Staff's Strategic Forum, War on the Rocks, January 28, 2014, "IT'S TIME TO ABANDON THE GLOBAL VILLAGE MYTH", <http://warontherocks.com/2014/01/its-time-to-abandon-the-global-village-myth/>

A closer look shows that the belief in a small world misconceives the security environment. Consider terrorism, supposedly borderless. On 9/11, Al Qaeda attacked under open skies. Yet Bin Laden's pilots hit America not from Afghanistan, but from forward operating bases such as flight schools in Arizona and meeting houses in Berlin, bases that America quickly shut down. Its training camps and sanctuaries in Afghanistan, the US-led coalition destroyed. The unspectacular steps of intensified police work, tighter border controls, international collaboration, the strengthening of the Nunn-Lugar program for locking down "loose" nuclear material, and strengthened airport security widened the space between Al Qaeda and America. For the budding nuclear terrorist, America the "far enemy" has effectively become more distant.

Al Qaeda then fragmented into a network. Theorists of "netwar" hailed this as an inspired move. But increased flexibility cost AQ the ability to direct its jihad. It lost its coherence, attracted indiscriminately brutal figures, and provoked the angry blowback of Muslims from northern Iraq to Algeria. The guerrillas of the information age can still inflict atrocity, but our resilient nation-states have reduced their ability to inflict mass casualty terrorism on Western soil. No longer do they pose a first-order threat.

AQ dead—affiliates are hype and not a threat

Zachary Keck, associate editor of The Diplomat, **3/17/14**, Al Qaeda's Brand is Dead, nationalinterest.org/print/commentary/al-qaedas-brand-dead-10059

As Al Qaeda's operational capability has withered, [3]some observers have sought [3] to reframe the terrorism threat to the U.S. and the West in terms of Al Qaeda's ideological appeal. According to this perspective, Al Qaeda continues to be a potent threat to the United States and the Western world because its ideology is spreading across the Arab world, and inspiring new groups that will attack the West.

Framing the threat in this way has the advantage of ensuring the Global War on Terror's longevity. Indeed, by this measurement the U.S. is still embroiled in WWII given that neo-Nazi groups continue to exist, and sometimes carry out terrorist attacks in the West.

But the larger problem with the argument that Al Qaeda's ideology is spreading is that it is **completely inaccurate**. The "Al Qaeda brand" was never as popular in the Arab world as it was portrayed in the West, and far from growing, its popularity has been rapidly declining in recent years. In fact, there are signs that Al Qaeda itself no longer believes in it.

Much of the confusion about Al Qaeda's popularity is rooted in the Western tendency to conflate Al Qaeda with Islamic terrorism more generally. If one defines Al Qaeda's brand as simply being any terrorist attack or insurgency carried out in the name of Islam, an argument could be made that the threat is growing. But, of course, this is not what Al Qaeda's ideology is, nor is it what made Al Qaeda such a threat to the United States and its Western allies.

Islamic-inspired terrorism long predated the formation of Al Qaeda. It was, for instance, a constant reality in the Arab world during the Cold War thanks to the many groups that were inspired by the writings of Sayyid Qutb. These groups sought to be vanguard movements that used terrorism and leadership assassinations to overthrow Arab regimes [the "near enemy"] that they viewed as insufficiently Islamic.

Al Qaeda was an entirely different story, as a few astute individuals in the U.S. national security establishment realized during the 1990s. Al Qaeda had a very precise ideology, which was seen as a competitor to the ideology espoused by the domestic jihadists.

Like the domestic jihadists, Al Qaeda's ultimate goal was to topple local regimes and replace them with ones based on Sharia Law (and ultimately a single Caliphate). However, Al Qaeda leaders claimed that the domestic jihadists were failing in this goal because of the support the local regimes received from the United States and its Western allies. According to Al Qaeda, the U.S. and its Western allies would never allow their allied governments in the Arab world to be toppled. Therefore, in order for jihadists to overthrow these hated regimes, and set up more Islamic governments in their place, they must first target the far enemy—the U.S. and the West. Only when the jihadists had forced the U.S. to stop supporting these local regimes could the latter be overthrown.

Ayman al-Zawahiri, the current leader of Al Qaeda, explained this ideological argument nicely in his [4]famous 2005 letter to [4]Al Qaeda [5] in Iraq's leader [4], Abu Musab al-Zarqawi. In the letter, al-Zawahiri wrote:

"It is my humble opinion that the Jihad in Iraq requires several incremental goals:

The first stage: Expel the Americans from Iraq.

The second stage: Establish an Islamic authority or emirate [in Iraq]....

The third stage: Extend the jihad wave to the secular countries neighboring Iraq."

Al Qaeda's ideology was also evident in the way it operated before 9/11. Specifically, the group set up shop in countries like Sudan and Afghanistan, where sympathetic governments existed. Although Al Qaeda provided some limited support to these regimes to shore up support, and provided some funds to domestic jihad groups, living in friendly territory allowed bin Laden and Al Qaeda to concentrate the bulk of their energies and resources on attacking the United States. Even after 9/11, Al Qaeda Central has operated primarily from Pakistan, where the government at least supports its allies, the Afghan Taliban.

None of the so-called Al Qaeda franchises have replicated this model. Only Al Qaeda in the Arabian Peninsula (AQAP) in Yemen has shown any real commitment to attacking the U.S. or other Western homelands. Even so, this commitment has been extremely limited, particularly when compared with AQAP's commitment to fighting the Yemeni government.

For the most part, the attacks in the U.S. that are often attributed to AQAP consisted of homegrown terrorists who contacted Anwar al-Awlaki, the Yemen-born American cleric killed by a U.S. drone strike in 2011, to get his approval for their attacks. Although al-Awlaki was happy to encourage these homegrown terrorists, AQAP didn't devote any of its own resources to support them. Similarly, al-Awaki and some of his associates published an English-language publication, Inspire Magazine, which urged Muslims living in Western countries to orchestrate their own attacks.

One of the exceptions to this model is Umar Farouk Abdulmutallab, the Nigerian who unsuccessfully tried to down a commercial airplane flying to Detroit on Christmas Day 2009. Abdulmutallab had been in Yemen studying Arabic when he decided to join the international jihad. After making contact with AQAP, the group built him a specially designed underwear bomb that would not be detected by airport security. Thus, the group did devote some resources to the attack—namely, building the bomb and possibly financing Abdulmutallab's airfare—but it wasn't willing to sacrifice any of its own members to attacking the U.S. Furthermore, the original impetus for the attack came from Abdulmutallab, who contacted the group on his own initiative.

Another exception to AQAP's usual model came in 2010, when the group attempted to ship two cargo bombs to Chicago. Tipped off by Saudi intelligence, the packages were discovered before the bombs exploded. Unlike the previous attacks, the initial impetus to launch this attack didn't come from outside the group. Still, the amount of resources AQAP devoted to the attack were minimal, a fact that the group publicly bragged about.

While these events demonstrate that AQAP does pose some threat to the U.S. homeland, they hardly suggest the group is modeling itself off Al Qaeda's ideology. In contrast to the limited resources it has devoted to attacking the United States, the group has spent the bulk of its energies on waging war against the Yemeni government. This has at times included launching conventional style attacks in south Yemen, and holding territory, which they have tried to govern. Clearly, then, AQAP is far more invested in attacking the near enemy, and only casually interested in attacks on the far enemy.

All the other Al Qaeda affiliates have focused exclusively on trying to overthrow local regimes and establishing Sharia governments in their place—which is a direct refutation to Al Qaeda's ideology. This cannot be attributed entirely to a lack of viable options for attacking the West. For years now Somali Americans have traveled to Somalia to join al-Shabaab in its fight for control over that country. [6]According to U.S. intelligence estimates [6], the group counted at least fifty U.S.-passport holders as members in 2011, and as many as twenty today. Al-Shabaab leaders could have directed any one of these members to return to the United States to carry out attacks there given the ease with which they could gain entry into America.

Yet there is no evidence al-Shabaab has decided to use a single one of these members for the purpose of attacking the United States. Instead, it has felt they are of more use staying in Somalia to fight in the civil war there. The only external attacks it has precipitated have been against African countries that have troops in Somalia fighting al-Shabaab. The goal of these attacks is to force those African countries to

withdraw their troops from Somalia, and therefore increase the chances that al-Shabaab will prevail in its effort to seize control of the country.

The actions of Al Qaeda in Iraq (AQI) are also telling. The group publicly claimed it was established to defend Iraq against the U.S.-led occupation, and for years it had easy access to U.S. and coalition troops in Iraq. True to its word, AQI did carry out brutal attacks against the U.S. and other international troops stationed in Iraq. Still, the bulk of AQI's efforts went towards attacking the Iraqi government and the country's Shi'a populations, despite al-Zawahiri's plea that it focus instead on the infidels. Once again, in contrast to Al Qaeda's ideology, AQI chose the near enemy over the far one. It has since expanded into Syria, where it once again is battling a near enemy rather than the West.

More recently, **even Al Qaeda Central has** seemingly **abandoned its own ideology**, as evidenced by al-Zawahiri calling on Muslims wage jihad everywhere from Syria to Russia. While it's far too early to proclaim that the remnants of Al Qaeda Central are no longer interested in attacking the U.S. homeland, the fact that the group's public statements now seem to be gravitating towards focusing on the near enemy or different far enemies suggest that even it is amending its ideology.

Symbolic of the [7] lack of support for Al Qaeda's mission is the fact that newer Islamist groups with supposed Al Qaeda links haven't adopted the Al Qaeda name. Even groups that formerly took the Al Qaeda name, such as AQAP and AQI (long before being disavowed by Al Qaeda Central), have dropped Al Qaeda from their names.

Instead of Al Qaeda's ideology spreading, then, what we are seeing is Islamist groups revert back to the domestic-jihad model that was prevalent in the Cold War but had lost steam in the 1990s. Al Qaeda had always considered itself an ideological competitor to these domestic jihadists. Increasingly, it is becoming one of them.

None of this should be surprising for at least two reasons. First, the Arab Spring unequivocally refuted Al Qaeda's central premise that the U.S. would never allow one of its local allies to be toppled by domestic uprisings. Al Qaeda leaders trying to make this argument today would sound absurd and gain few followers. The larger implication of this, however, is that it makes little sense for terrorist groups seeking to govern Muslim states to attack the U.S. Far from being necessary to achieve their ultimate objective, it is almost certainly counterproductive given that it attracts the attention of the formidable counterterrorism capabilities the U.S. has amassed since 9/11. This may explain why **AQAP hasn't attempted to attack the U.S.** homeland since the Arab Spring began.

The other reason it is not surprising that Al Qaeda has increasingly adopted the domestic jihadist ideology is because al-Zawahiri is now the leader of Al Qaeda Central. [8]According to many accounts [8], even during the pre-9/11 years al-Zawahiri was always far more interested in trying to seize control of his native Egypt than attacking the United States, which was bin Laden's main preoccupation. Reportedly, al-Zawahiri only joined bin Laden's global jihad out of desperation after the group he was running at the time, Egyptian Islamic Jihad, had run out of resources to fight the Egyptian government. With bin Laden no longer in charge, al-Zawahiri can now use Al Qaeda's resources to focus on what was always his true ambition in life, overthrowing local regimes.

ISIS

2AC

Loss of lifeline deters ISIS

Walker 6/17 (Jamie Walker – Middle East correspondent, “Kurds cut ISIS lifeline to supplies” The Australian, <http://www.theaustralian.com.au/news/world/kurds-cut-isis-lifeline-to-supplies/story-e6frg6so-1227401204116>) // CW

A lifeline to Islamic State’s proclaimed capital in Syria has been severed with the fall of the -strategic border town of Tal Abyad to Kurdish-led forces. The collapse of the jihadists’ resistance was announced last night in a telling blow for Islamic State, cutting a key supply route from Turkey to its command centre in Raqqa. The Syrian Observatory for Human Rights, a well-regarded monitor of the see-sawing war in Syria and Iraq, said Kurdish militia backed by Syrian opposition forces had seized Tal Abyad. “Since dawn this morning not a single shot has been fired in Tal Abyad,” said the monitoring group’s director, Rami Abdel Rahman. “The Kurdish fighters now have full control.” Islamic State, also known as ISIS, has used the strategic town, on the Syrian side of the border with Turkey, as a funnel for fighters, weapons, -ammunition and supplies. Tal Abyad’s recapture means the extremists must rely on border crossings further west in neighbouring Aleppo province, adding hundreds of kilometres to the supply line and increasing the likelihood of convoys being intercepted or destroyed. The opposition attack was aided by heavy airstrikes by the US-led military coalition that is bombing Islamic State and counts as a welcome success after the Iraqi city of Ramadi and Palmyra in central Syria were overrun by the militants. The onslaught from the air and on the ground forced thousands of civilians, inciting harrowing scenes on the border with Turkey as mothers pushed children and babies through torn-down fencing at closed checkpoints. The loss of Tal Abyad, only 80km north of Raqqa, the capital of the Islamic State’s self--declared caliphate, is the extremists’ biggest setback since Kurdish fighters took control of Kobani.

1AR

No ISIL WMD capability

Leonard **Weiss** is a visiting scholar at the Center for International Security and Cooperation at Stanford University, USA, and a member of the National Advisory Board of the Center for Arms Control and Non-Proliferation in Washington, DC. For more than two decades, he was staff director of the US Senate Committee on Governmental Affairs and its Subcommittee on Energy and Nuclear Proliferation, during which time he wrote major legislation on nuclear nonproliferation and led investigations of nuclear programs of other countries. He is a former professor of applied mathematics and engineering at Brown University and the University of Maryland, "On fear and nuclear terrorism," Bulletin of the Atomic Scientists '15, Vol. 71(2) 75–87

What about highly organized groups, designated appropriately as terrorist, that have acquired enough territory to enable them to operate in a quasigovernmental fashion, like the Islamic State (IS)? Such organizations are certainly dangerous, but how would nuclear terrorism fit in with a program for building and sustaining a new caliphate that would restore past glories of Islamic society, especially since, like any organized government, the Islamic State would itself be vulnerable to nuclear attack? Building a new Islamic state out of radioactive ashes is an unlikely ambition for such groups. However, now that it has become notorious, apocalyptic pronouncements in Western media may begin at any time, warning of the possible acquisition and use of nuclear weapons by IS.

ISIS no longer a threat

Barak **Mendelsohn**, Associate Professor of political science at Haverford College and a Senior Fellow at the Foreign Policy Research Institute (FPRI), 2/13/14, After Disowning ISIS, al Qaeda is Back On Top, www.foreignaffairs.com/articles/140786/barak-mendelsohn/after-disowning-isis-al-qaeda-is-back-on-top

Without his group's al Qaeda affiliation, Baghdadi is in a precarious position. His group benefitted from legitimacy that came with its relationship with al Qaeda without ever really obeying AQC's orders. Moreover, al Qaeda's tutelage provided ISIS a shield, keeping denunciations of its brutality and its religious innovations in check. Now ISIS finds itself portrayed as too extremist, even for al Qaeda. Unless it radically changes its ways -- very unlikely -- the chorus of criticism will only grow louder. Already, the group is left with very few credentialed supporters who could offer it a defense and cloak its actions with religious authority.

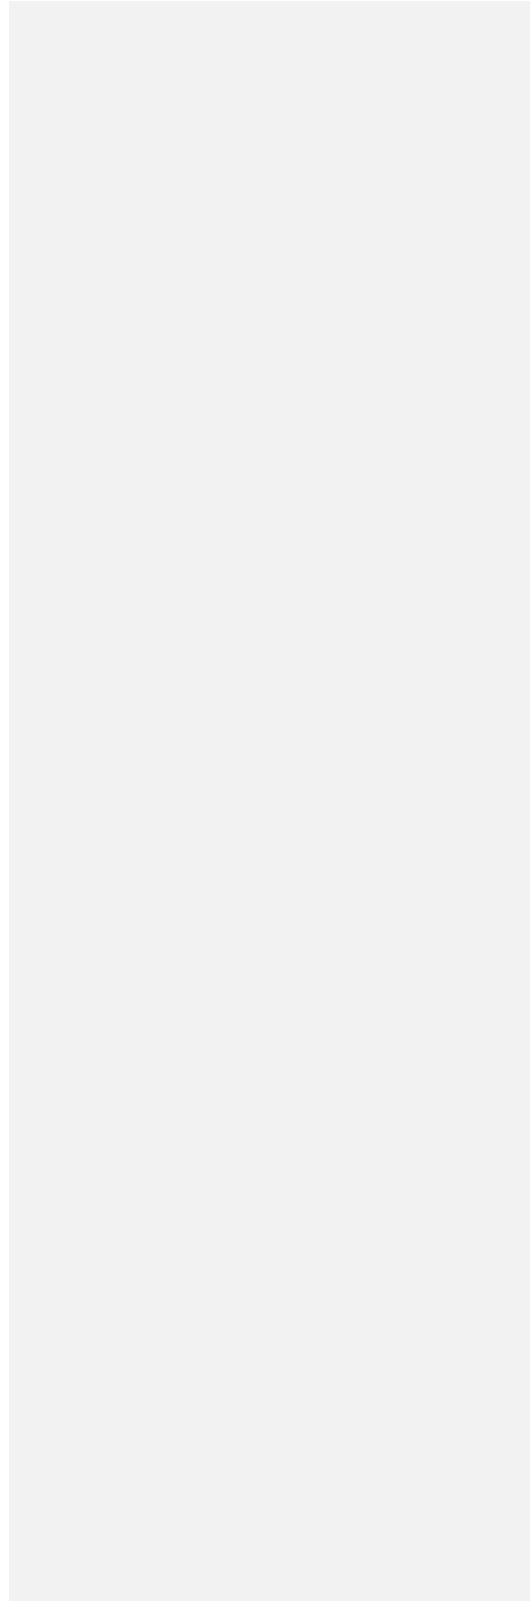

In many ways, ISIS seems to be heading down the same path of self-destruction that led the Algerian GIA (Armed Islamic Group) to its doom two decades ago. Between 1992 and 1998, that group had waged a violent campaign to replace the Algerian government with an Islamic state. It went to such extremes that it denounced even pious Muslims as heretics, killed numerous innocents and even fellow jihadis, and ended up squandering an opportunity to beat a hated and oppressive regime. For the jihadi community, the GIA's collapse is a cautionary tale. And the similarities between GIA and ISIS will not be

lost on ISIS' critics, which will put Baghdadi on the defensive: like the GIA was, ISIS is led by figures with limited religious credentials at best, and like GIA did, **ISIS has** gradually **lost its main supporters**.

ISIS may have considerable territory under its control, but without the stamp of approval of jihadi heavy-hitters, it will find keeping that territory extremely difficult. Its ability to provide material benefits to its members could keep ISIS in business for some time, but religious backing is irreplaceable. Without it, the group cannot attract pious Muslims and will have to rely ever more on uneducated youth with a proclivity for violence and criminality. It will also find it hard to get money from prominent donors, especially when there is an abundance of alternatives. If history is a guide, such financial pressures will likely push ISIS further toward criminality, which, in turn, will fuel public resentment toward the group.

ISIS could also crumble from within. The group's rank and file is already hearing repeated calls from popular jihadi scholars to defect to other Islamist groups in Syria. Many may heed that advice. But they are likely to find out how dangerous attempts to shift their allegiances could be. Already paranoid, ISIS is likely to see recent events as a confirmation of conspiracies against it. In response, it will grow more brutal and will place an emphasis on policing its own members. In an effort to deter defections, ISIS will likely prosecute defectors as traitors. Some members will opt to go against their commanders and fellow fighters, mostly by providing information to other rebel groups. And JN and the Islamic Front stand ready to accept it.

Pyroterror

2AC

Pyroterrorism not likely in the US.

Inkerman Monitor 7 – Inkerman Monitor, International business risk and intelligence company, 2007 ("The War on Ecoterror, An Analysis of the Use of Anti-Terrorism Legislation on Activist Movements in the UK & US," The Inkerman Monitor Volume III 2007, September, accessed 6/29/15)

Eco-terrorism may be the only kind of terrorism which has spawned a backlash form of terrorism, known as pyroterrorism. It has been suspected that forest fires in recent years may have been caused by anti-environmentalists who are "fed up" with the pro-environmental movement. Governments usually declare that forest fires are caused by lack of rain, lightning, or careless campers, but it has been suspected that disgruntled anti-environmentalists (who are sympathetic to the concerns of timber companies) deliberately start the fires. Pyroterrorism is suspected to be the case more in Australia and Latin America than in the US, and was most recently cited as a possibility for the fires in Greece in summer 2007.

1AR

No cases of arson in the U.S. have been attributed to terror groups.

Zahn 13 – Drew Zahn, contributing writer at WND, 2013 (“Jihadists Claim Credit for Arizona Fires,” WorldNetDaily, July 5th, available online at <http://www.wnd.com/2013/07/jihadists-claim-credit-for-arizona-fires/>, accessed 6/29/15)

A Palestinian jihadist group, Masada al Mujahideen, has claimed credit for starting the ongoing Arizona wildfire that has killed 19 firefighters, according to a report from The Long War Journal’s David Barnett. The Long War Journal is a project of the Foundation for the Defense of Democracies, whose leadership council includes among others former CIA Director R. James Woolsey Jr. and Former FBI Director Louis Freeh. According to the report, the SITE Intelligence Group obtained and translated from a jihadist Internet forum a statement titled “Masada al-Mujahideen Fulfilled its Promise and Attacked America Again After the Expiration of the Period with Fires that Achieved Historic Results.” The statement boasted of the deaths of the 19 firefighters and claimed, “We had previously announced an unconventional war against the occupation state of Israel, and then we escalated this war to reach its main supporter, America, so that it receives a major share of it, which will destroy their flora and fauna, with permission from Allah and then with our hands.” The statement further said that the group targeted the United States “in order to make it clear and to make it known we can reach it when we warn it, and to make it certain that our hands don’t just reach it, but also strike it.” The Arizona fire killed 19 of 20 members of the Granite Mountain Hotshot Crew, the greatest loss of life for firefighters in a wildfire since 1933 and the deadliest day for U.S. firefighters since the 9/11 when 340 died. “Just as we remembered the brave men who ran into the twin towers,” Arizona Gov. Jan Brewer said, “we will also remember the men of the Granite Mountain Hotshots.” Thus far, however, ABC News reports authorities believe the Arizona wildfire began with a lightning strike in Yarnell, Ariz., about 90 miles northwest of Phoenix, before spreading to roughly 6,000 acres amid triple-digit temperatures, low humidity and windy conditions. As WND reported, authorities have said a similarly deadly fire that struck Colorado last month was not the result of any “lightning strike.” “One thing that my investigators have given me the authority to state is that they have all but ruled out natural causes as the cause of this fire,” said Colorado’s El Paso County Sheriff Terry Maketa. “I can’t really go any further on that, but I can say we are pretty confident it was not, for instance, a lightning strike.” One expert on Islamic terrorism believes the wildfire that ravaged the outskirts of Colorado Springs, killing two people and destroying more than 500 homes, should be examined by terror investigators, if for no other reason because of the history of threats from al-Qaida and others to burn America’s forests. At the American Center for Democracy, noted terror funding expert Rachel Ehrenfeld wrote that Bill Scott, a senior fellow at ACD, warned about terrorist fires last July, speaking at the briefing on Capital Hill. “An expert on aerial firefighting, he presented a sobering analysis of the devastating (2012) Waldo Canyon Fire [in Colorado], pointing out that the striking rise [in] Western U.S. wildfires may be caused by elements other than nature,” Ehrenfeld wrote. “He noted that in spring 2012, al-Qaida’s English-language online magazine, Inspire, published an article called ‘It Is of Your Freedom to Ignite a Firebomb,’ which featured instructions on how to build an incendiary bomb to light forests on fire.” She explained that Russia’s security chief, Aleksandr Bortnikov, also has warned, “Al-Qaida was complicit in recent forest fires in Europe” as part of terrorism’s “strategy of a thousand cuts.” “Since then, more fatwas advocating that ‘fire is a cheap, easy and effective tool for economic warfare’ have been issued,” Ehrenfeld wrote. “They’ve included detailed instructions for constructing remote-controlled ‘ember bombs, and how to

set fires without leaving a trace.” Israel’s forests also have been targeted, she noted. “While many of the fires that have scorched millions of acres and destroyed thousands of homes in Arizona, California, Colorado, New Mexico, Utah and other states have been identified as arson, none has been publicly attributed to criminal or terrorist groups, despite the presence of Mexican gangs and [a] large number of other illegals in our Western states,” she said. Mother Jones reported Don Smurthwaite, a Bureau of Land Management spokesman, “downplayed” Ehrenfeld’s ideas, “but he didn’t dismiss the notion outright.” “We don’t have any hard evidence that any wildfires in the U.S. were started by terrorists in recent years,” he told the publication.

The notion of pyroterror is dismissed by authorities – even in zones of suspected “pyroterror”

Asia One News 9 – (“Police dismiss ‘forest jihad,’” Asia One News, February 11th, Available online at <http://news.asiaone.com/News/Latest+News/Asia/Story/A1Story20090211-121090.html> , accessed 6/29/15)

Police Wednesday dismissed any suggestion the wildfires that have killed more than 180 people could have been started by Islamic militants waging “forest jihad”. The idea has started to turn up on Internet blog sites after reports last year that a group of Islamic extremists had urged Muslims to light bushfires as a weapon of terror. Police believe some of the fires that ripped through southeast Australia since the weekend were started by arsonists, but a spokesman said there was no suspicion they were Islamic terror attacks. “None at all, absolutely nothing, zero,” Superintendent Ross McNeill told AFP. “We usually rank possibilities on a scale of 0 to 10 - this would be on a negative scale,” he said. McNeill said he was aware of last year’s report, which said US intelligence channels had identified a website calling on Muslims in Australia, the US, Europe and Russia to “start forest fires”. The report, carried by Melbourne’s The Age newspaper on September 7, said the website claimed “scholars have justified chopping down and burning the infidels” forests when they do the same to our lands. “Posted by a group called the Al-Ikhlās Islamic Network, it argues in Arabic that lighting fires is an effective form of terrorism justified in Islamic law under the doctrine of an ‘eye for an eye,’” the report said. It calls on Muslims to remember “forest jihad” in summer, saying fires cause economic damage and can take months to extinguish so that “this terror will haunt them for an extended period of time”. The Age report said Australian intelligence agencies were treating the possibility that bushfires could be used as a weapon of terrorism as a serious concern. Attorney-General Robert McClelland said the federal government remained “vigilant against such threats”, warning that anyone caught lighting a fire as a weapon of terror would feel the wrath of anti-terror laws, the paper said. But McNeill insisted there was no suggestion of a link to the fires that razed entire towns last weekend, killing at least 181 people and destroying more than 750 homes.

EMP

2AC

no impact to EMP

Farley 9—assistant professor at the University of Kentucky’s Patterson School of Diplomacy and International Commerce (Robert, Neocons Salivating Over Their Next Great Exaggerated "Threat": Electromagnetic Pulse Attack, 22 Oct. 2009 October 22, 2009, <http://kamran1919.wordpress.com/2009/10/22/neocons-salivating-over-their-next-great-exaggerated-threat-electromagnetic-pulse-attack-politics-alternet/>, AMiles)

Uterior Motives The central political purpose of the EMP awareness movement appears to be advancement of the cause of missile defense. The most extreme estimates of the effect of EMP restore the Cold War-era existential fears of nuclear war. Schwellenbach argues “what’s driving it is the political global context—it gives the right an issue that allows them to justify hawkish behavior. It is almost a perfect solution to any argument against missile defense—North Korea and Iran.” The 90 percent casualty estimate advanced by EMP awareness advocates hypes the notion that the United States faces potential annihilation at the hands of its enemies, and goes a step farther: even the smallest nuclear power can destroy the United States with a small number of warheads. This, in turn, reaffirms the need for both a secure missile defense shield (including space-based interceptor weapons) and a grand strategy of preventive war against potential nuclear and ballistic missile proliferators. Almost all EMP awareness advocates—including Gaffney, Gingrich, and Huckabee—call for increased spending on missile defense. Gaffney and Gingrich have also called for a “robust” policy of preemptive war, including attacks on Iranian and North Korean missiles on their launching pads. The fact that EMP is poorly researched and not well understood works in its favor as a scare tactic. Since evidence of EMP’s allegedly lasting impact is purely theoretical, EMP awareness advocates can make outlandish claims regarding the threat that even the smallest nuclear arsenal poses. They can also point to allegations made by the official EMP Commission, ignoring the fact that many outside experts dispute its findings. The Niagara conference’s emphasis on strategic and policy considerations shows that alarmist predictions about EMP attacks serve as fodder for promotion of a larger nuclear weapons stockpile, for missile defense, and for preventive attacks. Little Traction Despite the effort that conservatives have devoted to this cause, it appears to have gained little traction in the mainstream media. The New York Times, the Washington Post, CNN, Fox News, and other major television news organizations declined to cover the EMPACT conference. Indeed, even the neoconservative Weekly Standard, which seems perpetually on the lookout for ways to plug purported existential threats to the homeland, stayed away from Niagara. One Standard editor said in an interview with the author, “I don’t go for that EMP stuff. Kind of more interested in dangerous scenarios that might actually happen.”

1AR

EMP empirically denied

Faall 10 (Sorcha, Chinese EMP Attack Prompts US Missile Strike After Cruise Ship Crippled, 11 November 2010, <http://www.whatdoesitmean.com/index1421.htm>)

A new report circulating in the Kremlin today prepared for Prime Minister Putin by Director Anatoly Perminov of the Russian Federal Space Agency states that an Arkon-1 military satellite monitoring the western coastal regions of **North America detected an “EMP anomalous event”** occurring **on November 8th** at 0600 Pacific Standard Time (-8 hours GMT) that bore the “direct signature” of a YJ-62 subsonic anti-ship missile fired from a Chinese People’s Liberation Navy Type 041 submarine (NATO code name Yuan-Class) [photo 2nd left] known to be patrolling approximately 200 kilometers off United States coast. Nearly 11 hours after this EMP “event”, this report further says, Arkon-1 then detected a BGM-109 (Tomahawk) subsonic cruise missile launched from a US Navy Ohio-Class submarine operating off the coast of California [photo bottom left] on a “training mission” from its home port located at US Navy’s Kitsap Base in Washington State and was enroute to the largest American Naval Base on the US west coast in San Diego, California. Note: A Russian military intelligence (GRU) addendum to this report states that the “training mission” the Ohio-Class submarine was on is related to a new US law passed this year allowing for the first time in history for women to serve on US Navy subs and was an “operational exercise” testing female Naval Officers competence prior to their first “operational deployment”. **The “immediate effect” of the Chinese Navy’s firing of their EMP missile, this report continues, was the “catastrophic crippling” of the US based cruise ship Carnival Splendor** [photo 3rd left] that stranded its nearly 4,500 passengers and crew in a “dead in the water” boat and prompting the Americans to send the US Navy’s Ronald Reagan aircraft carrier, warplanes, and supply aircraft to protect it from further attack after all of its electronic systems were destroyed. An electromagnetic pulse **EMP** such as **was used upon the Carnival Splendor** is a burst of electromagnetic radiation that causes rapidly changing electric fields (or magnetic fields) that when coupling with electrical/electronic systems produces damaging current and voltage surges destroying all non-hardened electrical systems.

Prefer our ev – no impact to EMP

AT: Terrorism D.A

Uniqueness

NUQ – Broad Strategy

Not a question of individual gains and losses – the war on terror is *structurally unwinnable*

Martin 6/15 - D. G. Martin is the host of UNC-TV's "North Carolina Bookwatch," a retired lawyer, politician, and university administrator (D.G. Martin, 6-15-2015, "D.G. Martin: Why we lost the war on terror," Winston-Salem Journal, http://www.journalnow.com/opinion/columnists/d-g-martin-why-we-lost-the-war-on-terror/article_3767f5e4-1378-11e5-895c-175c238e0d66.html)//A-Sharma

I am a United States Army general, and I lost the Global War on Terrorism." These are the opening lines of retired U.S. Army Lt. Gen. Daniel P. Bolger's book, "Why We Lost: A General's Inside Account of the Iraq and Afghanistan Wars." Bolger teaches military history at N.C. State. "No U.S. general has criticized the Iraq and Afghanistan wars more sharply" than Bolger, wrote reviewer Carter Malkasian in The Washington Post. Continuing the shocking opening words of his book, Bolger writes, "It's like Alcoholics Anonymous; step one is admitting you have a problem. Well, I have a problem. So do my peers. And thanks to our problem, now all of America has a problem, to wit: two lost campaigns and a war gone awry." With President Obama's decision to send 450 more U.S. troops to Iraq, Bolger's acceptance of responsibility and his explanation of "why we lost" are extremely timely. Just what did Bolger and the other generals do wrong in Afghanistan and Iraq? You do not have to read all 500 pages of "Why We Lost" to understand Bolger's explanation. He makes his point in just a few pages in the book's epilogue. He writes, "Despite the unmatched courage of those in U.S. uniform -- including a good number of generals who led their people under fire -- our generals did not stumble due to a lack of intellect. Rather, we faltered due to a distinct lack of humility. Certain we knew best, confident our skilled troops would prevail, we persisted in a failed course for far too long and came up well short, to the detriment of our trusting countrymen." This failed course was the military's nation building efforts based on a counterinsurgency strategy. But, writes Bolger, "Counterinsurgency works if the intervening country demonstrates the will to remain forever." He continues, "Once it becomes clear that the external forces won't stay past a certain date, the guerrillas simply back off and wait it out. "We did not understand our enemies. Indeed, drawn into nasty local feuds, we took on too many diverse foes, sometimes confusing opponents with supporters and vice versa. Then we compounded that ignorance by using our conventionally trained military to comb through hostile villages looking for insurgents." Throughout the extended operations in Iraq and Afghanistan, Bolger says there were always only three options: "Stay the course. Add forces. Pull out. Over time, in both countries, all three approaches were tried. Only the third one, pulling out, worked, and that in the finite sense that it ended U.S. involvement. But it left both friends and foes behind, sowing the seeds for future troubles." The question remains. Why does Bolger blame himself and the other generals for losing the war on terrorism? Were not all these decisions made by the country's civilian leadership? Here is his answer. "The record to date shows that no senior officers argued for withdrawal. Instead, like Lee at Gettysburg, overly impressed by U.S. military capabilities and our superb volunteers, commander after commander, generals up and down the chain, kept right on going. We trusted our invincible men and women to figure it out and rebuild two shattered Muslim countries and do so under fire from enraged locals."

Losing the War on Terror – leaving the Middle East with issues unresolved sparked future conflict

Cerulus 6/28 – Freelance Journalist for POLITICO - (Laurens Cerulus, 6-28-2015, "Who lost Iraq?," POLITICO, <http://www.politico.eu/article/iraq-troops-us-white-house-strategy-middle-east-roundtable/>)/A-Sharma

For a brief, happy — and misguided — moment, most Americans stopped thinking about Iraq. After withdrawing the last U.S. troops in 2011, President Barack Obama declared the country “sovereign, stable and self-reliant.” No such luck. Iraq plunged back into chaos as the Islamic State stormed the region last year, and the fall of Ramadi in May revived questions about how, and whether, the country can be salvaged. As Americans try to understand what \$2 trillion and nearly 4,500 American lives really accomplished, partisans are battling over how much blame falls on Obama, who left Iraq, and on President George W. Bush, who took us there. “If you fought in Iraq, it worked,” 2016 presidential candidate Lindsey Graham recently said. “It’s not your fault it’s going to hell. It’s Obama’s fault.” Naturally, Democrats see it differently: “This represents the failed policies that took us down this path 10 years ago,” House Minority Leader Nancy Pelosi has said. Who’s right? Could Iraq have remained stable if Obama had left behind a small troop contingent? Did Bush’s “surge” really stabilize the country? In June, POLITICO assembled a group of experts — including veterans of both administrations from the State Department, White House, Pentagon and the CIA — and asked a simple question: Who lost Iraq? — Michael Crowley Iraq roundtable Michael Crowley: Ambassador Khalilzad, you were in Iraq from 2005 to 2007. Describe the trajectory Iraq was on when you left, and the Iraq that Obama inherited when he was inaugurated in January 2009. Zalmay Khalilzad: It was a very difficult period. Especially in the aftermath of the al-Askari Mosque bombing in 2006, the sectarian violence became front and center — a very large number of fatalities and casualties, both Shia and Sunni — and the rise of Al Qaeda in Iraq. We began a more concerted effort training Iraqi troops, which resulted in significant growth in their size and capabilities. The new Iraqi government led by Prime Minister Nouri al-Maliki showed more willingness to use force against the Shia militias in Basra and Baghdad’s Sadr City. Additionally, the excesses committed by Al Qaeda in Iraq [AQI] against the Sunni community was beginning to turn some Sunnis against them. With increased outreach to the Sunnis, we began to have significant numbers of them work with us. There were still some issues unresolved — there was no oil law for the distribution of resources, there still was no reform of de-Baathification. These were self-inflicted wounds, if you like — mistakes we made, in my judgment, at the very beginning. But I think the Iraqis were heading in the right direction. You had a government that acquired greater national legitimacy. There was a greater Sunni participation in government compared to an earlier period. The level of violence, by the end of the Bush administration, was significantly down compared to 2006, early 2007. We’re still talking about Iraq, but, relatively speaking, I would say it was on a positive trajectory with some big issues still unresolved.

War on Terror is being lost in the squo – lack of response by the US

Boot 15 (Max Boot, 2-18-2015, "Losing the War on Terror," Commentary Magazine, <https://www.commentarymagazine.com/2015/02/18/losing-war-terror/>)/A-Sharma

I am currently in the Philippines where I am reminded of how global the threat from Islamist terrorism has become: President Benigno Aquino III is under fire after 44 police commandos were killed in a battle with Muslim separatist groups. But the threat here is relatively limited because Muslims make up only 5 percent or so of the population. Muslims make up roughly the same percentage of the European population, which means that while atrocities such as the

recent shootings in Copenhagen and Paris are likely to continue, there is no threat of an actual Islamist takeover. The epicenter of the jihadist threat remains, of course, the Middle East, and recent trends there are alarming—they suggest that Islamists are increasingly ascendant. A few articles that have caught my eye: The Islamic State (ISIS) is expanding not only in Iraq and Syria but also in Libya, another country where it's easy for extremists to take advantage of the total chaos. A Sunni tribal sheikh in Iraq who preached reconciliation with Shiites was apparently abducted and killed by Shiite militias. Shiite militias, with more than 100,000 men under arms, now far outnumber the Iraqi army, which is down to 48,000 personnel. As a result the army is effectively becoming an adjunct of the militias—and that in turn means that U.S. air strikes, weapons, and training are effectively going to support the Quds Force, which controls the Shiite militias. Hezbollah is not only ramping up its operations in Syria but also in Iraq. The trends described above—Shiite and Sunni extremists expanding their operations—are in fact a closely-linked mirror image: the more that one side gains ground among its sectarian group (whether Sunni or Shiite), the more the other one gains in reaction. There is another link between them: the utter lack of a serious response from the United States. Given the failure of the U.S. and its allies to fill the vacuum in Iraq, Syria, or Libya, we can expect the further emergence of competing jihadist states, one Sunni, the other Shiite, to the detriment of our interests and those of our more moderate allies. I hate to say it, but we have been losing the battle against Islamist terror ever since President Obama's "mission accomplished" moment—the killing of Osama bin Laden. If the president has a plan to reverse this calamitous trend, he has kept it a closely guarded secret.

Losing the War on Terror – propaganda

Lieberman 6/28 - (Joe Lieberman, 6-28-2015, "Joe Lieberman: Obama Losing the Propaganda War to ISIS," Newsmax, <http://www.newsmax.com/Newsfront/Lieberman-Obama-ISIS-propaganda/2014/10/24/id/602919/>)/A-Sharma

Despite recent evidence that the Islamic State (ISIS) and al-Qaida possess sophisticated propaganda machines, former vice presidential candidate Joe Lieberman contends the government's response to their online radicalization has been "ad hoc" and absent of any comprehensive strategy. "Several government agencies, including the Department of Homeland Security and the Justice Department, have outreach programs to discuss this threat in meetings with community leaders in major cities." The FBI sometimes intervenes to dissuade individuals from engaging in extremist activity online by warning about the risks of illegal activity such as material support to a foreign terrorist organization. But such efforts have been sporadic and are carried out ad hoc, without a comprehensive strategy for countering the online radicalization of U.S. citizens," writes Lieberman in a Wall Street Journal editorial. In the editorial, co-authored with Christian Beckner of George Washington University's Homeland Security Policy Institute, Lieberman calls on the administration to make developing a strategy that integrates "counter-messaging, community engagement and law-enforcement efforts" a priority. "Without such a strategy in place, federal agencies have limited ability to develop programs that can counter the influence of ISIS's propaganda within the U.S," they argue, adding that the recent ISIS-inspired attacks in Canada reinforce the urgency to combat the spread of a violent Islamist ideology. The authors note that little has been done since President Barack Obama outlined his Strategic Implementation Plan (SIP) for Empowering Local Partners to Prevent Violent Extremism in December 2011. The administration announced plans this week to create a community-led program to combat homegrown terrorists, reports CBS News. The program will be modeled after a similar new program launched by Maryland's International Cultural Center. Critics note, however, the ineffectiveness of the administration's existing counterterror efforts. "Thirteen years into the war on terror, it is distressing to see certain ways the U.S. government is combating domestic radicalization by

groups like al-Qaida (AQ) and the Islamic State (IS). Among the more embarrassing of these ventures is the 'Think Again Turn Away' campaign, launched in English in December 2013 by the United States Department of State as part of an effort to enter the war of ideas and win over hearts and minds of jihadists on social media," Rita Katz, director of the SITE Intelligence Group, wrote in Time magazine in September. Special: Katz notes that the State Department's response to a post on the Think Again Turn Away Twitter account showing pictures of prisoners from the infamous Abu Gharib scandal was to tweet "US troops are punished for misconduct, #ISIS fighters are rewarded," accompanied by photos of American soldiers "interacting happily" with Middle Eastern children. Lieberman, who was a member of the Senate Homeland Security and Governmental Affairs Committee, has questioned the seriousness of the administration's efforts in the war on terror, including President Obama's reticence to use the term "terrorism." During an appearance on Fox News' "Hannity" program in September, Lieberman said he could not explain the president's reluctance to openly state the nation is at war. "I don't know. Maybe he's concerned legalistically that if he says we're in a war, then the Congress has to authorize whatever he does. But you got to tell it as it is, this is a war," said the former Connecticut senator in response to a question from host Sean Hannity. The former Democratic vice presidential candidate is set to join Mitt Romney, a former Republican presidential candidate, at the inaugural Israeli American Council (IAC) National Conference in Washington next month, reports The Jewish Press.

Individual drone strikes won't win the War on Terror – lack of stable government results in a “steady stream of recruits” for ISIS

The Washington Post 6/16 - (The Washington Post, "A dangerous mission in Libya requires a firm approach," Washington Post, http://www.washingtonpost.com/opinions/a-dangerous-mission-requires-a-firm-approach/2015/06/16/9d2df416-1399-11e5-9ddc-e3353542100c_story.html)//A-Sharma

A dangerous mission in Libya requires a firm approach

THE PENTAGON says it thinks a U.S. airstrike in Libya on Sunday may have killed one of the most dangerous terrorists in Africa, a man believed to have led a 2013 attack on an Algerian gas field that killed 38 civilians, including three Americans. Meanwhile, al-Qaeda has confirmed that its leader in Yemen was killed by a U.S. drone strike last week. It's good those two militants have been taken off the battlefield, but their elimination will not remedy the growing crises in Libya and Yemen. In that respect, the operations are another example of the limited benefits of President Obama's narrow approach to counterterrorism. For years, Mr. Obama has authorized drone strikes and raids against individuals designated as threats to the United States in Libya, Yemen and Somalia, while making only attenuated efforts to support the construction of stable governments in those countries. The result is that all three nations continue to produce a steady stream of recruits for al-Qaeda and the Islamic State, while Yemen and Libya have grown increasingly violent and chaotic. The threat from Libya is particularly worrisome. The country is divided between two competing armies and governments, one secular and one Islamist, each with its own foreign sponsors. Their destructive rivalry has drastically reduced the oil exports on which Libya's 7 million people depend, while opening the space for jihadists. The faction headed by Mokhtar Belmokhtar, presumed killed in the airstrike, was affiliated with al-Qaeda, but it has caused less concern recently than an Islamic State affiliate that has gained control of one of Libya's coastal towns, Sirte, and has been advancing toward the major port of Misrata. Amid the chaos, refugees and economic migrants from across northern Africa are converging on the Libyan coast, where smugglers offer access by boat to Europe. European Union officials say half a million people may try to cross the Mediterranean this summer, and thousands have already died en route.

War on Terror doomed from the beginning – political failures - ISIS expanding rapidly

Olomi 15 - Ali A. Olomi is a Ph.D student at UCI and specialize in the history of the Middle East- (Ali A., 5-30-2015, "The Political Failure of the War with ISIS," International Policy Digest, <http://www.internationalpolicydigest.org/2015/05/30/the-political-failure-of-the-war-with-isis/>)/A-Sharma

The United States is losing the war with ISIS. It is also losing the de facto War on Terror. ISIS has taken city after city and now Palmyra has fallen. The root of this failure is an inability to conceive of the enemy as a political force. Some have argued that this failure is Obama's doing, but in actuality the War on Terror was doomed from the start. In 2001, when President George W. Bush declared a "War on Terror" he and his administration cemented a flawed conceptual framework. President Obama's failing is that he has perpetuated the same framework that guides and informs US strategy in the Middle East. Today we are seeing the results of the US' ongoing folly. The fundamental problem is that the United States and its allies are fighting a completely different war than what ISIS, the Taliban, and other Muslim extremist groups are waging. The "War on Terror" is fundamentally based on the principle of military struggle. The US sees the problem of insurgency and terrorism as an ongoing military campaign to be won through force of arms. Muslim extremist groups on the other hand are waging a political battle. Certainly, military struggle is part of their strategy as is apparent by their ready use of violence, coercion, and their belligerence. At their core however, is that they view their respective groups as political movements. Both the Taliban and ISIS see themselves as Islamist groups of resistance or revolution. Their aims and methods are political. They engage in propaganda, foster recruitment practices, and orient themselves as the opponents of American imperialism. This positional stance capitalizes on the anti-American sentiment in the Middle East and makes them alluring to the politically alienated and disenfranchised throughout the region. The United States on the other hand completely fails to address the political aspect of the conflict, focusing entirely on military strategy. To the US, groups like ISIS are nothing more than religious bandits—with dangerous tactics certainly, but no real political threat. This purview is reductive and constrained by an inability to think of these groups in a complex political manner—it is unthinkable that groups like ISIS have enduring political ideologies and sound strategies. It is unthinkable that a brutal and cruel group like ISIS emerged as an insurgent revolutionary movement and is now a state formation. "Revolutions," "resistance," and "states" hold certain cherished meanings in our minds and "those" people are incapable of it. This conceptual blindness has severe consequences. Firstly, it leads to a failure to recognize that the very tool used to combat terrorist groups—military aggression—fans the flames of their growth. The United States declared its War on Terror over a decade ago and rather than see a decrease in terrorist activity, its virulence has grown and evolved. The Taliban remain firmly entrenched in Southern Afghanistan in a long term insurgency. The Pakistani Taliban threaten stability in Pakistan while enabling and fostering the insurgency in Afghanistan. The Iraq War was declared over and yet ISIS continues to confound the US and its allies. Syria is torn between the tyrannical forces of Assad on one hand and ISIS on the other who has seized nearly half the country. Then there is the Houthis in Yemen, Boko Haram in West African and dozens of more groups. Each and every one of these growing threats are seen as aberrations or mere military setbacks. In actuality they are political defeats. They are enabled by a very specific socio-political climate and each have their own respective political strategies. Iraqi military unit battling Islamic State militants. (Reuters) Iraqi military unit battling Islamic State militants. (Reuters) Take ISIS, for example, which was born from the collapse of the Iraqi security apparatus vis-à-vis US invasion and it was fostered by the alienation of the Sunni

tribes by the Shia elite in Baghdad. ISIS addresses these very problems as a mandate for a state that stands in opposition to American imperialism. It strategizes to build a state that never again will be vulnerable to occupation nor threats that erode the fabric of social and national security. It espouses an expansionist political strategy to redress perceived colonial wrongs. While we drop bombs from the sky, ISIS works through on the ground realities and as a result draws increasing number of recruits while expanding its territorial boundaries. If there is one lesson that we can learn from the past decade it is that a military strategy alone is not working. Bombing countries is not the solution to dealing with extremist and insurgent groups. The US needs to recognize that the political genealogy of these groups lie in the anti-imperial ideology of 19th and 20th century reformers like Sayyid Jamal Ad-din Al Afghani and Sayyid Qutb. From these roots, Muslim extremist groups see themselves as movements of resistance and revolution against imperial forces. Our bombs and missiles aimed at destroying and degrading become the political catalyst that allows these groups to spread, splinter, and find new purchase in the Middle East. Our view of ISIS and similar extremist groups stems from an orientalist way of thinking about the Middle East and insurgency, one that sees these groups as nothing more than backwards religious extremists that can be dealt with by force alone. It fails to see them as complex political actors with a dynamic political ideology that is fed by US military intervention and with specific strategic goals. We need to recognize these groups as more than mere bandits or aberrations, but as having political strategy and the capacity to enact those strategies. The enemy is not a bunch of backwards thugs that will be cowed with a "shock and awe" tactic, but are born from a very specific political milieu. The US needs to recognize that neither Bush's Global War on Terror, nor Obama's "series of persistent and targeted efforts" (which is really a continuation of the same framework, but with more drones) are solutions to this problem. What the United States needs more than ever is a political strategy to deal with ISIS and other groups like them. We need to think the unthinkable: that ISIS and groups like them are political actors who need to be dealt with politically in the same way that you would any other state. It is time to change the very framework that guides US policy towards ISIS and to groups like them. The US needs to recognize the complex and dynamic nature of these groups, their political aims, and acknowledge that notions like revolution and resistance do not exclusively belong to neoliberalism. In other words, the US needs to think the unthinkable, that revolution has led to a brutal Islamist state and adopt an according strategy. I am not suggesting that the United States abandon all military operations, but it is time for the United States to see beyond its policy of bombs and bullets.

Targeting individuals through drones doesn't bring stability to countries – inefficient and ineffective

Black 6/16 - (Ian Black, 6-16-2015, "Death of al-Qaida leader masks reality of drone strikes: they don't bring stability," Guardian, <http://www.theguardian.com/world/2015/jun/16/what-death-of-a-jihadi-leader-mean-for-western-war-militants>)/A-Sharma

Nearly 3,000 miles separate Ajdabiya in Libya from Mukalla in Yemen, but they have been linked by two events which demonstrate a US policy of fighting jihadi terrorism in the midst of chaos, violence and state collapse whose causes Washington is unable or unwilling to address. Reports of the death of the Algerian militant Mokhtar Belmokhtar in a US air attack on Saturday – denied by supporters – are still being being checked pending DNA tests. But al-Qaida in the Arabian Peninsula (Aqap) was quick to confirm the "martyrdom" of its leader, Nasir al-Wuhayshi, in a drone strike on 9 June. Both cases illustrate the effort by the US to target al-Qaida and like-minded groups alongside the more high-profile

international campaign against Islamic State in Iraq and Syria. Belmokhtar's history encapsulates the trajectory of the global jihadi movement over the past quarter of a century: starting with the Armed Islamic Group fighting the Algerian military in the 1990s, through combat with al-Qaida in Afghanistan to his return to North Africa to join al-Qaida in the Islamic Maghreb (Aqim) and other organisations in the grey area between fanaticism and criminality. Algeria hostage crisis: the full story of the kidnapping in the desert Read more Yet killing him smacks more of vengeance for the 2014 In Amenas attack on an Algerian gas installation than any comprehensive strategy. Belmokhtar's death, if confirmed, "will do little to address the broader chaos in Libya", commented the Soufan Group, a security analysis firm. Aqim, Islamic State and Ansar al-Sharia will continue to destabilise Libya, experts suggested. "Neither North Africa nor Yemen will be more stable for these hits," commented the historian Vijay Prashad. The US, which is seen in many Middle Eastern capitals as disengaging from the region, has been criticised for focusing narrowly on the war on Aqap to the detriment of Yemen's long-running crisis. The group has attracted close attention because of its capacity to hit western targets, but it is seen at home as merely one of many symptoms of state dysfunction and collapse. High-grade intelligence is crucial to track and identify targets but that depends to a significant extent on the collaboration of local partners. The difficulties of confirming whether an air strike or drone attack has been successful – to say nothing of the high risk of killing innocent bystanders – underline the limits of even the most sophisticated spycraft without a presence on the ground. In Yemen, now facing Saudi-led air strikes in an effort to restore the legitimate government and defeat Houthi rebels backed by Iran, the US effort was thought to have been damaged by the collapse of the friendly government in Sana'a earlier this year because it lost some of its ability to gather intelligence and find targets. Still, Wuhayshi was certainly a significant figure – a secretary to Osama Bin Laden and deputy to his successor, Ayman al-Zawahiri. "I wouldn't count Aqap out yet," noted the jihad-watcher Aron Zelin, "but it's probably in its weakest phase" since 2009, when it came into existence with the merger of the Saudi and Yemeni branches of the organisation. The White House said his death "strikes a major blow to al-Qaida's most dangerous affiliate". Nevertheless, Wuhayshi's swift replacement by his deputy, Qassim al-Raymi, reinforced the familiar criticism that assassinating terrorist leaders may only have a short-term disruptive effect. Obama famously declared in 2013 that the "war on terror" launched by George Bush was over. US policy has plenty of critics at home as well as abroad. On the right he has been lambasted for a "lethally desultory approach" and on the left for continuing to target jihadis on the "undeclared battlefields" of Yemen, Somalia and Pakistan. At least 38 people died before a CIA strike finally killed this man. Who were the rest? Reprieve "We are constantly told that US drones are surgically precise," said Cori Crider of the human rights charity Reprieve. "But any weapon – especially a remote-controlled one – is only as accurate as the intelligence behind it. At least 38 people died before a CIA strike finally killed this man. Who were the rest? How many lives did we take in the effort to assassinate al-Wuhayshi? How many have we driven into the arms of militants with the 38 others we killed? The secret drone war conceals a mountain of hidden costs, and the idea we can bomb our way out of the problem of terrorism is short-sighted and, ultimately, false." The US has carried out over 106 drone strikes in Yemen since Obama took office and killed more than 800 individuals identified as militants and roughly 80 civilians, according to the New America Foundation. It retains the ability to launch drones from outside Yemen, including Djibouti and presumably from Saudi Arabia. Attacks on Libya are likely mounted from bases in Italy. Earlier this year Obama responded to charges that he was downplaying the dangers of terrorism to the US, and argued that it must be kept in perspective. Terrorist groups, he insisted, do not pose an existential threat to the US or the world order. But Wuhayshi's demise, the White House said on Tuesday, "removes from the

battlefield an experienced terrorist leader and brings us closer to degrading and ultimately defeating these groups". Congressman Adam Schiff, the ranking Democrat on the House intelligence committee, has sought to introduce a degree of transparency to the CIA's drone operations. Responding to news of Wuhayshi's death, he warned that such strikes alone would not be enough to achieve that goal. "As significant as the loss of key leadership is in the disruption of plots against the United States, counter-terrorism operations ... must always be considered as only one element in a multi-pronged approach that includes building capacities of local and regional authorities, countering the flow of resources to terrorists, and working with partners in the Islamic world to defeat the ideology that attracts new recruits to replenish the ranks of those removed from the battlefield," he said

Existing internet surveillance fails

Davis, United States representative to Palestine, Congressional aide, lawyer, 2006

(Benjamin R. , European Journal for Criminology, "ENDING THE CYBER JIHAD: COMBATING TERRORIST EXPLOITATION OF THE INTERNET WITH THE RULE OF LAW AND IMPROVED TOOLS FOR CYBER GOVERNANCE" 2006, HeinOnline, p. 144)

** This card has been modified for ableist language

Following September 11th, a number of the most notorious terrorist Web sites, such as Azzam.com and Al Qaeda's <http://www.alneda.com>' 47 were shut down, but hundreds of other sites directly affiliated with terrorist groups emerged in their place.¹⁴⁸ Overall, domestic and international efforts to combat terrorists' use of the Internet have been anemic poor at best. ¹⁴⁹ Complex legal and investigative enforcement challenges have crippled joint initiatives restricting the use of the Internet for terrorist-related activities. This issue goes to the heart of whether states and international organizations can effectively regulate and enforce security and legal order in a landless and borderless cyber network. ⁵⁰ Not only have terror-related Web sites grown in number, but the technical sophistication and practical application of the sites have also evolved with astonishing speed and intensity. ⁵¹ Often with just superficial masking of language or imagery, notorious terrorist sympathizers, including Al Qaeda recruiters and financiers, maintain engaging, real-time Web sites designed to inspire and mobilize extremist audiences. ⁵² Yet, such terror-related Web sites continue to flourish with minimal threat of enforcement actions. ¹⁵³

Claims of inevitable and catastrophic terrorism are epistemically bankrupt – and further increases in hardline CT strategies replicate the terrorism they aim to solve Walt '15

[Stephen. Prof IR Harvard. "Chill Out, America" *Foreign Policy*, 5/29/15
<http://foreignpolicy.com/2015/05/29/chill-out-america-fear-terror-threats/>]

These days, prominent experts and politicians seem determined to keep the American people in a perpetual state of trembling fear. Richard Haass of the Council on Foreign Relations thinks "the question is not whether the world will continue to unravel but how fast and how far." The outgoing chairman of the Joint Chiefs of Staff, Martin Dempsey, told Congress last year that "[the world is] more dangerous than it has ever been." (Someone really ought to tell the general about the Cold War, the Cuban missile crisis, and a little episode known as World War II.) Not to be outdone, former Secretary of State Henry Kissinger believes the United States "has not faced a more diverse and complex array of crises since the end of the Second World War." And then there's CNN and Fox News, which seem to think that most news stories should be a variation on Fear Factor. ¶ One could multiply alarming forecasts such as these almost endlessly. As investigative journalist David Sirota tweeted in response to a recent speech by New Jersey governor and erstwhile presidential aspirant Chris Christie, where FDR told Americans the "only thing we have to fear is fear itself," today's politicians and pundits mostly tell us to "Be Afraid. Be Very Afraid." ¶ But if you're an ordinary American citizen living here in the United States, how much should you worry about foreign dangers? Surely, people in contemporary Syria, South Sudan, Gaza, Libya, eastern Ukraine, and any number of other places face obvious and disturbing dangers, as the media reminds us daily. But Americans? Not so much unless you have friends or family in a war zone or you've invested your entire retirement portfolio in Greek government bonds. ¶ Here in the United States, in fact, it's hard to identify any looming or imminent external threats, and certainly none as dire as the dangers that other societies face or as serious as the challenges the United States has overcome in the past. As I've noted before, the United States still has the world's largest and most diverse economy, the world's most powerful conventional forces, and a robust nuclear deterrent. It has no powerful enemies nearby, close allies in every corner of the world, and it is insulated from most foreign dangers by two enormous oceans. Despite the hype about the shrinking of geopolitical space and the emergence of a tightly connected "global village," distance and the "stopping power of water" still provide considerable security, if not quite 100 percent protection. ¶ Look, nobody is saying that there aren't any problems lurking outside U.S. borders, or suggesting there aren't some nasty characters in today's world. For starters, eight other countries have nuclear weapons, and we're not on the best of terms with some of them. China's growing power and long-term ambitions are an obvious concern, and the violent extremist movements that are convulsing countries in the Middle East and Africa are troubling on several levels. I'm even willing to concede that cybersecurity is worth some degree of vigilance, even if the danger is often overhyped. Problems such as these deserve attention, careful study, and sometimes vigorous and sustained action. ¶ But when did the country that conquered North America, won World Wars I and II, and stared down Joseph Stalin and his successors become so easily scared by spooks, ghosts, tin-pot dictators, and marginal radical movements like the Islamic State, whose total fighting force is smaller than two U.S. Army divisions and whose territory is mostly worthless desert? That's not to say these problems are of no concern; it's to ask why we routinely see this year's troubles as the Greatest Danger Ever. ¶ We exaggerate external dangers in part because violent events are vivid and dramatic, and they seem scary even when they are rare and when they are taking place tens of thousands of miles away. (The Islamic State understands this, by the way, which is why they use beheadings instead of something more "civilized" and discreet, such as a drone strike.) As Steven Pinker and Andrew Mack have noted, global news coverage and the 24/7 news cycle have led many people to conclude the world is becoming more violent and dangerous, when the actual long-term trend has been going in the other direction. Durable peace is a boring "non-event" in which nothing much happens, so nobody bothers to report it. And that means most people don't appreciate how safe they really are. ¶ But the main reason so many people stay afraid is that fear is good for the people who purvey it, and so they work hard to instill fear in the rest of us. Fear is what keeps the United States spending more on defense than the next dozen states combined. Fear is what gets politicians elected, fear is what justifies preventive wars, excessive government secrecy, covert surveillance, and targeted killings. And fear is what keeps people watching CNN and Fox News, and running out to buy the New York Times or the Washington Post. As both democratic and authoritarian leaders have long known, you can get people to do a lot of foolish things if they are sufficiently

scared.¶ Unfortunately, this enduring exaggeration of external dangers can blind us to real problems. In fact, if you look at the past 25 years or so, it is abundantly clear that external enemies have done far less damage to the United States than we have done to ourselves. Saddam Hussein was a very bad man, but he wasn't threatening or harming Americans after we kicked his ass in 1991. Ditto Slobodan Milosevic, Muammar al-Qaddafi, and the whole wretched Assad family. They were all problems, to be sure, but they weren't threatening many Americans and U.S. leaders did business with each of them at one time or another.¶ In terms of actual harm inflicted, America's most lethal opponent in recent years was the original al Qaeda. Al Qaeda struck U.S. military and diplomatic assets in several countries during the 1990s, and then the Sept. 11, 2001 attacks killed 2,977 people and caused an estimated \$178 billion in property damage and other economic losses. Those losses are hardly trivial — even for a \$16 trillion economy — but they pale in comparison to the damage that we've done to ourselves.¶ Do the math. After 9/11, the Bush administration's foolhardy invasion of Iraq cost at least \$3 trillion dollars, more than 40,000 U.S. personnel killed or wounded, and hundreds of thousands of Iraqis dead. What did we get for it? A broken Iraqi state, enhanced Iranian influence in the region, and the emergence of the Islamic State. The invasion of Iraq also diverted resources and attention from Afghanistan, guaranteeing the NATO mission there would also fail (at a cost of another \$1 trillion or so).¶ Let's add to these costs the creation of failed states in Libya and Yemen. The United States is not solely responsible for either outcome, but our interventions in both places surely did not help. The panicked U.S. response to 9/11 also produced an excessive "war on terror" that included the use of torture, illegal surveillance, and the emergence of an out-of-control intelligence community that repeatedly broke U.S. law and then lied about it. The costs to our global image are far from trivial, and it remains to be seen if our commitment to civil liberties will emerge unscathed. None of these actions were forced upon us by a powerful, hostile foe; they were choices made by U.S. leaders from both parties.¶ And don't forget that little financial hiccup in 2008. The global financial crisis originated here in the United States, and it was an entirely the product of hubris and insufficient oversight. The Federal Reserve Bank of Dallas estimates the cost in lost output from the 2008 crisis is between \$6 and \$14 trillion, or roughly \$50,000-\$120,000 per U.S. household. Unless you're one of the 1 percent, this ain't chump change. And as former FP editor Moisés Naim recently noted, political fragmentation within the United States has stymied efforts to reform economic institutions such as the International Monetary Fund or the Export-Import Bank — both of which could be important tools of U.S. influence — and thwarted efforts to reach intelligent trade agreements that could make U.S. citizens richer and improve our geopolitical position vis-à-vis China. In his words, "The most potent forces constraining America's economic power in the world are coming from Capitol Hill, not Beijing." Another self-inflicted wound.¶ The final cost of all this foolishness has been an understandable opposition to continued U.S. engagement abroad. Hawks are now fretting that the American people no longer seem enthusiastic about intervening all over the world, but what did they expect given the disasters that their own foolish policies produced? With typical hyperbole, the Wall Street Journal now sounds the alarm about the emergence of Russia, Iran, and China as "regional hegemonies" (a label that greatly exaggerates each state's position) and blames this supposed "hegemony" on an "American retreat." A key reason these three states are in a somewhat better position today than they were a decade ago is that too many U.S. leaders have listened to the Wall Street Journal's foreign policy advice and squandered American power in a series of pointless and failed crusades.¶ In short, what ought to worry most Americans is not that we face a powerful, cunning, and hostile set of foreign rivals (though I do have long-term concerns about China's ambitions in Asia and elsewhere). The real worry should be America's demonstrated talent for shooting itself in the foot and then pretending that was where it was aiming all along. If you want to something to worry about, you should ponder our inability or unwillingness to learn from past mistakes, the ability of special interests to warp key elements of U.S. foreign policy, the bipartisan tendency to recycle failed policies and the people who devised them, and our habitual surprise when we meddle in places we don't understand and discover that some of the people we've been pushing around don't like it, want us out, and are willing to do nasty things to achieve that goal. Unless and until these features of U.S. foreign policy are altered, even those of us who are lucky to be living here in the relative security of the United States have something to worry about.

(Geoffrey R. Stone is the Edward H. Levi Distinguished Service Professor of Law at the University of Chicago, Has won the National Book Award, the Los Angeles Times Book Prize for the Best Book of the Year in History, the Political Science Association's Award for the Best Book of the Year in Political Science, and Harvard University's Award for the Best Book in the Year in Public Affairs, January 19th 2014, "The President and the NSA", http://www.huffingtonpost.com/geoffrey-r-stone/the-president-and-the-nsa_b_4625829.html , TMP)

In his January 17 speech on the NSA, President Obama observed that, "In our rush to respond to a very real and novel set of threats" after the terrorist attacks of September 11, 2001, "the risk of government overreach -- the possibility" that we might inadvertently "lose some of our core liberties in pursuit of security -- became more pronounced." He explained that now that we are more than a decade past that event, **it is time for the nation to review the programs that were adopted in the wake of those attacks and "to make some important decisions about how to protect ourselves... while upholding the civil liberties and privacy protections that our ideals** -- and our Constitution -- require. ¶ "This effort," the president cautioned, "will not be completed overnight," but he emphasized that it is important for "the American people to know that the work has begun." To that end, he announced "a series of concrete and substantial reforms" that he intended either to adopt himself under his authority as president or, where appropriate, to call upon Congress to enact through legislation. ¶ How good a beginning has he made? I am in a reasonably good position to weigh in on that question, because I had the privilege of serving as one of the five members of the Review Group that President Obama appointed in August to advise him on these issues. The Review included individuals with a wide-range of divergent experiences, values, and expertise. It included, for example, both a card-carrying member of the ACLU (myself) and a former Deputy and Acting Director of the CIA (Michael Morell). After months of grueling work, the Review Group produced a 300-page report ("Liberty and Security in a Changing World") that included 46 unanimous recommendations. Those recommendations -- or at least some of the most important of them -- provided the foundation for the president's address. ¶ After offering an important and valuable framing of the challenge our nation faces in attempting to reconcile our deep commitments to both liberty and security, the president turned his attention to several specific recommendations. I will comment on three of them. ¶ First, as the president noted, **the most controversial surveillance program at present is the Section 215 telephone metadata program**. Under this program, **the NSA collects metadata on millions of Americans' phone calls every day from their telephone providers**. Metadata refers to the specific phone numbers with which a particular phone number is in contact. It does not include any information about the identities of the callers or the contents of the conversations. ¶ **The NSA holds this vast amount of metadata in its own computers.** When NSA analysts find that there is a reasonable and articulable suspicion that a particular phone number is associated with terrorism, **the NSA is permitted to "query" the database to find out if that number** (usually belonging to a foreign person) has been in touch -- directly or indirectly -- with any phone number in the United States that is independently believed to be connected to a possible terrorist. ¶ In 2012, **the last year for which a full year's records were available, the NSA queried the database for 288 different numbers. In 16 instances, the suspect number was found to be in touch with another suspect number in the United States.** In those 16 instances, the information was then passed on to the FBI for further investigation. **For in the seven years since this program was created, it has not provided any link that has proved necessary to prevent a pending terrorist attack.** ¶ That reason, some critics have argued that the program should be abandoned. Our judgment was that, in a world in which "connecting the dots" and "finding needles in haystacks" are apt metaphors, abandoning the program would be like throwing out your fire alarm because you haven't had a fire in seven years. ¶ ¶ On the other hand, **the Review Group recognized that this program poses a huge danger of government abuse.** The collection of vast amounts of telephone metadata can reveal all sorts of highly private information about how we lead our lives, and misguided government officials might well be tempted in the future to use that database for impermissible, illegal and unconstitutional purposes. We therefore concluded that it is essential to prevent that from happening. ¶ To that end, **we recommended that the metadata should be held, not by the government, but by private parties** -- either by the telephone providers themselves or by a newly-created private entity charged with the responsibility of protecting and overseeing the database. In addition, **we recommended that no one should be able to access the database without a court order.** ¶ With those changes in place, we concluded that the potential benefits of the program could be preserved while reducing dramatically the potential risks to privacy and civil liberties. ¶ In his address, **President Obama accepted these recommendations. The government, he announced, will no longer hold the data and will not be able to access the data without a court order.** ¶ This is a huge step forward. Critics have objected that the president did not lay out the details of how private parties would control the data, but as our Report noted, this is a complicated -- but solvable -- question. The president therefore directed that steps should be taken to resolve those issues expeditiously and to transition to the new model as soon as possible. This approach is wholly consistent with our recommendations. ¶ Second, the Review Group recommended that an independent Privacy and Civil Liberties Advocate should be created in order to present a competing perspective when complex legal and constitutional issues arise before the Foreign Intelligence Surveillance Court. The FISC was created in the late 1970s to bring judicial oversight for the first time to foreign intelligence surveillance. Before then, it was assumed that the president had authority to authorize such surveillance without any judicial approval or review. One reason for that assumption was that ordinary federal courts do not have top secret security clearances and therefore cannot themselves have access to such information. ¶ The FISC is a special court that has top secret clearances and that can therefore oversee foreign intelligence surveillance.

investigations. The Review Group concluded that, at least when complex issues arise, it is essential for the members of the FISC to hear both sides of the question. This practice lies at the very heart of our adversary system. The president accepted this recommendation and called upon Congress to enact legislation to implement it. Although the Review Group preferred a somewhat different structure for the Privacy and Civil Liberties Advocate than the one endorsed by the president, and I am sure we would be happy to argue the point, the most important fact is that he has endorsed this critical institutional change.¶ Third, we recommended that the FBI should no longer be permitted to issue National Security Letters without first obtaining a judicial order. In the absence of an emergency, NSLs enable the FBI to require banks, telephone companies, Internet providers, credit card companies, and the like to turn over the records of specific individuals when the FBI determines that they are relevant to a national security investigation. The FBI issues approximately 20,000 NSLs each year. The process is highly secret and remains so for decades after the fact.¶ Our judgment was that, in order to ensure the integrity of the program, NSLs generally should not issue without prior judicial approval. The FBI resisted this proposal vehemently. In its view, such a requirement would impair the FBI's ability to move quickly and efficiently. We rejected that contention, especially in light of the emergency exception. The FBI argued further that because prosecutors in ordinary criminal cases can issue subpoenas to obtain similar information without a court order, it made no sense to have a more burdensome procedure for national security investigations. We disagreed with that position, mainly because of the intensive secrecy surrounding the NSL process. The president sided with the FBI. Although stating that various reforms would be adopted to reduce the secrecy of NSLs -- reforms we endorse -- he declined to accept our recommendation

about judicial orders.¶ These are all difficult questions. What is needed is not dogmatism, posturing and self-righteous declarations of outrage (on either side of the debate), but careful, rigorous reasoning and scrutiny. The president's speech marks a potentially historic turning point in our continuing effort to strike a better balance between liberty and security. But only time will tell. As the president said, this is only the beginning. We must all watch very closely.

Constitutionality Turn

Domestic surveillance is unconstitutional – violates the 1st Amendment

Scott, 14 (Christopher, Angelo State University, 6/9/2014, "Domestic Surveillance and Government's Loss of Legitimacy", <https://repositories.tdl.org/asu-ir/handle/2346.1/30143>) KW

The rapid rise in technology and subsequent connectivity throughout the world over the course of the past 20 years has given rise to a bigger, stronger, and more intrusive National Security Administration (NSA).

While the agency defends its domestic surveillance on the basis that it is securing the nation against foreign enemies, its actions as of late unfortunately also give rise to the potential for domestic ones.

As a matter of fact, the very idea that the less private an individual is allowed to keep his or her life the more secure a nation is, remains antithetical to the very notion of freedom the NSA argues it is securing. Justice Powell (United States, 1972), writing for the majority in a Supreme Court decision mandating that warrants are required for domestic intelligence surveillance,

reminded the nation that "The price of lawful public dissent must not be a dread of subjection to an unchecked surveillance power. Nor must the fear of unauthorized official eavesdropping deter vigorous citizen

dissent and discussion of Government action in private conversation. For private dissent, no less than

open public discourse, is essential to our free society."

¶ The well-understood fear of domestic enemies is so great that such protection against it is enshrined within the United States armed forces Oath of Enlistment which specifically holds that the individual enlisting in the U.S. military "will support and defend the Constitution of the United States against all enemies, foreign and domestic" (Government Printing Office, 2010). What constitutes a domestic enemy need not be argued or even defined at this point. All that is required is the realization that access to the daily habits, beliefs, concerns, and actions of the individuals that make up a specific populace places those people and, by extension, the nation whose borders they reside within, in harm's way.

Unfortunately, many people do not understand how an agency, such as the NSA, having access to real-time data about the most intimate areas of their lives can result in its supporting of domestic enemies. To make sense of this, one need only look at the recent explosion of companies attempting to data mine the information they have collected about the individuals that use their services.¶ Companies like Facebook and Google, through the utilization of their massive analytical resources, have access to the viewing, shopping, and connectivity/interaction habits of billions of people worldwide. They use this information to deliver more relevant advertising and help individuals discover people and information on the Internet that they may not ever discover on their own. At the same time, these companies are able to increase their revenue by selling access to the information in the form of product placement. While, on the surface, many people may welcome such tailored and potentially relevant advertising, at what cost is this being pursued? As a recent Op/Ed in Forbes, penned by the Chairman of the Board of Action along with the company's President and CEO, points out, big data has the "capacity to better understand individual behavior" (Taylor & Schlein, 2014).

Although this understanding is value-neutral, there is great potential for such understanding and information to be used negatively in order to further the political agendas and personal beliefs of those in the upper echelons of government or those who lobby such individuals.¶ The U.S. was founded on the

belief that people should be allowed to think and say what they feel without fear of repercussion from

their government. Because such a government is composed of many different people, all with differing

thoughts and views about the world around them, it is imperative that the populace not be afraid to think or feel differently than that

government. Unfortunately, this is easier said than done, as society often ostracizes those who do not believe as the consensus does. Therefore, many people tend to keep their nonconforming thoughts and beliefs undercover and only share them with other like-minded individuals. To these people, privacy is not just a convenience but it is practically a necessity. What happens when these individuals' shopping habits, thoughts and beliefs, and participation in groups online and in real life are stored in giant databases? These people become nothing more than a snapshot in time.¶ The problem with being identified as only a snapshot in time is that individuals change as they are exposed to differing beliefs, opinions, cultures, increased education, and life experiences. As such, they may not be the same person five years from now that they once were.

The way data mining works, however, is that a question is asked or a hypothesis is formed first, then the data is combed for patterns that answer the question or support the hypothesis.

The patterns found may not be indicative of wrong-doing, just non-conformity. At this point, the

individual is perceived as a threat and becomes a target of government agencies. For all intents and purposes, he or she is seen as guilty until the

individual is proven innocent. The harm as a result of this is three-fold: 1) the individual is treated as a

criminal though he or she is not one, 2) the agency wastes time and resources tracking this individual

and building a case on false beliefs about him or her, and 3) the government loses legitimacy as it

attempts to prosecute innocent individuals because they do not conform with mainstream society. If

this were the only harm suffered as a result of the NSA's domestic surveillance program it would be

enough, but there is more to worry about.¶

Hacking Turn

Domestic surveillance exposes cyber vulnerabilities – undermines overall security

Scott, 14 (Christopher, Angelo State University, 6/9/2014, "Domestic Surveillance and Government's Loss of Legitimacy", <https://repositories.tdl.org/asu-ir/handle/2346.1/30143>) KW

Another very real fear results from the fact that so much information is held in databases making any individual available for scrutiny at any point in time. The NSA is not immune to hackers as any information connected to the Internet is only a few keystrokes away from being accessed by someone else down the street or on the other side of the planet. The only Internet security that is 100% effective is unplugging the computer from the Internet. However, this does not disconnect the Internet from the information the individual has already placed there. As such, not only do the American people have to worry about their information being misused by those who have legal access to their information (Alexander, 2013) but also by those who illegally access the information. This leaves the American people vulnerable to identity theft, harassment, and, even worse, persecution by those in government who do not share the individual's thoughts and beliefs. This latter assertion is significant because without dissenting thought real truth can never be known and government can be set in a specific direction without worry that its actions will be challenged by the populace. Such unrestrained information access leads to political power that is dangerous to the citizenry and the inherent U.S. ideals of what constitutes freedom. To understand just how likely such an abuse of power is, take a look at the past four decades.¶ Prior to the technological advances and widespread adoption of connectivity devices today, the Church Committee in 1975 had uncovered illegal domestic spying on anti-war protestors, civil rights activists, and political opponents by the NSA and other intelligence agencies. As a result, Senator Church pointed out "[The] capability at any time could be turned around on the American people, and no American would have any privacy left, such is the capability to monitor everything: telephone conversations, telegrams, it doesn't matter. There would be no place to hide" (Bamford, 2005). During the 1980s the Federal Bureau of Investigation (FBI) spied on domestic pacifists and religious groups who opposed American foreign policy in Central America (Gelbspan, 1991) and, again, in the 1990s when the agency "placed antiglobalization protests under its terrorist rubric even though no acts of violence were linked to the movement apart from select petty street vandalism" (Greenberg, 2011). In 2002, the NSA's data mining project, Total Information Awareness (TIA), was constructed to "assemble a massive database consisting of financial, educational, health, and other information on U.S. citizens, which would later be analyzed to single out people matching a terrorist profile" as described by Admiral John Poindexter (Solove, 2008, p. 343). However, a significant problem with surveillance such as this is that "suspicious behavior is often unusual behavior" and these judgments "are necessarily hunches about abnormality, regularity, and conformity" (Jon, 2013). An action is not criminal in nature just because it does not conform. While TIA was ultimately never funded due to public backlash, the idea was implemented in various other projects and, according to a government report, as of 2004 there were already 200 different government data mining projects being used or developed (Solove, 2008, p. 344).

Hate Crimes Turn

Domestic surveillance causes hate crimes – those drive terrorist attacks in the US

LoCicero, 15 (Alice, certified clinical psychologist, former president of the Society for Terrorism Research, “Domestic Consequences of US Counter-Terrorism Efforts: Making it Harder to Prevent Homegrown Terrorism”, The Open Psychology Journal, 2015, <http://benthamopen.com/ABSTRACT/TOPSYJ-8-32>) KW

Various groups track hate crimes toward Arab Americans and Muslims, and those who look to others like they may be Muslim. These groups report sharp increases in such crimes shortly after 9/11. The American Civil Liberties Union (ACLU) noted that government leaders are effective in reducing hate crimes when they forcefully speak against discrimination [7]. Still Islamophobia has become a common and familiar phenomenon. The existence of harmful stereotypes and the consequent discrimination and violations of civil rights of Muslims and Arabs in America are largely tolerated without an outcry from non-Muslims [8]. Even worse in its effects than random hate crimes against those who appear to be Muslim or Arab, is the increase in frequency of racial and ethnic "profiling" by American police, border security agents, and airport screeners. Such profiling has frequently been observed. Adding insult to the injurious effect of profiling is the impunity enjoyed by police and security, and the secrecy with which the rules and procedures governing security are held [9].

Besides anti-Muslim sentiment, the US has seen a rise in prejudice toward other marginalized groups. Recently, a nearly unthinkable spectacle highlighted just how far down the road to hatred towards all "outsider" and marginalized groups Americans have come. In a series of horrendous events covered incessantly by mainstream press, ordinary American adults are seen derogating and threatening children who have come from Central American countries to seek asylum in the United States. Many of these children came to the United States for safety because they believed they would be killed by gangs if they remained in their home countries. Ignorance on the part of Americans abounded. Some Americans asserted that the children's parents had sent them here in an opportunistic spirit. They asserted that the children should simply be put on planes and sent home [10]. In some parts of the country, neither officials nor law enforcement professionals were seen to decry these words or actions. In addition, the government itself has detained mothers and their children who have also come in desperation, placing them in terrible conditions and expediting deportation with little or no legal counsel. This treatment is particularly inhuman and degrading in that reports indicate that sick children are not being given adequate care, a clear violation of international treaties ratified by the United States. The rationale for rushed deportation is reported to be to discourage other mothers and their children from seeking asylum in the US. Government officials have often set extraordinarily high bail for those who argue successfully that they should be allowed to leave the detention centers [11].

Information Overload Turn

Data overload prevents finding actual terrorists.

Morrison, 13 (Steven, Assistant Professor of Law, University of North Dakota School of Law, "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", 7/11/13, Stanford Law and Policy Review, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf) KW

C. Determining Link Relevance

It is easy to find links, but difficult to judge their relevance.⁹¹ This is so in part because the amount of data of rare network events like terrorist groupings, compared to the massive amount of surrounding, innocent network behavior, is so small that samples to inform a network model are difficult to find. This can result in noisy data⁹² results, which deteriorate the performance of the analysis.⁹³

Compounding this data rarity problem is the fact that networks often depend on "weak ties,"⁹⁴ so that networks "consist[] of clusters tightly bound internally by strong ties and loosely linked to other clusters by weak ties."⁹⁵ If the prevailing view of terrorist networks is one of diffuse cells, then their connection by weak ties means that the relevance and probativeness of these weak ties are uncertain. Weak ties indicate some connection, which would cause law enforcement agents to view these ties as probative, but these ties, being weak, may imply no criminal mens rea.

These weak ties can also depend upon tenuous conclusions. One commentator, for example, has observed that the number of languages a person can speak might determine where he is placed in a terrorist network.⁹⁶ This produces the problem of "fuzzy boundaries," which describes the difficulty of determining who to include and who not to include in a network,⁹⁷ and the related "pizza delivery guy problem," which describes the difficulty of distinguishing regular interpersonal contact from significant contact.⁹⁸ In the end, social network mapping entails the same problem associated with imputing a person's individual criminal intent based on generalizations about that person's affinity group: based on the group's perceived criminality, the individual might look guilty, but attributing criminal intent and proving criminal elements requires an individual approach.

More data mining increases false feedback and number of falsely incriminated persons.

Morrison, 13 (Steven, Assistant Professor of Law, University of North Dakota School of Law, "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", 7/11/13, Stanford Law and Policy Review, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf) KW

Part B is more troubling because it quantitatively magnifies the positive loop effects. The feedback loop becomes magnified because it still captures within the network those who are active terror organization members and/or have committed actual acts intended to be addressed by counterterrorism moves, but does so on a much broader scale. What this means is that marginal players may be detected and prosecuted, whereas before, they may have gone undetected and unprosecuted.⁹⁹ Carley's 2002 social network map of al-Qaeda illustrates two problems with an expanded network. First, the expanded network includes people like Jose Padilla who may have had an affinity relationship with al-Qaeda and

who may even have committed crimes but who are such tangential members of the group that their inclusion in the network suggests a level of involvement that is misleading or exaggerated. Second, the expanded network, based as it is on a certain level of automated data collection, contains stark inaccuracies. Carley's network, for example, includes Ariel Sharon as a member and Benjamin Netanyahu as a key player, whose elimination would undermine al-Qaeda.¶ This new, expansive result may not be a net good for law enforcement or public safety. Expending law enforcement resources to pursue Sharon and Netanyahu for their support of al-Qaeda is clearly a wasteful endeavor, and many of the marginal players pose no real present or future danger. Pursing them also imposes an opportunity cost on law enforcement agents, who might have otherwise investigated truly and immediately dangerous people. It could also reduce the public's perception of the legitimacy of law enforcement moves, meaning that the public would be less likely to cooperate with law enforcement. Finally, it could lead to injustice at the margins, as small-time players are prosecuted when justice might favor exercise of prosecutorial discretion not to charge. 114¶ Part C introduces a qualitative difference to the loop and is therefore more normatively problematic than parts A and B because it brings people into the network who, for reasons discussed below, perhaps ought not to be there.¶ Part C builds upon parts A and B, as law enforcement continues to pursue not only terrorists, but also their associates, and their associates' associates (the NSA shop analysis instantiates Part C). This increases the perceived size of the terrorist network, continually drawing more and more people into it. Not only does this feedback loop operate on the principle of attenuation, but this loop also invents links between defendants and terrorism networks that do not, in reality, exist. It does so through the use of conspiracy, 115 pseudo-entrapment, 116 and pretextual charges such as immigration violations 117 and false statements 118 that are coded as terrorism related, but are not.¶ Part D relies most heavily on modern data mining, targeting of groups, and Saidian Othering. 119 Part D is driven by a number of factors. The core reality of 9/11 and the terrorists involved in that attack produced the not-another-9/11 imperative, 120 which, justifiably, drove law enforcement to seek out related al-Qaeda members. Suspects who were terrorists or who would likely engage in future terrorist acts were found. They were charged with substantive crimes, and the 9/11 social network was gradually extended. Extended social networks at some point cease to be bounded criminal conspiracies and become rhetorical tropes. To the extent that this social network includes only actual terrorists, those who are likely to participate in future terrorist acts, and those tertiary people who have taken positive actions toward actual criminal conduct, this social network and the law enforcement moves flowing from it are normatively untroubling. This normatively appropriate core, however, builds upon itself, producing part D of the loop that encompasses many other people outside of this terrorist core. From the location of an actual suspect and the reification of the global jihad movement flow two key consequences.¶ First, the government defines the scope of terrorist group membership more broadly, sweeping within its ambit more people. This is evident under the material support statute. 121 While it prohibits providing material support to terrorists, courts have interpreted material support to include providing medical support, 122 training groups to pursue their goals peacefully, 123 funding the social welfare aims of terrorist groups, 124 speaking in favor of groups as a member, 125 and independently translating religious documents that might help a group. 126 The tension between the freedom to associate and the imputation of group criminality persists 127 as the government imputes criminal intent to lawabiding people who may unwittingly associate with terrorists. 128¶ Second, the government becomes more imaginative in its law enforcement efforts, engaging in pseudo-entrapment, 129 charging people with sometimes tenuous conspiracy crimes, 130 charging people with pretextual crimes such as false statements 131 and immigration crimes, 132

applying novel and expansive interpretations of crimes such as providing material support to terrorists, and arresting people as material witnesses.¹³³ These moves expand the scope of the global jihad movement and confirm and reinforce its supposed reality.¹³⁴ This movement, therefore, takes on evidentiary value independent of its individual actors.¹³⁵ This means that evidence of the movement is often admissible.¹³⁶ There is little that defendants can do to rebut this evidence: in the face of suspicious and unpopular reading materials and a movement associated with terrorism, it is difficult for a defendant to argue the absence of criminal intent. When the charge is conspiracy, evidentiary rules disadvantage the defendant,¹³⁷ and where pseudo-entrapment or pretextual charges brought the defendant to court, there may in fact be factual guilt, but not the level of culpability the charge presumes or that the charge's connotations imply.

Too much information leads to intelligence breakdown between agencies.

Wright, 14 (Lynn M. Wright Branch Chief, Federal Emergency Management Agency B.S., Northeastern University; 12/14; "THE EMERGING THREAT OF DOMESTIC TERRORISM: A SYSTEMATIC REVIEW OF EVOLVING NEEDS, THREATS, AND OPPORTUNITIES"; Naval Postgraduate School; http://calhoun.nps.edu/bitstream/handle/10945/44693/14Dec_Wright_Lynn.pdf?sequence=1)

Domestic intelligence agencies may still have some issues sharing information, as the amount of information is simply too great for fusion centers or JTTFs to manage. This makes it even more important to have as many members of the intelligence environment as possible involved in collecting and reporting intelligence, including all local law enforcement and even the general public. Based on after-action assessments conducted on the Boston Marathon bombings and the Tsarnaev brothers' backgrounds, there may have been an intelligence breakdown between the Boston JTTF and Boston Police Department in 2011 when Tamerlan Tsarnaev was first investigated. However, the Boston JTTF conducted about 1,000 assessments that year, and the Tsarnaev case may not have warranted priority consideration or concern.¹⁷⁹ There are simply not enough federal intelligence and law enforcement resources to process all of the data currently being collected, analyzed, and disseminated. In fact, wider dissemination and greater information-sharing are needed to help monitor and investigate the plethora of targeted individuals, reports, tips, and activities related to potential domestic terrorism threats. As estimated in the U.S. House Homeland Security Committee's investigative report on the Boston Marathon bombings, there are only about 12,000 to 13,000 FBI agents worldwide and an estimated 800,000 local law enforcement officers in the U.S. to complement the efforts of federal law enforcement.¹⁸⁰ Fusion centers, originally established to improve the sharing of anti-terrorism information among federal, state, and local law enforcement, have taken on a much larger role. Not only do they fuse state and local information with federal threat intelligence, many (approximately 40 percent) take on an all-crimes and/or all-hazards mission. Is this too much responsibility for the fusion centers? They are trained and staffed for collection, analysis, and sharing terrorism-related information, and should focus on this effort for better efficiency and effectiveness. The review of the Boston Marathon bombings uncovered significant issues regarding the sharing of important risk-based information with local law enforcement. Tamerlan Tsarnaev had a history of radicalized behavior, was subject of a 2011 FBI-initiated threat assessment, and traveled to Russia in 2012, yet this was unknown to local law enforcement in Tsarnaev's own community. Local law enforcement officers are in the ideal position to collect and identify terrorist activities and should be considered the eyes and ears of the intelligence community. Members of the public can also assist with this effort, as they serve as additional eyes and ears of local law enforcement. The pressure, though, of reviewing and filtering all of

Commented [KW3]: Is this ok or should it not be underlined?

this information, while conducting regular police work, remains a challenge for local law enforcement officers. Each local law enforcement agency's responsibilities in the counterterrorism effort need to be formalized and must include officer training on how to recognize and synthesize key information to be shared, and maintain at least one counterterrorism point of contact within the community. This bottom-up strategy, similar to the United Kingdom's Special Branches initiative, is the basis of a national counterterrorism doctrine.¶

Too much data makes *effective* surveillance harder

Washington's Blog, 15 ["Authoritarians Use Paris Terror Attack As Excuse for Power Grab", 1/16/15, <http://www.washingtonsblog.com/2015/01/authoritarians-use-paris-terror-attack-excuse-power-grab.html>, 6/29/15]JRO

In the wake of the terror attack on the publication Charlie Hebdo in Paris, governments from around the world are calling for increased surveillance. But top security experts agree that mass surveillance is ineffective ... and actually makes us MORE vulnerable to terrorism. For example, the former head of the NSA's global intelligence gathering operations – Bill Binney – says that the mass surveillance INTERFERES with the government's ability to catch bad guys, and that the government failed to stop the Boston Bombing because it was overwhelmed with data from mass surveillance on Americans. Today, Washington's Blog asked Binney whether this applied to the Paris attack as well. He responded that it did: A good deal of the failure is, in my opinion, due to bulk data. So, I am calling all these attacks a result of "Data bulk failure." Too much data and too many people for the 10-20 thousand analysts to follow. Simple as that. Especially when they make word match pulls (like Google) and get dumps of data selected from close to 4 billion people. This is the same problem NSA had before 9/11. They had data that could have prevented 9/11 but did not know they had it in their data bases. This back then when the bulk collection was not going on. Now the problem is orders of magnitude greater. Result, it's harder to succeed. Expect more of the same from our deluded government that thinks more data improves possibilities of success. All this bulk data collection and storage does give law enforcement a great capability to retroactively analyze anyone they want. But, of course, that data cannot be used in court since it was not acquired with a warrant. The pro-spying NSA chief and NSA technicians confirmed Binney's statement 3 months before 9/11: In an interview, Air Force Lt. Gen. Michael Hayden, the NSA's director ... suggested that access isn't the problem. Rather, he said, the sheer volume and variety of today's communications means "there's simply too much out there, and it's too hard to understand." "What we got was a blast of digital bits, like a fire hydrant spraying you in the face," says one former NSA technician with knowledge of the project. "It was the classic needle-in-the-haystack pursuit, except here the haystack starts out huge and grows by the second," the former technician says. NSA's computers simply weren't equipped to sort through so much data flying at them so fast. And see this. High-level NSA whistleblowers J. Kirk Wiebe, Thomas Drake and Russell Tice all say that mass surveillance of one's one person is never necessary to protect national security. U.S. officials in the legislative, judicial and executive branches of government all say that the mass surveillance of our own people is ineffective: 3 Senators with top secret clearance "have reviewed this surveillance extensively and have seen no evidence that the bulk collection of Americans' phone records has provided any intelligence of value that could not have been gathered through less intrusive means" Another Senator with top secret clearance agrees, and so does the congress member who wrote the Patriot Act, and more than 100 congress members from both parties As does the official panel created by President Obama to review NSA spying, made up of top former White House officials and other government

insiders, including the head of counter-terrorism under Clinton and Bush and former deputy CIA director Michael J. Morrell NBC News reports: A member of the White House review panel on NSA surveillance said he was “absolutely” surprised when he discovered the agency’s lack of evidence that the bulk collection of telephone call records had thwarted any terrorist attacks. “It was, ‘Huh, hello? What are we doing here?’” said Geoffrey Stone, a University of Chicago law professor.... “That was stunning. That was the ballgame,” said one congressional intelligence official, who asked not to be publicly identified. “It flies in the face of everything that they have tossed at us.” The conclusions of the panel’s reports were at direct odds with public statements by President Barack Obama and U.S. intelligence officials. Former president Clinton (and apparently Carter, as well), agree that mass surveillance is unnecessary As do the chairs of the 9/11 Commission which was created by Congress and the White House As does the counter-terrorism czar under the Clinton and Bush administrations, Richard Clarke. And see this As does a federal judge (and see this) And many private sector security experts agree ... Ray Corrigan – senior lecturer in mathematics, computing and technology at the Open University, UK – noted yesterday in New Scientist that mass surveillance isn’t the answer: Brothers Said and Cherif Kouachi and Amedy Coulibaly, who murdered 17 people, were known to the French security services and considered a serious threat. France has blanket electronic surveillance. It didn’t avert what happened. The French authorities lost track of these extremists long enough for them to carry out their murderous acts. *** Surveillance of the entire population, the vast majority of whom are innocent, leads to the diversion of limited intelligence resources in pursuit of huge numbers of false leads. Terrorists are comparatively rare, so finding one is a needle in a haystack problem. You don’t make it easier by throwing more needleless hay on the stack. It is statistically impossible for total population surveillance to be an effective tool for catching terrorists. *** Mass surveillance makes the job of the security services more difficult and the rest of us less secure. Israeli-American terrorism expert Barry Rubins points out: What is most important to understand about the revelations of massive message interception by the U.S. government is this: In counterterrorist terms, it is a farce. Basically the NSA, as one of my readers suggested, is the digital equivalent of the TSA strip-searching an 80 year-old Minnesota grandmothers rather than profiling and focusing on the likely terrorists. *** And isn’t it absurd that the United States can’t ... stop a would-be terrorist in the U.S. army who gives a power point presentation on why he is about to shoot people (Major Nadal Hassan), can’t follow up on Russian intelligence warnings about Chechen terrorist contacts (the Boston bombing), or a dozen similar incidents must now collect every telephone call in the country? A system in which a photo shop clerk has to stop an attack on Fort Dix by overcoming his fear of appearing “racist” to report a cell of terrorists or brave passengers must jump a would-be “underpants bomber” from Nigeria because his own father’s warning that he was a terrorist was insufficient? And how about a country where terrorists and terrorist supporters visit the White House, hang out with the FBI, advise the U.S. government on counter-terrorist policy (even while, like CAIR) advising Muslims not to cooperate with law enforcement.... *** Or how about the time when the U.S. Consulate in Jerusalem had a (previously jailed) Hamas agent working in their motor pool with direct access to the vehicles and itineraries of all visiting US dignitaries and senior officials. *** Suppose the U.S. ambassador to Libya warns that the American compound there may be attacked. No response. Then he tells the deputy chief of mission that he is under attack. No response. Then the U.S. military is not allowed to respond. Then the president goes to sleep without making a decision about doing anything because communications break down between the secretaries of defense and state and the president, who goes to sleep because he has a very important fund-raiser the next day. But don’t worry because three billion telephone calls by Americans are daily being intercepted and supposedly analyzed.

In other words, you have a massive counterterrorist project costing \$1 trillion but when it comes down to it the thing repeatedly fails. In that case, to quote the former secretary of state, ""What difference does it make?" If one looks at the great intelligence failures of the past, these two points quickly become obvious. Take for example the Japanese surprise attack on Pearl Harbor on December 7, 1941. U.S. naval intelligence had broken Japanese codes. They had the information needed to conclude the attack would take place. [Background.] Yet a focus on the key to the problem was not achieved. The important messages were not read and interpreted; the strategic mindset of the leadership was not in place. *** And remember that the number of terrorists caught by the TSA hovers around the zero level. The shoe, underpants, and Times Square bombers weren't even caught by security at all and many other such cases can be listed. In addition to this, the U.S.-Mexico border is practically open. ** The war on al-Qaida has not really been won, since its continued campaigning is undeniable and it has even grown in Syria, partly thanks to U.S. policy. *** So the problem of growing government spying is three-fold. –First, it is against the American system and reduces liberty. –Second, it is a misapplication of resources, in other words money is being spent and liberty sacrificed for no real gain. –Third, since government decision making and policy about international terrorism is very bad the threat is increasing. Internationally-recognized security expert Bruce Schneier agrees that mass surveillance distracts resources from effective counter-terror activities. PC World reports: "In knowing a lot about a lot of different people [the data collection] is great for that," said Mike German, a former Federal Bureau of Investigation special agent whose policy counsel for national security at the American Civil Liberties Union. "In actually finding the very few bad actors that are out there, not so good." The mass collection of data from innocent people "won't tell you how guilty people act," German added. The problem with catching terrorism suspects has never been the inability to collect information, but to analyze the "oceans" of information collected, he said. Mass data collection is "like trying to look for needles by building bigger haystacks," added Wendy Grossman, a freelance technology writer who helped organize the conference. New Republic notes: This kind of dragnet-style data capture simply doesn't keep us safe. First, intelligence and law enforcement agencies are increasingly drowning in data; the more that comes in, the harder it is to stay afloat. Most recently, the failure of the intelligence community to intercept the 2009 "underwear bomber" was blamed in large part on a surfeit of information: according to an official White House review, a significant amount of critical information was "embedded in a large volume of other data." Similarly, the independent investigation of the alleged shootings by U.S. Army Major Nidal Hasan at Fort Hood concluded that the "crushing volume" of information was one of the factors that hampered the FBI's analysis before the attack. Multiple security officials have echoed this assessment. As one veteran CIA agent told The Washington Post in 2010, "The problem is that the system is clogged with information. Most of it isn't of interest, but people are afraid not to put it in." A former Department of Homeland Security official told a Senate subcommittee that there was "a lot of data clogging the system with no value." Even former Defense Secretary Robert Gates acknowledged that "we've built tremendous capability, but do we have more than we need?" And the NSA itself was brought to a grinding halt before 9/11 by the "torrent of data" pouring into the system, leaving the agency "brain-dead" for half a week and "[unable] to process information," as its then-director Gen. Michael Hayden publicly acknowledged. National security hawks say there's a simple answer to this glut: data mining. The NSA has apparently described its computer systems as having the ability to "manipulate and analyze huge volumes of data at mind-boggling speeds." Could those systems pore through this information trove to come up with unassailable patterns of terrorist activity? The Department of Defense and security experts have concluded that the answer is no: There is simply no known way to effectively

anticipate terrorist threats. *** The FBI's and NSA's scheme is an affront to democratic values. Let's also not pretend it's an effective and efficient way of keeping us safe. NBC News reports: Casting such wide nets is also ineffective, [security researcher Ashkan Soltani] argues. Collecting mountains and mountains of data simply means that when the time comes to find that proverbial needle in a haystack, you've simply created a bigger haystack."Law enforcement is being sold bill of goods that the more data you get, the better your security is. We find that is not true," Soltani said. Collecting data is a hard habit to break, as many U.S. corporations have discovered after years of expensive data breaches. The NSA's data hoard may be useful in future investigations, helping agents in the future in unpredictable ways, some argue. Schneier doesn't buy it. "The NSA has this fetish for data, and will get it any way they can, and get as much as they can," he said. "But old ladies who hoard newspapers say the same thing, that someday, this might be useful." Even worse, an overreliance on Big Data surveillance will shift focus from other security techniques that are both less invasive and potentially more effective, like old-fashioned "spycraft," Soltani says. An article on Bloomberg notes that real terrorists don't even use the normal phone service or publicly-visible portions of the web that we innocent Americans use: The debate over the U.S. government's monitoring of digital communications suggests that Americans are willing to allow it as long as it is genuinely targeted at terrorists. What they fail to realize is that the surveillance systems are best suited for gathering information on law-abiding citizens. *** The infrastructure set up by the National Security Agency, however, may only be good for gathering information on the stupidest, lowest-ranking of terrorists. The Prism surveillance program focuses on access to the servers of America's largest Internet companies, which support such popular services as Skype, Gmail and iCloud. These are not the services that truly dangerous elements typically use. In a January 2012 report titled "Jihadism on the Web: A Breeding Ground for Jihad in the Modern Age," the Dutch General Intelligence and Security Service drew a convincing picture of an Islamist Web underground centered around "core forums." These websites are part of the Deep Web, or Undernet, the multitude of online resources not indexed by commonly used search engines. The Netherlands' security service, which couldn't find recent data on the size of the Undernet, cited a 2003 study from the University of California at Berkeley as the "latest available scientific assessment." The study found that just 0.2 percent of the Internet could be searched. The rest remained inscrutable and has probably grown since. In 2010, Google Inc. said it had indexed just 0.004 percent of the information on the Internet. Websites aimed at attracting traffic do their best to get noticed, paying to tailor their content to the real or perceived requirements of search engines such as Google. Terrorists have no such ambitions. They prefer to lurk in the dark recesses of the Undernet. "People who radicalise under the influence of jihadist websites often go through a number of stages," the Dutch report said. "Their virtual activities increasingly shift to the invisible Web, their security awareness increases and their activities become more conspiratorial." *** Communication on the core forums is often encrypted. In 2012, a French court found nuclear physicist Adlene Hicheur guilty of, among other things, conspiring to commit an act of terror for distributing and using software called Asrar al-Mujahideen, or Mujahideen Secrets. The program employed various cutting-edge encryption methods, including variable stealth ciphers and RSA 2,048-bit keys. *** Even complete access to these servers brings U.S. authorities no closer to the core forums. These must be infiltrated by more traditional intelligence means, such as using agents posing as jihadists or by informants within terrorist organizations. Similarly, monitoring phone calls is hardly the way to catch terrorists. They're generally not dumb enough to use Verizon. *** At best, the recent revelations concerning Prism and telephone surveillance might deter potential recruits to terrorist causes from using the most visible parts of the Internet. Beyond that, the government's efforts

are much more dangerous to civil liberties than they are to al-Qaeda and other organizations like it. (And see this and this.) CNN terrorism expert Peter Bergen says that mass surveillance is not needed to stop another 9/11. Indeed, mass surveillance – which was already in place prior to 9/11 – hasn't caught a single terrorist. So why do governments want mass surveillance? Are they ignorant that it is counter-productive in stopping terrorism? Or are they engaging in a 5,000-year old type of power grab?

Legitimacy Tur

NSA surveillance fails and decks legitimacy

Scott, 14 (Christopher, Angelo State University, 6/9/2014, "Domestic Surveillance and Government's Loss of Legitimacy", <https://repositories.tdl.org/asu-ir/handle/2346.1/30143>) KW

It must always be remembered that a government's legitimization is a double-edged sword that is achieved only through the populace's belief that the government is, in fact, legitimate. As such, a government does not remain legitimate because it exists; rather, it continues to exist only because it is perceived as legitimate or establishes itself as a tyranny. In a political system such as that instituted in the U.S., any point at which the populace believes the government is not working as they think it should leads to a growing perception of illegitimacy (Jaycox, 2014). This necessarily results in increased dissidence throughout the country and explains the current criticism and hostility being levied by the U.S. populace against the NSA's domestic spying program. However, such discontent by the people does not mean that elected officials will necessarily listen. In March 2014, the secret Foreign Intelligence Surveillance Court refused a request by the Obama administration to allow classified NSA telephone surveillance data to be stored beyond the current limit of five years (Mears, 2014). While Judge Walton may have decided in favor of personal liberty that day, there is no guarantee that future attempts to subvert privacy will be denied or that his decision will not be overturned by a higher court upon appeal. What is important to note is that the attempt was even made in the first place in the midst of such popular backlash against it.

Power is an aphrodisiac that corrupts those who would most-readily abuse it, allpervasive gathering of information being the ultimate form of power in the technologically advanced and interconnected world of today. As technology continues to evolve and global connectivity becomes increasingly widespread, information becomes more readily available and the ability to abuse it increases, especially by agencies such as the NSA. Power also tends to be corrupting to those who would normally not act in such a manner, as proven by the Stanford Prison Experiment (Haney, Banks, & Zimbardo, 1973). Allowing the NSA to continue operating as it has been will only succeed in an aggregation of power into this one agency which will cause dissent among the populace. This will result in the loss of legitimacy for the government. Once a government is seen as illegitimate by its own citizenry, it can no longer count on the populace following its policies and legislation thus forcing the government to turn its power against the citizenry in an attempt to maintain its very existence. All those who disagree with the government policies and legislation will be perceived as threats to the status quo - i.e. home grown terrorists. Therefore, it is in the best interest of the government to reign in the excessive domestic surveillance of the American populace or it will face a homeland security threat from within far greater than that posed by any externality.

Vital internal link to control global terror

Colucci, 6/29/15 (Lamont, chair of politics and government at Ripon College, a former Fulbright scholar to the Diplomatic Academy of Vienna and author of "The National Security Doctrines of the American Presidency: How they Shape our Present and Future," among other books; "A New Rise in Terror

The Obama administration's failed leadership is to blame for the increase in attacks";
[//JPM">http://www.usnews.com/opinion/blogs/world-report/2015/06/29/terrorism-is-on-the-rise-again-and-failed-us-leadership-is-to-blame\)//JPM](http://www.usnews.com/opinion/blogs/world-report/2015/06/29/terrorism-is-on-the-rise-again-and-failed-us-leadership-is-to-blame)

On the weekend following the quadruple "Ramadan" attacks in France, Tunisia, Syria and Kuwait, we should focus attention on the State Department's release two weeks ago of the Country Reports on Terrorism 2014. The report outlines a significant rise in terrorist attacks, especially those that have killed over 100 people, which rose from two in 2013, to 20 in 2014. The spike in terrorist attacks is primarily credited to five places – Iraq, Pakistan, Afghanistan, Nigeria and India – where more than 60 percent of the attacks took place. Stunningly the report indicates that almost 33,000 people were killed, and more than 9,400 kidnapped by terrorists in 2014. Understandably, fingers have pointed towards the rise of the Islamic State group and Boko Haram as well as the continued activity of various manifestations of al-Qaida. More importantly the report blames the "weak or failed governance" of many states in combatting terrorism.¶ The report is typical of government documents like this, exhaustive in detail, with so much minutiae that it can avoid controversy; it is overly lengthy at 389 pages so as to give the impression that it is so large it is unassailable. What reports like this fail to do is address the cause and solution. The report lauds the Obama administration for captaining the effort for the U.N. Security Council to pass the 2014, United Nations Security Council Resolution 2178 which called on member states to take action to stem the flow of foreign terrorist fighters. The resolution has done absolutely nothing to stem the tide of violence, human rights abuses or the seizure of territory. It is the poster child of international liberalism whose adherence to multilateral calls to action is the guilt-assuaging method to avoid real action.¶ The report recognizes that the Syrian Civil War, the power vacuum in Iraq, the weakness of governments formerly allied with the United States and the state sponsorship of terrorism by regimes like Iran are the causes of the rise of terrorism.¶ In each instance, without exception, this was caused or the problem was exacerbated by policies of the Obama administration. Reports like this give the impression that the United States government, specifically the State Department and the White House are merely active observers and that the world state simply devolved into chaos. This is delusion at best, or duplicity at worst.¶ During the press conference introducing the report, Tina Kaidanow, the ambassador-at-large and coordinator for counterterrorism, was asked whether the U.S. has been effective fighting terrorism. "I think we have been effective in building the capability of our partners globally in a variety of regions and places," she said. Here is the Obama policy writ large: It is not about American leadership, American action, the American mission or American goals; it is about some figurative faith in multilateralism that rarely takes on corporeal form.¶ The Obama administration made an active choice to not support the moderate resistance movement in Syria from 2011 onward when it could have dominated events, instead of allowing them to be controlled by events, leading to the rise of the Islamic State group.¶ It made another active choice not to ensure that American troops stayed in Iraq that same year. President Barack Obama's grand desire to leave Iraq had no basis in the realism of geopolitics or the idealism of human rights. Instead it stemmed from an obsession with being able to issue a sound bite that he was the president that left Iraq for good.¶ The train of choices continued as the Islamic State group was first explained as the actions of the "JV team" that could be dealt with by the very regime (Iraq) and groups (the Free Syrian Army among others) that the Obama administration did not want to actively and muscularly support.¶ The option was then made to play a hands-off role as regimes which were trying to combat terrorism, many while inherently operating under duress from nations like Iran, were allowed to falter or collapse without American intervention. This is especially true in Yemen.¶ Finally, the state sponsorship of terrorism is recognized in the report, notably by Iran, Syria

and Sudan. These regimes have engaged in the worst human rights atrocities and in the case of Iran and Syria have attempted to develop and even use weapons of mass destruction. If the Obama administration were truly interested in using American leadership to solve a problem, save lives, and enhance international order and law, to create some semblance of peace, it must resurrect and direct the might of American power against the cancer that these tyrannies have created.

Local Coordination Turn

Coordinating local intelligence solves the risk of terrorism without the need for surveillance

White House '11

[White House Brief on Federal/Local Partnerships to Combat Extremism. "Empowering Local Partners to Combat Violent Extremism" August 2011

https://www.whitehouse.gov/sites/default/files/empowering_local_partners.pdf]

Communication and meaningful engagement with the American public is an essential part of the Federal Government's work. Our open system of governance requires that we respond to inquiries; educate and share information on our programs, policies, and initiatives; and provide a platform for communities to air grievances and contribute their views on policy and government. We do this consistently in a variety of ways: we convene forums, develop brochures, respond to correspondence, post information on websites, and we make available for comment proposed regulations in the Federal Register. We also reach out to communities directly to answer questions and provide information and guidance, offering opportunities for communities to provide valuable suggestions about how government can be more effective and responsive in addressing their concerns. As such, engagement with local communities provides an opportunity for us to reexamine and improve how we perform our functions. For these reasons, we view effective community engagement as an essential part of good governance and an important end in itself.¶ The vast majority of our engagement work relates to issues outside the national security arena, such as jobs, education, health, and civil rights. We must ensure that in our efforts to support community-based partnerships to counter violent extremism, we remain engaged in the full range of community concerns and interests, and do not narrowly build relationships around national security issues alone. Where appropriate, we are relying on preexisting Federal Government engagement efforts to discuss violent extremism, ensuring that these forums continue to focus on a wide variety of issues. There are instances when the government needs to build new relationships to address security issues, but these must be predicated upon multifaceted engagement. Indeed, we refuse to limit our engagement to what we are against, because we need to support active engagement in civic and democratic life and help forge partnerships that advance what we are for, including opportunity and equal treatment for all.¶ **Engagement is essential for supporting community-based efforts to prevent violent extremism because it allows government and communities to share information, concerns, and potential solutions.** Our aims in engaging with communities to discuss violent extremism are to (1) share sound, meaningful, and timely information about the threat of radicalization to violence with a wide range of community groups and organizations, particularly those involved in public safety issues; (2) respond to community concerns about government policies and actions; and (3) better understand how we can effectively support community-based solutions.¶ In addition to engaging communities on a wide range of issues, the Federal Government is using its convening power to help build a network of individuals, groups, civil society organizations, and private sector actors to support community-based efforts to counter violent extremism. Myriad groups with tools and capabilities to counter radicalization to violence often operate in separate spheres of activity and therefore do not know one another. The Federal Government, with its connections to diverse networks across the country, has a unique ability to draw together the constellation of previously unconnected efforts and programs to form a more cohesive enterprise against violent extremism.

Racial Profiling Turn

Domestic surveillance drives explicitly racist profiling policies – replicates terrorism recruitment and motivation

Morrison, 13 (Steven, Assistant Professor of Law, University of North Dakota School of Law, “THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT”, 7/11/13, Stanford Law and Policy Review, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf) KW

Part A of this feedback loop is, relative to the others, normatively untroubling because it is bounded by legitimate law enforcement moves and the detection of actual crime. To the extent that detection of actual crime informs the network, there is little internal concern (if counterterrorism moves target one group over another—say, Muslims over white separatists—then this feedback loop becomes externally concerning because it distorts the reality of terrorism and entails racial, ethnic, or religious profiling). In the wake of 9/11, it made sense to engage in network mapping and employ expansive law enforcement techniques designed to discern the contours of that network. Valdis Krebs offered the first expression of this feedback loop in the post- 9/11 era.¹¹³ His social network was confined to nineteen nodes, each representing one of the 9/11 hijackers, connected to each other by levels of affinity. This early, successful attempt at network mapping would result in deployment of law enforcement assets, through which a larger network, consisting of Osama bin Laden, Zacharias Moussaoui, and many others would be added. This network mapping was normatively untroubling because the people in the network were clearly criminal, their associates who were added were clearly criminal or highly likely to be criminal, and the network was based on an actual criminal event. Quantitatively, the network map was limited to that crime. Part B is more troubling because it quantitatively magnifies the positive loop effects. The feedback loop becomes magnified because it still captures within the network those who are active terror organization members and/or have committed actual acts intended to be addressed by counterterrorism moves, but does so on a much broader scale. What this means is that marginal players may be detected and prosecuted, whereas before, they may have gone undetected and unprosecuted. Carley’s 2002 social network map of al-Qaeda illustrates two problems with an expanded network. First, the expanded network includes people like Jose Padilla who may have had an affinity relationship with al-Qaeda and who may even have committed crimes but who are such tangential members of the group that their inclusion in the network suggests a level of involvement that is misleading or exaggerated. Second, the expanded network, based as it is on a certain level of automated data collection, contains stark inaccuracies. Carley’s network, for example, includes Ariel Sharon as a member and Benjamin Netanyahu as a key player, whose elimination would undermine al-Qaeda. This new, expansive result may not be a net good for law enforcement or public safety. Expending law enforcement resources to pursue Sharon and Netanyahu for their support of al-Qaeda is clearly a wasteful endeavor, and many of the marginal players pose no real present or future danger. Pursing them also imposes an opportunity cost on law enforcement agents, who might have otherwise investigated truly and immediately dangerous people. It could also reduce the public’s perception of the legitimacy of law enforcement moves, meaning that the public would be less likely to cooperate with law enforcement. Finally, it could lead to injustice at the margins, as small-time players are prosecuted when justice might favor exercise of prosecutorial discretion not to charge.¹¹⁴ Part C introduces a qualitative difference to the loop and is therefore more normatively problematic than parts A and B because it brings people into the network who, for reasons discussed below, perhaps ought not to be there. Part C builds upon parts A

and B, as law enforcement continues to pursue not only terrorists, but also their associates, and their associates' associates (the NSA shop analysis instantiates Part C). This increases the perceived size of the terrorist network, continually drawing more and more people into it. Not only does this feedback loop operate on the principle of attenuation, but **this loop also invents links between defendants and terrorism networks that do not, in reality, exist**. It does so through the use of conspiracy,¹¹⁵ pseudo-entrapment,¹¹⁶ and pretextual charges such as immigration violations¹¹⁷ and false statements¹¹⁸ that are coded as terrorism related, but are not. Part D relies most heavily on modern data mining, targeting of groups, and Saidian Othering.¹¹⁹ Part D is driven by a number of factors. The core reality of 9/11 and the terrorists involved in that attack produced the not-another-9/11 imperative,¹²⁰ which, justifiably, drove law enforcement to seek out related alQaeda members. Suspects who were terrorists or who would likely engage in future terrorist acts were found. They were charged with substantive crimes, and the 9/11 social network was gradually extended. Extended social networks at some point cease to be bounded criminal conspiracies and become rhetorical tropes. To the extent that this social network includes only actual terrorists, those who are likely to participate in future terrorist acts, and those tertiary people who have taken positive actions toward actual criminal conduct, this social network and the law enforcement moves flowing from it are normatively untroubling. This normatively appropriate core, however, builds upon itself, producing part D of the loop that encompasses many other people outside of this terrorist core. From the location of an actual suspect and the reification of the global jihad movement flow two key consequences. First, the government defines the scope of terrorist group membership more broadly, sweeping within its ambit more people. This is evident under the material support statute.¹²¹ While it prohibits providing material support to terrorists, courts have interpreted material support to include providing medical support,¹²² training groups to pursue their goals peacefully,¹²³ funding the social welfare aims of terrorist groups,¹²⁴ speaking in favor of groups as a member,¹²⁵ and independently translating religious documents that might help a group.¹²⁶ The tension between the freedom to associate and the imputation of group criminality persists¹²⁷ as the government imputes criminal intent to lawabiding people who may unwittingly associate with terrorists.¹²⁸ Second, the government becomes more imaginative in its law enforcement efforts, engaging in pseudo-entrapment,¹²⁹ charging people with sometimes tenuous conspiracy crimes,¹³⁰ charging people with pretextual crimes such as false statements¹³¹ and immigration crimes,¹³² applying novel and expansive interpretations of crimes such as providing material support to terrorists, and arresting people as material witnesses.¹³³ These moves expand the scope of the global jihad movement and confirm and reinforce its supposed reality.¹³⁴ This movement, therefore, takes on evidentiary value independent of its individual actors.¹³⁵ This means that evidence of the movement is often admissible.¹³⁶ There is little that defendants can do to rebut this evidence: in the face of suspicious and unpopular reading materials and a movement associated with terrorism, it is difficult for a defendant to argue the absence of criminal intent. When the charge is conspiracy, evidentiary rules disadvantage the defendant,¹³⁷ and where pseudo-entrapment or pretextual charges brought the defendant to court, there may in fact be factual guilt, but not the level of culpability the charge presumes or that the charge's connotations imply. The global jihad movement's expansion encourages law enforcement to engage in further data mining and group targeting. These two concepts are similar in that they have law enforcement performing wide sweeps of conduct to uncover criminal activity. Group targeting is aesthetically more troubling because it is associated with racial profiling,¹³⁸ but data mining is more pernicious because of its prevalence, intrusiveness, and secrecy.¹³⁹ The series of data mining and collection structures mentioned above are used to collect massive amounts of data and

organize them around the not-another-9/11 imperative and global jihad movement. They inform how law enforcement accesses the linked world: with an inherent confirmation bias, agents believe in and look for cyberjihad, online terrorism radicalization, and dots that connect terrorists. This remaps, or re-imagines, the linked world, which discerns people and conduct not along traditional evidentiary lines (can a crime be proven?), constitutional lines (is conduct protected?), or normative lines (should a person be prosecuted?), but pursuant to an expansive prevention imperative. Based on this re-mapping, law enforcement increasingly focuses on the groups and communities from which prior suspects have come.¹⁴⁰ Because the 9/11 attackers were defined along religio-political lines, subsequent suspects overwhelmingly are Muslims, who often, but not always, express discontent with American policies (but probably do so at a rate no higher than the American population at large). ¹⁴¹ Investigations tend to reengage racial, ethnic, or religious profiling. Along with false positives, these investigations also uncover some amount of actual or possible crime, and produce suspects, thus further feeding part D of the loop.

Trust Turn

Eliminating the factors that motivate extremists reduces the frequency and violence of terrorism – empirical evidence

Bock 07 [Andreas, Professor at the Akkon University of Human Sciences, “Negotiate with Terrorists! or: Why Terrorism Cannot be Deterred”, pg 156-159] AW

To reduce the threat of terrorism we must reduce people’s willingness to engage in terrorism. Our »line of defense« must run through areas where we know (and fear) that new terrorists will be recruited: the less support is offered to extremists like Usama bin Laden, the lower the danger of additional attacks. But how can this be achieved if not by negotiations? ¶ If we are willing to negotiate with terrorists we open up a window of opportunity for them to attain some of their objectives in a peaceful way. We can reward them if they are cooperative – for example, by instigating a ceasefire or releasing hostages – by accepting them as a negotiating partner. But this should not be misinterpreted to mean that we should acknowledge all their objectives or accept all their actions. It means merely offering them the same reward as that offered to rogue states like Libya: becoming a negotiating partner. And offering terrorists and their supporters a real and credible chance of achieving some of their objectives without violence will challenge the terrorists’ claim that they have no other choice than to use deadly force. Of course, there always will be some supporters of violence for the sake of violence. But it will become more difficult for an organization to find support and to recruit new followers for its violent actions if there is a credible peaceful alternative. This is the most convincing argument. By offering negotiations to terrorists, even when it seems taboo,10 we start to fight terrorism at its source: in a setting where violence is perceived, for whatever reason, as the only option. ¶ This is not utopian. ¶ In the Netherlands, for example, terrorist sympathizers are granted access to the media to a considerable extent. As a consequence, they do not have to turn to illegal means, and possibly bloodshed, in order to communicate their views« (Frey, 2004: 111). In Switzerland the »Front de Libération Jurassien,« that used violence in the 1960s for the independence of the Bernese Jura, was even integrated into the political process. The Swiss government agreed to hold a referendum on the future of the Bernese Jura and the attacks decreased immediately. The majority voted against independence. And when the »Front« attempted to recommence the struggle, »they lost popular support and soon ceased to exist« (Frey, 2004: 112). ¶ One may object that it is impossible to negotiate with, say, al Qaeda or Hizbollah, because they make unrealizable claims. But of course in negotiations demands are never completely realized. Which objectives will be realized and to what extent is a matter of negotiation. And even organizations like al Qaeda or Hizbollah have demands that could be partially realized: for example, both justify their attacks with reference, among other things, to the Israeli–Palestinian conflict. An offer to negotiate could be based, for example, on Security Council Resolutions 24211 and 154412 and link the creation of a sovereign Palestinian state with an unconditional commitment to acknowledge and respect Israel’s right to exist. ¶ A second objection, as an author suggests in The Conservative Voice, is that negotiations with terrorists are futile because they have no interest in keeping their part of the bargain, and they are not honest about their wishes. That means, »killing terrorists is the only practical means of coping with them.«13 ¶ But even if these objections are correct, they do not invalidate my argument. As mentioned above, negotiations tend not so much to influence the terrorists as their supporters and environment. Attempts to satisfy some terrorist objectives peacefully will, in the long run, reduce support for and belief in the need to use violence. And, unlike the demand to hunt terrorists down, the offer to negotiate will not provoke more violence. It is rather a rational attempt to break the vicious circle in which violence only causes more violence.

Surveillance Fails – Cyberterror

You can't deter cyberterror – six warrants

Bendiek and Metzger 15 [Annegret, deputy head of the External Relations Research Division at the German Institute for International and Security Affairs, Tobias, Research Assistant at the German Institute for International and Security Affairs, "Deterrence theory in the cyber-century" pg 6-8, German Institute for International and Security Affairs, May 2015] AW

Many of the same elements apply regarding attacks through cyber means although with some limitations. Signalling, for one, faces comparable challenges, although further complicated by the multitude of actors, including non-state groups and individuals. Other challenges are entirely new: In deterrence-by-retaliation, credibility is difficult to establish since demonstrating cyberpower and retaliating immediately and repeatedly is problematic, as outlined below. Although the U.S. and NATO have emphasized their willingness to respond to cyberattacks at a time, place and by means (including kinetic) of their choosing, there can hardly be automaticity in response. The similarity of nation-state and criminal cyberattacks requires time-consuming and costly forensics and close coordination between law enforcement and the military. As for the U.S., Germany and other established powers, the reluctance to admit to its development of offensive capabilities, and to strategically discuss their legality, creates opaqueness and significant grey areas. Given the offensive advantage, the number of attackers using cheap, readily available tools will continuously rise, empowering non-established powers such as Iran, North Korea or even Daesh/IS. Reversing this trend requires getting serious about agreeing on international norms and improving both defences, especially employees' and citizens' "cyber-hygiene", and about enforcement. Lack of clarity and impunity for attackers is a major roadblock for effective deterrence. ¶ The U.S. Army analysis that "[f]undamentally, there is no difference between deterrence in the cyber domain than in any other domain"⁴⁷ is flawed in at least three regards: First, cross-border differences in law enforcement and legal practice as well as unwillingness to cooperate allow attackers to act with impunity, diminishing the deterrent's credibility. Second, since "cyberweapons" rely largely on previously unknown, so called zero-day, vulnerabilities and cannot be displayed prior to their use, it is difficult to demonstrate power. Third, deterrence-by-denial differs greatly, since in cyber "you have to work from the assumption that your networks are already compromised"⁴⁸, meaning deterrence is constantly failing. In the nuclear context, all intrusions must be deterred, and a single instance of failed deterrence could mean the use of nuclear warheads and large-scale loss of life. Fourth, different from nuclear confrontation, uncertainty arises from the multitude of actors which threaten harm to one's systems and from the difficulty of quickly attributing an attack. Fearing unforeseen escalation, this may hinder immediate retaliation, especially when retaliating with kinetic strikes. ¶ Ambiguously defined interests, misperceived signalling and uncertainty on how to demonstrate force and how to respond, hamper deterrence postures. Melissa Hathaway, former director of a classified high-level effort to establish a U.S. cyberdeterrence strategy, admitted that "we didn't even come close".⁴⁹ Contrary to classical deterrence, the private sector plays a crucial role resulting in problematic signalling. While being a useful frame of analysis, cyberdeterrence fails to satisfy any of Patrick Morgan's six elements⁵⁰ of classical deterrence theory, according to Stevens. First, there is no prevailing military conflict; second, rational choice models differ for non-state actors; third, the challenge of attribution complicates immediate retaliation; fourth, repeated retaliation and certainty of inflicting severe pain is hampered; fifth, the difficulty of demonstrating offensive capabilities lessens credibility; and sixth, a multitude of (non-state) actors constantly threatens stability, risking escalation.⁵¹ Libicki aptly summarizes the core issues to be observed in national cybersecurity efforts: "The ambiguities of cyberdeterrence contrast starkly with the clarities of nuclear deterrence. In the Cold War nuclear realm, attribution of attack was not a problem; the prospect of battle damage was clear; the 1,000th bomb could be as powerful as the first; counterforce was possible; there were no third parties to worry about; private firms were not expected to defend themselves; any hostile nuclear use crossed an acknowledged threshold; no higher levels of war existed; and both sides always had a lot to lose."⁵² ¶ Beyond technical issues – which are being addressed – deterrence-by-retaliation is a question of credibility and capability. Firstly, could

governments effectively deploy cyberforce to respond to attacks, and should they use kinetic force – and if so under which circumstances – to react to cyberattacks, potentially risking escalation? Secondly, should there be stronger declarations of cyberforce to signal one’s ability?⁵³ For example, German offensive capabilities which were only revealed by a parliamentary inquiry, are not openly discussed or even used for deterrence signalling.⁵⁴ For deterrence-by-retaliation to work, the capacity to display force is crucial. Only verifiable tests and the demonstration of nuclear weaponry’s destructive force during WWII convinced nations that future use must be feared. Similar demonstration of cyberpower⁵⁴ is unlikely because of the “one use only component”⁵⁵, meaning that any use reveals significant information necessary to defend against future attacks. Deterrence-by-retaliation requires a demonstration of force, but cyberattacks are rendered useless if vulnerabilities are closed.⁵⁶ Therein lies the danger of using cyberweapons and the difficulty of credible signalling. Signalling is complicated by the multitude of actors beyond the great powers, and including the private sector and individuals.⁵⁷ Willingness to retaliate requires unmistakable signalling on the interest to be defended. While offensive capabilities have been revealed, Germany has never publicly announced their existence or threatened adversaries with their use in response to attacks. France and the UK publicly announced offensive capabilities, and France stated its intent of becoming a cyberpower in its 2011 cyber doctrine⁵⁸, but both left it unknown when and how cyberweapons could be used.⁵⁹ The U.S., on the other hand, emphasized via the Pentagon that the “response to a cyber-incident or attack on the US would not necessarily be a cyberresponse. All appropriate options would be on the table”.⁶⁰ Mutually assured destruction, equally, is out of the question, changing the cost-benefit calculation in favour of attack.⁶¹ If the MAD principle does not apply, the consequences of retaliation are considerably less severe, reducing the inherent costs of an attack. This leads to an advantage for the party which strikes first, according to offence-defence theory, making attacks more likely.⁶² While this suggests for other characteristics of offence-defence theory to apply – e.g. that an arms race ensues – the lacking ability to make quick and decisive victory changes the equation. If cyberattacks cannot disarm an opponent, what is the point of rushing into retaliation?⁶³ An attack may be stopped, but the attacker cannot be disarmed since cyberattacks can be conducted from third-party hardware, including internet cafés, unsecured wireless networks or infected computers, as part of a botnet.⁶⁴ Furthermore, the asymmetric nature of cyberspace is a common argument against retaliatory attacks against criminals or “cyber-terrorists”. Deterrence fails if there is no valid target to strike back at. The less connected an adversary, the less vulnerable he is to retaliation with cyber means. Retaliation by kinetic means, on the other hand, bears the risk of incurring injuries or deaths where the initial attack did not. ⁶⁵ Retaliation “requires not only breaking into sufficiently privileged levels, but also figuring out how to induce a system to fail and keep on failing”.⁶⁵ The ability to induce superficial damage, which is quickly repaired, has no deterrent effect. Battle damage assessment (BDA) is difficult to predict ahead of an attack, as this depends on the other’s technical and procedural resilience but also on chance – e.g. whether patches are installed, closing previously existing backdoors, some of which might have been intentionally created to allow attackers to bypass security measures.⁶⁶ The half-life of exploits creates a “use-it-or-lose-it dilemma”.⁶⁷ While initial attacks allow for intensive intelligence work, repeated retaliation is costly, if not impossible, since it requires firstly rapid attribution and secondly immediate and continuous knowledge of the target system. Figure two puts this question in context.

Surveillance Fails – Data / Empirics

Hardline surveillance strategies fail and increase the risk of retaliation – robust statistical evidence

Lum et al '9

[C. Professor and Administrator of the Justice Program at George Mason University. And Leslie Kennedy and Alison Sherley. "The Effectiveness of Counter-Terrorism Strategies: A Campbell Systematic Review" 2009 http://www.campbellcollaboration.org/lib/download/53/1010_R2.pdf.]

Figure 2 illustrates the effect sizes and confidence intervals (when calculated) of the 86 findings from the seven studies. Many effects are close to, or cannot be statistically discerned from, a **zero effect** and therefore **provide no statistical evidence** that the counter-terrorism strategy was effective or harmful. Additionally, while there appears to be negative effects (which indicate a decline in terrorism events due to the intervention), **there are also interventions that appear to have increased the likelihood of a terrorist event occurring** (effects greater than zero). As we warned earlier, summary statistics for all counter-terrorism programs examined can be misleading and difficult to interpret because the values represent effects from different types of interventions, constructs, and time periods. Thus, we cautiously report the following statistics for illustration only: The average of the effect sizes (no matter whether a standard error was reported) was 2.81 events, suggesting generally that across the findings, interventions tended to increase the likelihood of terrorism events. However, when using meta-analytic statistics on only those effect sizes which report standard errors, the weighted mean effect size across these findings was 0.30, with a standard error of 0.656, and a 95% confidence interval of {-0.98, 1.59}. For those findings in which standard errors were calculated, there appears to be no statistically significant evidence that interventions had an effect on terrorism. In other words, across all interventions studied, there does not seem to be a consistent indication of positive effects of counter-terrorism policy.

Their evidence is biased and overly optimistic – err aff

Lum et al '9

[C. Professor and Administrator of the Justice Program at George Mason University. And Leslie Kennedy and Alison Sherley. "The Effectiveness of Counter-Terrorism Strategies: A Campbell Systematic Review" 2009 http://www.campbellcollaboration.org/lib/download/53/1010_R2.pdf.]

The findings strongly confirm our initial speculation about the state of counter-terrorism strategies. There has been a proliferation of anti-terrorism programs and policies as well as massive increases in expenditures toward combating terrorism. Yet, we know almost nothing about the effectiveness of any of these programs. The seven studies we found, from a total of over 20,000 pieces of literature, focus on only a handful of specific interventions, and often involve the same researchers examining similar datasets, using similar methodologies. Clearly, the most important policy recommendation to emerge from this review is that the wide array of anti-terrorism policies need to be evaluated for effectiveness or at least be better informed by existing scientific evaluations. Related to this is the importance of funding and encouragement for scientific evaluations of counter-terrorism programs. The small amount of evaluation research in the area of terrorism may be due to a number of reasons. First, practical problems in either qualitatively or quantitatively studying terrorism are often thought to be significant obstacles to overcome. Not only are events thought of as "rare", but units of analysis (individuals or groups who employ terror violence or actual

events/incidents of terrorism) may be difficult to locate and study. Unlike criminological research that contains large amounts of data from frequently occurring events, terrorism research relies on much scarcer occurrences, which makes analysis more challenging (in terms of identifying patterns). Furthermore, challenges that do appear with using crime data are accentuated in terrorism prevention programs. These include the difficulty in detecting intervention effects of major programs where treatment effects may be unclear, or alternative explanations are difficult to control for. For terrorism, threats are often not clearly defined so the impacts of the programs are almost impossible to assess. Compounding this problem is the nature of the counter-terrorism enterprise itself, which, unlike much of current local policing, is shrouded in secrecy. Because of this, information about incidents and outcomes are difficult to collect for scientific purposes. There is also a real problem in establishing, for the data that are available, clear standards of accuracy and reliability, problems that have been exhaustively addressed in the reform of police statistical standards through UCR reporting and other standardization procedures. Further, in terms of evaluation, there is likely to be less willingness in this area to engage in experimental programs that might test differential program effects (a reluctance that was to a degree overcome in police evaluations, such as those performed by Sherman et al. (1992) in the area of domestic violence interventions). The evaluations, then, would have to be conducted ex post facto, as illustrated in the case studies that we report above. While these studies reveal some interesting and important effects, their real impact is diminished through the inability to adjust program effects or increase the sensitivity of measurement in an ongoing assessment process.

Surveillance Fails – Experts

Surveillance not stopping attacks- PCLOB and high ranking officials

Kilroy, 14 (Rick, Assistant Professor in the Department of Politics and Geography since July 2014, where he teaches courses in support of the Intelligence and Security degree program. He was previously Professor of Regional and Analytical Studies in the College of International Security Affairs, National Defense University, teaching in the Ft. Bragg, NC Program, where he also instructed Latin American Regional Studies. He came to NDU from Virginia Military Institute, where he served as Professor of International Studies. In his testimony before the Senate Judiciary Committee in October 2013, General Alexander admitted that the number of terrorist incidents prevented by the NSA’s collection programs was not as robust as initially reported by the Obama administration. Instead of the 54 confirmed cases previously cited, Alexander admitted that the number was probably “one or perhaps two” (Waterman, 2013). Alexander also admitted that of the 54 cases previously cited, only 13 actually involved potential attacks on the United States. However, Alexander was quick to defend the program and encourage Congress to continue supporting it. James Clapper, Director of National Intelligence, in a previous testimony on the Hill, also stated that numbers alone do not reveal the true extent of the value of the NSA’s domestic data collection program. He stated that the analysis produced from the data helped provide a broader picture of the terrorist threat, operations, linkages, etc., even if it did not provide evidence of a specific planned attack within the United States (Waterman, 2013). The Privacy and Civil Liberties Oversight Board (PCLOB), an independent organization created by the U.S. Congress as a result of the 9/11 Commission Report,6 conducted its own investigation of the NSA data collection program. While the focus of the investigation was the legality of the NSA program, the role of the FISC in authorizing its use under Section 215 of the USA PATRIOT ACT, and its impact on civil liberties, it also came to the following conclusion with regard to the effectiveness of the NSA program in preventing terrorist attacks in the United States: ... we conclude that the Section 215 program has shown minimal value in safeguarding the nation from terrorism. Based on the information provided to the Board, including classified briefings and documentation, we have not identified a single instance involving a threat to the United States in which the program made a concrete difference in the outcome of a counterterrorism investigation. Moreover, we are aware of no instance in which the program directly contributed to the discovery of a previously unknown terrorist plot or the disruption of a terrorist attack. And we believe that in only one instance over the past seven years has the program arguably contributed to the identification of an unknown terrorism suspect. Even in that case, the suspect was not involved in planning a terrorist attack and there is reason to believe that the FBI may have discovered him without the contribution of the NSA’s program (2014, p. 15).¶ While the PCLOB acknowledged that the threat of terrorism to the United States is real, it’s investigation into the Section 215 provisions of the USA PATRIOT Act does touch on the question that is inferred, but not asked. In other words, does the threat of terrorism warrant the use of such invasive intelligence gathering techniques? Mueller and Stewart (2012) analyzed 50 documented cases in the United States of terrorism and concluded that, “In the eleven years since the September 11 attacks, no terrorist has been able to detonate even a primitive bomb in the United States, and except for the four explosions in the London transportation system in 2005, neither has any in the United

Kingdom. Indeed, the only method by which Islamist terrorists have managed to kill anyone in the United States since September 11 has been with gunfire inflicting a total of perhaps sixteen deaths over the period" (p.88). Senator Patrick Leahy (D-VT), agreeing that the NSA surveillance program has not made America safer, proposed new legislation in January 2014, called the USA FREEDOM ACT (Uniting and Strengthening America by Fulfilling Rights and Ending Eavesdropping, Dragnet Collection, and Online Monitoring Act). The proposed legislation, co-sponsored with Representative James Sensenbrenner (R-WI) "would reform the secret Foreign Intelligence Surveillance Court, which approves spy agencies' surveillance efforts, end the bulk collection of data about phone calls and limit government officials' use of National Security Letters, which force people to hand over information" (Hattern, 2014).[¶] In defense of the NSA surveillance program, General Alexander asserted that the NSA did not do anything illegal and that the collection of bulk telephony metadata from U.S. citizens to support counterterrorism efforts was supported by Section 215 of the Patriot Act (and upheld by the FISA court in keeping with Section 702 of the Act). However, U.S. Federal District Judge, Richard Leon, ruled in his review of Klayman v. Obama (13-cv-881) that the NSA's actions were unconstitutional, in direct violation of the 4th Amendment (Mears and Perez, 2013). It appears likely the case will eventually progress to the U.S. Supreme Court, where the outcome is not obvious. The vote could fall along ideological lines with the conservative justices (Roberts, Scalia, Kennedy, Alito, and Thomas) supporting the administration's position on the NSA's collection programs, with the liberal justices (Ginsberg, Sotomayor, Kagan, and Breyer) supporting Leon's ruling; however, if anything, this Supreme Court has proven less than predictable on civil liberties issues.

New tech and surveillance measures do little to actually protect security

Kilroy, 14 (Rick, Assistant Professor in the Department of Politics and Geography since July 2014, where he teaches courses in support of the Intelligence and Security degree program. He was previously Professor of Regional and Analytical Studies in the College of International Security Affairs, National Defense University, teaching in the Ft. Bragg, NC Program, where he also instructed Latin American Regional Studies. He came to NDU from Virginia Military Institute, where he served as Professor of International Studies. Prior to that he was a Visiting Assistant Professor in Political Science at East Carolina University, where he also served as Assistant Director of Military Programs; 7/20/14; "Terror and Technology: Does the Expanding Role of the Federal Government in Domestic Intelligence and Information Collection Really Enhance Security?"; file:///Users/jpmickyd/Downloads/3.pdf//JPM

He spent 23 years on active-duty U.S. military service as an Army Military Intelligence and Latin America Foreign Area Officer.[¶] Today, the means of security involve complex technologies which provide the "federal councils" with the power to obtain an unprecedented amount of data, which, if analyzed correctly, judiciously, and timely, do portend the capability to identify and hopefully prevent terrorist attacks both domestically and abroad. The record to date, however, is that the technology alone can't promise security. It can be a means to an end, but "collecting it all" does not guarantee that such intelligence strategies make a society safer. It may, in fact, make members of that society less secure, if the information collected is not used for the original intent of protecting the union against the threat of foreign terrorist organizations. And with the rise of homegrown terrorist threats, the challenge of security professionals and elected officials, who take an oath to "protect and defend the Constitution of the United States against all enemies, foreign and domestic," becomes even more difficult.[¶] Benjamin Wittes identifies an additional concern which technology hath wrought: the "intelligence legitimacy paradox." He argues that "the threat environment America faces is growing ever more complicated and

multifaceted, and the ability to meet it is growing evermore-deeply dependent on first-rate intelligence. Yet at precisely the same time, the public has grown deeply anxious about our intelligence authorities and our intelligence community is facing a profound crisis of legitimacy over its basic authorities to collect” (Wittes, 2014). Thus is it highly likely that one of two scenarios may arise. If there is another terrorist attack that the intelligence community fails to prevent using all the technical means available to it (to include domestic surveillance), the U.S. public will grow more cynical and suspicious of the nation’s intelligence agencies and question their legitimacy, which would likely lead to a diminution of their role and authorities, which would make the nation even more vulnerable to even greater attacks. The other scenario would be an even further concentration of power in the hands of the federal government, to not only “collect it all” but also “control it all,” creating the conditions of the national security state, which Gorriti warned about. 13 Currently, the nation is equally divided in its views of whether the domestic surveillance techniques employed by the NSA are necessary in providing security against a terrorist attack within the United States.¹⁴ Going back to the original premise, it is hard to prove a negative. Thus we often only hear of operational success and intelligence failures in the war on terror. President Bush intimated as much when he said in his Address to the Nation after the September 11, 2001 attacks, that the fight against terror would not be like other wars, where much of it would remain hidden to the American public (Bush, 2001). However, as more of the tactics used in that war come to light (rendition, “enhanced” interrogation techniques, drone strikes, etc.), the more people are asking, is it worth it? Have they made us safer? Has the United States lost the “moral high ground” in its fight against terrorism, or even more broadly in its foreign policy? Clearly, charges against Chinese government spying and cyberwarfare conducted against the United States now fall on deaf ears, despite efforts to explain how these differ from what the NSA has been doing.¹⁵

Surveillance Fails – Increases Terrorism

Tactical CT is whack-a-mole and fails – claims to the contrary are bought off

Brooks 2015 (Rosa [Law professor at Georgetown University and a Schwartz senior fellow at the New America Foundation]; US Counterterrorism strategy is the definition of insanity; Jun 24; foreignpolicy.com/2015/06/24/u-s-counterterrorism-strategy-is-the-definition-of-insanity/?wp_login_redirect=0; kdf)

Show me someone who publicly insists that the United States has an effective counterterrorism strategy, and I'll show you someone who draws a paycheck from the U.S. government. "This week we have seen success across a broad spectrum," Pentagon spokesman Col. Steve Warren told reporters on June 16, commenting on the death of Yemeni al Qaeda leader Nasir al-Wuhayshi, reportedly killed as a result of a U.S. drone strike. "Any time a terrorist is removed from the battlefield, is killed or captured, I think the net gain outweighs any potential loss." Loyalty to your employer is a fine thing, especially in a press spokesman, but outside the ranks of officials in President Barack Obama's administration, experts are far more dubious about the heavy U.S. reliance on air power and targeted strikes. "The tactical, whack-a-mole approach is not having the desired effect," my Foreign Policy colleague Micah Zenko told the New York Times. "Not having the desired effect" was a polite circumlocution: As Zenko recently noted for FP, State Department figures show a substantial recent uptick in global terrorism. In 2014, terrorist attacks increased 39 percent over the previous year, while the number of fatalities caused by terrorist attacks went up 83 percent. In Yemen, which the administration inexplicably continues to tout as a counterterrorism "success," U.S. policy is in shambles. "If you're looking for logic here, you're not going to find much," Stephen Seche, a former U.S. ambassador to Yemen, told the New York Times. In mid-June, the Washington Post reported that "[al]-Qaeda affiliates are significantly expanding their footholds" in both Yemen and Syria. And the Islamic State also continues to gain ground in both countries. Meanwhile, in Libya, it's "utter chaos," former U.N. advisor Dirk Vandewalle told the Times: The Islamic State and al Qaeda-linked groups are vying for power, and a recent U.S. drone strike against al Qaeda operative Mokhtar Belmokhtar "shows that we're still relying on ad hoc measures." In Iraq, Somalia, and Afghanistan, it's the same story. The United States continues to rely heavily on airstrikes and targeted killings, while terrorist groups continue to cause mayhem and gain adherents.

Domestic surveillance just drives terrorism underground and encourages diffusion – makes it harder to stop

Morrison, 13 (Steven, Assistant Professor of Law, University of North Dakota School of Law, "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", 7/11/13, Stanford Law and Policy Review, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf) KW

The United States' success in fighting al-Qaeda has introduced an additional complicating factor. Prior to and just after 9/11, al-Qaeda was a hierarchical, organized, formal structure, not unlike a corporation. The United States' successes in disrupting and atomizing al-Qaeda have produced al-Qaeda 2.0, which is decentralized, cellular, and spontaneous—spread less by formal recruitment and more by an idea.¹⁶³ It is much more difficult to recognize and counter such an organization, and adds complicating factors such as lone wolf terrorists, the possible danger of online recruitment, and doubt as to the organizational source of any terrorist attack.

Counterterror strategies make terrorism inevitable

Brooks 2015 (Rosa [Law professor at Georgetown University and a Schwartz senior fellow at the New America Foundation]; US Counterterrorism strategy is the definition of insanity; Jun 24; foreignpolicy.com/2015/06/24/u-s-counterterrorism-strategy-is-the-definition-of-insanity/?wp_login_redirect=0; kdf)

Even some of those who do get paid by Uncle Sam have grown more openly skeptical of U.S. counterterrorism policy. Capt. Robert Newson, a Navy SEAL who served as director of the Joint Interagency Task Force-Counter Terrorism, told an interviewer at West Point's Combating Terrorism Center that "drone strikes, manned airstrikes, and special operations raids ... buy space and time. But by themselves they are only a delaying action, and everywhere I have been, in Iraq, Afghanistan, Yemen, every military person up and down the chain of command acknowledges this. This 'CT concept' — the solution that some people champion where the main or whole effort is drone strikes and special operations raids — is a fantasy." Like Newson, I haven't encountered many defenders of U.S. counterterrorism strikes. Last year, I co-chaired a Stimson Center commission on U.S. drone policy with retired Gen. John Abizaid. The commission, which included former senior military and intelligence officials from both Obama's and George W. Bush's administrations, concluded in June 2014 that "the Obama administration's heavy reliance on targeted killings as a pillar of US counterterrorism strategy rests on questionable assumptions, and risks increasing instability and escalating conflicts. While tactical strikes may have helped keep the homeland free of major terrorist attacks, existing evidence indicates that both Sunni and Shia Islamic extremist groups have grown in scope, lethality and influence in the broader area of operations in the Middle East, Africa and South Asia." In dozens of interviews and conversations with national security experts since June 2014, I have yet to find anyone who won't admit, off the record, that U.S. counterterrorism policy is flailing badly. So here's the question: If no one except administration press flacks thinks the whack-a-mole approach to counterterrorism is working, why are we still using it?

Domestic surveillance is ineffective and undermines broader counterterrorism

Morrison '13

[Steven R. - Assistant Professor of Law, University of North Dakota School of Law. "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", STANFORD LAW & POLICY REVIEW [Vol. 25:3412014], 7/11/13, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf] Schuler 40

It is held as truth that more data, if it is well-managed—that is, arranged in a useful way that reflects its true meaning—and effectively searchable, will inevitably improve law enforcement's ability to spot dangerous patterns and discern criminal intent.⁸ This Article challenges that assumed truth on two fronts. First, data mining may not produce its presumed accurate results. Bruce Schneier, for example, has argued that data mining will produce wasted law enforcement efforts in chasing false positives, and will also produce false negatives, because all that data mining does is enlarge the haystack. When what you are looking for is a rarity—as terrorist plots, or at least attacks, are⁹—and its rate of occurrence relative to all environmental conduct is quite low, then enlarging that field will make detecting the rarity statistically even more unlikely.¹⁰ Second, the positive feedback loop resulting from counterterrorism

law enforcement produces increasing systemic inefficiencies that (1) do not reduce data noise or reveal real criminal patterns; (2) reinforce the preconceived notion that such law enforcement does reduce noise and reveal patterns; and (3), as a result of (1) and (2), often lead to inaccurate targeting of suspects (either as false positives or false negatives). These results are inaccurate and inefficient law enforcement responses. **Because this is a positive, or self-reinforcing, feedback loop, these three inefficiencies tend to grow over time, resulting in systemic instability.** These inefficiencies emerge because of the apparent, but unproven, reliability of the digital age mosaic database that allows the government to link suspects with each other in social network maps, whether they have an actual relationship or not.¹¹ The faith that the government gives to these linking efforts amounts almost to a fetish.¹² It is instantiated at trial as prosecutors invoke the global jihad movement,¹³ a rhetorical tactic that is not entirely vacuous, accurate, or new.¹⁴ In the 1950s, prosecutors alleged the existence of an “international Communist movement,”¹⁵ similar in form and function to the global jihad movement. Both were supposed to indicate a worldwide network of people, closely aligned in ideology and criminal purpose to destroy the United States. They both worked to enable prosecutors to allege damning conspiracies and introduce questionably relevant evidence thereof.¹⁶ They both also retained currency as valid evidentiary tropes because observers believed that they signaled real foreign existential threats to democracy and society itself.¹⁷ This expansive vision produces expansive law enforcement, and thus the feedback loop

Surveillance Fails – Internet / Social Network

Simple social network analysis fails and is ineffective

Morrison 13 [Steven R. - Assistant Professor of Law, University of North Dakota School of Law. “THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT”, STANFORD LAW & POLICY REVIEW [Vol. 25:3412014], 7/11/13, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf] Schuler 41

Simple social network analysis. More recently, the popularity of social network analysis has emerged, certainly to augment traditional mapping in the crime context, but also to provide a new way to conduct domestic and international counterterrorism. Yang and Sageman define a social network as a network representing social actors and their interactions or relationships, in which nodes represent the actors and links represent the interactions or relationships Social groups are collections of actors who are closely linked to one another. Social positions are sets of actors who are linked into the total social system in similar ways.⁴⁹ A Google Images search for “social network analysis” will uncover a virtually endless number of aesthetically attractive analyses purporting to illustrate networks of members of al-Qaeda⁵⁰ and other, more mundane, networks.⁵¹ The government is also using social network analysis to hunt terrorists.⁵² The 9/11 attacks, unsurprisingly, brought what was an academic and abstract interest in social networks into use in war strategy. ⁵³ The most conservative purposes of simple social network mapping involve typical investigations: understanding the structure of criminal organizations and connections, determining who the leaders are, and detecting weaknesses that may be exploited. Simple social network analysis is controversial because it may not be effective as a tool for counterterrorism.⁵⁴ This is so in part because the analysis is meant to reveal incriminating information about individual suspects, such as their mens rea to commit terrorist acts, rather than general, depersonalized crime trends. One U.S. official even claimed that applying social network analysis in war zones has led to unethical practices.⁵⁵ One reason for this possible ineffectiveness is that the analyses remain static, whereas the networks they depict are constantly changing.⁵⁶ Another reason is that simple social network mapping is concerned only with the “who” in networks—it shows only whether people are connected in any way to others and does not account for the content or nature of that connection.⁵⁷ “The tricky part of . . . network analysis is not finding the links but knowing which of them are significant.”⁵⁸

Falls prey to operator bias

Morrison 13 [Steven R. - Assistant Professor of Law, University of North Dakota School of Law. “THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT”, STANFORD LAW & POLICY REVIEW [Vol. 25:3412014], 7/11/13, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf] Schuler 42

A presumed advantage of all types of crime mapping, including DNA, is that they provide a fact-based, objective picture of criminal or terrorist activity. To the contrary, the operation of these networks continues to depend upon human action to determine what data is deemed to be relevant⁶⁹ and also to create data-collection algorithms that adequately filter data to produce reliable, useable results.⁷⁰ Network data compilers, like anyone, have self-interested motives when compiling network data.⁷¹ They want to create network analyses that reflect reality and so permit the efficient direction of law enforcement resources, but crime mapping is also used to publicize the efficiency of police and to

provide grounds for their continued support.⁷² This motivation is expressed, as one commenter observes, in “gimmicks and tricks” to maximize the apparent threat of crime.⁷³ One such trick is based on crime reporting and categorization.⁷⁴ An accurate crime map depends upon accurate reporting and categorization, which can be undermined when agents exercise their discretion to not charge a crime, charge down a crime, or charge up a crime. This discretion is often an important justice-producing part of the criminal system, but it is also often used to make police departments appear more effective or neighborhoods safer than they really are.⁷⁵ In each case, any resulting crime map will not be perfectly accurate. The production of crime maps and social network analyses is, moreover, not unidirectional—operators produce the maps, but the maps also inform the operators and reinforce operators’ beliefs. As two commentators have said, maps tells us as much about ourselves as they do about the thing depicted. Maps, in other words, create reality.⁷⁶ This is important because government attempts to socially network terror are billed as reliable methods of depicting objective reality, but observer effects and observer-expectancy effects operate to undermine the alleged reliability of networking and remind us that maps are subject to the biases of the map creators.

Data collection is inconsistent

Morrison 13 [Steven R. - Assistant Professor of Law, University of North Dakota School of Law. “THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT”, STANFORD LAW & POLICY REVIEW [Vol. 25:3412014], 7/11/13, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf] Schuler 43

Social network mapping depends upon the collection of large amounts of data such that automated, algorithm-directed collection becomes necessary.⁷⁷ This collection accesses open sources such as articles culled from the Internet⁷⁸ and processed for categorization and conceptual generalization according to human-constructed thesauri.⁷⁹ These sources are heterogeneous,⁸⁰ which creates consistency problems. Just as code creates the architecture of the Internet,⁸¹ and thus determines how and to what extent people can access information online, compilation of data for social network mapping operates within a structure that limits how much data can be accessed and selectively compiles only certain types of data. This leads to what might be called “relationship distortion,”⁸² meaning that actual interpersonal linkages may not be depicted in the network and the linkages that are depicted do not necessarily depict reality. Evidence of the data collection problem is found in a network analysis that Carley performed, the depiction of which she entitled “Al Qaeda 2002 Actorto-Actor Network.”⁸³ This network linked Ariel Sharon to Yasir Arafat in apparent affinity with al-Qaeda and each other, despite the facts that neither man was a member of al-Qaeda⁸⁴ and the two men did not share views such that their linkage reflected affinity.⁸⁵ Carley’s analysis also linked Osama bin Laden to Saddam Hussein, even though bin Laden viewed Hussein as a non-Muslim secularist and Hussein viewed al-Qaeda as a threat, with no affinity between the two or any connection for purposes of counterterrorism.⁸⁶ Bin Laden was also linked to Jose Padilla,⁸⁷ who emerged to be little more than a welltraveled terrorist hanger-on.⁸⁸ Despite this, Padilla, bin Laden, and even Israeli Prime Minister Benjamin Netanyahu were listed together as “emergent leaders of the group.”⁸⁹ According to Carley, given the position of these men, “it should be difficult to recover from the loss of these individuals given their extensive expertise and position in terms of complex tasks.”⁹⁰ While Carley’s specific model may be amenable to technical fixes, it also suggests that the whole enterprise of predictive models, if they depend upon automation and algorithms, is of dubious reliability. In short, the more data is collected, the more automated the process becomes, and thus the less reliable the data is. In turn, as data collection becomes more

humanized, it becomes more nuanced and reliable, but it also cannot contribute to predictive modeling. As for now, it appears that there is an unavoidable trade-off between evidentiary reliability and investigative scope.

Link relevance is hard to determine

Morrison 13 [Steven R. - Assistant Professor of Law, University of North Dakota School of Law. "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", STANFORD LAW & POLICY REVIEW [Vol. 25:3412014], 7/11/13, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf] Schuler 44

It is easy to find links, but difficult to judge their relevance.⁹¹ This is so in part because the amount of data of rare network events like terrorist groupings, compared to the massive amount of surrounding, innocent network behavior, is so small that samples to inform a network model are difficult to find. This can result in noisy data⁹² results, which deteriorate the performance of the analysis.⁹³ Compounding this data rarity problem is the fact that networks often depend on "weak ties,"⁹⁴ so that networks "consist[] of clusters tightly bound internally by strong ties and loosely linked to other clusters by weak ties."⁹⁵ If the prevailing view of terrorist networks is one of diffuse cells, then their connection by weak ties means that the relevance and probativeness of these weak ties are uncertain. Weak ties indicate some connection, which would cause law enforcement agents to view these ties as probative, but these ties, being weak, may imply no criminal mens rea. These weak ties can also depend upon tenuous conclusions. One commentator, for example, has observed that the number of languages a person can speak might determine where he is placed in a terrorist network.⁹⁶ This produces the problem of "fuzzy boundaries," which describes the difficulty of determining who to include and who not to include in a network,⁹⁷ and the related "pizza delivery guy problem," which describes the difficulty of distinguishing regular interpersonal contact from significant contact.⁹⁸ In the end, social network mapping entails the same problem associated with imputing a person's individual criminal intent based on generalizations about that person's affinity group: based on the group's perceived criminality, the individual might look guilty, but attributing criminal intent and proving criminal elements requires an individual approach.

Surveillance Fails – Lone Wolves

They blend in too well to be surveilled

http://www.nypdshield.org/public/SiteFiles/documents/NYPD_Report-Radicalization_in_the_West.pdf,
SS)

Al-Qaeda has provided the inspiration for homegrown radicalization and terrorism; direct command and control by al-Qaeda has been the exception, rather than the rule among the case studies reviewed in this study. The four stages of the radicalization process, each with its distinct set of indicators and signatures, are clearly evident in each of the nearly one dozen terrorist-related case studies reviewed in this report. o In spite of the differences in both circumstances and environment in each of the cases, there is a remarkable consistency in the behaviors and trajectory of each of the plots across all the stages. o This consistency provides a tool for predictability. The trans-national phenomenon of radicalization in the West is largely a function of the people and the environment they live in. Much different from the Israeli Palestinian equation, the transformation of a Western-based individual to a terrorist is not triggered by oppression, suffering, revenge, or desperation. Rather, it is a phenomenon that occurs because the individual is looking for an identity and a cause and unfortunately, often finds them in the extremist Islam. There is no useful profile to assist law enforcement or intelligence to predict who will follow this trajectory of radicalization. Rather, the individuals who take this course begin as "unremarkable" from various walks of life.

Surveillance Fails – NSA

Surveillance doesn't solve terrorism – internal NSA problems

Cahall 13 - Master of Global Security and Foreign Policy (Bailey Cahall, 6-5-2013, "Do NSA's Bulk Surveillance Programs Stop Terrorists?," New America, <https://www.newamerica.org/international-security/do-nsas-bulk-surveillance-programs-stop-terrorists/>)/A-Sharma

June 5, 2013, the Guardian broke the first story in what would become a flood of revelations regarding the extent and nature of the NSA's surveillance programs. Facing an uproar over the threat such programs posed to privacy, the Obama administration scrambled to defend them as legal and essential to U.S. national security and counterterrorism. Two weeks after the first leaks by former NSA contractor Edward Snowden were published, President Obama defended the NSA surveillance programs during a visit to Berlin, saying: "We know of at least 50 threats that have been averted because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved." Gen. Keith Alexander, the director of the NSA, testified before Congress that: "the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50 potential terrorist events in more than 20 countries around the world." Rep. Mike Rogers (R-Mich.), chairman of the House Permanent Select Committee on Intelligence, said on the House floor in July that "54 times [the NSA programs] stopped and thwarted terrorist attacks both here and in Europe – saving real lives." However, our review of the government's claims about the role that NSA "bulk" surveillance of phone and email communications records has had in keeping the United States safe from terrorism shows that these claims are overblown and even misleading. An in-depth analysis of 225 individuals recruited by al-Qaeda or a like-minded group or inspired by al-Qaeda's ideology, and charged in the United States with an act of terrorism since 9/11, demonstrates that traditional investigative methods, such as the use of informants, tips from local communities, and targeted intelligence operations, provided the initial impetus for investigations in the majority of cases, while the contribution of NSA's bulk surveillance programs to these cases was minimal. Indeed, the controversial bulk collection of American telephone metadata, which includes the telephone numbers that originate and receive calls, as well as the time and date of those calls but not their content, under Section 215 of the USA PATRIOT Act, appears to have played an identifiable role in initiating, at most, 1.8 percent of these cases. NSA programs involving the surveillance of non-U.S. persons outside of the United States under Section 702 of the FISA Amendments Act played a role in 4.4 percent of the terrorism cases we examined, and NSA surveillance under an unidentified authority played a role in 1.3 percent of the cases we examined. Regular FISA warrants not issued in connection with Section 215 or Section 702, which are the traditional means for investigating foreign persons, were used in at least 48 (21 percent) of the cases we looked at, although it's unclear whether these warrants played an initiating role or were used at a later point in the investigation. (Click on the link to go to a database of all 225 individuals, complete with additional details about them and the government's investigations of these cases: <http://natsec.newamerica.net/nsa/analysis>). Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terrorist-related activity, such as fundraising for a terrorist group. Furthermore, our examination of the role of the database of U.S. citizens' telephone metadata in the single plot the government uses to justify the importance of the program – that of Basaaly Moalin, a San Diego cabdriver who in 2007 and 2008 provided \$8,500 to al-Shabaab, al-Qaeda's affiliate in Somalia – calls into question the necessity of the Section 215 bulk collection program. According to the government,

the database of American phone metadata allows intelligence authorities to quickly circumvent the traditional burden of proof associated with criminal warrants, thus allowing them to “connect the dots” faster and prevent future 9/11-scale attacks. Yet in the Moalin case, after using the NSA’s phone database to link a number in Somalia to Moalin, the FBI waited two months to begin an investigation and wiretap his phone. Although it’s unclear why there was a delay between the NSA tip and the FBI wiretapping, court documents show there was a two-month period in which the FBI was not monitoring Moalin’s calls, despite official statements that the bureau had Moalin’s phone number and had identified him. , This undercuts the government’s theory that the database of Americans’ telephone metadata is necessary to expedite the investigative process, since it clearly didn’t expedite the process in the single case the government uses to extol its virtues. Additionally, a careful review of three of the key terrorism cases the government has cited to defend NSA bulk surveillance programs reveals that government officials have exaggerated the role of the NSA in the cases against David Coleman Headley and Najibullah Zazi, and the significance of the threat posed by a notional plot to bomb the New York Stock Exchange. In 28 percent of the cases we reviewed, court records and public reporting do not identify which specific methods initiated the investigation. These cases, involving 62 individuals, may have been initiated by an undercover informant, an undercover officer, a family member tip, other traditional law enforcement methods, CIA- or FBI-generated intelligence, NSA surveillance of some kind, or any number of other methods. In 23 of these 62 cases (37 percent), an informant was used. However, we were unable to determine whether the informant initiated the investigation or was used after the investigation was initiated as a result of the use of some other investigative means. Some of these cases may also be too recent to have developed a public record large enough to identify which investigative tools were used. We have also identified three additional plots that the government has not publicly claimed as NSA successes, but in which court records and public reporting suggest the NSA had a role. However, it is not clear whether any of those three cases involved bulk surveillance programs. Finally, the overall problem for U.S. counterterrorism officials is not that they need vaster amounts of information from the bulk surveillance programs, but that they don’t sufficiently understand or widely share the information they already possess that was derived from conventional law enforcement and intelligence techniques. This was true for two of the 9/11 hijackers who were known to be in the United States before the attacks on New York and Washington, as well as with the case of Chicago resident David Coleman Headley, who helped plan the 2008 terrorist attacks in Mumbai, and it is the unfortunate pattern we have also seen in several other significant terrorism cases.

AT//Advanced Algorithms

The algorithms are flawed and net-increase the likelihood of successful terrorism

Morrison, 13 (Steven, Assistant Professor of Law, University of North Dakota School of Law, "THE SYSTEM OF DOMESTIC COUNTERTERRORISM LAW ENFORCEMENT", 7/11/13, Stanford Law and Policy Review, https://journals.law.stanford.edu/sites/default/files/stanford-law-policy-review/print/2014/06/morrison_25_stan._l._poly_rev._341_final.pdf) KW

B. Data Collection

Social network mapping depends upon the collection of large amounts of data such that automated, algorithm-directed collection becomes necessary.⁷⁷ This collection accesses open sources such as articles culled from the Internet⁷⁸ and processed for categorization and conceptual generalization according to human-constructed thesauri.⁷⁹ These sources are heterogeneous,⁸⁰ which creates consistency problems. Just as code creates the architecture of the Internet,⁸¹ and thus determines how and to what extent people can access information online, compilation of data for social network mapping operates within a structure that limits how much data can be accessed and selectively compiles only certain types of data. This leads to what might be called "relationship distortion,"⁸² meaning that actual interpersonal linkages may not be depicted in the network and the linkages that are depicted do not necessarily depict reality.[¶] Evidence of the data collection problem is found in a network analysis that Carley performed, the depiction of which she entitled "Al Qaeda 2002 Actor-to-Actor Network."⁸³ This network linked Ariel Sharon to Yasir Arafat in apparent affinity with al-Qaeda and each other, despite the facts that neither man was a member of al-Qaeda⁸⁴ and the two men did not share views such that their linkage reflected affinity.⁸⁵ Carley's analysis also linked Osama bin Laden to Saddam Hussein, even though bin Laden viewed Hussein as a non-Muslim secularist and Hussein viewed al-Qaeda as a threat, with no affinity between the two or any connection for purposes of counterterrorism.⁸⁶ Bin Laden was also linked to Jose Padilla,⁸⁷ who emerged to be little more than a well-traveled terrorist hanger-on.⁸⁸ Despite this, Padilla, bin Laden, and even Israeli Prime Minister Benjamin Netanyahu were listed together as "emergent leaders of the group."⁸⁹ According to Carley, given the position of these men, "it should be difficult to recover from the loss of these individuals given their extensive expertise and position in terms of complex tasks."⁹⁰ ¶ While Carley's specific model may be amenable to technical fixes, it also suggests that the whole enterprise of predictive models, if they depend upon automation and algorithms, is of dubious reliability. In short, the more data is collected, the more automated the process becomes, and thus the less reliable the data is. In turn, as data collection becomes more humanized, it becomes more nuanced and reliable, but it also cannot contribute to predictive modeling. As for now, it appears that there is an unavoidable trade-off between evidentiary reliability and investigative scope.

AT//Empirical Examples

NSA surveillance isn't stopping or going to stop a terror attack – the “surveillance stopped 50 attacks” claim is wrong

Nicks, 14 (Denver, writer for Time.com; 1/13/14; “Report: Usefulness of NSA Mass Surveillance ‘Overblown’”; <http://swampland.time.com/2014/01/13/report-usefulness-of-nsa-mass-surveillance-overblown/>)/JPM

White House and NSA's claim that 50 terror plots averted "misleading," says report¶ Ever since Edward Snowden's leaks began revealing the extent of the National Security Agency's mass surveillance—or “bulk collection”—programs last June, officials have defended the programs with one number: 50.¶ “We know of at least 50 threats that have been averted because of this information not just in the United States, but, in some cases, threats here in Germany. So lives have been saved,” President Obama said on a visit to Berlin. NSA Director Gen. Keith Alexander made the same claim testifying before Congress.¶ But a new study out Monday from The New America Foundation says that claim is simply false, calling it “overblown, and even misleading.”¶ “Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terrorist-related activity, such as fundraising for a terrorist group,” says the nonpartisan think tank's report, titled “Do NSA's Bulk Surveillance Programs Stop Terrorists?”¶ In an analysis of 225 al-Qaeda-linked individuals charged with terrorism in the U.S. since 9/11, the report found NSA mass surveillance of Americans telephone records—authorized under Section 215 of the USA PATRIOT Act—“played an identifiable role in initiating, at most, 1.8 percent” of investigations.¶ The report acknowledges that in 28 percent of cases it reviewed, researchers couldn't determine what methods initiated the investigation. But in many of those cases an informant played a role in the investigation, says the report.¶ ACLU Legislative Counsel Michelle Richardson told TIME the report “confirms that the numbers and examples the government has floated in support of its domestic spying programs are grossly inflated. More broadly though, it underlines how far the government has actually gotten away from the original lessons of 9/11. Instead of working on connecting the dots collected from traditional investigations, it has become obsessed with collecting ever more data whether it is useful or not.”

AT//Metadata Key

Metadata collection isn't key to effective surveillance Bergen et al '14

[Peter, CNN national security analyst; David Sterman, holds a master's degree from Georgetown's Center for Security Studies; Emily Schneider, is a program associate in the International Security Program at New America; Bailey Cahall, is a Policy Analyst at the New America Foundation, New America Foundation, "Do NSA's Bulk Surveillance Programs Stop Terrorists?", January 2014, http://pierreghz.legtux.org/streisand/autoblogs/frglobalvoicesonlineorg_0e319138ab63237c2d2aeff84b4cb506d936eab8/media/e1982452.Bergen_NAF_NSA20Surveillance_1_0.pdf, 6/26/15]JRO

Surveillance of American phone metadata has had no discernible impact on preventing acts of terrorism and only the most marginal of impacts on preventing terrorist-related activity, such as fundraising for a terrorist group. Furthermore, our examination of the role of the database of U.S. citizens' telephone metadata in the single plot the government uses to justify the importance of the program – that of Basaaly Moalin, a San Diego cabdriver who in 2007 and 2008 provided \$8,500 to al-Shabaab, al-Qaeda's affiliate in Somalia – calls into question the necessity of the Section 215 bulk collection program.⁵ According to the government, the database of American phone metadata allows intelligence authorities to quickly circumvent the traditional burden of proof associated with criminal warrants, thus allowing them to "connect the dots" faster and prevent future 9/11-scale attacks. Yet in the Moalin case, after using the NSA's phone database to link a number in Somalia to Moalin, the FBI waited two months to begin an investigation and wiretap his phone. Although it's unclear why there was a delay between the NSA tip and the FBI wiretapping, court documents show there was a two-month period in which the FBI was not monitoring Moalin's calls, despite official statements that the bureau had Moalin's phone number and had identified him.^{6,7} This undercuts the government's theory that the database of Americans' telephone metadata is necessary to expedite the investigative process, since it clearly didn't expedite the process in the single case the government uses to extol its virtues. Additionally, a careful review of three of the key terrorism cases the government has cited to defend NSA bulk surveillance programs reveals that government officials have exaggerated the role of the NSA in the cases against David Coleman Headley and Najibullah Zazi, and the significance of the threat posed by a notional plot to bomb the New York Stock Exchange.

AT//Targeted Killing

Drones don't play a key role in the War on Terror – small disruptions don't matter in the long run

WSJ 6/16 - (WSJ, 6-16-2015, "Wins in the War on Terror," <http://www.wsj.com/articles/wins-in-the-war-on-terror-1434496023>)/A-Sharma

The U.S. scored a noteworthy victory last week when an American missile killed Nasser al-Wuhayshi, the longtime leader of al Qaeda in the Arabian Peninsula and the global organization's Number Two. Coupled with unconfirmed reports that an F-15 airstrike in Libya killed jihadist mastermind Mokhtar Belmokhtar, the strikes are a reminder that the war on terror continues, whatever the Administration calls it. Yet the strikes are also a reminder that while killing senior jihadists has tactical and symbolic value disrupting terrorist networks while underscoring U.S. resolve they do not turn the tide of war. "Core" al Qaeda was not defeated after Osama bin Laden was killed in 2011, even if it was humbled. Neither was al Qaeda in Iraq beaten after the killing of Abu Musab al-Zarqawi in 2006. Killing the kingpins is necessary but not sufficient for victory. That much was made clear by the way Wuhayshi met his end near a beach in the Yemeni city of Al Mukalla, population 300,000. Al Qaeda took control of Al Mukalla in April, seizing close to \$80 million from the central bank. The group now controls the better part of southern Yemen. The same goes with Belmokhtar, who orchestrated the 2013 attack on an Algerian gas plant that killed 38 people and had pledged allegiance to al Qaeda's Ayman al-Zawahiri. If reports of Belmokhtar's death are confirmed this wouldn't be the first time he's been presumed dead it's a tactical coup for the U.S. and a moral victory for the terrorist's victims. But it does little to change the fact that jihadist groups, led by Islamic State, control significant territory in Libya, including Moammar Ghadafi's hometown of Sirte.

AT//They Know Something We Don't

Classified info isn't the issue, but ignorance and a failed bureaucracy— 6 reasons

Brooks 2015 (Rosa [Law professor at Georgetown University and a Schwartz senior fellow at the New America Foundation]; US Counterterrorism strategy is the definition of insanity; Jun 24; foreignpolicy.com/2015/06/24/u-s-counterterrorism-strategy-is-the-definition-of-insanity/?wp_login_redirect=0; kdf)

To me, that's one of the unsolved mysteries of the universe, right up there with "what is dark matter?" and "why do we yawn?" Why do smart people like Obama and his top advisors continue to rely on counterterrorism policies that aren't working? I can think of a few possibilities. 1. They know something we don't. This is the most generous hypothesis I can come up with. Maybe there's secret intelligence information showing that, contrary to all appearances, al Qaeda, the Islamic State, al-Shabab, Boko Haram, and other major terrorist groups have all been fatally weakened and peace on Earth is right around the corner. Maybe. But not very likely. 2. We know something they don't. Back in 2003, many of us were skeptical of the Bush administration's claims about Iraqi weapons of mass destruction, but told ourselves that senior officials probably knew something we didn't. Not so, as it turned out. Internal and external critics were ignored or silenced, and everyone from Defense Secretary Donald Rumsfeld to Secretary of State Colin Powell convinced themselves that dubious intelligence was the gospel truth. Had they paid more attention to critics, the United States might never have launched its misguided war in Iraq — the same war that became an inspiration and training ground for many of the terrorist leaders who continue to plague the region today. The critics were right. There's no particular reason to think that today's senior U.S. officials are any less prone to self-delusional groupthink. Maybe they're trapped in their own little bubble; maybe they've started to believe their own hype. 3. They don't know what they don't know. Or maybe they don't — and can't — know that they don't know what the rest of us know. Maybe no one draws their attention to critical reports. Maybe the internal critics — of whom there are clearly many — censor themselves when they're around the president and his inner circle. I sometimes think that the U.S. government is a giant machine designed to prevent senior decision-makers from every getting any useful information. For one thing, it's a vast and sprawling bureaucracy, and the right hand is frequently oblivious to the machinations of the left hand. In a sense, there's just no "there" there: The State Department doesn't always share important information with the Defense Department, the Defense Department doesn't always share important information with Department of Homeland Security, and the intelligence community generally doesn't share important information with anyone. Within agencies, it's no different. Central Command doesn't necessarily know what Special Operations Command knows, and Africa Command may not know what either knows. Central Command doesn't necessarily know what Special Operations Command knows, and Africa Command may not know what either knows. Military intelligence and surveillance assets are concentrated in the Central Command area or responsibility, leaving commanders elsewhere with less ability to monitor and understand what's going on. Meanwhile, the CIA's shift toward paramilitary operations has left it less able to gain vital human intelligence. Put all this together, and you get a situation in which U.S. officials can see millions of trees, but almost no one can spot any forests. Add to this the natural desire to bring good news rather than bad news to the boss — and combine it with a bureaucratic culture that insists that everything be boiled down to a few slides or a page of bullet points before it goes to senior officials. Maybe, at the end of the day, Obama can't be expected to know whether his approach to counterterrorism is succeeding or failing, because the structure and incentives of the players in his own

government make it impossible for him to know. 4. They don't want to know. Maybe that's too generous. Bush used to boast that he never read the newspaper. Maybe Obama has stopped reading the news too. Or maybe he skips articles that look critical or negative and goes straight to the sports section. It will be many years before current intelligence assessments are declassified, but so far, journalistic reports of leaked documents and comments by former officials suggest that there's no shortage of internal evidence that U.S. counterterrorism policy is failing. According to the BBC, leaked CIA reports concluded that targeting killings of Taliban leaders were ineffective, for instance. Other internal documents reportedly acknowledge that U.S. officials are often uncertain whom they're killing in the first place. But maybe senior officials find reasons to avoid reading such reports. Taking such information fully on board — or grappling with the full implications of the recent rise in global terrorism — would require senior officials to admit (to themselves, even if not to the general public) that a counterterrorism strategy centered on air power and targeted killings isn't working. Not fun. 5. They know, but don't care. Perhaps I'm still being too generous. Maybe senior administration officials know perfectly well that their approach to counterterrorism is failing, but simply have no incentive to change it. Why bother? In less than two years, this administration will be gone, and the next crew will have to clean up the mess — which won't be easy, since no one has any magic solutions. In the meantime, politics trumps policy. The experts, analysts, and pundits can yap all they want, but airstrikes and targeted killings scratch the itch to “do something” and look tough while doing it. The long-term efficacy of this approach is immaterial. 6. They're just really conflicted and confused. It's definitely possible. In May 2013, Obama told an audience at the National Defense University that counterterrorist drone strikes raise “profound questions” and that “the use of force must be seen as part of a larger discussion we need to have about a comprehensive counterterrorism strategy.” In May 2014, he repeated his commitment to having that discussion and added, “I also believe we must be more transparent about both the basis of our counterterrorism actions and the manner in which they are carried out.... When we cannot explain our efforts clearly and publicly, we face terrorist propaganda and international suspicion.” In September 2014, he admitted, “We don't have a strategy yet” for dealing with the rise of the Islamic State. A few weeks ago, he amended this to “we don't yet have a complete strategy.” It shows.

AT//Wide Net

Casting a wide net doesn't increase effectiveness – just catches a bunch of innocent citizens

Scott, 14 (Christopher, Angelo State University, 6/9/2014, "Domestic Surveillance and Government's Loss of Legitimacy", <https://repositories.tdl.org/asu-ir/handle/2346.1/30143>) KW

In terms of catching potential terrorists, this appears to be exactly what proponents of the NSA's domestic spying program want. However, it leaves the rest of the law-abiding populace vulnerable to abuse. Much like using a drift net results in catching all manner of fish, the outcome of the NSA's blanket spying program is that many innocent people are caught up with those few who are guilty. White House counselor, John Podesta, noted that a recent 90 day review ordered by President Obama found that "potential for discrimination is an issue that warrants a closer look" (Sullivan, 2014). What does this mean for a political system originally designed to better the lives of the people who live under it? The ease and availability of such abuses of power can inadvertently bring about the rise of a tyrannical movement within the government thereby negatively affecting the very people that government was created to protect.

Impact

No Attack

Terrorism is growing – but that doesn't translate into a high risk of another attack on the homeland. Much more likely to stay in the Middle East

Taylor '14

(Richard Norton - Taylor, writes for the Guardian on defence and security, was the paper's security editor, won the Freedom of Information Campaign Award in 1986 and in 1994, and Liberty's Human Rights Award for journalism in 2010, July 7, 2014, The Guardian, "Islamist terror threat to west blown out of proportion - former MI6 chief", <http://www.theguardian.com/uk-news/2014/jul/07/islamist-terror-threat-out-proportion-former-mi6-chief-richard-dearlove, SS>)

The government and media have blown the Islamist terrorism threat out of proportion, giving extremists publicity that is counter-productive, a former head of Britain's intelligence service has said. Sir Richard Dearlove, chief of MI6 at the time of the Iraq invasion, said that Britons spreading "blood-curdling" messages on the internet should be ignored. He told an audience in London on Monday there had been a fundamental change in the nature of Islamist extremism since the Arab spring. It had created a major political problem in the Middle East but the west, including Britain, was only "marginally affected". Unlike the threat posed by al-Qaida before and in the aftermath of the 9/11 attacks 13 years ago, the west was not the main target of the radical fundamentalism that created Isis, (the Islamic State in Iraq and the Levant), Dearlove said. Addressing the Royal United Services Institute, the London-based security and defence thinktank, he said the conflict was "essentially one of Muslim on Muslim". He made it clear he believed the way the British government and the media were giving the extremists the "oxygen of publicity" was counter-productive. The media were making monsters of "misguided young men, rather pathetic figures" who were getting coverage "more than their wildest dreams", said Dearlove, adding: "It is surely better to ignore them."

No Escalation

No existential threat from terrorists

Mueller and Stewart, 2/24/15 (John, Political scientist at Ohio State; Mark, engineer and risk analyst at the University of Newcastle in Australia; “Terrorism poses no existential threat to America. We must stop pretending otherwise”; [//JPM">http://www.theguardian.com/commentisfree/2015/feb/24/terrorism-poses-no-existential-threat-to-america\)//JPM](http://www.theguardian.com/commentisfree/2015/feb/24/terrorism-poses-no-existential-threat-to-america)

One of the most unchallenged, zany assertions during the war on terror has been that terrorists present an existential threat to the United States, the modern state and civilization itself. This is important because the overwrought expression, if accepted as valid, could close off evaluation of security efforts. For example, no defense of civil liberties is likely to be terribly effective if people believe the threat from terrorism to be existential.¶ At long last, President Barack Obama and other top officials are beginning to back away from this absurd position. This much overdue development may not last, however. Extravagant alarmism about the pathological but self-destructive Islamic State (Iis) in areas of Syria and Iraq may cause us to backslide. ¶ The notion that international terrorism presents an existential threat was spawned by the traumatized in the immediate aftermath of 9/11. Rudy Giuliani, mayor of New York at the time, recalls that all “security experts” expected “dozens and dozens and multiyears of attacks like this” and, in her book *The Dark Side*, Jane Mayer observed that “the only certainty shared by virtually the entire American intelligence community” was that “a second wave of even more devastating terrorist attacks on America was imminent”. Duly terrified, US intelligence services were soon imaginatively calculating the number of trained al-Qaida operatives in the United States to be between 2,000 and 5,000.¶ Also compelling was the extrapolation that, because the 9/11 terrorists were successful with box-cutters, they might well be able to turn out nuclear weapons. Soon it was being authoritatively proclaimed that atomic terrorists could “destroy civilization as we know it” and that it was likely that a nuclear terrorist attack on the United States would transpire by 2014.¶ No atomic terrorists have yet appeared (al-Qaida’s entire budget in 2001 for research on all weapons of mass destruction totaled less than \$4,000), and intelligence has been far better at counting al-Qaida operatives in the country than at finding them.¶ But the notion that terrorism presents an existential threat has played on. By 2008, Homeland Security Secretary Michael Chertoff declared it to be a “significant existential” one - carefully differentiating it, apparently, from all those insignificant existential threats Americans have faced in the past. The bizarre formulation survived into the Obama years. In October 2009, Bruce Riedel, an advisor to the new administration, publicly maintained the al-Qaida threat to the country to be existential.¶ In 2014, however, things began to change.¶ In a speech at Harvard in October, Vice President Joseph Biden offered the thought that “we face no existential threat – none – to our way of life or our ultimate security.” After a decent interval of three months, President Barack Obama reiterated this point at a press conference, and then expanded in an interview a few weeks later, adding that the US should not “provide a victory to these terrorist networks by over-inflating their importance and suggesting in some fashion that they are an existential threat to the United States or the world order.” Later, his national security advisor, Susan Rice, echoed the point in a formal speech.¶ It is astounding that these utterances – “blindingly obvious” as security specialist Bruce Schneier puts it – appear to mark the first time any officials in the United States have had the notion and the courage to say so in public

Even if the risk of an attack is high, the lethality is minimal

Russell, 15 (Jill, King's College London, writer for the Telegraph; 5/5/15; "How big a threat are Isil-inspired terror attacks to the US and western Europe?"; [//JPM">http://www.telegraph.co.uk/news/worldnews/islamic-state/11582416/How-big-a-threat-are-Isil-inspired-terror-attacks-to-the-US-and-western-Europe.html">//JPM](http://www.telegraph.co.uk/news/worldnews/islamic-state/11582416/How-big-a-threat-are-Isil-inspired-terror-attacks-to-the-US-and-western-Europe.html)

At the level of tangible damage, in fact such attacks present no real existential threat. Despite the seeming ease and simplicity of a potential Lone Wolf campaign, to achieve anything beyond isolated violence exceeds the capabilities of the potential jihadists. Charlie Hebdo is an excellent example of the hysteria that a relatively low-level attack can achieve. Those most likely to be susceptible to this call to arms are, fortunately, not masterminds. The Tsarnaev brothers in Boston are an instance of such terrorists undone by their incompetence. More boldly, it is not exceptional to say that these acts hold little power to inflict damage of any strategic consequence in and of themselves. There is a significant possible threat from these attacks, yes, but the actual risk of and from them is rather less. Looking to the political effect, the West is further protected. At its simplest, terrorism operates by using spectacle to inspire fear and lead political change. Against this direct bullying, states are consistent in their standard refusal to alter policies or make concessions as demanded by terrorists. Nevertheless, even as these attacks do not imperil our security or political freedom on their own, how we in the West will respond to them may in fact cause the greater damage, nowhere more so than in the very communities and societies which we seek to protect. Isil's strategy makes targets of the more vulnerable members of Western societies. In the current climate of the jihadi threat and Muslim communities in the West, the Lone Wolf becomes a cruel blight upon them, casting all under the pall of doubt. Isil's claim of responsibility for the latest attack in Garland, TX, will bring a backlash. Unfortunately, aggressive methods and measures to counter the threat will fall like a blunt weapon upon a greater demographic than deserves. This problem becomes more acute in the nexus between Muslim communities and other minorities. When we take into account the disaffection for the police within minority communities, the prospects that these responses will increase the hostility is high. These are the same communities with whom the authorities in Western states must build better relations. This is a crucial moment, and how we will respond to the threat by way of the authorities' interactions with these minorities will matter. It would be too tragically easy for Western governments to allow fear to drive a wedge of suspicion between them and the relevant communities. This would serve the Lone Wolf strategy by increasing the number of marginalised and angry individuals susceptible to Isil's call to action. The fabric of our diverse societies could be mortally wounded by rash and ill-considered responses to this threat. But it is equally true that this is a moment where the terms of Western society could be strengthened, its wisdom reaffirmed. In addition to every bit of fine, proactive counter-terror tactic and policy, the single best weapon against Isil and its immediate and long-term threats within Western societies is the strength of relations between the relevant communities and individuals and the authorities. Local knowledge and assistance are the most effective answers to lone wolves, plots, and radicalisation. Every action taken to build rapport, trust and respect will not only be an improvement to security, but will be a down-payment on the security and vibrancy of society in years to come. In the short term it would be unwise to give too much credence to the actions of Isil's lone wolves.

No Imminent Threat

The risk of a forthcoming attack on the homeland is minimal – their evidence is baseless paranoia

Wright, 14 (Lynn M. Wright Branch Chief, Federal Emergency Management Agency B.S., Northeastern University; 12/14; "THE EMERGING THREAT OF DOMESTIC TERRORISM: A SYSTEMATIC REVIEW OF EVOLVING NEEDS, THREATS, AND OPPORTUNITIES"; Naval Postgraduate School; http://calhoun.nps.edu/bitstream/handle/10945/44693/14Dec_Wright_Lynn.pdf?sequence=1)

Compared to many other countries, the U.S. does not face the same magnitude of terrorist attacks or threats on its own soil. The actual threat and the perceived threat may be significantly different, based on media influence, political rhetoric, and human nature. Any discussion on the domestic terrorist threat in the U.S. and the most effective methods for collecting and analyzing domestic intelligence and sharing information must take these factors into consideration. A variety of resources look at how fears, risk perceptions, and responses are not always logical. For example, Overblown: How Politicians and the Terrorism Industry Inflate National Security Threats, and Why We Believe Them, by John Mueller, claims that there is an "overreaction" to terrorism and suggests methods for reducing fear among Americans as a possible response to the perceived terrorist threat.⁴⁸ The Science of Fear: How the Culture of Fear Manipulates Your Brain, by Daniel Gardner, touts fear as an outstanding "marketing tool" and claims that government officials' narrative and media reporting significantly influence the public's perception of the actual terrorism threat.⁴⁹

AT//Al-Qaeda

Al Qaeda is shattered and remains cannot recover – its leadership is gone, it lacks resources, and recruitment is low

Burke 13 [Jason - he south Asia correspondent of the Guardian, based in Delhi. Over 15 years as a foreign correspondent, he has covered stories across the region, as well as in the Middle East. "Al-Qaida's membership declining and leadership damaged, but threat remains", The Guardian, 8/5/13, <http://www.theguardian.com/world/2013/aug/05/al-qaida-anniversary-attacks-reduced>] Schuler 24

Al-Qaida's leadership is a shattered remnant, reduced to begging funds and munitions from local allies and with its most capable members heading to Syria, according to recent briefings from Pakistan's intelligence services. But western analysts say the group retains the ability to regenerate quickly and dangerously and its ideology remains a potent threat around the world, as the closure of US embassies across the Middle East this week shows. With fewer than 100 leaders, fighters and trainers and few experienced operators, the ability of the group's Pakistan-based "general command" under Ayman al-Zawahiri, the Egyptian-born militant who replaced Osama bin Laden after he was killed by US special forces in 2011, to launch overseas attacks is limited, Pakistani officials have said. As demands mount elsewhere in the Islamic world, policymakers and specialists have to decide the focus of counter-terrorist efforts. But there is still little consensus on which elements of the al-Qaida phenomenon pose the greatest threat. In July, it was reported that the CIA would be shifting resources from Afghanistan and Pakistan to the Middle East and Africa. The current capabilities of the core leadership element of al-Qaida, founded in the Pakistani frontier city of Peshawar 25 years ago on 11 August and still based in the country, is a particularly controversial topic. US intelligence services and many of their counterparts overseas, including British agencies, broadly concur with the Pakistani view that the al-Qaida "senior leadership" or "general command" in the troubled south Asian state has been significantly damaged by the elimination of the majority of its senior operatives and by lower levels of support in the Muslim world. However, some argue that it remains a significant threat, particularly with most US and international forces due to leave Afghanistan within 18 months. Daveed Gartenstein-Ross of the Foundation for Defence of Democracies, a Washington thinktank, said: "Al-Qaida central has been degraded, but what does that mean? Their ability to regenerate is probably greater than most analysts believe." Advertisement A recent report published by Canadian intelligence services referred to al-Qaida's "hardcore" having "a deeper bench" of leaders and operatives. This, among other factors, suggested that "Al-Qaida Core is extremely likely to exist in 2017 much as it existed – despite predictions and assessments to the contrary – in 2007," the report said. The approaching withdrawal from Afghanistan has intensified the debate. The departure of most international troops could, some fear, provide a propaganda victory which would reinvigorate extremists both internationally and locally. Another concern is heightened lawlessness in Afghanistan which would help militant groups there and in Pakistan. "The ... withdrawal of US forces and Isaf [International Security Assistance Force] troops from Afghanistan by 2014 further suggests that core al-Qaida may well regain the breathing space and cross-border physical sanctuary needed to ensure its continued existence," the Canadian report says. Some analysts point out that together these factors partially replicate the circumstances in which al-Qaida emerged. "It is back to the future – you can't help but see parallels," said one Middle Eastern diplomat who was stationed in the region in the early 1990s. 'All won their battles' Al-Qaida was founded by veterans of the war against the Soviets in Afghanistan. The victory over the massive conventional forces of the USSR was a key factor in the formulation of the group's radical new global approach, which

sought to target the US – the so-called "far enemy" – to weaken regimes in the Middle East – the "near enemy" – and overcome the parochialism and infighting that plagued Islamist extremists at the time. The chaos in Afghanistan that followed the Soviet withdrawal and its destabilising effect on Pakistan helped al-Qaida to thrive through the following decade. Bin Laden (pictured right) left Pakistan for Saudi Arabia in 1991, though many militants remained, and then went to Sudan. He arrived in Afghanistan in 1996 at the invitation of local warlords. He then became close to Mullah Mohammed Omar, the leader of the Taliban, and was sheltered by the hardline movement until the war after the 9/11 attacks in 2001 that led to the end of its rule. Maleeha Lodhi, a former Pakistani ambassador in Washington and analyst, said: "The effect on militants [of the US withdrawal] depends on how the war [in Afghanistan] ends. There is a danger that the extremists see this as yet another defeat for another superpower and that would embolden them." Lodhi said a political settlement in Afghanistan would make such a narrative difficult to sustain. However, progress in negotiations between the Taliban, the US and the Afghan government has been slow. Afghanistan also faces new presidential elections late next spring and violence is rising. The coming international withdrawal is already having an impact even on long-running conflicts where there has never been any al-Qaida involvement. In the parts of the disputed Himalayan former princedom of Kashmir, where insurgency has pitted local and Pakistani-based militant groups against security forces for more than two decades, the "success" of the Taliban is seen by some as an argument for resuming a strategy of violent resistance that has largely been abandoned in recent years. In the town of Sopore, a hotbed of insurgent violence in northern Indian-administered Kashmir, young men spoke to the Guardian in between bouts of throwing rocks at local police during a morning's rioting last month. Events in Afghanistan, they said, had inspired them. "The US forces have pulled out because they could not beat the Taliban. This is an example for us. If we fight back we too can achieve something," said Shakeel Ahmed, a 24-year-old pharmaceutical representative. Muzaffar Ahmed Wani, a 50-year-old schoolmaster in the southern village of Tral whose teenage son is fighting with the Hizb-ul-Mujahideen group, said events in Afghanistan would "definitely have an impact". In Peshawar itself, few doubt that the withdrawal will encourage local fighters. "My father's father fought the British, my father fought the Soviets, my brother fought the Americans. All have won their battles even with small guns and stones against tanks and helicopters. This shows that when you fight in the way of God you will always win, whatever is against you," said Mohammed Rasheed, who works in a restaurant near the city's main bus station. But it is less clear that events in Afghanistan will have the same effect further afield. Internet forums and propaganda websites are dominated by news from Syria or other Middle Eastern countries. Al-Qaida "general command" has also lost its most effective propagandists: Bin Laden himself and Abu Yahya al-Libi, a younger militant who was killed last year. Al-Zawahiri, the current leader, lacks the charisma of either. A key factor determining the evolution of the remnant of al-Qaida's core in Pakistan in coming years will be its local allies, analysts agree. If either the Afghan Taliban or the rough coalition of groups known as the Pakistani Taliban (TTP) are definitively defeated, significantly degraded or conclude an agreement to lay down their weapons, al-Qaida could find itself without the haven that has given a modicum of precarious security over the last decade. Allies such as the Haqqani network, another organisation based on the Afghan-Pakistani frontier, could also withdraw support, though this is considered unlikely in the short term. "In some scenarios al-Qaida could be badly squeezed," said Ejaz Haider, a security analyst in Islamabad. Tenacious ideology For many years, the local outfits were junior partners to the prestigious international group. This is no longer the case, according to Pakistani officials. "We see [al-Qaida] more and more dependent on local networks who have funds and weapons and recruits, but with less and less to offer them. The overall picture is very

fragmented," said one senior officer based in the western Punjab province. One indication is the flow of recruits. Intelligence services are picking up signs that the TTP or even other "international" groups with a presence on the frontier are being preferred by volunteers. In one recent case, a young Pakistani who was studying in the UK returned to his homeland and sought out the TTP despite attempts by al-Qaida to recruit him. In another case volunteers chose the Islamic Movement of Uzbekistan, which has long been based in the tribal areas. One key development is what analysts call the "Pakistanisation" of al-Qaida in the country. Senior al-Qaida leaders established a local branch to develop operations and links in Pakistan several years ago and have recently ramped up propaganda directed at south Asian Muslims. "You are seeing a lot of material related not just to fighting in Afghanistan but focusing on Bangladesh, India and Burma that we have not really seen previously," said Aaron Zelin, a researcher at the Washington Institute for Near East Policy. But now analysts see a growing influence of locals inside the formerly almost exclusively international "al-Qaida hardcore". Recently, a Pakistani cleric has taken on the role of ideologue and spokesman for al-Qaida. The reported movement of al-Qaida operatives to Syria, if confirmed, could be evidence of a possible split, as those unhappy with the increasingly local character and focus of what was once the centre of an international network focus on waging "global jihad" elsewhere.

Al Qaeda poses zero risk – this card absolutely devastates their DA

Watts 15 [Clint- is a Senior Fellow at the Foreign Policy Research Institute. "Al Qaeda Loses Touch", Foreign Affairs, 2/4/15, <https://www.foreignaffairs.com/articles/middle-east/2015-02-04/al-qaeda-loses-touch>] Schuler 25

- Lack of leadership
- Loss of affiliate groups
- Lack of communication ability
- Ideology is unpopular
- They fled to Syria
- Loss of Iraqi fighters

If al Qaeda were a corporation today, it would be roughly equivalent to Microsoft: A big name but an aging brand, one now strikingly out of touch with the 18–35-year-old demographic. The group made its way back into the headlines this past January, after its affiliate—al Qaeda in the Arabian Peninsula, or AQAP—took credit for a deadly attack on the Paris offices of the French magazine Charlie Hebdo. But the claim of responsibility came a week after the fact, and lacked the sort of insider accounts or video footage that typically accompany such announcements, leading some to conclude that al Qaeda may not have known about the attackers' intentions. Put simply, al Qaeda's traditionally preeminent position in the jihadi hierarchy, long on the wane, is slipping still further. U.S. officials, for their part, are increasingly focused on the Islamic State, or ISIS, which continues to deliver a steady flow of battlefield victories and brutal beheadings. Yet al Qaeda has a clear path back to contention: a dramatic follow-up to the Hebdo attack. And with the group's need for a win so great, Washington would be mistaken to count it out. CONTROL KEY Al Qaeda's latest chapter began with the death of Osama bin Laden in May 2011. Shortly thereafter, Ayman al-Zawahiri, bin Laden's successor as al Qaeda's global leader, found himself facing numerous constraints. Aggressive U.S.-led counterterrorism efforts, buoyed by a deadly drone campaign, forced top al Qaeda commanders into hiding, limiting Zawahiri's ability to

communicate with al Qaeda's affiliates. Based in Pakistan rather than in Iraq, Zawahiri and his senior commanders lost touch with many fighters in Iraq. And with bin Laden dead, resources became tighter. Al Qaeda's affiliates, which were now receiving less guidance and fewer resources from al Qaeda central, took on a new level of independence. Some four years later, al Qaeda is essentially a collection of relatively small, though still capable, affiliates. AQAP, under the leadership of Nasir Wuhayshi, remained loyal to Zawahiri after bin Laden's death. But with Zawahiri and al Qaeda's senior leadership under siege from the drones in Pakistan, AQAP effectively became al Qaeda central. AQAP came close to executing three plots against Western targets, in 2009, 2010, and 2011. And it became the first affiliate to build its own insurgent force, Ansar al Sharia, which aimed to establish an Islamist emirate in Yemen. In Zawahiri's absence, other affiliates began to look to AQAP for guidance. Among them was al Qaeda in the Islamic Maghreb or AQIM, which was making a separate push for an Islamic emirate in northern Africa. By the spring of 2012, AQAP had sent the group's leaders two instructional letters, one in May and another in August, covering both tactics and strategy. AQAP further cemented its role by essentially creating its own affiliate, al Shabaab, in Somalia. Zawahiri confirmed al Shabaab's membership in al Qaeda in February 2012, but evidence suggests that the group had little interaction with al Qaeda central. Omar Hammami, an American member of the group, noted in his biography that al Shabaab's al Qaeda contacts came from Yemen rather than Pakistan. And even a senior al Shabaab leader, Sheikh Ali Muhamud Raage, seemed confused, at one time publicly stating that the group was joining AQAP. Al Qaeda central, meanwhile, has continued to struggle. In Pakistan, the U.S. drone program has kept Zawahiri tied down and led to an exodus of his senior deputies to Egypt, Libya, and Syria in search of refuge and new opportunities. Despite the overthrow of a democratically elected Muslim Brotherhood regime in Egypt—a confirmation of al Qaeda's narrative—the group has failed to gain traction there. Its so-called Nasr cell, which has allegedly plotted various attacks in the country, was disrupted in 2013, and its operatives in the Sinai have suffered losses at the hands of the Egyptian military and an attrition of followers to ISIS. Today, the Syrian conflict represents al Qaeda's greatest challenge. And here, too, al Qaeda's performance has been lackluster. Zawahiri dispatched top veterans to Syria, forming the so-called Khorasan unit under the flag of their affiliate, Jabhat al-Nusra. But those operatives have become embroiled in a deadly turf war with ISIS, which has used suicide bombers to target senior al Qaeda commanders. Even with ISIS under fresh pressure from an aggressive U.S. air campaign, al Qaeda has been unable to win a position at the top of the opposition to Syrian President Bashar al-Assad. TERROR DISRUPTED Had bin Laden and Zawahiri been holed up in remote tribal lands in 1994 rather than in 2004, they never would have been able to sustain their global network of affiliates or inspire far-flung supporters. But after 9/11, the expansion of the Internet provided bin Laden and his deputies the means to transmit their ideology, disseminate propaganda, communicate with subordinates, and guide new recruits from the remotest of locations. Al Qaeda's password-protected forums became a global dissemination platform linking like-minded jihadis from all over the world. Abu Musab al-Zarqawi, a commander of al Qaeda's Iraq affiliate, took jihadi Internet use in a new direction. The group's online outreach activities tell their own story: Content shifted from still-motion shots of a finger-waving bin Laden to videos of violent assaults and bombings targeting U.S. soldiers. YouTube became the first two-way engagement platform for all jihadi supporters to chime in and promote the battlefield heroics of Zarqawi and company—not necessarily al Qaeda central. But it was Al-Awlaki, based in Yemen, who brought al Qaeda its greatest online success. The American cleric's online preaching, one-to-one communication with Western jihadis, combined with the dissemination of the English jihadi magazine Inspire provided al Qaeda with new recruits in the West. But Awlaki's death in 2011, along with that of

his online provocateur, American Samir Khan, dealt a major blow to al Qaeda's Internet footprint. Subsequent issues of Inspire have been less frequent, of lower quality, and largely overshadowed by the new media prowess of ISIS. Bin Laden's death, coupled with the expansion of social media, opened the floodgates. Until 2011, respect for bin Laden and al Qaeda's use of controlled forums kept al Qaeda's message synchronized and its supporters in line. Not so under Zawahiri, and amidst the rise of social media platforms such as Facebook, Twitter, and YouTube. Suddenly, any jihadi supporter regardless of ideological credentials could lead jihadi discussions, challenge al Qaeda's direction, or lead his or her peers to support one campaign over another. Online, the meaning of global jihad shifted from an emphasis on violence as a means of pursuing an Islamic state (an approach advocated by al Qaeda) to statehood as a means of pursuing violence (one championed by ISIS). Omar Hammami, an American foreign fighter who defected from al Shabaab, signaled this shift best when he was on the run from the group's leader. "Terrorism is a staple so long as shari'ah is followed. Post-aq = broadbased jihad," he tweeted in January 2013. It increasingly appears that young jihadis have moved on from al Qaeda, more inspired by the violence of the Syrian conflict than the Islamist cause. In Syria, al Qaeda has applied its favored approach of behind-the-scenes capacity maneuvering, working primarily through senior envoys embedded with Jabhat al Nusra. ISIS, by contrast, has taken to the Internet with some of the most brutal jihadi content to date. In a break with tradition, Zawahiri began issuing his guidance and directives openly to bypass disobedient subordinates in September 2013, but it has largely failed to keep pace with ISIS in building a younger following.

Even American security officials believe it poses no threat

Browning 14 [Noah – staff writer, "Al Qaeda denies decline, acknowledges 'mistakes' by its branches", Reuters, 9/14/14, <http://www.reuters.com/article/2014/09/14/us-mideast-idUSKBN0H90MU20140914>] Schuler 26

Al Qaeda dismissed as "lies" a U.S. assessment that it is in decline, but a defiant online message issued by the network on Sunday made no mention of the ultra-hardline Islamic State group widely seen as its rival for the leadership of global jihad. "Whatever slip-ups or errors (regional branches)...may have committed are limited in number in the midst of mountains of good deeds and successes," said Hossam Abdul Raouf, an Egyptian veteran of the militant group. He said compensation and apologies had been given to unintended victimism but gave no details. Raouf, who served under assassinated leader Osama Bin Laden, said the group was expanding across the world. Al Qaeda faces a challenge to its leadership of the radical Islamist struggle with the West by the Islamic State group, and may be seeking to burnish its credentials as its rival girds for a fight to protect land it has seized in Iraq and Syria. The United States and Arab neighbors pledged to fight IS last week, and American warplanes have pounded its positions in Iraq for over a month. IS 'CALIPHATE' Islamic State's declaration of a "caliphate," or religious state over its lands has not been recognized by al Qaeda, which has produced a series of videos in recent weeks detailing its own activities but shying away from criticizing IS. IS released a video on Saturday night showing the beheading of a British hostage. The U.S. State Department in its annual terrorism report published in April said: "As a result of both ongoing worldwide efforts against the organization and senior leadership losses, AQ core's leadership has been degraded, limiting its ability to conduct attacks and direct its followers." The U.S. has repeatedly killed top al Qaeda leaders, including Bin Laden, in the group's haven on the Afghanistan-Pakistan border, where its leaders live under the protection of local

militants to whom they swear allegiance. Global affiliates of the group, however, have grabbed territory and harassed Western-backed governments in Somalia, Algeria and Yemen - attacking soldiers, bombing government installations and often killing civilians. "How then can al Qaeda have shrunken greatly and lost many of its senior leaders at a time when it is expanding horizontally and opening new fronts dependent on it?" Raouf said, although he said these groups had often erred. Al Qaeda fell out with IS - whose roots lie in Iraq - in 2013 over its expansion into Syria, where the militants have carried out beheadings, crucifixions, and mass executions. The global group's leader, Ayman al Zawahiri, designated the Nusra Front, another jihadi group which has clashed with IS, its representative in Syria. Counter-terrorism experts say al Qaeda's aging leadership is struggling to compete for recruits with Islamic State, which has galvanized young followers, seized advanced weapons from Iraqi and Syrian forces while accruing a vast store of cash.

The era of Al Qaeda inspired domestic terror is over – it lacks America propaganda experts

Berger 4/23 [J.M. - a nonresident fellow in the Project on U.S. Relations with the Islamic World at Brookings and the author of "Jihad Joe: Americans Who Go to War in the Name of Islam" and "ISIS: The State of Terror". "Al Qaeda's American Dream Ends", Politico Magazine, 4/23/15, <http://www.politico.com/magazine/story/2015/04/al-qaeda-adam-gadahn-isis-rebirth-americans-recruited-to-isil-117285.html#.VZBUvPIVhBc>] Schuler 27

The public first met Adam Gadahn in October 2004, under the name "Azzam the American," in an Al Qaeda video Q&A that seems almost quaint by today's gruesome standards. Gadahn's real name and strange life story soon emerged. A Jew raised on a California goat farm who dabbled in heavy metal before converting to Islam and subsequently joining Al Qaeda, he became one of the most prominent members of the pantheon of Americans in the terror group. Although his story was covered with breathless shock by many media outlets, Gadahn was hardly the first American to find a home and a cause in Al Qaeda. Americans had been present in the group since the days of its founding, frequently in senior operational roles. It was said that Osama bin Laden had a predilection for American recruits, and Americans played a key role in the first major terrorist attack Al Qaeda carried out from start to finish, the 1998 East African Embassy bombings. In many respects, however, the rise and decline of Gadahn mirrors the trajectory of Al Qaeda after September 11, as well as those of the other Americans who were caught up in its wake. Gadahn had joined Al Qaeda not long before 9/11, working as a translator at first, but eventually playing a much more substantial role in its media division. Under his tutelage, or at least with his collaboration, Al Qaeda began experimenting with digital distribution and modern styles of discourse. His voice narrated a documentary about the September 11 attacks called "The 19 Martyrs," which resembled a History Channel production in both its style and production values. He hosted a brief, aborted experimental news broadcast called "Voice of the Caliphate." Eventually, he became a significant spokesman in his own right, issuing threats against the American president while sitting at a desk with a coffee mug emblazoned with the logo of as-Sahab, Al Qaeda's media production company. Many of the techniques and approaches he pioneered have today been co-opted by the Islamic State, which has developed these ideas far more aggressively than Al Qaeda ever did. In the early days, the chief concern about Americans in the folds of Al Qaeda and its affiliates was that they would use their passports and their knowledge of the United States to carry out terrorist attacks on the homeland. And while there were very real examples of such efforts, the outsized impact of U.S. citizens was consistently seen in media operations, as with the American cleric Anwar Awlaki and his American protégé, Samir

Khan, who together created the much-heralded Inspire magazine, the English-language vehicle of Al Qaeda in the Arabian Peninsula. Although Inspire was in many ways derivative, it nevertheless had a wide-ranging impact and has benefited greatly from often-overblown media coverage, which was in turn enhanced by the fact that it was produced by Americans. As Ayman al Zawahiri famously wrote, more than half of the battle of terrorism takes place in the media, and Al Qaeda and its affiliates quickly absorbed the fact that its American recruits commanded a disproportionate share of the media's attention. At one point, AQAP proposed that Awlaki should take over as leader of the organization, because he produced such a windfall of media coverage. In Somalia, Al Qaeda ally (and later affiliate) al Shabab reaped similar benefits from one of its American recruits, an Alabama native named Omar Hammami. A video that featured Hammami preaching and improbably rapping about the benefits of jihad proved so popular that the group released several other raps under his name, although it later turned out they had been recorded by other Americans after Hammami declined to reprise his role. But with the media coverage came scrutiny and enhanced counterterrorism efforts. In 2011, Awlaki and Samir Khan were killed in a U.S. drone strike, silencing two of the most important American voices advocating for Al Qaeda. Inspire magazine continued after their deaths, but at a reduced level of effectiveness. Hammami's fate proved even more awkward for Al Qaeda. In 2012, Hammami made a dramatic and public split with al Shabab, detailing a number of grievances, including corruption, the mistreatment of foreign fighters, and, significantly, the assassination of Al Qaeda operatives sent to Somalia in an effort to establish lines of control over the insurgent group. After opening this can of worms and stirring a substantial controversy within and around al Shabab, Hammami was ambushed and killed by the Somali jihadist group in 2013. Like his fellow American in Somalia, Gadahn also proved to be a gadfly within Al Qaeda, although he kept his complaints behind closed doors, writing lengthy, scathing memos about the low quality of recruits on jihadist internet message boards and the excessive and indiscriminate violence of Al Qaeda in Iraq, the predecessor to the Islamic State group, commonly known today as ISIS or ISIL. In early 2014, ISIL leaked an Arabic-language video in which Gadahn issued a blistering criticism of the group, as well as a lightly veiled criticism of the killing of Omar Hammami and other Shabab dissidents. Gadahn's death marks, in some ways, the end of an era for the Americans of Al Qaeda. Its most-visible American recruits have been killed by U.S. counterterrorism actions or betrayed by their fellow jihadists. And the media innovations that Gadahn, Awlaki and Khan brought to the terrorist organization have now been thoroughly co-opted and surpassed by Al Qaeda's bitter rival, the Islamic State. As Al Qaeda's media output slowly dried up, limited to a trickle of extremely basic talking head videos and sporadic English-language magazine releases, ISIL took up the template Gadahn, Awlaki and Khan had painstakingly hammered out and created a media empire to outperform Al Qaeda in both quality and quantity, pushing out content on a weekly, sometimes daily basis, and blazing a trail onto a social media battlefield where Al Qaeda had only scraped the surface. The stark disparity in output between the two groups highlighted the growing gap in popularity and influence between the old guard and the new guard.

AT//Al-Shabaab

Their influence is regional Bergen '15

[Peter is a CNN National Security Analyst. "How big of a threat is Al-Shabaab to the United States?"
February 23, 2015 <http://edition.cnn.com/2015/02/22/opinion/bergen-al-shabaab-threat>]

How big a threat is Al-Shabaab to the United States? Despite the Somali terrorist group's calls over the weekend for attacks on malls in the West, including the vast Mall of America in Minnesota, the group isn't much of a threat at all to Americans. The reality is that Al-Shabaab has shown scant abilities to conduct operations outside of Somalia or neighboring countries such as Kenya. Indeed, the only operation anyone associated with the group has attempted in the West is when a Somali man armed with an ax in 2010 forced himself into the home of Kurt Westergaard -- a Danish cartoonist who had depicted the Prophet Mohammed with a bomb in his turban -- and tried unsuccessfully to break into the fortified safe room where Westergaard was hiding. Danish intelligence officials said the suspect had links with Al-Shabaab. That said, the group has succeeded in recruiting a number of Americans to fight in Somalia, most of whom are from Minnesota. Seven Somali-American men traveled from Minnesota to Somalia to fight for Al-Shabaab in late 2007, including Shirwa Ahmed, who graduated from high school in Minneapolis and then worked at the Minneapolis airport pushing passengers in wheelchairs. During this period, he became increasingly religious, and in his spare time, he would counsel drunken Somali kids in the impoverished area of Minneapolis known as "Little Mogadishu," after the Somali capital, to embrace their own culture. Ahmed left Minneapolis for good on December 4, 2007, on a flight that took him to Saudi Arabia, from where he eventually made his way to Somalia. In Somalia, he was trained by Al-Shabaab on the use of a wide variety of guns and weapons. On October 29, 2008, he drove a truck loaded with explosives toward a government compound in Puntland, northern Somalia, blowing himself up and killing 20 other people, becoming what then-FBI director Robert Mueller described as the first U.S. citizen to conduct a terrorist suicide bombing. Ahmed's suicide caused considerable consternation at the FBI. If an American citizen was willing to die in a suicide operation overseas, what might that say about the possibility of Americans conducting suicidal attacks in the States? One only had to look at the British experience to understand how this could develop. In 2003, a British citizen had conducted a suicide bombing at a jazz club frequented by Americans in Tel Aviv, Israel. This turned out to be something of a curtain-raiser for future terrorist attacks in the United Kingdom. Two years after the terrorist attack in Israel, four British citizens committed suicide in bombings on London's transportation system on July 7, 2005. It was the most deadly terrorist attack ever on British soil, claiming 52 lives. Alarmed by Al-Shabaab's campaign of suicide attacks across Somalia and its recruitment of Americans, the State Department designated the group as a foreign terrorist organization in March 2008, making it illegal for a person in the United States to knowingly provide Al-Shabaab with money, communications equipment, weapons or explosives or to join the group. By 2008, the Somali-Americans traveling to their homeland to join the al Qaeda aligned Al-Shabaab seemed like a particularly threatening cohort. Codenamed Operation Rhino, the FBI started a serious effort to crack down on anyone traveling to Somalia to support Al-Shabaab. Adding to the alarm at the FBI, in early June 2011, the agency announced that Farah Mohamed Beledi, from Minneapolis, had detonated a bomb, becoming one of two suicide attackers responsible for killing two African Union soldiers in Somalia. The third American to conduct a suicide attack was Abdulsalan Hussein Ali, a 22-year-old from Minneapolis who took part in a strike on African Union troops in Mogadishu on October 29, 2011. There may even have been a fourth American suicide attacker in Somalia. On September 17, 2009, two stolen U.N. vehicles loaded with bombs blew up at Mogadishu airport, killing more than a dozen peacekeepers of the African Union. The FBI suspected that 18-year-old Omar Mohamud of Seattle was one of the bombers. But Al-Shabaab's American support network has extended beyond Minnesota. Ruben Shumpert, an African-American convert to Islam from Seattle, was killed in Somalia in 2008. And a former U.S. soldier from Maryland, Craig Baxam, was arrested by Kenyan authorities in 2011 as he tried to make his way to Somalia to join Al-Shabaab, which he told FBI agents he considered to be a religious duty. Still, despite these developments, for the Americans who traveled to Somalia to fight for Al-Shabaab, it has typically been a one-way ticket. More than a dozen Americans have died while fighting for Al-Shabaab, according to a U.S. House Committee on Homeland Security report, while none of the Americans recruited by Al-Shabaab is known to have subsequently planned or conducted a terrorist attack inside the United States, according to a survey of more than 250 jihadist terrorism cases since the 9/11 attacks conducted by New America. The possibility remains, of course, that Al-Shabaab's calls for attack on malls in the West might inspire a lone wolf attack. But there is no sign so far that Al-Shabaab's recruits have actually plotted to launch an attack in the United States. For now, at least, the group has also not shown that it is capable of carrying out attacks in the West.

They cannot even leave Somalia to even launch an attack on the US The Economist 3/1

[The Economist. "Why Shabab poses little threat to American malls" March 1, 2015
<http://www.economist.com/blogs/economist-explains/2015/03/economist-explains>]

Shabab has never launched a successful attack outside East Africa and is less likely than ever to do so now. The 22,000-strong African Union force in Somalia has beaten the Islamists back from Mogadishu and a string of other towns, choking its sources of income and restricting its movement, while American drone strikes have killed senior commanders including the group's leader Ahmed Abdi Godane (who

makes a very rare cameo at the end of the new video). Minnesota, Edmonton and London are all named because of their large Somali communities, and the video's masked narrator, who appears in many Shabab productions, exhorts followers to "hurry up, hasten towards heaven and do not hesitate." But the call is unlikely to be answered. In the battle for publicity—and recruits—**Shabab has lost ground to fellow jihadists of the Islamic State of Iraq and Syria (ISIS) and Nigeria's Boko Haram, and its popularity abroad is waning. Shabab is losing on the battlefield and in the media.** Its brutality looks almost old-fashioned in comparison to the actions of IS. Under new leader Sheikh Ahmad Umar the group has continued to launch suicide attacks at home in Somalia, most recently killing 25 people at a hotel in Mogadishu, and has stepped up sectarian killings in Kenya. **There is little doubt Shabab will remain a regional threat for some time to come, but its danger to the West is limited.**

AT//Bioterror

Synthetic biology is too complex for terrorist groups

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King's College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King's College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King's College London. "The myths (and realities) of synthetic bioweapons", Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 29

Synthetic biology is not easy. The assumption that synthetic biology makes it easy for anybody to "engineer biology" is not true. The underlying vision holds that well-characterized biological parts can be easily obtained from open-source online registries and then assembled, by people with no specialist training outside professional scientific institutions, into genetic circuits, devices and systems that will reliably perform desired functions in live organisms. This vision, however, does not even reflect current realities in academic or commercial science laboratories, let alone the situation facing people with no specialist training who work outside professional scientific institutions. Academic and commercial researchers are still struggling with every stage of the standardization and mechanization process. Even if the engineering approaches offered by synthetic biology make processes more systematic and more reproducible, skills do not become irrelevant, and all aspects of the work do not become easier. Certainly, advances in synthetic biology do not make it easier for anybody to engineer biological systems, including dangerous ones. An analogy to aeronautical engineering is useful: Planes are built from a large number of well-characterized parts in a systematic way. But this does not mean that any member of the general public can build a plane, make it fly, and use it for commercial transportation.

Do-it-yourself biology does not pose a threat

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King's College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King's College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King's College London. "The myths (and realities) of synthetic bioweapons", Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 30

Do-it-yourself biology is not particularly sophisticated. Developments in synthetic biology are seen to be closely associated with the growth of the do-it-yourself bio-community, and some observers have expressed concerns that do-it-yourselfers could offer knowledge, tools, and equipment to bioterrorists seeking to do harm. But the link between synthetic biology and DIYbio, and the level of sophistication of the experiments typically being performed, is grossly overstated. Do-it-yourself biologists typically comprise a wide range of participants of varying levels of expertise, ranging from complete novices with no prior background in biology to trained scientists who conduct experiments in their own time. Some do-it-yourself biologists work in home laboratories assembled from everyday household tools and second-hand laboratory equipment purchased online; the majority conduct their experiments in community labs or "hackerspaces." Studies of scientific practice in community labs demonstrate the challenges that amateur biologists face while trying to successfully conduct even rudimentary biological experiments. These amateurs particularly lack access to the shared knowledge available to institutional

researchers, highlighting the importance of local, specialized knowledge and enculturation in laboratory practices.

Designing a virus is impossible for terrorists

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King’s College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King’s College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King’s College London. “The myths (and realities) of synthetic bioweapons”, Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 31

Building a dangerous virus from scratch is hard. DNA synthesis is one of the key enabling technologies of synthetic biology. There are now a number of commercial companies that provide DNA synthesis services, so the process can be out-sourced: A client can order a DNA sequence online and receive the synthesized DNA material by post within days or weeks. The price charged by these companies has greatly reduced over the last 20 years and is now around 3 cents a base pair, which puts the cost within reach of a broad range of actors. This has led to routine statements suggesting that it is now cheap and easy to obtain a synthesized version of any desired DNA sequence. There are however several challenges that need to be taken into account when assessing the potential for misuse that inexpensive DNA sequencing might enable. Even specialized DNA synthesis companies cannot easily synthesize, de novo, any desired DNA sequence. Several commercial companies provide routine gene synthesis services for sequences of less than 3,000 base pairs, but length is a crucial factor; the process is error prone, and some sequences are resistant to chemical synthesis. A number of entirely new synthesized DNA fragments would have to be assembled to produce a full genome, and, even if doing so were not already regulated by guidelines, simply ordering the full-length genome sequence of a small virus online is not possible. Ordering short DNA sequences and assembling them into a genome requires specialist expertise, experience, and equipment available in academic laboratories but not easily accessible to an amateur working from home. For longer sequences, assembly of DNA fragments becomes the crucial step. This was the major technological feat in the work conducted at the J. Craig Venter Institute that produced a “synthetic” bacterial genome, and the Gibson assembly method developed for that project is now widely used. The description of that work, however, demonstrates how the assembly of smaller fragments into larger ones and eventually into a functioning genome requires substantial levels of expertise and resources, including those needed to conduct trouble-shooting experiments to identify and correct errors when assembled DNA constructs do not perform as expected. Constructing a genome-size DNA fragment is not the same as creating a functional genome. In particular, ensuring the desired expression of viral proteins is a well-documented, complex challenge.

Terrorists lack experts – and even they have a hard time enhancing pathogens

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King’s College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King’s College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King’s College London. “The myths (and realities) of synthetic bioweapons”, Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 32

Even experts have a hard time enhancing disease pathogens. Some observers have also expressed concerns that synthetic biology could be used to enhance the virulence or increase the transmissibility of known pathogens, creating novel threat agents. Mousepox and bird flu (H5N1) experiments are frequently cited to demonstrate how dangerous new pathogens could be designed. But assessments of this threat tend to overlook a salient fact: In both these experiments, the researchers did not actually design the pathogens. With respect to H5N1, researchers had indeed been trying to design an air-transmissible virus variant for some time, without success. The ferret experiment was set up as an alternative approach, to see whether natural mutations could generate an air-transmissible variant. The researchers had no influence on the specific mutations induced. In the mousepox experiment, researchers inserted the gene for interleukin-4 into the mousepox virus to induce infertility in mice and serve as an infectious contraceptive for pest control. The result—that the altered virus was lethal to mice—was unanticipated by the researchers. In other words, it was not planned. Moreover, some of the key lessons that came out of the extensive Soviet program to weaponize biological agents involve the trade-offs between improving characteristics that are “desired” in the context of a bioweapons program—such as virulence—and diminishing other equally “desired” characteristics, such as transmissibility or stability. Pleiotropic effects—that is, when a single gene affects more than one characteristic—and genetic instability are common in microorganisms. While it is too simple to say that increased transmissibility will always be associated with reduced virulence, this is often the case for strains produced in laboratories. Bioterror Impact D

If terrorists can even make bioweapons medical countermeasures stop worst effects and empirics prove the impact is minimal

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King’s College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King’s College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King’s College London. “The myths (and realities) of synthetic bioweapons”, Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 33

The bioterror WMD myth. Those who have overemphasized the bioterrorism threat typically portray it as an imminent concern, with emphasis placed on high-consequence, mass-casualty attacks, performed with weapons of mass destruction (WMD). This is a myth with two dimensions. The first involves the identities of terrorists and what their intentions are. The assumption is that terrorists would seek to produce mass-casualty weapons and pursue capabilities on the scale of 20th century, state-level bioweapons programs. Most leading biological disarmament and non-proliferation experts believe that the risk of a small-scale bioterrorism attack is very real and present. But they consider the risk of sophisticated large-scale bioterrorism attacks to be quite small. This judgment is backed up by historical evidence. The three confirmed attempts to use biological agents against humans in terrorist attacks in the past were small-scale, low-casualty events aimed at causing panic and disruption rather than excessive death tolls. The second dimension involves capabilities and the level of skills and resources available to terrorists. The implicit assumption is that producing a pathogenic organism equates to producing a weapon of mass destruction. It does not. Considerable knowledge and resources are necessary for the processes of scaling up, storage, and dissemination. These processes present significant technical and logistical barriers. Even if a biological weapon were disseminated successfully, the outcome of an attack would be affected by factors like the health of the people who are exposed

and the speed and manner with which public health authorities and medical professionals detect and respond to the resulting outbreak. A prompt response with effective medical countermeasures, such as antibodies and vaccination, can significantly blunt the impact of an attack.

Bioterror threats are exaggerated to justify political action

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King’s College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King’s College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King’s College London. “The myths (and realities) of synthetic bioweapons”, Bulletin of the Atomic Scientists, 9/18/14, <http://thebulletin.org/myths-and-realities-synthetic-bioweapons7626>] Schuler 34

More than sloppy shorthand. We have identified a number of assumptions that underlie policy discourse on the security threat posed by synthetic biology and characterized them as myths. Use of the term “myths” is not intended to imply falsity. We are not simplistically opposing myth and reality, and we are not arguing that there is no threat. Rather, we aim to convey the pervasiveness of misleading assumptions about both synthetic biology and bioterrorism that frequently underlie discussions about the dual-use threat of synthetic biology. In doing so, we hope to present some of the subtleties that frequently disappear from these discussions. We acknowledge that these particular myths have power and perform real functions; they mobilize support for resources and action to deal with the bioterror threat. The dominant narrative we describe influences the way in which the problem is defined, and, therefore, the kinds of solutions that are proposed. In short, these myths are real enough to influence policy in significant ways, which makes it all the more important to examine them more carefully than they have been in the run of public discourse to date.

Bioterror ineffective – too complex and dispersal is hard to predict

Jefferson, Lentzos, and Marris 14 [Catherine Jefferson is a researcher in the Department of Social Science, Health, and Medicine at King’s College London. Filippa Lentzos is a senior research fellow in the Department of Social Science, Health and Medicine at King’s College London. Claire Marris is a senior research fellow in the Department of Social Science, Health, and Medicine at King’s College London. “Synthetic Biology and Biosecurity: Challenging the “Myths”, Front Public Health, 8/21/14, <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC4139924/>] Schuler 38

Scaling up fragile microorganisms that are sensitive to environmental conditions and susceptible to change — and viruses are more sensitive than bacteria — has been one of the stiffest challenges for past bioweapons programs to overcome, even with appropriate expertise at hand. Scaling-up requires a gradual approach, moving from laboratory sample, to a larger laboratory quantity, to pilot-scale production, and then to even larger-scale production. During each stage, the production parameters need to be tested and often modified to maintain the lethal qualities of the agent; the entire scaling-up process can take several years (68). The dissemination of biological agents also poses difficult technical challenges. Whereas persistent chemical agents such as sulfur mustard and VX nerve gas are readily absorbed through the intact skin, no bacteria and viruses can enter the body via that route unless the skin has already been broken. Biological agents must either be ingested or inhaled to cause infection. To expose large numbers of people through the gastrointestinal tract, possible means of delivery are contamination of food and drinking water, yet neither of these scenarios would be easy to accomplish.

Large urban reservoirs are usually unguarded, but unless terrorists added massive quantities of biological agent, the dilution effect would be so great that no healthy person drinking the water would receive an infectious dose (66). Moreover, modern sanitary techniques such as chlorination and filtration are designed to kill pathogens from natural sources and would probably be equally effective against a deliberately released agent. Bacterial contamination of the food supply is also unlikely to inflict mass casualties. Cooking, boiling, pasteurization, and other routine safety precautions are generally sufficient to kill pathogenic bacteria. The most likely way to inflict mass casualties with a biological agent is by disseminating it as a respirable aerosol: an invisible cloud of infectious droplets or particles so tiny that they remain suspended in the air for long periods and can be inhaled by large numbers of people. A high-concentration aerosol of B. anthracis or some other pathogen, released into the air in a densely populated urban area, could potentially infect thousands of victims simultaneously. After an incubation period of a few days, depending on the type of agent and the inhaled dose, the exposed population would experience an outbreak of an incapacitating or fatal illness. Although aerosol delivery is potentially the most lethal way of delivering a biological attack, it involves major technical hurdles that most terrorists would be unlikely to overcome. To infect through the lungs, infectious particles must be microscopic in size – between 1 and 5 µm in diameter. Terrorists would therefore have to develop or acquire a sophisticated delivery system capable of generating an aerosol cloud with the necessary particle size range and a high enough agent concentration to cover a broad area. Overall, an important trade-off exists between ease of production and effectiveness of dissemination. The easiest way to produce microbial agents is in a liquid form, yet when such a “slurry” is sprayed into the air, it forms heavy droplets that fall to the ground so that only a small percentage of the agent is aerosolized. In contrast, if the bacteria are first dried to a solid cake and then milled into a fine powder, they become far easier to aerosolize, yet the drying and milling process is technically difficult. The Aum Shinrikyo cult struggled with dissemination (67, 69, 70). In one of its anthrax dissemination attempts, it sprayed unknown, but probably very large, quantities of a liquid aerosol (most likely crude culture, unprocessed in any way) of B. anthracis from the roof of the Aum’s headquarters building in Tokyo. For the dissemination, the Aum set up two sprayers on the roof of the eight-story building, each within a large round cooling tower. Pipes were extended from the cooling towers to tanks below, which were filled with a liquid suspension of B. anthracis. The device worked poorly, producing large droplets rather than the very fine aerosol needed for effective transmission of anthrax. It also appears the spore concentration was very low (at least five orders of magnitude below that necessary for a highly infectious wet aerosol). In another dissemination attempt, targeting the area around the Kanagawa prefectural office and the Imperial Palace, the Aum equipped vehicles with spraying devices, but according to prosecutors’ statements, the nozzle of the sprayer clogged and the operation failed. Despite its 200 m² laboratory containing, amongst other equipment, a glove box, incubator, centrifuge, drier, DNA/RNA synthesizer, electron microscope, two fermenters each having about a 2,000 litre capacity, and an extensive scientific library, and despite its repeated attempts at dissemination, the Aum was unsuccessful in causing any disease, and in retrospect it is clear that the cult did not even make the first substantive step toward an effective bioweapon. If, despite the odds, aerosolization was achieved, the effective delivery of biological agents in the open air is highly dependent on atmospheric and wind conditions, creating additional uncertainties. Only under highly stable atmospheric conditions would the aerosol cloud remain close to the ground where it can be inhaled, rather than being rapidly dispersed. Moreover, most microorganisms are sensitive to ultraviolet radiation and cannot survive more than 30 min in bright sunlight, limiting their use to night-time attacks. One major exception is anthrax, which

can be induced to form spores with tough outer coats that enable them to survive for several hours in sunlight. Terrorists could, of course, stage a biological attack inside an enclosed space such as a building, a subway station, a shopping mall, or a sports arena. Such an attack, if it involved a respiratory aerosol, might infect thousands of people, but even here the technical hurdles would by no means be trivial. Finally, even if a biological weapon had been disseminated successfully, the outcome of an attack would be affected by factors like the health of the people who are exposed to the agent, and the speed and manner with which public health authorities and medical professionals detected and were able to respond to the resulting outbreak. A prompt response with effective medical countermeasures, such as antibodies and vaccination, can significantly blunt the impact of an attack. Simple, proven ways to curtail epidemics, such as wearing face masks, hand washing, and avoiding hospitals where transmission rates might soar, can also prove effective in stemming the spread of a disease. Indeed, this aspect of a bioterrorism attack is often underplayed in scenarios like Tara O’Toole’s “Dark Winter” and “Atlantic Storm,” where the rates of contagion used are often significantly higher than those in historical cases of natural outbreaks (71).

Ebola scare catalyzed new bioterror measures

O’Grady 4/23 [Siobhán O’Grady is a fellow at Foreign Policy. “What Did the U.S. Learn From Ebola? How to Prepare for Bioterrorist Attacks”, The Cable, 4/23/15, <http://foreignpolicy.com/2015/04/23/what-did-the-u-s-learn-from-ebola-how-to-prepare-for-bioterrorist-attacks/>] Schuler 36

But in the United States, where major hospitals prepared for an outbreak, there were only four in-country diagnoses, one of which resulted in a death. And some see the urgency of that response as a lesson in how the government can prepare for another public health hazard: a bioterrorist attack. Arizona Rep. Martha McSally chairs a House subcommittee that will examine over the next few months the threat of bioterrorist attacks and U.S. preparedness to respond to them. She told Foreign Policy that even if a disease outbreak and the use of a biological agent in a coordinated attack are not completely analogous, the response strains similar systems. “We can learn lessons from other outbreaks that are naturally occurring,” she said. “We can identify weaknesses in our response and even if it wasn’t terrorism, it presses the system at the same level.” What McSally and her colleagues saw as the biggest failure in the response to Ebola within U.S. borders was lack of central command. Bureaucracy, she said, got in the way of providing an effective response for Americans nationwide. And that Ebola czar Obama named? “He was a messaging social operative more than anything,” McSally said. Leonard Cole, an expert in bioterrorism who also teaches at Rutgers Medical School, reiterated McSally’s concerns about comprehensive national protocol. In a conversation with FP, Cole noted that in New Jersey and California, for example, governors ignored Center for Disease Control guidelines and insisted those under observation for Ebola stay quarantined for a full 21 days. The CDC said monitoring was certainly necessary, but total quarantine wasn’t always required. According to Cole, that contradiction was a major breach of protocol for confronting a public health threat. “Rule No. 1 is there has to be an orderly and consistent manner of informing the public,” he said. In 2010, a commission set up to assess national

security responses gave the United States a failing grade on its ability to confront a bioterrorist threat. Today, McSally said, the United States is still only prepared to confront a fraction of the 15 potential biological agents that could be released in an attack. What the Ebola response taught the government, she said, was that effective communication isn't optional next time. And the White House needs to prioritize the naming of a single coordinator for agencies responsible for responding to such an attack. A biological threat from the Islamic State or al Qaeda is not necessarily immediate, McSally said, but there are three phases of biological attacks to take into account: isolation, weaponization, and dispersion of the agent. She said many U.S. cities currently would be left scrambling to respond. New York, for example, is better prepared for an attack or pandemic outbreak than other cities because its budget allows for trial runs of emergency response systems. But even New York would need a significant increase in federal funding to prepare its entire population for such a scenario. And then there are rural areas to take into account, which would face entirely different challenges. "We can't possibly expect every single hospital in every single rural area to have the ability to respond to this," she said. The solution, she thinks, might instead be setting up regional response stations and transportation systems that could evacuate those in need of medical help. Cole told FP that responding to anthrax scares in 2001 also prepared the United States for future attacks. But "honestly, the average physician is not thinking of anthrax or Ebola today," he said. McSally, who served 26 years in the Air Force, said preparation for a bioterrorist attack can only begin when Obama is willing to give someone the job. And trying to learn from mistakes made during the Ebola response sadly reminds her of an old military joke: "We call them lessons learned," she said. "But really they're just lessons identified until we actually learn from them.

AT//Chemical Terrorism

Zero risk – chemical agents are hard to use, impossible to manufacture, and the low number of historical instances of chemical terrorism proves it's an undesirable method

Dugan et al '14

[Laura. Assc Prof Criminology, Maryland. And Gary – Director National Center for the Study of Terrorism and Responses to Terrorism. And Erin – Manager of the Global Terrorism Database at Maryland. *Putting Terrorism in Context: Lessons from the Global Terror Database*, 2014. Pg 183-4]

Chemical and biological agents also pose serious challenges for those who would use them as weapons. First, while instructions on how to develop these agents can easily be found on the Internet and other public sources, safely manufacturing and dispersing these agents generally requires at least some training. As researcher Michael Kenney points out (2010), learning how to build sophisticated weapons based only on information available on the Internet has major limitations. If handled improperly, both chemical and biological agents can kill the attackers as easily as their intended targets. Second, effective dissemination of chemical and biological agents is highly dependent on the environment. Both types of agents can be rendered inert by exposure to heat or moisture, or through dissipation by wind. Moreover, both are most effective in enclosed areas where weather effects are absent, although a much larger amount of chemical agent is needed to equally impact the same area as a biological agent. Further, it is difficult to successfully contaminate water supplies because water effectively dilutes large concentrations of agents and what is left over is usually neutralized by water safety protocols (Gleick 2006; Purvcr 1995). Third, once released these weapons are difficult to control. In fact, this is a greater problem for biological than chemical agents because once biological agents start to spread, it is impossible to control their diffusion pathways. While this concern is less pronounced with chemical attacks, nonetheless, once chemical agents are released, attackers also lose control of who is actually affected (Puiver 1995). Finally, because the impact of chemical and biological weapons could be cataclysmic, attackers who decide to use these weapons risk undermining the legitimacy of their cause. For this reason, compared to others, terrorist organizations that have no constituency outside the organization, such as the apocalyptic group Aum Shinrikyo, may be more likely to deploy these agents. In fact, Aum Shinrikyo had already lost many of its followers once the group began preaching the benefits of facilitating the end of the world (Cronii 2000). In general, the development of biological weapons is far more advanced than chemical weapons; agents that produce sickness and infection and organic poisons have been around for centuries. Researchers Gary Ackerman and Victor Asal (2008) show that the use of biological weapons can be traced as far back as 190 BCE, when the Carthaginian general Hannibal reputedly catapulted venomous snakes onto enemy ships. Other early biological weapons include the use of *Mycobacterium leprae* (which causes leprosy), saliva from rabid dogs, and the variola virus (which causes smallpox). Likewise, examples of the use of chemical agents (such as poison) as weapons date back to the Macedonian and Roman Empires. Historians and toxicologists have long speculated that Alexander the Great was assassinated using some type of poison (Schep et al. 2014). Indeed, a group whose actions would likely be considered terrorism today, the Zealots, reportedly poisoned the Roman food and water supply in Jerusalem in order to undermine Roman officials and provoke a repressive response (Smith 2008). Despite the potential deadliness of chemical and biological agents, they have rarely been used by terrorist attackers over the past four decades. Of

the more than 113,000 attacks recorded in the GTD only 220 used chemical weapons and only 32 used biological weapons.⁹ The most commonly named chemical weapons recorded in the GTD are cyanide, unspecified acids and gases, mercury, and insecticides. While *Bacillus cinlhracis* (which causes anthrax) is the most common biological weapon in the GTD, salmonella, ricin, botulinum toxin, and HIV have also been used in terrorist attacks. The low frequency of chemical and biological attacks in the GTD strongly suggests that the problems of obtaining these weapons and the expertise needed to process and disperse them discourages or precludes most organizations from adopting this innovation in place of more conventional tactics. In other words, at this point in the diffusion cycle, the costs may be too high to attract users. ⁱⁱⁱ Figure 9.3 we present overall trends in the use of biological and chemical weapons (solid line, measured on left axis) compared to the overall number of the terror attacks in the GTD (dashed line, measured on right axis). While we see quite a bit of variation, the use of these nonconventional weapons has generally increased over time. In the 1970s and 1980s chemical and biological weapons were used an average of three times a year, for the 1990s usage rose to over seven times per year, and since the turn of the twenty-first century usage was approaching ten times per year. These trends reinforce the idea that so far chemical and biological weapons used in terrorism have not passed the early adoption stage. In fact, we see that the year 2001, with 27 attacks, had the single largest annual number of chemical and biological attacks in the GTD - but a tiny fraction of total annual attacks in the database. Because these attacks are relatively rare, a series of coordinated events in which a perpetrator sends numerous letters or packages containing chemical or biological agents to various targets within a short period of time can have a big impact on the overall trend. Thus, the two major points drawn from Figure 9.3 are that the use of chemical and biological weapons in terrorism is relatively rare; however, consistent with overall patterns of terrorism.

AT//Cyberterror

No risk or impact related to cyberterror

BICCHIERAI 5/18/15 [LORENZO FRANCESCHI - staff writer at VICE Motherboard in Brooklyn, New York, where he covers hacking, information security, and digital rights. "The 'ISIS Cyberwar' Hype Machine Is Doing More Harm Than Good", MotherBoard,]

Yet, that didn't stop a new round of breathless hype. On Sunday, The Hill wrote that ISIS was preparing for "cyberwar" and an "all-out cyber crusade." Looks like ISIS wannabes successfully hacked the media once again. "Toss out a shitty video that claims that you do things that you're not—doesn't matter, we'll still overreact," Peter W. Singer, an author and well-known expert in cybersecurity, told Motherboard. Instead of responding with a "keep calm and carry on" attitude "we lose our shit." That being said, it's worth pointing out that ISIS could do real damage by doing espionage online, monitoring and tracking down dissidents who live in ISIS-controlled territories. That might have already happened. Last November someone targeted a Syrian citizen media group known as Raqqa Is Being Slaughtered Silently (RSS), which documents human rights crimes in Raqqa, the self-proclaimed capital of the ISIS caliphate. To date, however, there hasn't been a case of actual cyberterrorism—an act targeting computers systems that result in physical violence, as the FBI defines it. In fact, squirrels have been way more damaging to US critical infrastructure than cyberterrorists. Singer criticized the article, which he said is good for a "cyber laugh." But jokes apart, Singer warned that hyping ISIS hacking abilities rewards the group with useful attention that it can turn into recruiting power. Instead of responding with a "keep calm and carry on" attitude, Singer added, "we lose our shit." This encourages and incentivizes ISIS to keep attacking, or at least claim attacks—something that doesn't help anyone. Robert M. Lee, an active duty Air Force cyber warfare operations officer, agreed with Singer, and dismissed the hype on Twitter. "Terrorist groups will continue to use the internet to spread their message and perform hacktivist-type acts but nothing of significant damage," he wrote. "Performing significant damage requires more than just internet connected devices. It requires advanced logistical support and expertise." **"Describing savvy use of social media as cyberwar is akin to describing Miley Cyrus as the Clausewitz of cyberwar."** In other words, being good at social media, as ISIS is, doesn't mean you'll be a good hacker. The truth, as we reported before, is that all the cyberattacks attributed to ISIS in the recent past have been unsophisticated attacks carried out by what looks like online fanboys not at all affiliated with the group. As Singer put it, "it's either sympathizers or people doing it for shits and giggles." As Singer explained in 2012, "cyberterrorism" is overhyped, just like our obsessive fear of sharks. As he put it, we are "15,000 times more likely to be hurt or killed by an accident involving a toilet," yet Discovery Channel has Shark Week and not Toilet Week.

Cyberattacks have no impact

Lee 15 [Robert - a US Cyber Warfare Operations Officer, and is studying for a PhD in Cyber Security at King's College London. "Is cyber-warfare really that scary?", BBC News, 5/6/15, <http://www.bbc.com/news/world-32534923>] Schuler 48

"A lot of my research debunks stories. I can't cite them because they're not true. There's a general narrative that horrible things are happening all the time: cyber-war, nation states are crumbling. That's not true. "If you hear, 'There's been some recent research around aviation and planes are going to be hacked and fall out of the sky,' or, 'People are going to cyber-attack trains and derail them,' that's not

realistic. "Security companies are ramping up the threat. The military's relabelled a lot of things 'cyber-warfare' because they want to get the budget from Congress. Nato and the different alliances ramp up the threat to encourage other countries to invest in security. "One of the narratives that gets built around critical infrastructure is that we're going to have these cascading power failures; someone's going to break in and very easily take down the power grid. While it's true there's vulnerable infrastructure, you can't just take down the entirety of the power grid from a cyber-capability. "[And] we all have the same threat. If the US wants to be able to do that against Russia, or China wants to do that against the US, they have to accept their own vulnerability and do things that would impact themselves as well. "The head of Cyber Command and the head of the National Security Agency say, 'OK, we need to invest in offensive capabilities to be able to secure our critical infrastructure'. Those capabilities trickle down to fringe groups. "If you developed a cyber-capability that could take down the Chinese power grid, it would be nearly identical to the capability you would need to take down the US power grid. We use the same systems. The hype is forcing us to look into offence, which is exactly what we should not be doing. "We actually saw a very concerning case recently, where a company said, 'Iran, they're attacking the US hundreds of thousands of times a year'. But they redefined 'attack': they used ways of describing the events in a way that no-one else in the security world support. The way they framed it was very dangerous."

No meaningful cyberterrorism – your impact artificially inflates the risk Benson '14

[David, PhD candidate at University of Chicago, MA in International Relations from University of Chicago, fellow at Chicago Project on Security and Terrorism "Why the Internet is Not Increasing Terrorism", Security Studies, Spring 2014, Taylor and Francis]

When evaluating the effect of the Internet on transnational terrorism, existing empirical assessments examine individual terrorist attacks and establish how terrorists have used the Internet to plan and execute their attacks. Unsurprisingly, such methods show that terrorists have indeed used the Internet in committing terrorist attacks. Since the Internet is ubiquitous, it would be strange if today's terrorists did not use the Internet, just as it would be strange if past terrorists did not use the postal service or telephones. Presence of the Internet does not, however, demonstrate a causal effect. There are three reasons the established approach has led to spurious findings. First, by looking only at cases of completion or near completion and showing only that the Internet was present, these studies have no variation on either the independent variable or dependent variable and cannot demonstrate that a change in the purported cause influences the outcomes. Second, when attempting to show that the Internet causes terrorism, merely establishing that the Internet played a role does not preclude the possibility the terrorists were first motivated offline to attack and only later used the Internet as one tool among many to attempt to carry out that attack. Third, the established analysis ignores an important intervening variable, namely state use of the Internet. As a result, such studies neglect to consider that the effectiveness of terrorism is not due to the terrorists alone, but to a strategic interaction between the state (or counterterrorists) and terrorists. As these weaknesses indicate, the key empirical question is not whether the Internet has been used in some terror attacks, but whether the Internet has benefited terrorists more than governments and other counterterrorists. Both terrorists and counterterrorists have benefited from the Internet in absolute terms, but this is insufficient to demonstrate the Internet's causal impact (or the lack thereof) for either. In order to assess the belief

that the Internet is helping terrorists on its own terms and compare that belief to the new theory offered in this article, the empirical implications of each must be established first and then applied to the world as observed. Importantly, the evidence must be examined with variation in both independent and dependent variables, account for use of the Internet by terrorists and by the state, and include negative cases to determine the net effect of the Internet on transnational terrorism.

Cyberterror happens all the time – but the *really catastrophic attacks* are impossible to pull off

Singer '12

(Peter Singer, Director, 21st Century Defense Initiative, Senior Fellow, Foreign Policy, November 2012, "The Cyber Terror Bogeyman", Brookings, <http://www.brookings.edu/research/articles/2012/11/cyber-terror-singer>, SS)

About 31,300. That is roughly the number of magazine and journal articles written so far that discuss the phenomenon of cyber terrorism. Zero. That is the number of people that who been hurt or killed by cyber terrorism at the time this went to press. In many ways, cyber terrorism is like the Discovery Channel's "Shark Week," when we obsess about shark attacks despite the fact that you are roughly 15,000 times more likely to be hurt or killed in an accident involving a toilet. but by looking at how terror groups actually use the Internet, rather than fixating on nightmare scenarios, we can properly prioritize and focus our efforts. Part of the problem is the way we talk about the issue. The FBI defines cyber terrorism as a "premeditated, politically motivated attack against information, computer systems, computer programs and data which results in violence against non-combatant targets by subnational groups or clandestine agents." A key word there is "violence," yet many discussions sweep all sorts of nonviolent online mischief into the "terror" bin Various reports lump together everything from Defense Secretary Leon Panetta's recent statements that a terror group might launch a "digital Pearl Harbor" to Stuxnet-like sabotage (ahem, committed by state forces) to hacktivism, WikiLeaks and credit card fraud. As one congressional staffer put it, the way we use a term like cyber terrorism "has as much clarity as cybersecurity — that is, none at all." Another part of the problem is that we often mix up our fears with the actual state of affairs. Last year, Deputy Defense Secretary William Lynn, the Pentagon's lead official for cybersecurity, spoke to the top experts in the field at the RSA Conference in San Francisco. "It is possible for a terrorist group to develop cyber-attack tools on their own or to buy them on the black market," Lynn warned. "A couple dozen talented programmers wearing flip-flops and drinking Red Bull can do a lot of damage." The deputy defense secretary was conflating fear and reality, not just about what stimulant-drinking programmers are actually hired to do, but also what is needed to pull off an attack that causes meaningful violence. The requirements go well beyond finding top cyber experts. Taking down hydroelectric generators, or designing malware like Stuxnet that causes nuclear centrifuges to spin out of sequence doesn't just require the skills and means to get into a computer system. It's also knowing what to do once you are in. To cause true damage requires an understanding of the devices themselves and how they run, the engineering and physics behind the target. The Stuxnet case, for example, involved not just cyber experts well beyond a few wearing flip-flops, but also experts in areas that ranged from intelligence and surveillance to nuclear physics to the engineering of a specific kind of Siemens-brand industrial equipment. It also required expensive tests, not only of the software, but on working versions of the target hardware as well. As George R. Lucas Jr., a professor at the U.S. Naval Academy, put it, conducting a truly mass-scale action using cyber means "simply outstrips the intellectual, organizational and personnel capacities of even the most well-funded and well-organized terrorist organization, as well as those of even the most sophisticated international criminal enterprises." Lucas said the threat of cyber terrorism has been vastly overblown. To be blunt, neither the 14-year-old hacker in your next-door neighbor's upstairs bedroom, nor the two- or three-person al-Qaida cell holed up in some apartment in Hamburg are going to bring down the Glen Canyon and Hoover dams," he said.

No cyber terror – too expensive

Conway, 14 (Maura, Professor at the School of Law and Government at Dublin City University, 5/26/14, “Reality Check: Assessing the (Un)Likelihood of Cyberterrorism”, http://link.springer.com/chapter/10.1007/978-1-4939-0962-9_6) KW

6.3.1 Cost Factor

Even though exact figures are difficult to obtain, one thing is clear, car bomb construction is cheap. The first World Trade Centre attack in 1993 killed six people and injured more than a thousand; the truck bomb is estimated to have cost \$400 to construct (Giacomello 2004 :397). In April 1995, the Oklahoma City bombing, which prior to 9/11 was the largest terrorist attack on US soil in history, killed 168 people. It is estimated to have cost less than US\$5,000, which was outlaid for fertiliser, fuel, and van rental fees (Michel and Herbeck 2001 :176). The 9/11 attacks— although not strictly VBIED attacks—were also relatively cheap to carry out; the 9 / 11 Commission Report estimated that it cost just \$400,000–\$500,000 in total financing over nearly 2 years, including living expenses for and other payments to the 19 hijackers (2004:172; see also Wilson 2014). VBIED attacks are commonplace in on-going conflicts, such as in Iraq and Afghanistan. The US Department of Defense’s Joint Improvised Explosive Device Defeat Organisation (JIEDDO) estimated that the average cost to construct a car bomb in Afghanistan in 2006—the most recent year for which such information is (publicly?) available—was just \$1,675 (Ackerman 2011). ¶ If the exact cost of VBIED construction is difficult to estimate due to the diversity of components used, significant cost disparities depending on where the vehicle and/or other components are purchased, and so forth, the challenge of estimating the cost of a potential cyberterrorism attack is exponentially greater. Giampiero Giacomello nevertheless engaged in a speculative analysis that addressed precisely this issue in 2004 . In his ‘Bangs for the Buck: A Cost-Benefit Analysis of Cyberterrorism,’ Giacomello considered the cost of two common cyberterrorism scenarios: a cyber attack on a hydroelectric dam and a cyber attack on air traffic control systems. He estimated the cost of the dam attack at \$1.2–1.3 million with potential fatalities of between 50 and 100 and the cost of the air traffic attack at \$2.5–3 million with the potential for 250–500 casualties (Giacomello 2004 :397– 398). The dam attack, he pointed out, “would look like an attractive investment, if it were not the case that a suicide bomber would cause roughly the same amount of casualties at a fraction of that cost” (Giacomello 2004 :397). Now consider that according to the author of the definitive analysis of Stuxnet, testing for that attack “must have involved a fully-functional mock-up [uranium enrichment test bed] operating with real uranium hexafluoride” (Langner 2013 :20). This puts the cost of just a portion of that attack at (conservatively) tens of millions of dollars. There is every appearance therefore that Giacomello got it right when he concluded that on the basis of financial considerations alone “cyberterrorism would be a highly inefficient solution for terrorists, due to high costs and meagre returns” (2004 :388).

No cyberterror – too difficult

Conway, 14 (Maura, Professor at the School of Law and Government at Dublin City University, 5/26/14, “Reality Check: Assessing the (Un)Likelihood of Cyberterrorism”, http://link.springer.com/chapter/10.1007/978-1-4939-0962-9_6) KW

6.3.2 Complexity Factor

VBIEDs are relatively simple to build and deliver. Bicycles, scooters, motorcycles, cars, vans, mini-buses, trucks, and tankers are everywhere. Many people own small vehicles and so are already in possession of an important component of the finished device; larger vehicles can be bought, rented, or stolen. In terms of a delivery mechanism, VBIEDs are highly innocuous and therefore difficult to guard against. Fertiliser is the other major component of many VBIEDs. Large amounts of it can still be purchased easily

(and relatively cheaply) due to its wide legitimate use in agriculture, despite governments' efforts to place curbs on sales of large amounts due to its explosive capacities. A great many groups and individuals have the necessary expertise to themselves construct and/or to educate others how to construct VBIEDs. These include members or former members of terrorist organisations, such as Hamas, Hizbollah, the Liberation Tigers of Tamil Eelam (LTTE), and the Provisional IRA, and increasing numbers of violent jihadi bomb-makers active in Afghanistan, Iraq, and elsewhere. Individuals with no known links to any terrorist organisation have also demonstrated the capacity for VBIED-construction; these include Timothy McVeigh and Terry Nichols, the perpetrators of the Oklahoma City bombing, and Anders Breivik, who deployed a VBIED against government offices in Oslo, Norway on 22 July, 2011 that killed 8 people and injured over 200.

There has been heightened concern amongst policymakers, law enforcement agencies, and others since the 9/11 attacks regarding the proliferation of "how to" information online devoted to explaining, amongst other things, the technical intricacies of making VBIEDs. In fact, as early as 1997, the US Department of Justice had concluded that the availability of bomb-making information played a significant role in facilitating terrorist and other criminal acts (pp.'s 15–16). Today, there is easy online access to various types of forums and content containing bombmaking information. The level of threat posed by this remains a source of debate with some commentators insisting that legislation must be put in place to outlaw such online content, and others pointing out both that this material is already easily accessible in bookstores and libraries (Leonard 2013) and also that much of the information is unreliable or simply wrong (Kenney 2010). Sophisticated terrorist organizations do not need to rely on the Internet for developing their bomb-making skills, but disaffected individuals prepared to use terrorist tactics to advance their politics, of whatever stripe, appear to have increasing recourse to online content. While Faisal Shazad, the failed Times Square car-bomber, is said to have travelled to acquire his bomb-making skills in Pakistan where he received 3–5 days of training (Hoffman 2010 :3), Anders Breivik produced a new type of fertiliser bomb through combining knowledge from different recipes he located on the Internet (Aasland Ravndal 2012 :17). The main point here is that rudimentary bomb-making skills can be easily and quickly obtained in a number of different ways. On the other hand, the failed Times Square attack, along with the failed car bomb attacks planned and carried out by medical doctors in central London and at Glasgow airport in June 2007, shows that even relatively unsophisticated real-world attacks have a level of difficulty and are routinely unsuccessful. Cyberterrorism can be expected to have an exponentially greater margin of difficulty.

In a March 2010 speech, then FBI Director (2001–2013) Robert Mueller observed "Terrorists have shown a clear interest in pursuing hacking skills. And they will either train their own recruits or hire outsiders, with an eye toward combining physical attacks with cyber attacks." That may very well be true, but 'wanting' to do something is quite different from having the ability to do the same. Violent jihadis' IT knowledge is not superior to the ordinary public. Research found that of a random sampling of 404 members of violent Islamist groups, 196 (48.5 %) had a higher education, with information about subject areas available for 178 individuals. Of these 178, some 8 (4.5 %) had trained in computing, which means that out of the entire sample, less than 2 % of the jihadis came from a computing background (Gambetta and Hertog 2007 :8–12) And not even these few could be assumed to have mastery of the complex systems necessary to carry out a successful cyberterrorist attack. Journalists therefore need to stop elevating so-called 'script-kiddies' to potential cyberterrorists and insinuating that just because some group has the capacity to establish a website, distribute content online, and/or engage in DDoS

attacks the next step is a major attack by them using the Internet. This threat framing has taken on renewed salience in the wake of recent 'attacks' by the al-Qassam Cyber Fighters and the Syrian Electronic Army, which have been repeatedly characterised as cyberterrorism.

Many people respond to the above arguments by saying that if one doesn't have the requisite know-how in-house, an alternative option is to hire "outsiders" to undertake a cyberterrorism attack on one's behalf. This would force the terrorists to operate outside their own trusted circles and thus leave them ripe for infiltration however. Moreover, even if contact with "real" hackers was successful, the terrorist group would be in no position to gauge their competency accurately; they would simply have to rely on trust. This would be very personally and operationally risky (Conway 2003b :10–12). Turning to the possibility of online crowd sourcing as a response to these types of challenges then; if proxies could be employed to actually commit acts of cyberterrorism, terrorists would improve their ability to avoid culpability or blame altogether. The problem with this is two-fold: first, it would require gathering a 'crowd' which would, in turn, require fairly wide dissemination of information about the activity to be undertaken thus opening-up the very real possibility of the attack plans coming to the attention of the authorities. Second, the terrorists would lose control over when, where, how, or even if the attack took place. This might be advantageous in terms of instigating low-level 'real world' (e.g. jihadi-inspired lone actor terrorism) and cyber operations (e.g. (D)DoS attacks), but is not a suitable method for undertaking a major cyberterrorism operation. Furthermore, while the potential anonymity provided by crowd sourcing might protect the instigators from being detected, it would also lose them their credit for the attack. On the basis of technical knowhow alone, then, cyberterrorism is not feasible.

AT//EMP

No EMP impact Armbruster '13

[Ben, National Security Editor for ThinkProgress.org at the Center for American Progress Action Fund
"Right-Wing Pundit Hypes Fictional North Korean EMP Threat," Think Progress, 4/5/13,
<http://thinkprogress.org/security/2013/04/05/1828101/gaffney-north-korea-emp/#>]

It was only a matter of time before the right wing would turn the current crisis on the Korean peninsula into a parody. It's not entirely surprising that chief conspiracy theorist Frank Gaffney kicked things off on Thursday with an interesting theory about he thinks the real threat from North Korea is. Gaffney told Laura Ingraham radio show fill-in host Raymond Arroyo that we should really be worried about the North Koreans putting one of their nukes on a ship to the West Coast, attaching it on a short-range missile and — don't aim it at any particular large American city where it would inflict the most damage — but fire it up above the atmosphere creating the dreaded "Electro Magnetic Pulse" that will (supposedly) put the entire United States out of business for good: GAFFNEY: They certainly have an abundance of shorter range missiles which could be brought close to our shores aboard ships. A capability that their Iranian partners, we know, have demonstrated. And by lobbing a relatively small, relatively unsophisticated nuclear weapon of the kind that they seem to have tested now three times on one of these short range missiles high over the United States and detonating it outside of our atmosphere, the North Koreans know they could inflict incalculable harm on this country, even perhaps with just one of these weapons. And how would that work? Such a weapon detonated in space would trigger something called "Electro Magnetic Pulse," a very powerful form of electromagnetic energy that would essentially damage or destroy every piece of electronic gear and particularly sensitive equipment like transformers that are the backbone of our electrical power grid. And if those go down, we cease to exist as a 21st Century society because without electrical power, look at Katrina as an example or what happened with Sandy more recently, except the power doesn't come back on after a couple of days or a couple of weeks. It stays off and that means, really, returning us to kind of a pre-industrial society. So the North Koreans will ship a nuke and a missile all the way to the United States — undetected — attach the nuke to the missile (a process they have yet to master) and launch it way up in the atmosphere while U.S. defense officials (particularly the Missile Defense Agency) are none the wiser. If that sounds like something out of a doomsday fiction novel (or a video game), you're right. As CAP's Matt Duss once noted referring to Gaffney's claim that Iran would pull off such a stunt, "it's probably worth pointing out here that the likelihood of Iran, or anyone, actually pulling off such an attack is roughly the same as Iran building an enormous, space-bound vacuum cleaner and sucking up all of America's oxygen."

LoL Fisheraug '12

Max, writer and editor for the Atlantic ("The Ridiculous 'Red Dawn' Remake Is Even More Absurd Than You Think," The Atlantic, 8/13/12, <http://www.theatlantic.com/international/archive/2012/08/the-ridiculous-red-dawn-remake-is-even-more-absurd-than-you-think/261009/>)

An EMP Blast Is Not Going to Destroy the Military: The film adopts a fringe conspiracy theory that has long been pushed by a small, right-wing coalition led by Newt Gingrich: that terrorists or a rogue state could devastate America with an electro-magnetic pulse, or EMP. The idea is that detonating a nuclear

weapon way up in the stratosphere would send out an EMP that would fry all of our electronics, from helicopters to coffee makers, easing the way for a foreign invasion. In fact, EMP is untested at best and ineffective at worst; studies suggest it might actually stop as little as five percent of electronics. Even if it did work, America is really big and knocking out our entire lower 48 would require many, many more warheads than North Korea could possibly possess. The Days of a 'Pearl Harbor' Surprise Attacks Are Over; And it's not just because the U.S. military and intelligence agencies have covered the globe with a blanket of satellite and electronic surveillance that monitors, among other things, foreign military movements. If a bunch of North Korean troops were to even drive to the nearest airport, we're probably going to know about it. And the U.S. military just isn't as centralized as it used to be. At any given moment, the U.S. has about 100,000 troops afloat and 200,000 on foreign military bases, many of those bases located somewhere between North Korea and the U.S., and all of them made for quick deployment. The Navy alone has six enormous, self-contained fleets floating around the world's oceans, not to mention 11 aircraft carriers. Even if an invading force were able to somehow magically subdue the million-plus active duty military personnel on U.S. soil, you could probably set your watch by the American counter-invasion.

AT//ISIS

ISIS fails at literally everything

Gartenstein-Ross, 15 [Daveed, is an American counter-terrorism scholar and analyst, and a Senior Fellow at the Foundation for Defense of Democracies, The Atlantic, “ISIS Is Losing Its Greatest Weapon: Momentum”, 1/6/15, <http://www.theatlantic.com/international/archive/2015/01/the-decline-of-isis-syria-iraq/384261/>, 6/28/15]JRO

There was a time when the Islamic State of Iraq and Syria appeared unstoppable. In September and October, as the jihadist group captured territory through a major offensive in Iraq’s Anbar province, culminating in the fall of the town of Hit on October 13, observers feared that even Baghdad was in danger of being overrun. ISIS is now in the midst of another major military movement in Anbar, but the always-overblown fears about the organization’s advance are now receding—and the group’s decline has grown increasingly apparent. ISIS’s signature attributes, ferocity and unpredictability, have raised the group’s profile and inspired a spate of lone-wolf attackers. But the organization has also made several strategic errors along the way. The Islamic State’s lifeblood is partially money and territory, but primarily momentum against weak and ill-prepared enemies. And that momentum, which peaked in early August, has stalled. Where has ISIS overplayed its hand? The group already had an impressive array of foes when a June blitzkrieg extended its reach into Iraq—enemies that included the Iraqi government, the Iranian regime, and even other jihadist groups like the Nusra Front, with whom it frequently skirmished in Syria. This offensive wasn’t solely the work of ISIS, which fought alongside a coalition of Sunni insurgent groups that included former members of Saddam Hussein’s Baath party. The offensive was also widely backed by Iraq’s disaffected Sunni elite. But once its initial gains were secured, ISIS quickly betrayed the very groups that had aided its advance. Most prominently, ISIS declared the reestablishment of the caliphate, with the group’s spokesman Abu Muhammad al-Adnani claiming that “the legality of all emirates, groups, states, and organizations, becomes null by the expansion of the khilafah’s authority.” The statement clearly signaled that ISIS believed it had usurped the authority of its allies; indeed, in early July it rounded up ex-Baathist leaders in Mosul (doing so proved particularly problematic for ISIS because the ex-Baathists were also managing the actual governance and administration of the northern Iraqi city, and their arrest hastened the rapid disintegration of basic services). ISIS committed a more damaging error at the beginning of August, when it launched a surprise incursion into Iraq’s Kurdish territory and promptly engaged in a campaign of genocidal slaughter and enslavement against the Yazidi minority sect. The moves were pointless from a military perspective, since the Kurdistan Regional Government’s Peshmerga forces weren’t fighting ISIS and the Yazidis didn’t pose a threat to the incipient caliphate. These decisions, along with the beheading of the American journalists James Foley and Steven Sotloff, helped draw even more enemies into the theater, including the United States and an international coalition backing U.S. military action. The most obvious sign of ISIS’s decline is that the group is no longer conquering territory, seizing no major towns or cities since Hit (and this hasn’t been for lack of effort on its part). ISIS continues to capture villages from time to time; for example, on December 27 it gained control of 14 villages in Anbar after Iraqi security forces withdrew from the area. But those villages aren’t equivalent to a major urban area and had been taken from ISIS by Iraqi forces just two days earlier. In October, ISIS advanced ominously on the Syrian city of Kobane; the French philosopher Bernard-Henri Levy declared in The New Republic that “Kobane will fall. In a matter of hours.” It has yet to fall, and Kurdish forces now appear to have the advantage, though the town remains contested. ISIS has even been losing ground, albeit unevenly. In December, the group

pulled its forces from Iraq's Sinjar district, home to one of ISIS's main resupply routes from Syria into Iraq (the other being Tal Afar). This has threatened to isolate ISIS-held Mosul. ISIS's brutality has also proven isolating. Local opposition against the group, including by Sunnis, is mounting in Mosul and Anbar, although ISIS did recently succeed in suppressing a revolt against it in Syria's Dayr al-Zawr. These uprisings are certain to grow if ISIS weakens. Meanwhile, the group's leaders seem increasingly paranoid, reportedly executing many of their own fighters in Mosul and elsewhere. In December, for example, Muammar Tawhlah, ISIS's top official in Mosul, was killed by firing squad for suspected espionage. And ISIS's bureaucratic mismanagement has alienated local populations, leaving them with a lack of job opportunities and essential services. As a resident of Mosul told the Financial Times, "When I was seven years old the war against Iran started. Since then, we've been at war. We've endured international sanctions, poverty, injustice. But it was never worse than it is now." ISIS's financial and military resources have also shrunk as U.S. airstrikes have destroyed the group's materiel and capacity to refine oil. The Islamic State is still able to sell unrefined oil on the black market, but the difference between the price it can set for unrefined versus refined oil is significant. Reports this week indicated that ISIS expects a \$250-million surplus in its \$2-billion budget, but these figures are entirely self-reported: Accountants aren't exactly lining up to get into ISIS-controlled territory and perform an outside audit. ISIS, moreover, lacks an industrial base capable of sustaining its military efforts (Ninawa and Salahaddin governorates have a number of factories, but the group has a shortage of qualified technical personnel to man and supply them). It cannot build its own heavy armor, armored personnel carriers, Humvees, anti-tank weapons, surface-to-air missiles, anti-aircraft weapons, or radar stations. Only through military raids can the organization capture the equipment it needs for battle, and the last time it did this successfully was in August.

They'll inevitably collapse

Bowen '15

[Andrew Bowen, Ph.D. is a Senior Fellow and the Director of Middle East Studies at the Center for the National Interest.. "Time Bomb: The Islamic State Implodes" *National Interest*, 3/11/15
<http://nationalinterest.org/feature/time-bomb-the-islamic-state-implodes-12397>]

However, Daesh is facing its own existential crisis in terms of both its organization and ideology. Confronted by war on a number of fronts, Daesh's self-proclaimed Caliph, Abu Bakr Al-Baghdadi, has struggled to create a state in practice, focusing more of the group's attention on further expansion and elaborate media stunts than establishing an actual institutional polity. In theory, Daesh has an organizational hierarchy to "govern" its territory, but this structure is dependent on a growing number of Arab and foreign fighters, who have varying aims, motivations, and differences amongst them. As Liz Sly noted this week in The Washington Post, foreign and Arab fighters are unhappily co-existing with the local population and fighting at times with one another over Daesh's war aims, their status within the new state, and the allocation of the state's resources. This raises critical questions about whether Baghdadi will be able to maintain his "state" as he is increasingly pressed on multiple fronts. Numerous reports suggest that Syrians and Iraqis living under Daesh's rule are finding that life in the new state isn't what many had hoped for after decades of mismanagement under the former regimes. Beyond these organizational problems and contradictions, Daesh's ideology—which, unlike Al Qaeda—focuses on on

the “near enemy”—may help it form new alliances with groups like Boko Haram and militants in Libya and Yemen, which are also fighting various vestiges of state governments. Nonetheless, this ideology hasn’t been attractive enough to sustain the group’s territorial expansion to new areas of Syria and Iraq where local officials and fighters neither share Daesh’s ideology nor its vision. If history is any guide, Daesh’s ideology may also prove the group’s undoing. Ayman al-Zawahiri, the leader of Al Qaeda, learned this lesson two decades ago in Egypt when, as the leader of the Islamic Jihad, he unsuccessfully challenged former President Hosni Mubarak’s government. Islamic Jihad’s failure in Egypt was largely the result of the brutality of the group’s tactics, which alienated the local population. Osama Bin Laden criticized the “near enemy” approach for this very reason and, consequently, ordered Al Qaeda to target the “far enemy.” Beyond these organizational and ideological challenges, Daesh faces a host of military challenges, including the growing casualty rate of foreign fighters and a slow loss of territory. The ongoing siege of Tikrit and a late spring or summer Mosul offensive will only compound Daesh’s increasingly strenuous position in Iraq. These offensives alone cannot eradicate Daesh from Iraq. At the very least, however, they will put the group on the defensive until alternative government structures can be built. In Syria, on the other hand, Daesh’s territorial control is currently being challenged by both a U.S.-led air campaign and a separate ground campaign conducted by the Syrian army and Hezbollah. The group will therefore be increasingly squeezed territorially and financially as it loses access to smuggling routes, oil facilities, and urban sanctuaries. Nonetheless, Daesh’s likely to avoid complete defeat in Syria as long as a political solution to that country’s ongoing civil war remains elusive. Regardless of its ability to hold territory or finance itself, Daesh’s destruction is sewn into the organization’s deficiencies and ideology. A government at war is a government not focused on state building, and the natural moderation needed for governing compared to fighting a war will lead to splits within the organization and a struggle over the allocation of resources. A “state” then increasingly fueled and sustained by its own radicalism and violence will never become the idealized state that many of its most radical supporters struggle for. Instead, it will be a ruin within the sands of Iraq and Syria. It is thus wiser for the United States, the EU, and their regional partners to reinforce existing counter-ISIL strategies, while avoiding the temptation of a new military ground campaign in Syria and Iraq, which has its own risks and limitations. Regardless of CVE initiatives and counter-terrorism measures, Washington will defeat Daesh more so by waiting it out as the organization implodes from within. As such, the West should focus on supporting alternative governance options for Syria and Iraq, which can offer a more sustainable future than the violent and austere future Baghdadi has presented to Syrians and Iraqis.

ISIS is not an existential threat and other anti-ISIS states will defeat them in a regional, contained war

Buchanan 14 - Patrick J. Buchanan has been a senior advisor to three American Presidents. (“Is ISIS 'An Existential Threat?'” <http://townhall.com/columnists/patbuchanan/2014/08/12/is-isis-an-existential-threat-n1877527/page/full/8/12/2014>) STRYKER
“ISIS is a direct threat to the United States of America,” said Rep. Peter King. John McCain called for bombing ISIS in Syria and Iraq. But using air power to prevent ISIS from seizing the Kurdish capital of Irbil and Baghdad is not enough, said Sen. Lindsey Graham. “We need to go on offense,” he told FOX News, “There is no force within the Mideast that can neutralize or contain or destroy ISIS without at least American air power.”“The Islamic State is “an existential threat” to our homeland, Graham added, asking, “do we really want to let America be attacked?”“Came then this warning from Sen. Graham: “If he [Obama] does not go on the offensive against ISIS, ISIL, whatever you want to call these guys, they’re coming here. This is not just about Baghdad, not just about Syria. It is about our homeland.” “I think of an American city in flames because of the terrorists’ ability to operate in Syria and Iraq,” said Graham, “Mr. President ... what is your strategy to stop these people from attacking the homeland?” “This semi-hysterical talk of an “existential threat” to the “homeland,” and the dread specter of “an American city in flames” is vintage war party, designed to panic us into launching a new war. But before allowing these “Cassandras” to stampe us back into the civil-sectarian Middle East wars that resulted from our previous interventions, let us inspect more

closely what they are saying. If ISIS' gains are truly an "existential threat" to the republic and our cities are about to "go up in flames," why did these Republican hawks not demand that

President Obama call back Congress from its five-week vacation to vote to authorize a new war on ISIS in Syria and Iraq? After all, King, McCain and Graham belong to a party that is suing the president for usurping Congressional powers. Yet, they are also demanding that Obama start bombing nations he has no authority to bomb, as ISIS has not attacked us. King, McCain and Graham want Obama to play imperial president and launch a preemptive war that their own Congress has not authorized. What kind of

constitutionalists, what kind of conservatives are these? Is Graham right that an "existential threat" is at hand? Is our very existence as a nation in peril? Graham says no force in the Mideast can stop ISIL without us. Is this true?

Turkey, a nation of 76 million, has the second-largest army in NATO, equipped with U.S. weapons, and an air force ISIL does not have. If President Recep Tayyip Erdogan wanted to crush ISIS, he could seal his border to foreign fighters entering Syria and send the Turkish army to assist President Bashar Assad in annihilating ISIS in Syria. The jihadists of the Islamic State may be more motivated, but they are hugely outnumbered and outgunned in the region. The Syrian government and army, Hezbollah in Lebanon, the Shia-dominated government of Iraq, a Shia Iran of 70 million, and the Kurds in Syria and Kurdistan are all anti-Islamic State and willing to fight. All are potential allies in a coalition to contain or crush ISIS, as is Vladimir Putin's Russia. if U.S. diplomacy were not frozen in the 1980s. Only last August, McCain and Graham were attacking Obama for not enforcing his "red line" by bombing Syria's army, the most successful anti-ISIL force in the field. The threat of the Islamic State should not be minimized. It would provide a breeding and training ground for terrorists to attack us and the West. But it should not be wildly exaggerated to plunge us into a new war. For wherever ISIS has won ground, it has, through atrocities and beheadings, imposition of Sharia law, and ruthless repression, alienated almost everyone, including al-Qaida. Should ISIS succeed in holding northern Syria and western Iraq, who will recognize this caliphate? Who will trade with it? How will it hold the allegiance of peoples upon whom it is even now imposing terrorist rule? The Sunni of Iraq are already chaffing against ISIS rule. How long will Turks, Syrians, Iraqis, Kurds and Iranians tolerate a Talibanized Islamic State right next door? And should ISIS attack the United States, we have more than sufficient means to retaliate, without sending in American troops. Let Middle Easterners take the lead in fighting this newest Middle East war.

No ISIS threat—reject exaggerations

Beinart 14 – Peter Beinart is a contributing editor at The Atlantic and National Journal, an associate professor of journalism and political science at the City University of New York, and a senior fellow at the New America Foundation. ("How Serious a Threat Is ISIS?" <http://www.theatlantic.com/international/archive/2014/09/obama-iraq-syria-isis-war-sold/380026/> 9/11/2014) STRYKER

It's important to remember that moment now, amid our current bout of war fever. It may be worth attacking the Islamic State of Iraq and Syria for purely humanitarian reasons. After all, the United States launched air wars against Serbia (twice) and Libya without claiming that their regimes posed a national-security threat, and ISIS is more savage than either Slobodan Milosevic or Muammer al-Qaddafi. It may be worth attacking ISIS because of the threat it poses to our allies in the Middle East. If unchecked, the group could destabilize not only Iraq and Syria, but potentially Jordan and Saudi Arabia too. (Judging by social media, ISIS has a lot of fans in the kingdom of Saud.) But, for the most part, that's not how this war is being sold. It's being sold as a war to protect the United States homeland against a profound terrorist threat. Democratic Senator Dianne Feinstein recently said, "The threat ISIS poses cannot be overstated." Her Republican colleague Jim Inhofe has claimed that ISIS is "rapidly developing a method of blowing up a major U.S. city" and that as a result, "We're in the most dangerous position we've ever been in as a nation." This time, the press needs to aggressively investigate whether that's true. If it is, then the Obama administration should be considering ground troops, as General Lloyd Austin, commander of U.S. forces in the Middle East, reportedly requested—domestic politics be damned. We sent them into Afghanistan, after all. And if the ISIS threat really is greater than the al-Qaeda threat was on September 10, as Inhofe suggests, then there's a case for doing the same in Iraq and Syria today. If, on the other hand, ISIS lacks the motivation and capacity for anything close to 9/11, then President Obama's stated justification for even an air war looks weak. So far, the press hasn't done a good enough job of determining if this is the case. Many publications have uncritically accepted Secretary of Defense Chuck Hagel's claim about the number of Americans who have gone to fight with ISIS—a figure that New America Foundation terrorism expert Peter Bergen argues is dramatically exaggerated. Other media commentary simply assumes that if Westerners go to fight with ISIS in Iraq or Syria, they're destined to attack Europe or the United States. But that's not true. Bergen notes, for instance, that of the 29 Americans who have gone to fight with the Somali jihadist group al-Shabab, none have tried to commit terrorism against the United States. One reason is that many of them ended up dead. Press coverage of ISIS often ignores the fact that, in the past, the group has not targeted the American homeland. Jihadist groups, even monstrous ones, don't inevitably go after the United States. Al-Qaeda began doing so as part of a specific strategy. After fighting the Soviets in Afghanistan, it initially turned its attention to overthrowing regimes in Egypt and Saudi Arabia that Osama bin Laden and Ayman al-Zawahiri considered oppressive, corrupt, and un-Islamic. It was only when those direct efforts failed that al-Qaeda hatched a new strategy: attacking those regimes' patron, the United States. That's still al-Qaeda's strategy. And as a result, so far, the U.S. has arguably had more to fear from those Westerners who have joined the al-Nusra Front, al-Qaeda's affiliate in Syria, than from those who have joined ISIS. But, ironically, al-Nusra may be a beneficiary of America's war, as it takes territory that ISIS now claims. It's entirely possible that ISIS would, on its own, make the transition to attacks inside the United States. But, as Michael Morell, a former acting CIA director, has suggested, declaring war on the group makes that transition more likely, not less. It doesn't in any way lessen the despicable, barbaric nature of the beheadings of James Foley and Steven Sotloff to note that ISIS justified them as a response to U.S. airstrikes. It's also possible that even if ISIS as an organization doesn't plan complex, 9/11-style operations against the U.S., some of its operatives might take matters into their own hands, in "lone-wolf" attacks like the one initiated by the "underwear bomber" in the skies over Detroit. But lone-wolf attacks, serious as they are,

are highly unlikely to do anywhere near the damage al-Qaeda did on September 11. That's one reason The New York Times, in an article on Thursday that models the journalism we need, quotes former State Department counterterrorism coordinator Daniel Benjamin calling Beltway discussion of the ISIS threat a "farce," with "members of the cabinet and top military officers all over the place describing the threat in lurid terms that are not justified."¶ President Obama, to his credit, has not done that. Unlike President Bush in the run-up to the Iraq War, he has not hyped the threat. Look at what he said in his speech on Wednesday night (the italics are mine).¶ "If left unchecked, these terrorists could pose a growing threat beyond that region—including to the United States," he said. "While we have not yet detected specific plotting against our homeland, ISIL leaders have threatened America and our allies. Our intelligence community believes that thousands of foreigners—including Europeans and some Americans—have joined them in Syria and Iraq. Trained and battle-hardened, these fighters could try to return to their home countries and carry out deadly attacks."¶ Lots of things could threaten the United States. The critical question, as the U.S. launches a war against ISIS that will likely take years and have myriad unforeseen consequences, is what "could" actually means. This time, the press needs to do a better job of finding out.

Err negative—social media exaggeration

Kilgore 15 - Ed Kilgore edits the Political Animal blog and is a contributing writer to the Washington Monthly. He is managing editor for the Democratic Strategist, a weekly columnist at Talking Points Memo, and the author of Election 2014: Why Republicans Swept the Midterms, recently published by the University of Pennsylvania Press. ("Are Beheadings an Existential Threat to America?" http://www.washingtonmonthly.com/political-animal-a/2015_02/are_beheadings_an_existential054199.php 2/16/2015) STRYKER

I'm sure a lot of other people are as baffled as I am at the huge, galvanizing effect IS has achieved with its use of social media broadcasts of hostage beheadings. Yes, it's horrible, of course; so are all murders of innocents. But as Greg Sargent asks today, are the beheadings really an adequate justification for a reconvening of the Global War on Terrorism with all of its excesses and failures?¶ It would be nice if we could look at each new development in this conflict and make a rational assessment of what it actually changes, how it affects the United States, and what we should do, or not do, in response. But brutality overwhelms rationality, just as ISIS intends. A couple of hundred thousand Americans die every year from preventable medical errors and the response from the government amounts to "Gee, that's too bad," but all it takes is a few videos of brutal executions 6,000 miles away to spur a wholesale reexamination of American foreign policy....¶ To date, ISIS has killed four Americans, a horrible tragedy for those people and their families. But since the idea of the group's threat to America is at this point entirely hypothetical, we should be as specific as we can when we talk about that threat. Do we think they're going to try to hijack planes or send agents here to set off bombs? And if so, what do we need to do to counter those threats that we aren't already doing? If we're going to expand our military involvement in the Middle East, is there a way to do it that won't create more problems than it solves?¶ I'll put my cards right on the table: there is one, and only one, terrorist threat that rises to the level of an existential threat to the United States, and that's nuclear terrorism. There are few rational measures I would not support that would significantly lower the risk of a dirty bomb going off in an American city. You get the sense right now, however, that all too many Americans would favor the atomization of the Muslim Middle East if it meant no more beheadings by IS. This is precisely the kind of public opinion tendency that swollen to a large majority by 9/11 led the Bush administration to decide to invade Iraq; not because there was any fresh justification for doing so, but because they knew could get away with it.

ISIS isn't a threat – their capabilities are overhyped by politicians

Waldman, 3/20 [Paul, senior writer for The American Prospect., The Washington Post, "The Islamic State isn't actually much of a threat to the United States", 3/20/15, <http://www.washingtonpost.com/blogs/plum-line/wp/2015/03/20/the-islamic-state-isnt-actually-much-of-a-threat-to-the-united-states/>, 6/28/15]JRO

Now, let's entertain a truly radical notion: Even if the Islamic State could launch a successful terrorist attack in the United States, that still wouldn't make them much of a threat. How many Americans could they kill? A dozen? A hundred? That would be horrible. But car accidents kill almost a hundred Americans each and every day. It's easy to see why Republicans would want to make Americans as afraid as possible of the Islamic State: The emotional state of fear creates support for more belligerent policies and more use of military force, which are the things Republicans favor. So whatever they actually believe about the Islamic State, they have an interest in everyone being as afraid as possible. And the creation of that fear is, of course, what terrorism is all about: The spectacle and the reaction it produces are the whole point. For their part, Democrats may argue that a different set of policies is more likely to defeat the Islamic State, but you won't hear them say that the group doesn't actually

threaten the United States in any meaningful way — not when 94 percent of Americans are convinced otherwise. But we should try to see if we can simultaneously hold three separate thoughts in our heads: 1. The Islamic State has done ghastly things. 2. We should work to eliminate them in any way we can. 3. Even so, they are not actually much of a threat to the United States. The same people who want everyone to constantly proclaim the United States' awesomeness often act as though we're a nation on the verge of destruction, so weak and vulnerable are we in the face of knife-wielding masked men thousands of miles away. But we aren't on the verge of destruction. The Islamic State presents a profound challenge, because they are bringing misery wherever they go and uprooting them will be difficult and complex. But that isn't the same as saying that we here in the United States should live in a state of fear.

ISIS is weakening – The battle of Kobane proves they will be defeated shortly

Crompton, 15 [Paul, is a journalist for Al Arabiya News in Dubai., Al Arabiya News, "Experts: Kobane defeat a sign of ISIS weakening", 2/6/15, <http://english.alarabiya.net/en/perspective/analysis/2015/02/06/Kobane-defeat-a-sign-of-ISIS-weakening-experts.html>, 6/28/15]JRO

The rout of the Islamic State of Iraq and Syria (ISIS) from the long-embattled Syrian border town of Kobane is a sign that the militant group can be weakened and beaten, experts told Al Arabiya News. The fight over Kobane – which began in September last year – reached a conclusion this week after Kurdish fighters aided by heavy coalition airstrikes regained full control of the city, an event hailed by U.S. Secretary of State John Kerry as a "big deal." ISIS's defeat in Kobane "demonstrates that it is more adept at propaganda, terrorism and light guerrilla warfare than it is about performing as a significant military force when faced by a determined enemy," said Michael Ryan, a scholar at the Washington-based Middle East Institute and the author of "Decoding al-Qaeda's Strategy: The Deep Battle Against America." The group's "actual fighting force is probably much smaller than its overall reported numbers might suggest and thus the loss of hundreds of fighters is likely a significant blow to its power base," he added. Although ISIS is "far from defeated" in Syria and Iraq, the loss of Kobane is a major blow to the group and shows that it "can be beaten," Ryan said. But the success in the ground campaign by Kurdish fighters – including the Peshmerga from Iraq's Kurdistan – could have come much faster if the Kurds were better equipped by their Western allies, some experts say. "One of ISIS's primary assets since June 2014 has been the aura of momentum generated by its military gains," said Noah Bonsey, a Syria analyst at the Brussels-based International Crisis Group, referring to the group's sweeping takeover of the Iraq's second largest city of Mosul in summer last year. "The battle of Kobane halted that momentum in Syria, and in that sense ISIS's loss there is significant," he added. Hilal Khashan, a political science professor at the American University of Beirut, said that there is "no question" that ISIS has been contained. "ISIS is sustaining tremendous losses and, even though it has not yet been decimated, it is only a question of time before it is convincingly defeated." But the Kurds and the U.S.-led coalition - as well as other groups fighting ISIS on the ground in Syria and Iraq - should not rest on their laurels. "We should not be surprised if [ISIS] attempts further attacks against Kobane in the future in an attempt to erase what is widely perceived as a defeat," said Ryan. ISIS's steady stream of recruitment - with new fighters reportedly continuing to trickle in - could preserve the group's staying power, Bonsey said. The resolve

of Arab countries to combat ISIS may have been strengthened this week after the release of a gruesome video showing the burning alive of captured Jordanian fighter pilot Moaz al-Kasasbeh at the hands of the militants. News of his killing spurred Jordan - a neighbor of Iraq and Syria and an ally in the U.S.-led coalition - against the group to step up its bombing campaigns, reportedly killing 55 militants on Thursday. Additionally, such "Medieval thinking cannot possibly win against the 21st century," said Khashan. "ISIS is out of place and out of time."

ISIS is unstable – Infighting is causing the group to weaken

Kumar, 15 – [Anugrah, Christian Post Contributor, Christian Post, ISIS Being Weakened by Infighting, Says Mideast Expert; Loses Key Stronghold in Iraq, "ISIS Being Weakened by Infighting, Says Mideast Expert; Loses Key Stronghold in Iraq", 3/9/15, <http://www.christianpost.com/news/isis-being-weakened-by-infighting-says-mideast-expert-loses-key-stronghold-in-iraq-135345/>, 6/28/15]JRO

Even as reports suggest that the Islamic State is facing rising tensions between its foreign and local fighters amid growing attacks by local militias, Iraqi forces and pro-government militias in Iraq have regained control from the terror group in two key areas near the city of Tikrit. "The key challenge facing ISIS right now is more internal than external," The Washington Post quotes Lina Khatib, director of the Carnegie Middle East Center in Beirut, as saying. "We're seeing basically a failure of the central tenet of ISIS ideology, which is to unify people of different origins under the caliphate. This is not working on the ground. It is making them less effective in governing and less effective in military operations." For example, local recruits of ISIS, a Sunni terror group also known as ISIL, are expressing anger over preferential treatment that the expatriates receive in Syria, according to the Post. The salaries and living conditions of the two cannot be compared although it's the local recruits who risk their lives in rural areas. The two groups have fired at each other in the town of Abu Kamal on Syria's border with Iraq on several occasions. ISIS is an offshoot of al-Qaeda and wants to establish a caliphate in the Levant region and beyond. It has gained control over large swathes of territories in Syria and Iraq. However, the U.K.-based Syrian Observatory for Human Rights has recorded about 120 public executions by ISIS of its own members. While ISIS has not been able to deal with growing infighting, offensives on areas under its control are increasingly being launched by Kurds in northern Syria and northern Iraq as well as by Shiite militias in Iraq.> On Sunday, pro-government Shiite militias in Iraq managed to enter the village of Abu Ajeel, east of Tikrit, and the Dawr area, south of the city – which had been ISIS stronghold for several months. About 30,000 Iraqi troops and militia fighters were part of the Tikrit offensive. Meanwhile, 26 ISIS terrorists, including two commanders, were killed in airstrikes in Syria's Hama province during the weekend. Elsewhere, ISIS has been targeting Christian villages near Tal Tamr to get the corridor to the eastern border to Iraq. ISIS has attacked numerous villages of Assyrian Christians in recent weeks, and captured hundreds of villagers. Since last June, when ISIS declared its "caliphate," the terror group has killed roughly 2,000 people, about two-thirds of them civilians, according to the Observatory.

ISIS is weakening - prolonged combat, administrative and financial issues

Winsor, 15 [Morgan, is a Breaking News Reporter for International Business Times covering Africa and the Middle East., International Business Times, "ISIS Infighting: Islamic State Executions Signal Mistrust, Tensions, Power Struggles", 2/19/15, <http://www.ibtimes.com/isis-infighting-islamic-state-executions-signal-mistrust-tensions-power-struggles-1822482>, 6/28/15]JRO

Recent tensions, power struggles and even executions within the Islamic State's ranks of foreign fighters signal fractures within the extremist group, after its militants were defeated in the Syrian city of Kobani. Although the Islamic State -- also known as ISIS or ISIL -- retains a firm grip on swaths of Middle Eastern territory, the group appears to be on the defensive in Syria for the first time, suffering blows from U.S.-led coalition airstrikes, fighting on the ground and mistrust among its own members, the Associated Press reported. Tensions among foreign fighters within ISIS have emerged over different national backgrounds as well as administrative and financial issues. The Islamic State group has executed at least 120 of its own members, the majority of whom were foreign fighters trying to flee, the Syrian Observatory for Human Rights, a British-based monitoring group, said in December. The severed head of a senior ISIS official was found last month in eastern Syria with a cigarette between its lips, reportedly trying to show he was beheaded for smoking, which is banned under Sharia law. But there are rumors that the official -- who was an Egyptian national -- was actually killed on suspicion of spying, according to AP. "The prolonged battle for Kobani caused a lot of tensions -- fighters accused each other of treachery and eventually turned on each other," Bari Abdellatif, a resident of al-Bab who has fled to Turkey, told AP Thursday. ISIS suffered its worst defeat last month in Kobani where more than 1,000 militants were killed by Iraqi Kurdish forces, which have successfully repelled the group from the border town in northern Syria, the Syrian Observatory for Human Rights said in January. Kurdish forces have since joined with moderate Syrian rebels to recapture about 215 villages in the area, wrenching ISIS supply lines. Amplified coalition airstrikes in retaliation for the burning death of the Jordanian pilot have also strained the terror group. ISIS militants in Raqqa -- the group's de facto capital -- forced Syrian civilians to donate blood after dozens of ISIS fighters were seriously wounded, ARA News reported last week. Since September, U.S.-led coalition airstrikes have killed some 7,000 ISIS fighters or about 20 percent of the group's military capabilities, according to Al Arabiya News.> Still, the militants captured new territory in Iraq for the first time in months. Last week, the besieged western Iraqi town of al-Baghdadi fell to ISIS, who then burned to death 45 people, the local police chief told BBC News Tuesday.

ISIS is crumbling – Infighting and a loss of public support

Bender, 15 [Jeremy, received a BA in Middle Eastern Studies from Rutgers University and is a staff writer at Business Insider Business Insider, "Cracks in ISIS are becoming more clear", 3/9/15, <http://www.businessinsider.com/weaknesses-of-isis-2015-3>, 6/28/15]JRO

The Islamic State, also known as ISIS or ISIL, which controls a chunk of Iraq and Syria the size of Britain, is facing pressing internal problems, according to multiple reports. The so-called caliphate's promises of Muslim unity have not stopped bitter disputes between foreign fighters and native Iraqis and Syrians. "The key challenge facing ISIS right now is more internal than external," Lina Khatib, the director of the Carnegie Middle East Center in Beirut, told The Washington Post. "We're seeing basically a failure of the central tenet of ISIS ideology, which is to unify people of different origins under the caliphate. This is not

working on the ground. It is making them less effective in governing and less effective in military operations." The core dispute in the organization is the preferential treatment that foreign fighters receive over their local counterparts. Foreigners in the organization earn as much as twice as much pay as local fighters. Foreign fighters also receive nicer living accommodations in ISIS-controlled cities and are less frequently deployed to the frontline than their Syrian or Iraqi counterparts, The Wall Street Journal reports. This alleged preferential treatment has bred resentment within ISIS as locals feel they take a larger share of the military risk. The disparity has actually led to violence between the groups within ISIS: Foreign fighters and Syrian militants had a shootout in the town of Abu Kamal on the Iraqi border following an order that deployed the Syrians to the Iraqi front line, The Post reports. This treatment has led ISIS to lose support among ordinary Syrians, many of whom have always viewed ISIS, which has its origins in Al Qaeda's Iraqi franchise, as a foreign Iraqi force to begin with. ISIS "was never popular, but people supported them because they were scared or they needed money," Ahmed Mhidi, a Syrian businessman who fled to Turkey, told The Post. "Now people want nothing to do with them, and if the Islamic State puts pressure on them, they just flee." Foreign fighters are also reportedly disillusioned with the group. Foreigners who come to join ISIS generally have little military experience and little interest in actually fighting. Many had instead hoped to take part in the creation of the caliphate, a project that some view as both an exciting political and social experiment, as well as a religious obligation. When these foreigners are forced to fight, many have tried to desert only to face execution at the hands of ISIS.

AT//Lone Wolves

No lone wolf threat – no impact and can't be effectively surveilled

Gomez, 14 (David, 10/24/14, "The Myth of the Big Bad Lone Wolf", Foreign Policy, <http://foreignpolicy.com/2014/10/25/the-myth-of-the-big-bad-lone-wolf/>) KW

***We don't endorse the author's use of the "f word" or any other objectionable language

The terror attack on Canadian soldier Nathan Cirillo and the Canadian Parliament by recent Muslim convert Michael Zehaf-Bibeau has re-focused attention on the threat from "lone-wolf" terrorists, those who operate "without direction from abroad and without help from a terrorist organization or cell."[¶] The current discussion once again revolves around whether or not increased surveillance by Canadian law enforcement and intelligence agencies could have prevented the attack — and whether such efforts are worth the expense in terms of law enforcement manpower and the erosion of civil liberties in Canada. They are not. In the FBI, trying to prevent these type of lone wolf attacks is a Sisyphean task known among agents as a BFWAT, or ~~Big Fucking Waste of an Agent's Time~~. That's no less true for Canada's FBI equivalent, the Royal Canadian Mounted Police (RCMP).[¶] Much like the FBI in the United States, the RCMP has primary responsibility for preventing and investigating criminal terrorist activity in Canada. Along with Canadian Security Intelligence Service (CSIS) — the intelligence service that was created from the RCMP's Security Service in 1984 and that has no law enforcement function or powers — the RCMP has limited resources available to find and monitor every potential lone wolf in Canada. Particularly when the threat from lone-wolf terrorists is minimal compared to broader national security threats from al Qaeda- and Islamic State-trained terrorists in the United States, Canada, and abroad.[¶] The lone-wolf phenomenon — sometimes dismissively referred to within U.S. law enforcement circles as "stray-dogs" — is a real threat. But unlike the threat posed by criminal enterprises or even known terrorist organizations, lone wolves are nearly impossible to identify and investigate. By their very nature they have the power of anonymity. While most lone wolves have never heard of Louis Beam's theory of leaderless resistance, all true lone wolves ascribe to his tenant involving "very small or one-man cells of resistance." Beam understood that one-man cells are "an intelligence nightmare" and near impossible to police.[¶] True lone wolves remain a fairly rare phenomenon by law enforcement or criminal investigative standards. Michael Zehaf-Bibeau was not, however, a true lone wolf. The classic lone wolf often mirrors the personality, preparation, and actions of the successful serial killer. Like serial killer and rapist Ted Bundy, the lone wolf is intelligent, articulate, and personable to those he meets, particularly potential victims, yet perceived as somewhat aloof and a loner to outsiders. Like "Unabomber" Theodore Kaczynski, the lone wolf is organized and meticulous in the planning and preparation of his crimes and often provides a written rational or manifesto for committing his crimes. In spite of Kaczynski being a paranoid schizophrenic, he was able to remain undetected for 17 years until he wanted his manifesto published.[¶] Being an organized offender, the classic lone wolf often prepares escape and contingency plans. In the case of Eric Rudolph, a radical right-wing bomber in the 1990s, the lone wolf was able to commit multiple crimes and live for years as a fugitive in the mountains of North Carolina. Most importantly, the lone wolf offender, just like the serial killer he is or aspire to be, is successful. The true lone wolf hides in plain sight, never drawing attention until something prompts him to act on his fantasy.[¶] None of the above traits and characteristics fit Zehaf-Bibeau's profile.[¶] His life was a train wreck of drugs and mental illness with little or no evidence of organization. While all current evidence points to the fact that Zehaf-Bibeau was most-likely acting alone and without direction, he does not

appear to be a classic organized lone wolf. Rather he more closely resembles a spree killer who acts spontaneously, without a plan, attempting to kill as many people as possible in as short a time as possible. Zehaf-Bibeau was on a suicide mission with no expectation of survival, therefore no plan for escape. And as far as we know, he left no manifesto or explanation of his actions. In short, Zehaf-Bibeau was a disorganized murderer, acting out his fantasies.¶ The dilemma for law enforcement in a constitutional or parliamentary democracy centers around how to identify the Zehaf-Bibeaus of the world and prevent criminal acts when they represent such a small minority among a terrorism demographic that, by definition, is willing to act without the direction or support of any main terror organization.¶ The media has been quick to label this case an intelligence failure without considering the limitations on when an intelligence or criminal case can be initiated and pursued by CSIS or the RCMP. According to Canadian media reports, Zehaf-Bibeau was neither a "high priority" for CSIS nor on the RCMP's list of "90 or so individuals under criminal investigation as potential threats," unlike the previous week's lone wolf, Martin Couture-Rouleau "who waited in a parking lot for at least two hours before driving his car into two Canadian soldiers."¶ No one familiar with law enforcement procedures will be surprised to learn that Zehaf-Bibeau wasn't on the radar of the RCMP or CSIS. Until he began his shooting spree, Zehaf-Bibeau had committed no recent crime nor telegraphed any specific intent to do so. Yet the Globe and Mail reported later that Zehaf-Bibeau "tried and failed to use prayer as a shield against the drug addiction and mental instability stalking him through adulthood." And the New York Times reported "despite a criminal record, an embrace of extremist ideas and an intent to travel to Syria" Zehaf-Bibeau "was not identified as a threat."¶ Even if Zehaf-Bibeau had somehow signaled his growing radicalization, the RCMP would still have been constrained in its ability to investigate him. In the United States the standard is for "reasonable suspicion." In Canada it is the same. Prior to the shooting there was no evidence that the shooter presented a specific or articulable threat.¶ The public dilemma for the RCMP, and also the FBI in the U.S., is how to identify the less than one percent of offenders who will evolve and mature into violent, psychopathic, spree-killing terrorists – and, possibly, self-organized lone wolf offenders — without violating their civil rights — and everyone else's. Absent specific intelligence to direct law enforcement to the most dangerous terrorist threats and develop reasonable suspicion to open a case, the FBI or RCMP will be forced to conduct assessments on every wanna-be jihadist, angry teenager with a grudge, psychopath looking for an excuse to kill, and generally disorganized murderous wing-nut seeking revenge — whether religious or otherwise — in order to find that one percent reflecting a potential "lone wolf" terrorist.

Needless to say, that's a tremendous waste of officers' time and taxpayers' resources. Finding a true lone wolf offender is like trying to find the proverbial needle in a haystack. Finding a true lone wolf offender is like trying to find the proverbial needle in a haystack.

Any successful attack would have incredibly low lethality, like the Boston Marathon bombing or a school shooting
Harwood 2/5

[Matthew Harwood is a freelance writer, whose work has been published by the American Conservative, Columbia Journalism Review, the Guardian, Guernica, Reason, Salon, Truthout, and the Washington Monthly. "Lone Wolf Terrorists Are Exceedingly Rare, So Why Does Everyone Keep Talking About Them?" 2/5/15 <http://www.motherjones.com/politics/2015/02/government-using-fear-lone-wolf-terrorist-justify-police-state>]crk

Fortunately, what makes lone wolves so difficult to detect beforehand renders them more impotent when they strike. Because such individuals don't have a larger network of financing and training, and may be disturbed as well, they are likely to have a far less sophisticated skill set when it comes to arming themselves or planning attacks. Terrorism researcher Ramon Spaaij of Australia's Victoria University created a database of 88 identified lone wolves who perpetrated attacks between 1968 and 2010 in 15 countries. What he found should dispel some of the fear now being associated with lone-wolf terrorism and so the increasingly elaborate and overzealous government planning around it. Spaaij identified 198 total attacks by those 88 solo actors—just 1.8% of the 11,235 recorded terrorist incidents worldwide. Since lone wolves generally don't have the know-how to construct bombs (as the Unabomber did), they usually rely on firearms and attack soft, populated targets, which law enforcement responds to quickly. Therefore, Spaaij found that the average lethality rate was .062 deaths per attack while group-based terrorists averaged 1.6 people per attack. Inside the United States, 136 people died due to individual terrorist attacks between 1940 and 2012—each death undoubtedly a tragedy, but still a microscopic total compared to the 14,000 murders the FBI has reported in each of the last five years. In other words, you shouldn't be losing sleep over lone-wolf attacks. As an American, the chance that you'll die in any kind of terrorist violence is infinitesimal to begin with. In fact, you're four more times likely to die from being struck by lightning. If anything, the present elevation of the lone-wolf terrorist to existential threat status in Washington creates the kind of fear and government overreach that the perpetrators of such attacks want to provoke. If individual terrorists are the "new nightmare," it's only because we allow them to be.

The only groups who could have a devastating impact are organized terrorist groups

NYDN 2/17 [New York Daily News "No terrorist group is capable of a 9/11-type attack, but they could get weapons to take down an airliner: Ex-CIA chief" 2/17/15

<http://www.nydailynews.com/news/politics/ex-cia-chief-warns-lone-wolf-terror-attacks-article-1.2118984>]crk

Right now, there isn't a terrorist group out there capable of killing thousands of Americans with a 9/11-type attack — but it's possible one could get the weapons to shoot down an airliner. That was the dire warning the former acting director of the CIA gave Tuesday to the NYPD. "There is nobody in the world today who has the capability to bring complex sophisticated, simultaneous attacks to our homeland that kill thousands," Michael Morell said at an anti-terrorism conference at police headquarters. Al Qaeda had it once, "but they do not have it today, thanks to U.S. counterterrorism operations," he said. Left unchecked, however, it would take Al Qaeda just "three years" to pose that kind of threat again, he said. Another big worry, Morell said, is that terrorist outfits like the Al Qaeda-affiliated Khorasan Group in Syria or the Yemen-based Al Qaeda in the Arabian Peninsula could get their hands on enough firepower to shoot down jetliners.

State dept strategy solves

Boyer 1/14 [Dave Boyer is a White House correspondent for The Washington Times. "Obama's 'lone wolf' focus misguided as terrorist threat expands, critics say" 1/14/15

<http://www.washingtontimes.com/news/2015/jan/14/obama-lone-wolf-focus-misguided-as-terrorist-threa/?page=all>]

The Obama administration has expanded its counterterrorism efforts in recent years to prevent attacks by loners that are potentially harder to detect in the plotting stage, because such attacks are carried out by individuals operating outside known terrorist networks. "The most likely scenario that we have to

guard against right now ends up being more of a lone wolf operation than a large, well-coordinated terrorist attack," Mr. Obama said in 2011, after a lone gunman slaughtered 77 people at a youth camp in Norway. "When you've got one person who is deranged or driven by a hateful ideology, they can do a lot of damage, and it's a lot harder to trace those lone wolf operators." As part of the effort to prevent such attacks, **national security agencies under Mr. Obama have expanded outreach efforts to communities where such homegrown terrorists might arise. "They've done a really good job of reaching out to influencers, Muslim-American community leaders and others who are aware of the individuals and the influences of radicalization on the local level,"** said Dafna Rand, deputy director at the Center for a New American Security in Washington. "**There's also been an incredible amount of intelligence-sharing with other countries** that's really useful here. There's been a lot of progress. You can never assure all Americans that it would never happen, but there **has been a lot of progress, to the credit of this administration.**"

Lone Wolf threats hype to justify expanded surveillance – the threat isn't real

Harwood 2/5 [Matthew Harwood is a freelance writer, whose work has been published by the American Conservative, Columbia Journalism Review, the Guardian, Guernica, Reason, Salon, Truthout, and the Washington Monthly. "Lone Wolf Terrorists Are Exceedingly Rare, So Why Does Everyone Keep Talking About Them?" 2/5/15 <http://www.motherjones.com/politics/2015/02/government-using-fear-lone-wolf-terrorist-justify-police-state>]

The shadow of a new threat seems to be darkening the national security landscape: the lone-wolf terrorist. "The lone wolf is the new nightmare," wrote Washington Post columnist Charles Krauthammer recently, and the conservative pundit wasn't alone in thinking so. "I really see [lone wolves] as being a bigger threat than al-Qaeda, or the Islamic State, or the al-Qaeda franchises," Scott Stewart, vice president of tactical analysis at the global intelligence and advisory firm Stratfor, told VICE News. Similarly, in the aftermath of the Paris terrorist attacks, appearing on "Meet the Press," Attorney General Eric Holder said, "The thing that I think keeps me up most at night [is] this concern about the lone wolf who goes undetected." You could multiply such statements many times over. There's only one problem with the rising crescendo of alarm about lone wolves: most of it **simply isn't true.** There's **nothing new about the "threat" and the concept is notoriously unreliable, as well as selectively used.** (These days, "lone wolf" has largely become a stand-in for "Islamic terrorist," though the category itself is not bound to any specific ideological type.) Worst of all, its recent highlighting paves the way for the heightening of abusive and counterproductive police and national security practices, including the infiltration of minority and activist communities and elaborate sting operations that ensnare the vulnerable. In addition, the categorization of such solitary individuals as terrorists supposedly driven by ideology —left or right, secular or religious—often obscures multiple other factors that may actually cause them to engage in violence. Like all violent crime, individual terrorism represents a genuine risk, **just an exceedingly rare and minimal one.** It's not the sort of thing that the government should be able to build whole new, intrusive surveillance programs on or use as an excuse for sending in agents to infiltrate communities. National programs now being set up to combat lone-wolf terrorism **have a way of wildly exaggerating its prevalence and dangers—and in the end are only likely to exacerbate the problem.** For Americans to concede more of their civil liberties in return for "security" against lone wolves wouldn't be a trade; it would be fraud.

There's no deterring them – that's the psychological definition of a lone wolf – if an attack is coming it can't be stopped

Harwood 2/5

[Matthew Harwood is a freelance writer, whose work has been published by the American Conservative, Columbia Journalism Review, the Guardian, Guernica, Reason, Salon, Truthout, and the Washington Monthly. "Lone Wolf Terrorists Are Exceedingly Rare, So Why Does Everyone Keep Talking About Them?" 2/5/15 <http://www.motherjones.com/politics/2015/02/government-using-fear-lone-wolf-terrorist-justify-police-state>]

The "literature" on both terrorism and the lone wolf should be approached with a healthy degree of skepticism. To this day, there is little consensus on what exactly terrorism is; the same is true of the lone-wolf variety. In the media and in recent academic studies, what separates the lone-wolf terrorist from the phenomenon in general is the perpetrator. Lone wolves are, by definition, solitary individuals, almost always men, often with mental health problems, who lash out violently against civilian targets. At least in some fashion, they are spurred on by belief. Researcher Michael Becker defines it this way: "Ideologically driven violence, or attempted violence, perpetrated by an individual who plans and executes an attack in the absence of collaboration with other individuals or groups." Although you wouldn't know it at the moment in America, the motivation for such attacks can run the gamut from religiously inspired anti-abortion beliefs to white supremacism, from animal rights to an al-Qaeda-inspired worldview. According to the literature, lone wolves are unique in the annals of terrorism because of the solitariness with which they plan and carry out their acts. They lack peer or group pressure and their crimes are conceived and executed without assistance. In this way, they bear a strong resemblance to the individual school shooters and rampage killers that Americans are already so used to.

They're too immature, impatient, incompetent and small to cause serious damage

Stewart '11

(Scott Stewart, Supervisor for Stratfor's analysis of terrorism and security issues, former special agent with the U.S. State Department for 10 years, involved in hundreds of terrorism investigations, September 22, 2011, Stratfor, "Cutting Through the Lone-Wolf Hype", <https://www.stratfor.com/weekly/20110921-cutting-through-lone-wolf-hype>, SS)

However, in the jihadist realm, as in the white-supremacist realm before it, the shift to leaderless resistance was an admission of weakness rather than a sign of strength. Jihadists recognized that they have been extremely limited in their ability to successfully attack the West and while jihadist groups welcomed recruits in the past, they are now telling them it is too dangerous because of the steps taken by the United States and its allies to combat the transnational terrorist threat. Busting the Mystique: Having established that when a group promotes leaderless resistance as an operational model it is a sign of failure rather than strength, let's take a look at how the theory translates into practice. On its face, as described by strategists such as Beam and al-Suri, the leaderless-resistance theory is tactically sound. By operating as lone wolves or small, insulated cells, operatives can increase their operational security and make it more difficult for law enforcement and intelligence agencies to identify them. As seen by examples such as Fort Hood shooter Nidal Hassan and Roshonara Choudhry, who stabbed British lawmaker Stephen Timms with a kitchen knife in May 2010, such attacks can create a significant impact with very little cost. Lone wolves and small cells do indeed present unique challenges, but history has shown that it is very difficult to put the lone-wolf theory into practice For every Eric Rudolph, Nidal Hasan and Anders Breivik there are scores of half-baked lone-wolf wannabes who either botch their operations or are uncovered before they can launch an attack. It is a rare individual who possesses the requisite

combination of will, discipline, adaptability, resourcefulness and technical skill to make the leap from theory to practice and become a successful lone wolf. Immaturity, impatience and incompetence are frequently the bane of failed lone-wolf operators, who also frequently lack a realistic assessment of their capabilities and tend to attempt attacks that are far too complex. When they try to do something spectacular they frequently achieve little or nothing. By definition and operational necessity, lone-wolf operatives do not have the luxury of attending training camps where they can be taught effective terrorist tradecraft. Nasir al-Wahayshi has recognized this and has urged jihadist lone wolves to focus on simple, easily accomplished attacks that can be conducted with readily available items and that do not require advanced tradecraft to succeed. It must also be recognized that attacks, even those conducted by lone wolves, do not simply materialize out of a vacuum. Lone-wolf attacks must follow the same planning process as an attack conducted by a small cell or hierarchical group. This means that lone wolves are also vulnerable to detection during their planning and preparation for an attack – even more so, since a lone wolf must conduct each step of the process alone and therefore must expose himself to detection on multiple occasions rather than delegate risky tasks such as surveillance to someone else in order to reduce the risk of detection. A lone wolf must conduct all the preoperational surveillance, acquire all the weapons, assemble and test all the components of the improvised explosive device (if one is to be used) and then deploy everything required for the attack before launching it. Certainly, there is far more effort in a truck bomb attack than a simple attack with a knife, and the planning process is shorter for the latter, but the lone wolf still must follow and complete all the steps. While this operational model offers security advantages regarding communications and makes it impossible for the authorities to plant an informant in a group, it also increases operational security risks by exposing the lone operator at multiple points of the planning process. Operating alone also takes more time, does not allow the lone attacker to leverage the skills of others and requires that the lone attacker provide all the necessary resources for the attack. When we consider all the traits required for someone to bridge the gap between lone-wolf theory and practice, from will and discipline to self-sufficiency and tactical ability, there simply are not many people who have both the ability and the intent to conduct such attacks. This is why we have not seen more lone-wolf attacks despite the fact that the theory does offer some tactical advantages and has been around for so long. The limits of working alone also mean that, for the most part, lone-wolf attacks tend to be smaller and less damaging than attacks conducted by independent cells or hierarchical organizations. Breivik's attack in Norway and Hasan's attack at Fort Hood are rare exceptions and not the rule. When we set aside the mystique of the lone wolf and look at the reality of the phenomenon, we can see that the threat is often far less daunting in fact than in theory. One of the most vocal proponents of the theory in the white supremacist movement in the late 1990s was a young California neo-Nazi named Alex Curtis. After Curtis was arrested in 2000 and convicted of harassing Jewish figures in Southern

AT//Nuclear Terror

Nuclear material impossible for terrorists to obtain and handle

Salik 14 [Naeem - pursuing PhD at the Centre for Muslim States and Societies/Political Science and International Relations at the University of Western Australia and is former Director, Arms Control & Disarmament at Pakistan's National Command Authority (NCA). "Nuclear Terrorism: Assessing the Danger", Strategic Analysis, 2014 Vol. 38, No. 2, 173–184, <http://dx.doi.org/10.1080/09700161.2014.884437>] Schuler 51

The way these essential elements have been described makes the task look rather simple but in actual fact each of these steps presents a huge challenge of its own. The necessary technical and financial resources would mean the availability of expertise in nuclear physics, explosives chemistry, metallurgy, mechanical and electronic engineering and machining of special metals while the resources would run into at least tens of millions of dollars. The technical expertise in the above-mentioned specialities is rare and the experts are well known. It is hard to imagine that these people could remain involved in the project for months or maybe a year without arousing the suspicion of their families, friends and/or government agencies. Acquisition of sufficient fissile material is again a challenge since an IND would require a minimum of 50–60 kg of highly enriched uranium. No government is likely to gift or sell such a huge amount of material to a terrorist group. It is hard to imagine that theft of such significant quantities of sensitive material would not be noticed and diversion in small amounts would be a long drawn out process. There have been a large number of reported cases of theft or pilferage of fissile materials from facilities in Russia and some former Soviet republics but the quantity of material involved ranged between 100 g and 2 kg. The sum total of all reported cases of illicit trafficking of nuclear materials was around 16 pounds, none of which was nuclear grade material. Different criminal groups were involved in different episodes and the potential buyers were also varied; in fact, in many cases they were undercover security officials. This clearly proves that pilfered or stolen materials in small quantities will not necessarily end up with a single buyer and add up to a significant amount sufficient to fashion an IND. Plutonium is too difficult to handle and is susceptible to detection by normal detection equipment due to its strong radioactive signatures. Again, fabrication of an IND is an extremely complex task, although some experts such as Charles Ferguson and William Potter would have us believe that a crude gun assembly-type device is not very technically demanding especially if a sufficient amount of highly enriched uranium is available.²³ If the intended target is not located in the country where the material is acquired and the IND is fabricated, it will have to be transported across borders through land, air or sea, which is again a very costly and dangerous feat to accomplish.

There is absolutely no way they could get materials – assumes all your scenarios

Salik 14 [Naeem - pursuing PhD at the Centre for Muslim States and Societies/Political Science and International Relations at the University of Western Australia and is former Director, Arms Control & Disarmament at Pakistan's National Command Authority (NCA). "Nuclear Terrorism: Assessing the Danger", Strategic Analysis, 2014 Vol. 38, No. 2, 173–184, <http://dx.doi.org/10.1080/09700161.2014.884437>] Schuler 52

The whole idea of terrorists somehow obtaining a ready-to-use nuclear weapon is highly questionable. Several scenarios have been painted, such as the terrorists forcibly snatching a weapon from an inadequately guarded nuclear storage site in a 'new weapon state'. Nuclear weapons are considered to

be the crown jewels of any country and would therefore be protected with every means at their disposal. Assuming that despite all the security arrangements the potential terrorists somehow overpower the defences and run away with a weapon or two, they would raise alarm bells not only in that particular country but around the world and would be chased down all the way. With the security forces on their tail, they would not have an opportunity to transport the weapon to its intended target, especially if it happens to be across borders or overseas. The second scenario pertains to would-be terrorists buying a weapon from a country, and related to this is the third wherein a state with close links to a terrorist group 'gifts' or hands over a nuclear weapon to that group. Historically, no state has ever handed over a weapon to another state, even the closest of allies, let alone a non-state actor.²⁴ The issue was brought into the limelight by President Bush in his first State of the Union Address after the 9/11 attacks, in which he warned that, 'rogue states could provide weapons of mass destruction to terrorists, giving them the means to match their hatred'.²⁵ This theme was further amplified by Vice President Cheney and National Security Advisor Condoleezza Rice, in their bid to build a case for war against Iraq. Rice declared in a speech delivered to the Chicago Council of Foreign Affairs that '[t]errorists might acquire such weapons from Saddam Hussein's regime, to mount a future attack far beyond the scale of 9/11. This terrible prospect could not be ignored or wished away'.²⁶ It is not difficult to discern the context and the motives behind Rice's alarmist statement. Any state, rogue or otherwise, will do a cost-gain analysis before committing the reckless act of handing over a nuclear device or even nuclear material to a terrorist outfit because of the strong possibility of the bomb or the material being traced back to the source after an act of nuclear terrorism. 'Nuclear forensics' is making rapid advances and it would not be too difficult to determine the origin of nuclear materials. The experience of attribution of conventional terrorist attacks to those responsible suggests that 'three quarters of the attacks that kill 100 people or more are traced back to the perpetrators. Second, attribution rates are far higher for attacks on the US homeland or the territory of a major US ally—97 per cent for incidents that killed ten or more people. Third, tracing culpability from a guilty terrorist group back to its state sponsor is not likely to be difficult'.²⁷ Again, the frequently discussed possibility of terrorist groups illicitly acquiring through theft or purchase post-Soviet suitcase bombs has failed to materialise. According to Russian nuclear officials, those weapons were built before 1991 and due to difficulty of maintenance their life span is as short as one to three years, after which they are no more than 'radioactive scrap'. The Centre for Non-proliferation Studies (CNS) has also concluded that there is no evidence to suggest that any such weapons have been lost and corroborates the statement of Russian experts that these weapons are very difficult to maintain. The officials also maintain that the weapons have either been destroyed or fully secured.²⁸ According to Anna Pluto and Peter Zimmerman, 'It is probably true that there are no loose nukes, transportable nuclear weapons missing from their proper storage locations and available for purchase in some way'.²⁹

Can't get the material

Kwok '13

(Augustine Kwok, Policy Analyst at Department of Foreign Affairs, Trade and Development, November 20, 2013, "EVALUATING THE THREAT OF NUCLEAR TERRORISM: Cutting through the rhetoric", <http://www.ruor.uottawa.ca/bitstream/10393/30520/1/KWOK%2c%20Augustine%2020139.pdf>, SS)

When it comes to theft, the primary fear among alarmists stems from the perception that the Russian arsenal is poorly defended and materials at facilities scattered throughout the former USSR are poorly secured and vulnerable to theft. On the contrary however, Russian nuclear weapons are found to be under the good control of elite troops hailing from the 12th Main Directorate, having similar functions and capacities as the US' Defense Nuclear Agency.⁶⁵ To date, the only unsecured sources of Russian nuclear material lie in the hulks of nuclear submarines on the ocean floor inaccessible to salvage operations, let alone any terrorist attempt to recover them. These concerns were most apparent during the disintegration of the former Soviet Union, as due to the "chaos and turbulent times," there was fear that the authorities would lose control over their nuclear material stockpiles. As history has shown however, nuclear weapons are of extreme importance to a nuclear weapon state, and this is enough to ensure that their stockpiles remain uncompromised, even during periods of transition or instability.⁶⁶ Pakistan is another potential source of theft due to its precarious state as a nation on the brink of losing control, giving rise to fears that weapons from its stockpile could become readily accessible to terrorists looking to acquire them. However, Islamabad has always reiterated that it has, "institutionalized numerous precautionary measures to guarantee that these weapons would be remained [sic] out of the reach of the transnational terrorist groups during chaos or political crisis."⁶⁷ Pakistan has installed sophisticated firing mechanisms as well as instigated Personnel and Human Reliability Programmes to prevent its nuclear personnel from being infiltrated.⁶⁸ As such, there is no evidence in open-source material that, "a single nuclear warhead from any national arsenal or another source, has ever made its way into the world's illegal arms bazaars, let alone into terrorist hands."⁶⁹ Even if a nuclear weapon was acquired by a terrorist organization it would not be able to access the device due to the built in protective code systems that accompany such devices.

Terrorists can't buy nuclear weapons either Kwok '13

(Augustine Kwok, Policy Analyst at Department of Foreign Affairs, Trade and Development, November 20, 2013, "EVALUATING THE THREAT OF NUCLEAR TERRORISM: Cutting through the rhetoric", <http://www.ruor.uottawa.ca/bitstream/10393/30520/1/KWOK%2c%20Augustine%2020139.pdf>, SS)

There is no evidence in open-source literature of the existence of an international black market for nuclear materials. Virtually all known cases of nuclear theft or smuggling have involved amateurs hoping for rich returns. The market is entirely driven by supply, there is no true demand. Organized crime has not gotten involved in nuclear trafficking."⁷⁰ Even if terrorists were able to acquire a nuclear weapon or device through the nuclear black market the logistical and technical difficulties in delivery and detonation would still prove insurmountable for terrorist groups.⁷¹ The potential sources from which a terrorist organization could purchase a nuclear weapon span the globe. Even though "many assume that nuclear weapons or materials are either too well guarded for a thief to obtain or too dangerous for an insider to contemplate selling," documented cases of Pakistani meetings with Al-Qaeda, the revelations about the AQ Khan network and the fear of "impoverished Russian scientists," continue to drive these fears.⁷² It is important to note that there has been no documented evidence to prove that Al-Qaeda has attempted to obtain fissile material or "ever has had a serious and sustained program to do so."⁷³ However, the continued close relationship between "elements of the Pakistani armed forces and their Inter-Services Intelligence Directorate (ISI) and the former Al-Qaeda regime in Afghanistan," in addition to "strong Islamist sentiments still held by many members of the Pakistani armed forces,"⁷⁴ remains a cause for concern. However, Pakistan has undertaken a number of unilateral and multilateral initiatives to shore up the security of its nuclear programme out of fear of punishment from potentially being the state which provides terrorists with the means by which to instigate a nuclear attack. In addition, the AQ Khan network was based on the proliferation of nuclear technology to states that were pursuing illegal

nuclear programmes and not on the sale of nuclear materials.⁷⁵ There is no evidence to suggest that any such network is currently operating. As such, the fears of alarmist with regards to terrorists purchasing the materials necessary for a nuclear attack are unfounded. Furthermore, if terrorists were able to purchase fissile materials, they would still have to find a way to transport the material is from point of purchase, to assembly point, to destination point. There are a number of initiatives set up in order to prevent such transit from being possible. Through the Global Initiative to Combat Nuclear Terrorism (GICNT), the Global Partnership Against the Spread of Weapons and Materials of Mass Destruction (GP), the US' National Nuclear Security Administration's (NNSA) Megaports initiative and INTERPOL; countries identified with major transshipment points have had their transport and maritime security infrastructure upgraded and supplemented with equipment to detect the transfer of nuclear material. Such safeguards, in addition to the implementation of norms across the global nuclear industry through the Nuclear Suppliers Group, the Wassenaar Arrangement and the Zangger Committee have ensured that the highest standards are applied to global transport infrastructure. Security is geared to facilitate the safe and secure transport of authorized nuclear materials while detecting, interdicting and preventing any illegal transfers of material. Finally, the largest piece of the global infrastructure to prevent the illegal transfer of nuclear material can be found in the IAEA's Incident and Trafficking Database (ITDB), which comprises 124 state participants and provides a comprehensive worldwide network to detect and prevent any unauthorized and illegal attempts to traffic nuclear materials. Between 1993 and 2012, there were a total of 2,331 incidents that were reported by participating States and some non-participating States. Of these 2,331 incidents, 419 were found to involve unauthorized possession and/or criminal activity. Of these 419 incidents, 16 were found to involve HEU or Pu. In total, there were 615 incidents reported that involved the theft or loss of nuclear or other radioactive material and a total of 1,244 cases involving other unauthorized activities, including the unauthorized disposal of radioactive materials or discovery of uncontrolled sources.⁷⁶ The total for all IAEA-confirmed trafficking cases involving HEU was just 8.35kg, with the total amount of Pu at 374.3g. ⁷⁷ With the number of cases that have been documented and still no indications that terrorists currently pose a credible nuclear threat, it is safe to assume that there is a high success rate for both detection and intervention.

Terrorists can't get WMD's – several hurdles and their authors are just paranoid Mueller '9

(John Mueller, political scientist in the field of international relations, March 25, 2009, "Overblown: How Politicians and the Terrorism Industry Inflate National Security Threats, and Why We Believe Them" , SS)

Nonetheless, terrorism analyses tend to focus on lurid worst-case scenarios, a great portion of them involving weapons of mass destruction, a concept that, especially after the cold war, has been expanded to embrace chemical and biological and sometimes radiological as well as nuclear weapons.¹ Although chemical, radiological, and most biological weapons do not belong in the same category of destructiveness as nuclear weapons, all members of the WMD list are similar in that their acquisition and deployment present enormous difficulties, especially for terrorists. Nuclear weapons can indeed inflict massive destruction, and an atomic bomb in the hands of a terrorist or rogue state could kill tens of thousands of people or even, in exceptional circumstances, more. But it is also essential to note that making such a bomb is an extraordinarily difficult task. As the Gilmore Commission, a special advisory panel to the president and Congress, stresses, building a nuclear device capable of producing mass destruction presents "Herculean challenges." The process requires obtaining enough fissile material, designing a weapon "that will bring that mass together in a tiny fraction of a second, before the heat from early fission blows the material apart," and figuring out some way to deliver the thing. And the Commission emphasizes that these merely constitute "the minimum requirements." If each is not fully met, the result is not simply a less powerful weapon, but one that can't produce any significant nuclear yield at all or can't be delivered. Moreover, proliferation of these weapons has been remarkably slow. During the cold war there were many dire predictions about nuclear proliferation that proved to be greatly exaggerated. Among these was the nearly unanimous expectation in the 1950s and 1960s that dozens of countries would soon have nuclear weapons. For example, a report in 1958 predicted "a rapid rise" in the number of atomic powers by the mid-1960s, and a couple of years later, John Kennedy observed that there might be "ten, fifteen, twenty" countries with a nuclear capacity by 1964. In 1985 Time magazine devoted a cover story to the claim that "the

nuclear threat is spreading" and worried that "the rate of proliferation could grow rapidly worse" thanks to what it ominously called "phantom proliferators." Yet, twenty years later, the only clear addition to the nuclear club is Pakistan. similar alarms were issued in the early 1990s, in the aftermath of the cold war. Well over a decade ago, it was argued that Japan and Germany would, by natural impulse, soon come to yearn for nuclear weapons. The Japanese and the Germans themselves continue to seem viscerally uninterested, though problems with North Korea could alter that perspective for Japan. It is also worth noting that, although nuclear weapons have been around now for well over half a century, no state has ever given another state—even a close ally, much less a terrorist group—a nuclear weapon (or chemical, biological, or radiological one either, for that matter) that the recipient could use independently. For example, during the cold war, North Korea tried to acquire nuclear weapons from its close ally, China, and was firmly refused? Donors understand that there is always the danger the weapon will be used in a manner the donor would not approve—or even, potentially, on the donor itself. There could be some danger from private profiteers, like the network established by Pakistani scientist A. Q. Khan. However, its activities were rather easily penetrated by intelligence agencies, and it was closed down abruptly after 9/11.

Terrorists can't get nukes – building and buying is impossible

(Peter **Bergen**, CNN's national security analyst, December 5, **2008**, CNN, "Commentary: WMD terrorism fears are overblown", <http://www.cnn.com/2008/POLITICS/12/05/bergen.wmd/>, SS)

There is a semantic problem in any discussion of WMDs because the ominous term "Weapons of Mass Destruction" is something of a misnomer. In the popular imagination, chemical, biological and nuclear devices are all weapons of mass destruction. In fact, there is only one weapon of mass destruction that can kill tens or hundreds of thousands and that is a nuclear device So the real question is: Can terrorists deploy nuclear weapons any time in the next five years or even further in the future? To do so, terrorists would have one of four options: to buy, steal, develop or be given a nuclear weapon. But none of those scenarios are remotely realistic outside the world of Hollywood. To understand how complex it is to develop a nuclear weapon, it is worth recalling that Saddam Hussein put tens of millions of dollars into his nuclear program with no success. Iran, which has had a nuclear program for almost two decades, is still years away from developing a nuclear bomb. Terrorist groups simply don't have the massive resources of states, and so the notion that they could develop their own, even crude, nuclear weapons is fanciful. Well, what about terrorists being given nukes? Preventing this was one of the underlying rationales of the push to topple Hussein in 2003. This does not pass the laugh test. Brian Michael Jenkins, one of the leading U.S. terrorism experts in a book published this year, "Will Terrorists Go Nuclear?," points out that there are two reasons this is quite unlikely. First, governments are not about to hand over their crown jewels to organizations that are "not entirely under state control and whose reliability is not certain." Second, "giving them a nuclear weapon almost certainly exposes the state sponsor to retaliation." For the same reason that states won't give nukes to terrorists, they also won't sell them either, which leaves the option of stealing a nuclear weapon. But that is similarly unlikely because nuclear-armed governments, including Pakistan, are pretty careful about the security measures they place around their most valued weapons. None of this of course is to suggest that al Qaeda is not interested in deploying nuclear devices. Osama bin Laden and other al Qaeda leaders have repeatedly bled about the necessity of nuking the West and have even implied that they have the capability to do so. This is nonsense. Yes, in the mid-1990s when Al Qaeda was based in Sudan, members of the group tried to buy highly enriched uranium suitable for a nuke, but the deal did not go through. And it is certainly the case that a year or so before 9/11, bin Laden was meeting with veterans of Pakistan's nuclear program to discuss how al Qaeda might get into the nuclear weapons business. But all of this was aspirational, not operational. There is not a shred of evidence that any of this got beyond the talking stage. In 2002, former U.N. weapons inspector David Albright undertook a careful study of al Qaeda's nuclear research program and concluded it was virtually impossible for al Qaeda to have acquired any type of nuclear weapon.

-- Allison Indict

Allison is conclusively wrong and concedes it is unlikely terrorists could pull off a successful attack

Salik 14 [Naeem - pursuing PhD at the Centre for Muslim States and Societies/Political Science and International Relations at the University of Western Australia and is former Director, Arms Control & Disarmament at Pakistan's National Command Authority (NCA). "Nuclear Terrorism: Assessing the Danger", Strategic Analysis, 2014 Vol. 38, No. 2, 173-184, <http://dx.doi.org/10.1080/09700161.2014.884437>] Schuler 53

Graham Allison is convinced that a highly motivated terrorist group could eventually overcome all difficulties and challenges and would be able to somehow acquire a 'crude bomb or device', but concedes that such a device would be 'large, cumbersome, unsafe, unpredictable and inefficient'. 31 It is not difficult to imagine that a bomb or device of such description would be so unwieldy that it would not be deliverable by any conventional means. It would have to be detonated by a suicidal group of terrorists, and due to difficulty in stealthy transportation of this monstrous contraption it would ideally be used in the same country in which it was fabricated. The obvious conclusion would be that every state that possesses fissile materials would guard these as best as it could, because it would be the most likely victim if a terrorist group managed to steal a substantial amount of such material. In contrast to Allison, William Langewiesche, after evaluating the prospects of a terrorist group putting together a nuclear bomb, has come to the conclusion that 'it remains very, very unlikely. It's a possibility, but unlikely'. He further adds that, 'if you look carefully and practically at this process, you see that it is an enormous undertaking full of risks for the would-be terrorists. And so far there is no public case, at least known, of any appreciable amount of weapons-grade HEU [highly enriched uranium] disappearing. And that's the first step. If you don't have that, you don't have anything'. 32 Elsewhere he is not so unequivocal in his assessment, stating that 'if a would-be nuclear terrorist calculated the odds, he would have to admit that they are stacked against him, but they are not impossible'.

AT//Turns Case

Domestic surveillance and public paranoia drive the existence of the national security state – not the aff

LoCicero, 15 (Alice, certified clinical psychologist, former president of the Society for Terrorism Research, “Domestic Consequences of US Counter-Terrorism Efforts: Making it Harder to Prevent Homegrown Terrorism”, The Open Psychology Journal, 2015, <http://benthamopen.com/ABSTRACT/TOPSYJ-8-32>) KW

US counterterrorism policies have created hostility toward those who express antiwar perspectives. The unpopularity and intolerance for antiwar perspectives were expected. Beyond intolerance for antiwar perspectives, extreme pro-war imagery and enthusiasm has abounded. Military and security forces have become popular topics in Hollywood and on television. Government sanctioned violence, such as war, is idealized, rather than thoughtfully debated. Local police are now in possession of military style weaponry, vehicles, and gear. As witnessed in the summer of 2014, in Ferguson, Missouri, the use of this gear has a predictable effect: it makes the police more aggressive [19]. This could easily have been predicted (and thus avoided) by using principles of psychological science. When pro-war sentiment waned, as a result of the protracted and unsuccessful wars in Iraq and Afghanistan, it was easily regenerated by hysteria created by government and media portrayals of a group calling itself the Islamic State (although it is neither Islamic nor a state.) Although the government could not define or specify any threat to the US by this group, it insisted, and media portrayed, that such a threat was certain.¶ The group calling itself the Islamic State (more accurately called an un-Islamic, non-State) tried to get the US to provide ransom for the release of an American held hostage, James Foley. The government refused, and also informed members of Foley’s family, who considered trying to raise money and provide the ransom themselves, that it would be unlawful to do so [20]. When the group then, in a dramatic and well-publicized procedure, beheaded Foley and other American hostages, the actions of the media and government, rather than putting Americans’ fears into perspective in order to prevent panic, increased the panic.¶ At MacDill Air Force Base on September 19, 2014, President Obama made comments, later summarized and distributed by the White House, about the so-called Islamic State, (referred to in the comments as “ISIL”). The puzzling claim that ISIL is definitely threatening America, even though no specific plots have been detected, and no action is recommended, is reminiscent of the problems with color-coded threat levels referred to above. Vague suggestions of something to be afraid of with no suggested action to take, other than, perhaps, to support the bombings targeted at the group calling itself Islamic State, has, as would have been predicted, caused panic and hysteria among Americans. Here is part of a summary of those comments, as distributed by the White House.

Doesn’t turn the case – terrorism doesn’t produce widespread hysteria

Mawson, 05 (Anthony, Visiting Professor, School of Health Sciences, Jackson State University; Summer 2005; Psychiatry: Interpersonal and Biological Processes

Volume 68, Issue 2; “Understanding Mass Panic and Other Collective Responses to Threat and Disaster”; ProQuest; <http://www.tandfonline.com/doi/abs/10.1521/psyc.2005.68.2.95>)/JPM

While mass panic (and/or violence) and self-preservation are often assumed to be the natural response to physical danger and perceived entrapment, the literature indicates that expressions of mutual aid are common and often predominate, and collective flight may be so delayed that survival is threatened. In fact, the typical response to a variety of threats and disasters is not to flee but to seek the proximity of familiar persons and places; moreover, separation from attachment figures is a greater stressor than physical danger. Such observations can be explained by an alternative "social attachment" model that recognizes the fundamentally gregarious nature of human beings and the primacy of attachments. In the relatively rare instances where flight occurs, the latter can be understood as one aspect of a more general affiliative response that involves escaping from certain situations and moving toward other situations that are perceived as familiar but which may not necessarily be objectively safe. The occurrence of flight-and-affiliation depends mainly on the social context and especially the whereabouts of familiar persons (i.e., attachment figures); their physical presence has a calming effect and reduces the probability of flight-and-affiliation, while their absence has the opposite effect. Combining the factors of perceived physical danger and the location of attachment figures results in a four-fold typology that encompasses a wide spectrum of collective responses to threat and disaster. Implications of the model for predicting community responses to terrorist attacks and/or use of weapons of mass destruction are briefly discussed.⁴ The collective response to threat and disaster is often portrayed as tending toward hysteria and social breakdown, with mass panic (and/or violence) as the natural response to physical danger and perceived entrapment. However, mass panic is **uncommon** in situations such as combat (L'Etang, 1966), air-raid or bombing attacks (Janis, Chapman, Gillin, & Spiegel, 1955), structural fires (Best, 1978; Keating, 1982; Proulx, 2002), and disasters (Fritz & Williams, 1957; Kinston & Rosser, 1974; Noji, 1997; Quarantelli, 1960, 2001). On the contrary, **expressions of mutual aid are common and tend to predominate.**

AT: Generic Link

Leading experts—surveillance doesn't solve terror

Baker and Sanger 2015 (Peter and David E; Why the NSA Isn't Howling over restrictions; May 1; www.nytimes.com/2015/05/02/us/politics/giving-in-a-little-on-national-security-agency-data-collection.html; kdf)

The foundation's analysis said the bill "should end" the bulk collection of "everybody's phone records." But it pointed out that the N.S.A. could still search for records beyond telephone data with fewer restrictions. And it noted that the bill would not address warrantless collection of Americans' international calls and e-mails under Section 702 of the Foreign Intelligence Surveillance Act amendments of 2008. The future of the bulk collection program may have been sealed in December 2013, when a panel of experts appointed by Mr. Obama found that the program had been of minimal intelligence value and ran considerable risks of invading privacy. "N.S.A. believes that on at least a few occasions, information derived" had "contributed to its efforts to prevent possible terrorist attacks, either in the United States or somewhere else in the world," the report said. But the panel concluded that its review showed that the information collected under the program "was not essential to preventing attacks and could readily have been obtained in a timely manner using conventional" court orders. The panel recommended legislation that "terminates the storage of bulk telephony metadata by the government" and that it be held instead by telecommunications companies or some other third party, ensuring that the government gained access only when the Foreign Intelligence Surveillance Court issued an order. Although the government said nothing at the time, General Alexander, then in his last months as the head of the N.S.A., told Mr. Obama that it would be preferable if legislation were passed that moved the program to private hands.

AT: Link – Drones Aff

Drones are inefficient mechanism to solve terrorism

Rothfuss 2014 (Ian F [George Mason School of Law]; Student Comment: An Economic Perspective on the Privacy Implications of Domestic Drone Surveillance; 10 J.L. Econ. & Pol'y 441; kdf)

Conclusion

U.S. citizens want to be safe from terrorist attacks and other threats, but not at the expense of their privacy rights. Therefore, a delicate balance must be achieved between privacy and security interests. Drones represent a surveillance technology advancement that threatens to dramatically alter the balance between these interests. As discussed in this comment, the current legal framework does not adequately protect privacy from the widespread surveillance that will likely result from the unrestricted domestic use of drones. Therefore, prompt legislative action is necessary to address the fundamental privacy challenges presented by the use of drones. Such legislation should allow for constructive use of drones within a framework that contains restrictions to protect individual privacy rights. While widespread general surveillance could make the nation safer from crime and terrorism, such extensive surveillance will ultimately be inefficient. The surveillance that could result from the domestic use of drones would detract from individual privacy and cause individuals to reduce productive activities and invest in countermeasures. Such "privacy disutility" will outweigh the societal benefits unless domestic drone surveillance is restricted. Therefore, [*462] without legislative action we may soon live in a world where "every time we walk out of our front door we have to look up and wonder whether some invisible eye in the sky is monitoring us." n175

Surveillance makes counter-terror tools ineffective

Corrigan 2015 (Ray [senior lecturer in mathematics, computing, and technology at the Open University, U.K.]; Mass Surveillance Will Not Stop Terrorism; Jan 25; www.slate.com/articles/health_and_science/new_scientist/2015/01/mass_surveillance_against_terrorism_gathering_intelligence_on_all_is_statistically.html; kdf)

Police, intelligence, and security systems are imperfect. They process vast amounts of imperfect intelligence data and do not have the resources to monitor all known suspects 24/7. The French authorities lost track of these extremists long enough for them to carry out their murderous acts. You cannot fix any of this by treating the entire population as suspects and then engaging in suspicionless, blanket collection and processing of personal data. Mass data collectors can dig deeply into anyone's digital persona but don't have the resources to do so with everyone. Surveillance of the entire population, the vast majority of whom are innocent, leads to the diversion of limited intelligence resources in pursuit of huge numbers of false leads. Terrorists are comparatively rare, so finding one is a needle-in-a-haystack problem. You don't make it easier by throwing more needleless hay on the stack. It is statistically impossible for total population surveillance to be an effective tool for catching terrorists. Even if your magic terrorist-catching machine has a false positive rate of 1 in 1,000—and no security technology comes anywhere near this—every time you asked it for suspects in the U.K. it would flag 60,000 innocent people. Law enforcement and security services need to be able to move with the times, using modern digital technologies intelligently and through targeted data preservation—not a mass surveillance regime—to engage in court-supervised technological surveillance of individuals whom they have reasonable cause to suspect. That is not, however, the same as building an infrastructure of mass surveillance. **Mass surveillance makes the job of the security services more difficult and the rest of us less secure.**

Less data leads to effective data, the aff is key to solve terrorism

Schwartz 2015 (Mattathias [Staff writer @ The New Yorker]; The Whole Haystack; Jan 26; www.newyorker.com/magazine/2015/01/26/whole-haystack; kdf)

Before the event, every bit of hay is potentially relevant. "The most dangerous adversaries will be the ones who most successfully disguise their individual transactions to appear normal, reasonable, and legitimate," Ted Senator, a data scientist who worked on an early post-9/11 program called Total Information Awareness, said, in 2002. Since then, intelligence officials have often referred to "lone-wolf terrorists," "cells," and, as Alexander has put it, the "terrorist who walks among us," as though Al Qaeda were a fifth column, capable of camouflaging itself within civil society. Patrick Skinner, a former C.I.A. case officer who works with the Soufan Group, a security company, told me that this image is wrong. "We knew about these networks," he said, speaking of the Charlie Hebdo attacks. Mass surveillance, he continued, "gives a false sense of security. It sounds great when you say you're monitoring every phone call in the United States. You can put that in a PowerPoint. But, actually, you have no idea what's going on." By flooding the system with false positives, big-data approaches to counterterrorism might actually make it harder to identify real terrorists before they act. Two years before the Boston Marathon bombing, Tamerlan Tsarnaev, the older of the two brothers alleged to have committed the attack, was assessed by the city's Joint Terrorism Task Force. They determined that he was not a threat. This was one of about a thousand assessments that the Boston J.T.T.F. conducted that year, a number that had nearly doubled in the previous two years, according to the Boston F.B.I. As of 2013, the Justice Department has trained nearly three hundred thousand law-enforcement officers in how to file "suspicious-activity reports." In 2010, a central database held about three thousand of these reports; by 2012 it had grown to almost twenty-eight thousand. "The bigger haystack makes it harder to find the needle," Sensenbrenner told me. Thomas Drake, a former N.S.A. executive and whistle-blower who has become one of the agency's most vocal critics, told me, "If you target everything, there's no target." Drake favors what he calls "a traditional law-enforcement" approach to terrorism, gathering more intelligence on a smaller set of

targets. Decisions about which targets matter, he said, should be driven by human expertise, not by a database.

xt—Link Turn: DA=Self-fulfilling prophecy

The fear of terrorism justifies the expansion of surveillance, but fails to solve terror

Weiss 2015 (Leonard [visiting scholar at Stanford University's Center for International Security and Cooperation]; On fear and nuclear terror; Mar 3; Bulletin of the Atomic Scientists 2015, Vol. 71(2) 75–87; kdf)

The rise of the national surveillance state. Lowering the risk of terrorism, particularly the nuclear kind, is the quintessential reason that the mandarins of the national security state have given for employing the most invasive national surveillance system in history. "Finding the needle in the haystack" is how some describe the effort to discern terrorist plots from telephone metadata and intercepted communications. But the haystack keeps expanding, and large elements of the American population appear willing to allow significant encroachments on the constitutional protections provided by the Fourth Amendment. The fear of terrorism has produced this change in the American psyche even though there is no evidence that the collection of such data has resulted in the discovery of terrorist plots beyond those found by traditional police and intelligence methods. It is doubtful that we shall soon (if ever) see a return to the status quo ante regarding constitutional protections. This reduction in the freedom of Americans from the prying eyes of the state is a major consequence of the hyping of terrorism, especially nuclear terrorism. This is exemplified by the blithe conclusion in the previously referenced paper by Friedman and Lewis (2014), in which readers are advised to "be more proactive in supporting our government's actions to ameliorate potential risks." The National Security Agency should love this.

Link Turn - Drones

Federal regulation of drones is necessary to build safeguards against cyber war

Bernd 2013 (Candice [assistant editor/reporter with Truthout]; The Coming Domestic Drone Wars; Sep 19; www.truth-out.org/news/item/18951-the-coming-domestic-drone-wars#; kdf)

Domestic Drone Weaknesses Cyber warfare may prove to be the most enduring challenge for the FAA when it comes to ensuring guidelines that will protect Americans adequately as drone technology makes its transition into civilian life. Peter Singer is the director of the Center for 21st Century Security and Intelligence and a senior fellow in the Foreign Policy program at Brookings Institute. He is the author of *Wired for War: The Robotics Revolution and Conflict in the 21st Century*. According to him, the primary weakness of drone technology is many systems' dependence on GPS signals and remote operation. Even military-grade drone technology can be co-opted, he said. In December 2011, the Iranian Army's electronic warfare unit brought down an American drone, the RQ-170 Sentinel, after it crossed into Iranian airspace. In Iraq in 2009, Iraqi insurgents were able to use \$26 software to intercept the video feeds of US Predator drones in a manner "akin to a criminal listening in on the police radio scanner," Singer told Truthout. Most recently, a research team at the University of Texas was able to demonstrate successfully the spoofing of a UAV by creating false civil GPS signals that trick the drone's GPS receiver. "There aren't easy answers to these other than good encryption requirements," Singer told Truthout in an email. The Texas research team hoped to demonstrate the dangers of spoofing early on in the FAA's task to write the mandated rules for UAS integration in the national airspace, and the Department of Homeland Security invited the team to demonstrate the spoofing in New Mexico. "Vulnerability to jamming and spoofing depends highly on the design of the aircraft and control systems and vary across differing architectures. Minimum system performance and design standards developed for civil UAS designs will address these vulnerabilities," an FAA spokesman told Truthout. Whether minimum standards for system performance will be enough to address the changing dynamic of cyber warfare, and for that matter, technology, remains a question, but it's something the FAA and Homeland Security are examining as drone technology becomes more widespread in the US.

AT: Experts

Their “experts” have motive to exaggerate the likelihood of an attack

Weiss 2015 (Leonard [visiting scholar at Stanford University’s Center for International Security and Cooperation]; On fear and nuclear terror; Mar 3; Bulletin of the Atomic Scientists 2015, Vol. 71(2) 75–87; kdf)

There is a tendency on the part of security policy advocates to hype security threats to obtain support for their desired policy outcomes. They are free to do so in a democratic society, and most come by their advocacy through genuine conviction that a real security threat is receiving insufficient attention. But there is now enough evidence of how such advocacy has been distorted for the purpose of overcoming political opposition to policies stemming from ideology that careful public exposure and examination of data on claimed threats should be part of any such debate. Until this happens, the most appropriate attitude toward claimed threats of nuclear terrorism, especially when accompanied by advocacy of policies intruding on individual freedom, should be one of skepticism. Interestingly, while all this attention to nuclear terrorism goes on, the United States and other nuclear nations have no problem promoting the use of nuclear power and national nuclear programs (only for friends, of course) that end up creating more nuclear materials that can be used for weapons. The use of civilian nuclear programs to disguise national weapon ambitions has been hallmark of proliferation history ever since the Atoms for Peace program (Sokolski, 2001), suggesting that the real nuclear threat resides where it always has resided-in national nuclear programs; but placing the threat where it properly belongs does not carry the public-relations frisson currently attached to the word “terrorism.”

No Terror Attack

Terrorists lack the motivation to get the bomb – even if they did, they’d never pull off an attack

Weiss 2015 (Leonard [visiting scholar at Stanford University’s Center for International Security and Cooperation]; On fear and nuclear terror; Mar 3; Bulletin of the Atomic Scientists 2015, Vol. 71(2) 75–87; kdf)

A recent paper (Friedman and Lewis, 2014) postulates a scenario by which terrorists might seize nuclear materials in Pakistan for fashioning a weapon. While jihadist sympathizers are known to have worked within the Pakistani nuclear establishment, there is little to no evidence that terrorist groups in or outside the region are seriously trying to obtain a nuclear capability. And Pakistan has been operating a uranium enrichment plant for its weapons program for nearly 30 years with no credible reports of diversion of HEU from the plant. There is one stark example of a terrorist organization that actually started a nuclear effort: the Aum Shinrikyo group. At its peak, this religious cult had a membership estimated in the tens of thousands spread over a variety of countries, including Japan; its members had scientific expertise in many areas; and the group was well funded. Aum Shinrikyo obtained access to natural uranium supplies, but the nuclear weapon effort stalled and was abandoned. The group was also interested in chemical weapons and did produce sarin nerve gas with which they attacked the Tokyo subway system, killing 13 persons. AumShinrikyo is now a small organization under continuing close surveillance. What about highly organized groups, designated appropriately as terrorist, that have acquired enough territory to enable them to operate in a quasigovernmental fashion, like the Islamic State (IS)? Such organizations are certainly dangerous, but how would nuclear terrorism fit in with a program for building and sustaining a new caliphate that would restore past glories of Islamic society, especially since, like any organized government, the Islamic State would itself be vulnerable to nuclear attack? Building a new Islamic state out of radioactive ashes is an unlikely ambition for such groups. However, now that it has become notorious, apocalyptic pronouncements in Western media may begin at any time, warning of the possible acquisition and use of nuclear weapons by IS. Even if a terror group were to achieve technical nuclear proficiency, the time, money, and infrastructure needed to build nuclear weapons creates significant risks of discovery that would put the group at risk of attack. Given the ease of obtaining conventional explosives and the ability to deploy them, a terrorist group is unlikely to exchange a big part of its operational program to engage in a risky nuclear development effort with such doubtful prospects. And, of course, 9/11 has heightened sensitivity to the need for protection, lowering further the probability of a successful effort.

xt—No nuclear terror

No risk of nuclear terror – leading expert

Weiss 2015 (Leonard [visiting scholar at Stanford University's Center for International Security and Cooperation]; On fear and nuclear terror; Mar 3; Bulletin of the Atomic Scientists 2015, Vol. 71(2) 75–87; kdf)

Fear of nuclear weapons is rational, but its extension to terrorism has been a vehicle for fear-mongering that is unjustified by available data. The debate on nuclear terrorism tends to distract from events that raise the risk of nuclear war, the consequences of which would far exceed the results of terrorist attacks. And the historical record shows that the war risk is real. The Cuban Missile Crisis and other confrontations have demonstrated that miscalculation, misinterpretation, and misinformation could lead to a 'close call' regarding nuclear war. Although there has been much commentary on the interest that Osama bin Laden, when he was alive, reportedly expressed in obtaining nuclear weapons, evidence of any terrorist group working seriously toward the theft of nuclear weapons or the acquisition of such weapons by other means is virtually nonexistent. The acquisition of nuclear weapons by terrorists requires significant time, planning, resources, and expertise, with no guarantees that an acquired device would work. It requires putting aside at least some aspects of a groups more immediate activities and goals for an attempted operation that no terrorist group has accomplished. While absence of evidence does not mean evidence of absence, it is reasonable to conclude that the fear of nuclear terrorism has swamped realistic consideration of the threat.

AT: Lone Wolves

No lone wolf terror

Becker, 12/14/14 [The Foreign Policy Essay: Wolves Who Are Lonely By Michael Becker Sunday, December 14, 2014 at 10:00 AM, Michael Becker is a Ph.D. student in political science at Northeastern University. His research focuses on international security, conflict, and terrorism. He can be reached at becker.m@husky.neu.edu.http://www.lawfareblog.com/2014/12/the-foreign-policy-essay-wolves-who-are-lonely/]

But much of the fear surrounding lone wolves is unwarranted and based on ignorance of how they operate. My research shows that lone- actor terrorists tend to conform to certain distinct patterns that can be useful in preventing future attacks. Perhaps more important, my findings indicate that lone wolves are not nearly as threatening as either their name or the hype around them suggest. Becker photo The concern about lone-wolf terrorism pervades much of the U.S. national security establishment. President Obama, former Secretary of Homeland Security Janet Napolitano, and current DHS Secretary Jeh Johnson, among others, have cited lone wolves as one of the gravest potential threats to U.S. security. They point to the rise of social media and terrorist propaganda, like the sophisticated videos produced by the Islamic State, and express concern that socially isolated individuals can become radicalized with troubling ease. It is true that lone-wolf terrorism against the United States has become more common in the past several years. And several lone-actor attacks—including the 2011 shooting of Representative Gabrielle Giffords, which left six dead, and the 2009 Fort Hood shooting, which killed 13—have had deadly and tragic consequences. Concurrently, there has been little success in terms of identifying a lone wolf “profile.” They can be young or old; black or white; radical Islamists, right-wing extremists, anti-Semites, militant environmentalists, or of another ideological persuasion altogether. Given the diversity of their backgrounds, how can such a proban enemy be countered? I recently undertook an analysis of 84 lone-wolf attacks that occurred in the United States between 1940 and 2012 in an effort to identify patterns in the targets that lone wolves chose. I came away with several findings that have important national security implications. First, similar to our recent experience with the Ebola outbreak, the fear of the thing is usually worse than the thing itself. Few lone-wolf attacks in the United States actually kill anyone, and many others only succeed in killing one person the lone wolf himself (they are almost invariably men) Many lone wolves are incompetent loners with no experience discharging a bomb or firearm; oftentimes they exhibit behavior that, in retrospect, is more bizarre and sad than frightening. Take Dwight Watson, a.k.a. the “Tractor Man.” In 2003, Watson drove his tractor to Washington, D.C., and threatened to blow up explosives near the National Mall. After two days, he surrendered unceremoniously and it was revealed that he never had any weapons at all. Part of the reason for the low casualty rate in lone-wolf attacks is that unlike groups such as al-Qaeda that have significant resources at their disposal and, even more important, a sophisticated division of labor lone wolves have to do all the work of terrorism themselves: finding a target, planning an attack, gathering supplies, doing reconnaissance, actually carrying out the attack, and possibly executing an escape plan. This disadvantage is reflected in the weapons most lone wolves choose: firearms. Globally at the organizational level, most terrorist attacks are bombings but lone wolves mainly choose guns. In part, this is because guns can more easily be attained than bombs in the United States, but lone wolves’ preference for firearms obtains globally as well, suggesting it is driven by their lack of facility with explosives. And a lone gunman—while still potentially able to cause multiple casualties—is likely to produce fewer fatalities than a well-made and well-placed bomb. Another significant characteristic of lone wolves is their limited ability to select meaningful targets. The expertise needed to conduct a successful attack on a hardened target—not an easy task—is reflected in the targets most lone wolves choose and how they conduct themselves. Lone wolves tend to choose unhardened, undefended targets like college campuses, churches, and local government buildings. Only rarely do they opt for significant or symbolic targets like the National Mall. I suspect that this tendency is due to two factors: the more personal motives that—alongside their political ideologies—inform lone wolves’ violent tendencies; and the desire to carry out a successful attack a task made easier by choosing a softer target. The targets lone wolves choose tend to be congruent with the ideologies that they say motivate them: so anti-abortion lone wolves go after clinics or doctors who perform abortions, while right-wing extremists target government buildings and officials. What is even more striking is that these small, ball targets tend to be found in or near places well known to perpetrators—the square in their hometown, the synagogue they pass on their way to work, etc. Their daily routines, in other words, are usually the scene of the crime. What should all these patterns mean to counterterrorism officials? They indicate most notably that lone wolves are not as fearsome as they are often made out to be. Lone wolves are only rarely deadly. What is more, when they do manage to kill people, their incompetence and reliance on firearms usually limit the number of deaths. As a result, policymakers concern about lone wolves is probably overblown, and the allocation of resources for counterterrorism purposes should take account of this. In some

sense, this requires us to learn to live with the existence of lone-wolf terrorism.

Even if the threat were more severe, there are too many potential targets and too many potential lone wolves to expect law enforcement to monitor, detect, and interdict them all.

AT: Cyber attacks

No cyber threats

Healey 13 Jason, Director of the Cyber Statecraft Initiative at the Atlantic Council, "No, Cyberwarfare Isn't as Dangerous as Nuclear War", 3/20, www.usnews.com/opinion/blogs/world-report/2013/03/20/cyber-attacks-not-yet-an-existential-threat-to-the-us

America does not face an existential cyberthreat today, despite recent warnings. Our cybervulnerabilities are undoubtedly grave and the threats we face are severe but far from comparable to nuclear war. ¶ The most recent alarms come in a Defense Science Board report on how to make military cybersystems more resilient against advanced threats (in short, Russia or China). It warned that the "cyber threat is serious, with potential consequences similar in some ways to the nuclear threat of the Cold War." Such fears were also expressed by Adm. Mike Mullen, then chairman of the Joint Chiefs of Staff, in 2011. He called cyber "The single biggest existential threat that's out there" because "cyber actually more than theoretically, can attack our infrastructure, our financial systems." ¶ While it is true that cyber attacks might do these things, it is also true they have not only never happened but are far more difficult to accomplish than mainstream thinking believes. The consequences from cyber threats may be similar in some ways to nuclear, as the Science Board concluded, but mostly, they are incredibly dissimilar. ¶ Eighty years ago, the generals of the U.S. Army Air Corps were sure that their bombers would easily topple other countries and cause their populations to panic, claims which did not stand up to reality. A study of the 25-year history of cyber conflict, by the Atlantic Council and Cyber Conflict Studies Association, has shown a similar dynamic where the impact of disruptive cyberattacks has been consistently overestimated. ¶ Rather than theorizing about future cyberwars or extrapolating from today's concerns, the history of cyberconflict that have actually been fought, shows that cyber incidents have so far tended to have effects that are either widespread but fleeting or persistent but narrowly focused. No attacks, so far, have been both widespread and persistent. There have been no authenticated cases of anyone dying from a cyber attack. Any widespread disruptions, even the 2007 disruption against Estonia, have been short-lived causing no significant GDP loss. ¶ Moreover, as with conflict in other domains, cyberattacks can take down many targets but keeping them down over time in the face of determined defenses has so far been out of the range of all but the most dangerous adversaries such as Russia and China. Of course, if the United States is in a conflict with those nations, cyber will be the least important of the existential threats policymakers should be worrying about. Plutonium trumps bytes in a shooting war. ¶ This is not all good news. Policymakers have recognized the problems since at least 1998 with little significant progress. Worse, the threats and vulnerabilities are getting steadily more worrying. Still, experts have been warning of a cyber Pearl Harbor for 20 of the 70 years since the actual Pearl Harbor. ¶ The transfer of U.S. trade secrets through Chinese cyber espionage could someday accumulate into an existential threat. But it doesn't seem so seem just yet, with only handwaving estimates of annual losses of 0.1 to 0.5 percent to the total U.S. GDP of around \$15 trillion. That's bad, but it doesn't add up to an existential crisis or "economic cyberwar."

ISIS is structurally incapable of being a threat

Matthews and Preble 2015 (Dylan and Christopher [Cato's vice president for defense and foreign policy studies]; Ignore the headlines. The world is getting safer all the time.; Jan 15; www.vox.com/2015/1/14/7546165/world-getting-safer; kdf)

DM: Did ISIS change your thinking on this at all? ISIS fighter An ISIS fighter in Syria. (AFP/Getty Images)
CP: Not really, for a couple reasons. ISIS may be a terrorist organization, and may be an insurgency, and may be a quasi-nation-state or attempting to become a quasi-nation-state, but it's hard to be all of those things simultaneously. Austin Long writes about this in his chapter, about the differences between insurgents and terrorists. Most terrorists operate in the shadows. The hard part is not killing them, it's finding them. That's why traditional counterterrorism is an intelligence and information-gathering process. It's a lot like police work. By declaring itself a state and raising a flag over territory it seizes and holds, ISIS is trading away one of its key advantages, and opening itself up to more traditional military

attacks. It's a virulent, reprehensible state, but it's not clear to me that it's a greater terrorist threat than other organizations that are continuing to operate in the shadows.

AT: Right Wing Extremism

Surveillance only increases the risks of right-wing terror

Cannon 6/19/2015 (Gabrielle; Should the Charleston Attack Be Called Terrorism;
www.motherjones.com/politics/2015/06/charleston-shooting-terrorism-american-extremism; kdf)

The Southern Poverty Law Center, a nonprofit advocacy organization, still maintains a database called "The Extremist Files" that profiles prominent hate groups and extremist movements and ideologies, but Johnson hopes more will be done to get lawmakers to take note. "Hopefully this will get the attention of those in charge of not only enforcement, but also those making our laws," he said. "Try to wrap your arms around this problem and try to actually develop a strategy to combat it and mitigate it. That is not being done." Still, as former Mother Jones reporter Adam Serwer pointed out in his 2011 coverage of the Sikh temple shooting, surveillance doesn't always lead to prevention and can impede constitutional rights: "Mike German, a former FBI agent who did undercover work infiltrating extremist groups including neo-Nazis and militia groups and is now senior policy counsel for the ACLU, told me that more government surveillance isn't the solution, and that it's a mistake to think there's a technological silver bullet that can flawlessly identify threats before they can be carried out. Most people with extreme views, German says, hold horrible (but constitutionally protected) beliefs they never act on." After Johnson left the DHS, the agency contended it was doing all it could to prevent domestic terror. As WIRED reported, DHS spokesman Matt Chandler responded by saying that the "DHS continues to work with its state, local, tribal, territorial, and private partners to prevent and protect against potential threats to the United States by focusing on preventing violence that is motivated by extreme ideological beliefs."

xt – No ISIS Terror

No threat of ISIS terrorism – litany of reasons

Byman and Shapiro 2015 (Daniel L [research director @ Center for Middle East Policy, Brookings] and Jeremy [Fellow @ Brookings]; Be Afraid. Be A Little Afraid: The Threat of Terrorism from Western Foreign Fighters in Syria and Iraq; January; www.brookings.edu/research/papers/2015/01/western-foreign-fighters-in-syria-and-iraq-byman-shapiro?rssid=LatestFromBrookings; kdf)

Despite these fears and the real danger that motivates them, the Syrian and Iraqi foreign fighter threat can easily be exaggerated. Previous cases and information emerging from Syria suggest several mitigating effects that may reduce—but hardly eliminate—the potential terrorist threat from foreign fighters who have gone to Syria. Those mitigating factors include: • Many die, blowing themselves up in suicide attacks or perishing quickly in wildfires with opposing forces. • Many never return home, but continue fighting in the conflict zone or at the next battle for jihad. • Many of the foreign fighters quickly become disillusioned, and a number even return to their home country without engaging in further violence. • Others are arrested or disrupted by intelligence services. Indeed, becoming a foreign fighter—particularly with today's heavy use of social media—makes a terrorist far more likely to come to the attention of security services. The danger posed by returning foreign fighters is real, but American and European security services have tools that they can successfully deploy to mitigate the threat. These tools will have to be adapted to the new context in Syria and Iraq, but they will remain useful and effective. Key Policy Recommendations The model below shows how the various mitigating factors and effective policies can (though not necessarily will) lessen the danger presented by foreign fighters. Complex Model of Foreign Fighter Radicalization Complex Model of Foreign Fighter Radicalization Decide First is the decision stage. It makes sense to reduce the numbers of those going to the conflict zone in the first place by interfering in the decision to go. After all, those who do not go cannot be radicalized by foreign fighting. Western countries should push a counter-narrative that stresses the brutality of the conflict and the internecine violence among jihadists. However, in general, governments are poor at developing counter-narratives and lack community credibility. It is usually better to elevate existing voices of community leaders who already embrace the counter-narrative than to try to handle this directly through government channels. Also vital is developing peaceful alternatives for helping the people affected by the conflicts in the Middle East. Some fighters—certainly not all but a significant portion—were originally motivated by a genuine desire to defend the Syrian people against the brutality of the Assad regime. Encouraging charitable activities, identifying legitimate channels for assistance, and otherwise highlighting what concerned individuals can do to help alleviate the suffering of the Syrian people may siphon off some of the supply of foreign fighters. Local programs for providing assistance can also improve domestic intelligence gathering capabilities in two ways, according to Western security service officials. First, simply being out and about in the community gives government officials more access to information about potential radicals. Families become comfortable with intelligence services, as do community leaders. Second, such programs allow intelligence officials to gain access to individuals who can potentially be recruited to inform on other would-be jihadists. Desired Results: • Talked out of joining the foreign militias by family or community intervention. • Choose peaceful alternative to fighting. Travel The second stage in the foreign fighter radicalization process is the travel to Syria. Disrupting the transit route via Turkey is one of the most promising ways of reducing the threat of foreign fighters to Europe and the United States. Doing so will primarily require better cooperation between Western governments and Turkish authorities, who have not always seen stopping the flow of fighters as their highest priority. But as Turkish authorities are now becoming more worried about the jihadist threat to Turkey, Western security services should establish channels with Turkish intelligence and police to warn them of the presence of specific individuals headed to Syria through Turkey and to encourage Turkey to turn them away from the Turkish border or stop them at the Syrian border and deport them. Though there are other ways into Syria, all are far harder and more costly for Western fighters. Security cooperation among European services and between European and American services is also essential. Intelligence collected from the communications of foreign fighters, shared open source monitoring, and other information from one service can prove vital for discovering transnational networks. Cooperation within Europe is indispensable for stopping travel as jihadists from one European country often try to travel to Turkey and then on to Syria via another European country in an effort to avoid detection. Desired Results: • Arrested en route. • Stopped at border and deported. Train and Fight In the third stage of the process, the foreign fighters receive training and fight in Syria or Iraq, mostly out of the reach of European or American influence. But even here, there are subtle ways of influencing the terrorist indoctrination process. Western security agencies should do everything they can to sow doubt in the minds of extremist leaders in Iraq and Syria about the true loyalties of Western Muslim volunteers. Highlighting information gained from recruits and even disinformation about the degree of infiltration by security services can heighten fears. If jihadist organizations come to view foreigners as potential spies or as corrupting influences, they might assign them to non-combat roles, test their allegiances by offering them the one-way ticket of suicide bombings, or even avoid recruiting them altogether. Desired Results: • Die in the combat zone. • Stay abroad and fight. • Become disillusioned with the struggle. Return Upon the foreign fighters' return, the fourth stage, it is critical to turn them away from violence and jihad. Western services report that they usually know when individuals return and that many return with doubts. As a first step, security services must triage returnees, identifying which ones deserve the most attention: our interviews indicate triaging is done inconsistently (and in some cases not at all) among the Western security services. Inevitably, some dangerous individuals will be missed, and some individuals identified as not particularly dangerous might later become a threat, but a first look is vital for prioritization. Efforts to promote a counter-narrative are valuable, particularly if they involve parents, preachers and community leaders. Community programs deserve considerable attention. The goal should be to move potential terrorists towards non-violence; since many are in that category already, hounding them with the threat of arrest or otherwise creating a sense of alienation can backfire. In the past, family and community members have at times been successful in steering returned fighters toward a different path, even getting them to inform on their former comrades. Indeed, sending returnees to jail for relatively minor crimes such as going abroad to fight with a foreign terrorist organization against a distant enemy may simply put them in prison for a few years and expose them to the radicalizing elements present in many European prisons, where many minor players become exposed to hardened jihadists and integrate into broader networks. Desired Results: • Arrested and jailed. • De-radicalized and reintegrated. • No desire to attack at home. Plot To disrupt foreign fighters in the fifth and final stage of plotting terrorist attacks, security services must remain focused on the returnee problem and have sufficient resources to monitor the problem as it emerges in their countries. The good news is that going to Syria and Iraq and returning home usually does bring one to the attention of the security services. But maintaining vigilance as the numbers increase will be difficult purely for reasons of resources. Marc Hecker, a French expert on terrorism, commented that France could handle the "dozens" who returned from Iraq but would be over-whelmed by the "hundreds" who may come back from Syria. Keeping track of that many suspects, is exceptionally resource

intensive, particularly if it involves full-time surveillance. For intelligence services, often the problem is not in accessing or gathering the data, but in processing, analyzing, and following up on it in a timely manner. At the same time, their own effectiveness can work against them: by reducing the problem considerably, they decrease the danger, thereby creating the impression that they need fewer resources. One way to mitigate this effect is for security services to spread the burden of responsibility around by training and sharing information with local police and other law-enforcement and community organizations. Security cooperation among European services and between European and American services is absolutely necessary. Intelligence from the communications of foreign fighters, shared open-source monitoring, and other information obtained by one service can prove crucial for discovering transnational networks. As noted earlier, cooperation within Europe is critical for stopping travel, as jihadists from one European country often try to travel to Turkey and then on to Syria via another European country in order to avoid detection. Desired Results: • Attack foiled by law enforcement. • Attack fails due to lack of training or wrong skills. Conclusion The United States and Europe already have effective measures in place to greatly reduce the threat of terrorism from jihadist returnees and to limit the scale of any attacks that might occur. Those measures can and should be improved—and, more importantly, adequately resourced. But the standard of success cannot be perfection. If it is, then Western governments are doomed to fail, and, worse, doomed to an overreaction which will waste resources and cause dangerous policy mistakes.

Privacy Link

No Spillover

No spillover — pro-privacy legislative action is dependent without crisis.

Kerr 4 — Orin S. Kerr, Associate Professor of Law, George Washington University Law School, B.S.E. 1993, Princeton University; M.S. 1994, Stanford University; J.D. 1997, Harvard Law School, 2004 (“Technology, Privacy, And The Courts: A Reply To Colb And Swire,” *Michigan Law Review* (102 Mich. L. Rev. 933), Available Online to Subscribing Institutions via Lexis-Nexis)

Contrary to Swire's suggestion, I think that statutory protections also tend to reach a middle ground. If there is a general trend toward lesser statutory protection over time, it is not clear to me. Swire focuses on the fact that Congress did not act on an Internet privacy bill that the House Judiciary Committee approved in 2000, but then passed the USA Patriot Act in 2001. To Swire, this suggests that the legislative process is broken: Congress passed (bad) pro-government legislation but not (good) pro-privacy legislation, leading to less privacy.ⁿ¹⁹ I find it difficult to draw a lesson from this example. It is worth noting, however, that in Swire's own example the legislative process rejected FBI and DOJ proposals and instead attempted to push the law in a strongly pro-privacy direction. Then, when Congress passed some of the proposals a few years later, it did so only under remarkable circumstances and even then only subject to a sunset provision.ⁿ²⁰ If Swire's example is supposed to show a trend toward [*938] lessening privacy protection over time, then it is at best a mixed signal. More broadly, the privacy/security pendulum swings both ways; while there may be times of crisis when the pendulum swings in favor of law enforcement, there are other periods when the pendulum swings in favor of privacy. I would pose this question to Swire: if there is a systematic tendency toward greater surveillance, in what year was privacy most protected by the legislative process? In 1960, when federal law did not forbid wiretapping? In 1970, before FISA was enacted? In 1980, before Congress passed ECPA?

Turn: Surveillance Backlash

Turn: Surveillance causes public backlash which increases privacy.

Moncrieff, Venkatesh, and West 9 — Simon Moncrieff, research fellow in the Department of Computing at Curtin University of Technology, Svetha Venkatesh, professor in the Department of Computing at Curtin University of Technology, and Geoff West, professor in the Department of Spatial Sciences at Curtin University of Technology and at the Cooperative Research Centre for Spatial Information, 2009 (“Dynamic privacy in public surveillance” *Computer*, 42(9) <http://dro.deakin.edu.au/eserv/DU:30044204/venkatesh-dynamicprivacy-2009.pdf>)

As surveillance becomes increasingly intrusive, public opposition to these technologies will grow. Lawmakers will be pressured to force organizations that develop and deploy surveillance systems to incorporate additional privacy protections. However, because legislation tends to lag behind technology, such measures will inevitably inhibit preexisting systems’ functionality. Designing surveillance systems with privacy in mind, rather than as an afterthought, will accelerate the adoption of privacy policies in surveillance and reduce the impact of enforced privacy measures.⁶ For example, Google did not foresee privacy issues with Street View and thus did not incorporate privacy protections into the initial release of this feature in 2007. In response to public outcry, the company instituted several measures including the blurring of facial images and vehicle number plates and reducing image resolution to limit discernible information about pedestrians and vehicles. However, there is still considerable debate as to whether these measures go far enough; other identifying data such as location, clothes, and stature/gait are evident in Street View and may violate local privacy laws.

Link Non-Unique

Link non-unique — people are concerned about their privacy now

Trujillo 15 — Mario Trujillo, Professor in the Engineering department at University of Wisconsin – Madison, PhD from the University of Illinois, 2015 (“Poll: Large concern over data collection through smart devices,” *TheHill*, January 15th, Available online at <http://thehill.com/policy/technology/228472-poll-large-concern-over-data-collection-through-smart-devices>, Accessed 7-20-15)

Nearly eight in 10 people are concerned about their personal information being collected through smartphones and other devices, according to a poll released Monday.

The survey commissioned by TRUSTe, a consumer privacy company, also found that 69 percent of people believe they should own the data that is collected through their smart devices.

Twenty percent, on the other hand, believe the benefits of the products outweigh privacy concerns.

Eighty-seven percent expressed concern about their personal information being used in ways they are not aware of. Eighty-six percent said they are concerned about identity theft or their device being infected by malware. Seventy-eight percent expressed concern about their geographical location being unknowingly revealed.

Link non-unique — NFA, Snowden, activists, journalists, and increased internet use

Bartlett 15 — Jamie Bartlett, Director of the Centre for Analysis of Social Media, 2015 (“How we all became obsessed with online privacy,” *Content Loop*, June 16th, Available Online at <http://www.content-loop.com/how-we-all-became-obsessed-with-online-privacy/>, Accessed 7-20-2015)

It began with radical 'cypherpunks' who wanted to destroy the state. Now it's a hot-button issue for every Facebook user. How did the notion of internet privacy gain so much traction, and where will it take us next?

Cast your mind back to just 5 or ten years ago. Did you ever think about data, your digital footprint, the NSA, or what happened to your social media posts? Doubtful, even though you might have been doing much the same online. The question of internet privacy wasn't something many of us gave much thought to.

In the last couple of weeks, a handful of events have demonstrated how much that has all changed. Earlier this month the US Congress passed the 'Freedom Act' (which, in American tradition, stands awkwardly for Uniting and Strengthening America by Fulfilling Rights and Ending Eavesdropping, Dragnet-collection and Online Monitoring). It placed limits of mass data collected on US citizens by the National Security Agency, something many privacy advocates thought impossible. Last week, David Anderson published an independent review of the UK government's investigatory powers – it's very good by the way – and made over 100 recommendations about how to make surveillance simpler, clearer, and with more oversight. Perhaps even more surprising, although barely reported, Facebook decided to allow users to send encrypted messages on their messenger service.

This is all driven by growing public concern of course. According to the 2014 Deloitte Data Nation survey, 24 per cent of people in the UK do not trust any type of organisation with their personal information. Recent research by my think-tank Demos found half of young people said they were either extremely or

very concerned by 'online privacy' – more than environmental issues, immigration, tax avoidance, or the EU. There are more people are using tools and techniques to cover their digital tracks, especially since Edward Snowden blew his whistle.

Internet privacy has become a major political and social preoccupation. But very few people know much about the origins of the idea. The hope that modern, digital cryptographic software could change society goes back to the 1990s Californian 'Cypherpunks' (a mash up of the word cypher with cyber-punk). All were radical libertarians and early adopters of computer technology, sharing an interest in the effects it would have on politics and society. But while many West Coast liberals at the time were toasting the dawn of a new and liberating electronic age, these Cypherpunks spotted that networked computing might just as likely herald a golden age of state spying and control. They all believed that the great political issue of the day was whether governments of the world would use the internet to strangle individual freedom and privacy through digital surveillance, or whether autonomous individuals would undermine and even destroy the state through the subversive tools digital computing also promised.

At their first meeting, Tim May, as close to a leader as the group ever had, set out his vision to the excited group of rebellious, ponytailed twenty-and thirty-somethings. If the government can't monitor you, he argued, it can't control you. Fortunately, said May, thanks to modern computing, individual liberty can be assured by something more reliable than man-made laws: the unflinching rules of math and physics, existing on software that couldn't be deleted. 'Politics has never given anyone lasting freedom, and it never will,' he wrote in 1993. But computer systems could. What was needed, May argued, was new software that could help ordinary people evade government surveillance.

The group quickly grew to include hundreds of subscribers who were soon posting on a dedicated email list every day: exchanging ideas, discussing developments, proposing and testing cyphers. This remarkable email list predicted, developed or invented almost every technique now employed by computer users to avoid government surveillance. Tim May proposed, among other things, secure crypto-currencies, a tool enabling people to browse the web anonymously, an unregulated marketplace—which he called 'BlackNet'—where anything could be bought or sold without being tracked. Twenty years before the notorious Silk Road.

Ultimately they also hoped their endeavors would eventually bring about an economic, political and social revolution. In 1994 May published Cyphernomicon, his manifesto of the cypher-punk world view, on the mailing list. In it, he explained that 'many of us are explicitly anti-democratic and hope to use encryption to undermine the so-called democratic governments of the world.' On the whole, the cypherpunks were rugged libertarians who believed that far too many decisions that affected the liberty of the individual were determined by a popular vote of democratic governments. They saw internet privacy as the way out. (Julian Assange was joined the mailing list in late 1993 or early 1994).

Of course, not everyone who cared about internet privacy shared the cypherpunks' view that internet privacy was a route to pulling down governments. Each time governments – especially the US government - overreached by trying to spy on citizens too much, new movements and organisations would join the fray. And through the course of the 1990s and 2000s, internet privacy slowly started to inch into people's peripheral vision as something worth worrying about.

But it's really only the last 5 years or so that it's moved from periphery to centre. Partly it's Snowden. Partly it's the relentless work of activists and journalists who share concerns. But mostly it's the amount

of time we now spend online, and a dawning realization that all that data we produce must be going somewhere. These days we share inordinate amounts of digital information about ourselves: our bank details, our love life, our holiday snaps; our whole lives are online. And it's no longer just governments snaffling it all up – it is private companies, too. Think for a moment: do you ever wonder why it is that we get all these amazing internet services – Facebook, Twitter, YouTube, Gmail – for free? I rarely think about it, either, because I'm used to it all just being there, and always working. But it costs an awful lot of money to run these platforms: the server space, the highly skilled engineers, the legal teams. We are paying all right, just not in cash. We pay with our data and our privacy.

Public opinion is moving in favor of privacy — Congressional security rhetoric is the only opposition

Margolis 13 — Jason Margolis, reporter on economics and politics, M.A. in Journalism from the University of California at Berkeley, citing Joseph Nye, former Dean of the John F. Kennedy School of Government at Harvard University, PhD in political science from Harvard University, 2013 ("After Snowden, Global Debate Over Privacy vs. National Security Gaining Momentum," *PRI*, July 17th, Available Online at <http://www.pri.org/stories/2013-07-17/after-snowden-global-debate-over-privacy-vs-national-security-gaining-momentum>, Accessed 7-22-15)

Those figures mirror the mood in the US: There's a clear conflict between the need to protect our national security and our civil liberties.

There's a pendulum that constantly moves between security and privacy needs, said Harvard political scientist Joseph Nye, author of the new book, "Presidential Leadership and the Creation of the American Era."•

"I mean we saw it in the Civil War when Lincoln suspended Habeas Corpus, or in World War II when Franklin Roosevelt basically interned American citizens of Japanese origin,"• he said. "And then later the country swung back to saying this was excessive."•

Nye said nearly 12 years after the September 11th attacks the pendulum is beginning to swing back toward more calls for civil liberties. He adds Congress and the Administration need to find an acceptable middle ground.

That's difficult, because many members of Congress say the surveillance programs are working successfully and have thwarted terrorist attacks.

The link is non-unique – people are concerned with their privacy – prefer our studies

Doherty 13 — Carroll Doherty, director of political research at Pew, develops the research agenda, masters in international studies and bachelor in political science, regularly provides public opinion for BBC and NPR, 2013, ("Balancing Act: National Security and Civil Liberties in Post-9/11 Era" Pew Research Center, June 7th, Available Online at <http://www.pewresearch.org/fact-tank/2013/06/07/balancing-act-national-security-and-civil-liberties-in-post-911-era/>, Accessed 07-14-15

The revelations that Obama administration secretly collected phone records and accessed the internet activity of millions of Americans have raised new questions about the public's willingness to sacrifice civil liberties in the interests of national security. Since 9/11, Americans generally have valued protection from terrorism over civil liberties, yet they also have expressed concerns over government overreach

and intrusions on their personal privacy. Security First. Since shortly after 9/11, Pew Research has asked whether people's greater concern is that anti-terror policies will go too far in restricting civil liberties, or that they won't go far enough in adequately protecting the country. The balance of opinion has consistently favored protection. Most recently, in 2010, 47% said they were more concerned that government policies "have not gone far enough to adequately protect the country," while 32% said they were more concerned that "they have gone too far in restricting the average person's civil liberties." But Fewer See Need to Sacrifice Civil Liberties. Yet fewer Americans think it will be necessary to sacrifice civil liberties to combat terrorism than did so shortly after the 9/11 attacks. In a poll conducted in 2011, shortly before the 10th anniversary of 9/11, 40% said that "in order to curb terrorism in this country it will be necessary for the average person to give up some civil liberties," while 54% said it would not. A decade earlier, in the aftermath of 9/11 and before the passage of the Patriot Act, opinion was nearly the reverse (55% necessary, 35% not necessary).

The link is non-unique – Snowden leaks made people concerned about their privacy

Pierce June 5th — Charles Pierce, working journalist since 1976, author of four books, 2015, ("There Would Be No USA Freedom Act Without Edward Snowden," Esquire, June 5th, Available Online at <http://readersupportednews.org/opinion2/277-75/30564-there-would-be-no-usa-freedom-act-without-edward-snowden>, Accessed 07-14-15

The passage of the USA Freedom Act paves the way for telecom companies to assume responsibility of the controversial phone records collection program, while also bringing to a close a short lapse in the broad NSA and FBI domestic spying authorities. Those powers expired with key provisions of the Patriot Act at 12.01 am on Monday amid a showdown between defense hawks and civil liberties advocates. The American Civil Liberties Union praised the passage of the USA Freedom Act as "a milestone" but pointed out that there were many more "intrusive and overbroad" surveillance powers yet untouched. The ambivalence about Edward Snowden, International Man Of Luggage, all clears away at one simple point -- without him, none of this happens. Without what he did, nobody looks closely enough at the NSA and its surveillance programs even to think of reforming them even in the mildest way, which is pretty much what this is. Without what he did, the conversation not only doesn't change, it doesn't even occur. Oregon senator Ron Wyden, a Democrat on the intelligence committee who has railed against NSA surveillance for years, praised the breakthrough but said the work is far from complete. "This is the only beginning. There is a lot more to do," Wyden told reporters after the vote. "We're going to have very vigorous debate about the flawed idea of the FBI director to require companies to build weaknesses into their products. We're going to try to close the backdoor search loophole – this is part of the Fisa Act and is going to be increasingly important, because Americans are going to have their emails swept up increasingly as global communications systems begin to merge." Without what Edward Snowden did, even these first tremors of a rollback from the politics of fear that have encrusted the country in the wake of the attacks of September 11, 2001 would not have been felt in Washington this week.

Vaccine DA — Culture of Rights Uniqueness

Non-unique – Culture of privacy/rights now

Increasing numbers of young people think parental choice outweighs mandatory vaccination – age is the most influential factor – it comparatively outweighs other variables like class, race, gender, and political affiliations.

Anderson 15 – Monica Anderson, Research Analyst at Pew Research Center, holds a Master's degree in Communication, Culture, and Technology from Georgetown University and a BA in Political Science and Feminist Studies from Southwestern University, 2015 ("Young adults more likely to say vaccinating kids should be a parental choice", Pew Research Center, February 2, Available Online at <http://www.pewresearch.org/fact-tank/2015/02/02/young-adults-more-likely-to-say-vaccinating-kids-should-be-a-parental-choice/>, accessed 7/14/15, KM)

As the number of measles cases linked to the California outbreak climbs to over 100, health officials are urging parents to properly immunize their children, citing unvaccinated individuals as a main contributor to the disease's spread. Some have linked the outbreak to the anti-vaccination movement – a group whose members claim vaccinations are unsafe and ineffective. A Pew Research Center report released last week shows that a majority of Americans say children should be required to get vaccinated. Further analysis of the survey data reveals significant age differences in views about vaccines. In 2009, by contrast, opinions about vaccines were roughly the same across age groups. Also, some modest partisan divisions have emerged since 2009, when Pew Research last polled on the issue. Overall, 68% of U.S. adults say childhood vaccinations should be required, while 30% say parents should be able to decide. Among all age groups, young adults are more likely to say vaccinating children should be a parental choice. Some 41% of 18- to 29-year-olds say parents should be able to decide whether or not their child gets vaccinated; only 20% of adults 65 or older echo this opinion. Measles Cases fall with vaccine Older Americans are strong supporters of requiring childhood vaccinations – 79% say they hold that view, compared with 59% of those under 30. One possible reason that older groups might be more supportive of mandatory vaccinations is that many among them remember when diseases like measles were common. Prior to the first licensed measles vaccine in 1963, hundreds of thousands of measles cases were reported annually in the U.S. In 1958 alone, there were more than 750,000 cases. A decade later, in 1968, that number fell to about 22,000, according to an analysis of data from the Centers for Disease Control and Prevention. Today, measles cases are extremely rare, but the CDC reported a spike in 2014, with more than 600 measles cases, the first such jump in more than a decade. The CDC attributed the increase to an outbreak among unvaccinated Ohio Amish communities and cases related to an outbreak in the Philippines. Although some have linked the anti-vaccination movement to more-affluent, highly educated parents, Pew Research data show little difference in people's views based on income or education. Vaccines Public Opinion About 30% of adults living in households earning \$75,000 or more a year say parents should decide whether or not their child gets vaccinated. This holds true even among the highest of earners (those in households making \$100,000 or more). These opinions are on par with people living in lower- and middle-income households. Men and women share similar views on whether vaccines should be required or not and opinions on this issue vary little by race. At the same time, slightly more parents of minor children than those without children believe vaccinating children is a parental choice. There are slight differences in views about vaccines along political lines. A majority of Democrats (76%), Republicans (65%) and independents (65%) say that vaccines should be required. But Republicans and independents are somewhat more inclined than are Democrats to say that parents should be able to decide. In 2009, there was no difference in views on vaccinations along party lines.

Non-unique – No pro-vax influence

Influencing anti-vaccination proponents is impossible – a consensus of studies agree.

Marcotte 14 – Amanda Marcotte, American blogger who writes on feminism and politics, 2014

("According to a New Study, Nothing Can Change an Anti-Vaxxer's Mind", Slate, March 3, Available

Online at

http://www.slate.com/blogs/xx_factor/2014/03/03/effective_messages_in_vaccine_promotion_when_it_comes_to_anti_vaxxers_there.html, accessed 7/22/15, KM)

While some false beliefs, such as astrology, are fairly harmless, parents who believe falsely that vaccination is dangerous or unnecessary for children present a real public health hazard. That's why researchers, publishing in *Pediatrics*, decided to test four different pro-vaccination messages on a group of parents with children under 18 and with a variety of attitudes about vaccination to see which one was most persuasive in persuading them to vaccinate. As Chris Mooney reports for *Mother Jones*, the results are utterly demoralizing: Nothing made anti-vaccination parents more amenable to vaccinating their kids. At best, the messages didn't move the needle one way or another, but it seems the harder you try to persuade a vaccination denialist to see the light, the more stubborn they get about not vaccinating their kids. Brendan Nyhan of Dartmouth College and his colleagues tested four different messages on parents. Mooney describes them: The first message, dubbed "Autism correction," was a factual, science-heavy correction of false claims that the MMR vaccine causes autism, assuring parents that the vaccine is "safe and effective" and citing multiple studies that disprove claims of an autism link. The second message, dubbed "Disease risks," simply listed the many risks of contracting the measles, the mumps, or rubella, describing the nasty complications that can come with these diseases. The third message, dubbed "Disease narrative," told a "true story" about a 10-month-old whose temperature shot up to a terrifying 106 degrees after he contracted measles from another child in a pediatrician's waiting room. The fourth message was to show parents pictures of children afflicted with the diseases they could get without vaccination. Both the pictures and the horrible story about measles increased parental fears about vaccinations. Researchers don't know why but theorize that the problem might be that invoking fears of sick children just makes parents more fearful in general of all risks, whether real or imagined. The cooler, more distant "disease risks" message didn't change parents' minds either way, but what was most startling was what happened with the message correcting misinformation on autism: As for "Autism correction," it actually worked, among survey respondents as a whole, to somewhat reduce belief in the falsehood that vaccines cause autism. But at the same time, the message had an unexpected negative effect, decreasing the percentage of parents saying that they would be likely to vaccinate their children. In other words, learning that they were wrong to believe that vaccines were dangerous to their kids made vaccine-hostile parents more, not less likely to reject vaccination. Mooney calls this the "backfire effect," but feel free to regard it as stubborn, childish defensiveness, if you'd rather. If you produce evidence that vaccination fears about autism are misplaced, anti-vaccination parents don't apologize and slink off to get their kids vaccinated. No, according to this study, they tend to double down. This reaction, where people become more assured of their stupid opinions when confronted with factual or scientific evidence proving them wrong, has been demonstrated in similar studies time and time again. (This is why arguing with your Facebook friends who watch Fox News will only bring you migraines.) Mooney suggests that state governments should respond by making it harder to opt out of vaccinations. That would be helpful, but there's also some preliminary research from the James Randi Educational Foundation and Women Thinking Inc. that shows that reframing the argument in positive terms can help. When parents were prompted to think of vaccination as one of the steps you take to protect a child, like buckling a seat belt, they were more invested in doing it than if they were reminded that vaccine denialists are spouting misinformation. Hopefully, future research into pro-vaccination messaging, as opposed to just anti-anti-vaccination messaging, will provide further insight.

The influence of the pro-vaccination movement is irrelevant – studies say there’s only a risk that pro-vax messages make it worse – anti-vaccination parents are too suspicious of the science.

Alter 14 – Charlotte Alter, covers women, culture, politics and breaking news for TIME, 2014 (“Nothing, Not Even Hard Facts, Can Make Anti-Vaxxers Change Their Minds”, Times, March 4, Available Online at <http://healthland.time.com/2014/03/04/nothing-not-even-hard-facts-can-make-anti-vaxxers-change-their-minds/>, accessed 7/22/15, KM)

Maybe there should be a vaccine for stubbornness, because it sure seems tough to cure. A new study shows that when presented with four different scientifically proven arguments that vaccinations are safe, some anti-vaccination parents seemed even less inclined to inoculate their kids against measles, mumps and rubella (MMR) once they saw the evidence. “We shouldn’t overestimate how effective facts and evidence are in convincing people to accept a claim and change their behavior,” said Brendan Nyhan, who authored the study published in Pediatrics, “but throwing facts and evidence at them isn’t likely to be the most effective approach.” Nyhan and his colleagues surveyed almost 1,800 parents of young children after seeing one of four vaccination messages similar to those provided by the CDC. The first messages were focused on conveying the dangers of measles, mumps, and rubella: the “Disease Risk” message detailed the medical risk of contracting MMR, the “Danger Narrative” told the story of a woman whose son contracted the measles from another child and got a 106-degree fever, and the “Disease Images” showed disturbing pictures of infected children. A fourth message, “Autism Correction,” provided heavy scientific evidence that disproved the link between vaccinations and autism. All that sounds convincing, but none of it really works. The researchers found that none of the four messages significantly increased rates of intended vaccination (they only measured whether parents intended to vaccinate, not whether they actually did) and some even provoked an anti-vaccination backlash. The least successful messages were “Disease Narrative” and “Disease Images,” which actually increased the misconception that vaccinations will have negative side effects by 6%, and looking at the photos of the sick kids increased the subjects’ perception that vaccines cause autism. Nyhan said that he thought this was because when people saw children in distress, they became preoccupied with other dangers their child could encounter. “Disease Risks” and “Autism Correction” had slightly better results, but neither seemed to convince parents. And while “Autism Correction” proved to some parents that there’s no link between vaccines and autism, it produced a strong backlash in others that just reinforced their sense that vaccinations are a conspiracy theory. Only 45% of the already anti-vaccine parents said they would vaccinate after they saw the “Autism Correction” message, compared to 70% of the control group. Nyhan thinks that these parents are suspicious of the scientists and that the pro-vaccine movement is trying to pull a fast one on them. “People think, ‘what are they trying to convince me?’” he explained. “The ‘don’t worry, don’t worry, everything is safe’ approach is not often effective, because they think ‘why are they trying so hard to reassure me that everything is safe?’” The fact that none of these messages were particularly effective is a little disconcerting considering that vaccinations only work if a majority of the population is vaccinated. And Nyhan also pointed out that these diseases are more dangerous than ever, because MMR is so rare that we almost never encounter them. Regardless, it seems that the CDC has a serious PR problem, since none of their pro-vaccination messages seem to actually convince people. “We need to test the messages we use in public health the way we test other kinds of inventions,” Nyhan said. “There isn’t a crisis now, but this is about making sure we don’t have one.”

Pro-vaccination has zero influence – there’s too much skepticism in its benefits and acceptance of the vaccine-autism link. Our evidence assumes events like the Disneyland outbreak, or as anti-vaxxers like to say, “hype”.

Haberman 15 – Clyde Haberman, American journalist who was a longtime columnist and correspondent for The New York Times, 2015 (“A Discredited Vaccine Study’s Continuing Impact on Public Health”, New York Times, February 1, Available Online at

http://www.nytimes.com/2015/02/02/us/a-discredited-vaccine-study-continuing-impact-on-public-health.html?_r=0, accessed 7/22/15, KM)

In the churning over the refusal of some parents to immunize their children against certain diseases, a venerable Latin phrase may prove useful: Post hoc, ergo propter hoc. It means, "After this, therefore because of this." In plainer language: Event B follows Event A, so B must be the direct result of A. It is a classic fallacy in logic. An outbreak of measles several weeks ago at Disneyland in Southern California focused minds and deepened concerns. It was as if the amusement park had become the tragic kingdom. Dozens of measles cases have spread across California. Arizona and other nearby states reported their own eruptions of this nasty illness, which officialdom had pronounced essentially eradicated in this country as recently as 2000. But it is back. In 2014, there were 644 cases in 27 states, according to the Centers for Disease Control and Prevention. Should the pace set in January continue, the numbers could go still higher in 2015. While no one is known to have died in the new outbreaks, the lethal possibilities cannot be shrugged off. If the past is a guide, one or two of every 1,000 infected people will not survive. To explore how matters reached this pass, Retro Report, a series of video documentaries studying major news stories of the past and their consequences, offers this special episode. It turns on a seminal moment in anti-vaccination resistance. This was an announcement in 1998 by a British doctor who said he had found a relationship between the M.M.R. vaccine — measles, mumps, rubella — and the onset of autism. Typically, the M.M.R. shot is given to infants at about 12 months and again at age 5 or 6. This doctor, Andrew Wakefield, wrote that his study of 12 children showed that the three vaccines taken together could alter immune systems, causing intestinal woes that then reach, and damage, the brain. In fairly short order, his findings were widely rejected as — not to put too fine a point on it — bunk. Dozens of epidemiological studies found no merit to his work, which was based on a tiny sample. The British Medical Journal went so far as to call his research "fraudulent." The British journal Lancet, which originally published Dr. Wakefield's paper, retracted it. The British medical authorities stripped him of his license. Nonetheless, despite his being held in disgrace, the vaccine-autism link has continued to be accepted on faith by some. Among the more prominently outspoken is Jenny McCarthy, a former television host and Playboy Playmate, who has linked her son's autism to his vaccination: He got the shot, and then he was not O.K. Post hoc, etc. Steadily, as time passed, clusters of resistance to inoculation bubbled up. While the nationwide rate of vaccination against childhood diseases has stayed at 90 percent or higher, the percentage in some parts of the country has fallen well below that mark. Often enough, these are places whose residents tend to be well off and well educated, with parents seeking exemptions from vaccinations for religious or other personal reasons. At the heart of the matter is a concept known as herd immunity. It means that the overall national rate of vaccination is not the only significant gauge. The rate in each community must also be kept high to ensure that pretty much everyone will be protected against sudden disease, including those who have not been immunized. A solid display of herd immunity reduces the likelihood in a given city or town that an infected person will even brush up against, let alone endanger, someone who could be vulnerable, like a 9-year-old whose parents rejected inoculations, or a baby too young for the M.M.R. shot. Health professionals say that a vaccination rate of about 95 percent is needed to effectively protect a community. Fall much below that level and trouble can begin. Mass vaccinations have been described by the C.D.C. as among the "10 great public health achievements" of the 20th century, one that had prevented tens of thousands of deaths in the United States. Yet diseases once presumed to have been kept reasonably in check are bouncing back. Whooping cough is one example. Measles draws especially close attention because it is highly infectious. Someone who has it can sneeze in a room, and the virus will linger in the air for two hours. Any unvaccinated person who enters that room risks becoming infected and, of course, can then spread it further. Disneyland proved a case in point. The measles outbreak there showed that it is indeed a small world, after all. What motivates vaccine-averse parents? One factor may be the very success of the vaccines. Several generations of Americans lack their parents' and grandparents' visceral fear of polio, for example. For those people, "you might as well be protecting against aliens — these are things they've never seen," said Seth Mnookin, who teaches science writing at the Massachusetts Institute of Technology and is the author of "The Panic Virus," a 2011 book on vaccinations and their opponents. Mr. Mnookin, interviewed by Retro Report, said skepticism about inoculations is "one of those issues that seem to grab people across the political spectrum." It goes arm in arm with a pervasive mistrust of many national institutions: the government that says vaccinations are essential, news organizations that echo the point, pharmaceutical companies that make money on vaccines, scientists who have hardly been shown to be error-free. Then, too, Mr. Mnookin said, scientists don't always do themselves favors in their choice of language. They tend to shun absolutes, and lean more toward constructions on the order of: There is no vaccine-autism link "to the best of our knowledge" or "as far as we know." Those sorts of qualifiers leave room for doubters to question how much the lab guys do, in fact, know. Thus far, the Disneyland measles outbreak has failed to deter the more fervent anti-vaccine skeptics. "Hype." That is how the flurry of concern in California and elsewhere was described by Barbara Loe Fisher, president of the National Vaccine Information Center, an organization that takes a dim view of vaccinations. The hype, Ms. Fisher said in a Jan. 28 post on her group's website, "has more to do with covering up vaccine failures and propping up the dissolving myth of vaccine acquired herd immunity than it does about protecting the public health." Clearly, she remained untroubled that most health professionals regard her views as belonging somewhere in Fantasyland.

Anti-vaxxers are winning the propaganda fight – they are dominating sites like Twitter and using social media to collectively harass pro-vaccination individuals.

DiResta and Lotan 15 – Renee DiResta, Principal of O'Reilly AlphaTech Ventures and Gilad Lotan, Chief data scientist at betaworks, 2015 ("Anti-Vaxxers Are Using Twitter to Manipulate a Vaccine Bill",

Wired, June 8, Available Online at <http://www.wired.com/2015/06/antivaxxers-influencing-legislation/>, accessed 7/22/15, KM)

To take a closer look at how anti-vax Twitter organizes its attacks, specifically against the California legislation, we analyzed the hashtags used by people in the network. In network graphs like the one above, circular nodes are Twitter handles; larger nodes indicate accounts with more followers within the network, making their tweets more likely to be seen and acted upon. That's called "high centrality." The lines between the nodes represent follower relationships. Different colors represent communities of people who are sharing a similar message, and the distance between regions is based on common ties—the closer a colored group is to another, the more shared connections its members have, and the more likely information is to spread amongst the groups. Much like any other group with a message, anti-vaxxers have leveraged Facebook, Twitter, and YouTube for quite some time. In the early days, the majority of their activism focused on propagating the myth of the autism-vaccination connection. In August of 2014, anti-vax activity began to coalesce into one primary hashtag: #cdcwhistleblower, a reference to an anti-vaxxer conspiracy theory that claims the CDC is concealing information that proves a link between the MMR vaccine and autism in African American children. Within two days, autism-vaccine proponents had looped in celebrity sympathizers such as Donald Trump and Rob Schneider to amplify their message. Andrew Wakefield, author of the original fraudulent study linking MMR and autism, got involved. CDC scientists responded, but the idea of the conspiracy—and the hashtag—continued to grow in popularity. There were 250,000 #cdcwhistleblower tweets between August 18 and December 1 of 2014. A whopping 63,555 of these came from 10 prominent anti-vax accounts. In terms of massive events and national conversations, 250,000 tweets is rather small (there were 19.1 million tweets sent in a 12 hour period about the Oscars). But it became apparent to anti-vax leaders that this Twitter hashtag had attracted a loyal following among true believers. And so, in December 2014, "hashtag organizers" began to publish nightly "Trends and Tips" (TaTips) instruction videos on YouTube, containing instructions on what to tweet to advance the cause, and to improve the SEO of "vaccine questioning" websites. There are over 150 of these videos now—a testament to how much the anti-vax movement prioritizes Twitter. Like any good brand, that messaging has evolved to tie to current events—including legislation to increase vaccination rates. As the California personal exemption bill progressed, tweets with the #cdcwhistleblower hashtag started to shift to include #sb277, the number of the bill. When we dig into the activity in the #sb277 hashtag over time, trends and ties emerge. If you look at the first network graph, several distinct clusters emerge based on the hashtags and topics tweeted by each account. In other words, we didn't search for the group labels deliberately; they revealed themselves. Pink is tweeters focused on anti-vax content; orange is the autism community. These groups tweet about many of the same topics, but don't share the exact same material or use the same hashtags. Blue are social conservatives, many of whom use popular Tea Party hashtags. The long strands between the blue groups and the anti-vaxxer group indicates minimal overlap among accounts following each other; the networks are not tightly connected. But as you look at this second network graph, you can see how antivax political strategy has shifted. A new group emerges in the space between "Antivax Twitter" and "Conservative Twitter"—we call it "vaccine choice" Twitter. The tweeters are the same individuals who have long been active in the autism-vaccine #cdcwhistleblower network. And originally, much of the content shared in #sb277 focused on the same anti-vax pseudoscience underlying #cdcwhistleblower. However, as bad science and conspiracies repeatedly lost in legislative votes, anti-vaxxers updated their marketing: They are now "pro-SAFE vaccine" parental rights advocates. Instructions to the group now focus on hammering home traditionally conservative "parental choice" and "health freedom" messaging rather than tweeting about autism and toxins. Twitter activity around #sb277 is part of a multipronged strategy that takes place alongside phone, email, and fax campaigns, coordinated by well-funded groups including the Canary Party and the NVIC. The net effect is that legislators and staffers feel besieged on all fronts. In one unfortunate video, a movement leader encouraged supporters to use Twitter to harass and stalk a lobbyist, who has since filed police reports. In a very recent creation, that same leader excoriates her "Twitter army" for diluting the power of the #cdcwhistleblower movement by creating their own hashtags rather than using the ones they've been assigned. She also requests that the entire network tweet at Assembly representatives to inform them that their political careers will be over if they vote in favor of SB277. Much like Food Babe leverages her #foodbabearmy to flood corporations with demands for change, the goal of anti-vax twitter is to dominate the conversation and make it look as if all parents are vehemently opposed to the legislation. The other finding from observing anti-vax network graphs is that despite the vast majority vaccinating—national vaccination rates remain above 90 percent—there is no offsetting pro-vaccine Twitter machine; most parents simply vaccinate and move on with their lives. People don't organize in groups around everyday life-saving measures; there is no pro-seatbelt activist community on Twitter. The recent emergence, lack of central coordination, and weak connections seen among pro-vaccine Twitter users, who often use the hashtag #vaccineswork, means that the pro-vax message (in green) is not amplified to the same degree. "Tweiatrician" doctors, lawyers, and pro-vaccine parents often do attempt to join the conversation around the antivax hashtags. Unfortunately, many of the most active accounts experience the same attention received by the legislators: They become the target of harassment that includes phone calls to their places of employment, tweets posting identifying information or photos of their children, or warnings that they are being watched. Pro-vaccine activists and legislators alike often encounter paranoia when they attempt to engage the

anti-vax community. They face accusations of being shells paid by Big Pharma to sway the narrative and keep “vaccine choice” activists from spreading The Truth. Like many fringe communities, while the group is extremely well-organized and passionate they are largely tweeting into an echo chamber. Twitter users who don’t look for these hashtags would likely not know that they exist. Besides occasional celebrity amplification, very little percolates out to a mainstream audience or trends at a meaningful level. And even theoretically-sympathetic affinity groups that they occasionally reach out to, such as anti-GMO, conservative, and autism groups, are not amplifying their hashtags. However, the broader public health implications of propagating these memes and articles make anti-vax activities more than a bizarre online curiosity. Most of the material that the #cdcwhistleblower accounts tweet are designed to erode confidence in vaccination. The goal is to make new parents question everything, says anti-vax leader Dana Gorman in one of her instructional videos. Public health officials are concerned. “It is important to remember that today, the vast majority of people follow the recommended vaccine schedule—they take the advice of their doctors, supported by professional medical bodies and the WHO,” says Gary Finnegan, editor of Vaccines Today. “However, it is essential that when people go online for information they are left with the clear impression that vaccines are safe and effective.” If that’s going to change, the people fighting misinformation need to understand how it gets spread in the first place.

Vaccine DA — Link Answers

Link turn – big data

Big data link turns their unfounded vaccination claims – by using datasets, big data allows for powerful visual representations of the impact of immunization.

Munro 14 – Dan Munro, write about the intersection of healthcare innovation and policy, Quora Top Writer from 2013 to 2015, 2014 (“Big Data Crushes Anti-Vaccination Movement”, Forbes, January 23, Available Online at <http://www.forbes.com/sites/danmunro/2014/01/23/big-data-crushes-anti-vaccination-movement/>, accessed 7/21/15, KM)

For years it’s been relatively easy to ignite medical controversy with emotional (but often anecdotal) evidence. TV is a popular format for doing just that. It’s quick, colorful and dramatic (and increasingly in high-def and big-screen). Add a well known celebrity (or two) and the effects can be powerful, long term and hard to refute. Much of that power, however, is changing and will continue to change with large datasets that are freely available online – or soon will be. When we talk about the science of “Big Data” as a new discipline, it’s often the datasets that we’re referencing – and the visualization of those datasets can be equally powerful and dramatic. As a single example, I wrote about the release of one such dataset on hospital pricing released last year by the Government (here). On Monday, Aaron Carroll (over at the Incidental Economist here) highlighted another chart that was based on a dataset recently published by the Council On Foreign Relations. The chart shows “vaccine preventable outbreaks” around the world from 2006 to present day. The original chart is online here and is interactive by year, outbreak type, location and number of people. The data covers outbreaks for Measles, Mumps, Rubella, Polio, “other” – and is also available as a downloadable CSV file (for use with most spreadsheet applications – here). The CSV data also includes source citation, country, longitude/latitude, number of cases and fatalities by outbreak type. The graphic and the data it represents is a compelling argument against those who think that the vaccinations themselves are dangerous and should be avoided. The Mayo Clinic has a great Q&A section which flatly states: “Vaccines do not cause autism. Despite much controversy on the topic, researchers haven’t found a connection between autism and childhood vaccines. In fact, the original study that ignited the debate years ago has been retracted.” Mayo Clinic – Childhood Vaccines: Tough questions, straight answers (here)

Alt causes

Too many alt causes to solve immunization, especially internationally – anti-American sentiment, religious differences, logistical issues, cost.

Welsh 15 – Teresa Welsh, foreign affairs reporter at U.S. News & World Report, 2015 (“Anti-Vaccine Movements Not Unique to the U.S.”, US News, February 18, Available Online at <http://www.usnews.com/news/articles/2015/02/18/anti-vaccine-movements-not-just-a-us-problem>, accessed 7/22/15, KM)

With widespread access to medical care and immunizations, the U.S. typically doesn't see massive outbreaks of preventable diseases like the measles. But American anti-vaxxers – parents who refuse to have their children vaccinated and seek exemptions from immunization requirements – aren't alone in their misgivings: Skepticism abounds in many other countries about the safety and effectiveness of disease-fighting injections. “There is opposition to vaccine I think in every country around the world, and the nature of the opposition varies from place to place.” says Dr. Alan Hinman, a senior public health scientist with The Task Force for Global Health. Vaccine hesitancy, according to a World Health Organization working group created to study the phenomenon, is a “delay in acceptance or refusal of vaccines despite availability of vaccine services.” The group studied the issue for more than two years and found that it is “complex and context-specific, varying across time, place and vaccines.” “It can be due to religious beliefs, it can be through personal beliefs or it can just be through misinformation on the need and importance of vaccination,” says Hayate Hasan, a technical officer in the WHO's Department of Immunization, Vaccines and Biologicals. In the U.S., where a recent measles outbreak has renewed calls for parents to vaccinate their children, some parents are still hesitant to do so because of a 1998 study linking the vaccine for measles, mumps and rubella to autism, even though that study has long since been debunked. Similarly, misconceptions about the potentially adverse effects of vaccinations also impact the rates at which certain communities abroad vaccinate their children. Researchers often cite an episode in northern Nigeria about a decade ago, when political and religious leaders instructed parents not to immunize their children against polio. The leaders said they believed the vaccines could be contaminated with an antifertility agent meant to sterilize the population, as well as with HIV, and immunizations stopped. Polio cases spread, and the vaccines were shown not to have been tainted. “The leaders actually admitted that they didn't really believe the vaccine was contaminated, but they were opposed to the polio eradication effort because they viewed it as a Western-led activity.” Hinman says. In India, suspicion of the West also has sparked aversion to vaccinations. Lois Privor-Dumm, director of policy, advocacy and communications at the Johns Hopkins Bloomberg School of Public Health's International Vaccine Access Center, says her team works with Indian physicians to provide them with data so they can make informed decisions about immunizations. She says some vaccines have been widely accepted in India for years while other, newer vaccines have been resisted because they aren't manufactured by Indian suppliers and Indians think they are too expensive. Distrust of efforts to battle disease also isn't unique to immunization programs. In West Africa – the heart of the recent Ebola epidemic – some have considered Ebola a government conspiracy or not a real malady, and vulnerable residents have resisted amending burial practices to avoid spreading the disease. Health workers trying to increase awareness about the dangers of Ebola have even been attacked and killed. The WHO working group found that efforts tailored to specific countries are most effective in addressing vaccine hesitancy around the world. In Bulgaria, an analysis of the Roma population – a nomadic ethnic group also known as Gypsies – found the main reason the community resisted vaccination wasn't a lack of knowledge about vaccines or a lack of confidence in their effectiveness; rather, it was due to a lack of immunization programs that were welcoming to Roma. For that community, the quality of the patient's encounter with a health worker was the most important factor. “These diagnostic findings were used to tailor and target programs designed to address the main cause of Roma vaccine hesitancy,” the working group explained. Religious beliefs also have been a barrier to vaccination efforts around the world, with some Muslim communities in the U.K. objecting to porcine elements in a nasal flu vaccine. The porcine gelatin is used

to stabilize the vaccine, but Islam does not permit the consumption of pork. Officials have also sought to allay concerns among Jews in the U.K. about the vaccine. Last year in Kenya, a group of Catholic bishops vocally opposed a WHO-led tetanus vaccination campaign because they said the immunization was "laced" with a birth-control hormone that could eventually lead to sterilization. The bishops were suspicious of the campaign, which targeted women of reproductive age, and said they were convinced it was "a disguised population control program." They also said the Catholic Church had not been given "adequate stakeholder engagement." "There's the belief that vaccines may be some type of plot against their religion" to control the population, Privor-Dumm says. All 50 U.S. states have immunization requirements for public school students, but vaccine mandates vary around the world. In Canada, only a small number of provinces require vaccinations for students, while a study of Iceland, Norway and 27 European Union countries published in 2012 found that 15 countries had no vaccination requirements. Vaccine opposition in England dates back to the 1800s, when people objected to smallpox vaccinations. Many low-income countries also lack an advisory body to make vaccine recommendations, so governments often take the WHO's advice for what vaccines to recommend to their populations. Dr. Kathy Neuzil, program leader for vaccine access and delivery at PATH, an international nonprofit that focuses on global health, says many developing countries also lack a program the U.S. has to provide compensation for those who suffer a vaccine-related injury. Neuzil notes that adverse effects such as sudden illness from vaccinations do occur, so the medical community must be careful to document such cases to show that they are very rare. But proximity doesn't necessarily prove cause: A child could have a seizure for the first time two hours after being vaccinated – leading parents to believe the vaccination caused the problem – but that may not be the case, Neuzil says. "Some of these adverse events or safety concerns are going to occur by chance, but it's very difficult as a mother to not believe that a vaccine may have caused something that's temporally related," Neuzil says. In developed countries like the U.S., Hasan says the WHO leaves it to national health authorities to address vaccine hesitancy, because they are better able to identify the cause behind it. "Is it because people don't understand the need for immunization? Is it because people are questioning does vaccine cause autism, even though billions of children around the world have been vaccinated with the measles vaccine since the 1960s?" Hasan asks. Measles was declared eliminated from the U.S. in 2000. In comparison, Hinman says there are more than 100,000 deaths from the disease around the world each year, mostly in India and sub-Saharan Africa, where children rarely receive vaccinations for it. "That means that today's parents of young children [in the U.S.] have never seen measles. It also means that many younger physicians have also not seen measles, and so it's difficult for them to maintain what we consider to be the proper respect for a highly contagious and potentially fatal disease," Hinman says. Heidi Larson, an anthropologist who leads The Vaccine Confidence Project at the London School of Hygiene and Tropical Medicine, says the "back-to-nature movement" fueling oppositions to vaccines in the U.S. is also present in Japan and elsewhere. Some also refuse vaccinations because they object to government intervention, she says. But in some developed countries, Hasan says, children are not vaccinated simply because their parents don't have time to take them to the doctor. Some children receive a first round of vaccinations, but don't get booster shots and therefore don't develop full immunity. And in poorer countries where parents must travel long distances to clinics or take time off work, time constraints and transportation can also be barriers. Many parents and caregivers in developing countries also simply haven't learned why vaccines are important. Logistically, it can be difficult for health workers to reach populations to educate them about the necessity of immunization, while properly storing vaccinations that require refrigeration also presents a challenge for ensuring populations are vaccinated according to schedule. The Gavi Alliance, an organization that seeks to improve access to vaccines in poor countries, says the key to the success of an immunization program is having buy-in from the community. And when children aren't vaccinated, it can impact more than just their immunity to particular diseases, Privor-Dumm says. Healthy children don't have to miss school and can stay on track to climb out of poverty. While some Americans have grown "complacent" about vaccinations, Neuzil says, parents in poorer countries can't afford that luxury. "That's a major difference as compared to these places where it's ... an everyday part of their life that children are dying from vaccine-preventable diseases," Neuzil says.

Budget cuts are an alt cause – the CDC is targeting vaccinations

NACCHO 15 — NACCHO, The National Association of County and City Health Officials (NACCHO) represents the nation's 2,800 local governmental health departments. These city, county, metropolitan, district, and tribal departments work every day to protect and promote health and well-being for all people in their communities. For more information about NACCHO, please visit www.naccho.org, 2-2-2015 ("NACCHO Expresses Concern Over the President's Budget Cuts To Immunization Funding During Measles Outbreak," 2-2-2015, Available Online at <http://naccho.org/press/releases/budget-proposal-2016.cfm>, Accessed 7-21-2015)

Washington, D.C. (February 2, 2015) - The National Association of County and City Health Officials (NACCHO) today expressed concern that the Obama Administration is proposing to cut discretionary

funding for immunization and other programs that are key to preventing disease outbreaks and other disasters, especially while the country is in the midst of a measles outbreak. It is the role of local health departments to monitor, prevent, and control disease to reduce health risks through vaccine awareness and immunization programs. The President's FY2016 budget proposal cuts funding to the Centers for Disease Control and Prevention's (CDC) immunization program by \$50 million. The program supports the purchase of vaccines, as well as immunization operations at the local, state, and national levels.

According to CDC, the United States experienced a record number of measles cases during 2014, with 644 cases from 27 states. In January 2015 alone, 102 people from 14 states were reported to have measles.

NACCHO commends other aspects of the budget, including the \$141 million increase to the CDC and removing the harmful across-the-board budget cuts that have kept discretionary spending at historically low levels. The budget also provides new funding for important public health activities, such as viral hepatitis prevention, antibiotic resistance, drug overdose prevention, and the strategic national stockpile.

"Despite this new funding, the President's budget misses an important opportunity to bolster the capacity of the nation's public health departments to prevent infectious disease outbreaks, including those that are vaccine preventable," said NACCHO's executive director Robert M. Pestronk.

No link – Court rulings solve

No link – Courts have already ruled multiple times that mandatory vaccination is constitutional – no risk the plan’s surveillance reform overturns vaccination rulings.

Farias 15 – Cristian Farias, Legal Affairs Writer with a special focus on civil rights, criminal justice, and the U.S. Supreme Court, holds a JD from City University of New York School of Law, 2015 (“Yes, the Government Can Make You Vaccinate Your Child”, New Republic, February 3, Available Online at <http://www.newrepublic.com/article/120950/courts-have-upheld-governments-constitutional-right-vaccine-laws>, accessed 7/20/15, KM)

New Jersey Governor Chris Christie’s comments on Monday—later clarified—that the government has to find a “balance” between public health policy and giving parents “some measure of choice” has renewed the debate over vaccine laws. But it’s instructive to remember that the Supreme Court settled the question of compulsory vaccinations more than 100 years ago. And just last month, the U.S. Court of Appeals for the Second Circuit, which sits in Manhattan, cited that century-old precedent in rejecting a constitutional challenge to a New York law requiring that all kids attending public schools be vaccinated. The case involved a group of parents who had religious objections to the law. Two of the parents, both of them Catholic, had obtained religious exemptions for their children, which the law permits so long as the parents “hold genuine and sincere religious beliefs” against vaccines; the law also contains a separate exemption for medical reasons. The parents balked, however, when their kids were excluded from school after a schoolmate contracted chicken pox. It turns out a separate New York regulation provides that children with immunization exemptions be excluded from attendance in the event of an outbreak. Unhappy with both the law and the regulation, the parents sued in federal court. A third parent also sued, but on the grounds that she couldn’t obtain a religious exemption. At a hearing, the woman had testified that decisions about her child’s health were guided “strictly by the word of God.” But the judge, after hearing the woman testify that vaccination “could hurt my daughter. It could kill her.... It could cause any number of things,” found the woman’s religious beliefs to be neither genuine nor sincere, but merely health-related. The court denied her request. That’s when the three parents joined forces and mounted a constitutional challenge to New York’s vaccination requirement. They threw the book at the state, arguing, among other things, violations of their rights under the First and Fourteenth Amendments, as well as under state and municipal law. The rub of their arguments: that the state was infringing on their liberty and religious interests. A federal judge in Brooklyn dismissed all their claims. That’s when the Second Circuit court, as it’s wont to do on appeal, took up all of these grievances anew and rejected them one by one. Citing Jacobson v. Massachusetts, the 1905 case, a three-judge panel ruled in a short opinion that New York was well within its “police power” to mandate vaccinations for schoolchildren. Since immunizations are “in the interest of the population as a whole,” the court said they trump the parents’ individual wishes. The court brushed aside their claim that “a growing body of scientific evidence demonstrates that vaccines cause more harm to society than good,” noting that only the legislature—and not the parents or the court—could make the call on the alleged body of evidence. Turning to the parents’ religious claims, the court relied on a 1944 case, *Prince v. Massachusetts*, where the Supreme Court stated that a parent “cannot claim freedom from compulsory vaccination for the child more than for himself on religious grounds.” The court went on to note that the First Amendment right to religious freedom “does not include liberty to expose the community or the child to communicable disease or the latter to ill health or death.” And because the law compelling vaccinations is neutral—that is, it applies to everyone and doesn’t specifically target a particular religion—no constitutional violation occurred. Plus, two of the parents had received exemptions, so the court viewed New York’s limited exclusion during an outbreak as permissible. Of course, the ruling is only binding within the context of public education; nothing prevents the parents from homeschooling their children and keeping them vaccination-free. And it remains to be seen whether these parents will be appealing to a higher court to review the case. But given that the Supreme Court has already spoken loudly on the matter, here’s hoping faith in the judgment of the courts and the rule of law will prevail.

Vaccine DA — Impact Defense

Anti-science

There is science behind anti-vaxxer's claims.

Walia 13 — Arjun Walia, 8-2-2013 ("Polish Study Confirms Vaccines Can Cause Large Number of Adverse Effects," Collective-Evolution, 8-2-2013, Available Online at <http://www.collective-evolution.com/2013/08/02/polish-medical-school-study-determines-vaccines-can-cause-irreparable-harm/>, Accessed 7-22-2015)

Despite the conviction of the necessity and safety of vaccinations, there are a number of studies coming forward that illustrate the potential dangers they may pose. A scientific review published by the Department of Paediatric Rehabilitation from the Medical School at the University of Bialystok has determined that there are a number of neurological adverse events that follow vaccination. This research is specific to Polish vaccinations, but is still useful given the fact that many ingredients used and examined in the study are still used in vaccinations all over the world.

The University of Bialystok is a well known medical university that has published a tremendous amount of research on various topics. The evidence that's out there supporting the hazards of vaccines is irrefutable. There is a lot of research that medical professionals are not privy to, this is credible research coming out of Universities done by doctors and professors. Medical professionals are usually guided to research done by pharmaceutical companies and the vaccine manufactures themselves. It's important to look at both sides of the coin, and examine all information available before coming to a conclusion.

It is not reasonable to assume that manipulation of the immune system through an increasing number of vaccinations during critical periods of brain development will not result in adverse neurodevelopment outcomes(1)

The study addresses the use of vaccines in terms of adverse effects, immune system effects, neurological symptoms following vaccinations and a history of vaccines demonstrating little benefit. We often hear of studies only from the western world, expanding our sphere of research to a global one provides us with a broad range of information coming from a variety of different sources. A report like this coming from a medical school should not be taken lightly. It coincides with a lot of other research that's emerging to suggest that vaccines can be hazardous to human health.

Post-Vaccine Neurological Complications

The authors focused on thimerosal, otherwise known as ethylmercury. It's known to be a key ingredient in vaccines for preservation. A number of conditions are associated with thimerosal including toxicity of the heart, liver, kidneys and the nervous system. Over the last two decades, neurological conditions such as epilepsy, autism, ADHD and mental retardation have increased dramatically all over the world.

From the 1990s new vaccines for infants containing thimerosal began to be used in America. In the DTP, Hib and Hep B vaccines, children received a dose 62.5 ug of mercury, which is 125-fold more than the dose considered safe, which is 0.1 ug a day. These reports were the reason that Scandinavian countries already prohibited the use of mercury in 1990(1)

Research has shown that there is a direct relationship between thimerosal and the rate of autism. The paper determined that there was also a correlation between the number of measles-containing vaccines and autism prevalence during the 1980's. A couple of years ago, an Italian court ruled that the MMR

vaccine was the cause of Autism in the case presented. A recent study by the University of British Columbia came out exposing the HPV vaccine as being dangerous to health as well. UBC doctors also exposed a Vaccination cover-up, demonstrating through official documents that vaccine manufactures have been aware of their adverse effects for a number of years.

Adverse Effects

Reports in many Polish and foreign medical journals lead us to conclude that postvaccinal complications among children can be observed in sporadic cases and that they are disproportionate to the benefits of vaccination in the elimination of dangerous diseases in childhood(1)

This study and many others leave little doubt that vaccines can be extremely hazardous to human health.

They first illustrate the adverse effects that occur shortly after vaccination as they are acknowledged by Polish law. These include:

Local reactions, including:

local reactions after the BCG (tuberculosis) vaccine

swelling

lymphadenopathy

abscess at the injection site

Postvaccinal adverse events of the central nervous system:

encephalopathy

febrile convulsions

non-febrile convulsions

paralytic poliomyelitis caused by vaccine virus

encephalitis

meningitis

Guillain-Barré syndrome

Other adverse events following immunization:

joint pain

hypotonic-hyporesponsive episode

fever above 39°C

thrombocytopenia

continuous inconsolable crying

Next they explore the fact that the vaccine schedule has increased dramatically since the time of these studies and antigens are being injected again and again.

Doctors and researchers point to the worsening state of the health of the child population since the 1960s, which coincided with increasingly introduced vaccinations. Allergic diseases, including asthma autoimmune diseases, diabetes and many neurological dysfunctions-difficulty in learning, ADD, ADHD, seizures, and autism – are chronic conditions, to which attention has been brought(1)

As far as immune system effects, they go on to state that the common practice of administering more than one adjuvant at a time or repeatedly injecting the same antigen can produce autoimmune disorders. They also point out that the toxicity of adjuvants can produce a range of adverse reactions. The hepatitis B vaccine has been known to cause Fatal Auto-Immune Disorder.

Experimental evidence clearly shows, that simultaneous administration of as little as two to three immune adjuvants, or repeated stimulation of the immune system by the same antigen can overcome genetic resistance to autoimmunity(1)

We continue to vaccinate en mass despite the growing body of evidence that clearly reveals how vaccines can be harmful to the body. The manner in which the body responds to vaccines is not well understood. With the amount of studies published, alarm bells should be ringing for the medical industry to start making adjustments and at least warning parents. This isn't meant to create an anti-vaccines position, but instead to look at all the facts vs. just some.

Often times, Doctors are not fully aware of the dangers associated with vaccines nor the ingredients and studies available to show they can be hazardous. Doctors should be encouraged to independently seek out a variety of sources and look at a variety of journals on the subject. It is quite possible that they would realize the vaccine world is not black and white and serious consideration needs to be taken when looking at the current vaccine schedule.

A burgeoning body of evidence shows that immune molecules play integral roles in CNS development, affecting processes such as neurogenesis, neuronal migration, axon guidance, synaptic connectivity and synaptic plasticity. Despite the dogma that peripheral immune responses do not affect CNS function, substantial evidence points exactly to the contrary. Thus, it is not reasonable to assume that manipulation of the immune system through an increasing number of vaccinations during critical periods of brain development will not result in adverse neurodevelopment outcomes(1)

Ableism — No solvency

The neg's narrow focus on autism in the vaccination debate is insufficient – a complete critical examination of ableist structures and mindsets should be the priority.

Choicewords 14 – Choicewords is a blog that highlights the young people's views on issues related reproductive justice and gender equity, 2014 ("Challenging Ableism: Autism and the Conversation About Vaccines", Unite for Reproductive and Gender Equality, March 24, Available Online at <http://urges.org/challenging-ableism-autism-and-the-conversation-about-vaccines/>, accessed 7/21/15, KM)

Recently there has been a debacle in the public health field about the connection between vaccines and autism. The Center for Disease Control will tell you there is no connection, while plenty of Americans and Jenny McCarthy believe that there is a definite link between the two. First off, there is such a range of autism. I will be using the term autism spectrum disorders (ASD) to cover the range of them, including Asperger syndrome, since there is rarely the distinction around this conversation. If you are not familiar with ASD, check out what information the Center for Disease Control has. But I am not here to debate with you about whether vaccines "cause" ASD. But here's the thing: Why are we so afraid of autism and children with disabilities? One of the problems I have with this debate is how we talk about oppression and autism. Why is it that we talk about being afraid of having children with autism, rather than ways to change ableist mindsets? I acknowledge that the quality of life with autism is not high for a number of reasons beyond social circumstances; but why aren't we focusing on eliminating oppression, rather than the disorder itself? Why is our biggest debate about whether or not autism is caused by vaccines, rather than why kids with ASD are more likely to grow up to be unemployed, or why children of color with ASD are less likely to have access to services? Ableism and ableist language is a huge problem in public health communities, with language about "eliminating" particular disabilities being very prominent. While the intentions of folks in the public health field are to improve the well-being of the community, it ignores how this language impacts how people with ASD are perceived. When we put down ASD, we are putting down people with ASD. When we talk about "preventing" ASD, we are creating a hierarchy of, able bodies > disabled bodies. It perpetuates oppression of people with ASD. In social justice, we also must ask the question to ourselves: why are we so obsessed with "curing" disabilities, instead of focusing on making life easier for folks with disabilities? Why are we so content with putting expensive prosthetic limbs on people with an amputated leg, instead of making the 2nd floor of a building accessible? This is especially true in reproductive justice movements, when we consider the ethics of terminating pregnancies with fetuses with disabilities and predicting them in utero. In the end, our obsession with curing and preventing disabilities comes down to internalized ableism, and people being terrified of themselves or their children being diagnosed with a disability. Ultimately, creating accessible and accepting spaces, uplifting voices of folks with ASD and other disabilities, and dismantling an ableist mindset should be our priority, rather than dueling out how to prevent autism in the battle of the vaccines.

AT: War Powers D.A

Uniqueness

Restrictions inev

Restrictions inevitable – it's only a question of making them deliberate or haphazard

Wittes 9 - senior fellow and research director in public law at the Brookings Institution, author of *Law and the Long War: The Future of Justice in the Age of Terror*, member of the Hoover Institution's Task Force on National Security and Law (Benjamin, "Legislating the War on Terror: An Agenda for Reform," 11-3-9, Book, p. 17) //AD

A new administration now confronts the same hard problems that plagued its ideologically opposite predecessor, and its very efforts to turn the page on the past make acute the problems of institutionalization. For while the new administration can promise to close the detention facility at Guantanamo Bay and can talk about its desire to prosecute suspects criminally, for example, it cannot so easily forswear noncriminal detention. While it can eschew the term "global war on terror," it cannot forswear those uses of force—Predator strikes, for example—that law enforcement powers would never countenance. Nor is it hastening to give back the surveillance powers that Congress finally gave the Bush administration. In other words, its very efforts to avoid the Bush administrations vocabulary have only emphasized the conflicts hybrid nature—indeed- emphasized that the United States is building something new here, not merely applying something old.[¶] That point should not provoke controversy. The evidence that the United States is fumbling toward the creation of hybrid institutions to handle terrorism cases is everywhere around us. U.S. law, for example, now contemplates extensive- probing judicial review of detentions under the laws of war—a naked marriage of criminal justice and wartime traditions. It also contemplates warrantless wiretapping with judicial oversight of surveillance targeting procedures—thereby mingling the traditional judicial role in reviewing domestic surveillance with the vacuum cleaner-type acquisition of intelligence typical of overseas intelligence gathering. Slowly but surely, through an unpredictable combination of litigation, legislation, and evolutionary developments within executive branch policy, the nation is creating novel institutional arrangements to authorize and regulate the war on terror. The real question is not whether institutionalization will take place but whether it will take place deliberately or haphazardly, whether the United States will create through legislation the institutions with which it wishes to govern itself or whether it will allow an endless sequence of common law adjudications to shape them.[¶] The authors of the chapters in this book disagree about a great many things. They span a considerable swath of the U.S. political spectrum, and they would no doubt object to some of one another's policy prescriptions. Indeed, some of the proposals are arguably inconsistent with one another, and it will be the very rare reader who reads this entire volume and wishes to see all of its ideas implemented in legislation. What binds these authors together is not the programmatic aspects of their policy prescriptions but the belief in the value of legislative action to help shape the contours of the continuing U.S. confrontation with terrorism. That is, the authors all believe that Congress has a significant role to play in the process of institutionalization—and they have all attempted to describe that role with reference to one of the policy areas over which Americans have sparred these past several years and will likely continue sparring over the next several years.

War power checks good and inevitable – either that non-uniques the DA or means the plan is key to solve

Flower and Beavers 13 (Ruth, Elizabeth, "Congress must rein in president's war power," *The Hill*, 9-29-13, <http://thehill.com/blogs/congress-blog/foreign-policy/325205-congress-must-rein-in-presidents-war-power>) //AD

Congress passed the War Powers Resolution over President Nixon's veto in an effort to curb the president's rapidly growing powers, as evidenced by the Vietnam War. The law sets up a clear framework: the president must "in every possible instance" consult with Congress, report to Congress within 48 hours of introducing armed forces into hostilities, and withdraw troops after 60 to 90 days if Congress does not

provide authorization. Finally, Congress retains the power to order the troops withdrawn by concurrent resolution. Yet no president has considered the War Powers Resolution binding, nor fully complied with its requirements. Thus, a law meant to decisively scale back executive war powers has become effectively useless. But does this matter? Is it necessary to have a clearly-defined, fully functional framework which requires the president to involve Congress in decisions of war? The example of Syria clearly demonstrates the benefits of the democratic process. When President Obama asked Congress for authorization, that decision slowed the process enough to allow the American people to voice their clear opposition. It also allowed the international community the opportunity to coalesce toward diplomacy and peace. Further, the pas de deux of consultation, deliberation, and decision-making between the political branches in a lead-up to war is consistent with the requirements of the Constitution. Fearing an all-powerful executive capable of singlehandedly plunging the nation into senseless war, the Founders intentionally separated the war powers by giving to Congress the power to declare war and to the president, the role of commander-in-chief, once war had been initiated. Clearly, the War Powers Resolution as it stands is insufficient to ensure that Congress will be involved in the process. If democratic principles of war-making are to be revived, some key policies must be in place. First, Congress must decide what war actually is. The War Powers Resolution fails to define “hostilities,” and this is a giant loophole through which presidents have become accustomed to slipping unilateral hostile actions. For example, President Obama did not consider the enforcement of a no-fly zone, without troops on the ground in Libya in 2011 to constitute “hostilities” or “war,” as imagined by the law. Long gone are the days of uniformed armies fighting clearly declared wars between states. Instead, modern warfare seems destined to involve such unconventional aspects as civilian rebel groups, unmanned drones, and air strikes. By clearly defining “hostilities” and “war,” Congress asserts its own authority and upholds the democratic process as an effective means of oversight over the wide-ranging technologies and tactics of modern warfare. Second, Congress should stop providing “blank check” authorizations for military force to the president. Perhaps the best and most recent example is the vague language of the Authorization for the Use of Military Force in 2001, which was best described by Representative Barbara Lee of California as giving the president “the authority to wage war at any time, in any place, for nearly any purpose.” Indeed, the test of time has demonstrated the danger of such broad authority, as the AUMF has been cited as legal authority for a multitude of controversial practices, including the indefinite detentions in Guantanamo Bay and the assassination of U.S. citizen Anwar al-Awlaki. The congressional power to limit presidential authority is meaningless if not exercised, and the failure to exercise such power may have unintended far-reaching consequences. Lastly, Congress should utilize its most potent tool – the “power of the purse.” The Constitution is clear that the legislative branch controls the borrowing and appropriation of money. Thus, Congress should refuse to allow money to be borrowed for purposes of war, and especially not for military actions in contravention of the War Powers Resolution. In addition to limiting the president’s widespread powers, the requirement of specific revenue for military action would cause both political branches to pause before entering into impulsive or potentially endless war. Further, it would encourage fiscal responsibility and draw much-needed public attention to the truly exorbitant cost of war. This is the time for elected representatives to re-assert themselves and the voices of the American people into the decision-making process. Rather than enabling the president to unilaterally commit American life and treasure, Congress must set up an effective framework to ensure that even decisions of war are subject to the consent of the governed.

Decline inev

War power decline inevitable through the court – plan’s action key

Wittes 8 - Senior Fellow in Governance Studies at the Brookings Institution, co-founder and editor-in-chief of the Lawfare blog, member of the Hoover Institution’s Task Force on National Security Law (Benjamin, Law and the Long War: The Future of Justice in the Age of Terror, June 2008, google books)
//AD

What the Supreme Court has done is carve itself a seat at the table. It has intimated, without ever deciding, that a constitutional basis for its actions exists—in addition to the statutory bases on which it decided the cases—meaning that its authority over overseas detentions may be an inherent feature of judicial power, not a policy question on which the legislature and executive can work their will. Whether the votes exist on the court to go this extra step we will find out soon enough. But the specter of a vastly different judicial posture in this area now haunts the executive branch—one in which the justices assert an inherent authority to review executive detention and interrogation practices, divine rights to apply with that jurisdiction based on due process and vaguely worded international humanitarian law principles not clearly implemented in U.S. law, and allow their own power to follow the military’s anywhere in the world. Such a posture would constitute an earthquake in the relationships among all three branches of government, and the doctrinal seeds for it have all been planted. Whether they ultimately take root depends on factors extrinsic to the war on terror—particularly the future composition of a Supreme Court now closely divided on these questions. It will also pivot on the manner in which the political branches posture the legal foundations of the war in the future. Building a strong legislative architecture now may be the only way to avert a major expansion of judicial power over foreign policy and warfare.

Link

Link turn – balance

The plan's balance of power solves – boosts policy effectiveness

Weinberger 9 - Assistant Professor in the Department of Politics and Government at the University of Puget Sound, M.A. and Ph.D. in Political Science from Duke University (Seth, "Balancing War Powers in an Age of Terror", *The Good Society*, 18(2), http://muse.jhu.edu/journals/good_society/v018/18.2.weinberger.html) //AD

For the Founding Fathers, that balance emerged from the fundamental structure of constitutional government that they created. "Ambition must be made to counteract ambition," James Madison wrote in a powerful argument for the separation of powers.² At first glimpse, this might seem to contradict Ford's advice to avoid "a constant rivalry" over the conduct of America's war efforts. But, if the rivalry over control of war powers occurs not with the branches fighting over the right to use this or that particular power but rather involves the presidency and Congress wielding their own specific powers both in pursuit of a coherent policy as well as to prevent the other from becoming too strong, then Ford's vision can be merged with that of the Founders. While constant rivalry and competition between the branches may not be desirable, neither is a situation in which one branch exercises unchecked power. A sound theory of war powers should create a situation in which each branch uses its unique strengths and weaknesses not only to check the ambitions of the other but also to develop common solutions to the challenges that threaten the security of the nation.³ The war on terror has posed considerable problems for the constitutional balance of powers between the executive and legislative branches. In its efforts to protect the United States in the wake of the September 11 attacks, the Bush administration has tried to expand the scope and breadth of executive power. Time and time again, when the constitutionality of its policies have been challenged, the executive branch has responded with claims of inherent presidential power to take actions necessary to defend the country. However, in almost every instance of a legal challenge to those policies, the administration has lost. What do these challenges and defeats mean for the overall distribution of war powers? On the one hand, the powers claimed by the executive branch would give the president unprecedented powers for a potentially indefinite period, as it is hard to imagine that terrorism—a tactic rather than an enemy—will ever be defeated. On the other hand, it must be recognized that the threat of international terrorism is no idle matter. Terrorism of the kind that manifested itself on September 11, 2001, is a threat unlike any other that the United States has ever faced. The question of allocating war powers between the president and Congress is a critical one. If too much power is concentrated in the hands of the executive, the country risks undermining basic constitutional protections of individual freedoms and eroding the democratic nature of the republic; if too much of a role is given to Congress, the country may not be able to effectively develop policies to protect itself. And when there is no clear theory guiding the actions of the government, policy muddles along, with the executive branch taking the lead by putting an idea into action and hoping that it will withstand judicial scrutiny. Thus there is a need for a balanced theory of war powers that respects the constitutional allocation of power and heeds the advice of President Ford.

Link turn – terror/rights

Executive flex undermines counterterror and liberty – legal limits are a more effective security strategy

Sayre 14 – citing Tiberiu Dragu: Assistant Professor, Wilf Family Department of Politics, New York University, and Mattias Polborn: Professor, Department of Economics and Department of Political Science, University of Illinois (Mike, “THE RULE OF LAW IN THE FIGHT AGAINST TERRORISM: LESS EXECUTIVE POWER, MORE SECURITY,” American Journal of Political Science, 5-4-15, <http://ajps.org/2015/05/04/the-rule-of-law-in-the-fight-against-terrorism-less-executive-power-more-security/>) //AD

In the aftermath of 9/11 terrorist attacks, it has become increasingly difficult to argue that the executive branch of the United States be bounded by constitutional rules that might hamper its capacity to ensure collective security. Given the potentially horrific costs of failing to stop another large-scale terrorist attack, the citizens themselves viewed a rigid adherence to legal limits as problematic and were willing to grant the executive more powers at the expense of fundamental rights and liberties. But does increasing the executive’s counterterrorism powers make us safer from terrorism? Our article, “The Rule of Law Against Terrorism”, shows that legal limits on executive counterterrorism powers can be beneficial on security grounds alone and therefore strengthening institutions that uphold the rule of law in the fight against terrorism can be an effective way to achieve security from terrorism. Security crises pose fundamental challenges to the constitutional structure of liberal governments. Unexpected security dangers such as catastrophic terrorist attacks serve as a reminder that collective security is a precondition for the proper functioning of a liberal order, raising the following question: What is the role of legal limits on executive power, if any, when citizens demand more security and allowing executive officials legal flexibility of action appears necessary to achieve it? This question becomes most compelling when governments seek to prevent a security crisis rather than simply react to it. Few if any would argue that executive officials should wait until the actual realization of catastrophic terrorist attacks and not take preventive actions to ward off such security threats. To prevent crises of such proportions, the executive must have the means to act proactively. Crisis prevention seemingly requires permanent executive discretionary powers, and thus represents a constant challenge to the ideal of limited government enshrined in the U.S. Constitution and the Federalist Papers. The tension between the institutional structure of liberal government and successful crisis prevention came to the fore in the aftermath of the 9/11 terrorist attacks. To enhance their governments’ capacities to prevent terrorist attacks, the discretionary powers of the executive were promptly augmented in the United States and other liberal societies. In turn, many of the executive’s counterterrorism activities have infringed upon the rights and liberties of aliens and non-citizens, in particular. In the United States, for example, the executive undertook scores of repressive counterterrorism policies, ranging from ethnic profiling to increased restrictions on immigration, to increased surveillance of certain ethnic and religious communities and even torture of aliens suspected of terrorist activities. The rationale for such repressive policies is that executive discretion is essential to respond effectively to terrorist activities, and thus the executive should be afforded legal flexibility to thwart security dangers. Without necessarily denying that the ethnic and religious communities in which potential terrorists have roots are important in fighting terrorism, the presumption is that executive discretion increases security from terrorism because there are political controls on how executive counterterrorism powers are used. If repressive policies would be harmful for terrorism prevention, so the argument goes, the executive will restrain itself from undertaking such suboptimal counterterrorism policies because citizens can punish ineffective usage of executive power at election times. The logic behind the security rationale for executive discretion appears simple and intuitive. If the executive cares about security from terrorism and also about being in office, and if the citizens are more likely to reelect the executive if it is successful in preventing terrorism, then allowing executive officials legal flexibility of action should translate into more security from terrorism. Our research questions this security rationale on its own terms. To this end, we developed a game-theoretic model to show that that even if citizens are less

likely to reelect the government when failing to prevent terrorist attacks, that is, even if electoral controls on how executive counterterrorism powers are used are effective, security from terrorism can actually decrease if the executive has legal flexibility to choose any policy it finds optimal. In contrast, security from terrorism always increases if there are explicit legal limits on the executive's counterterrorism actions. We also show that the executive achieves the objective of terrorism prevention more effectively when there are some limitations on its counterterrorism powers rather than when executive officials have legal flexibility to devise security policy. At the minimum, the analysis suggests that the burden of empirical proof should be on executive officials who must show that discretionary powers achieve the intended security benefits and, perhaps, whether such benefits can be achieved without setting aside fundamental liberal-democratic principles. Moreover, our analysis indicates that even when citizens want a readjustment in the balance between security and liberty, it is not necessarily security-beneficial if the executive itself decides on the scope of government power. Our research underscores a novel rationale for legal limits and checks on executive powers. The traditional Madisonian argument for such institutions is that they stem abuses of governmental power and thus help preserve citizens' rights and liberties. Security crises challenge this very rationale. Times of duress are associated with unfettered governmental powers; ordinary, regular situations with separation of powers and checks and balances institutions. Without disputing the importance of constitutional limits and institutional checks within the tradition of a liberal distrust of government, the analysis here underscores another, perhaps less intuitive virtue: such institutional arrangements can increase a government's capacity to prevent crises. Thus they might be a necessary component of structuring the government if the social objective is terrorism prevention. Our paper also contributes to an empirical literature on terrorism and political violence. Scholars have noted that liberal democracies often resort to repressive policies and focus their coercive efforts on political, ethnic or religious communities associated with a particular security threat. Scholars have also empirically shown that repressive tactics at odds with fundamental liberal-democratic principles can negatively affect security from terrorism, empirical findings that raise the following puzzle: why would a rational government intending to achieve security from terrorism nevertheless engage in repressive tactics that undermine it? Our model shows that it can be an equilibrium behavior for the executive to undertake repressive policies that harm security from terrorism, a behavior induced by electoral incentives to provide security from terrorism.

Flex bad

Total flex results in net worse decision-making – the aff makes the process more effective

Pearlstein 9 - lecturer in public and international affairs, Woodrow Wilson School of Public & International Affairs (Deborah N, ""Form and Function in the National Security Constitution," July 2009, Connecticut Law Review, 41 Conn. L. Rev. 1549, LN) //AD

It is in part for such reasons that studies of organizational performance in crisis management have regularly found that "planning and effective [*1604] response are causally connected." n196 Clear, well-understood rules, formalized training and planning can function to match cultural and individual instincts that emerge in a crisis with commitments that flow from standard operating procedures and professional norms. n197 Indeed, "the less an organization has to change its pre-disaster functions and roles to perform in a disaster, the more effective is its disaster [sic] response." n198 In this sense, a decision maker with absolute flexibility in an emergency-unconstrained by protocols or plans-may be systematically more prone to error than a decision-maker who is in some way compelled to follow procedures and guidelines, which have incorporated professional expertise, and which are set as effective constraints in advance.¶ Examples of excessive flexibility producing adverse consequences are ample. Following Hurricane Katrina, one of the most important lessons independent analysis drew from the government response was the extent to which the disaster was made worse as a result of the lack of experience and knowledge of crisis procedures among key officials, the absence of expert advisors replacing those rules with more than the most general guidance about custodial intelligence collection. available to key officials (including the President), and the failure to follow existing response plans or to draw from lessons learned from simulations conducted before the fact. n199 Among the many consequences, [*1605] basic items like food, water, and medicines were in such short supply that local law enforcement (instead of focusing on security issues) were occupied, in part, with breaking into businesses and taking what residents needed. n200¶ Or consider the widespread abuse of prisoners at U.S. detention facilities such as Abu Ghraib. Whatever the theoretical merits of applying coercive interrogation in a carefully selected way against key intelligence targets, n201 the systemic torture and abuse of scores of detainees was an outcome no one purported to seek. There is substantial agreement among security analysts of both parties that the prisoner abuse scandals have produced predominantly negative consequences for U.S. national security. n202 While there remain important questions about the extent to which some of the abuses at Abu Ghraib were the result of civilian or senior military command actions or omissions, one of the too often overlooked findings of the government investigations of the incidents is the unanimous agreement that the abuse was (at least in part) the result of structural organization failures n203 -failures that one might expect to [*1606] produce errors either to the benefit or detriment of security.¶ In particular, military investigators looking at the causes of Abu Ghraib cited vague guidance, as well as inadequate training and planning for detention and interrogation operations, as key factors leading to the abuse. Remarkably, "pre-war planning [did] not include[] planning for detainee operations" in Iraq. n204 Moreover, investigators cited failures at the policy level- decisions to lift existing detention and interrogation strictures without n205 As one Army General later investigating the abuses noted: "By October 2003, interrogation policy in Iraq had changed three times in less than thirty days and it became very confusing as to what techniques could be employed and at what level non-doctrinal approaches had to be approved." n206 It was thus unsurprising that detention and interrogation operations were assigned to troops with grossly inadequate training in any rules that were still recognized. n207 The uncertain effect of broad, general guidance, coupled [*1607] with the competing imperatives of guidelines that differed among theaters of operation, agencies, and military units, caused serious confusion among troops and led to decisionmaking that it is overly kind to call arbitrary. n208¶ Would the new functionalists disagree with the importance of government planning for detention operations in an emergency surrounding a terrorist nuclear attack? Not necessarily. Can an organization anticipate and plan for everything? Certainly not. But such findings should at least call into question the inclination to simply maximize flexibility and discretion in an emergency, without, for example, structural incentives that might ensure the engagement of professional expertise. n209 Particularly

if one embraces the view that the most potentially damaging terrorist threats are nuclear and biological terrorism, involving highly technical information about weapons acquisition and deployment, a security policy structure based on nothing more than general popular mandate and political instincts is unlikely to suffice; a structure that systematically excludes knowledge of and training in emergency response will almost certainly result in mismanagement.ⁿ²¹⁰ In this light, a general take on role effectiveness might suggest favoring a structure in which the engagement of relevant expertise in crisis management is required, leaders have incentives to anticipate and plan in advance for trade-offs, and [*1608] organizations are able to train subordinates to ensure that plans are adhered to in emergencies. Such structural constraints could help increase the likelihood that something more than arbitrary attention has been paid before transcendent priorities are overridden.

Checks good

Stronger checks on war powers boost foreign threat perception – increases deterrence credibility

Waxman 14 - Professor of Law, Columbia Law School; Adjunct Senior Fellow for Law and Foreign Policy, Council on Foreign Relations (Matthew C, "The Constitutional Power to Threaten War," 8-25-14, Yale Law Journal, vol. 123 (2014), 2013, PDF) //AD

A second argument, this one advanced by some congressionalists, is that stronger legislative checks on presidential uses of force would improve deterrent and coercive strategies by making them more selective and credible. The most credible U.S. threats, this argument holds, are those that carry formal approval by Congress, which reflects strong public support and willingness to bear the costs of war; requiring express legislative backing to make good on threats might therefore be thought to enhance the potency of threats by encouraging the President to seek congressional authorization before acting.¹⁸¹ A frequently cited instance is President Eisenhower's request (soon granted) for standing congressional authorization to use force in the Taiwan Straits crises of the mid- and late-1950s – an authorization he claimed at the time was important to bolstering the credibility of U.S. threats to protect Formosa from Chinese aggression.¹⁸² (Eisenhower did not go so far as to suggest that congressional authorization ought to be legally required, however.) "It was [Eisenhower's] seasoned judgment ... that a commitment the United States would have much greater impact on allies and enemies alike because it would represent the collective judgment of the President and Congress," concludes Louis Fisher. "Single-handed actions taken by a President, without the support of Congress and the people, can threaten national prestige and undermine the presidency. Eisenhower's position was sound then. It is sound now."¹⁸³ A critical assumption here is that legal requirements of congressional participation in decisions to use force filters out unpopular uses of force, the threats of which are unlikely to be credible and which, if unsuccessful, undermine the credibility of future U.S. threats.¶ A third view is that legal clarity is important to U.S. coercive and deterrent strategies; that ambiguity as to the President's powers to use force undermines the credibility of threats. Michael Reisman observed, for example, in 1989: "Lack of clarity in the allocation of competence and the uncertain congressional role will sow uncertainty among those who depend on U.S. effectiveness for security and the maintenance of world order. Some reduction in U.S. credibility and diplomatic effectiveness may result."¹⁸⁴ Such stress on legal clarity is common among lawyers, who usually regard it as important to planning, whereas strategists tend to see possible value in "constructive ambiguity", or deliberate fudging of drawn lines as a negotiating tactic or for domestic political purposes.¹⁸⁵ A critical assumption here is that clarity of constitutional or statutory design with respect to decisions about force exerts significant effects on foreign perceptions of U.S. resolve to make good on threats, if not by affecting the substance of U.S. policy commitments with regard to force then by pointing foreign actors to the appropriate institution or process for reading them.

Congressional checks are meaningless – no hamper on authority

Cooper 15 – National correspondent, Reed College (Ryan, “Obama's war-powers farce: If you want to limit presidential power, don't start illegal wars,” The Week, 2-17-15, <http://theweek.com/articles/539263/obamas-warpowers-farce-want-limit-presidential-power-dont-start-illegal-wars>) //AD

President Obama is seeking a new Authorization for Use of Military Force, as the U.S. continues its bombing campaign against the Islamic State. It comes just a tad late: about three and half months after it was necessary, according to the War Powers Act. This raises the question: Why is he even bothering? Matt Yglesias, following on the heels of his interview with the president, argues that this drive for a new AUMF is about limiting presidential power, because it would introduce a more limited legal framework for future wars. I don't doubt that's a major part of the administration's rationale. Scrambling to hem in the next person's ability to do stuff you consider bad is a traditional end-of-presidency activity. But as Greg Sargent points out, this is closing the barn door after the horse has bolted. When it comes to legal limits on the president's authority to start new wars, Obama has already blown a hole in them big enough to drive through an aircraft carrier. If the president wanted to stop President Cruz's future wars of aggression, he should have done so in 2011, when he started his first illegal war in Libya. The War Powers Act, as commonly interpreted, says that the president can use force for 60 days without congressional authorization, and if he doesn't get it, then he has to stop hostilities within 30 days. Even that might not have passed legal muster in Libya, because the law states that any unauthorized use of force has to be in response to "a national emergency created by attack upon the United States, its territories or possessions, or its armed forces." At any rate, Obama casually blew off the 90-day limit anyway. The Justice Department's Office of Legal Counsel is supposed to be the authoritative voice on legal interpretation for the executive branch, but when the OLC insisted the War Powers Act applied in this situation, Obama ignored the lawyers and brought in political hacks to cook up another rationale. Eventually they settled, ludicrously, on arguing the new war didn't really constitute "hostilities." When Congress refused to pass a new AUMF, he ignored that, too. The latest war with the Islamic State has followed the same script, except this time Obama is claiming it's the 2001 AUMF that covers the use of force. Though somewhat less preposterous than the Libya case, it's still nonsense. That statute is clearly directed at those who "planned, authorized, committed, or aided " the 9/11 attacks, and the Islamic State didn't even exist in 2001. Of course, the 2001 AUMF has turned into a blank legal check for dirty wars around the globe, and Obama's proposal leaves it in place, making this whole exercise pointless. As Jameel Jaffer of the ACLU told Sargent: "If you don't repeal the original AUMF, you create the possibility the president will continue to rely on it," Jaffer said. "Any limitations Congress imposes under the new AUMF could be ignored. This is a meaningless exercise unless it includes repeal of the original AUMF." [The Washington Post] Finally, there's the political reality. Congressional restrictions on presidential power are only as good as Congress' willingness to act when the restrictions are breached. And right now there is approximately zero reason to think that Congress gives a crap about illegal war. In response to Libya, Congress should have threatened to remove him from office. But the best it could do was offer some annoyed muttering, which lapsed into virtual silence by the time Obama turned to the Islamic State. In other words, in today's political climate, Obama is basically asking for the authority to start war against anyone who's watched an Islamic State video. Indeed, the main axis of debate is whether the proposed authority is broad enough. Except for Sen. Rand Paul, Republicans are basically fine with Obama being able to make war wherever he wants. So until Congress starts caring about fulfilling its constitutional prerogatives, lawmakers might as well save their breath when it comes to new authorizations.

Flexibility link is wrong – no impact

Streichler 8 – Stuart Streichler, Adjunct Faculty at Seattle University School of Law. Ph.D. at Johns Hopkins University; J.D. at the University of Michigan Law School; B.S. at Bowling Green State University, "Mad about Yoo, or Why Worry about the Next Unconstitutional War", *The Journal of Law & Politics*, Winter, 24 J. L. 26 *Politics* 93, Lexis) //AD

When Yoo discusses the need for flexibility in the process for warmaking, he creates a false dilemma. He suggests that the president has discretionary power to start wars or that the president must secure prior authorization from Congress through a "fixed, legalistic process."²³⁰ For Yoo, the latter would inevitably hamper the government's ability to respond to terrorist threats.²³¹ Yet even if Congress has the power to decide whether to go to war, the president retains substantial powers to respond quickly to defend the country. No lawmaker would insist on Congress deliberating while terrorists set off weapons of mass destruction in the United States. Americans who lived with the risk of nuclear attack during the Cold War accepted the president's authority to respond to the Soviet Union without waiting for the results of legislative debate. Additionally, Congress has demonstrated that it can move quickly to authorize the use of military force. Three days after September 11, the Senate voted 98-0 to authorize the president to use force in response to the attacks,²³² and the House approved the measure a few hours later (420-1).²³³ Another four days passed before the president signed it.²³⁴ The last time Congress declared war in response to an attack on the United States, it did not take lawmakers long to do so. The Senate (82-0) and the House (388-1) issued a declaration of war thirty-three minutes after President Franklin D. Roosevelt's "Day of Infamy" speech.²³⁵ Furthermore, whatever their capacity for dynamic response, presidents do not always react to security threats with speed and energy. position with flexibility, there is more to constructing an adaptive foreign policy than letting the president initiate military hostilities. Executive decisions on war that appear, in the short term, to reflect a flexible approach may limit policy options over the long run, constraining foreign policymakers and military planners. Yoo expresses no doubt that the president's capacity to make decisions in foreign affairs and defense—to "consider policy choices" and to "evaluate threats"—is "far superior" to Congress's.²³⁶ That overstates the reach such an unqualified conclusion. Seemingly for every example where executive decision-making works well, another can be cited exposing its de v affect the president's decision on whether to take the nation to ficiencies. President John F. Kennedy's management of the Cuban missile crisis, though not without its critics, is often cited as a classic model of decision-making in crisis. The same president's handling of the Bay of Pigs invasion has been roundly criticized.²³⁷ As Yoo presents his argument on executive decision-making, it does not matter who occupies the office of the president. In fact, that can make a good deal of difference. With the presidency structured around one individual, the decision-making process is shaped by the chief executive's native abilities, judgment, and experience.²³⁸ A whole range of personal qualities matter: how the president assesses risk (especially with the uncertain conditions that prevail in foreign affairs); whether he or she engages in wishful thinking; whether he or she is practical, flexible, and openminded.²³⁹ While every president consults with advisers, small group dynamics add another layer of difficulties in the executive decision-making process. Even talented White House staffers and independent-minded cabinet secretaries succumb to groupthink, as it has been called—the overt and subtle pressures driving group cohesiveness that can distort the decisionmaking process.²⁴⁰ This effect can be pronounced in foreign policy, with stressful crises that often involve morally difficult choices.²⁴¹ Members of the president's team, not fully aware they are doing so, may overrate their own power or moral position, cut off the flow of information, downplay contrary views of outside experts, limit consideration of long-term consequences, underestimate the risks of a particular policy, or fail to develop contingency plans.²⁴² Once the group coalesces around a particular view, it becomes increasingly difficult for individual members to press the group to reassess rejected alternatives.²⁴³ The unique circumstances of working for the president can make matters worse. Members of the administration generally share the president's outlook, ideology, and policy preferences because executive officials give advice based on what they think the president wants to hear. Even if the president's subordinates differ with the chief executive on particular questions, they can only go so far to challenge the president.²⁴⁴ In short, there are more questions surrounding presidential decisionmaking on war than Yoo is willing to admit. Congress, with the president still involved, may be able to offset the structural disadvantages of a decision-making process taking place behind closed doors in the White House. While the executive branch tends to concentrate command authority in one person, power is dispersed on Capitol Hill. Not all members of Congress are equal, but no person has influence comparable to the president's power within the executive branch. In comparison with the select handful of advisers who have the most influence with the president, the number of elected legislators and their diverse ideologies, constituencies, and perspective to the president's decision-making process, insulated by executive privilege, the legislative process involves on-the-record votes and speeches by elected representatives and thus provides a forum for public deliberation.²⁴⁵ To be sure, Congress is not an idealized debating society. Lawmakers have parochial concerns. They often bargain in private. Their public debates can be grounded in

emotional appeals as much as reason.²⁴⁶ Yet in eagerness to rate the president far above Congress in deciding to go to war, Yoo overlooks the value in having a decision-making process conducted in relatively open view and the possibilities for lawmakers to engage in serious deliberations on vital questions of national security.

link defense

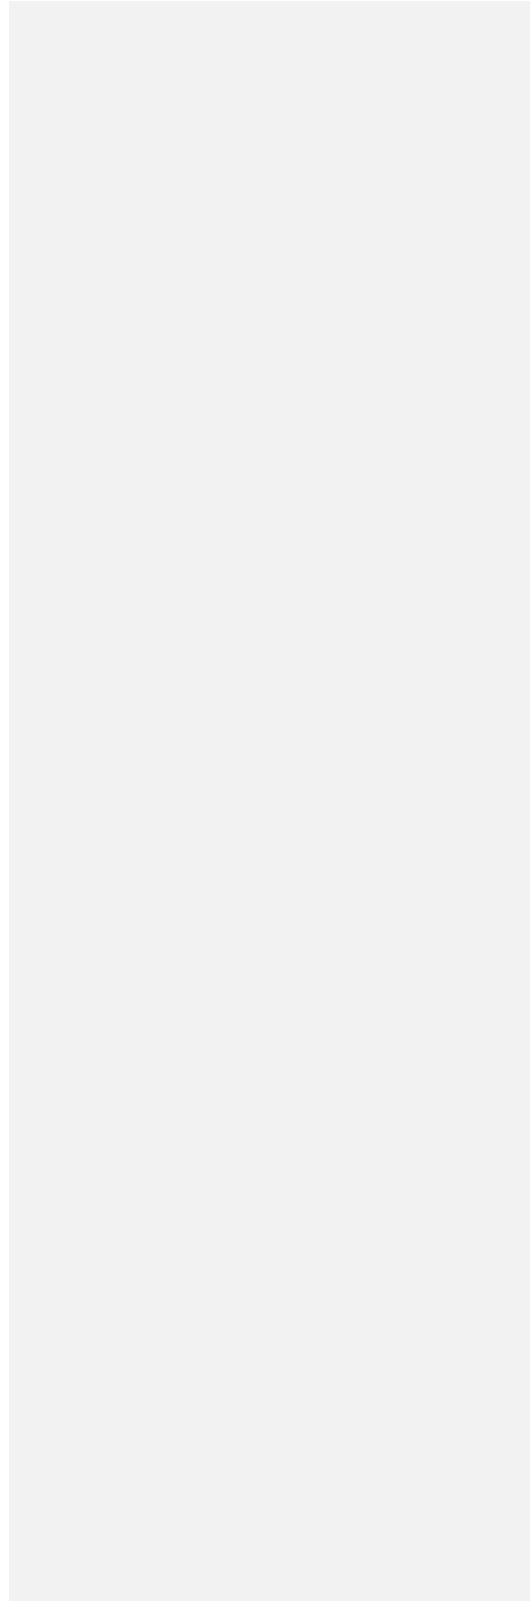

Surveillance not key to war powers and Congressional checks boost presidential powers – FISA and recent restraints disprove the link

Levy 06 – (Robert A, “Wartime Executive Power and the NSA’s Surveillance Authority II,” Cato Institute, 2-28-06, <http://www.cato.org/publications/congressional-testimony/wartime-executive-power-nsas-surveillance-authority-ii>) //AD

I respectfully disagree — which is not to say I believe the president is powerless to order warrantless wartime surveillance. For example, intercepting enemy communications on the battlefield is clearly an incident of his war power. But warrantless surveillance of Americans inside the United States, who may have nothing to do with al-Qaeda, does not qualify as incidental wartime authority. The president’s war powers are broad, but **not boundless**. Indeed, the war powers of Congress, not the president, are those that are constitutionalized with greater specificity.⁴⁴ The question is not whether the president has unilateral executive authority, but rather the extent of that authority. And the key Supreme Court opinion that provides a framework for resolving that question is Justice Robert Jackson’s concurrence in *Youngstown Sheet & Tube v. Sawyer*⁴⁵ — the 1952 case denying President Truman’s authority to seize the steel mills. Truman had argued that a labor strike would irreparably damage national security because steel production was essential to the production of war munitions. But during the debate over the 1947 Taft-Hartley Act,⁴⁶ Congress had expressly rejected seizure. Justice Jackson offered the following analysis, which was recently adopted by the Second Circuit in holding that the administration could no longer imprison Jose Padilla:⁴⁷ First, when the president acts pursuant to an express or implied authorization from Congress, “his authority is at its maximum.”⁴⁸ Second, when the president acts in the absence of either a congressional grant or denial of authority, “there is a zone of twilight in which he and Congress may have concurrent authority, or in which its distribution is uncertain.”⁴⁹ But third, where the president takes measures incompatible with the express or implied will of Congress — such as the NSA program, which violates an express provision of the FISA statute — “his power is at its lowest.”⁵⁰ Even under *Youngstown’s* second category (congressional silence), the president might have inherent wartime authority to interpret the “reasonableness” standard of the Fourth Amendment in a manner that would sanction certain warrantless surveillance. But the NSA program does not fit in *Youngstown’s* second category. It belongs in the third category, in which the president has acted in the face of an express statutory prohibition. Naturally, if the statutory prohibition is itself unconstitutional, the administration is not only permitted but obligated to ignore it. That’s the argument administration supporters have proffered to excuse the NSA’s defiance of FISA.⁵¹ To bolster their case, they cite the only opinion that the FISA Court of Review has ever issued, *In re: Sealed Case*.⁵² There, the appellate panel mentioned several earlier cases⁵³ that concluded the president has “inherent authority to conduct warrantless searches to obtain foreign intelligence information.”⁵⁴ The Court of Review then added: “We take for granted that the President does have that authority and, assuming that is so, FISA could not encroach on the President’s constitutional power.”⁵⁵ Three responses: First, I do not contend that the president lacks “inherent authority to conduct warrantless searches to obtain foreign intelligence information.” He has such authority, but Congress, exercising its own concurrent wartime powers, has limited the scope of that authority by excluding warrantless surveillance intentionally targeted at a U.S. person in the United States. Second, the surveillance in the earlier cases cited by *Sealed Case* took place pre-FISA, so Congress had not yet laid out the rules. Third, the quote from *Sealed Case* conveniently stops one sentence short. Here is the very next sentence: “The question before us is the reverse, does FISA amplify the President’s power by providing a mechanism that at least approaches a classic warrant and which therefore supports the government’s contention that FISA searches are constitutionally reasonable.”⁵⁶ In resolving that question, the Court of Review did not conclude that FISA “encroach[ed] on the President’s constitutional power.” Quite the contrary, according to the court, **FISA permissibly amplified the president’s power.** The restrictive provisions in FISA were simply a clarification of his new and expanded authority. Thus, *Sealed Case* provides **no support for the assertion that FISA unconstitutionally constrains the president’s inherent wartime authority.** Moreover, such claims leave important questions unanswered. For example: If warrantless domestic surveillance is incidental to the president’s inherent powers, so too are sneak-and-peek searches, roving wiretaps, library records

searches, and national security letters — all of which were vigorously debated in deciding whether to reauthorize the PATRIOT Act. Could the president have proceeded with those activities even if they were not authorized by Congress? If so, what was the purpose of the debate? And if not, what makes the NSA program different? Further, the attorney general asserts that the AUMF and the commander-in-chief power are sufficient to justify the NSA program. He, or his predecessor, made similar claims for military tribunals without congressional authorization,⁵⁷ secret CIA prisons,⁵⁸ indefinite detention of U.S. citizens,⁵⁹ enemy combatant declarations without hearings as required by the Geneva Conventions,⁶⁰ and interrogation techniques that may have violated our treaty commitments banning torture.⁶¹ Is any of those activities outside the president's commander-in-chief and AUMF powers? If not, what are the bounds, if any, that constrain the president's unilateral wartime authority?

Internal link

No signaling

No internal link – war power authority is irrelevant for signaling

Sitaraman 14 - Assistant Professor of Law, Vanderbilt Law School (Ganesh, "Credibility and War Powers," Harvard Law Review, January 2014, www.harvardlawreview.org/issues/127/january14/forum_1024.php#_ftnref19) //AD

For all the talk of credibility, political scientists have offered devastating critiques of credibility arguments in the context of military threats. They have demonstrated not only that the concept is often deployed in incomplete and illogical ways but also that as a historical matter, a country's "credibility" based on its reputation and past actions has little or no effect on the behavior of opponents in high-stakes international crises. In the crises in the run-up to World War I, in the Berlin crises of the late 1950s and early 1960s, and even in the crises leading to World War II, threats from countries that had previously backed down were not seen as less credible by their opponents. In some cases, the threats were even thought to be more credible. For constitutional lawyers, this research should be particularly troubling because credibility has migrated from foreign policy into the constitutional law of war powers. In a series of opinions, including on Somalia (1992), Haiti (2004), and Libya (2011), the Justice Department's Office of Legal Counsel (OLC) has argued that the credibility of the United Nations Security Council is a "national interest" that can justify presidential authority to use military force without prior congressional authorization.⁴ This Essay argues that the credibility justification for the use of force should be removed from the constitutional law of presidential war power. Incorporating credibility as one of the "national interests" that justify presidential use of force expands the President's war powers significantly without a legitimate policy justification.¹

Understanding Credibility As a justification for the use of military force, the preservation of credibility is ubiquitous in foreign policy. President Clinton thought that if the United States failed to uphold its commitments in Somalia after the Black Hawk Down incident, then "[o]ur own credibility with friends and allies would be severely damaged. Our leadership in world affairs would be undermined . . ."⁵ President Reagan argued that if the United States failed to confront guerrillas in Central America, "our credibility would collapse."⁶ Years earlier, President Truman said that defeat in Korea "would be an open invitation to new acts of aggression elsewhere."⁷ For decades during the Cold War, credibility arguments were prominent in game theory analyses of deterrence, arms control, and U.S.-Soviet relations.⁸ Despite the importance of these theories, political scientists at the time acknowledged that they "know remarkably little" about credibility⁹ and had "neither theoretically grounded expectations nor solid evidence" of how behavior affects expectations of future action.¹⁰ More recently, political scientists have turned to serious study of credibility. These studies call into question the use of credibility arguments in the context of military threats. A. Theories of Credibility The credibility of a threat is "the perceived likelihood that the threat will be carried out" if the conditions that are supposed to trigger it are met.¹¹ When people believe a threat will be carried out, it is credible; when they believe it is a bluff, the threat is not credible. Credibility is an audience's perception. If the United States thinks its threats are credible, but opponents do not, then the threats are not credible. Credibility is also not universal. Different actors might assess the credibility of a threat differently — and different individuals within the same government might debate the credibility of a threat.¹² Political scientists have identified five different theories by which people perceive threats as credible. The most prominent — and the one consistently invoked as "credibility" in foreign policy debates from Vietnam to Syria — is the past actions theory.¹³ The past actions theory links credibility to a country's historical record of fulfilling its threats. It has two central claims: First, credibility is determined by the historical evidence of a country's actions. Second, there is a direct relationship between the perception that a country historically follows through on its commitments and the country's credibility. The theory's rationale is that past actions might illustrate something important about the adversary's character, interests, or capacity to act. But the core of the theory is narrower: the likelihood of a country following through on a threat today is dependent on whether the country followed through on its threats in the past. Commentators have also frequently offered a variation of the past actions theory of credibility that focuses on

reputation arguments.¹⁴ A reputation is a “judgment of someone’s character (or disposition) that is then used to predict or explain future behavior.”¹⁵ Reputation arguments in international politics assume that decisionmakers attribute behavior to character or dispositional traits, rather than to situational factors (such as national interests, public pressure, or military capabilities). When decisions are attributed to situation, the assumption is that most people in the same situation would act the same way. When decisions are attributed to disposition, it means that this individual actor will behave a certain way, independent of the situation. Note that the reputation and past actions theories are not exactly the same: A nation’s past actions may lead to a reputation if others interpret its behavior in dispositional rather than situational terms and then use that past conduct to predict similar behavior in the future. A nation’s reputation, however, might also be ascribed to other dispositional traits (such as ideological commitments or inherent characteristics). The leading alternative to the past actions and reputation theories of credibility is the current calculus theory.¹⁶ Current calculus theory holds that credibility is not a function of past actions or reputation, but rather a function of a country’s present capabilities and interests in a particular situation. On this theory, an adversary assesses credibility based on the country’s ability to effectuate its threat and the costs and benefits to that country in enforcing its threat. Two other theories are worth noting. The ingrained lessons theory holds that decisionmakers do not look to the threatening country’s history, but instead to their own history. For example, they will expect today’s adversary to back down if their previous adversaries also backed down. The never again theory holds that breaking a commitment actually increases credibility of future threats because decisionmakers will understand that backing down a second time is too costly. This Essay focuses on the past actions and reputation theories, and given their dominance in foreign policy, refers to them together as “credibility arguments.”

B. The Logical Limits of Credibility Arguments In the context of military threats and the use of force, credibility arguments suffer from some important limitations. First, because both past actions and reputation are based on audience interpretations, a country can have multiple reputations and a single action can create different reputations among different audiences.¹⁷ To some, following through on a threat demonstrates resolve; to others, foolishness. Second, action in one context might not migrate into reputation in another.¹⁸ If the United States sets a “red line” on a fishing issue for Micronesia and then backs down, it is unlikely to send a signal to Iran that all American “red lines” are bluffs. The Iranians may ignore the Micronesian case because it is fundamentally different from their own. Third, if we assume that credibility matters, then both sides know that it matters, and both sides can take it into account. Social scientists call the resulting problem recursion,¹⁹ but we generally know it as the “if she knows that I know that she knows . . .” problem. Take Syria.²⁰ If we assume Assad is simpleminded, and the United States backs down, then Assad will think he can use chemical weapons again. But if Assad also knows that credibility is important, and the United States backs down, then Assad knows President Obama has paid a reputation cost in bluffing. Perhaps some in the United States will even say “never again!” If Assad then uses chemical weapons again, it will be harder for Obama to bluff a second time. As a result, backing down the first time actually makes any future threat by Obama more credible. And Assad knows this. Now take it one step further. If Assad knows that Obama knows this, then Assad will reason that Obama’s threat is a bluff because Obama knows Assad will think Obama’s action is more credible. “Keeping the logic straight is difficult,” as Jonathan Mercer puts it, “but it is also irrelevant: no one knows how many rounds the game will go on, for there is no logical place to stop.”²¹ Credibility arguments are self-defeating because if we assume they matter, everyone else knows they matter too — and can account for them. Because the recursion game goes on ad infinitum, it is impossible to determine what policy to pursue.

C. Evidence from History Credibility arguments could also be justified with real world evidence. For example, data could shed light on the manner of leaders’ credibility determinations: Do they actually pay attention to the disposition of the opponent based on their past actions? Or do they undertake a current calculus and focus on interests, capabilities, and the immediate situational context? In a series of qualitative studies, political scientists have shown that past actions and reputation theories of credibility have little historical basis for support.²² When leaders evaluate their opponents, they assess threats based on current calculations, not on past actions. And when leaders have justified conflicts based on preserving a reputation for resolve, others have not always interpreted their actions as was intended. Note that these studies are limited to the context of military threats and international crises. Scholars hypothesize that military threats might differ from other contexts because the stakes are so high that leaders analyze the situation instead of using heuristics like reputation.²³ These findings therefore do not extend to all international issues.²⁴ In the most extensive research on credibility theories, Professor Daryl Press reviewed thousands of pages of archival documents and found that the current calculus theory, not the past action theory, best explains decisionmaking in the “appeasement crises” of the 1930s, the Berlin crises of the late 1950s and early 1960s, and the deliberations during the Cuban Missile Crisis. On the past actions theory, the Nazis should have interpreted British and French threats as not credible because the Allies repeatedly backed down when Germany took aggressive steps in the 1930s. The historical evidence, however, shows that German leaders believed British and French threats were credible — even after the Allies backed down. For the German leaders, credibility was a function of the Allies’ power, not their reputation. Indeed, Press finds that German leaders almost never referenced past actions by the British and French. Accordingly, he concludes that appeasement was poor strategy not because the Allies undermined their credibility, but because it allowed Germany to increase its power.²⁵ From 1958 to 1961, the world watched a number of Berlin crises unfold between the Soviets and the West. Soviet Premier Nikita Khrushchev set six-month deadlines for the Allies to withdraw from West Berlin, and he threatened

to cut off access to the city. Yet every time, Khrushchev backed down. On the past actions theory, British and American leaders should have interpreted each successive threat as less credible. However, Press found that Soviet threats actually became more credible, not less credible.²⁶ During this same period, the Soviets expanded their nuclear arsenal; as their nuclear prowess grew, so did their credibility. Indeed, by the time of the Cuban Missile Crisis, American leaders strongly believed that Khrushchev would not back down if the United States acted in Cuba. Here too Press finds that British and American leaders almost never mentioned Khrushchev's record of bluffing.²⁷ In an important book on reputation, Mercer analyzed the crises leading up to World War I.²⁸ He finds that decisionmakers interpreted their adversaries' backing down based more on the specific situational context, rather than on the disposition of the actors.²⁹ Thus, when the Germans backed down, the Triple Entente of Britain, France, and Russia attributed those defeats to situational factors. To the extent they considered past actions, the Entente believed Germany would be more likely to follow through on its threats in the future because it had previously been defeated. Note also that both Press's and Mercer's cases stack the deck in favor of past actions theory: the players were the same, there were repeated crises in a short period of time, and the crises involved the same issues. These are precisely the situations in which we would expect past action theories of credibility to be most powerful at explaining behavior. Looking specifically at military actions justified by credibility arguments, political scientists have also provided historical evidence that allies and adversaries do not necessarily interpret these actions as enhancing America's reputation or credibility. In a study of the Korean War, Mercer recounts how Secretary of State Dean Acheson believed that Western European allies were at "near-panic" over whether the United States would act.³⁰ They were not. When the British Cabinet met to discuss the issue, Korea was fourth on their agenda and some of the ministers could not locate Korea on the map.³¹ Meanwhile, the French were concerned that the Americans would be too resolute. They worried that the United States would start a world war over what they saw as an area that was strategically unimportant.³² In another study, Professor Ted Hopf analyzed the Soviet reaction to the United States's withdrawal from Vietnam. Hopf found that the Soviets did not see United States withdrawal as decreasing American credibility in the Cold War.³³

Impact

Prez Powers

No impact to Presidential powers

Healy 11 - vice president at the Cato Institute (Gene, "Book Review: Hail to the Tyrant," The CATO Institute, June 2011, <http://www.cato.org/publications/commentary/book-review-hail-tyrant>) //AD

Legal checks "have been relaxed largely because of the need for centralized, relatively efficient government under the complex conditions of a modern dynamic economy and a highly interrelated international order." What's more, the authors insist, America needs the legally unconstrained presidency both at home (given an increasingly complex economy) and abroad (given the shrinking of global distances). These are disputed points, to say the least. If Friedrich Hayek was at all correct about the knowledge problem, then if anything increasing economic complexity argues for less central direction. Nor does the fact that we face "a highly interrelated international order" suggest that we're more vulnerable than we were in 1789, as a tiny frontier republic surrounded by hostile tribes and great powers. Economic interdependence — and the rise of other modern industrial democracies — means that other players have a stake in protecting the global trading system. Posner and Vermuele coin the term "tyrannophobia," which stands for unjustified fear of executive abuse. That fear is written into the American genetic code: the authors call the Declaration of Independence "the ur-text of tyrannophobia in the United States." As they see it, that's a problem because "the risk that the public will fail to trust a well-motivated president is just as serious as the risk that it will trust an ill-motivated one." They contend that our inherited skepticism toward power exacerbates biases that lead us to overestimate the dangers of unchecked presidential power. Our primate brains exaggerate highly visible risks that fill us with a sense of dread and loss of control, so we may decline to cede more power to the president even when more power is needed. Fair enough in the abstract — but Posner and Vermuele fail to provide a single compelling example that might lead you to lament our allegedly atavistic "tyrannophobia." And they seem oblivious to the fact that those same irrational biases drive the perceived need for emergency government at least as much as they do hostility towards it. Highly visible public events like the 9/11 attacks also instill dread and a perceived loss of control, even if all the available evidence shows that such incidents are vanishingly rare. The most recent year for which the U.S. State Department has data, 2009, saw just 25 U.S. noncombatants worldwide die from terrorist strikes. I know of no evidence suggesting that unchecked executive power is what stood between us and a much larger death toll. Posner and Vermuele argue that only the executive unbound can address modernity's myriad crises. But they spend little time exploring whether unconstrained power generates the very emergencies that the executive branch uses to justify its lack of constraint. Discussing George H.W. Bush's difficulties convincing Congress and the public that the 1991 Gulf War's risks were worth it, they comment, "in retrospect it might seem that he was clearly right." Had that war been avoided, though, there would have been no mass presence of U.S. troops on Saudi soil — "Osama bin Laden's principal recruiting device," according to Paul Wolfowitz — and perhaps no 9/11. Posner and Vermuele are slightly more perceptive when it comes to the home front, letting drop as an aside the observation that because of the easy-money policy that helped inflate the housing bubble, "the Fed is at least partly responsible for both the financial crisis of 2008-2009 and for its resolution." Oh, well — I guess we're even, then. Sometimes, the authors are so enamored with the elegant economic models they construct that they can't be bothered to check their work against observable reality. At one point, attempting to show that separation of powers is inefficient, they analogize the Madisonian scheme to "a market in which two firms must act in order to supply a good," concluding that "the extra transaction costs of cooperation" make "the consumer (taxpayer) no better off and probably worse off than she would be under the unitary system." But the government-as-firm metaphor is daffy. In the Madisonian vision, inefficiency isn't a bug, it's a feature — a check on "the facility and excess of law-making ... the diseases to which our governments are most liable," per Federalist No. 62. If the "firm" in question also generates public "bads" like unnecessary federal programs and destructive foreign wars — and if the "consumer (taxpayer)" has no choice about whether to "consume" them — he might well favor constraints on production. From Franklin Roosevelt onward, we've had something close to vertical integration under presidential command. Whatever benefits that system has brought, it's imposed

considerable costs — not least over 100,000 U.S. combat deaths in the resulting presidential wars. That system has also encouraged hubristic occupants of the Oval Office to burnish their legacies by engaging in “humanitarian war” — an “oxymoron,” according to Posner. In a sharply argued 2006 Washington Post op-ed, he noted that the Iraq War had killed tens of thousands of innocents and observed archly, “polls do not reveal the opinions of dead Iraqis.”

Impact turn – prez powers bad

Unchecked presidential powers destroy privacy and result in less effective policies through a dictatorship – war power checks key

Schneier 05 – Chief Technology Officer of Resilient Systems, fellow at Harvard's Berkman Center for Cyber-law Internet and Society, and a board member of the Electronic Frontier Foundation (Bruce, "The Security Threat of Unchecked Presidential Power," 12-21-05, https://www.schneier.com/blog/archives/2005/12/the_security_th_1.html) //AD

Yoo's memo ignored this. Written 11 days after Congress refused to grant the president wide-ranging powers, it admitted that "the Joint Resolution is somewhat narrower than the President's constitutional authority," but argued "the President's broad constitutional power to use military force ... would allow the President to ... [take] whatever actions he deems appropriate... to pre-empt or respond to terrorist threats from new quarters." Even if Congress specifically says no. The result is that the president's wartime powers, with its armies, battles, victories, and congressional declarations, now extend to the rhetorical "War on Terror": a war with no fronts, no boundaries, no opposing army, and -- most ominously -- no knowable "victory." Investigations, arrests, and trials are not tools of war. But according to the Yoo memo, the president can define war however he chooses, and remain "at war" for as long as he chooses. This is indefinite dictatorial power. And I don't use that term lightly; the very definition of a dictatorship is a system that puts a ruler above the law. In the weeks after 9/11, while America and the world were grieving, Bush built a legal rationale for a dictatorship. Then he immediately started using it to avoid the law. This is, fundamentally, why this issue crossed political lines in Congress. If the president can ignore laws regulating surveillance and wiretapping, why is Congress bothering to debate reauthorizing certain provisions of the Patriot Act? Any debate over laws is predicated on the belief that the executive branch will follow the law. This is not a partisan issue between Democrats and Republicans; it's a president unilaterally overriding the Fourth Amendment, Congress and the Supreme Court. Unchecked presidential power has nothing to do with how much you either love or hate George W. Bush. You have to imagine this power in the hands of the person you most don't want to see as president, whether it be Dick Cheney or Hillary Rodham Clinton, Michael Moore or Ann Coulter. Laws are what give us security against the actions of the majority and the powerful. If we discard our constitutional protections against tyranny in an attempt to protect us from terrorism, we're all less safe as a result.

Unconstitutional/nug

Executive war power authority is unconstitutional – congressional checks key and war power restraints are nonunquie

Blumrosen and Blumrosen 11 - Thomas A. Cowan Professor Emeritus Rutgers School of Law—Newark. B.A., J.D., University of Michigan; B.A., University of Michigan; J.D., Quinnipiac University School of Law(Steven M, Alfred W, “RESTORING THE CONGRESSIONAL DUTY TO DECLARE WAR,” Rutgers Law Review, 7-11-11, Vol. 63:2, <http://www.warpower.us/LRArt.pdf>) //AD

When the Constitution provided Congress with the power to declare war, did it give the people the right to have Congress take the nation to war or could Congress transfer that power to the President, though the Constitution forbade it? The deliberations that began on June 1, 1787 are dispositive. The Constitutional Convention determined that the power to declare war could not be given by Congress to the President, except as the Constitution authorized the Congress to provide in advance for specified situations. The power itself was —legislative.! The President has no —legislative! power.⁴⁹⁴ Therefore Congress could not transfer that power to him any more than Marbury could sue Secretary of State Madison in the Supreme Court rather than a federal district court, or than the President could seize steel companies during war without congressional authority.⁴⁹⁵ From the adoption of the Constitution, voters had the right to evaluate their federal representatives on the basis of the legislator’s views on taking the nation to war. The AUMF destroys or dilutes that right by taking the vote away from the representative and allowing the President to make such decisions. This exercise of the electorate’s right to vote on the issue of taking the nation to war was emphasized at the Constitutional Convention and in ratifying conventions. Since Congress had this duty to vote on war, the voters had a corresponding right to consider their representatives’ votes on war. The AUMF destroys or dilutes that right, denying voters their Fifth Amendment rights. The nature of the right to vote has been extensively examined under the Due Process Clause of the Fourteenth Amendment, applicable to state and local governments. These twin due process clauses have been interpreted similarly.⁴⁹⁶ The test for recognizing a substantive right under the Fourteenth Amendment’s Due Process Clause was described by Chief Justice Rehnquist in 1997 as follows: Our established method of substantive-due-process analysis has two primary features: First, we have regularly observed that the Due Process Clause specially protects those fundamental rights and liberties which are, objectively, —deeply rooted in this Nation’s history and tradition,| . . . (—so rooted in the traditions and conscience of our people as to be ranked as fundamental), and —implicit in the concept of ordered liberty,| such that —neither liberty nor justice would exist if they were sacrificed.| . . . Second, we have required in substantive-due-process cases a —careful description| of the asserted fundamental liberty interest. . . . Our Nation’s history, legal traditions, and practices thus provide the crucial —guideposts for responsible decisionmaking.| . . . that direct and restrain our exposition of the Due Process Clause.⁴⁹⁷ Thus there may be an enforceable —fundamental right| to constitutionally required procedures when the right is —deeply rooted and carefully described. Both of these conditions apply to an AUMF. For more than 100 years, the Fourteenth Amendment’s Due Process Clause has protected the rights of citizens to vote. That right, as we have seen, includes influencing and electing representatives based on their views on taking the nation to war. By denying citizens the right to have their representatives vote on the issue of war, the President and Congress have denied both the Fifth and Fourteenth Amendment. Representatives no longer vote on that issue; they vote to let the President decide that issue. Ironically, on June 15, 1964, in Reynolds v. Sims, the Supreme Court, sitting across the street from Congress, explained that the right to vote was the —essence of a democratic society.⁴⁹⁸ Two months later, Congress, on August 17, 1964, enacted the Gulf of Tonkin AUMF that deprived voters of their rights to influence their representatives on whether to take the nation to war.⁴⁹⁹ Chief Justice Earl Warren wrote in Reynolds: [T]he Constitution of the United States protects the right of all qualified citizens to vote, in state as well as in federal elections. . . . It has been repeatedly recognized that all qualified voters have a constitutionally protected right to vote, and to have their votes counted. . . . Racially based gerrymandering, and the conducting of white primaries, both of which result in denying to some citizens their right to vote, have been held to be constitutionally impermissible. And history has seen a continuing expansion of the scope of the right of suffrage in this country. The right to vote freely for the candidate of one’s choice is of the essence of a democratic society, and any restrictions on that right strike at the heart of representative government. And the right of suffrage can be denied by a debasement or dilution of the weight of a citizen’s vote just as effectively as by wholly prohibiting the free exercise of the franchise.⁵⁰⁰ The AUMF that disregards the constitutional duty of Congress to declare war, coupled with the opportunity for legislators to evade their responsibility to the voters, is precisely a danger to the debasement of the right of suffrage described by Chief Justice Warren. The AUMF neatly removes an obligation that the founders

had assigned to Congress so that the public could make their views on going to war felt by their representatives. The enhanced power of the President as political leader, noted sixty-five years ago by Justice Jackson, may influence legislators to hew the —party line,¹ rather than the interest of their constituents.⁵⁰¹ It is time for the courts to honor the Constitution without hiding behind the political question doctrine. The AUMF eliminates the citizen’s opportunity to advise, reward or punish legislators depending on how they vote on declaring war, a right the Constitution confers on citizens. This right ultimately involves life or death, as important as the budgetary rights involved in *Clinton v. New York*,⁵⁰² the individual rights of a person subject to deportation in *INS v. Chadha*,⁵⁰³ and the right to own a gun for self defense at home in *District of Columbia v. Heller*.⁵⁰⁴ It meets all the criteria of a —fundamental right.¹ In Chief Justice Rehnquist’s terms, it is —objectively, deeply rooted in this Nation’s history and tradition,¹ and is —implicit in the concept of ordered liberty,¹ such that —neither liberty nor justice would exist if they were sacrificed.¹⁵⁰⁵ The Declare War Clause on its face and from the history of June 1 creates a mandatory process for the decision to go to war.⁵⁰⁶ The statutory AUMF is inconsistent with that process. Therefore, it violates both Article I, Section 8 and the Fifth Amendment. Congress and the President could resolve the —declaration of war issue by adopting a limited authorization for the use of force in the manner suggested in *Bas v. Tingy*. Other formulas may fit as well or better. The key is to make sure that the decision is made by Congress—and by no one else. The AUMF is exactly what Congress and the President might have achieved under one of Madison’s withdrawn proposals on June 1, 1787. Charles Pinckney led the Convention to reject the idea that Presidents might declare war, or permit Congress to authorize the President to take the nation to war.⁵⁰⁷ This rejection should carry the AUMF down with it. Pinckney’s struggle to —keep a republic on June 1, 1787 should be recognized as a major contribution to the making of America. The fact that June 1, 1787 has been ignored for so long and by so many federal courts of appeals does not matter. The Constitution cannot be amended by the actions of the President and Congress.⁵⁰⁸ The Supreme Court has the flexibility to reject the opinions of courts of appeals when the matter comes before it.⁵⁰⁹ CONCLUSION We have placed a heavy burden on June 1-4, 1787 to correct the errors of a dozen courts of appeals that have convinced each other that the power of Congress to —declare war really means the opposite of what it says—that the Framers intended to share these powers between Congress and the President. This supposed —sharing¹ of —joint¹ powers has produced two of America’s most damaging wars, killed more than 60,000 Americans and uncounted others, and piled an enormous debt on the United States with no visible gain to the country. We cannot prove that these two disasters would not have happened if Congress had taken the responsibility that June 1 imposed on its members. But there is one modest glimmer of hope in the otherwise tragic story of politics, law and war that has permeated this article. On September 12, 2001, when the President of the United States asked for the authority to —deter and pre-empt any future acts of terrorism and aggression against the United States,¹ something very important happened both in the Capitol and the White House.⁵¹⁰ Facing the enormous pressure that the 9/11 atrocities generated to give the President unlimited authority to protect the nation, members of Congress and their staffs resisted turning the entire war power over to the President. They forced changes to limit the presidential —blank check¹ demands as a response to 9/11.⁵¹¹ Weak as they proved to be the following year in adopting the AUMF against Iraq, they did manage to confine the President’s claim to unlimited power, in the immediate impact of the 9/11 carnage. The Congress must decide whether to take military action against an enemy even if we are faced with a —sudden attack¹ and the President has responded with military force. Most of the information on which Congress will rely will come from the President.⁵¹² The 9/11 Resolution was rushed through the House and Senate by September 14. The Senate voted 98-0; and the House acted later in the day.⁵¹³ The Gulf of Tonkin Resolution was passed by Congress on August 7, 1964 based on incidents that may have occurred on August 2 and 4.⁵¹⁴ In both situations the Congress was put under extraordinary pressure by the President that precluded careful consideration.⁵¹⁵ One lesson from these two experiences is clear: Congress must carefully evaluate its response to a President’s claims of serious attacks on the United States. Professor Phillip Bobbit has focused on the difficulties of assigning —blame¹ for a terrorist attack from an uncertain source, and the dangerous consequences of a rush to judgment.⁵¹⁶ An attack against our water supply, electrical grid, or the transportation system, where the perpetrators plant phony evidence that the plot originated in Russia, China, or Iran could lead us to a nuclear response that would —bomb us all into the stone age. This would suit only those who believe that western civilization is an abomination. Congress must be alert to determine what actions a President plans to take after a —terrorist incident¹ against the United States, and satisfy itself and the public that the President has not —rushed to judgment¹ about the culprits and their backers. The President’s claim that time is of the essence, is rarely the case. In connection with the Second Iraq War, the President pressured Congress to act favorably just before the bi-annual election in 2002, then waited five months to commence hostilities. The Gulf of Tonkin Resolution was rushed through on flimsy evidence in August, 1964. Johnson

had no intention of using it until after the presidential elections in November, so he could run for election on a policy of keeping our boys out of Vietnam.⁵¹⁷ After his victory, he made the decision to deploy more than half a million troops to Vietnam. Congress should gird itself for negotiations with the White House and for serious reviews of the facts, rather than the meaningless speechmaking that accompanied the 2002 AUMF against Iraq or the worry about the political consequences of a serious review of the Gulf of Tonkin Resolution. Congress has a problem of resources.⁵¹⁸ The presidential staff consists of thousands of professionals in the Departments of Justice, Defense, State and the Intelligence agencies.⁵¹⁹ Congress needs a stand-by committee of experts on both war and diplomacy to evaluate proposals for military action.⁵²⁰ While we believe that Presidents and Congresses will continue to rely on the AUMF because it simplifies life at both ends of Pennsylvania Avenue, we also believe that the AUMF has served the nation so badly that we cannot continue to rely on the Vietnam War cases. Congress may reform itself, but at the moment, hope lies with a judiciary that may yet absorb the significance of June 1, 1787. There are other views on how to remedy the ineffectiveness of the Declare War Clause. Political Science Professor Peter Irons concludes that only a —slow, incremental grassroots activism that marked the civil rights movement in its struggle against Jim Crow laws can bring Congress to comply with the Constitution.⁵²¹ Prolific analyst Louis Fisher concludes that a reform in education of the young to understand the limits of presidential power can lay a foundation for a change in perceptions concerning the balance of powers between the President and Congress, and that legislators should —participate in the daily grind of overseeing administration policies, passing judgment on them, and behaving as a coequal, independent branch.⁵²² We believe that the judgment of Congress must be brought to bear on the issue of war, and that this cannot be accomplished alone through patient evolutionary processes or in a willingness of Congress to reform itself.⁵²³ It is high time for the judiciary—which has stumbled badly—to recognize that the world is as hazardous today as in 1787-88, and that the dangers of personal and political ambition are magnified by modern politics and technology. The original understanding of the Constitution will serve us better than the system that brought us the Vietnam War and the war in Iraq. The appropriate remedy is a declaratory judgment, making clear that members of Congress must take personal responsibility for commencing war, as the nation was promised in 1787.

No link-Terrorists don't use bitcoin

Terrorist groups won't use bitcoin

Beckhusen 14 Managing editor of Medium (Robert, "Bitcoins Kind of Suck at Funding Terrorism", War is Boring, 11/16/2014, <https://medium.com/war-is-boring/bitcoins-kind-of-suck-at-funding-terrorism-9c46eece93e5>)

It's a recurring narrative in stories about Bitcoin and other digital crypto-currencies. Terrorists are out there waiting, ready to descend on the promise of limitless and untraceable financing for attacks. In a fit of panic, governments institute strict regulations on the nascent currencies. In other words, it's a Bitcoin enthusiast's worst nightmare. There's a grain of truth in this story. It's certainly true that terrorists—like those affiliated with Islamic State—are looking at crypto-currencies as a means to move money without spies and law enforcement agencies tracking them. But as a widespread way to circumvent currency controls, it's not really taking off. That's according to a new report by CTC Sentinel, West Point's counter-terror journal. Even as terror groups like Islamic State become more sophisticated—and even as they begin to use crypto-currencies more often—it's still likely to be a marginal source of financing, at best. "While these tools have gained in popularity, in recent years their expansion into various terrorist organizations has been slow and deliberate and has not matched pace with transnational criminal uses of these same technologies," states Aaron Brantly, the report's author and a professor of cybersecurity at the United States Military Academy at West Point. The crux of the problem for Islamic State is that these currencies are really not as anonymous as popularly assumed. They're the opposite of anonymous, in at least one important respect. Currencies like Bitcoin rely on openly sharing all transaction information across the entire network. Everyone can see the entire history of transactions involving the currency. This has several advantages. For one, this builds trust by showing that currency flowing from one place to another is in fact doing just that. Also, the history makes it harder to pull off a scam, like simultaneously paying for two different things—from two owners—with the same Bitcoin and stiffing one or both. What's anonymous is where the money is coming from and where it's going, except for an address—tied to one or more private keys—which the sender can reconfigure after every transaction. That's just enough for sleuths to potentially pinpoint your identity. Even better is that spies have the entire transaction history at their fingertips. "Novice users could provide a point of origin for intelligence and law enforcement agencies to begin work on deconstructing a terrorist finance network," Brantly states. "Specifically, the more transactions made to a single or set of public keys, the less likely it is that the parties involved will maintain anonymity in a distributed funding or donation network." A terror group would have to be highly disciplined to make this work. There are some tools out there—Dark Wallet and Bitcoin Fog are two of them—that are trying to make it easier to hide one's identity by further scrambling addresses or burying them behind the Tor private network. But even one screw-up could expose a whole terror-financing structure to prying eyes. Another thing is that terrorists happen to really like hard cash. And Bitcoin won't pay for most of the practical, everyday necessities that come with building an Islamic caliphate and financing a multi-sided war. "It is possible that as the technical capacity of these organizations increases, their use of digital currencies will also increase," Brantly writes. "This increase is likely to be small, however, in relation to overall terror financing through other channels such as hawala, kidnapping, front companies, narcotics sales, oil sales, and many more," he adds. To be sure, crypto-currencies have a lot of support among libertarians and anarchists who see it as a means of weakening state controls over how people spend their money. But Islamic State is in the state-building business. Islamic State even announced this month it's creating its own money made out of looted gold, silver and copper. But whether the jihadists have the ability to manufacture and distribute it is another question, let alone whether anyone would be willing to trade with it. Now can we expect the same group to build an economy on Bitcoins? Not in this world. Let's also see how they react to some huge market crashes.

Bitcoin will not finance terrorists

Delaney 14 - Masters in Public Administration, Bachelors in Management (P.J., "Will Bitcoin Be Used To Fund Terrorism?", CryptoCoin News, 8/13/2014, <https://www.cryptocoinsnews.com/bitcoin-supporting-fighting-terrorism/>)

One of the charges that has been levied against Bitcoin is that it is involved in the funding of terrorism. In the current media, such a charge is highly damaging, but is it entirely without foundation? In an article titled "'Bitcoin and the Charity of Violent Physical Struggle,' supporters of the Islamic State of Iraq and Syria (ISIS) called for terrorism-supporters around the world to fund a global jihadist campaign by using Bitcoin. The blog advises ISIS on how Bitcoin can facilitate the anonymous transfer that suit the needs of an army in jihad. However, the pro-ISIS blog that suggested the funding move did not take the time to consider if Bitcoin was Sharia compliant, something more hardcore Islamic fundamentalists will undoubtedly want to consider. The pro-ISIS blogpost stokes fears around the world that Bitcoin will be used for terrorist funding, though it is just a suggestion and ISIS is not currently accepting Bitcoin donations at all. In February this year, the Canadian Government warned that Bitcoin could be used as a means of funding terrorism. Indeed, last May, the US Government's Combating Terrorism Technical Support Office stated that there was a level of concern that: "The introduction of virtual currency will likely shape threat finance by increasing the opaqueness, transactional velocity, and overall efficiencies of terrorist attacks." The article, Bitcoin and the Charity of Violent physical struggle, advocates the encryption of transactions by the means of Dark Wallet, Thus making it harder for state agencies fighting terrorism to track the transactions. The post later goes on to explain that: "This allows our brothers stuck outside of the ardh Dawlatul-Islam to avoid government taxes along with secretly fund the Mujahideen with no legal danger upon them." It then goes on to remind Muslims of their need to give to charity, and then seeks to draw a similarity between this sunnah and funding terrorism. "This system has the potential to revive the lost sunnah of donating to the Mujahideen, it is simple, easy, and we ask Allah to hasten its usage for us." So, what does this mean for Bitcoin? Not what you might think! Let us look, for a moment, at where terror groups receive funding and why they are facilitated to operate. Let me then suggest that one solution to funding of terrorism may well turn out to be Bitcoin. One of the main weapons used to combat terrorism is the targeting of finance. Terrorists with modern weapons are far more effective, particularly in poorer countries, than uneducated and poorly funded fighters. It must be stated that one of the main sources of funding for terrorists is... governments! The late Colonel Gadaffi used massive amounts of Libyan oil money to fund many organisations, including, The Black Panther Party, Nation of Islam, Tupamaros, 19th of April Movement and Sandinista National Liberation Front in the Americas, the ANC among others in Africa, the Provisional Irish Republican Army, Action Directe, ETA, the Red Brigades, and the Red Army Faction in Europe, and the Armenian Secret Army, Japanese Red Army, Free Aceh Movement, and Moro National Liberation Front in Asia. Joseph Stalin funded the North Korean Army, he also provided Adolf Hitler with significant funds in the early days of the Nazi party. The use of terror as a method of control within the USSR must also not be underestimated. Stalin had a policy of funding Communist Party activities throughout the world, something that Chinese communist also emulated over the decades. When the USSR invaded Afghanistan the American CIA trained and armed the Taliban, facilitating them to carry out a campaign against the Soviet army. It is undoubtedly, not the only terror group that the US has, on various occasions, assisted throughout the world. There is indeed a fine line between freedom fighter and terrorist; it is often simply a matter of perspective. But, what have all of the above examples got in common? Well, for one thing, most of the organizations have been either stood down or defeated. One other they all have in common is that all of the above examples happened before Bitcoin, the funding they received was in the form of bullion, local currencies, arms and/or training. We know that the organizations were funded because of admissions made. Bitcoin can indeed be used to fund terrorism, but there will be a path; the path may well be encrypted, but there will still be a path. It is this writer's opinion that Bitcoin will present tools that the state may well choose to use to track terrorist funding. There is, of course, another matter to be considered. Many financial services providers allow workers to send home money. From London to certain African countries can cost as much as 12.5%. For an economic migrant, sending a portion of their wages home, this is almost criminal. Bitcoin allows almost free money transfers. Not all criminals wear masks, many wear suits. If ISIS is looking at Bitcoin as a means of funding terrorist activity, they are looking at Bitcoin in the same way that Western Union and Visa are looking at it. ISIS is looking for funding and in this it has nothing to hide, doesn't need to hide its interest for fear of commercial sensitivities. I have, over the years, visited several mosques including the very beautiful Blue Mosque in Istanbul. I was made feel welcome. I have also visited synagogues, I again felt welcome. Terrorism is not a matter of religion. It is a matter of power. The powerful must never be allowed to target the weak as a means to achieve their own objectives.

Link Turn

The more terrorists use bitcoin, the easier they become to catch

Brantly 14-Assistant Professor of International Relations and Cybersecurity in the Department of Social Sciences, Cyber Policy Fellow at the Army Cyber Institute, and Cyber Policy Fellow at the Combating Terrorism Center at the United States Military Academy at West Point [Aaron, "Financing Terror Bit by Bit," Combating Terrorism Center, 10/31/2014, <https://www.ctc.usma.edu/posts/financing-terror-bit-by-bit>, DKP]

While novice participation in Bitcoin is relatively straightforward, the maintenance of high levels of anonymity on Bitcoin requires substantial effort and technical skill. Amateur jihadist use of Bitcoin poses a technical problem for the widespread use of Bitcoin by terrorist organizations. The amateur (non-anonymous) use of Bitcoin by a participant in a network can reduce the anonymity of all network transactions. Novice users could provide a point of origin for intelligence and law enforcement agencies to begin work on deconstructing a terrorist finance network. Specifically, the more transactions made to a single or set of public keys, the less likely it is that the parties involved will maintain anonymity in a distributed funding or donation network. Unless terrorist organizations can sufficiently educate all members that use crypto currencies to do so at a very high level, the use of these networks may leave the overall organization vulnerable.

Soft Power

Info Rev k2 Soft Power

The information revolution is the biggest internal link to soft power—controlling spin is key

Nye 14-University Distinguished Service Professor, and former Dean of the Harvard's Kennedy School of Government, PhD in Political Science @ Harvard, Rhodes Scholar from Oxford University [Joseph, "The Information Revolution and Soft Power," Current History 113(759): 19-22, http://dash.harvard.edu/bitstream/handle/1/11738398/Nye-InformationRevolution.pdf?sequence=1_DKP]

One of the notable trends of the past century that is likely to continue to strongly influence global politics in this century is the current information revolution. And with it comes an increase in the role of soft power – the ability to obtain preferred outcomes by attraction and persuasion rather than coercion and payment. Information revolutions are not new – one can think back to the dramatic effects of Gutenberg's printing press in the 16th century – but the current information revolution is changing the nature of power and increasing its diffusion. The current information revolution, sometimes called "the third industrial revolution," is based on rapid technological advances in computers and communications that in turn have led to dramatic decreases in the cost of creating, processing and transmitting, and searching for information. One could date the current information revolution from Moore's Law in the 1960s -- the capacity to double the number of transistors on a computer chip every 18 months. As a result, computing power doubled every couple of years, and by the beginning of the twenty-first century it cost one-thousandth of what it did in the early 1970s. In 1993, there were about 50 websites in the world; by 2000, that number surpassed 5 million. Today, about a third of the world population is online; by 2020 that is projected to grow to 60 percent or five billion people, many connected with multiple devices. The key characteristic of this information revolution is not the speed of communications between the wealthy and powerful: for a century and a half instantaneous communication by telegraph has been possible between Europe and North America. The crucial change is the enormous reduction in the cost of transmitting information. If the price of an automobile had declined as rapidly as the price of computing power, one could buy a car for \$10-15. When the price of a technology declines so rapidly, it becomes readily accessible and the barriers to entry are reduced. For all practical purposes, transmission costs have become negligible; hence the amount of information that can be transmitted worldwide is effectively infinite. In the middle of the twentieth century, people feared that the computers and communications of the current information revolution would create the central governmental control dramatized in George Orwell's dystopian novel 1984. Instead, as computing power has decreased in cost and computers have shrunk to the size of smart phones and other portable devices, their decentralizing effects have outweighed their centralizing effects. Power over information is much more widely distributed today than even a few decades ago. Information can often provide a key power resource, and more people have access to more information than ever before. As I describe in The Future of Power, this has led to a diffusion of power away from governments to non-state actors ranging from large corporations to non-profits to informal ad hoc groups.

This does not mean the end of the nation-state. Governments will remain the most powerful actors on the global stage, but the stage will become more crowded. And many of those other actors will compete effectively in the realm of soft power. The increasingly important cyber domain provides a good example. A powerful navy is important in controlling sea lanes; it does not provide much help on the internet. The historian A.J.P. Taylor wrote that in 19th century Europe, the mark of a great power was the ability to prevail in war, but as John Arquilla notes, in today's global information age, victory may sometimes depend not on whose army wins, but on whose story wins.

A2-Hard Power Outweighs

Even if hard power outweighs, soft power is crucial to ensuring effectiveness and sustainability—empirics

Burnett 15 - the editor of The World Tonight, a BBC News program [Alistair, "China, Russia and the US Juggle Soft and Hard Power," YaleGlobal Online, 1/8/2015, <http://yaleglobal.yale.edu/content/china-russia-and-us-juggle-soft-and-hard-power>, DKP]

LONDON: This year has seen marked resurgence in the use of hard power by states in pursuit of national interests. The US return to military action in Iraq and direct intervention in Syria, Russia's annexation of Crimea and destabilization of eastern Ukraine and China's assertion of its territorial claims in the East and South China seas are just three examples of major powers turning to force and coercion to achieve strategic aims. Yet, not so long ago, talk in diplomatic, academic and journalistic circles focused on the growing importance of soft power in international relations. In recent years, governments consider how to boost soft power, investing heavily in tools like international broadcasting and cultural institutes to win friends abroad. China has spent billions expanding China Central TV's broadcasts in English and other languages and opening 450 Confucius Institutes around the world teaching Chinese language and culture. It has even invested in trying to create global pop star Jia Ruhua. Russia has expanded its international TV news station, RT. The US continues to fund international broadcasting started during the Cold War. These are all efforts to influence the views of people in other countries, winning them over to a way of thinking so they will pressure their governments – even in authoritarian states – to fall into line with new policies. The US is considered the world leader in soft and hard power, and there's no doubt American culture is attractive to many around the world – consider the numbers wanting to migrate there and who wear baseball caps, eat American-style fast food, listen to American music and watch Hollywood movies. Much of the global attractiveness of the US has little to do with its government, and photographs of anti-American protesters in the Middle East in jeans and T-shirts demonstrate how it's possible to like American culture and dislike Washington's policies. The US is considered a leader in soft and hard power... its culture is attractive to many around the world. But while the US has accumulated a lot of this soft power without having to spend a cent, relying instead on the sheer attractiveness of American society, the government still takes steps to manipulate attitudes. One little publicized effort is how the Pentagon influences its on-screen image through its film liaison office which can save Hollywood producers millions in special effects by providing hardware and personnel on approved scripts. But do events of the past year suggest that in a world where the global balance of power is shifting and countries really want their own way, they turn to old-fashioned hard power? Harvard Professor Joe Nye who coined the term "soft power" argues it is not a binary choice. He developed on his original definition of power by identifying a third way states could convince others to do what they wanted – with "smart power" – basically wielding a mix of hard and soft power. Looking at how the United States, Russia and China have conducted themselves through this lens shows all three are trying – with varying levels of success – to use smart power. Before using military force in Iraq and Syria against Islamic State, the Obama administration utilized soft power to maximize impact of the use of its hard power. Washington was keen that its intervention was not seen as unilateral action by aggressive Christian states against Muslims, so it portrayed IS as an enemy of fellow Muslims. Washington also emphasizes it intervenes in Iraq at the invitation of Baghdad and has been successful in building a coalition including leading Sunni Arab states to carry out airstrikes in Syria. So far the campaign has slowed IS down. Events of the past year may suggest that countries are turning to hard power as the global balance of power shifts. In Ukraine, Russia's campaign to take Crimea and destabilize the eastern part of the country has been called hybrid warfare because of its mix of diplomacy. TV and social media propaganda about the threat to Russian speakers from Ukrainian nationalists, and use of irregular and disguised forces designed for ambiguity long enough to achieve Russian objectives. In the case of Crimea, annexed with little fighting, acute observers of Russian policy see this as an effective use of smart power. Stalemate in eastern Ukraine suggests it may be less effective there. Beijing's attempt to use smart power has met with mixed results. In the South China Sea, China claims waters also claimed by the Philippines, Vietnam, Malaysia, Brunei and Taiwan. It has spent recent years reassuring neighbors it's not a threat despite its growing economic and military strength. But, earlier this year, China sent an oil exploration vessel into an area Vietnam also claims leading to clashes between Chinese and Vietnamese ships. Tensions with the Philippines emerged after Chinese ships tried to block Filipino efforts to resupply a garrison of marines on a disputed atoll. The result was anti-Chinese riots in Vietnam, diplomatic protests by the Philippines, and both countries establishing closer military ties with the United States. Attractiveness is a result of complex interplay of what a country can offer and how the offer is perceived. The long-term effectiveness of the return to hard power is probably more dependent on the military and economic strength of the United States, Russia and China than their international image. Russia will probably hang on to Crimea because Ukraine is the weaker state and shows no real appetite to get it back. China's economic preponderance in the South China Sea region

means its neighbors, while not rolling over, will probably meet it more than halfway in the resolving the maritime disputes. The US battle with what's now called IS really goes back to the 2003 Iraq invasion which allowed jihadis to get a foothold in the country by presenting themselves as the resistance to infidel invaders. The extremists extended their power to western Iraq and Syria after 2011 when the Syrian civil war broke out and US troops left Iraq. Ultimately, defeating IS depends on a political solution in Syria and an Iraqi government truly inclusive of Sunnis as well as Shias and Kurds. In all these cases though, soft power is being deployed in subtle ways to attract support by trying to “shape the narrative” by portraying rivals and enemies as acting outside shared global norms and values. The United States claims to defend Muslims from the Islamic extremism; Russia says it defends Russian-speakers from Ukrainian nationalists; and China describes itself as a rising, but peace-loving nation. The success of these attempts depends not just on the language and imagery used by officials, but also on whether the media and other opinion-formers adopt similar language and imagery. Wielding soft and smart power is also complicated because one country's attractiveness to another is a result of a complex interplay of what a country has to offer and how the offer is perceived. For instance, the United States has appeal in a country like Burma, because many people there want democratic elections and free speech after decades of repression, while many Pakistanis dislike the United States, regarding it as a country that doesn't respect their sovereignty while also killing many of citizens in its anti-terror operations.

Soft Power Bad

Sift Power Fails-Generic

Soft Power fails-doesn't affect competing ideologies

Shah, 11-19-2014-BBC Journalist [Ritula, "Is US monopoly on the use of soft power at an end?" BBC News, <http://www.bbc.com/news/world-29536648>]

¶ But the limits of soft power are also apparent everywhere. ¶ If you look back across the period since the end of the Cold War, the US has actually deployed rather a lot of "hard power" around the world; two wars in Iraq, Bosnia, Kosovo and Afghanistan and the current airstrikes in Iraq and Syria, to name a few and not to mention the use of drones. ¶ In all these cases, soft power wasn't enough to avert a conflict or military intervention. ¶ Also, as Prof Nye concedes, soft power can only work when people are receptive to the messages it's peddling. ¶ So the movies may help to spread a US vision of what a free, democratic life might look like, but only if the people watching, recognise the importance of those values to them. ¶ It seems unlikely that the violent jihadists of Islamic State will be persuaded to abandon their anti-Western vision. ¶ But despite its brutal hard power approach to spreading its ideology through war, IS isn't averse to also exploiting soft power tactics, like using social media to disseminate their uncompromising views. ¶ In fact it may be that the distinction between "hard" and "soft" power may be morphing into a new concept put forward by Prof Nye, that of "smart power". ¶ He points to the World War Two as an example: the enemy was defeated with hard power but then brought back into the fold with the creation of institutions and alliances (soft power) which have lasted until now. ¶ A similar case is made by some in relation to IS in Iraq and Syria. Former US Assistant Secretary of State PJ Crowley argues that while military power can degrade IS, it can't defeat or destroy the ideology behind it. ¶ He says that will take soft power - although once again, that raises the question of whether you can successfully deploy soft power against an ideology which actively rejects Western values and ideas.

Soft Power → Terrorism and Instability

Soft power is a fantasy—diplomacy and dialogue just embolden aggression, terrorism, civil strife and armed conflict

McParland, 9-29-2014 [Kelly, staff writer @ the National Post, "Kelly McParland: Obama's about-face blows a hole in soft power's fantasy world," National Post, <http://news.nationalpost.com/full-comment/kelly-mcparland-obamas-about-face-blows-a-hole-in-soft-powers-fantasy-world>

President Barack Obama sudden about-face at last week's high-profile UN gathering has only exacerbated the difficulty "progressives" have in sorting out how to bring order to the world. Mr. Obama came to office preaching one approach — dialogue, diplomacy, co-operation, brotherhood — and it didn't work. Now he's trying bombs. For "progressives" it's a cruel blow. They approve of dialogue, diplomacy, co-operation and brotherhood. Mr. Obama won a Nobel peace prize for just talking about his plan. Now he's throwing it away, after six years of defending his reluctance to deploy U.S. power. His supporters — a dwindling crowd to begin with — are left holding an idealistic theory no one wants to claim. Mr. Obama's reversal was comprehensive. In his campaign for the White House, and his early years as President, he preached a new role for the U.S., one of greater respect and support for international institutions, increased co-operation and reliance on allies, an emphasis on dialogue in place of confrontation, and an extreme reluctance to commit U.S. military forces in any but the most self-evident of situations. The net result has been dismal. Mr. Obama succeeded in withdrawing U.S. troops from the two wars he inherited from George W. Bush, only to witness a sharp expansion of chaos in the Middle East. After six years in office, no one can claim he's made the world a safer or more rational place. Egypt has a new military ruler, just like the old one. Israel is still defending itself from missiles fired by terrorists who hide among civilians. Syria has been torn by civil war, Iraq is in disarray, and a new blood-crazed super-terrorism has arisen in the form of the Islamic State. The situation is so dire Mr. Obama was finally forced by public opinion to abandon the last vestiges of his isolationist instincts and head to the UN in search of allies to help pound ISIS into the footnotes of history. In doing so he has aped Mr. Bush in cobbling together an international alliance of supporting nations. The two men came at the task from different directions: Mr. Bush simply wanted a crowd of cheerleaders to provide cover for a U.S. war. Mr. Obama is motivated more by a belief that countries have a duty to protect their own before asking the U.S. to spend lives doing it for them. But the net result is the same: the U.S. will do the heavy lifting while Arab states clap quietly from the sidelines and contribute as little as they can get away with. It all makes it difficult for "progressives" to continue arguing that dialogue and quiet diplomacy are the preferred role for a country like Canada. One of the favoured myths of Canadian liberals is that Canada's natural role is that of honest broker, a nation of blue-helmeted peacekeepers who can be counted on to pursue the peaceful path between belligerents intent on war. It's more fantasy than reality, but it's dear to the heart of those who insist the Conservatives have frittered it away by taking sides and choosing between right and wrong. The late Jack Layton maintained western powers should be talking to the Taliban rather than simply dropping bombs on its caves. His successor Thomas Mulcair refuses to give NDP support to the limited co-operation Ottawa has pledged to the U.S.-led mission. Liberal leader Justin Trudeau is typically trying to play both sides of the fence, supporting the battle against ISIS in principle while hedging the Liberal position with caveats just in case things go wrong. Mr. Obama's reversal is not the only blow to the cause of soft power. The UN, the international institution "progressives" love best, has proven wholly ineffective in dealing with any of the ongoing crises: in Ukraine, in Syria, in Iraq, in Africa. Secretary General Ban Ki-moon opened last week's UN gathering by noting that "Not since the end of the Second World War have there been so many refugees, displaced people and asylum seekers." As with Mr. Bush's invasion, the UN's main contribution to the ISIS crisis has been to breath a sigh of relief and offer the Security Council's blessing to Mr. Obama's change of heart. In trying to rework the U.S. role as global policeman, Mr. Obama has mainly demonstrated that other countries have no Plan B: if the U.S. doesn't want the job, they're not about to take it upon themselves. Europe and NATO have shown themselves to be empty vessels. NATO can't even get agree to beef up its presence on the borders of Vladimir Putin's Russia, other than some token "rapid action" installations to shake their fist should Mr. Putin continue his aggression. Turkey, NATO's only Muslim member, continues to allow oil shipments that help finance the ISIS campaign. The European Union has spent most of its time wishing the Americans would get more involved. So the UN, dialogue, diplomacy and Mr. Obama's six years of trying have all failed to produce the kinder, gentler international relations that "progressives" argue is the desired path for the world, and the one Canada should be following. And while Mr. Obama used his address to the General Assembly to launch yet another argument on behalf of the policies that have failed so miserably to date, his immediate priority is rounding up friends with fighter jets and ground troops who can help wipe out the scourge that has grown in the absence of effective force.

ICANN BAD

ICANN Kills US-EU Relations

ICANN hurts US-EU relations and emboldens aggressive cybersecurity policy

Barbière 13-MA in Strategy, Public Political Decision making @ the Institut Supérieur de Management Public et Politique [Cécile, "EU challenges US hegemony in global internet governance," EurActiv, 1/8/2015, <http://www.euractiv.com/infosociety/eu-challenges-us-hegemony-global-news-532137>, DKP]

French lawmakers, supported by the EU's Digital Agenda Commissioner Neelie Kroes, are pressing the European Union to stand up more firmly against American domination in cyberspace. 33 French MPs launched an information mission on 3 December to explore the EU's role on the global governance of the Internet. "The European Union is not present enough in the different international fora on Internet governance although the future of the Internet is a significant challenge," said Catherine Morin-Desailly, vice-president of the EU Affairs Committee in the French Senate. She urged French and EU authorities alike to "truly take over the international digital challenges". "Only the EU has the necessary power to influence this new cyberspace where the USA dominates," she added. US hegemony The MPs' concerns stem largely from the massive and illegal wiretapping done by the Americans which were revealed by whistleblower Edward Snowden. America's digital hegemony is obvious in the influence it exerts over the Internet Corporation for Assigned Names and Numbers (ICANN), the body which deals with the attribution of domain names worldwide. The issue of attribution of domain names is becoming more sensitive in Europe and globally. Aside from the traditional extensions like .com or .fr, since 2011, ICANN has allowed more specific ones such as .paris or .vin. While there was no problem about the .paris attributed to the City of Paris, the .vin or .wine extensions are much coveted by three different companies specialised in the auctioning of domain names. The problem is that ICANN has no established rules to limit the speculation on domain names, or to protect the commercial use of winemaking geographical indications, which has angered winemakers. "It's not normal that ICANN is the only one to decide. Governments and the EU should have the same power, rather than just give simple recommendations, as is the case now", claims Pascal Bobiller-Monnet, the director of the French confederation of winemakers and alcohol producers with controlled designation of origin. Commission letter to ICANN The European Commission has already sent a letter to ICANN and the Commissioner in charge of digital issues, Neelie Kroes, requested ICANN to wait for a compromise which will protect geographical indications before attributing the names. "Our position is firm: in no case can we accept .vin and .wine extensions on the Internet if the rights and interests of the geographical indications and those of the consumers are protected," Kroes wrote. But for now, both sides remain at loggerheads. Inside the Governmental Advisory Committee (GAC) of the ICANN, countries are split in two groups. On one side, the US, New Zealand and Australia are opposed to framing the process. On the other 34 members including the EU, Latin America and French speaking African countries are in favour of it. The European Commission firmly stands on its position over the domain names and on the issue of governance imposed by ICANN. "For the Commission, the Internet governance issue is open," Pascal Bobiller-Monnet assures. "The current debate over .vin and .wine extensions also opens questions about the decision making process within the GAC," the EU Commissioner wrote in another letter from 28 October. Brussels is not alone in its battle against the American hegemony at ICANN. Countries like China and Russia are thinking about establishing their own regulation body.

ICANN Cap Link

Shifting ICANN globally only benefits the corporate elite—it encourages irrational buying and selling of domain names creating a speculative bubble that only benefit ICANN's corporate beneficiaries, expanding corporate exploitation

Harris 13 (Frederick, holds graduate degrees in philosophy, technology and law, his views are his own, PhD @ Univ of Toronto, 12/17/13, "Rewiring Internet Governance: U.S. Government Will Likely Be Forced to Jettison ICANN (Part 3)", http://www.circleid.com/posts/20131217_rewiring_internet_governance_us_likely_be_forced_to_jettison_icann/)[aps]

Is ICANN really "remarkably agile and successful? Is Internet actually under threat from some governments? Here's reality: **If Internet is tormented, the source of the threat is ICANN itself.** The latter ignored warnings from four separate senate and house committees, plus the Federal Trade Commission, and NTIA, to go slow; look out for the public interest; protect the Internet; cushion small business; try a "small pilot project" for subsequent evaluation before a large scale rollout. Instead of listening to Congress **ICANN took policy decisions that generated unwarranted complexity**, semantic gymnastics, related legal headaches, forthcoming land rushes, inevitable cybersquatting, unnecessary trademark controversies, **and avoidable predatory pricing**, the latter **which amounts to what economists call "asymmetrically dominated alternatives"**^(Ok et al, 2011). **In other words, economic domination by private interests that encourage less than rational buying, selling, trading, reselling and auctioning of domain names which are ethereal goods without a physical presence and where there is no U.S. legal consensus as to whether domains names are even real property to begin with.** What should reasonable people make of this? **ICANN resides in a Janus-like dream world where** its delusional agility and success in dealing with "burgeoning policy issues" actually amounts to the biggest policy boondoggle in the history of the Internet; and where **real world evidence shows itself in the double-talking promotions that are published on the web sites of ICANN's corporate beneficiaries.** Policy clearly reduces to Lowi's "who gets what"; but the problem runs deeper. The real politik behind ICANN's predicament stems from shifting political assessments about whether the rest of the world concurs with ICANN's ideology of the empire of business which blends into, and therefore corrupts, policy making. **If, as ICANN claims, a global and interoperable Internet is failing because of "emerging pressures", the stressors were created by ICANN** itself. Arguably the source stems from ICANN's "cognitive toolkit" (Kurbalija, 5th edition, Diplo Foundation) which in governance terms defies common sense. ICANN has done some things reasonably well, meaning security and steadiness of the root zone which in a technical sense supports internet governance. However, in ICANN's case stability and security are subordinate to its driving ambition to be king of the world insofar as "ruling the root" The result is "bad equilibrium" (Fukuyama, 2013) and policy perversity. **The practical effect of subordinating policy decisions to internal ideology is that bottom-up governance, however well meaning, contradicts political reality. When push comes to shove politics is about power. ICANN's narrative coupled with policy blunders that ignore political sensibility anticipate ICANN's sooner rather than later demise.** I will explain why that's a distinct possibility.

ICANN Fails

Internet fragmentation inevitable and ICANN only makes it worse

Harris 13 (Frederick, holds graduate degrees in philosophy, technology and law, his views are his own, PhD @ Univ of Toronto, 12/17/13, "Rewiring Internet Governance: U.S. Government Will Likely Be Forced to Jettison ICANN (Part 3)", http://www.circleid.com/posts/20131217_rewiring_internet_governance_us_likely_be_forced_to_jettison_icann/)[aps]

That ICANN's policy actions contradict its implied and specific promises-of-performance is readily discerned. Consider the following: 1) ICANN's version of the "public interest" amounts to a world awash with privately run gTLDs, many of them from brand name entities that signal information silos controlled by big corporations. 2) ICANN's cognitive toolkit connected to an appetite for money that obviated applications from not-for-profits focused, for example, on world-wide hunger, in-country genocide, unspeakable poverty, rampant disease, or child mortality. 3) ICANN's clueless oblivion to the perceived cultural bias which obtains when the internet platform delivers technical virtuosity at the expensive of foreign political and cultural sensitivities. **All this speaks to the internet fragmentation that worries ICANN's** board, and with good reason. Its own policy blunders beg the larger question of the probable impacts of over extended ambition when politics on a large canvas confronts U.S. Congress and thus NTIA over root zone stability seriously impaired by incompetence. Sooner rather than later peer institutions may begin avoiding discredited ICANN. Foreign governments will likely begin demanding accountability. Congress might be compelled to discard ICANN which was precisely the outcome it sought to avoid. What is it about ICANN that warrants this?

Alt cause—Republicans will block the transition

Hill 14 (Jonah Force, MTS, MPP, is a technology and international affairs consultant and a Fellow of the Global Governance Futures (GGF 2025) program, 9/18/14, "No Guarantees on the ICANN Transition", <http://www.globalpolicyjournal.com/blog/18/09/2014/no-guarantees-icann-transition>)[aps]

The announcement of the transition, however, while supported internationally, was immediately met with sharp denunciations from the President's Republican opposition at home. The Republican resistance may derive from domestic political conflicts as much as an informed concern about the operability of the Internet, but many lawmakers and pundits have cited their fears that repressive governments, or even the United Nations (to their minds a proxy for authoritarian governments), could gain greater influence over the Internet as a result of the withdrawal, despite assurances to the contrary from the Administration.

For many Republicans and similarly-minded Obama critics, the ICANN transition is yet another example of the President's foreign policy capitulation to the demands of the international community. As former House of Representatives Speaker Newt Gingrich tweeted: "What is the global internet community that Obama wants to turn the Internet over to? This risks foreign dictatorships defining the Internet."

Republicans in the House of Representatives have not limited their opposition to speeches and social media. They have sought legislative action to prevent the President from following through with the planned transition.

Representative John Shimkus (R-IL) introduced a bill in April 2014, entitled the DOTCOM Act, that would, "...prohibit the National

Telecommunications and Information Administration from relinquishing responsibility over the Internet domain name system until the Comptroller General of the United States submits to Congress a report on the role of the NTIA with respect to such system.” The law would prohibit the Obama Administration from moving forward with the transition until Congress had received a report from the Government Accountability Office (also known as the Comptroller General) analyzing the implications of the transition plan.

In addition, Republicans have offered amendments to existing bills and spending authorizations to prevent the handover. Congressman Shimkus also introduced an amendment to the \$601 billion National Defense Authorization Act, the legislative authorization for U.S. military expenditures, which similarly would prohibit the transition. Congressman Sean Duffy (R-WI) added an amendment to the Commerce Justice and Science Appropriations bill that would cut the Commerce Department’s funding significantly if the withdrawal went through.

These bills and amendments have all been removed or voted down as part of negotiations between the two houses of the legislature, but other critics have even questioned whether the Department of Commerce even has the legal authority to withdraw from the contract with ICANN at all. L. Gordon Crovitz of the Wall Street Journal, an especially vocal opponent of the move, has highlighted a study from the Office of the General Counsel at the Government Accountability Office, which suggests that an ICANN transition may require a transfer of U.S. government property, an authority that the Department of Commerce may not have at its disposal. No legal action has been taken but that may be coming.

AT: Trafficking D.A

N/U-Can't Detect Drugs

Drug traffickers are turning to different types of drugs that security cant detect

BORYS 14- he writes for VICE Media, Inc., The Daily Beast, Black Hawk Digital and used to work at Shopify, Toronto Standard, New Alliance Media and got his education here Bitmaker Labs [Christian, "Drug Smuggling Is Getting a High Tech Makeover," motherboard/vice, 12/11/14, <http://motherboard.vice.com/read/drug-smuggling-is-getting-a-high-tech-makeover>, MHS]

Drug enforcement agents in America are constantly bewildered by the ingenuity of Sinaloa tools, like the firetruck sized drillers it used to tunnel into America. Yet, despite the effectiveness of expensive systems, drug traffickers have maintained a reliance on human drug mules—they're reinventing the age-old drug caravan. As researchers from the Journal of Forensic Science, Medicine and Pathology point out, "there are numerous and highly imaginative forms of smuggling, but one common method for illegal drug transport is intracorporeally in the gastrointestinal tract, usually by swallowing, and to a lesser extent, by rectal or vaginal insertion." There are two problems with this method of smuggling, however. The drug mule is forced to navigate, for one, through airports, the majority of which are heavily surveilled. And then the person smuggling the drugs is also highly susceptible to death if the drugs spill or leak inside their bodies, rendering the product unextractable. That's why cartels are increasingly turning to liquid cocaine. For narco traffickers, liquid cocaine is the future of drug trafficking. "Liquid cocaine is a novel method for smuggling drugs," said the same researchers. "Cocaine powder can be dissolved in a variety of solvents to produce a liquid form which allows later conversion back to powder. Liquid cocaine's radiologic properties are different than those of cocaine powder making it harder to detect on abdominal plain films." So hard to detect, in fact, that the packets of cocaine remain hidden to trained specialists. Unlike the powder form, the liquid packets have indistinct borders and can therefore resemble regular bowel content. That means a suspected drug mule would have to be processed all the way through to a CT scan in order to confirm the presence of cocaine. Airports don't exactly have CT scanners lying around, either. While they do have full body scanners, the level of detail from a full body scan doesn't give you the same thorough imaging a CT scan gives you. According to Dr. Andrew J. Einstein, director of cardiac CT research at Columbia University, those machines lack the sheer power of a CT scan. "A passenger would need to be scanned using a backscatter scanner, from both the front and the back, about 200,000 times to receive the amount of radiation equal to one typical CT scan," Einstein told me. One other enormous benefit of liquid cocaine is the ability to incorporate the substance into any other material, like clothing, or in one recent case, a very long hiking rope. The problem is so extensive that Bolivian government officials have even admitted to being wholly unable to detect the presence of liquid cocaine. Instead, the Bolivians are resorting to retraining airport agents to detect smugglers based on their appearance and behaviour. The problem is beginning to show itself stateside as well with U.S agents recently arresting a man at JFK airport who attempted to smuggle \$300,000 worth of liquid cocaine disguised as rum. Drug enforcement agents around the world will continue to face more and more of these attempts until surveillance systems capable of clear detection are built. The prospect of that however seems dim at this point in time and with the resources at their disposal, it's quite likely that the smugglers are already working on the next iteration which will keep them one step ahead. As officials from Argentina discovered in May, drug smugglers have already found a way to produce the liquid cocaine en masse. The shipment they tracked down in that particular case was worth over \$40 million, and headed right for the US. The crime syndicate mixed liquid cocaine into a shipment of insulating oil with the help of a Mexican chemist. With this type of ingenuity at play, and the lawlessness of Crimean ports, it's easy to understand how enormous the opportunity to smuggle drugs through new routes like Sevastopol into Europe really is. At this point, global authorities face a growing challenge when it comes to keeping up with the latest technologies and tactics of the world's narco elites.
