Joseph Menn Reuters, "ANALYSIS-Despite fears, NSA revelations helping U.S. tech industry," Reuters 15 September 2013 Factiva

BOON FOR ENCRYPTION SECTOR

As for the upside, so far only a minority of people and businesses are tackling encryption on their own or moving to privacy-protecting Web browsers, but encryption is expected to get easier with more new entrants. Snowden himself said that strong encryption, applied correctly, was still reliable, even though the NSA has cracked or circumvented most of the ordinary, built-in security around Web email and financial transactions. James Denaro, a patent attorney with security training in Washington, was already using Pretty Good Privacy (PGP), a complicated system for encrypting email, before the Snowden leaks. Afterward, he adopted phone and text encryption as

well to protect client information. "One of the results we see from Snowden is an increased awareness across the board about the incredible cyber insecurity," Denaro said. Some early adopters of encryption have senior jobs inside companies, and they could bring their habits to the office and eventually change the technology habits of the whole workplace, in the same way that executive fondness for iPhones and iPads prompted more companies to allow them access to corporate networks. "Clients are now inquiring how they can protect their data overseas, what kinds of access the states might have and what controls or constraints they could put in with residency or encryption," said Gartner researcher Lawrence Pingree, formerly chief security architect at PeopleSoft, later bought by Oracle. Richard Stiennon, a security industry analyst and author, predicted that security spending will rise sharply. A week ago, Google said it had intensified encryption of internal data flows after learning about NSA practices from Snowden's files, and consultants are urging other big businesses to do the same. Stiennon said that after more companies encrypt, the NSA and other agencies will spend more to break through, accelerating a lucrative cycle. "They will start focusing on the encrypted data, because that's where all the good stuff is," Stiennon said. Already, in a fiscal 2013 federal budget request from the intelligence community published this month by the Washington Post, officials wrote that investing in "groundbreaking cryptanalytic capabilities" was a top priority. (Reporting by Joseph Menn; Editing by Jonathan Weber and Ken Wills)

Cybersecurity is a massive growth sector, its key to the economy.

Sorcher, 2015

Sara Sorcher is the deputy editor of Passcode, a section from The Christian Science Monitor that covers security and privacy in the Digital Age, 5-3-2015, "The cyber gold rush," Christian Science Monitor, http://www.csmonitor.com/USA/Society/2015/0503/The-cyber-gold-rush

While California's Silicon Valley is the technology capital of America, cities and states across the country are now vying to dominate the next big economic frontier – the booming market for securing what actually lies within the nation's electronic networks. From California to Texas to Florida, public and private groups are positioning themselves to win millions in federal contracts and from venture capital firms. Some are going to extraordinary lengths to build what they call "a cybersecurity ecosystem." They are commissioning economic-impact studies, hatching tax-incentive packages, and hiring PR firms to devise branding strategies. They are investing in start-ups with money from state coffers. With as many as 300,000 cybersecurity jobs in the United States going unfilled last year alone, according to security company Symantec, they are also crafting academic programs for public universities to win research grants and generate the next generation of highly skilled workers poised to make six-figure salaries – and stay local. The nation has seen all this before, of course. The cyber gold rush is part of an enduring attempt by cities and states to tap the next great emerging industry in the name of economic salvation. From the birth of the automobile and steel industries, through the aerospace, computer, and biotech eras, communities have sought to ride industrial cycles to prosperity and middle-class comfort. Some were successful. Some weren't. Now cybersecurity promises to produce a similar spreadsheet of winners and losers – with a few notable differences. Unlike the actual gold rush in California in the mid-1800s, or the clustering of manufacturing industries in the Northeast and

upper Midwest decades later, the cybersecurity gold rush is not dependent on the availability of natural resources. And unlike the automobile industry, an ability to build physical structures or sprawling factories to dominate the competition through mass production will not determine which city becomes the epicenter of data protection. Economists note the start-up cost to be a cybersecurity hub – even with pricey data centers – is far less than, say, the relative cost of what it took to create assembly lines in the early 1900s. Yet the potential return for cities is substantial. In 2011, the global cybersecurity market hit $67 billion. It is projected to grow to as high as $156 billion by 2019, according to Markets and Markets, a Dallas-based research firm. The need for cybersecurity is likely only to grow as more giants such as Sony Pictures Entertainment, Target, and Home Depot are hacked; consumers demand better security; and businesses grow more aware of the potential cost to their sales and reputation if they do not provide it. On a consumer level, the way people interact with technology in their homes and on their bodies will also drive the market. Networking giant Cisco predicts there will be some 50 billion devices and objects connected to the Internet by 2020. Already, smart watches track your heart rate, and thermostats in your home can be controlled remotely by cellphone apps. This burgeoning Internet of Things drives a pressing need to protect the increasingly personal data people put online. "This is one of the fastest growing industries – not just in the tech sector, but in the world," says Peter Singer, a strategist who focuses on cybersecurity at the New America think tank in Washington. And no one has yet claimed it, Mr. Singer says. "What's the next Silicon Valley for cybersecurity?"

Foreign Surveillance Key to Solve the Economy

Foreign, not domestic, surveillance is what is driving data pull out – restrictions on domestic surveillance will only further this push

Chander and Le 15

Anupam Chander, Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar; Uyên P. Lê Free Speech and Technology Fellow, California International Law Center; "Data Nationalism," Emory Law Journal, Vol. 64:677, http://law.emory.edu/elj/_documents/volumes/64/3/articles/chander-le.pdf

First, the United States, like many countries, concentrates much of its surveillance efforts abroad. Indeed, the Foreign Intelligence Surveillance Act is focused on gathering information overseas, limiting data gathering largely only when it implicates U.S. persons.174 The recent NSA surveillance disclosures have revealed extensive foreign operations.175 Indeed, constraints on domestic operations may well have spurred the NSA to expand operations abroad. As the Washington Post reports, "Intercepting communications overseas has clear advantages for the

NSA, with looser restrictions and less oversight."176 Deterred by a 2011 ruling by the Foreign Intelligence Surveillance Court barring certain broad domestic surveillance of Internet and telephone traffic,177 the NSA may have increasingly turned its attention overseas. Second, the use of malware eliminates even the need to have operations on the ground in the countries in which surveillance occurs. The Dutch newspaper NRC Handelsblad reports that the NSA has infiltrated every corner of the world through a network of malicious malware.178 A German computer expert noted that "data was intercepted here [by the NSA] on a large scale."179 The NRC Handelsblad suggests that the NSA has even scaled the Great Firewall of China,180 demonstrating that efforts to keep information inside a heavily secured and monitored ironclad firewall do not necessarily mean that it cannot be accessed by those on the other side of the earth. This is a commonplace phenomenon on the Internet, of course. The recent enormous security breach of millions of Target customers in the United States likely sent credit card data of Americans to servers in Russia, perhaps through the installation of malware on point-of-sale devices in stores.

They can't solve foreign surveillance which is the critical factor for the tech industry, international clients won't be protected – the USA freedom act proves.

Kuranda, 2015

Sarah Kuranda, Sarah Kuranda is an Associate Editor at CRN covering security. 6-2-2015, "Solution Providers: New NSA Controls Fall Short Of Restoring Trust In Cloud Services," CRN, http://www.crn.com/news/security/300077006/solution-providers-new-nsa-controls-fall-short-of-restoring-trust-in-cloud-services.htm

Grealish said the bill appeared to "bolster" trust in cloud services in the U.S., but failed to extend that trust over the border. "It appears that the new bills do nothing to prevent U.S. authorities, via the appropriate legal mechanisms, to gain access to cloud-based data of foreign enterprises operating in U.S. cloud services, so businesses operating outside of the U.S. will have to continue to deal with conflicting regional laws and regulations if they are contemplating moving data across their borders to the U.S," Grealish said. The U.S.A. Freedom Act is now on its way to President Obama, who said he will sign it into law.

No Economic Losses from NSA Spying

Losses much lower than expected.

Ferrara, 2015

Ed Ferrara,Forrester's principal analyst serving security and risk professionals , 4-1-2015, "Forrester Research : Research : Government Spying Will Cost US Vendors Fewer Billions Than Initial Estimates," Forrester , https://www.forrester.com/Government+Spying+Will+Cost+US+Vendors+Fewer+Billions+Than+Initial+Estimates/fulltext/-/E-res122149

Is Edward Snowden's unveiling of the US National Security Agency's PRISM spying program ruining the fates of US cloud, hosting, and outsourcing businesses as international customers walk away from any vendor within the agency's reach? Forrester's first survey of these customers about the effects of PRISM suggests a significant financial impact, but not to the degree speculated in 2013. Our analysis of the pullback by non-US enterprise spending on US-based cloud and outsourcing vendors suggests an overall three-year loss in potential revenues of $47 billion. Traditional outsourcers are feeling the brunt of this impact. Lost revenue from spending on cloud services and platforms comes to just over $500 million between 2014 and 2016. While significant, these impacts are far less than speculated, as more companies reported taking control of security and encryption instead of walking away from US providers. US-based CIOs need not worry that the fallout of PRISM will cripple US cloud vendors, and CIOs outside the US should understand that there are options besides avoiding these US vendors.

Cloud companies have increased revenues after Snowden leaks – Customers aren't leaving.

Verton, 2014

Dan Verton Editorial Director, Editorial Director - FedScoop, 11-3-2014, "Is the post-Snowden cloud apocalypse real?," FedScoop, http://fedscoop.com/happened-post-snowden-cloud-predictions

When news broke last year of the National Security Agency's PRISM surveillance program, which enabled direct access to the servers of some of the nation's largest Internet companies, industry executives and analysts immediately warned that U.S.-based cloud providers would lose hundreds of billions of dollars in revenue as European and other foreign organizations moved their data elsewhere. But so far, the mass exodus from U.S.-based cloud providers doesn't appear to have materialized. Not only have the biggest players in the U.S. cloud market reported increases in foreign revenues and users, many have outlined aggressive international expansion plans for cloud services and data centers, according to Securities and Exchange Commission filings reviewed by FedScoop. In a series of telephone and email interviews, however, analysts and industry executives paint a more complex picture of the post-Snowden cloud market. Although anecdotal evidence remains strong that European companies and governments are more wary of U.S. cloud providers, the length of cloud contract commitments and the resources necessary to move to the cloud have led organizations to focus more on security and data localization rather than a mass abandonment of the biggest U.S. cloud providers.

NSA surveillance does not effect actual corporate decisions.

Perez, 2013

Juan Carlos Perez Assistant News Editor, 12-5-2013, "Why CIOs stick with cloud computing despite NSA snooping scandal," PCWorld, http://www.pcworld.com/article/2069681/why-cios-stick-with-cloud-computing-despite-nsa-snooping-scandal.html

Explosive revelations in the past six months about the U.S. government's massive cyber-spying activities have spooked individuals, rankled politicians and enraged privacy watchdogs, but top IT executives aren't panicking—yet. So far, they are monitoring the issue, getting informed and taking steps to mitigate their risk in various ways. But the alarming reports haven't prompted them to roll back their decisions to host applications and data in the cloud. That's the consensus from about 20 high-ranking IT executives interviewed in North America and Europe about the effect that the U.S. National Security Agency's snooping practices have had on their cloud computing strategy. The news broke in June, after former NSA contractor Edward Snowden began leaking the earth-shaking secrets to the media. Many of the IT executives interviewed say that they're not thrilled with the situation, and that it has made them more careful about cloud computing plans and deployments, prompting them to review agreements with vendors, double-check best practices and tighten security controls. However, these IT executives haven't been completely surprised by the revelations. Whether by overt means or through covert operations, it's well known that governments engage in surveillance of telecommunications and Internet traffic. "Government surveillance hasn't changed our opinion about cloud computing. The cloud model is attractive to us, and I was never that naive to think that this type of government monitoring wasn't going on," said Kent Fuller, director of enterprise infrastructure services at BCBG MaxAzria Group, a Los Angeles-based women's fashion designer and seller that uses Microsoft's Office 365 public cloud suite primarily for employee email.

No evidence of businesses losing clients due to Snowden.

Menn, 2013

Joseph Menn Reuters, "ANALYSIS-Despite fears, NSA revelations helping U.S. tech industry," Reuters 15 September 2013 Factiva

Edward Snowden's unprecedented exposure of U.S. technology companies' close collaboration with national intelligence agencies, widely expected to damage the industry's financial performance abroad, may actually end up helping. Despite emphatic predictions of waning business prospects, some of the big Internet companies that the former National Security Agency contractor showed to be closely involved in gathering data on people overseas - such as Google Inc. and Facebook Inc. - say privately that they have felt little if any impact on their businesses. Insiders at companies that offer remote computing services known as cloud computing, including Amazon and Microsoft Corp, also say they are seeing no fallout. Meanwhile, smaller U.S. companies offering encryption and related security services are seeing a jump in business overseas, along with an uptick in sales domestically as individuals and companies work harder to

protect secrets. "Our value proposition had been that it's a wild world out there, while doing business internationally you need to protect yourself," said Jon Callas, co-founder of phone and text encryption provider Silent Circle, where revenue quadrupled from May to June on a small base. "Now the message people are getting from the newspapers every day is that it's a wild world even domestically." PROPHESIES OF DOOM Shortly after Snowden's leaked documents detailed collaboration giving the NSA access to the accounts of tens of thousands of net companies' users, the big Internet companies and their allies issued dire warnings, predicting that American businesses would lose tens of billions of dollars in revenue abroad as distrustful customers seek out local alternatives. In a federal court filing last week, Google said that still-unfolding news coverage was causing "substantial harm to Google's reputation and business". The company said that could be mitigated if it were allowed to comment with precision about its intelligence dealings. Likewise, last month, six technology trade groups wrote to the White House to urge reforms in the spy programs, citing what it called a "study" predicting a $35 billion cumulative shortfall by 2016 in the vital economic sector. That number, it turns out, was extrapolated from a security trade group's survey of 207 non-U.S. members - and the group, the Cloud Security Alliance, had explicitly cautioned that its members weren't representative of the entire industry. "I know you want sectors and numbers, but I don't have it," said Ed Black, president of the Computer & Communications Industry Association, one of the trade groups behind the letter. "Anybody who tells you they do is making it up." The trade groups aren't the only ones issuing dismal, and headline-grabbing, forecasts. Forrester Research analyst James Staten wrote of the $35 billion figure: "We think this estimate is too low and could be as high as $180 billion, or a 25 percent hit to overall IT [information technology] service provider revenues." Staten's comments generated dozens of media stories, some of which neglected to mention that Staten said the worst would come to pass only if businesses decided that spying was a bigger issue than the savings they gained from a shift to cloud computing. In an interview with Reuters, Staten said he didn't believe that would be the case. "I don't think there's going to be a significant pullback," he said, though the rate of growth could slow for a couple of years. LITTLE IMPACT Google employees told Reuters that the company has seen no significant impact on its business, and a person briefed on Microsoft's business in Europe likewise said that company has had no issues. At Amazon, which was not named in Snowden's documents but is seen as a likely victim because it is a top provider of cloud computing services, a spokeswoman said global demand "has never been greater."

No Losses – Cloud too valuable

Upside of cloud computing is bigger than any NSA risk for businesses.

Kim 2014

Gary Kim, Contributing Editor for Techzone360, 7-11-2014, "What is Impact of Spy Scandal on U.S. Cloud Computing Business?," Techzone360, http://www.techzone360.com/topics/techzone/articles/2014/07/11/383598-what-impact-spy-scandal-us-cloud-computing-business.htm

One might argue the impact of the spying scandal is hard to quantify, as it will be expressed primarily as a loss of new sales to competitors based elsewhere, and perhaps slower growth than might otherwise have been the case.

On the other hand, there are counterbalancing trends at work. U.S. enterprises and smaller businesses are shifting information technology spending from “premises” to “cloud” sources. So, despite any potential sales headwinds created by the spying threats, business customer spending on cloud services seems destined to grow, irrespective of new security threats. After all, many customers could conclude, the upside is greater than the potential downside. Spend is shifting from internal to external, in direction of cloud services, says Arthur Gruen, principal at Wilkofsky Gruen Associates. It is hard to see new machine to machine apps being abandoned because security issues now loom larger. Instead, entities are likely to pursue M2M apps because there are clear business advantages, and simply spend more money on security.

No Losses – Increased Security

Companies have increased security and encryption to keep customers, they haven’t lost business.

Verton, 2014

Dan Verton Editorial Director, Editorial Director - FedScoop, 11-3-2014, "Is the post-Snowden cloud apocalypse real?," FedScoop, http://fedscoop.com/happened-post-snowden-cloud-predictions

"With or without the Snowden controversy, security is still the biggest hurdle for cloud adoption, particularly in the enterprise segment," Poon said. "Industry verticals that are still subject to stringent regulatory requirements, they are unlikely to offload workloads to third-party public cloud providers. The typical, preferred model we see so far is private cloud deployment — a dedicated private cloud with physical isolation (both on-net / off-net), followed by virtual private cloud [and] hybrid cloud." The new demands being placed on cloud providers by European customers may be manageable, but they are also an added cost, Neivert said. "Much of the [Snowden] fallout is also hidden in the cost line, not the revenue line," he said, referring to emerging requirements to store data locally and add new encryption requirements.

No alternative to Cloud

There’s no alternative to American cloud companies, the won’t lose business.

Menn, 2013

Joseph Menn Reuters, “ANALYSIS-Despite fears, NSA revelations helping U.S. tech industry,” Reuters 15 September 2013 Factiva

FEW GOOD ALTERNATIVES

There are multiple theories for why the business impact of the Snowden leaks has been so minimal. One is that cloud customers have few good alternatives, since U.S. companies have most of the market and switching costs money. Perhaps more convincing, Amazon, Microsoft and some others offer data centers in Europe with encryption that prevents significant hurdles to snooping by anyone including the service providers themselves and the U.S. agencies. Encryption, however, comes with drawbacks, making using the cloud more cumbersome. On Thursday, Brazil's president called for laws that would require local data centers for the likes of Google and Facebook. But former senior Google engineer Bill Coughran, now a partner at Sequoia Capital, said that even in the worst-case scenario, those companies would simply spend extra to manage more Balkanized systems. Another possibility is that tech-buying companies elsewhere believe that their own governments have scanning procedures that are every bit as invasive as the American programs.

Cloud Sector Growing now

Trust in cloud computing has increased, not decreased in the aftermath of Snowden.

Kim, 2014,

Gary, Contributing Editor for Techzone360, COVER STORY: Telecoms in the post-Snowden era, 4 September 2014, Capacity Magazine, Proquest

Ironically, an earlier Lieberman Software study in November 2012 – prior to the Snowden revelations – found 48% of respondents were discouraged from using the cloud because of fear of government snooping, while 86% said they preferred to keep sensitive data on their own network, rather than the cloud. "These findings indicate that trust in the security of the cloud has increased over the past year," Lieberman Software says. To be sure, a few US firms reported an initial sales dip after the Snowden revelations. One can point to a few instances where firms such as Cisco have reported significant sales slowdowns, but the Edward Snowden revelations might not have been the primary and principal cause of the sales dips.

Data localization is inevitable

Data localization was not caused by Snowden's NSA revelations.

Fontaine, 2014

Richard Fontaine is the President of the Center for a New American Security, He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. "Bringing Liberty Online Reenergizing the Internet Freedom Agenda in a Post-Snowden Era." Center for a New American Security (9/2014). http://www.cnas.org/internetfreedom#.VaClavlViko

A cautionary note is in order when interpreting the reactions to the Snowden affair. Some developments – such as data localization requirements and worries about a splintering Internet – predated the revelations and have been accelerated rather than prompted by them. Autocratic governments also drew lessons from the technology-fueled Arab Spring, resulting in actions aimed at limiting Internet freedom. Other white-hot responses cooled when rhetoric turned to action. Brazil's new "Marco Civil" Internet law, approved in April 2014, left out a number of the strongest responses that had been widely debated in the run-up to its adoption. The EU did not go through with its threatened Safe Harbor data-exchange boycott. And for all of the worries about laws that would require the local storage of users' data, few countries have actually passed them. Nevertheless, the potential for such fallout remains.

Much broader questions drive international conflicts over "internet freedom," the plan can't solve.

Nocetti,2015

Julien Research Fellow at the French Institute of International Relations (IFRI) in Paris. (2015), Contest and conquest: Russia and global internet governance. International Affairs, 91: 111–130. doi: 10.1111/1468-2346.12189

It is not surprising that it is the younger nation-states that seem to be the most strongly committed to a neo-Westphalian approach to internet governance. In many respects, the battle over the vision of internet governance cannot be characterized entirely accurately as between authoritarian, undemocratic states and liberal, freedom-loving states; it is also, and indeed more centrally, a conflict between long-established, cosmopolitan states and newer states that do not yet feel safe in their sovereignty. Russia fits into the latter category, as a relatively young nation-state that has been experiencing, since the chaotic 1990s transition to a free market economy and pluralism, a potent feeling of insecurity. This feeling stems in part from the complex interactions between state authorities and the media ecosystem since the 1980s, when Soviet leaders tolerated increased access to previously suppressed information, thus opening the 'information gates' to the masses. In the 2000s, with Russia striving to recover its full sovereignty and struggling against the 'permeability' of its neighbourhood, Putin gradually saw the information revolution—driven by the considerable growth in (domestic) internet access—as one of the most pervasive components of US expansionism in the post-Soviet sphere, most notably in Russia itself. Russia's policy on global internet governance issues therefore cannot be separated from a domestic political context in which digital technologies are increasingly used for purposes of contention by an active and articulate 'netizen' middle class.

Decline doesn't cause war

No war from economic collapse

Barnett '09

(Thomas P.M. Barnett is the Chief Analyst at Wikistrat, 8/24/9, " The New Rules: Security Remains Stable Amid Financial Crisis", http://www.worldpoliticsreview.com/articles/4213/the-new-rules-security-remains-stable-amid-financial-crisis)

When the global financial crisis struck roughly a year ago, the blogosphere was ablaze with all sorts of scary predictions of, and commentary regarding, ensuing conflict and wars -- a rerun of the Great Depression leading to world war, as it were. Now, as global economic news brightens and recovery -- surprisingly led by China and emerging markets -- is the talk of the day, it's interesting to look back over the past year and realize how globalization's first truly worldwide recession has had virtually no impact whatsoever on the international security landscape. None of the more than three-dozen ongoing conflicts listed by GlobalSecurity.org can be clearly attributed to the global recession. Indeed, the last new entry (civil conflict between Hamas and Fatah in the Palestine) predates the economic crisis by a year, and three quarters of the chronic struggles began in the last century. Ditto for the 15 low-intensity conflicts listed by Wikipedia (where the latest entry is the Mexican "drug war" begun in 2006). Certainly, the Russia-Georgia conflict last August was specifically timed, but by most accounts the opening ceremony of the Beijing Olympics was the most important external trigger (followed by the U.S. presidential campaign) for that sudden spike in an almost two-decade long struggle between Georgia and its two breakaway regions. Looking over the various databases, then, we see a most familiar picture: the usual mix of civil conflicts, insurgencies, and liberation-themed terrorist movements. Besides the recent Russia-Georgia dust-up, the only two potential state-on-state wars (North v. South Korea, Israel v. Iran) are both tied to one side acquiring a nuclear weapon capacity -- a process wholly unrelated to global economic trends. And with the United States effectively tied down by its two ongoing major interventions (Iraq and Afghanistan-bleeding-into-Pakistan), our involvement elsewhere around the planet has been quite modest, both leading up to and following the onset of the economic crisis: e.g., the usual counter-drug efforts in Latin America, the usual military exercises with allies across Asia, mixing it up with pirates off Somalia's coast). Everywhere else we find serious instability we pretty much let it burn, occasionally pressing the Chinese -- unsuccessfully -- to do something. Our new Africa Command, for example, hasn't led us to anything beyond advising and training local forces. So, to sum up: *No significant uptick in mass violence or unrest (remember the smattering of urban riots last year in places like Greece, Moldova and Latvia?); *The usual frequency maintained in civil conflicts (in all the usual places); *Not a single state-on-state war directly caused (and no great-power-on-great-power crises even triggered); *No great improvement or disruption in great-power cooperation regarding the emergence of new nuclear powers (despite all that diplomacy); *A modest scaling back of international policing efforts by the system's acknowledged Leviathan power (inevitable given the strain); and *No serious efforts by any rising great power to challenge that Leviathan or supplant its role. (The worst things we can cite are Moscow's occasional deployments of strategic assets to the Western hemisphere and its weak efforts to outbid the United States on basing rights in Kyrgyzstan; but the best include China and India stepping up their aid and investments in Afghanistan and Iraq.) Sure, we've finally seen global defense spending surpass the previous world record set in the late 1980s, but even that's likely to wane given the stress on public budgets created by all this unprecedented "stimulus" spending. If anything, the friendly cooperation on such stimulus packaging was the most notable great-power dynamic caused by the crisis. Can we say that the world has suffered a distinct shift to political radicalism as a result of the economic

crisis? Indeed, no. The world's major economies remain governed by center-left or center-right political factions that remain decidedly friendly to both markets and trade

Decline doesn't cause war

Jervis, Colubmia international affairs professor, 2011

(Robert, "Forces in Our Times", Survival, 25.4, December, ebsco)

Even if war is still seen as evil, the security community could be dissolved if severe conflicts of interest were to arise. Could the more peaceful world generate new interests that would bring the members of the community into sharp disputes? 45 A zero-sum sense of status would be one example, perhaps linked to a steep rise in nationalism. More likely would be a worsening of the current economic difficulties, which could itself produce greater nationalism, undermine democracy and bring back old-fashioned beggar-my-neighbor economic policies. While these dangers are real, it is hard to believe that the conflicts could be great enough to lead the members of the community to contemplate fighting each other. It is not so much that economic interdependence has proceeded to the point where it could not be reversed – states that were more internally interdependent than anything seen internationally have fought bloody civil wars. Rather it is that even if the more extreme versions of free trade and economic liberalism become discredited, it is hard to see how without building on a preexisting high level of political conflict leaders and mass opinion would come to believe that their countries could prosper by impoverishing or even attacking others. Is it possible that problems will not only become severe, but that people will entertain the thought that they have to be solved by war? While a pessimist could note that this argument does not appear as outlandish as it did before the financial crisis, an optimist could reply (correctly, in my view) that the very fact that we have seen such a sharp economic down-turn without anyone suggesting that force of arms is the solution shows that even if bad times bring about greater economic conflict, it will not make war thinkable.

Answers to Internet Advantage

1NC FRONTLINE – INTERNET FREEDOM

1. Internet Freedom doesn't work, the best empirical data proves that expansion of access to the web does not create democracy.

Geelmuyden and Weidmann, 2015.

Espen Geelmuyden Rød, Department of Politics and Public Administration, University of Konstanz & Peace Research Institute Oslo (PRIO) Nils B Weidmann Department of Politics and Public Administration, University of Konstanz "Empowering activists or autocrats? The Internet in authoritarian regimes." Journal of Peace Research 52.3 (2015): 338-351.

In doing so, we distinguish regimes that worry about public opinion and those that do so to a lesser extent. If the former are more likely to expand, this should be due to the fact that modern communication technology, in particular the Internet, is not immune to government interference. Rather, as illustrated in the examples above, autocratic regimes benefit from these technologies through ample opportunities to censor and influence public opinion and to track members of the opposition. Our first empirical analysis confirms this suspicion: regimes that are concerned about public opinion – and go to great lengths to censor it – are more likely to expand the Internet. In our second analysis, we turn to the question of how Internet expansion affects changes towards democracy. Here, we fail to find any evidence that the Internet is linked to positive changes in democracy scores. When looking more closely at democratic and autocratic changes from 2006 to 2010, the data indicate that movements toward democracy are more frequent in countries with low Internet penetration. No country in the low penetration group experienced autocratic change in this period, while six countries in the high penetration group did. Our findings shed considerable doubt on the frequently held assumption that the Internet universally, and unconditionally, fosters freedom and democracy. Autocrats are likely aware of the tremendous potential this technology has for creating and maintaining a tightly controlled sphere of public opinion. Looking back at ~~mankind's~~ first two decades of experience with Internet technology, our results suggest that in the wrong hands, Internet, cell phones, and other modern means of communication can serve evil purposes.

2. Internet Freedom is not free, the American push for governance of the internet is about profits, not human rights.

Powers and Jablonski, 2015

Shawn Powers is an Assistant Professor of Communication at Georgia State University. Michael Jablonski is an attorney and presidential fellow in communication at Georgia State University. "Introduction: Geopolitics and the Internet " The Real Cyber War: The Political Economy of Internet Freedom. Champaign: University of Illinois Press, 2015. Project MUSE. Web.

The chapter concludes with a discussion of Google's role in the internet freedom movement. While the company routinely espouses the economic and political benefits of a free flow of

information between people and countries, there is little evidence that this is the reason it pursues greater global connectivity. Numerous examples of Google's compliance with law enforcement agencies in both democratic and authoritarian countries suggest that its desire for freedom of expression is certainly not driving its global business strategy. Instead, a more compelling explanation for Google's interest in internet freedom and connectivity is the simple fact that its survival (in the political economy sense of the word) depends on getting more and more people online to use its complimentary services. Connecting commodification and structuration, chapter 4 focuses on the economics of internet connectivity and the fight over which international institutions are responsible for the regulation of digital information flows. We suggest that, at a basic level, U.S. internet policy can be boiled down to getting as many people using the network of networks as possible, while protecting the status quo legal, institutional, and economic arrangements governing connectivity and exchanges online. From the global infrastructure facilitating exchanges of data to the creation of unique content and services online, American companies are dominant, extraordinarily profitable, and, in most cases, well ahead of foreign competition. Building on chapters 2 and 3, chapter 4 traces how economic logic continues to drive U.S. policy as well as U.S. negotiating strategy in the international arena. From this perspective the real cyber war is not over offensive capabilities or cybersecurity but rather about legitimizing existing institutions and norms governing internet industries in order to assure their continued market dominance and profitability.

3. The aff can't solve internet freedom because it doesn't stop surveillance of foreign targets, which is what matters to the rest of the world.

Fontaine, 2014

Richard Fontaine is the President of the Center for a New American Security, He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. "Bringing Liberty Online Reenergizing the Internet Freedom Agenda in a Post-Snowden Era." Center for a New American Security (9/2014). http://www.cnas.org/internetfreedom#.VaClavlViko

Despite the international outrage, and both public and private criticism of U.S. surveillance policies, the U.S. government has continued its Internet freedom–related activities, albeit at a lower public volume. In early 2014, Secretary of State John Kerry, addressing the Freedom Online Coalition conference in Estonia, called for an "open, secure, and inclusive Internet."33 U.S. Internet freedom programming continues: the State Department's Bureau of Democracy, Human Rights and Labor alone planned to expend roughly $18 million in 2014 on anti-censorship technology, secure communications, technology training and rapid response to bloggers under threat.34 In June, the United States sponsored a successful U.N. Human Rights Council resolution reaffirming that the same rights that people have offline, including freedom of expression, must be protected online, regardless of frontiers.35 While continuing to execute the

Internet freedom agenda, U.S. officials have attempted to reconcile their government's surveillance practices with its expressed desire for greater online freedom. This is challenging, to say the least. U.S. officials draw a critical distinction between monitoring communications for purposes of protecting national security and surveillance aimed at repressing political speech and activity. While this distinction is intuitive to many Americans, it is likely to be lost on many others, particularly where autocratic regimes consider domestic political dissent to be a national security threat. At its bluntest, the American position is that it is legitimate, for example, for the U.S. government, but not for the Chinese government, to surveil Chinese citizens. This is and will remain a tough sell.

4. The US isn't modeled and domestic surveillance isn't key

Naughton 2015

John Naughton is professor of the public understanding of technology at the Open University. "Surveillance laws are being rewritten post-Snowden, but what will really change?; The ripples from the revelations of NSA surveillance can be felt around the world - but intelligence and law-enforcement agencies will carry on regardless," Lexis Nexis, 6/17/2015

At one level it's a significant moment: one in which - as a Guardian leader writer put it - "an outlaw rewrites the law". And in a few other countries, notably Germany, Snowden's revelations do seem to be having a demonstrable impact - as witnessed, for example, by the Bundestag's inquiry into NSA surveillance within the Federal Republic. These are non-trivial outcomes, but we shouldn't get carried away. The revelations have had close to zero effect on the way the British security agencies - and their political masters - go about things. And now that the Tories are liberated from the tiresome obsession of the Lib Dems with privacy and human rights, who knows what Theresa May and the spooks are cooking up? (The relevant passage in the Queen's speech merely says that "new legislation will modernise the law on communications data".) On the other side of the Atlantic, although the USA Freedom Act does introduce a number of reforms, the surveillance landscape remains largely unchanged. Americans' phone records will still be hoovered up - but now by the telephone companies, not the NSA - and access to them will require a warranting process. And elements of transparency around government surveillance and the operations of the secret Fisa court will be introduced. So while there is some good news for American citizens in the new legislation, the position for the rest of the world is that nothing changes. The US retains the right to snoop on us in any way it pleases - and of course to spy on any US citizen who has the misfortune to exchange a phone call or an email message with us. Edward Snowden's revelations have thus brought about some amelioration in the domestic surveillance regime within the US, but so far they have done little to protect those who live outside that benighted realm and quaintly regard privacy as a basic human right.

5. Democracy doesn't prevent war.

Goldstein, '11 (Joshua, is professor emeritus of international relations at American University and author of Winning the War on War: The Decline of Armed Conflict Worldwide, Sept/Oct 2011, "Think Again: War. World peace could be closer than you think", *Foreign Policy*)

"A More Democratic World Will Be a More Peaceful One." Not necessarily. The well-worn observation that real democracies almost never fight each other is historically correct, but it's also true that democracies have always been perfectly willing to fight nondemocracies. In fact, democracy can heighten conflict by amplifying ethnic and nationalist forces, pushing leaders to appease belligerent sentiment in order to stay in power. Thomas Paine and Immanuel Kant both believed that selfish autocrats caused wars, whereas the common people, who bear the costs, would be loath to fight. But try telling that to the leaders of authoritarian China, who are struggling to hold in check, not inflame, a popular undercurrent of nationalism against Japanese and American historical enemies. Public opinion in tentatively democratic Egypt is far more hostile toward Israel than the authoritarian government of Hosni Mubarak ever was (though being hostile and actually going to war are quite different things). Why then do democracies limit their wars to non-democracies rather than fight each other? Nobody really knows As the University of Chicago's Charles Lipson once quipped about the notion of a democratic peace, "We know it works in practice. Now we have to see if it works in theory!" The best explanation is that of political scientists Bruce Russett and John Oneal, who argue that three elements -- democracy, economic interdependence (especially trade), and the growth of international organizations -- are mutually supportive of each other and of peace within the community of democratic countries. Democratic leaders, then, see themselves as having less to lose in going to war with autocracies.

Internet doesn't create Democracy

The internet does not create democracy.

Morozov, 2009

Evgeny, writer and researcher of Belarusian origin who studies political and social implications of technology. He is currently a senior editor at The New Republic. "How dictators watch us on the web," 11-18-09. http://www.prospectmagazine.co.uk/features/how-dictators-watch-us-on-the-web

Yet while the internet may take the power away from an authoritarian (or any other) state or institution, that power is not necessarily transferred to pro-democracy groups. Instead it often flows to groups who, if anything, are nastier than the regime. Social media's greatest assets—anonymity, "virality," interconnectedness—are also its main weaknesses.

No evidence that the internet actually spurs democratization

Aday et al. 10

Sean Aday is an associate professor of media and public affairs and international affairs at The George Washington University, and director of the Institute for Public Diplomacy and Global Communication. August 2010, "Blogs And Bullets: new media in contentious politics", http://www.usip.org/files/resources/pw65.pdf

New media, such as blogs, Twitter, Facebook, and YouTube, have played a major role in episodes of contentious political action. They are often described as important tools for activists seeking to replace authoritarian regimes and to promote freedom and democracy, and they have been lauded for their democratizing potential. Despite the prominence of "Twitter revolutions," "color revolutions," and the like in public debate, policymakers and scholars know very little about whether and how new media affect contentious politics. Journalistic accounts are inevitably based on anecdotes rather than rigorously designed research. Although data on new media have been sketchy, new tools are emerging that measure linkage patterns and content as well as track memes across media outlets and thus might offer fresh insights into new media. The impact of new media can be better understood through a framework that considers five levels of analysis: individual transformation, intergroup relations, collective action, regime policies, and external attention. New media have the potential to change how citizens think or act, mitigate or exacerbate group conflict, facilitate collective action, spur a backlash among regimes, and garner international attention toward a given country. Evidence from the protests after the Iranian presidential election in June 2009 suggests the utility of examining the role of new media at each of these five levels. Although there is reason to believe the Iranian case exposes the potential benefits of new media, other evidence—such as the Iranian regime's use of the same social network tools to harass, identify, and imprison protesters—suggests that, like any media, the Internet is not a "magic bullet." At best, it may be a "rusty bullet." Indeed, it is plausible that traditional media sources were equally if not more important. Scholars and policymakers should adopt a more nuanced view of new media's role in democratization and social change, one that recognizes that new media can have both positive and negative effects.

Internet Freedom is a Myth

"Internet freedom" is about the expansion of American economic power, not human rights.

Kiggins, 2012

Ryan D. University Of Central Oklahoma, Department of Political Science, Faculty Member "US Identity, Security, and Governance of the Internet." Cyberspaces and Global Affairs eds: Jake Perry, Professor Sean S Costigan p 189.

My study is able to demonstrate how agents shape structures through ideas. I am also able to show how ideas held by U.S. policy-makers concerning the appropriate normative structure for

global politics and the global economy were shaped by concerns over the economic performance of the U.S. economy and especially over the relative position of U.S. high-technology companies in the emerging digital economy of the twenty-first century. Foremost on the minds of U.S. policymakers was spurring job creation for U.S. high-technology workers. Job creation, preserving the relative dominance of U.S. high-technology companies, and positioning the Internet as a platform for the global expansion of commerce and freedom are important cogs in broader U.S. national security policy. Policy-makers within the U.S. government engaged in a well-planned and executed strategy to discursively construct the Internet as the lynchpin for future global and domestic economic growth. Within that discourse, the idea of freedom played the starring role.

Domestic Surveillance doesn't solve

Limits on domestic surveillance will not solve American leadership, they don't limit foreign surveillance and aren't credible because its all secret.

Fontaine, 2014

Richard Fontaine is the President of the Center for a New American Security, He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. "Bringing Liberty Online Reenergizing the Internet Freedom Agenda in a Post-Snowden Era." Center for a New American Security (9/2014). http://www.cnas.org/internetfreedom#.VaClavlViko

Secretary Kerry has defended the Obama administration's reforms to signals intelligence collection, saying that they are based on the rule of law, conducted pursuant to a legitimate purpose, guided by proper oversight, characterized by greater transparency than before and fully consistent with the American vision of a free and open Internet.36 In March 2014, Deputy Assistant Secretary of State Scott Busby addressed the linkage between surveillance and Internet freedom and added two principles to Kerry's – that surveillance should not be arbitrary but rather as tailored as possible, and that decisions about intelligence collection priorities should be informed by guidance from an authority outside the collection agency.37 In addition, the U.S. government has taken other steps to temper the international reaction. For example, the Department of Commerce opted to relinquish its oversight of ICANN – the organization that manages domain name registries – to the "global Internet community."38

Such moves are destined to have only a modest effect on foreign reactions. U.S. surveillance will inevitably continue under any reasonably likely scenario (indeed, despite the expressions of outrage, not a single country has said that it would cease its surveillance activities). Many of the demands – such as for greater transparency – will not be met, simply due to the clandestine nature of electronic espionage. Any limits on surveillance that a government might announce will not be publicly verifiable and thus perhaps not fully credible. Nor will there be an international "no-spying" convention to reassure foreign citizens that their communications are unmonitored. As it has for centuries, statesponsored espionage activities are likely to remain accepted international practice, unconstrained by international law. The one major possible shift in policy following the Snowden affair – a stop to the bulk collection of telecommunications metadata in the United States – will not constrain the activity most disturbing to foreigners; that is, America's

surveillance of them. At the same time, U.S. officials are highly unlikely to articulate a global "right to privacy" (as have the U.N. High Commissioner for Human Rights and some foreign officials), akin to that derived from the U.S. Constitution's fourth amendment, that would permit foreigners to sue in U.S. courts to enforce such a right.39 The Obama administration's January 2014 presidential directive on signals intelligence refers, notably, to the "legitimate privacy interests" of all persons, regardless of nationality, and not to a privacy "right."40

The aff can't solve credibility, curtailing domestic surveillance won't solve surveillance of people around the world.

Sagar, **2015**

Rahul, associate professor of political science at Yale-NUS College and the Lee Kuan Yew School of Public Policy at the National University of Singapore. "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics & International Affairs / Volume 29 / Issue 02 / 2015, pp 145-159.

So far I have focused on the limited credibility of domestic oversight. If we accept the view that all persons, regardless of citizenship, have privacy rights, then there is a further set of difficulties to overcome. To begin with, we lack an established set of norms that overseers can utilize to regulate international surveillance. Such norms will not be easy to generate given competing conceptions of privacy (China, for instance, is unlikely to consent to a norm that forbids it from operating its so-called Great Firewall). We also confront grave enforcement difficulties. It is hard to see who could fairly adjudicate between the interests of a particular state (for example, the United States) and a foreign national (for example, an Iraqi). It is hard to foresee support for an international regulatory body. Not only the United States but also countries such as China and Russia are likely to balk at sharing intelligence with an international regulator whose internal controls may be less robust than theirs and whose members may be drawn from rival states. Yet if compliance with international norms were allowed to be voluntary, then little would prevent foreign powers from monitoring peoples and organizations as they see fit. In this event, curtailing the NSA's surveillance operations would not remedy the loss of privacy experienced by persons around the world, since their communications would still be monitored by other nations.

Foreign and domestic surveillance affect soft power

Champion 2014

Marc, writes editorials on international affairs, "U.S. soft power takes a hit in wake of report," The Japan Times, 12/16/14, http://www.japantimes.co.jp/opinion/2014/12/16/commentary/world-commentary/u-s-soft-power-takes-a-hit-in-wake-of-report/#.VYhSy9NVjZF

A second area where the U.S. is suffering severe damage to its image is from the National Security Agency's claim to have the collection of Internet metadata from citizens anywhere and everywhere. As with the U.S. renditions policy, America's closest allies collude in this collection effort and have suffered a public backlash as a result. Again, the publics of these countries aren't wholly naive: They know that governments spy on other governments, as well as on criminals and terrorists. Indeed, they mostly support spying on terrorists. But the NSA revelations were disruptive, because they created the perception that the U.S. was using its dominance of the Internet to collect data on ordinary citizens across the globe. Again, according to the Pew global survey, majorities disapprove of the U.S. monitoring foreign citizens in all except five countries (one of which was the U.S.). Americans should hardly be surprised: More than 60 percent of them find it unacceptable for the U.S. to spy on its own citizens — so why would Germans or Italians feel otherwise?

The US is not a Model

Countries don't model U.S. policy – it's a myth.

Moravcsik 2005

Andrew - Professor of Government and Director of the European Union Program at Harvard University, January 31, 2005, Newsweek, "Dream On, America," lexis

Not long ago, the American dream was a global fantasy. Not only Americans saw themselves as a beacon unto nations. So did much of the rest of the world. East Europeans tuned into Radio Free Europe. Chinese students erected a replica of the Statue of Liberty in Tiananmen Square. You had only to listen to George W. Bush's Inaugural Address last week (invoking "freedom" and "liberty" 49 times) to appreciate just how deeply Americans still believe in this founding myth. For many in the world, the president's rhetoric confirmed their worst fears of an imperial America relentlessly pursuing its narrow national interests. But the greater danger may be a delusional America--one that believes, despite all evidence to the contrary, that the American Dream lives on, that America remains a model for the world, one whose mission is to spread the word. The gulf between how Americans view themselves and how the world views them was summed up in a poll last week by the BBC. Fully 71 percent of Americans see the United States as a source of good in the world. More than half view Bush's election as positive for global security. Other studies report that 70 percent have faith in their domestic institutions and nearly 80 percent believe "American ideas and customs" should spread globally. Foreigners take an entirely different view: 58 percent in the BBC poll see Bush's re-election as a threat to world peace. Among America's traditional allies, the figure is strikingly higher: 77 percent in Germany, 64 percent in Britain and 82 percent in Turkey. Among the 1.3 billion members of the Islamic world, public support for the United States is measured in single digits. Only Poland, the Philippines and India viewed Bush's second Inaugural positively. Tellingly, the anti-Bushism of the president's first term is giving way to a more general anti-Americanism. A plurality of voters (the average is 70 percent) in each of the 21 countries surveyed by the BBC oppose sending any troops to Iraq, including those in most of the countries that have done so. Only one third, disproportionately in the poorest and most dictatorial countries, would like to see American values spread in their country. Says Doug Miller of GlobeScan, which conducted the BBC report: "President Bush has further isolated America from the world. Unless the administration changes its approach, it will

continue to erode America's good name, and hence its ability to effectively influence world affairs." Former Brazilian president Jose Sarney expressed the sentiments of the 78 percent of his countrymen who see America as a threat: "Now that Bush has been re-elected, all I can say is, God bless the rest of the world." The truth is that Americans are living in a dream world. Not only do others not share America's self-regard, they no longer aspire to emulate the country's social and economic achievements. The loss of faith in the American Dream goes beyond this swaggering administration and its war in Iraq. A President Kerry would have had to confront a similar disaffection, for it grows from the success of something America holds dear: the spread of democracy, free markets and international institutions--globalization, in a word. Countries today have dozens of political, economic and social models to choose from. Anti-Americanism is especially virulent in Europe and Latin America, where countries have established their own distinctive ways--none made in America. Futurologist Jeremy Rifkin, in his recent book "The European Dream," hails an emerging European Union based on generous social welfare, cultural diversity and respect for international law--a model that's caught on quickly across the former nations of Eastern Europe and the Baltics. In Asia, the rise of autocratic capitalism in China or Singapore is as much a "model" for development as America's scandal-ridden corporate culture. "First we emulate," one Chinese businessman recently told the board of one U.S. multinational, "then we overtake."

Democracy doesn't solve war

Democratic peace theory false- competing interests

Larison 12. (Daniel Larison columnist for The Week. PhD in history from the University of Chicago. April 17, 2012. "Democratic Peace Theory Is False" http://www.theamericanconservative.com/larison/democratic-peace-theory-is-false/

Rojas' claim depends entirely on the meaning of "genuine democracy." Even though there are numerous examples of wars between states with universal male suffrage and elected governments (including that little dust-up known as WWI), the states in question probably don't qualify as "genuine" democracies and so can't be used as counter-examples. Regardless, democratic peace theory draws broad conclusions from a short period in modern history with very few cases before the 20th century. The core of democratic peace theory as I understand it is that democratic governments are more accountable to their populations, and because the people will bear the costs of the war they are going to be less willing to support a war policy. This supposedly keeps democratic states from waging wars against one another because of the built-in electoral and institutional checks on government power. One small problem with this is that it is rubbish. Democracies in antiquity fought against one another. Political equality and voting do not abolish conflicts of interest between competing states. Democratic peace theory doesn't account for the effects of nationalist and imperialist ideologies on the way democratic nations think about war. Democratic nations that have professional armies to do the fighting for them are often enthusiastic about overseas wars. The Conservative-Unionist government that waged the South African War (against two states with elected governments, I might add) enjoyed great popular support and won a huge majority in the "Khaki" election that followed. As long as it goes well and doesn't have too many costs, war can be quite popular, and even if the war is costly it may still be popular if it is fought for nationalist reasons that appeal to a majority of the public. If the

public is whipped into thinking that there is an intolerable foreign threat or if they believe that their country can gain something at relatively low cost by going to war, the type of government they have really is irrelevant. Unless a democratic public believes that a military conflict will go badly for their military, they may be ready to welcome the outbreak of a war that they expect to win. Setting aside the flaws and failures of U.S.-led democracy promotion for a moment, the idea that reducing the number of non-democracies makes war less likely is just fantasy. Clashing interests between states aren't going away, and the more democratic states there are in the world the more likely it is that two or more of them will eventually fight one another.

Democracy doesn't prevent the main threats to peace

Ostrowski '2

(James, Staff – Rockwell, "The Myth of Democratic Peace, Spring, http://www.lewrockwell.com/ostrowski/ostrowski72.html)

Spencer R. Weart alleges that democracies rarely if ever go to war with each other. Even if this is true, it distorts reality and makes people far too sanguine about democracy's ability to deliver the world's greatest need today – peace. In reality, the main threat to world peace today is not war between two nation-states, but (1) nuclear arms proliferation; (2) terrorism; and (3) ethnic and religious conflict within states. As this paper was being written, India, the world's largest democracy, appeared to be itching to start a war with Pakistan, bringing the world closer to nuclear war than it has been for many years. The United States, the world's leading democracy, is waging war in Afghanistan, which war relates to the second and third threats noted above – terrorism and ethnic/religious conflict. If the terrorists are to be believed – and why would they lie?—they struck at the United States on September 11th because of its democratically-induced interventions into ethnic/religious disputes in their parts of the world.

Solvency

1NC FRONTLINE – SOLVENCY

1. The affirmative is unneccessary, the USA freedom act solved the abusive parts of NSA surveillance.

Kaplan 15,
Fred, American author and Pulitzer Prize-winning journalist, PhD in Political Science from MIT. 6-1-2015, "The USA Freedom Act Won't Harm National Security," Slate Magazine, http://www.slate.com/articles/news_and_politics/war_stories/2015/06/don_t_worry_about_the_patriot_act_expiring_the_usa_freedom_act_won_t_hurt.2.html

So does the new law have any significance whatever? Can it properly be called a reform law? Yes, for three main reasons. First, it adopts another of the Obama commission's recommendations: requiring the appointment of a privacy advocate on the FISA Court. This may

make the court hearings—which are held in secret—less of a rubber-stamp exercise. Second, it requires periodic declassification review of the court's rulings (another commission recommendation), which may lead to greater accountability.Third, and most significant, the very removal of metadata from NSA headquarters substantially reduces the potential for abuse. The Obama commission found no evidence that the NSA has used metadata analysis to go after political opponents—or, for that matter, any target other than suspected members or associates of three specific terrorist organizations. It is worth noting that Snowden's documents have revealed no such evidence, either. However, one can imagine what Richard Nixon or J. Edgar Hoover might have done with the technology that the NSA has at its disposal—and it's hardly a farfetched notion that the likes of Nixon or Hoover could again ascend to national power. The NSA has set its metadata-search algorithms to trace terrorists, but there's no physical reason why they couldn't be set to search for domestic drug traffickers, criminals, political enemies, or troublemakers of whatever category some rogue director might choose. (Currently the NSA is crawling with lawyers, who assiduously follow reporting requirements, but one can imagine a climate in which a director might tear down this whole apparatus.) Removing the metadata from the NSA removes the temptation, or opportunity, for abuse. Given the fears tapped by Snowden's disclosures, and some harrowing chapters of 20th-century American history, this is a very good thing. And it's been accomplished with no compromise of national security.

2. The NSA's actions taken under Section 702 have sufficient oversight in the status quo.

Carrie **Cordero 14,**

Director, National Security Studies Georgetown Law Formerly worked for the Justice Department and argued in front of the FISA court, The Brookings Institution A Debate One Year After Snowden: The Future Of U.S. Surveillance Authorities Washington, D.C. Thursday, June 5, 2014 http://www.brookings.edu/events/2014/06/05-debate-snowden-future-us-surveillance-nsa#/full-event/

So, the driving question becomes what problem is it that we're actually trying to solve because some of the reforms that are currently on the table are wildly out of sync with the actual information that has been revealed. And it's also worth noting that there have been significant harms from the disclosures, including operational, economic, and political harms.What has not been revealed is that there is any type of systematic, deliberate, strategic-level misuse or abuse of NSA's authorities, and what we also have learned is that there is actually a significant amount of oversight and accountability that exists over NSA's activities, and this involves oversight of all three branches of government. It involves federal judges who sit on the Foreign Intelligence Surveillance Court, inspectors general, compliance offices, and so when we want to think about what might be meaningful reform going forward, one area that we can focus on is ensuring that those oversight and accountability mechanisms continue to be well-funded, well-staffed, and are continually evaluated for their effectiveness. We also can focus on making sure that there's more information made publicly available regarding how those oversight mechanisms monitor what's going on.

3. Domestic communications are a tiny fraction of data collected by the NSA.

Etzioni, Professor of International Relations at the George Washington University, **2014**
Amitai Etzioni , Intelligence and National Security (2014): NSA: National Security vs. Individual Rights, Intelligence and National Security, DOI: 10.1080/02684527.2013.867221

Critics contend that these standards and procedures are far from rigorous and do not satisfactorily ensure that targeted persons are not American citizens or residents.127 Numbers are difficult to come by, as the intelligence community maintains that it is 'not reasonably possible to identify the number of people located in the United States whose communications may have been reviewed under the authority' of the FISA Amendments Act that authorizes PRISM.128 John D. Bates, the chief judge of the Foreign Intelligence Surveillance Court, has noted that, given the scale of the NSA's data collection, 'the court cannot know for certain the exact number' of wholly domestic communications collected under the act.129

Critics cite an NSA internal audit dated May 2012, which found 2776 incidents in the preceding 12months of unauthorized collection, storage, access to or distribution of protected communications. Most of these incidents were unintended, many involved failures of due diligence or violations of operating procedures. However, 'the most serious incidents included a violation of a court order and unauthorized use of data about more than 3000 Americans and greencard holders.'

Other reports show that (1) these violations make up just a tiny fraction of 250 million communications that are collected by the NSA each year;130 (2) practically all were inadvertent, mostly technical mistakes e.g., syntax errors when making database queries 131 or the programming error that interchanged the Washington DC area code 202 with the international dialing code for Egypt which is 20; 132 (3) measures were taken to reduce error rate; 133 (4) wilful violations of privacy led to termination of the offending employees;134 and (5) the NSA was responsive to internal audits and deferred to court guidance – which shows that oversight works.135

4. Circumvention Turn - NSA Surveillance is much more than a single program, the aff is just playing a game of "Whack-A-Mole." Surveillance will just pop up with another name.

Howell & Zeisberg, 2015
William, Sydney Stein Professor of American Politics at the University of Chicago; Mariah, Associate Professor of Political Science at the University of Michigan; 7-1-2015, "Executive Secrecy," Boston Review, http://bostonreview.net/books-ideas/howell-zeisberg-executive-secrecy

Consider too the development of new computing systems underwriting the surveillance state. Like most legal scholars, Kitrosser focuses her attention on the kinds of information the federal

government can collect and the purposes to which this information can be put. But she does not adequately grapple with the sheer size and breadth of the new capacities that underlie the collection and analysis of information. As Arnold reports, the Department of Defense is working on a "global information grid" with the power to store and process "possibly yottabytes" of data—that is, 1024 bytes, or 100,000 gigabytes, which amounts to 500 quintillion pages of text.

An apparatus of this scale presents a dazzling array of opportunities for mischief. It is as if the government has created an unimaginably large game of Whack-a-Mole: while checking may be an effective way to suppress one troubling program, the existence of this grid will create constant opportunities for new information gathering regimes. For example, although President Barack Obama openly supported the recent restrictions on the NSA implemented by the 2015 Freedom Act, other legislation provides opportunities for him and his successors to continue collecting such data. Through FISA legislation (the legal basis for PRISM and other surveillance and data programs) and Executive Order 12333 (which provides authority for NSA foreign surveillance, and may encompass domestic communications data that travel outside the U.S), presidents will be able to continue programs of mass surveillance despite the Freedom Act—a fact lamented by stalwart critics such as Rand Paul.

Moreover, Kitrosser's framework may call in vain upon legislators and judges to exert independence and oversight they would just as soon disavow. The FISA Court's record of granting 99 percent or more of the warrants that the government requests—including, according to a Snowden leak, permitting the NSA to compel a Verizon company to turn over daily information on every phone call made, foreign or domestic—demonstrates that courts may be only too willing to cooperate with the executive.

5. The NSA will simply come up with new legal authorities and technology to continue surveillance.

Waldman 2015,
Paul contributor to The Plum Line blog, and a senior writer at The American Prospect., 6-3-2015, "A reality check on the future of government spying," Washington Post, http://www.washingtonpost.com/blogs/plum-line/wp/2015/06/03/a-reality-check-on-the-future-of-government-spying/

And let's not forget that the NSA and other government agencies are certain — not possible, not likely, but certain — to come up with new ways to spy on Americans as new technologies become available. Just as the NSA did with the bulk phone data collection, they'll probably take a look at earlier laws and decide that there's a legal basis for whatever new kind of surveillance they want to begin — and that it's best if the public didn't know about it. Indeed, just this week an investigation by the Associated Press revealed that the FBI is using aircraft with advanced cameras to conduct investigations without warrants. That's a relatively mundane use of technology, but there will always be new tools and capabilities coming down the pike, and the impulse will always be to put them into operation, then figure out afterward if it's legally justifiable. The story of the bulk telephone data collection tells us that the only thing likely to

restrain the expansion of government surveillance is public exposure. If you're hoping that politicians who care about privacy will do it on their own, you're likely to be disappointed.

USA Freedom Act Solves Violations

USA Freedom increases transparency and limits the NSA's worst programs.

Nakashima 15,
Ellen, National Security Reporter for the Washington Post 6-1-2015, "Congressional action on NSA is a milestone in the post-9/11 world," Washington Post, http://www.washingtonpost.com/world/national-security/congressional-action-on-nsa-is-a-milestone-in-the-post-911-world/2015/06/02/f46330a2-0944-11e5-95fd-d580f1c5d44e_story.html

The USA Freedom Act, passed by Congress and signed into law by President Obama on Tuesday, marks the first piece of legislation to rein in surveillance powers in the wake of disclosures two years ago by former intelligence contractor Edward Snowden and the national debate he catalyzed. It comes as Obama is winding down the nation's wars overseas and as fears of another terrorist attack on the scale of Sept. 11, 2001, no longer galvanize and unify lawmakers in the same way they once did. Today, Congress and the nation are much more divided about the proper balance between liberty and security. The inability of the Senate for weeks to resolve the issue, forcing the lapse of three surveillance powers at midnight Sunday, reflected the fissures between those who think that the terrorist threat is as potent as ever and those who believe that the government has overreached in its goal to keep Americans safe. With the passage of the USA Freedom Act, though, Congress has answered Obama's call to end the National Security Agency's bulk storage of Americans' phone data while preserving a way for the agency to obtain the records of terrorism suspects. "The Senate's passage of the USA Freedom Act today is a huge win for national security and the Fourth Amendment," said Sen. Mike Lee (R-Utah), a lead sponsor of the bill. At the same time, the legislation doesn't end the surveillance debate or go as far as some members of the president's liberal base or the libertarian right would like. Some lawmakers have vowed to press for further changes to protect citizens' privacy and enhance transparency. "The fight to protect Americans' constitutional rights against government overreach is not over," Sen. Ron Wyden (D-Ore.), who has long called for an end to secret surveillance law, said in a statement. He added: "Everybody who has supported our fight for surveillance reform over the last two years is responsible for our victory today and I'm looking forward to working with a bipartisan coalition to push for greater reforms in the future." The bill's passage is a milestone in the post-9/11 world. "For the first time since 9/11, Congress has placed significant limits on the government's ability to spy on Americans," said Elizabeth Goitein, a national security expert at New York University Law School's Brennan Center for Justice. But the bill's significance, some analysts say, will become apparent only with time. "Is it the beginning of a recalibration of intelligence policy, or is it the most that Congress can accomplish and the end of the reform process?" said Steven Aftergood, a national security and transparency expert at the Federation of American Scientists. "We won't really know that until we get further down the

line." Stewart Baker, a former NSA general counsel, said the law is a landmark — but not a good one. "It is going to make the National Security Agency risk-averse in ways that the CIA has occasionally been risk-averse," he said. "They followed the rules. They believed they were following the rules, and they got punished nonetheless." The USA Freedom Act not only ends NSA bulk collection but also narrows the collection of other types of records under the USA Patriot Act and other intelligence authorities. It increases transparency in surveillance court decisions and provides the opportunity for a public advocate in normally closed court hearings. It also reinstates the three lapsed authorities, while amending one of them.

Oversight works now

Oversight of section 702 is working now.

Cordero, 2014

Carrie F. Cordero, Director, National Security Studies Georgetown Law Formerly worked for the Justice Department and argued in front of the FISA court 6-13-2014, "Fear vs. Facts: Exploring the Rules the NSA Operates Under," Cato Unbound, http://www.cato-unbound.org/2014/06/13/carrie-f-cordero/fear-vs-facts-exploring-rules-nsa-operates-under

It is worth exploring. Here is how oversight of the Section 702 surveillance works, as one example, since it has been the subject of a significant part of the debate of the past year. Section 702 was added to FISA by the FISA Amendments Act of 2008. It authorizes the NSA to acquire the communications, for foreign intelligence purposes, of non-U.S. persons reasonably believed to be outside the United States. These are persons with no Constitutional protections, and yet, because the acquisition requires the assistance of a U.S. electronic communications provider, there is an extensive approval and oversight process. There is a statutory framework. Specifically, the Attorney General and Director of National Intelligence jointly approve certifications. According to declassified documents, the certifications are topical, meaning, the way the statute is being implemented, the certifications are not so specific that they identify individual targets; but they are not so broad that they cover any and everything that might be foreign intelligence information. The certifications are filed with the FISC, along with targeting and minimization procedures. Targeting procedures are the rules by which NSA selects valid foreign intelligence targets for collection. Minimization procedures are rules by which NSA handles information concerning U.S. persons. The FISC has to approve these procedures. If it does not approve them, the government has to fix them. The Court reviews these procedures and processes annually. The Court can request a hearing with government witnesses (like senior intelligence officials, even the NSA Director, if the judge wanted or needed to hear from him personally) or additional information in order to aid in its decisionmaking process. Information about the 702 certifications is reported to the Congressional intelligence committees.

Once the certifications are in effect, attorneys from the Department of Justice's (DOJ) National Security Division and attorneys and civil liberties officials from the Office of the Director of National Intelligence (ODNI) review the NSA's targeting decisions and compliance with the rules. They conduct reviews at least every 90 days. During that 90-day period, oversight personnel are in contact with NSA operational and compliance personnel. Compliance incidents

can be discovered in one of at least two ways: the NSA can self-report them, which it does; or the DOJ and ODNI oversight personnel may discover them on their own. Sometimes the NSA does not report a compliance incident in the required timeframe. Then the time lag in reporting may become an additional compliance incident. The DOJ and ODNI compliance teams write up semi-annual reports describing the results of their reviews. The reports are approved by the Attorney General and Director of National Intelligence and provided to the FISC and to Congress. According to the one report that has been declassified so far, in August 2013, for a six-month period in 2012, the rate of error for the NSA's compliance under Section 702 collection was .49% - less than half of one percent. If we subtract the compliance incidents that were actually delays in reporting, then the noncompliance rate falls to between .15-.25% - less than one quarter of one percent. Hardly an agency run amok.

Amount of Surveillance is Limited

The program under Section 702 does not collect a large amount of data.

Dempsey, 2014

James X Dempsey, Member of the President's Civil Liberties Oversight Board, 7-10-2014, "Take it from a civil liberties watchdog: not everything is bulk surveillance," Guardian, http://www.theguardian.com/commentisfree/2014/jul/10/nsa-privacy-civil-liberties-oversight-board

Our report on the so-called "702 program" provides probably the most complete accounting of any national security surveillance program published by any country in the world. In my personal view, many details about the program could have been made public before Edward Snowden's leaks without hindering the intelligence agencies in doing their job. Indeed, they should have been. There are huge benefits, in terms of democratic legitimacy, to the public knowing what its government is doing. We found that the 702 program does not scan internet communications for keywords. It targets specific individuals using specific identifiers such as email addresses and phone numbers. We saw a demonstration of the government's targeting process. We reviewed sample targeting decisions. We considered how data is filtered before it enters the government's coffers. In sum, what we found is not a bulk collection program.

Collection under Section 702 is miniscule.

Dickerson, 2015

Julie, 3L at Harvard Law School, and previously served as Senior Editor for the Harvard National Security Journal, 2-17-2015, "Harvard National Security Journal – Meaningful Transparency: The Missing Numbers the NSA and FISC Should Reveal," Harvard National Security Journal, http://harvardnsj.org/2015/02/meaningful-transparency-the-missing-numbers-the-nsa-and-fisc-should-reveal/

Under § 702 of the USA-PATRIOT Act, the NSA uses information from U.S. electronic communication service providers to target non-Americans outside the United States for documented foreign intelligence purposes. The NSA collects more than 250 million internet communications under this power each year. While a large absolute number, it is unclear what percent of total internet communications these § 702 communications constitute. The NSA has revealed that the internet carries 1,826 Petabytes of information per day, the NSA touches 1.6% of that data in its foreign intelligence mission, and the NSA only selects 0.025% of that data for review. The net result is that NSA analysts look at a mere 0.00004% of the world's traffic. These percentages of total data traffic, though indicative that the percent of § 702 communications collected is likely miniscule, do not map perfectly onto percentages of total communications.

NSA will Circumvent Restrictions

Limits on NSA surveillance fail, they will simply seek other ways to collect the data, which may be more intrusive.

Pozen, 2015

Pozen, David, Associate Professor, Columbia Law School. Privacy-Privacy Tradeoffs (June 28, 2015). University of Chicago Law Review, Forthcoming. Available at SSRN: http://ssrn.com/abstract=

Restated in more general and prescriptive terms, the suggested tradeoff is that tighter limits on what sorts of data the NSA can electronically collect or mine at the front end might lead to looser—and more privacy-invasive—investigatory practices at the back end. Beyond the automated "sifting" function identified by Posner, a variety of mechanisms could conceivably produce such a result. In the absence of bulk metadata collection under Section 215 of the PATRIOT Act, for instance, the NSA might seek to identify suspected foreign terrorists' American associates in a less surgical manner, through ever-widening wiretaps instead of link analysis and contact chaining. 71

Tighter limits on what may be acquired under any particular authority, such as Section 215, could push NSA officers to submit broader warrant applications to the FISC 72 or to make greater use of other legal authorities, as by expanding the targeting of non-U.S. persons under Section 702 of the Foreign Intelligence Surveillance Act on the hope or expectation that this would yield more "incidental" collection of U.S. persons' communications.73 Barriers to domestic acquisition could likewise lead to more aggressive "privacy shopping," whereby the NSA relies on foreign partners to obtain data it cannot lawfully or efficiently obtain on its own.74

In short, it is not implausible to think that collection limits could backfire; or that the more (meta)data the NSA has at its disposal, the less it will need officers to review intercepted communications. Big Data analytics can take over, to some extent, from old-fashioned listening and reading. And if one deems the latter to be an especially or uniquely significant privacy problem, one can arrive at the unsettling paradox of preferring that the NSA "collect it all"75 on privacy grounds.

Empirically, Presidents have done anything to avoid restrictions on their authority.

Howell & Zeisberg, 2015

William, Sydney Stein Professor of American Politics at the University of Chicago; Mariah, Associate Professor of Political Science at the University of Michigan; 7-1-2015, "Executive Secrecy," Boston Review, http://bostonreview.net/books-ideas/howell-zeisberg-executive-secrecy

But presidents, Arnold reminds us, had no desire to toil in the light of day for all to see. If Congress longed for an information revolution, presidents responded with policy retrenchment. Rather than bend to Congress's wishes, subsequent presidents—Democrats and Republicans alike—went to extraordinary lengths to conceal their activities, defy the clear intent of statutory law, suppress scientific information—in short, to circumvent, hedge, and deny at nearly every turn. "A complete history of the era," Arnold says, "reveals episode after episode of evasive maneuvers, rule bending, clever rhetorical gambits, and outright defiance."

In their effort to work around the legal architecture of the sunshine era, presidents have not merely lurked in the shadows. Arnold catalogs a multitude of cases in which presidents, long before September 11, 2001, developed formal procedures with the express intent of evading the watchful eyes of Congress and the courts. Presidents have repeatedly asserted the authority to classify information that, by all rights, ought to be the subject of public deliberation. Through national security directives and Office of Legal Counsel memos, they have propagated secret laws that are not subject to the checks that Madison and his intellectual descendants considered so vital.

Circumvention of laws banning surveillance is empirically proven.

Ackerman 15,

Spencer, national security editor for the Guardian US. 6-1-2015, "Fears NSA will seek to undermine surveillance reform," Guardian, http://www.theguardian.com/us-news/2015/jun/01/nsa-surveillance-patriot-act-congress-secret-law

Yet in recent memory, the US government permitted the NSA to circumvent the Fisa court entirely. Not a single Fisa court judge was aware of Stellar Wind, the NSA's post-9/11 constellation of bulk surveillance programs, from 2001 to 2004. Energetic legal tactics followed to fit the programs under existing legal authorities after internal controversy or outright exposure. When the continuation of a bulk domestic internet metadata collection program risked the mass resignation of Justice Department officials in 2004, an internal NSA draft history records that attorneys found a different legal rationale that "essentially gave NSA the same authority to collect bulk internet metadata that it had". After a New York Times story in 2005 revealed the existence

of the bulk domestic phone records program, attorneys for the US Justice Department and NSA argued, with the blessing of the Fisa court, that Section 215 of the Patriot Act authorized it all along – precisely the contention that the second circuit court of appeals rejected in May.

Offcase

Topicality

1NC – TOPICALITY DOMESTIC SURVEILLANCE

1. Interpretation - ***Domestic surveillance is surveillance that physically takes place on the surveilling state's territory, which is distinct from foreign surveillance which is in surveillance across state borders and surveillance entirely overseas.***

Deeks, 2015

Ashley. Associate Professor, University of Virginia Law School. "An International Legal Framework for Surveillance." Virginia Journal of International Law 55 (2015): 2014-53.

As a result, this Article is focused on the category of spying that consists of foreign surveillance. "Foreign surveillance" here refers to the clandestine surveillance by one state during peacetime of the communications of another state's officials or citizens (who are located outside the surveilling state's territory) using electronic means, including cyber-monitoring, telecommunications monitoring, satellites, or drones. Foreign surveillance is comprised of two types of surveillance: "transnational surveillance" and "extraterritorial surveillance."13 Transnational surveillance refers to the surveillance of communications that cross state borders, including those that begin and end overseas but incidentally pass through the collecting state. Extraterritorial surveillance refers to the surveillance of communications that take place entirely overseas. For example, if Australia intercepted a phone call between two French nationals that was routed through a German cell tower, this would be extraterritorial surveillance. In contrast, surveillance that takes place on the surveilling state's territory ("domestic surveillance") against either that state's nationals or any other individual physically present in that state generally would be regulated by the ICCPR, as discussed below.14 This Article focuses predominately on transnational and extraterritorial surveillance, arguing that states should close the gap between the ways in which they regulate the two.

2. Violation – The NSA collection of internet traffic under 702 is foreign surveillance the communications of at least one party are outside the US.

Simcox 2015

Robin Simcox is a Research Fellow at The Henry Jackson Society "Surveillance After Snowden Effective Espionage in an Age of Transparency" 5/26/2015 Henry Jackson Society http://henryjacksonsociety.org/2015/05/26/surveillance-after-snowden-effective-espionage-in-an-age-of-transparency/

Foreign Intelligence Surveillance Act Section 702 Section 702 of the Foreign Intelligence Surveillance Act (FISA) governs the interception of communications – for the specific purpose of acquiring foreign intelligence information – of those based outside the US. It is widely considered to be more integral to the NSA's work than that of Section 215.

3. The Affirmative interpretation is bad for debate

Limits are necessary for negative preparation and clash, and their interpretation makes the topic too big. They make the domestic limit meaningless. All surveillance becomes topical by their standards.

4. Topicality is a Voting Issue because the opportunity to prepare promotes better debating

2NC Topicality – Domestic Interpretation

Domestic Surveillance must be entirely within the territorial boundaries of a state.

Forcese, 2011

Craig. Associate Professor, Faculty of Law, University of Ottawa, Canada"Spies Without Borders: International Law and Intelligence Collection." Journal of National Security Law and Policy 5 (2011).

Likewise, electronic surveillance may have a domestic, foreign, and transnational nexus. As noted, a domestic wiretap may be the source of intelligence. In another scenario, one state may covertly monitor communications arising in another state from a listening facility housed in the first state's embassy in the second state's capital. In addition, signals emanating from the territory of one state may be intercepted on the territory of another.

The range of geographic permutations on spying is laid out in table 1. For the purposes of this paper, I shall use the terms "territorial" to describe purely domestic spying, "extraterritorial" to describe purely foreign spying and "transnational" to describe spying that straddles state borders.

Table 1: Geography of Spying

	Territorial	Extraterritorial	Transnational

Human intelligence	Collection of information by a state agent from people and their associated documents and media sources that takes place within the state.	Collection of information by a state agent from people and their associated documents and media sources that takes place on the territory of another the state.	Collection of information by a state agent from peo and their associated documents and media sources in which the sou (but not the agent) is located on the territory o another state.
Electronic surveillance	Interception of communications or actions passed by radio, wire, or other electromagnetic, photo-electronic and/or photooptical means and of electromagnetic radiations in which both the communication and the interception takes place within the state.	Interception of communications or actions passed by radio, wire, or other electromagnetic, photo-electronic and/or photooptical means and of electromagnetic radiations in which both the communication and the interception take place on the territory of another the state.	Interception of communications or actio passed by radio, wire, or other electromagnetic, photo-electronic and/or photo-optical means and electromagnetic radiatio in which the communication (but not interception) takes place the territory of another state

2NC Topicality – Domestic Interpretation Good

The distinction between domestic and foreign is the critical question in determining how to handle surveillance. Their blurring of this distinction means we don't learn about the law.

Freiwald, 2008

Susan. Professor, University of San Francisco School of Law. "Electronic Surveillance at the Virtual Border." Mississippi Law Journal 78 (2008): 2009-15.

While the FISA scheme is a creature of Congress, it must conform to constitutional constraints.26 As Part II discusses, Fourth Amendment precedents require the judiciary to oversee executive branch surveillance of purely "domestic" surveillance.27 But the Fourth Amendment has much less, if anything, to say about executive branch conduct of purely "foreign" surveillance.28 One could defensibly arrange the scenarios along a spectrum from most "domestic," and therefore protected by the Fourth Amendment, to most "foreign," and therefore least protected.

Rather than viewing the Fourth Amendment as providing decreasing judicial oversight as the character of the electronic surveillance becomes increasingly foreign, however, one could instead view Fourth Amendment protection as being all or nothing. In other words, one could view the Fourth Amendment as providing strict regulation for purely domestic investigations and no regulation for purely foreign investigations because the latter are governed by executive branch discretion. Then one would view the rules for cases that fall in the middle as designed to determine whether to treat the investigation as domestic or foreign. Under this view, in cases that are neither clearly domestic nor clearly foreign, the judge's role would be to review the executive's decision to deprive the target of judicial oversight of the surveillance that the Fourth Amendment mandates. The executive makes such a determination when a target effectively acts in the interest of a foreign power; in such a case, the executive may be said to "exile" that target if she is a U.S. Person.29

In this analysis, the virtual border plays a key role. On this side of the virtual border, domestic targets enjoy extensive judicial review of executive branch surveillance, pursuant to the dictates of the Fourth Amendment.30 On the other side, foreign targets are subject to whatever electronic surveillance the executive branch chooses to conduct in the exercise of its foreign affair powers.31 Foreign targets have no right to complain about surveillance techniques in our courts, though they may of course raise their complaints in their own courts.32

2NC Topicality – Clear Definition Good

Clear definition of domestic surveillance is critical to good policy making.

Yoo and Sulmasy 2007,

Yoo, John, Judge Advocate and Associate Professor of Law, United States Coast Guard Academy. Sulmasy, Glenn, Professor of Law, Boalt Hall School of Law, University of California–Berkeley; visiting scholar, American Enterprise Institute Counterintuitive: Intelligence Operations and International Law. Michigan Journal of International Law, Vol. 28, 2007; UC Berkeley Public Law Research Paper No. 1030763. Available at SSRN: http://ssrn.com/abstract=1030763

Domestically, so many components and issues comprise "intelligence" that it remains difficult to pin down a specific definition.22 Mark Lowenthal, an expert in intelligence gathering, has noted that "[v]irtually every book written on the subject of intelligence begins with a discussion of what the author believes 'intelligence' to mean, or at least how the he or she intends to use the term. This editorial fact tells us much about the field of intelligence."23 Even those who have spent years in the field find the term vague.24 Any international convention on the peacetime conduct of intelligence collection would prove unsuccessful at the very least because of difficulties in defining exactly what it would seek to regulate. Defining intelligence and intelligence gathering often derives from such vague subject terms as counterintelligence, business intelligence, foreign intelligence, espionage, maritime intelligence, space-related intelligence, signals intelligence, and human intelligence. These subject terms themselves then need an established universal definition and further simplification in order to reduce the ambiguity associated with attempts to regulate the practice. Currently, the United States defines intelligence as a body of evidence and the

conclusions drawn from it. It is often derived from information that is concealed or not intended to be available for use by the inquirer."25 This vague and overly broad definitional statement reveals the problems with actually articulating what intelligence is and what it is not. Without a clear definition of the term (from the United States or any other state for that matter), we should not expect regulation of intelligence activities at the international level.

2NC Topicality – NSA is Foreign Surveillance

The NSA is a Foreign Intelligence agency.

De, 2014,

Rajesh De, General Counsel, National Security Agency, 10-16-2014, "The NSA and Accountability in an Era of Big Data," Journal Of National Security Law & Policy, http://search.proquest.com/docview/1547942293/D7CD0D4112B54FC9PQ/2?accountid=10422

As noted earlier, NSA is a foreign intelligence agency. Executive Order 12333 defines foreign intelligence as "information relating to the capabilities, intentions, or activities of foreign governments or elements thereof, foreign organizations, foreign persons, or international terrorists." This language largely mirrors that which Congress adopted in the National Security Act of 1947. FISA contains a more intricate definition of foreign intelligence information for the specific purposes of that statutory scheme, but all support the same overall conclusion - NSA's mission is neither open-ended, nor is it discretionary. NSA may only collect signals intelligence for a foreign purpose.

Section 702 collects communications of non-Americans outside of the US.

Dickerson, 2015

Julie, 3L at Harvard Law School, and previously served as Senior Editor for the Harvard National Security Journal, 2-17-2015, "Harvard National Security Journal – Meaningful Transparency: The Missing Numbers the NSA and FISC Should Reveal," Harvard National Security Journal, http://harvardnsj.org/2015/02/meaningful-transparency-the-missing-numbers-the-nsa-and-fisc-should-reveal/

Under § 702 of the USA-PATRIOT Act, the NSA uses information from U.S. electronic communication service providers to target non-Americans outside the United States for documented foreign intelligence purposes. The NSA collects more than 250 million internet communications under this power each year. While a large absolute number, it is unclear what percent of total internet communications these § 702 communications constitute. The NSA has revealed that the internet carries 1,826 Petabytes of information per day, the NSA touches 1.6% of that data in its foreign intelligence mission, and the NSA only selects 0.025% of that data for review. The net result is that NSA analysts look at a mere 0.00004% of the world's traffic. These percentages of total data traffic, though indicative that the percent of § 702 communications collected is likely miniscule, do not map perfectly onto percentages of total communications.

Terrorism DA
1NC TERRORISM DA LINK

Link –Section 702 is the most valuable NSA surveillance program, it has prevented multiple terror attacks.

Taylor 14

Stuart Taylor, JD (Harvard), author and freelance journalist focusing on legal and policy issues, a Brookings Institution nonresident senior fellow, and a National Journal contributing editor. The Big Snoop: Life, Liberty, and the Pursuit of Terrorists

April 28, 2014 http://www.brookings.edu/research/essays/2014/big-snoop

Yet there's no denying that PRISM's mining of emails and other Internet messages has produced a mother lode of useful information. An internal NSA document leaked by Snowden described the program as "the most prolific contributor to the President's Daily Brief" and the NSA's "leading source of raw material, accounting for nearly one in seven [of all the intelligence community's secret] reports."

More to the point, PRISM has often contributed to the collection of actionable intelligence used in the fight against terrorism. Even Wyden, the NSA's strongest congressional critic, acknowledges as much. He and his ally on the surveillance issue, Senator Mark Udall (D-Colo.), said in a joint statement last summer that "multiple terrorist plots have been disrupted at least in part because of information obtained under Section 702."

Link Terrorism- 702 and Prism

Surveillance under section 702 is crucial to detect and act on threats of terrorism.

Hines 13

Pierre Hines is a defense council member of the Truman National Security Project, "Here's how metadata on billions of phone calls predicts terrorist attacks" http://qz.com/95719/heres-how-metadata-on-billions-of-phone-calls-predicts-terrorist-attacks, June 19th, 2013

Yesterday, when NSA Director General Keith Alexander testified before the House Committee on Intelligence, he declared that the NSA's surveillance programs have provided "critical leads to help prevent over 50 potential terrorist events." FBI Deputy Director Sean Boyce elaborated by describing four instances when the NSA's surveillance programs have had an impact: (1) when an intercepted email from a terrorist in Pakistan led to foiling a plan to bomb of the New York subway system; (2) when NSA's programs helped prevent a plot to bomb the New York Stock Exchange; (3) when intelligence led to the arrest of a U.S. citizen who planned to bomb the Danish Newspaper office that published cartoon depictions of the Prophet Muhammad; and (4) when the NSA's programs triggered reopening the 9/11 investigation. So what are the practical applications of internet and phone records gathered from two NSA programs? And how can "metadata" actually prevent terrorist attacks? Metadata does not give the NSA and intelligence

community access to the content of internet and phone communications. Instead, metadata is more like the transactional information cell phone customers would normally see on their billing statements—metadata can indicate when a call, email, or online chat began and how long the communication lasted. Section 215 of the Patriot Act provides the legal authority to obtain "business records" from phone companies. Meanwhile, the NSA uses Section 702 of the Foreign Intelligence Surveillance Act to authorize its PRISM program. According the figures provided by Gen. Alexander, intelligence gathered based on Section 702 authority contributed in over 90% of the 50 cases. One of major benefits of metadata is that it provides hindsight—it gives intelligence analysts a retrospective view of a sequence of events. As Deputy Director Boyce discussed, the ability to analyze previous communications allowed the FBI to reopen the 9/11 investigation and determine who was linked to that attack. It is important to recognize that terrorist attacks are not orchestrated overnight; they take months or years to plan. Therefore, if the intelligence community only catches wind of an attack halfway into the terrorists' planning cycle, or even after a terrorist attack has taken place, metadata might be the only source of information that captures the sequence of events leading up to an attack. Once a terrorist suspect has been identified or once an attack has taken place, intelligence analysts can use powerful software to sift through metadata to determine which numbers, IP addresses, or individuals are associated with the suspect. Moreover, phone numbers and IP addresses sometimes serve as a proxy for the general location of where the planning has taken place. This ability to narrow down the location of terrorists can help determine whether the intelligence community is dealing with a domestic or international threat.

Link Terrorism – Online Surveillance

Surveillance of internet communication is critical to stop terrorism.

De, 2014

Rajesh De, General Counsel, National Security Agency, 10-16-2014, "The NSA and Accountability in an Era of Big Data," Journal Of National Security Law & Policy, http://search.proquest.com/docview/1547942293/D7CD0D4112B54FC9PQ/2?accountid=10422

NSA performs its mission in an ever more rapidly evolving operational environment, one characterized by persistent change in both the nature of our adversaries and their communications. Foreign threats are no longer limited to traditional nation state actors, or even widely-recognized terrorist groups like al Qaeda and its affiliates. Moreover, adversaries today communicate through means more operationally simple yet technically sophisticated than ever before. As you know better than most, these changes are taking place against a backdrop of increasingly complex, dynamic, and voluminous communications data flows around the globe. Industry and academic estimates regularly chart the growth of such trends, often in metrics of such dizzying scale that they can become mind numbing: as of 2012, about 2.5 exabytes of data are created each day; more data crosses the internet every second today than was stored on the entire internet 20 years ago; global mobile traffic grew 70 percent in 2012, reaching 885 petabytes per month; and it is estimated that the number of mobile-connected devices will exceed the world's population in 2013. Scale, however, is merely one of the challenges for a signals intelligence agency like NSA-trends toward greater mobility and the increasing adoption of internet- based encryption pose additional challenges as well.

Perhaps the most alarming trend is that the digital communications infra- structure is increasingly also becoming the domain for foreign threat activity. In other words, it is no longer just a question of "collecting" or even "connecting" the dots in order to assess foreign threats amidst more and more digital noise, it is also a question of determining which of the so-called "dots" may constitute the threat itself. As President Obama has recognized, "the cyber threat to our nation is one of the most serious economic and national security challenges we face."

Blocking intelligence from using the internet is a huge risk- terrorists use the internet.

Cordero, 2013

Carrie Director of National Security Studies & Adjunct Professor of Law Georgetown University Law Center "Continued Oversight of US Government Surveillance Authorities: Hearing Before the S. Committee on the Judiciary, 113th Cong., December 11, 2013 (Statement by Professor Carrie F. Cordero, Geo. UL Center)." (2013).

Some will argue that Congress should outlaw bulk collection under FISA, based on the "power of metadata" argument as well as arguments about our changing expectation of privacy in light of the methods of modern communications. But everyday Americans, or friends in foreign nations, are not the only people using the Internet to communicate. We all - - regular people, government leaders, as well as those who pose national security threats such as terrorists, terrorist financiers and facilitators, proliferators of weapons of mass destruction, spies, sophisticated hackers, and cyber intruders - - use the Internet, computers, and smart phones to communicate. And so just as regular people should not be expected to turn off their modern communications and revert to old fashioned modes of communication, neither should the Intelligence Community or law enforcement resort to pen, paper and index cards to conduct national security collection or investigations. It is just as unrealistic to expect citizens to unplug, as it is to expect or require the NSA or FBI to use 20th century collection, analytic or investigative techniques or methods to protect the nation from 21st century threats.

Link Terrorism – Delay

The plan results in a huge amount of paperwork for the NSA – makes them really slow

Cordero, 2013

Carrie Director of National Security Studies & Adjunct Professor of Law Georgetown University Law Center "Continued Oversight of US Government Surveillance Authorities: Hearing Before the S. Committee on the Judiciary, 113th Cong., December 11, 2013 (Statement by Professor Carrie F. Cordero, Geo. UL Center)." (2013).

In light of recent unauthorized disclosures, concerns have also been expressed regarding the NSA's collection targeting or pertaining to foreign persons located outside the United States. Suggestions have been made that U.S. foreign intelligence collection should recognize some sort of privacy right for non-U.S. persons. In fact, the U.S. Intelligence Community has a recent history of affording Constitutional protections to persons who are not entitled to them. Congress made a deliberate decision with the passage of the FISA Amendments Act of 2008 to end that practice. And for good reason: prior to 2007, the U.S. government was, in fact, going through incredible hoops to acquire certain communications of foreign terrorist targets overseas. Two parallel processes caused this to happen. The first was described in a written statement for the record by the Director of National Intelligence before this Committee in September 2007

"…[P]rior to Congress passing the Protect America Act last month, in a significant number of cases, IC agencies were required to make a showing of probable cause in order to target for surveillance the communications of a foreign intelligence target located overseas. Then, they needed to explain that probable cause finding in documentation, and obtain approval of the FISA Court to collect against a foreign terrorist located in a foreign country. Frequently, although not always, that person's communications were with another foreign person located overseas. In such cases, prior to the Protect America Act, FISA's requirement to obtain a court order, based on a showing of probable cause, slowed, and in some cases prevented altogether, the Government's ability to collect foreign intelligence information, without serving any substantial privacy or civil liberties interests."

In other words, the Intelligence Community, because of the requirements of the FISA statute prior to 2007, found itself in a position where it was seeking individual probable cause-based orders from the FISC to target terrorists overseas. When the government needed to obtain certain communications of a terrorist target, located in, as examples, Pakistan or Yemen, it was preparing a full application to the FISC, with a detailed factual showing providing probable cause that the target was an agent of a foreign power, and obtaining the signatures of a high ranking national security official and the Attorney General, and then submitting that application to the FISC for approval. This extensive process, in addition to being unnecessary from a Constitutional perspective, was a crushing force on the system.

Terrorism – Answers to "Too much Data"

The NSA needs all of the data – its like taking out 200 pieces of a 1000 piece puzzle, it becomes a lot harder to understand the picture when you eliminate data.

Lewis, 2014

James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy. "Underestimating Risk in the Surveillance Debate" Center for Strategic and International Studies http://csis.org/publication/underestimating-risk-surveillance-debate

This effort takes place over months and involves multiple intelligence, law enforcement, and military agencies, with more than a dozen individuals from these agencies collaborating to build up a picture of the bomb-maker and his planned attack. When the bomb-maker leaves the Middle East to carry out his attack, he is prevented from entering the United States. An analogy for how this works would be to take a 1,000-piece jigsaw puzzle, randomly select 200 pieces, and provide them to a team of analysts who, using incomplete data, must guess what the entire picture looks like. The likelihood of their success is determined by how much information they receive, how much time they have, and by experience and luck. Their guess can be tested by using a range of

collection programs, including communications surveillance programs like the 215 metadata program.

What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects.

There's not too much data – computer processing power solves the problem.

Sagar, 2015

Rahul, associate professor of political science at Yale-NUS College and the Lee Kuan Yew School of Public Policy at the National University of Singapore. He was previously assistant professor in the Department of Politics at Princeton University., "Against Moral Absolutism: Surveillance and Disclosure After Snowden," Ethics & International Affairs / Volume 29 / Issue 02 / 2015, pp 145-159.

Greenwald also raises objections from a national security perspective. He warns that mass surveillance undermines national security because "it swamps the intelligence agencies with so much data that they cannot possibly sort through it effectively."11 He also questions the efficacy of communications surveillance, arguing that it has little to show in terms of success in combating terrorism. But these criticisms are equally unpersuasive. It is certainly possible that a surveillance program could generate so much raw data that an important piece of information is overlooked. But in such a case the appropriate response would not be to shut down the program but rather to bulk up the processing power and ~~manpower~~ devoted to it. Finally, both the President's Review Group and the Privacy and Civil Liberties Oversight Board have examined the efficacy of the NSA's programs. Both report that the NSA's foreign surveillance programs have contributed to more than fifty counterterrorism investigations, leading them to conclude that the NSA "does in fact play an important role in the nation's effort to prevent terrorist attacks across the globe."12

Bulk data is critical to eliminate false positives.

Lewis, 2014

James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy. "Underestimating Risk in the Surveillance

Debate" Center for Strategic and International Studies http://csis.org/publication/underestimating-risk-surveillance-debate

Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents.

Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios.

Offcase Other
POLITICS DISAD LINK

The plan is unpopular because PRISM works, Congress got rid of metadata in the USA Freedom act because it was ineffecitve.

Volz and Fox 15,
Dustin Volz is a staff correspondent for National Journal covering tech policy. Dustin is a graduate of Arizona State University. *Lauren Fox* is a staff correspondent for National Journal. She graduated from the University of Oregon. 6-3-2015, "The War Over NSA Spying Is Just Beginning," nationaljournal, http://www.nationaljournal.com/tech/the-war-over-nsa-spying-is-just-beginning-20150603

The momentum to end the NSA's phone dragnet snowballed over the past year and a half as two review panels deemed it ineffective. President Obama pledged to end it "as it currently exists" and a federal appeals court deemed it illegal. But further reforms—such as to the Internet surveillance program known as PRISM, which Snowden also revealed—are likely to be tougher sells in Congress. For PRISM especially, that's in part because the program is considered more useful and because it deals primarily with surveillance of foreigners. U.S. tech companies that are subject to PRISM, including Facebook, Yahoo, and Google, have called for changes to the program. Yet when asked about whether he would work to take down PRISM, even Wyden bristled at the question. "I am going to keep it to the three that I am going to

change," Wyden said. Even reformers outside the confines of the Senate recognize that ending PRISM is a complicated pursuit. "It is not going to be quite as easy to drum up the same support," says Liza Goitein, codirector for the Liberty & National Security Program at the Brennan Center for Justice.

Executive Counter-plan Solvency

The President should limit NSA programs on their own. Congressional limits are too inflexible and link to the Terrorism disad.

Carrie **Cordero 14,**
Director, National Security Studies Georgetown Law Formerly worked for the Justice Department and argued in front of the FISA court, The Brookings Institution A Debate One Year After Snowden: The Future Of U.S. Surveillance Authorities Washington, D.C. Thursday, June 5, 2014 http://www.brookings.edu/events/2014/06/05-debate-snowden-future-us-surveillance-nsa#/full-event/

MS. CORDERO: One additional point on the President's initiative. So, there have been policy directives. The President issued a new order in January that does place additional limits on the collection. That is completely within the President's authority and is appropriate and so forth.

Where I think this debate over the last year is now taking a turn is now the President can make those determinations, and if it determines that those policy decisions are having an adverse impact on national security and he needs to adjust them, he currently has the flexibility to do that.

The problem with some of the legislative proposals that are currently on the table is that they will outlaw certain activity, and it will be in law if bulk collection, for example, is outlawed, can't be conducted under the FISA statute. And that's where we risk the potential to create an environment that nobody in the legal community or the national security community wants to revisit, which is the environment that we faced in the pre-9/11 days and right after where the law, the statutes, had become so outdated with respect to the way the technology occurred and the threats that we were facing that the Executive needed to act on Executive authority alone. And unfortunately some of the proposals that are currently on the table risk putting us down that path in the years to come.

The President can unilaterally end the programs.

Brand, 2015
Rachel L. Brand 15, Hon. Rachel L. Brand is a member of the US Privacy and Civil Liberties Oversight Board. Previously, Ms. Brand served as assistant attorney general for legal policy and as an associate counsel to President George W. Bush. She was a law clerk to Justice Anthony Kennedy of the US Supreme Court., 5-20-2015, "Opinion: What Congress gets wrong about NSA surveillance practices," Christian Science Monitor,

http://www.csmonitor.com/World/Passcode/Passcode-Voices/2015/0520/Opinion-What-Congress-gets-wrong-about-NSA-surveillance-practices

The debate about this program is important, and reasonable people differ on whether its benefits outweigh its privacy impacts. But if the goal is to do away with this program, legislation is unnecessary. The president could unilaterally end the program today without any action by Congress. This would be simpler and have fewer unintended consequences than passing legislation that permanently removes this investigative tool from the toolbox and tinkers with a number of other important counterterrorism tools.

Advantage answers

Privacy

1nc – privacy advantage

Overwhelming corporate and government tracking is inevitable – the aff is a meaningless half-measure

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

There's a whole industry devoted to tracking you in real time. Companies use your phone to track you in stores to learn how you shop, track you on the road to determine how close you might be to a particular store, and deliver advertising to your phone based on where you are right now.

Your location data is so valuable that cell phone companies are now selling it to data brokers, who in turn **resell it** to anyone willing to pay for it. Companies like Sense Networks specialize in using this data to build personal profiles of each of us.

Phone companies are not the only source of cell phone data. The US company Verint sells cell phone tracking systems to both **corporations and governments worldwide**. The company's website says that it's "a global leader in Actionable Intelligence solutions for customer engagement optimization, security intelligence, and fraud, risk and compliance," with clients in "more than 10,000 organizations in over 180 countries." The UK company Cobham sells a system that allows someone to send a "blind" call to a phone—one that doesn't ring, and isn't detectable. The blind call forces the phone to transmit on a certain frequency, allowing the sender to track that phone to within one meter. The company boasts government customers in Algeria, Brunei, Ghana, Pakistan, Saudi Arabia, Singapore, and the United States. Defentek, a company mysteriously registered in Panama, sells a system that can "locate and track any phone number in the world … undetected and unknown by the network, carrier, or the target." It's not an idle boast; telecommunications researcher Tobias Engel demonstrated the same thing at a hacker conference in 2008. Criminals do the same today.

All this location tracking is based on the cellular system. There's another entirely different and more accurate location system built into your smartphone: GPS. This is what provides location data to the various apps running on your phone. Some apps use location data to deliver service: Google Maps, Uber, Yelp. Others, like Angry Birds, just want to be able to collect and sell it.

You can do this, too. HelloSpy is an app that you can surreptitiously install on someone else's smartphone to track her. Perfect for an anxious mom wanting to spy on her teenager—or an

abusive man wanting to spy on his wife or girlfriend. Employers have used apps like this to spy on their employees.

The US National Security Agency (NSA) and its UK counterpart, Government Communications Headquarters (GCHQ), use location data to track people. The NSA collects cell phone location data from a variety of sources: the cell towers that phones connect to, the location of Wi-Fi networks that phones log on to, and GPS location data from Internet apps. Two of the NSA's internal databases, code-named HAPPYFOOT and FASCIA, contain comprehensive location information of devices worldwide. The NSA uses the databases to track people's movements, identify people who associate with people of interest, and target drone strikes.

The NSA can allegedly track cell phones even when they are turned off. I've just been talking about location information from one source—your cell phone— but the issue is far larger than this. The computers you interact with are constantly producing intimate personal data about you. It includes what you read, watch, and listen to. It includes whom you talk to and what you say. Ultimately, it covers what you're thinking about, at least to the extent that your thoughts lead you to the Internet and search engines. We are living in the **golden age of surveillance**.

Sun Microsystems' CEO Scott McNealy said it plainly way back in 1999: "You have zero privacy anyway. Get over it." He's wrong about how we should react to surveillance, of course, but he's right that it's becoming harder and harder to avoid surveillance and maintain privacy.

Surveillance is a politically and emotionally loaded term, but I use it deliberately. The US military defines surveillance as "systematic observation." As I'll explain, modern-day electronic surveillance is exactly that. **We're all open books** to both governments and corporations; their ability to peer into our collective personal lives is greater than it has ever been before.

The bargain you make, again and again, with various companies is surveillance in exchange for free service. Google's chairman Eric Schmidt and its director of ideas Jared Cohen laid it out in their 2013 book, The New Digital Age. Here I'm paraphrasing their message: if you let us have all your data, we will show you advertisements you want to see and we'll throw in free web search, e-mail, and all sorts of other services. It's convenience, basically. We are social animals, and there's nothing more powerful or rewarding than communicating with other people. Digital means have become the easiest and quickest way to communicate. And why do we allow governments access? Because we fear the terrorists, fear the strangers abducting our children, fear the drug dealers, fear whatever bad guy is in vogue at the moment. That's the NSA's justification for its mass surveillance programs; if you let us have all of your data, we'll relieve your fear.

No privacy intrusion – legal restraints prevent data collection of non-targets

De 14 - General Counsel, National Security Agency (Rajesh, "The NSA and Accountability in an Era of Big Data", JOURNAL OF NATIONAL SECURITY LAW & POLICY, 2014, p.6-8//DM)

False Myth: #2: NSA is spying on Americans at home and abroad with questionable or no legal basis.

This false myth reflects both deep philosophical distrust of the secretive NSA by some, and the reality that signals intelligence activities, unlike some other intelligence activities, inevitably

implicate the privacy rights of U.S. persons. It also reflects more recent controversy over so-called "warrantless wiretapping" under the President's Terrorist Surveillance Program (TSP). Without getting into details about the TSP (the authorization for which ended in 2007, but much of which is still classified and the subject of litigation) or FISA (an intricate statutory scheme), I would like to make a few general points about our current operations to help dispel this myth.

First, without an individualized determination of probable cause by a federal judge, NSA does not target the communications of any unconsenting U.S. person anywhere in the world when there is a reasonable expectation of privacy and a warrant would be required for law enforcement purposes in the United States (note that pursuant to statute and regulation, under certain emergency scenarios the Attorney General can make an initial finding of probable cause, but if within the purview of FISA, the Foreign Intelligence Surveillance Court must subsequently make that determination). One point worth highlighting in particular is that, amidst the controversy over the recent amendments made to FISA in 2008 and reauthorized in 2012, an important change was made: targeting a U.S. person abroad now requires a probable cause finding by a federal judge, whereas previously it could be approved by the Attorney General alone under Executive Order 12333.

Second, under even one of the more controversial provisions of the recent FISA amendments, Section 702, where no individualized probable cause finding is required, express limits were enacted:

● Section 702 may only be used to target non-U.S. persons reasonably believed to be located outside the United States.

● Section 702 may not be used to intentionally target any person in the United States or a U.S. person outside the United States.

● Section 702 may not be used to conduct "reverse targeting" – i.e., targeting of a person outside the United States if the purpose is to target a particular, known person inside the United States.

● Section 702 may not be used to intentionally acquire a "wholly-domestic communication" – i.e., a communication where all communicants are inside the United States.

● Section 702 must be implemented in a manner consistent with the Fourth Amendment.

2nc – corporate surveillance inevitable

Corporate surveillance is inevitable and they'll willingly provide data to the government

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

Corporate surveillance and government surveillance aren't separate. They're intertwined; the two support each other. It's a **public-private surveillance partnership** that spans the world. This isn't a formal agreement; it's more an alliance of interests. Although it isn't absolute, it's become a de facto reality, with many powerful stakeholders supporting its perpetuation. And though Snowden's revelations about NSA surveillance have caused rifts in the partnership—we'll talk about those in Chapter 14—it's still strong. The Snowden documents made it clear how much the NSA relies on US corporations to eavesdrop on the Internet. The NSA didn't build a massive Internet eavesdropping system from scratch. It noticed that the corporate world was already building one, and tapped into it. Through programs like PRISM, the NSA legally compels Internet companies like Microsoft, Google, Apple, and Yahoo to provide data on several thousand individuals of interest. Through other programs, the NSA gets direct access to the Internet backbone to conduct mass surveillance on everyone. Sometimes those corporations **work with the NSA willingly**. Sometimes they're forced by the courts to hand over data, largely in secret. At other times, the NSA has hacked into those corporations' infrastructure without their permission.

This is happening all over the world. Many countries use corporate surveillance capabilities to monitor their own citizens. Through programs such as TEMPORA, the UK's GCHQ pays telcos like BT and Vodafone to give it access to bulk communications all over the world. Vodafone gives Albania, Egypt, Hungary, Ireland, and Qatar—possibly 29 countries in total—direct access to Internet traffic flowing inside their countries. We don't know to what extent these countries are paying for access, as the UK does, or just demanding it. The French government eavesdrops on France Télécom and Orange. We've already talked about China and Russia in Chapter 5. About a dozen countries have data retention laws—declared unconstitutional in the EU in 2014—requiring ISPs to keep surveillance data on their customers for some months in case the government wants access to it. Internet cafes in Iran, Vietnam, India, and elsewhere must collect and retain identity information of their customers.

Similar things are happening off the Internet. Immediately after 9/11, the US government bought data from data brokers, including air passenger data from Torch Concepts and a database of Mexican voters from ChoicePoint. US law requires financial institutions to report cash transactions of $10,000 or larger to the government; for currency exchangers, the threshold is $1,000. Many governments require hotels to report which foreigners are sleeping there that night, and many more make copies of guests' ID cards and passports. CCTV cameras, license plate capture systems, and cell phone location data are being used by numerous governments.

By the same token, corporations obtain government data for their own purposes. States like Illinois, Ohio, Texas, and Florida sell driver's license data, including photos, to private buyers. Some states sell voter registration data. The UK government proposed the sale of taxpayer data in 2014, but public outcry has halted that, at least temporarily. The UK National Health Service also plans to sell patient health data to drug and insurance firms. There's a feedback loop: corporations argue for more government data collection, then argue that the data should be released under open government laws, and then repackage the data and sell it back to the government.

The net result is that a lot of surveillance data moves back and forth between government and corporations. One consequence of this is that it's hard to get effective laws passed to curb corporate surveillance—governments don't really want to limit their own access to data by crippling the **corporate hand that feeds them**.

The government can just ask for or buy the data – surveillance unnecessary

Turner, 15 - Brad Turner is a graduate of Duke Law School and a practicing attorney in Ohio. ("When Big Data Meets Big Brother: Why Courts Should Apply United States v. Jones to Protect People's Data" 16 N.C. J.L. & Tech. 377, January, lexis)

The government can obtain second-hand data from private parties in a variety of ways. First, the government can simply ask for it. According to Google, nearly 1% of requests for its user data from law enforcement are emergency requests. n185 A bill that has been proposed in Congress, called the Cyber Intelligence Sharing and Protection Act ("CISPA"), might dramatically increase this percentage. CISPA would make it legal for the government to ask companies for data about their customers and then protect those companies from lawsuits related to the handing over of that data, "notwithstanding any other provision of law." n186

Second, the government can demand the data with a subpoena. A subpoena need not be reviewed or pre-approved by a court to be valid and enforceable. n187 Google says that 68% of its data requests from the government are in the form of a subpoena. n188 Subpoenas can request any information or documents that are at all relevant to an investigation. Relevance is defined very broadly and includes any information or documents that "might have the potential to lead to relevant information." n189 So long as a subpoena meets this very lenient standard, a court will deem the subpoena valid to the extent that the subpoena's demands are not overbroad or unduly burdensome. n190

Third, the government can demand the information with a court order, which, by definition, does require prior approval by a [*411] court. n191 Google says that 22% of its requests for data by the government are from warrants, and another 6% are from court orders. n192 The NSA collects much of its data by using secret FISA court orders, collecting huge sums of data from U.S. telephone companies, including AT&T, Verizon, and Sprint, and Internet service-providers like Facebook, Apple, Google, Microsoft, Yahoo, and AOL. n193 Statutes regulate these data-collection efforts. n194

Fourth, the government **can purchase the information**. Big Data is valuable and companies are willing to sell. n195 For the right price, [*412] government can access the same rich data-troves held by private organizations. For example, the federal government recently started buying access to a private database maintained by the credit bureau Equifax, called "The Work Numbers." n196 The database contains 54 million active salary and employment records and more than 175 million historical records from approximately 2,500 U.S. employers. n197 Equifax also sells this same data to credit card issuers, property managers, and auto lenders. n198

Can't solve privacy – private sector and foreign government collection

Lewis 5/28 – Director and Senior Fellow, Strategic Technologies Program (James Lewis, "What Happens on June 1?", CSIS Strategic Technologies Program, http://www.csistech.org/blog/2015/5/28/what-happens-on-june-1, 5/28/2015)//MBB

Privacy itself will not increase. The privacy battle was lost years ago when extracting your personal data became the business model of the internet. Americans have far less privacy than they did in 1995 and NSA has nothing to do with this. There are several ironies in this situation, not the least being that NSA collection operated under far more rules than private sector or foreign government collection, and many of the immense private sector databases are likely **accessible to foreign governments** (if they decide they can use them).

Economic incentives for corporate surveillance overwhelm the plan on a massive scale

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

Historically, surveillance was difficult and expensive. We did it only when it was important: when the police needed to tail a suspect, or a business required a detailed purchasing history for billing purposes. There were exceptions, and they were extreme and expensive. The exceptionally paranoid East German government had 102,000 Stasi surveilling a population of 17 million: that's one spy for every 166 citizens, or one for every 66 if you include civilian informants.

Corporate surveillance has grown from collecting as little data as necessary to collecting as much as possible. Corporations always collected information on their customers, but in the past they didn't collect very much of it and held it only as long as necessary. Credit card companies collected only the information about their customers' transactions that they needed for billing. Stores hardly ever collected information about their customers, and mail-order companies only collected names and addresses, and maybe some purchasing history so they knew when to remove someone from their mailing list. Even Google, back in the beginning, collected far less information about its users than it does today. When surveillance information was expensive to collect and store, corporations made do with as little as possible.

The cost of computing technology has declined rapidly in recent decades. This has been a profoundly good thing. It has become cheaper and easier for people to communicate, to publish their thoughts, to access information, and so on. But that same decline in price has also brought down the price of surveillance. As computer technologies improved, corporations were able to collect more information on everyone they did business with. As the cost of data storage became cheaper, they were able to save more data and for a longer time. As big data analysis tools became more powerful, it became profitable to save more information. This led to the surveillance-based business models I'll talk about in Chapter 4.

Government surveillance has gone from collecting data on as few people as necessary to collecting it on as many as possible. When surveillance was manual and expensive, it could only be justified in extreme cases. The warrant process limited police surveillance, and resource constraints and the risk of discovery limited national intelligence surveillance. Specific individuals were targeted for surveillance, and maximal information was collected on them alone. There were also strict minimization rules about not collecting information on other people. If the

FBI was listening in on a mobster's phone, for example, the listener was supposed to hang up and stop recording if the mobster's wife or children got on the line.

As technology improved and prices dropped, governments broadened their surveillance. The NSA could surveil large groups—the Soviet government, the Chinese diplomatic corps, leftist political organizations and activists—not just individuals. Roving wiretaps meant that the FBI could eavesdrop on people regardless of the device they used to communicate with. Eventually, US agencies could spy on entire populations and save the data for years. This dovetailed with a changing threat, and they continued espionage against specific governments, while expanding mass surveillance of broad populations to look for potentially dangerous individuals. I'll talk about this in Chapter 5.

The result is that corporate and government surveillance interests have converged. Both now want to know everything about everyone. The motivations are different, but the methodologies are the same. That is the primary reason for the strong public-private security partnership that I'll talk about in Chapter 6.

All personal information is freely available – the aff is a meaningless gesture

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

The result of this declining cost of surveillance technology is not just a difference in price; it's a difference in kind. Organizations end up doing more surveillance—a lot more. For example, in 2012, after a Supreme Court ruling, the FBI was required to either obtain warrants for or turn off 3,000 GPS surveillance devices installed in cars. It would simply be impossible for the FBI to follow 3,000 cars without automation; the agency just doesn't have the manpower. And now the prevalence of cell phones means that everyone can be followed, all of the time.

Another example is license plate scanners, which are becoming more common. Several companies maintain databases of vehicle license plates whose owners have defaulted on their auto loans. Spotter cars and tow trucks mount cameras on their roofs that continually scan license plates and send the data back to the companies, looking for a hit. There's big money to be made in the repossession business, so lots of individuals participate—all of them feeding data into the companies' centralized databases. One scanning company, Vigilant Solutions of Livermore, California, claims to have 2.5 billion records and collects 70 million scans in the US per month, along with date, time, and GPS location information.

In addition to repossession businesses, scanning companies also sell their data to divorce lawyers, private investigators, and others. They sometimes relay it, in real time, to police departments, which combine it with scans they get from interstate highway onramps, toll plazas, border crossings, and airport parking lots. They're looking for stolen vehicles and drivers with outstanding warrants and unpaid tickets. Already, the states' driver's license databases are being used by the FBI to identify people, and the US Department of Homeland Security wants all this

data in a single national database. In the UK, a similar government-run system based on fixed cameras is deployed throughout the country. It enforces London's automobile congestion charge system, and searches for vehicles that are behind on their mandatory inspections.

Expect the same thing to happen with automatic face recognition. Initially, the data from private cameras will most likely be used by bounty hunters tracking down bail jumpers. Eventually, though, it will be sold for other uses and given to the government. Already the FBI has a database of 52 million faces, and facial recognition software that's pretty good. The Dubai police are integrating custom facial recognition software with Google Glass to automatically identify suspects. With enough cameras in a city, police officers will be able to follow cars and people around without ever leaving their desks. This is mass surveillance, impossible without computers, networks, and automation. It's not "follow that car"; it's "follow every car." Police could always tail a suspect, but with an urban mesh of cameras, license plate scanners, and facial recognition software, they can tail everyone—suspect or not.

Similarly, putting a device called a pen register on a suspect's land line to record the phone numbers he calls used to be both time-consuming and expensive. But now that the FBI can demand that data from the phone companies' databases, it can acquire that information about everybody in the US. And it has.

In 2008, the company Waze (acquired by Google in 2013) introduced a new navigation system for smartphones. The idea was that by tracking the movements of cars that used Waze, the company could infer real-time traffic data and route people to the fastest roads. We'd all like to avoid traffic jams. In fact, all of society, not just Waze's customers, benefits when people are steered away from traffic jams so they don't add to them. But are we aware of how much data we're giving away?

For the first time in history, governments and corporations have the ability to conduct mass surveillance on entire populations. They can do it with our Internet use, our communications, our financial transactions, our movements … everything. Even the East Germans couldn't follow everybody all of the time. Now it's easy.

Internet freedom

1nc – NSA overreach

Existing oversight checks NSA overreach

Cordero, 14 - Carrie F. Cordero is the Director of National Security Studies at Georgetown University Law Center ("Fear vs. Facts: Exploring the Rules the NSA Operates Under" 6/13, http://www.cato-unbound.org/2014/06/13/carrie-f-cordero/fear-vs-facts-exploring-rules-nsa-operates-under

There is no doubt the Snowden disclosures have launched a debate that raises significant issues regarding the extent of U.S. government national security surveillance authorities and activities. And Julian Sanchez's essay Snowden: Year One raises a number of these issues, including whether the surveillance is too broad, with too few limits and too little oversight. But an overarching theme of Sanchez's essay is fear – and fear of what might be overshadows what actually is, or is even likely. Indeed, he suggests that by just "tweaking a few lines of code" the NSA's significant capabilities could be misdirected from targeting valid counterterrorism suspects to Americans involved in the Tea Party or Occupy movements.

So really, what would it take to turn NSA's capabilities inward, to the dark corner of monitoring political activity and dissent? It turns out, quite a lot. So much, in fact, that after a considered review of the checks and balances in place, it may turn out to be not worth fearing much at all.

First, a little history. Prior to 1978, NSA conducted surveillance activities for foreign intelligence purposes under Executive authority alone. In 1978, Congress passed the Foreign Intelligence Surveillance Act (FISA), which distinguished between surveillance that occurred here at home and that which occurred overseas. FISA requires that when electronic surveillance is conducted inside the United States, the government seek an order from the Foreign Intelligence Surveillance Court (FISC or the Court) based on probable cause. So, if the government wants to conduct surveillance targeting a foreign agent or foreign power here in the United States, it must obtain FISC approval to do so. By law, the Court may not issue an order targeting an American based solely on activities protected by the First Amendment to the Constitution. The Attorney General is required to report on the full range of activities that take place under FISA to four congressional committees: both the intelligence and judiciary committees in Congress. The law requires that the committees be "fully informed" twice each year.

There have been a number of amendments to FISA over the years. In 1994, the statute was amended to require that physical searches for national security purposes conducted inside the United States also happen by an order from the FISC. The USA-PATRIOT Act of 2001 amended several provisions of FISA, one of which enabled better sharing of information between terrorism and criminal investigators. And in 2008, FISA was amended to provide a statutory framework for certain approvals by the Attorney General, Director of National Intelligence, and FISC regarding the targeting of non-U.S. persons reasonably believed to be outside the United States for foreign intelligence purposes, when the cooperation of a U.S. communications service provider is needed.

So how do we know that this system of approvals is followed? Is the oversight over NSA's activities meaningful, or "decorative," as Sanchez suggests?

It is worth exploring. Here is how oversight of the Section 702 surveillance works, as one example, since it has been the subject of a significant part of the debate of the past year. Section 702 was added to FISA by the FISA Amendments Act of 2008. It authorizes the NSA to acquire the communications, for foreign intelligence purposes, of non-U.S. persons reasonably believed to be outside the United States. These are persons with no Constitutional protections, and yet, because the acquisition requires the assistance of a U.S. electronic communications provider, there is an extensive approval and oversight process. There is a statutory framework. Specifically, the Attorney General and Director of National Intelligence jointly approve certifications. According to declassified documents, the certifications are topical, meaning, the way the statute is being implemented, the certifications are not so specific that they identify individual targets; but they are not so broad that they cover any and everything that might be foreign intelligence

information. The certifications are filed with the FISC, along with targeting and minimization procedures. Targeting procedures are the rules by which NSA selects valid foreign intelligence targets for collection. Minimization procedures are rules by which NSA handles information concerning U.S. persons. The FISC has to approve these procedures. If it does not approve them, the government has to fix them. The Court reviews these procedures and processes annually. The Court can request a hearing with government witnesses (like senior intelligence officials, even the NSA Director, if the judge wanted or needed to hear from him personally) or additional information in order to aid in its decisionmaking process. Information about the 702 certifications is reported to the Congressional intelligence committees.

Once the certifications are in effect, attorneys from the Department of Justice's (DOJ) National Security Division and attorneys and civil liberties officials from the Office of the Director of National Intelligence (ODNI) review the NSA's targeting decisions and compliance with the rules. They conduct reviews at least every 90 days. During that 90-day period, oversight personnel are in contact with NSA operational and compliance personnel. Compliance incidents can be discovered in one of at least two ways: the NSA can self-report them, which it does; or the DOJ and ODNI oversight personnel may discover them on their own. Sometimes the NSA does not report a compliance incident in the required timeframe. Then the time lag in reporting may become an additional compliance incident. The DOJ and ODNI compliance teams write up semi-annual reports describing the results of their reviews. The reports are approved by the Attorney General and Director of National Intelligence and provided to the FISC and to Congress. According to the one report that has been declassified so far, in August 2013, for a six-month period in 2012, the rate of error for the NSA's compliance under Section 702 collection was .49% - less than half of one percent. If we subtract the compliance incidents that were actually delays in reporting, then the noncompliance rate falls to between .15-.25% - **less than one quarter of one percent**. Hardly an agency run amok.

PPD-28 means the US already has the strongest global surveillance protection

Edgar, 15 - Timothy H. Edgar is a visiting scholar at the Brown University's Watson Institute for International Studies and has also taught at the Georgetown University Law Center and Boston University ("Why Should We Buy Into The Notion That The United States Doesn't Care About Privacy?" Lawfare, 2/23, http://www.lawfareblog.com/why-should-we-buy-notion-united-states-doesnt-care-about-privacy

Here, the record is clear: the United States wins, hands down. A comprehensive analysis of worldwide surveillance laws undertaken by the Center for Democracy and Technology shows just how little is required in most countries around the world, including in Europe, for undertaking national security surveillance. For example, under the UK's Regulation of Investigatory Powers Act (RIPA), such surveillance can be obtained with the approval of a Secretary of State. Germany authorizes such surveillance through a parliamentary committee. These safeguards, structurally inferior to the court orders required by FISA, have been determined by European courts to satisfy the fundamental liberties required by the European Convention on Human Rights.

What about external surveillance? New rules issued by the Obama administration under Presidential Policy Directive 28 (PPD-28) provide practical protection for the privacy of

foreigners in NSA collection. These may make only modest changes to surveillance practices in the short run, but it is a mistake to see them as mere "tweaks" in surveillance policy. **They are a major paradigm shift**. When I served as a privacy official in the intelligence community, I had no law, executive order, or directive that told me that the privacy rights of foreigners matter. The new rules change that. The mechanisms of intelligence oversight---privacy officials and boards, inspectors general, and lawyers---now must pay attention to everyone's privacy. No other nation has publicly committed its external intelligence services to specific rules designed to respect everyone's privacy. Germany and many other European nations have protested NSA spying. Will their intelligence services issue oversight rules protecting the privacy not just of their own citizens, but of all of us?

On transparency, the United States wins again. While the United States continues to declassify more and more details of its intelligence operations in the wake of the Snowden revelations, European countries play catch up. Last month, a UK court that oversees UK intelligence services---the Investigatory Powers Tribunal---found in a case brought by civil liberties groups that, although its information sharing with the NSA was consistent with European human rights law, it needed to be much more transparent about the rules under which it operates.

I'm looking forward to the launch of "GCHQ on the record."

The United States should not be shy in talking about its record on intelligence oversight, nor should it accept the premise that Europeans care more about privacy than Americans. The United States **leads the world** when it comes to privacy protection in intelligence activities – if only because the rest of the world's rules are so weak. We should start talking about it.

AT: Nonbinding

Obama policy statement minimizes data abuse risks and is binding US policy

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, April, lexis)

Edward Snowden's disclosures have thus far centered on two NSA programs. One is domestic - the so-called metadata program, operated pursuant to section 215 of the USA PATRIOT Act, n13 and entailing the bulk collection of call record information, including phone numbers and times of calls. n14 The other is foreign - the PRISM program, operated pursuant to section 702 of the Foreign Intelligence Surveillance Act (FISA). n15 Under section 702, the government may conduct surveillance targeting the contents of communications of non-U.S. persons reasonably believed to be located abroad when the surveillance will result in acquiring foreign intelligence information. n16 The FISC must approve any government request for surveillance under section 702, although these requests can [*2141] describe broad types of communications without identifying particular individuals. n17

Under section 702, "foreign intelligence information" that the government may acquire includes a number of grounds related to national security, such as information relating to an "actual or potential attack" or "other grave hostile acts of a foreign power or an agent of a foreign power." n18 It also includes information relating to possible sabotage n19 and clandestine foreign "intelligence activities." n20 Another prong of the definition appears to sweep more broadly, including information relating to "the conduct of the foreign affairs of the United States." n21 Despite the greater breadth of this provision, President Obama informed a domestic and global audience that U.S. intelligence agencies seek a narrow range of information centering on the national security and foreign intelligence concerns described above. n22 While the U.S. intelligence agencies acquire a substantial amount of data that does not fit under these rubrics, the president's speech confirmed that U.S. analysts do not rummage through such data randomly or for invidious purposes. n23 A scatter-shot approach of this kind would be unethical, illegal, and ineffective. Instead, NSA officials query communications using specific "identifiers" such as phone numbers and email addresses that officials reasonably believe are used by non-U.S. persons abroad to communicate foreign intelligence information. n24 The government must also have in place minimization procedures to limit the acquisition, retention, and dissemination of nonpublic information about U.S. persons. n25 The NSA deletes all irrelevant content, including content from non-U.S. persons, after five years. n26

In acknowledging the "legitimate privacy interests" of both U.S. and non-U.S. persons, President Obama affirmed the U.S. commitment to core principles in January 2014. n27 First, he narrowed the operating definition of [*2142] foreign intelligence information, limiting it to "information relating to the capabilities, intentions, or activities of foreign governments or elements thereof, foreign organizations, foreign persons, or international terrorists." n28 In addition, he asserted that the NSA would engage in bulk collection of communications for purposes of "detecting and countering" terrorism, espionage, nuclear proliferation, threats to U.S. forces, and financial crimes, including evasion of duly enacted sanctions. n29 Addressing anticipated concerns that these limits still left the NSA with too much discretion, President Obama declared what the United States would not do. First, it would not collect communications content "for the purpose of suppressing or burdening criticism or dissent, or for disadvantaging persons based on their ethnicity, race, gender, sexual orientation, or religion." n30 Second, it would disseminate and store information regarding any person based on criteria in section 2.3 of Executive Order 12,333 n31: cases involving "foreign intelligence or counterintelligence," public safety, or ascertainment of a potential intelligence source's credibility. n32

Of course, President Obama's speech did not quell the complaints of NSA critics. One could argue that even the description the president provided has legal flaws under domestic and/or international law. One can also argue that the president's policy directive, statutory provisions, and case law cannot wholly eliminate the possibility of systemic or individual abuse of NSA authority. That said, there are compelling reasons for treating the president's speech and directive as an **authoritative and binding** statement of U.S. policy. The most compelling reason may be the simplest: no American president has ever been so forthright on the subject of intelligence collection, and few heads of state around the globe have ventured down the path that President Obama chose. n33 That alone counsels treating President Obama's guidance as more than "cheap talk."

AT: Wheeler

Wheeler is wrong – Obama reforms restored trust

Cordero, 14 – Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law (Carrie, "Correcting some Inaccuracies about NSA Surveillance" 6/20,

http://www.cato-unbound.org/2014/06/20/carrie-f-cordero/correcting-some-inaccuracies-about-nsa-surveillance

In her response essay, Marcy Wheeler keys on an important, and serious, consequence of the unauthorized disclosures and their aftermath: the developing adversarial relationship between the government and the private sector. Now past the first year of the disclosures, it is clear that companies on the receiving end of orders or directives issued under the Foreign Intelligence Surveillance Act (FISA) may be more likely to challenge them in the future. At least one company has already increased its challenges to requests for data from the government issued under National Security Letters or the Electronic Communications Privacy Act (ECPA). But Wheeler is wrong to suggest that – whatever it is the government may have done to effect the collection of foreign intelligence information overseas (which has happened for decades and continues to occur under Executive Order 12333) – somehow "violated…the deal" that was reached through the FISA Amendments Act of 2008 (FAA). Instead, the information that has been released and declassified over the last year has demonstrated that the FAA has been implemented consistently with how it was described in the public record of legislative text and Congressional hearings that took place up to its passage in 2008.

It is also not accurate to describe the steps the Obama Administration has taken as "refus[ing] to do anything" to limit NSA surveillance. Indeed, the President has already implemented significant reforms to the telephone metadata program, including requiring advance approval from the Foreign Intelligence Surveillance Court (FISC) before querying the data, and limiting the extent of analysis of that data. His Presidential Policy Directive-28 (PPD-28), issued in January 2014, limits the categories of bulk collection the NSA may collect. He has adopted the Surveillance Review Group's principle of "risk management," to more formally involve foreign policy implications, for example, in making collection decisions. And he has directed that procedures and rules be changed in order to add privacy protections for foreigners in how the NSA handles information it has acquired. Although it is too soon to assess how the details of some of these and other changes will be implemented, their significance should not be underestimated.

AT: XO12333

XO12333 has the same minimization procedures as FISA – no abuse

Joel, 14 - Alexander W. Joel is the civil liberties protection officer for the Office of the Director of National Intelligence and reports directly to Director of National Intelligence James R. Clapper ("The Truth About Executive Order 12333" Politico, 8/18,

http://www.politico.com/magazine/story/2014/08/the-truth-about-executive-order-12333-110121.html#.VYomBfl4pyg

Under EO 12333, intelligence agencies may collect, retain, and disseminate information about Americans "only in accordance with procedures … approved by the Attorney General … after consultation with the Director [of National Intelligence]." Tye noted that he is not familiar with the details of these procedures, but nonetheless said that Americans should be troubled by "the collection and storage of their communications" under the executive order.

As the civil liberties protection officer for the director of national intelligence (DNI), I work with intelligence agencies on these procedures, and would like to describe how they safeguard privacy and civil liberties.

But first I want to commend Tye for raising his concerns through the processes established for that purpose. Using those processes, he has been able to review his concerns with intelligence oversight bodies as well as with the public, all while continuing to protect classified information.

At the outset, remember that FISA, with very limited exceptions, requires the government to seek an individualized court order before it can intentionally target a United States person anywhere in the world to collect the content of his or her communications. The FISA court must be satisfied, based on a probable cause standard, that the United States person target is an agent of a foreign power, or, as appropriate, an officer or employee of a foreign power.

But even when the government targets foreign nationals overseas in response to valid foreign intelligence requirements, it will inevitably collect some communications about Americans. As the Privacy and Civil Liberties Oversight Board noted in its examination of Section 702 of FISA, "[t]he collection of communications to and from a target inevitably returns communications in which non-targets are on the other end, some of whom will be U.S. persons." Indeed, when Congress first enacted FISA in 1978, it required the government to follow what are called "minimization procedures." These procedures, which must be approved by the FISA court, restrict what the government can do with collected information about U.S. persons (such as for how long that information may be retained, and under what circumstances it may be shared).

Similarly, EO 12333 requires procedures to minimize how an agency collects, retains or disseminates U.S. person information. These procedures must be approved by the attorney general, providing an important additional check. The National Security Agency's procedures are reflected in documents such as United States Signals Intelligence Directive SP0018 (USSID 18), issued in 1993 and updated in 2011. These procedures generally provide that communications may not be retained for more than five years. In addition, NSA personnel may not use U.S. person "selection terms" (such as names, phone numbers or email addresses) to retrieve communications from its collection under EO 12333 without a finding by the attorney general that the U.S. person is an agent of a foreign power (or in other similarly narrow circumstances). And even if the NSA determines that information about an American constitutes foreign intelligence, it routinely uses a generic label like "U.S. Person 1" in intelligence reporting to safeguard the person's identity. The underlying identity may be provided only in a very limited set of circumstances, such as if it's necessary to understand the particular foreign intelligence being conveyed.

Oversight is extensive and multi-layered. Executive branch oversight is provided internally at the NSA and by both the Department of Defense and the Office of the DNI by agency inspectors general, general counsels, compliance officers and privacy officers (including my office and the NSA's new Civil Liberties and Privacy Office). The Department of Justice also provides oversight, as do the Privacy and Civil Liberties Oversight Board and the president's Intelligence Oversight Board. In addition, Congress has the power to oversee, authorize and fund these activities.

2nc – squo oversight solves

Squo Congressional oversight prevents abuse and oversight reform is better than scaling back

Cordero, 14 - Carrie F. Cordero is the Director of National Security Studies at Georgetown University Law Center ("Fear vs. Facts: Exploring the Rules the NSA Operates Under" 6/13, http://www.cato-unbound.org/2014/06/13/carrie-f-cordero/fear-vs-facts-exploring-rules-nsa-operates-under

Generally, however, Congressional committees charged with oversight of the Intelligence Community do their job. The Intelligence Committees of Congress have professional staff, often with deep experience in national security matters. The Committees conduct substantive hearings, although, due to the sensitive and operational nature of the topics discussed, often in classified session. Congressional staff also receive briefings. During the debate surrounding the passage of the FISA Amendments Act of 2008, many members of Congress and their staffs visited the NSA and received dozens of briefings regarding its details and subsequent implementation.

Decorative? Returning to the question implicitly posed by Sanchez's argument: what would it take to turn this system inside out? Most likely, it would take either a conspiracy of the highest order, or the complete incompetence of everyone involved in the process – from operators to leadership inside the Intelligence Community, from lawyers to senior officials at the Justice Department, from legal advisors to judges of the FISC, from staff to members of Congress.

Here's what happens in the real world: people make mistakes; technological implementation goes awry; bureaucracy gets in the way of getting down to the bottom line. The adequacy and rigor of Congressional oversight waxes and wanes based, at times, on the quality of the leadership of the various committees at any time. Government employees also sometimes do the wrong thing, such as the twelve cases in ten years that the NSA has explained to Congress, and then they are held accountable. Oversight and compliance systems sometimes fail, too, such as the delay in recognizing the problems in the technical implementation of the phone metadata program that was subsequently brought to the Court's attention. These are all valid reasons to work on improving auditing, compliance, oversight and accountability mechanisms. They are not valid reasons for adopting reforms that would dramatically scale back important national security capabilities that keep the nation safe.

The NSA collects a miniscule amount of info

Dickerson, 15 - Julie Dickerson is currently a 3L at Harvard Law School, and previously served as Senior Editor for the Harvard National Security Journal ("Meaningful Transparency: The Missing Numbers the NSA and FISC Should Reveal" Harvard National Security Journal, http://harvardnsj.org/2015/02/meaningful-transparency-the-missing-numbers-the-nsa-and-fisc-should-reveal/

Under § 702 of the USA-PATRIOT Act, the NSA uses information from U.S. electronic communication service providers to target non-Americans outside the United States for documented foreign intelligence purposes. The NSA collects more than 250 million internet communications under this power each year. While a large absolute number, it is unclear what percent of total internet communications these § 702 communications constitute. The NSA has revealed that the internet carries 1,826 Petabytes of information per day, the NSA touches 1.6% of that data in its foreign intelligence mission, and the NSA only selects 0.025% of that data for review. The net result is that NSA analysts look at a mere 0.00004% of the world's traffic. These percentages of total data traffic, though indicative that the percent of § 702 communications collected is **likely miniscule**, do not map perfectly onto percentages of total communications.

No NSA overreach – it's subject to external security from multiple entities

De 14 - General Counsel, National Security Agency (Rajesh, "The NSA and Accountability in an Era of Big Data", JOURNAL OF NATIONAL SECURITY LAW & POLICY, 2014, p.8-10//DM)

False Myth #3: NSA operates in the shadows free from external scrutiny or any true accountability.

This false myth is obviously a product of the necessarily secretive nature of NSA's day-to-day operations. There is no doubt that in a democracy like ours, an important form of accountability is public transparency. However, it is absolutely essential not to assume that the legitimacy afforded by public transparency is the only way to achieve accountability, which may – in fact, must, with respect to NSA – primarily be achieved through alternate means. There is no perfect substitute for public transparency in a democracy; but when there is also no way to provide information to those whom you seek to protect without also providing it to those from whom you seek to protect them, we must largely rely on such alternate means of accountability.

It is evident to me that I am the General Counsel for one of the most highly regulated entities in the world. It is a reality that most audiences cannot appreciate given the classified nature of intelligence work. Given NSA's unique mission, however, it makes perfect sense. NSA is part of the Department of Defense as well as the Intelligence Community. This means that NSA is subject to the relevant rules and regulations for DOD as well as to those applicable to other members of the IC. More broadly, NSA is subject to a spectrum of detailed scrutiny from across

all three branches of government as a matter of law, policy, and practice. First, within the executive branch alone, NSA is responsible to multiple stakeholders, including:

● internal oversight officials, including an Inspector General to whom Congress recently provided independent statutory authority under the 2010 Intelligence Authorization Act;

● the Department of Defense, which pursuant to presidential directive and statute exercises supervisory authority over NSA, to include offi- cials such as the Assistant to the Secretary for Intelligence Oversight, the Under Secretary of Defense for Intelligence, the General Counsel, and the DOD Inspector General;

● the Office of the Director of National Intelligence, which pursuant to presidential directive and statute is responsible for coordination of the Intelligence Community, and has an oversight role with respect to certain FISA activities, to include its own General Counsel, Inspector General, and Civil Liberties Protection Officer;

● the Department of Justice, which by statute also has an oversight role with respect to certain FISA activities, and to which NSA like other intelligence agencies is obligated by statute and Executive Order 12333 to report violations of federal law;

● the White House, to include the National Security Council, the President's Intelligence Advisory Board, and the Intelligence Oversight Board, to whom NSA like other intelligence agencies is required to report "any intelligence activities... that they have reason to believe may be unlawful or contrary to executive order or presidential directive"; and

● independent entities such as the Privacy and Civil Liberties Oversight Board.

Second, apart from the multiple layers of accountability within the executive branch, NSA is by law accountable to the legislative branch. As a member of the Intelligence Community, NSA is required by law to keep the intelligence oversight committees of the Senate and House of Representatives "fully and currently informed" with respect to the Agency's activities. Given the unique role of NSA and the range of its activities, however, oversight is exercised as well by a host of additional committees as diverse as the armed services, judiciary, and homeland security committees of both chambers of Congress. NSA, for example, is required by statute to provide both the intelligence and judiciary committees a copy of any decision, order, or opinion of the FISC that includes "significant construction or interpretation" of any provision of FISA. NSA also keeps Congress apprised of its activities routinely via testimony at open and closed hearings; formal notifications; other written submissions; informal briefings, visits; and other means. In other words, we interact with our Congressional overseers virtually every day.

Third, NSA is directly accountable to the Foreign Intelligence Surveillance Court for those activities conducted pursuant to FISA. The Court is comprised of eleven federal district judges appointed by the Chief Justice of the U.S. Supreme Court. The FISC not only authorizes certain activities pursuant to FISA, but it plays an active and constructive role in ensuring those activities are carried out appropriately. As I noted earlier, it is evident that the manner in which NSA operates is just as important as the authority under which it operates. The rules of the FISC, for example, reflect this commitment in that "[i]f the government discovers that any authority or approval granted by the Court has been implemented in a manner that did not comply with the Court's authorization or approval or with applicable law," the government must "immediately"

notify the Court. This obligation is one that NSA, together with our partners at the Department of Justice, take seriously every single day.

2nc – PPD-28 solves

PPD-28 solves international criticism without constraining the US

Wittes 14 *senior fellow in Governance Studies at The Brookings Institution (Benjamin, "Obama's NSA Speech Wasn't an Apology. It Was a Clever Defense", New Republic 01/21/14, http://www.newrepublic.com/article/116284/obamas-nsa-speech-wasnt-apology-it-was-clever-defense)//GK

Before turning to the substance of the speech and the PPD, we should pause a moment and consider the very fact that the President of the United States has issued, in public, a policy directive on signals intelligence at all. For, indeed, the first notable thing about the PDD is that it exists. My Brookings colleague Bruce Riedel, a longtime CIA veteran, focused on this—quite rightly, in my view—in our event on Friday, saying that the document "is in my judgment unprecedented. In two hours, I couldn't really check, but I don't think we've ever had a document like this that lays out the protocols and principles for American signals intelligence collection." Nor, I might add, do many other countries have public documents that lay out principles and doctrines of surveillance permission and restraint. In other words, the mere fact of this document puts the United States in a very forward-leaning place with respect to surveillance transparency—a place it was already coming to occupy with the big declassifications following the Snowden disclosures. How many of the countries that have been so quick to criticize US surveillance practices will follow suit and issue their own formal documents spelling out what they do and what they do not do both with regard to their own citizens and those of other countries? Obama begins the speech by situating his discussion of the NSA controversies against the activities of the Sons of Liberty and Paul Revere in Boston in revolutionary times. "Throughout American history, intelligence has helped secure our country and our freedoms," he says. It is against this highly-favorable background—one in which intelligence is central to liberty, not in tension or at odds with it—that Obama mentions the birth of NSA. Indeed, the entire first portion of the speech offers a strong defense of NSA and its intelligence programs. While Obama acknowledges that intelligence gathering can be abused and has been abused, and while he reiterates that aspects of the post-9/11 response "contradicted our values," that is not the frame he uses for NSA's current activities. To the contrary, when he came into office, he reports, he had a "healthy skepticism towards our surveillance programs" and ordered that they be reviewed. But the biggest problems had already been corrected "through a combination of action by the courts, increased congressional oversight, and adjustments by the previous Administration." So while in some cases, there were changes, "What I did not do is stop these programs wholesale—not only because I felt that they made us more secure; but also because nothing in that initial review, and nothing that I have learned since, indicated that our intelligence community has sought to violate the law or is cavalier about the civil liberties of their fellow citizens." In what will surely be one of the more important passages in the speech for many people in the intelligence community, Obama then says: To the contrary, in an extraordinarily difficult job, one in which actions are second-guessed, success is unreported, and failure can be catastrophic, the men and women of the intelligence community, including the NSA, consistently follow protocols designed to protect the privacy of ordinary people. They are not abusing authorities in order to listen to your private phone calls, or read your emails. When mistakes are made—which is inevitable in any large and complicated human enterprise—they correct those mistakes. Laboring in obscurity, often unable to discuss their work even with family and friends, they know that if another 9/11 or massive cyber-attack occurs, they will be asked, by Congress and the media, why they failed to connect the dots. With this statement, Obama squarely aligns himself with the intelligence community's own central narrative of recent events: Its activities are essential, the president says; its activities are lawful and non-abusive (mistakes notwithstanding); and the community's critics will hold it accountable for failures to connect the dots just as breezily as they now hold it accountable for the use of available tools to connect those dots. That said, Obama goes on, we need changes. But Obama is careful to describe the reasons we need changes. It's not to rein in an out of control intelligence community. It's because "for our intelligence community to be effective over the long haul, we must maintain the trust of the American people, and people around the world." These are confidence-building steps for an apparatus that is essentially law-abiding. And that brings us to the changes that Obama announces—beginning with those in the PPD. The PPD is an exceedingly-clever document, one that conveys and writes into policy a great deal of values without

constraining a great deal of practice. It does this by, in essence, using values-based statements as justifications for policies that already exist, at least de facto, for purely functional reasons. PPD-28 is long on rhetoric about how "all persons should be treated with dignity and respect, regardless of their nationality or wherever they might reside, and [how] all persons have legitimate privacy interests in the handling of their personal information." It comes back to this theme over and over again. And the theme is genuinely important. The United States is now on record as a formal matter of presidential policy announcing that it respects the privacy of non-citizens abroad and takes that into account when it conducts espionage; it doesn't just disseminate and retain information about people willy nilly with no regard for the information's importance relative to that material's value to foreign intelligence. That's an amazing statement. But it actually does not require a revolution—or even much change—in intelligence affairs to implement.

PPD 28 proves that surveillance has been curbed and overreach has been solved in the squo

Litt, 15 [Robert S., second General Counsel of the Office of the Director of National Intelligence, U.S. Intelligence Community Surveillance One Year After President Obama's Address, file:///C:/Users/Jonah/Downloads/3_NatlSecLJ_210-231_Litt.pdf] Schloss1

I began by noting the huge amount of private information that we all expose today, through social media, e-commerce, and so on. But I acknowledged that government access to the same information worries us more—with good reason—because of what the government could do with that information. So I suggested we should address that problem directly. And in fact, I said, we can and do protect both privacy and national security by a regime that not only puts limits on collection but also restricts access to, and use of, the data we collect based on factors such as the sensitivity of the data, the volume of the collection, how it was collected, and the reason for which it was collected, and that backs up those restrictions with technological and human controls and auditing. This approach has largely been effective. The information that has come out since my speech, both licitly and illicitly, has validated my statement then: while there have been technological challenges and human error in our current signals intelligence activities, there has been no systematic abuse or misuse akin to the very real illegalities and abuses of the 1960s and 1970s.

Well, you may have noticed that my speech did not entirely put the public concerns to rest.

Questions have continued to be asked, and we've continued to address them. In particular, just over a year ago, President Obama gave a speech about surveillance reform, and issued Presidential Policy Directive 28 ("PPD-28"). The President reaffirmed the critical importance of signals intelligence activity to protect our national security and that of our allies against terrorism and other threats. But he took note of the concerns that had been raised and directed a number of reforms to "give the American people greater confidence that their rights are being protected, even as our intelligence and law enforcement agencies maintain the tools they need to keep us safe," as well as to provide "ordinary citizens in other countries . . . confidence that the United States respects their privacy, too."2

The Intelligence Community has spent the year since the President's speech implementing the reforms he set out, as well as many of the recommendations of the Privacy and Civil Liberties Oversight Board ("PCLOB") and the President's Review Group on Intelligence and Communications Technologies. And I'd note in passing that the PCLOB last week issued a report finding that we have made substantial progress towards implementing the

great majority of its recommendations. We've consulted with privacy groups, industry, Congress, and foreign partners. In particular, we have a robust ongoing dialogue with our European allies and partners about privacy and data protection. We've participated in a wide variety of public events at which reform proposals have been discussed and debated. And yesterday, the Office of the Director of National Intelligence ("ODNI") released a report detailing the concrete steps we have taken so far, along with the actual agency policies that implement some of those reforms.3 What I want to do today is drill down on what we have done in the last year, and in particular explain how we have responded to some of the concerns that have been raised in the last year and a half.

PPD 28 solves the perception of abuse caused by XO 12333

Litt, 15 [Robert S., second General Counsel of the Office of the Director of National Intelligence, U.S. Intelligence Community Surveillance One Year After President Obama's Address, file:///C:/Users/Jonah/Downloads/3_NatlSecLJ_210-231_Litt.pdf] Schloss1

One persistent but mistaken charge in the wake of the leaks has been that our signals intelligence activity is overly broad, that it is not adequately overseen and is subject to abuse—in short, that NSA "collects whatever it wants." This is and always has been a myth, but in addition to greater transparency we have taken a number of concrete steps to reassure the public that we conduct signals intelligence activity only within the scope of our legal authorities and applicable policy limits.

To begin with, in PPD-28, the President set out a number of important general principles that govern our signals intelligence activity:

§ The collection of signals intelligence must be authorized by statute or Presidential authorization, and must be conducted in accordance with the Constitution and law.

2015] U.S. Intelligence Community Surveillance 217

§ Privacy and civil liberties must be integral considerations in planning signals intelligence activities.

§ Signals intelligence will be collected only when there is a valid foreign intelligence or counterintelligence purpose.

§ We will not conduct signals intelligence activities for the purpose of suppressing criticism or dissent.

§ We will not use signals intelligence to disadvantage people based on their ethnicity, race, gender, sexual orientation or religion.

§ We will not use signals intelligence to afford a competitive commercial advantage to U.S. companies and business sectors.

§ Our signals intelligence activity must always be as tailored as feasible, taking into account the availability of other sources of information.

The President also directed that we set up processes to ensure that we adhere to these restrictions, and that we have appropriate policy review of our signals intelligence collection. I

want to spend a little time now talking about what these processes are—how we try to ensure that signals intelligence is only collected in appropriate circumstances. And you'll forgive me if I get a bit down into the weeds on this, but I think this is important for people to understand. To begin with, neither NSA nor any other intelligence agency decides on its own what to collect. Each year, the President sets the nation's highest priorities for foreign intelligence collection after an extensive, formal interagency process. Moreover, as a result of PPD-28, the rest of our intelligence priorities are now also reviewed and approved through a high-level interagency policy process. Overall, this process ensures that all of our intelligence priorities are set by senior policymakers who are in the best position to identify our foreign intelligence requirements, and that those policymakers take into account not only the potential value of the intelligence collection but also the risks of that collection, including the risks to privacy, national economic interests, and foreign relations.

The DNI then translates these priorities into the National Intelligence Priorities Framework, or "NIPF." Our Intelligence Community Directive ("ICD") about the NIPF, ICD 204, which in corporates the requirements of PPD-28, is publicly available on ourwebsite.7 And while the NIPF itself is classified, much of it is reflected annually in the DNI's unclassified Worldwide Threat Assessment.

But the priorities in the NIPF are at a fairly high level of generality. They include topics such as the pursuit of nuclear and ballistic missile capabilities by particular foreign adversaries, the effects of drug cartel corruption in Mexico, and human rights abuses in specific countries. And they apply not just to signals intelligence, but to all intelligence activities. So how do the priorities in the NIPF get translated into actual signals intelligence collection?

The organization that is responsible for doing this is called the National Signals Intelligence Committee, or "SIGCOM." (We have acronyms for everything.) It operates under the auspices of the Director of the NSA, who is designated by Executive Order 12333 as what we call the functional manager for signals intelligence, responsible for overseeing and coordinating signals intelligence across the Intelligence Community under the oversight of the Secretary of Defense and the DNI. The SIGCOM has representatives from all elements of the community and, as we fully implementPPD-28, also will have full representation from other departments and agencies with a policy interest in signals intelligence.

All departments and agencies that are consumers of intelligence submit their requests for collection to the SIGCOM. The SIGCOM reviews those requests, ensures that they are consistent with the NIPF, and assigns them priorities using criteria such as:

§ Can SIGINT provide useful information in this case?

Perhaps imagery or human sources are better or more cost effective sources of information to address the requirement.

§ How critical is this information need? If it is a high priority in the NIPF, it will most often be a high SIGINT priority.

§ What type of SIGINT could be used? NSA collects three types of signals intelligence: collection against foreign weapons systems (known as "FISINT"), foreign communications (known as "COMINT"), and other foreign electronic signals such as radar (known as "ELINT").

§ Is the collection as tailored as feasible? Should there be time, focus, or other limitations?

And our signals intelligence requirements process also requires explicit consideration of other factors, namely:

§ Is the target of the collection, or the methodology used to collect, particularly sensitive? If so, it will require review by senior policy makers.

§ Will the collection present an unwarranted risk to privacy and civil liberties, regardless of nationality? And . . .

§ Are additional dissemination and retention safeguards necessary to protect privacy or national security interests?

Finally, at the end of the process, a limited number of trained

NSA personnel take the priorities validated by the SIGCOM and research and identify specific selection terms, such as telephone numbers or email addresses, that are expected to collect foreign intelligence responsive to these priorities. Any selector must be reviewed and approved by two persons before it is entered into

NSA's collection systems. Even then, however, whether and when actual collection takes place will depend in part on additional considerations such as the availability of appropriate collection resources. And, of course, when collection is conducted pursuant to the Foreign Intelligence Surveillance Act, NSA and other agencies must follow additional restrictions approved by the court.

So that's how we ensure that signals intelligence collection targets reflect valid and important foreign intelligence needs. But, as is typically the case with our signals intelligence activities, we don't just set rules and processes at the front end; we also have mechanisms to ensure that we are complying with those rules and processes.

Cabinet officials are required to validate their SIGINT requirements each year NSA checks signals intelligence targets throughout the collection process to determine if they are actually providing valuable foreign intelligence responsive to the priorities, and will stop collection against targets that are not. In addition, all selection terms are reviewed by supervisors annually.

Based on a recommendation from the President's Review Group, the DNI has established a new mechanism to monitor the collection and dissemination of signals intelligence that is particularly

sensitive because of the nature of the target or the means of collection, to ensure that it is consistent with the determinations of policymakers.

Finally, ODNI annually reviews the Intelligence Community's allocation of resources against the NIPF priorities and the intelligence mission as a whole. This review includes assessment so the value of all types of intelligence collection, including SIGINT, and looks both backward—how successful have we been in achieving our goals?—and forward—what will we need in the future?—and helps ensure that our SIGINT resources are applied to the most important national priorities.

The point I want to make with this perhaps excessively detailed description is that the Intelligence Community does not 2015] U.S. Intelligence Community Surveillance 221decide on its own which conversations to listen to, nor does it try to collect everything. Its activities are focused on priorities set by policymakers, through a process that involves input from across the government, and that is overseen both within NSA and by the ODNI and Department of Defense. The processes put in place by PPD-28,which are described in the report we issued yesterday,8 have further strengthened this oversight to ensure that our signals intelligence activities are conducted for appropriate foreign intelligence purposes and with full consideration of the risks of collection as well as the benefits.

AT: PRISM overreach

The NSA already implemented technical reforms to PRISM that prevent overreach

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

The second program--known as PRISM or section 702--uses court orders issued under section 702 of FISA n18 to collect the content of certain international communications. In particular, the NSA targets specific non-Americans who are reasonably believed to be located outside the country, and also engages in bulk collection of some foreign-to-foreign communications that happen to be passing through telecommunications infrastructure in the United States. n19 The FISA [*527] court does not approve individual surveillance applications each time the NSA wishes to intercept these communications; instead, it issues once-a-year blanket authorizations. n20 As detailed below, in 2011 the FISA court struck down the program on constitutional and statutory grounds after the government disclosed that it was inadvertently intercepting a significant number of communications involving Americans; n21 the court later upheld the program when the NSA devised a technical solution that prevented such over-collection. n22

Zero incentive exists to expand PRISM – practicality prevents abuse

Lempert, 13 - Richard O. Lempert is a Visiting Fellow in Governance Studies at the Brookings Foundation and the University of Michigan's Eric Stein Distinguished University Professor of Law and Sociology emeritus ("PRISM and Boundless Informant: Is NSA Surveillance a Threat?" 6/13, http://www.brookings.edu/blogs/up-front/posts/2013/06/13-prism-boundless-informant-nsa-surveillance-lempert

The protection most of us enjoy under PRISM may be more practical than legal. The amount of data that can be collected limits the reach of the program. Not only is capturing too much information from innocent Americans a waste of resources, but also suspicious communications can be lost in a forest of irrelevant data. The NSA thus has powerful reasons to limit impermissible observations, at least where there is no good reason to suspect Americans of terrorist involvements. Still we lack two bits of information important in assessing this program. One is the fate of information pertaining to Americans who should not have been observed in the first place. If this information is purged from all databases except perhaps when the person is dangerous, erroneous capture is less of a concern than it otherwise would be. Second, we don't know how monitoring targets are determined or the number of targets selected. To the extent that individuals, organizations and sites are targeted based on target-specific concerns about the threats they pose, the net cast is likely to be narrow, and even if the reasons for targeting do not rise to the level of legally cognizable probable cause, they tend in this direction. But if targets are selected based on the impersonal outputs of other data mining efforts like the telephone records that feed Boundless Informant, all bets are off. Depending on the algorithms used and the degree to which they have been empirically validated, the net could be wide or narrow, and the likelihood that a target would be involved in terrorism or that citizens would be swept into the net may be great or small. Congress in overseeing PRISM should demand this information if it is not already provided.

It is easy to be cynical about government and the respect that agencies show for the laws under which they operate. Cynicism is fed by occasional scandals and by the more frequent pseudo-scandals which make it appear that within the Beltway things are out of control. Having spent four years as a Division Director at the National Science Foundation and three years as Chief Scientist in the Human Factors/ Behavioral Science Division of DHS's Science and Technology Directorate, I am not cynical. Time and again I have seen government employees seek to follow the law even when it seems silly and interferes with their mission. When I joined DHS I was most surprised by the fierceness of efforts to comply with the U.S. Privacy Act. At times interpretations of what the Act protected were so broad as to border on the ridiculous, and costs were real: research projects with national security implications were delayed, redesigned or even precluded because privacy officers, sometimes with little basis in the statute, felt there was a risk that personally identifiable information (PII) would be impermissibly collected. The absence of any reason to fear revelation or misuse made no difference. The strict scrutiny applied to research that might involve PII is, to be sure, relaxed in front line operational settings like PRISM and legal restrictions may differ, but my experience in two agencies as well as conversations with people in the intelligence community (IC) lead me to believe that it is a mistake to regard as a sham the legal restrictions on PRISM or other IC data mining and surveillance activities.

Through its PRISM and Boundless Informant efforts, NSA is working to protect the nation, apparently with some success. The 99.9% of us who pose no threat of terrorism and do not inadvertently consort with possible terrorists should not worry that the government will track our phone or internet exchanges or that our privacy will be otherwise infringed.

Corporate surveillance wrecks internet freedom

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 6)//AK

Most of the big US defense contractors, such as Raytheon, Northrop Grumman, and Harris Corporation, build cyberweapons for the US military. And many big IT companies help build surveillance centers around the world. The French company Bull SA helped the Libyan government build its surveillance center. Nigeria used the Israeli firm Elbit Systems. Syria used the German company Siemens, the Italian company Area SpA, and others. The Gadhafi regime in Libya purchased telephone surveillance technology from China's ZTE and South Africa's VASTech. We don't know who built the Internet surveillance systems used in Azerbaijan and Uzbekistan, but almost certainly some Western companies helped them. There are few laws prohibiting this kind of technology transfer, and the ones that exist are easily bypassed.

These are not only specially designed government eavesdropping systems; much government surveillance infrastructure is built for corporate use. US-based Blue Coat sells monitoring and content filtering systems for corporate networks, which are also used for government surveillance in countries like Burma, China, Egypt, Indonesia, Nigeria, Qatar, Saudi Arabia, Turkey, and Venezuela. Netsweeper is a Canadian corporate filtering product used for censorship by governments in Qatar, Yemen, the UAE, Somalia, and Pakistan. Filtering software from the US company Fortinet is used to censor the Internet in Burma; SmartFilter, from the US company McAfee and normally used in schools, helps the governments of Tunisia and Iran censor the Internet in their countries. Commercial security equipment from the UK company Sophos has been used by Syria and other oppressive regimes to surveil and arrest their citizens.

Technology is value neutral. You can use your phone to call 911 or to plan a bank robbery. There's no technical difference between a government's using a tool to identify criminals or using it to identify dissidents. There's no technical difference between corporate and government uses. Legitimate corporate tools for blocking employees from e-mailing confidential data can be used by repressive governments for surveillance and censorship. Conversely, the same anti-censorship tools that Saudi and Iranian dissidents use to evade their governments can be used by criminals to distribute child porn. Encryption allows the good guys to communicate without being eavesdropped on by the bad guys, and also allows the bad guys to communicate without being eavesdropped on by the good guys. And the same facial recognition technology that Disney uses in its theme parks to pick out photos its patrons might want to buy as souvenirs can identify political protesters in China, and Occupy Wall Street protesters in New York.

The OPM hack outweighs NSA's effect on internet freedom

Wittes, 15 - editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution (Benjamin, "Turns Out Privacy Groups are Outraged About the OPM Hack—At Me" 6/18, http://tinyurl.com/oz4kkog

Conversely, if you're a privacy group devoted to protecting the privacy of Americans, the OPM hack should be unthinkable to ignore. It is, after all, a far bigger threat to the interests you are pledged to protect than is any activity by your own government. You may have an argument for leaving Chinese domestic collection to Chinese civil libertarians to restrain, but to the extent you don't speak up against the bulk collection of the health records of kids of U.S. federal employees, you are tolerating an absurd double standard in which anyone can ride roughshod over Americans' privacy except the United States government.

Recall, moreover, that the whole theory of international outrage at NSA's behavior was that global collection implicates some kind of international social contract, not just the relationship between individuals and their own governments. Remember all that talk about the international right to privacy, that idea—now embraced by the U.S. government—that U.S. collection must take into account the privacy interests of foreigners overseas? U.S. privacy groups have had no trouble invoking the ICCPR to restrain U.S. surveillance practices. Surely, surely, surely they are not more concerned about using the ICCPR to "hold the US to account for its [surveillance] abuses"—as CDT recently put it—than they are in that dcoument's restraining Chinese abuses against U.S. nationals.

To put it simply, whether you're a privacy group focused narrowly on the privacy interests of Americans or a citizen of the world who believes that espionage must be conducted in general with a solicitude for the privacy of all, the sort of collection reflected in this hack ought to be far more upsetting than NSA collection under Section 702 or Executive Order 12333.

Violence is innate – the internet solves nothing

Elias, 12 – doctor in Sydney (Phillip, "Will humanity perish without the internet?" 1/19, http://www.mercatornet.com/articles/view/will_humanity_perish_without_the_internet

The Wikipedian view of the past is the 21st century's 'Whig interpretation of history': everything has been building towards a world in which there is open, secure and free internet. Without this resource is it any wonder that societies of the past were (relatively) despotic and cruel? It is easy to forget that Wikipedians didn't invent sharing, or honesty, or even freedom. Facebook didn't invent friends. We inherited all of these from the Dark Ages before the iPod was even a glint in Apple's eye.

The new Encyclopaedists make the opposite mistake about the future. Inherent in their worldview is the idea that setting up a system where information can be shared quickly, widely, and freely will somehow eliminate corruption, greed and violence from the world. It is almost as though human foibles were glitches in the software of society. But human vices can never be reduced to social viruses. They come from deep within us and can find their way into the most scientific settings.

Do Wikipedians think themselves immune from the temptation to wield their power towards their own ends?

Free access to information for everyone could be said to be the Wikipedian creed. It encapsulates the Enlightenment values of liberty and equality. But, like the French terror of the 1790s, it neglects that other ideal needed to give them gumption -- a genuine concern for other human beings.

But fraternité is not achieved by giving everyone more information, more freedom and more equality. And it is what is so often lacking on the internet, on blogs, and in other forms of web communication. Online interaction is so often vitriolic it is unreadable, and it is at its worst when the tech-savvy confront each other. I have seen very few geeks who try to love their enemies.

Fraternité comes from empathising with others. This is difficult to learn online. But without it, how can we understand the point of view of those who have different concepts of freedom or equality, or of troglodytes who don't blog, or of nematodes who don't have access to the internet. Believe it or not, there is a life offline and wisdom is wider than the web.

2nc - OPM hack

Chinese hacking is a greater threat than the NSA

Wittes, 15 - editor in chief of Lawfare and a Senior Fellow in Governance Studies at the Brookings Institution (Benjamin, "Is the Privacy Community Focused on the Wrong Government?" Lawfare, 6/15, http://www.lawfareblog.com/privacy-community-focused-wrong-government

A giant government surveillance program has scooped up sensitive personal information on literally millions of Americans. The spying almost certainly includes the creation of digital dossiers on people. It is apparently conducted without minimization requirements, without court orders, or legislative oversight—indeed, without any publicly known rules. The dossiers include mental health information, individuals' alcohol and drug histories, and people's past criminal histories; they include intimate contacts, family networks and friends. They include social security numbers. It's everything civil libertarians and privacy activists have been warning about for years.

Yet the privacy community is virtually silent. Look on the websites of the major privacy groups and you'll see almost nothing about this program. Don't look for breathless coverage of it on the The Intercept either.

The reason? This giant surveillance program isn't being run by the United States government. It's being run against the U.S. government—by the Chinese government. And for some reason, even the grossest of privacy violations—in this case the pilfering of millions of background investigations and personnel records—just doesn't seem so bad when someone other than the United States is doing it.

For the record, I have no problem with the Chinese going after this kind of data. Espionage is a rough business and the Chinese owe as little to the privacy rights of our citizens as our intelligence services do to the employees of the Chinese government. It's our government's job to protect this material, knowing it could be used to compromise, threaten, or injure its people—not

the job of the People's Liberation Army to forebear collection of material that may have real utility.

Yet I would have thought that privacy groups that take such strong views of the need to put limits on American collection, even American collection overseas against non-U.S. persons, would look a little askance at a foreign intelligence operation consisting of the bulk collection of the most highly-personal information—an operation involving not only government employees but also those close to them. You'd think this would raise someone's privacy hackles, if not mine.

Yet take a look at CDT's website. It's busy triumphing over the passage of the USA FREEDOM Act and, ironically enough, worrying about the privacy implications of pending cybersecurity legislation. The ACLU also responds to the news of the OPM breaches by criticizing cybersecurity legislation. EFF? Nope. That group doesn't seem to mention the OPM hacks at all. The Intercept has one good story, but you'd certainly never know how badly these hacks outmatch the NSA's most aggressive programs as threats to Americans' privacy from reading the publication founded to pick the Snowden scab.

Why the difference? I'm really not sure how to explain it. One possibility is simply that privacy advocates expect the Chinese to run roughshod over people's privacy, so they're not that outraged when the Chinese go and do it. Another possibility is that they have such totally inflated expectations of the moral purity of our own country's foreign intelligence activities that they become outraged when those agencies behave like, well, intelligence agencies. Still another possibility, I suppose, is that they would contend that this material, consisting of government records, is fair game. I could actually accept that argument, except that I don't believe the same privacy groups would sit still for the bulk collection by our own intelligence services of, say, all personnel records of the Chinese government.

To put the matter simply, there's a huge double-standard at play here. In the wake of this spate of revelations, I'd like to hear some privacy advocate explain why I should continue to regard the world's great threat to privacy as NSA.

2nc – internet solves nothing

Reject their ahistorical idealism – the internet accelerates the worst parts of humanity

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 256)//TT

Even worse, the supposed lawlessness and networked anarchy enabled by the Internet have resulted in greater social pressure to tame the Web. In a sense, the more important the Internet becomes, the greater the onus to rein in its externalities. Promoting the freedom to connect will be a tricky proposal to sell to voters, many of whom actually want the government to promote the freedom to disconnect—at least for particular political and social groups. If the last decade is anything to judge by, the pressure to regulate the Web is as likely to come from concerned

parents, environmental groups, or various ethnic and social minorities as it is from authoritarian governments. The truth is that many of the opportunities created by a free-for-all anonymous Internet culture have been creatively exploited by people and networks that undermine democracy. For instance, it's almost certain that a Russian white supremacist group that calls itself the Northern Brotherhood would have never existed in the pre-Internet era. It has managed to set up an online game in which participants—many of them leading a comfortable middleclass existence—are asked to videotape their violent attacks on migrant guest workers, share them on YouTube, and compete for cash awards.

Crime gangs in Mexico have also become big fans of the Internet. Not only do they use YouTube to disseminate violent videos and promote a climate of fear, but they are also reportedly going through social networking sites hunting for personal details of people to kidnap. It doesn't help that the offspring of Mexico's upper classes are all interconnected on Facebook. Ghaleb Krame, a security expert at Alliant International University in Mexico City, points out that "criminals can find out who are the family members of someone who has a high rank in the police. Perhaps they don't have an account on Twitter or Facebook, but their children and close family probably do." It's hard to imagine Mexican police officers becoming braver as a result. And social networking can also help to spread fear: In April 2010, a series of Facebook messages warning of impending gang wars paralyzed life in Cuernavaca, a popular resort, with only a few brave people daring to step outside (it proved to be a false alarm).

The leaders of al-Shabab ("The Lads"), Somalia's most prominent Islamist insurgency group, use text messaging to communicate with their subordinates, avoiding any face-to-face communication and the risks it entails. It's not a particularly contentious conclusion that they have become more effective—and thus more of a menace—as a result.

Plenty of other less notorious (and less violent) cases of networked harm barely receive any global attention. According to a 2010 report from the Convention on International Trade in Endangered Species, an international intergovernmental organization, the Internet has created a new market for trade in extinct species, allowing buyers and sellers to find each other more easily and trade more effectively. Kaiser's spotted newt, found only in Iran, may be the first real victim of the Twitter Revolution. According to reports in the Independent, more than ten companies are selling wild-caught specimens over the Internet. Not surprisingly, the newt's population was reduced 80 percent between 2001 and 2005 alone.

Another informal market the Internet has boosted is organ trading. Desperate individuals in the developing world are bypassing any intermediaries and are offering their organs directly to those who are willing to pay up. Indonesians, for example, use a website called iklanoke.com, a local alternative to Craigslist, where their postings usually go unmonitored by police. A typical ad from Iklanoke reads, "16-year-old male selling a kidney for 350 million rupiah or in exchange for a Toyota Camry."

Text messaging has been used to spread hate in Africa, most recently in Muslim-Christian squabbles that erupted in the central Nigerian city of Jos in early 2010 that took the lives of more than three hundred people. Human rights activists working in Jos identified at least 145 such messages. Some instructed the recipients how to kill, dispose of, and burn bodies ("kill before they kill you. Dump them in a pit before they dump you"); others spread rumors that triggered even more violence. According to Agence France-Presse, one such message urged Christians to

avoid food sold by Muslim hawkers, as it could have been poisoned; another message claimed political leaders were planning to cut water supplies to dehydrate members of one faith.

Two years earlier Kenya lived through an eerily similar tumultuous period. The political crisis that followed Kenya's disputed election that took place on December 27, 2007, showed that the networks fostered by mobile technology, far from being "net goods," could easily escalate into uncontrollable violence. "If your neighbor is kykuyu, throw him out of his house. No one will hold you responsible," said a typical message sent at the peak of the violence; another one, also targeting Kykuyus, said, "Let's wipe out the Mt. Kenya mafia," adding, "Kill 2, get 1 free." But there was also a more disturbing effort by some Kykuyus to use text messaging to first collect sensitive information about members of particular ethnic groups and then distribute that information to attack and intimidate them. "The blood of innocent Kykuyus will cease to flow! We will massacre them right here in the capital. In the name of justice put down the names of all the Luos and Kaleos you know from work, your property, anywhere in Nairobi, not forgetting where and how their children go to school. We will give you a number on where to text these messages," said one such message. At one point, the Kenyan authorities were considering shutting down mobile networks to avoid any further escalation of violence (between 800 and 1,500 people died, and up to 250,000 were displaced).

Even though text messaging also proved instrumental in setting up a system that helped to track how violence spread around Kenya—a success story that gained far more attention in the media—one can't just disregard the fact that text messaging also helped to mobilize hate. In fact, text messages full of hatred and highly intimidating death threats kept haunting witnesses who agreed to testify to the high-level Waki Commission set up to investigate the violence two years after the clashes. ("You are still a young man and you are not supposed to die, but you betrayed our leader, so what we shall do to you is just to kill you" was the text of a message received by one such witness.)

The bloody Uighur-Han clashes that took place in China's Xinjiang Province in the summer of 2009 and resulted in a ten-month ban on Internet communications appear to have been triggered by a provocative article posted to the Internet forum www.sg169.com. Written by an angry twenty-three-year-old who had been laid off by the Xuri Toy Factory in China's Guangdong Province, 3,000 miles from Xinjiang, the article asserted that "six Xinjiang boys raped two innocent girls at the Xuri Toy Factory." (China's official media stated that the rape accusations were fake, and foreign journalists could not find any evidence to substantiate such claims either.) Ten days later, the Uighur workers at the toy factory were attacked by a group of angry Han people (two Uighurs were killed, and over a hundred were injured). That confrontation, in turn, triggered even more rumors, many of which overstated the number of people who had been killed, and the situation got further out of control soon thereafter, with text messaging and phone calls helping to mobilize both sides (the authorities eventually turned off all phone communications soon thereafter). A gruesome video that showed several Uighur workers being beaten by a mob armed with metal pipes quickly went viral as well, only adding to the tensions.

Even countries with a long democratic tradition have not been sparred some of the SMS-terror. In 2005, many Australians received text messages urging attacks on their fellow citizens of Lebanese descent ("This Sunday every Fucking Aussie in the shire, get down to North Cronulla to help support Leb and wog bashing day. . . . Bring your mates down and let's show them this is our beach and they're never welcome back"), sparking major ethnic fights in an otherwise peaceful country. Ethnic Lebanese got similar messages, only calling for attacks on non-Lebanese

Australians. More recently, right-wing extremists in the Czech Republic have been aggressively using text messaging to threaten local Roma communities. Of course, even if text messaging had never been invented, neo-Nazis would still hate the Roma with as much passion; to blame their racism on mobile phones would be yet another manifestation of focusing on technology at the expense of political and social factors. But the ease, scale, and speed of communications afforded by text messaging makes the brief and previously locally contained outbursts of neo-Nazi anger resonate in ways that they could have never resonated in an era marked by less connectedness.

Perhaps, the freedom to connect, at least in its current somewhat abstract interpretation, would be a great policy priority in a democratic paradise, where citizens have long forgotten about hate, culture wars, and ethnic prejudice. But such an oasis of tolerance simply does not exist. Even in Switzerland, commonly held up as a paragon of decentralized democratic decision making and mutual respect, the freedom to connect means that a rather small and marginalized fraction of the country's population managed to tap the power of the Internet to mobilize their fellow citizens to ban building new minarets in the country. The movement was spearheaded by right-wing blogs and various groups on social networking sites (many of them featuring extremely graphic posters—or "political Molotov cocktails," as Michael Kimmelman of the New York Times described them—suggesting Muslims are threatening Switzerland, including one that showed minarets rising from the Swiss flag like missiles), and even peace-loving Swiss voters could not resist succumbing to the populist networked discourse. Never underestimate the power of Twitter and Photoshop in the hands of people mobilized by prejudice.

The internet is a global cesspool that reflects the worst of everyone

Barnhizer 13 - Professor Emeritus, Cleveland-Marshall College of Law (David, "Through a PRISM Darkly: Surveillance and Speech Suppression in the "Post-Democracy Electronic State"", working paper, September 2013, p.27//DM)

Much of what is occurring has to do with the incredible expansion of our communications linkages and technologies over the past twenty years. As the capabilities of the Internet have expanded and penetrated our society the volume of "instant accusations" and criticisms has exploded. But the Internet is not simply a communications and information acquisition system. The Internet has been converted into a weapon for psychological warfare and propaganda (not to mention actual criminal activity).64

The Internet-as-weapon has been refined into a tool for surveillance, persuasion and intimidation by government, private business and political interests.65Everything anyone says electronically is now captured and permanently stored--ready to be dredged up years later when it provides useful ammunition against an opponent.66With blogs, e-mails, "tweets", Facebook postings and the like anything can suddenly "go viral" and be distributed to millions of people with no controls over truth, accuracy, context or fairness. Such messages take on a permanent life and prove the classic observation that you "can't put the genie back in the bottle" (or toothpaste into the tube). Deliberate distortions, lies and half-truths have become important elements of political strategy used by people for whom the ends do justify the means, including many of our top political leaders.

Internet freedom inhibits rational policymaking

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 266)//TT

As the Internet mediates more and more of our foreign policy, we are poised to surrender more and more control over it. Of course, the era when diplomats could take the time to formulate deep and extremely careful responses to events was already over with the arrival of the telegraph, which all but killed the autonomy of the foreign corps. As far as thoughtful foreign policy is concerned, it's all been downhill from there. It's hardly surprising that John Herz, the noted theorist of international relations, observed in 1976 that "where formerly more leisurely but also cooler and more thoroughly thought-out action was possible, one now must act or react immediately."

The age of Internet politics deprives the diplomats of more than just autonomy. It's also the end of rational policymaking, as policymakers are bombarded with information they cannot process, while a digitally mobilized global public demands an immediate response. Let's not kid ourselves: Policymakers cannot craft effective policies under the influence of blood-curling videos of Iranian protesters dying on the pavement.

By 1992 George Kennan, the don of American diplomacy and author of the famous "Long Telegram" from Moscow, which shaped much of American thinking during the Cold War and helped to articulate the policy of containment, had come to believe that the media killed America's ability to develop rational foreign policy. Back then viral political videos were still the bread and butter of network television. After he watched the gruesome footage of several dead U.S. Army rangers being dragged through the streets of Mogadishu on CNN, Kennan made the following bitter note in his diary, soon republished as an op-ed in the New York Times: "If American policy from here on out . . . is to be controlled by popular emotional impulses, and particularly ones invoked by the commercial television industry, then there is no place—not only for myself but for what have traditionally been regarded as the responsible deliberative organs of our government, in both executive and legislative branches." Kennan's words were soon seconded by Thomas Keenan, the director of the Human Rights Project at Bard College, who believes that "the rational consideration of information, with a view to grounding what one does in what one knows, now seems overtaken and displaced by emotion, and responses are now somehow controlled or, better, remote-controlled by television images."

Now that television images have been superseded by YouTube videos and angry tweets, the threshold of intervention has dropped even lower. All it took to get the U.S. State Department to ask Twitter to put off their maintenance was a high number of tweets of highly dubious provenance. When the whole world expects us to react immediately—and the tweets are piling up in the diplomats' in-boxes—we are not likely to rely on history, or even our own experiences and earlier mistakes, but instead decide that tweets + young Iranians holding mobile phones = a Twitter Revolution.

William Scheuerman, a political theorist who studies the role of speed in international affairs, is right to worry that "the historical amnesia engendered by a speed-obsessed society invites

propagandistic and fictional retellings of the past, where political history is simply recounted to the direct advantage of presently dominant political and economic groups." Apparently, it's also fictional retellings of the most recent present that a speed-obsessed society should be concerned about. When facts no longer shape their reactions, policymakers are likely to produce wrong responses.

The viral aspect of today's Internet culture is hardly exerting a positive influence on diplomats' ability to think clearly. Back in the 1990s, many pundits and policymakers liked to denigrate (and a select few worship) the so-called "CNN effect," referring to the power of modern media to exert pressure on decision makers by streaming images from the scene of a conflict, eventually forcing them to make decisions they may not have otherwise made. CNN's supposed—but mostly unproven—influence on foreign policy in the 1990s could at least be justified by the fact that it was speaking on behalf of some idealistic and even humanistic position; we knew who was behind CNN, and we knew what their (mostly liberal) biases were.

The humanism of a bunch of Facebook groups is harder to verify. Who are these people, and what do they want? Why are they urging us to interfere or withdraw from a given conflict? Where the optimists see democratization of access, the realists may see the ultimate victory of special interests over agenda setting. Governments, of course, are not stupid. They are also taking advantage of this tremendous new opportunity to cover their own attempts to influence global public opinion in the cloth of vox populi, either directly or through the work of proxies. Take Megaphone, a technology developed by a private Israeli firm. It keeps track of various online polls and surveys, usually run by international newspapers and magazines, that ask their readers questions about the future of the Middle East, Palestine, the legitimacy of Israeli policies, etc. Whenever a new poll is found, the tool pings its users, urging them to head to a given URL and cast a pro-Israel vote. Similarly, the tool also offers to help mass-email articles favorable to Israel, with the objective of pushing such articles to the "most emailed" lists that are available on many newspaper websites.

But it's not only nimble guerilla-like Web experiments like Megaphone that are influencing global public opinion. The truth is that Russia and China have created their own CNNs, which aim to project their own take on the world news. Both have vibrant websites. As American and British news media are experimenting with paywalls to remain afloat, it's government-owned English-language media from Russia and China that stand to benefit the most. They would even pay people to read them!

For all intents and purposes, navigating the new "democratized" public spaces created by the Internet is extremely difficult. But it's even more difficult to judge whether the segments that we happen to see are representative of the entire population. It's never been easier to mistake a few extremely unrepresentative parts for the whole. This in part ex plains why our expectations about the transformative power of the Internet in authoritarian states are so inflated and skewed toward optimism: The people we usually hear from are those who are already on the frontlines of using new media to push for democratic change in authoritarian societies. Somehow, the Chinese bloggers who cover fashion, music, or pornography—even though those subjects are much more popular in the Chinese blogosphere than human rights or rule of law—never make it to congressional hearings in Washington.

The media is not helping either. Assuming they speak good English, those blogging for the Muslim Brotherhood in Egypt may simply have no intention of helping BBC or CNN to produce

yet another report about the power of the blogosphere. That's why the only power Western media cover is usually secular, liberal, or pro-Western. Not surprisingly, they tell us what we wanted to hear all along: Bloggers are fighting for secularism, liberalism, and Western-style democracy. This is why so many Western politicians fall under the wrong impression that bloggers are natural allies, even harbingers, of democracy. "If it's true that there are more bloggers per head of population in Iran than any other country in the world, that makes me optimistic about the future of Iran," said then UK's foreign minister, David Miliband, while visiting Google's headquarters. Why this should be the case—given that Iran's conservative bloggers, who are often more hard-line than the government and are anything but a force for democracy, equality, and justice, are a formidable and rapidly expanding force in the Iranian blogosphere—is unclear. Chances are that Miliband's advisors simply never ventured beyond a handful of pro-Western Iranian blogs that dominate much of the media coverage of the country. It's hard to say what Miliband would make of certain groups of Chinese nationalists who, when they're not making anti-Western or anti-CNN videos, are busy translating books by Western philosophers like Leibniz and Husserl.

Things get worse when Western policymakers start listening to bloggers in exile. Such bloggers often have a grudge against their home country and are thus conditioned to portray all domestic politics as an extension of their own struggle. Their livelihoods and careers often depend on important power brokers in Washington, London, and Brussels making certain assumptions about the Internet. Many of them have joined various new media NGOs or even created a few of their own; should the mainstream assumptions about the power of blogging shift, many of these newly created NGOs are likely to go under.

Not surprisingly, people who get grants to harness the power of the Internet to fight dictators are not going to tell us that they are not succeeding. It's as if we've produced a few million clones of Ahmed Chala - bi, that notoriously misinformed Iraqi exile who gave a highly inaccurate picture of Iraq to those who were willing to listen, and hired them to tell us how to fix their countries. Of course, the influence of exiles on foreign policy is a problem that most governments have had to deal with in the past, but bloggers, perhaps thanks to the inevitable comparisons to Soviet dissidents and the era of samizdat, are often not subjected to the level of scrutiny they deserve.

1nc Internet freedom – at: democracy

Internet centrism and cyber-utopianism wrecks global democracy

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, Introduction)//TT

To be truly effective, the West needs to do more than just cleanse itself of cyber-utopian bias and adopt a more realist posture. When it comes to concrete steps to promote democracy, cyber-utopian convictions often give rise to an equally flawed approach that I dub "Internetcentrism." Unlike cyber-utopianism, Internet-centrism is not a set of beliefs; rather, it's a philosophy of action that informs how decisions, including those that deal with democracy promotion, are made and how long-term strategies are crafted. While cyber-utopianism stipulates what has to be done,

Internet-centrism stipulates how it should be done. Internet-centrists like to answer every question about democratic change by first reframing it in terms of the Internet rather than the context in which that change is to occur. They are often completely oblivious to the highly political nature of technology, especially the Internet, and like to come up with strategies that assume that the logic of the Internet, which, in most cases, they are the only ones to perceive, will shape every environment than it penetrates rather than vice versa.

While most utopians are Internet-centrists, the latter are not necessarily utopians. In fact, many of them like to think of themselves as pragmatic individuals who have abandoned grand theorizing about utopia in the name of achieving tangible results. Sometimes, they are even eager to acknowledge that it takes more than bytes to foster, install, and consolidate a healthy democratic regime.

Their realistic convictions, however, rarely make up for their flawed methodology, which prioritizes the tool over the environment, and, as such, is deaf to the social, cultural, and political subtleties and indeterminacies. Internet-centrism is a highly disorienting drug; it ignores context and entraps policymakers into believing that they have a useful and powerful ally on their side. Pushed to its extreme, it leads to hubris, arrogance, and a false sense of confidence, all bolstered by the dangerous illusion of having established effective command of the Internet. All too often, its practitioners fashion themselves as possessing full mastery of their favorite tool, treating it as a stable and finalized technology, oblivious to the numerous forces that are constantly reshaping the Internet— not all of them for the better. Treating the Internet as a constant, they fail to see their own responsibility in preserving its freedom and reining in the ever-powerful intermediaries, companies like Google and Facebook.

As the Internet takes on an even greater role in the politics of both authoritarian and democratic states, the pressure to forget the context and start with what the Internet allows will only grow. All by itself, however, the Internet provides nothing certain. In fact, as has become obvious in too many contexts, it empowers the strong and disempowers the weak. It is impossible to place the Internet at the heart of the enterprise of democracy promotion without risking the success of that very enterprise.

The premise of this book is thus very simple: To salvage the Internet's promise to aid the fight against authoritarianism, those of us in the West who still care about the future of democracy will need to ditch both cyber-utopianism and Internet-centrism. Currently, we start with a flawed set of assumptions (cyber-utopianism) and act on them using a flawed, even crippled, methodology (Internet-centrism). The result is what I call the **Net Delusion.** Pushed to the extreme, **such logic is poised to have significant global consequences that may risk undermining the very project of promoting democracy**. It's a folly that the West could do without.

Instead, we'll need to opt for policies informed by a realistic assessment of the risks and dangers posed by the Internet, matched by a highly scrupulous and unbiased assessment of its promises, and a theory of action that is highly sensitive to the local context, that is cognizant of the complex connections between the Internet and the rest of foreign policymaking, and that originates not in what technology allows but in what a certain geopolitical environment requires.

In a sense, giving in to cyber-utopianism and Internet-centrism is akin to agreeing to box blindfolded. Sure, every now and then we may still strike some powerful blows against our authoritarian adversaries, but in general this is a poor strategy if we want to win. The struggle

against authoritarianism is too important of a battle to fight with a voluntary intellectual handicap, even if that handicap allows us to play with the latest fancy gadgets.

2nc – Internet freedom hurts democracy

Internet freedom wrecks democracy – information overload prevents stable transitions

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 271)//TT

It may be that what we gain in the ability to network and communicate, we lose in the inevitable empowerment of angry online mobs, who are well-trained to throw "data grenades" at their victims. This may be an acceptable consequence of promoting Internet freedom, but we'd better plan ahead and think of ways in which we can protect the victims. It's irresponsible to put people's lives on the line while hoping we can deal at some later point with the consequences of opening up all the networks and databases.

That the excess of data can pose a danger to freedom and democracy as significant as (if not more significant than) the lack of data has **mostly been lost on those cheerleading for Internet freedom**. This is hardly surprising, for this may not be such an acute problem in liberal democracies, where the dominant pluralist ideology, growing multiculturalism, and a strong rule of law mitigate the consequences of the data deluge.

But most authoritarian or even transitional states do not have that luxury. Hoping that simply opening up all the networks and uploading all the documents would make a transition to democracy easier or more likely is just an illusion. If the sad experience of the 1990s has taught us anything, it's that successful transitions require a strong state and a relatively orderly public life. **The Internet**, so far, **has posed a major threat to both.**

Internet freedom empowers anti-democratic forces more quickly

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 261)//TT

All the recent chatter about how the Internet is breaking down institutions, barriers, and intermediaries can make us oblivious to the fact that strong and well-functioning institutions, especially governments, are essential to the preservation of freedom. Even if we assume that the Internet may facilitate the toppling of authoritarian regimes, it does not necessarily follow that it would also facilitate the consolidation of democracy. If anything, the fact that various antidemocratic forces— including extremists, nationalists, and former elites—have suddenly

gained a new platform to mobilize and spread their gospel suggests that the consolidation of democracy may become harder rather than easier.

Concerns that the information revolution will weaken the nation state are not new. Arthur Schlesinger Jr., the Pulitzer-winning historian who advised John F. Kennedy, foresaw where increasing computerization might lead, if left unchecked, when he wrote in 1997: "The computer turns the untrammeled market into a global juggernaut crashing across frontiers, enfeebling national powers of taxation and regulation, undercutting national management of interest rates and exchanges rates, widening disparities of wealth within and between nations, dragging down labor standards, degrading the environment, denying nations the shaping of their own economic destiny, accountable to no one, creating a world economy without a world polity." Fortunately, things haven't proved as dramatic as he expected, but Schlesinger's prophecy does point to the importance of thinking through what it is we value about state institutions in the context of democratization and ensuring that the Internet does not fully erode those qualities. While it's tempting to use the Internet to cut off all the heads of the authoritarian hydra, no one has yet succeeded in building a successful democracy with that dead hydra (the state apparatus) still lying there. It's then hardly surprising that those living in democracies may not appreciate the fact that without a strong state any kind of journalism—regardless of whether it's performed by mainstream media or bloggers—is impossible.

As Silvio Waisbord, a scholar of press freedom at the George Washington University, points out: "'the state' means functional mechanisms to institutionalize the rule of law, observe legislation to promote access to information, facilitate viable and diversified economies to support mixed media systems, ensure functional and independent tribunals that support 'the public's right to know,' control corruption inside and outside newsrooms, and stop violence against reporters, sources, and citizens." If the cyber-utopians believe their own rhetoric about crumbling institutions, they've got a major problem on their hands, and yet they repeatedly refuse to engage with it.

Nowhere is this more evident than in countries like Afghanistan, where an already weak government is made even weaker by various political, military, and social forces. We can continue celebrating the potential role of the mobile phone in empowering Afghan women, but the Taliban has terrorized many of the mobile networks into shutting down their services between certain hours of the day (avoiding compliance with the Taliban's demands is not an option; when some carriers tried that, the Taliban responded by attacking cellphone towers and murdering their staff). The Taliban doesn't want to shut the system down entirely—for they also use cellphones to communicate—but they still manage to show who is in control and to dictate how technology should be used. Without a strong Afghan government, the numerous empowerment opportunities associated with the mobile phone will never be realized.

Stephen Holmes, a professor of law at New York University, makes this point in an essay titled "How Weak States Threaten Freedom" published in the American Prospect in 1997. Commenting on how Russia was slowly disintegrating under the pressures of gangsterism and corrupt oligarchy, Holmes explains what many Westerners have overlooked: "Russia's politically disorganized society reminds us of liberalism's deep dependence on efficacious government. The idea that autonomous individuals can enjoy their private liberties if they are simply left unpestered by the public power dissolves before the disturbing realities of the new Russia."

Internet enthusiasts often forget that if a government, even an authoritarian one, loses the ability to exercise control over its population or territory, democracy is not necessarily inevitable. As tempting as it is to imagine all authoritarian states as soulless Stalinist wastelands, where every single thing the government does aims at restricting the freedom of the individual, this is a simplistic conception of politics. Were the Russian or Chinese state bureaucracies to collapse tomorrow, it would not be pure democracy that would replace them. It would probably be anarchy and possibly even ethnic strife. This does not mean that either country is unreformable, but reforms can't start by blowing up the state apparatus first.

This is yet another one of those instances in which the peaceful transition to democracy in postcommunist Eastern Europe was interpreted by the West as the ultimate proof that once a government run by authoritarian crooks is out, something inherently democratic would inevitably emerge in its place. The peaceful transition did happen, but it was the result of economic, cultural, and political forces that were rather unique both to the region and to that particular moment in history. The manner in which the transition took place was not predefined by some general law of nature, positing that people always want democracy and, once all barriers are removed, it will necessarily triumph over every single challenge. The utopian vision inherent in such views was on full display in 2003, when, after the statue of Saddam Hussein was toppled in Baghdad, nothing even remotely resembling Eastern European postcommunist democracy ever came to replace it. (Holmes, in another essay, vividly summed up such reductionist views as "remove the lid and out leaps democracy.")

The only thing worse than an authoritarian state is a failed one. The fact that the Internet empowers and amplifies so many forces that impinge on citizen's rights and hurt various minorities is likely to result in more aggressive public demands for a stronger state to protect citizens from the lawlessness of cyberspace. As child pornographers, criminal gangs, nationalists, and terrorists use the Internet to cause more and more harm, the public's patience will sooner or later run out. When Chinese netizens find themselves targets of attacks by "human flesh search engines," they are not waiting for Robin Hood to come and protect them. They expect their otherwise authoritarian government to draft adequate privacy laws and enforce them. Similarly, when corrupt Russian police officers leak databases containing the personal details of many citizens, including their passport details and cell phone numbers, and these databases resurface on commercial Internet sites, it hardly makes Russians celebrate the virtues of limited government. Multiply the power of the Internet by the incompetence of a weakened state, and what you get is a lot of anarchy and injustice. The reason why so many otherwise astute observers see democracy where there is none is that they confuse the democratization of access to tools with the democratization of society. But one does not necessarily lead to the other, especially in environments where governments are too weak, too distracted, or too unwilling to mitigate the consequences of the democratization of tool access. More and cheaper tools in the wrong hands can result in less, not more, democracy.

It's much like the perpetual debate about blogging versus journalism. Today anyone can blog because the tools for producing and disseminating information are cheap. Yet giving everyone a blog will not by itself increase the health of modern-day Western democracy; in fact, the possible side effects—the disappearance of watchdogs, the end of serendipitous news discovery, the further polarization of society—may not be the price worth paying for the still unclear virtues of the blogging revolution. (This does not mean, of course, that a set of smart policies—implemented by the government or private actors—won't help to address those problems.) Why

should it be different with the Internet and politics? For all we know, many social ills may have become considerably worse since the dawn of social media. We need to start looking at the totality of side effects, not just at the fact that the costs of being a political activist have fallen so dramatically.

In debunking the "more access to technology = more democracy" fallacy, Gerald Doppelt, a professor of philosophy at the University of California at San Diego, suggests some further issues we need to ponder. "In order to evaluate the impact of any particular case of technical politics on the democratization of technology and society," writes Doppelt, "we need to ask who is this group of users challenging technology, where do they stand in society, what have they been denied, and what is the ethical significance of the technical change they seek for democratic ideals?" Without asking those questions, even the sharpest observers of technology will keep circling around the paradoxical conclusion that the blogging Al-Qaeda is good for democracy, because blogs have opened up new and cheap vistas for public participation. Any theory of democracy that doesn't go beyond the cost of mobilization as its only criteria of democratization is a theory that policymakers would be well-advised to avoid, even more so in the digital age, when many costs are plummeting across the board.

Not asking those questions would also prevent us from identifying the political consequences of such democratization of access to technology. Only irresponsible pundits would advocate democratizing access to guns in failed states. But the Internet, of course, has so many positive uses—some of which promote freedom of expression—that the gun analogy is rarely invoked by anyone. The good uses, however, do not always cancel out all the bad ones; if guns could also be used as megaphones, they would still make good targets for regulation. The danger is that the colorful banner of Internet freedom may further conceal the fact that the Internet is much more than the megaphone for democratic speech, that its other uses can be extremely antidemocratic in nature, and that without addressing those uses the very project of democracy promotion might be in great danger. The first prerequisite to getting Internet freedom policy right is convincing its greatest advocates that the Internet is more important and disruptive than they have previously theorized.

Internet freedom gives unlimited power to democratic enemies

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 253)//TT

The problem is that the West began its quest for Internet freedom based on the mostly untested cyber-utopian assumption that more connections and more networks necessarily lead to more freedom or more democracy. In her Internet freedom address, Hillary Clinton spoke of the importance of promoting what she dubbed a "freedom to connect," saying that it's "like the freedom of assembly, only in cyberspace. It allows individuals to get online, come together, and hopefully cooperate. Once you're on the internet, you don't need to be a tycoon or a rock star to have a huge impact on society." The U.S. State Department's Alec Ross, one of the chief

architects of Clinton's Internet freedom policy, said that "the very existence of social networks is a net good."

But are social networks really goods to be treasured in themselves? After all, the mafia, prostitution and gambling rings, and youth gangs are social networks, too, but no one would claim that their existence in the physical world is a net good or that it shouldn't be regulated. Ever since Mitch Kapor, one of the founding fathers of cyber-utopianism, proclaimed that "life in cyberspace seems to be shaping up exactly like Thomas Jefferson would have wanted: founded on the primacy of individual liberty and a commitment to pluralism, diversity, and community" in 1993, many policymakers have been under the impression that the only networks to find homes online would be those promoting peace and prosperity. But Kapor hasn't read his Jefferson closely enough, for the latter was well aware of the antidemocratic spirit of many civil associations, writing that "the mobs of the great cities add just so much to the support of pure government as sores do to the strength of the human body." Jefferson, apparently, was not persuaded by the absolute goodness of the "smart mobs," a fancy term to describe social groups that have been organized spontaneously, usually with the help of technology.

As Luke Allnut, an editor with Radio Free Europe, points out, "where the techno-utopianists are limited in their vision is that in this great mass of Internet users all capable of great things in the name of democracy, they see only a mirror image of themselves: progressive, philanthropic, cosmopolitan. They don't see the neo-Nazis, pedophiles, or genocidal maniacs who have networked, grown, and prospered on the Internet." The problem of treating all networks as good in themselves is that it allows policymakers to ignore their political and social effects, delaying effective response to their otherwise harmful activities. "Cooperation," which seems to be the ultimate objective of Clinton's network building, is too ambiguous of a term to build meaningful policy around.

A brief look at history—for example, at the politics of Weimar Germany, where increased civic engagement helped to delegitimize parliamentary democracy—would reveal that an increase in civic activity does not necessarily deepen democracy. American history in the post Tocqueville era offers plenty of similar cues as well. The Ku Klux Klan was also a social network, after all. As Ariel Armony, a political scientist at Colby College in Maine, puts it, "civic involvement may. . . be linked to undemocratic outcomes in state and society, the presence of a 'vital society' may fail to prevent outcomes inimical to democracy, or it may contribute to such results." It's political and economic factors, rather than the ease of forming associations, that primarily set the tone and the vector in which social networks contribute to democratization; one would be naïve to believe that such factors would always favor democracy. For example, if online social networking tools end up over empowering various nationalist elements within China, it is quite obvious that the latter's influence on the direction of China's foreign policy will increase as well. Given the rather peculiar relationship between nationalism, foreign policy, and government legitimacy in China, such developments may not necessarily be particularly conducive to democratization, especially if they lead to more confrontations with Taiwan or Japan.

Even Manuel Castells, a prominent Spanish sociologist and one of the most enthusiastic promoters of the information society, has not been sold on the idea of just "letting a thousand networks bloom." "The Internet is indeed a technology of freedom," writes Castells, "but it can make the powerful free to oppress the uninformed" and "lead to the exclusion of the devalued by the conquerors of value." Robert Putnam, the famed American political theorist who lamented the sad state of social capital in America in his best-selling Bowling Alone, also cautioned against the

"kumbaja interpretation of social capital." "Networks and associated norms of reciprocity are generally good for those inside the network," he wrote, "but the external effects of social capital are by no means always positive." From the perspective of American foreign policy, social networks may, indeed, be net goods, but only as long as they don't include anyone hiding in the caves of Waziristan. When senator after senator deplores the fact that YouTube has become a second home to Islamic terrorists, they hardly sound like absolute believers in the inherent democratic nature of the networked world.

One can't just limit the freedom to connect to the pro-Western nodes of the Web, and everyone—including plenty of anti-Western nodes— stands to profit from the complex nature of the Internet. When it comes to democracy promotion, one major problem with a networked society is that it has also suddenly over empowered those who oppose the very process of democratization, be they the church, former communists, or fringe political movements. As a result, it has become difficult to focus on getting things done, for it's not immediately obvious if the new, networked threats to democracy are more ominous than the ones the West originally thought to fight. Have the nonstate enemies of democracy been empowered to a greater degree than the previous enemy (i.e., the monolith authoritarian state) has been disempowered? It certainly seems like a plausible scenario, at least in some cases; to assume anything otherwise is to cling to an outdated conception of power that is incompatible with the networked nature of the modern world. "People routinely praise the Internet for its decentralizing tendencies. Decentralization and diffusion of power, however, is not the same thing as less power exercised over human beings. Nor is it the same thing as democracy. . . . The fact that no one is in charge does not mean that everyone is free," writes Jack Balkin of Yale Law School. The authoritarian lion may be dead, but now there are hundreds of hungry hyenas swirling around the body.

Internet freedom increases the risk of nationalistic groups

Morozov, 2012– Contributing editor at The New Republic and author of two books ; has written for The New York Times, The Economist, The Wall Street Journal, Financial Times, London Review of Books, Times Literary Supplement (Evgeny, The Net Delusion: The Dark Side of Internet Freedom, p. 247)//TT

The good news is that we are not rushing toward a globalized nirvana where everyone eats at MacDonald's and watches the same Hollywood films, as feared by some early critics of globalization. The bad news is that, under the pressure of religious, nationalist, and cultural forces reignited by the Internet, global politics is poised to become even more complex, contentious, and fragmented. While many in the West view the Internet as offering an excellent opportunity to revive the least credible bits of modernization theory—the once popular belief that, with some assistance, all developing societies can reach a take-off point where they put their history, culture, and religion on hold and simply follow in the policy steps of more developed nations—such ideas don't have much basis in reality.

Egypt's Muslim Brotherhood certainly does not perceive the Internet to be a tool of hyper-modernization, because they reject the very project of hyper-modernization, at least as it is being marketed by the neoliberal institutions that are propping up the Mubarak regime they oppose. And although others have doubts about their vision for the future of Egypt and the Middle East in

general, the Brothers have nothing against using modern tools like the Internet to achieve it. After all, modern technologies abet all revolutions, not just those that are decidedly pro-Western in character. Even such a devout conservative as Ayatollah Khomeini did not shy away from using audiotapes to distribute his sermons in the shah's Iran. "We are struggling against autocracy, for democracy, by means of xeroxracy," was one of the numerous technology worshiping slogans adopted by the anti-shah intelligentsia in the late 1970s. Had Twitter been around at the time, the anti-shah demonstrators would surely be celebrating Twitterocracy. And even though the Islamic Republic did embrace many elements of modernity—cloning, a vibrant legal market in organ donations, string theory, to name just a few areas where contemporary Iran is far ahead of its peers in the Middle East—its politics and public life are still shaped by religious discourse. It's quite likely that a large chunk of both the West's funds and its attention will need to go toward mitigating the inevitable negative effects that Internet-powered religion will have on world affairs. This is not a moral evaluation of religion: It has proved to be good for democracy and freedom at some points in history, but history has also shown how pernicious its influence can be.

A commitment to Internet freedom—or a combination of its various elements—may be the right and inevitable moral choice the West needs to make (albeit with a thousand footnotes), but the West must also understand that a freer Internet, by its very nature, may significantly change the rest of the agenda, creating new problems and entrenching old ones. This doesn't mean that the West should embark on an ambitious global censorship campaign against the Internet. Rather, different countries require a different combination of policies, some of them aimed at countering and mitigating the influence of religion and other cultural forces and some of them amplifying their influence.

Smallpox Strikes Back

Nationalism, too, is going through a major revival on the Web. Members of displaced nations can find each other online, and existing nationalist movements can delve into the freshly digitized national archives to produce their own version of history. New Internet services often open up new venues for contesting history. Nations are now arguing about whether Google Earth renders their borders in accordance with their wishes. Syria and Israel continue battling about how the contested Golan Heights territory should be listed in Facebook's dropdown menus. Indian and Pakistan bloggers have been competing to mark parts of the contested territory of Kashmir as belonging to either of the two countries on Google Maps. The site had also been under attack for listing some Indian villages in the Arunachal Pradesh province, on the Indian-Chinese border, under Chinese names and as belonging to China. Cambodians, too, have been outraged by Google Earth's decision to mark eleventh-century Preah Vihear temple, ownership of which was awarded to Cambodia in a 1962 court ruling, as part of Thailand.

But such fights over the proper marking of digital assets aside, has the Internet reduced our prejudices against other nations? Was Nicholas Negroponte, one of the intellectual fathers of cyber-utopianism, correct when he predicted in 1995 that "[on the Internet] there will be no more room for nationalism than there is for smallpox"? The evidence for such sweeping claims is thin. In fact, quite the opposite may have happened. Now that South Koreans can observe their old enemies from Japan through a 24/7 digital panopticon, they are waging cyber-wars over such petty disputes as figure skating. Many of the deeply rooted national prejudices cannot be cured by increased transparency alone; if anything, greater exposure may only heighten them. Ask Nigerians how they feel about the entire world believing them to be a nation of scammers who only use the Internet to inform us that a Nigerian chieftain was kind enough to include us in his

will. Perversely, it's Nigerians themselves who—often quite willingly—use the Internet to create and perpetuate stereotypes about their nation. Had Facebook and Twitter been around in the early 1990s, when Yugoslavia was rapidly descending into madness, cyber-utopians like Negroponte would have been surprised to see Facebook groups calling for Serbs, Croats, and Bosnians to be exterminated popping up all over the Web.

Perhaps, nationalism and the Internet are something of natural allies. Anyone eager to satisfy their nostalgia for the mighty Soviet, Eastern German, or Yugoslavian past can do so easily on YouTube and eBay, basking in a plethora of historical memorabilia. But it's not just memorabilia; historical facts, too, can now be easily compiled and twisted to suit one's own interpretation of history. Fringe literature dealing with revisionist or outright racist interpretations of history used to be hard to find. Major publishers would never touch such contentious material, and the independent publishers that took the risk usually published only a handful of copies. That world of scarcity is no more: Even the most obscure nationalistic texts, which previously could only be found in select public libraries, have been digitized by their zealous fans and widely disseminated online. Thus, extreme Russian nationalists who believe that the Great Ukrainian Hunger of 1933 was a myth or, at any rate, does not deserve to be called a genocide, can now link to a number of always-available scanned texts, residing somewhere in the cloud, that look extremely persuasive, even if historically incorrect.

And it's not just myth-making based on frivolous interpretations of history that thrives online. The Internet also abets many national groups in formulating legitimate claims against the titular nation. Take the case of the Circassians, a once great nation scattered all over the Northern Caucasus. History was not kind to them: The Circassian nattion was broken into numerous ethnic pieces that were eventually crammed into Russia's vast possessions in the Caucasus. Today, the Circassians make up titular nations of three Russian federal subjects (Adygeya, Karachay-Cherkessia, and Kabardino-Balkaria) and, according to the 2002 Russian population census, number 720,000 people. During the Soviet era, the Kremlin's strategy was to suppress Circassian nationalism at all costs; thus most Circassians were separated into subgroups, depending on their dialect and place of residence, becoming Adygeys, Adygs, Cherkess, Kabards, and Shapsugs. For much of the twentieth century, Circassian nationalism lay dormant, in part because the Soviets banned any competing interpretations of what happened in the Russian-Circassian war in the nineteenth century. Today, however, most of the scholarly and journalistic materials related to the war have been scanned and uploaded to several Circassian websites, so that anyone can access them. Not surprisingly, Circassian nationalism has been quite assertive of late. In 2010 a dedicated website was set up to call on residents of the five nations to list themselves simply as "Circassians" in Russia's 2010 census, and an aggressive online campaign followed. "The internet seems to offer a lifeline to Circassian activists in terms of rejuvenating their mass appeal," notes Zeynel Abidin Besleney, an expert on Circassian nationalism at the School of Oriental and African Studies at the University of London.

Russia, with its eighty-nine federal subjects, has certainly more than one Circassian problem on its plate. Tatars, the largest national minority in Russia, for a long time had to suffer under the policy of Russification imposed by Moscow. Now their youngsters are turning to popular social networking sites to set up online groups that focus on the issue of national Tatar revival. Not only do they use such groups to watch new videos and share links to news and music, but they are also exposed to information, often missing from Russia's own media, about Tatar history and culture and the internal politics of Tatarstan.

As the Circassian and the Tatar cases illustrate, thanks to the Internet many of the Soviet (and even Tsarist) myths that seemed to tie the nation together no longer sound tenable, with many previously captive nations beginning to rediscover their national identities. How Russia will keep its territorial integrity in the long run—especially if more nations try to secede or at least to overcome artificial ethnic divisions of the Soviet era—is anyone's guess. Not surprisingly, the Kremlin's ideologists like Konstantin Rykov have begun emphasizing the need to use the Internet to tie the Russian nation together. At this point, it's impossible to tell what such increased contentiousness means for the future of democracy in Russia, but it would take a giant dose of optimism to assume that, somehow, modern-state Russia would simply choose to disintegrate as peacefully as the Soviet Union did and, more, that democracy would prevail in all of its new parts. Developing an opinion about the long-term impact of the Internet on Russian democracy would inevitably require asking—if not answering—tough questions about nationalism, separatism, center-periphery relations, and so forth. (And not just in Russia: Similar problems are also present in China and, to a lesser degree, Iran, which have sizable minorities of their own.)

The influence of the diasporas—many of whom are not always composed of progressive and democracy-loving individuals—is also poised to rise in an age when Skype facilitates so much of the cultural traffic. Will some of that influence be positive and conducive to democratization? Perhaps, but there will also surely be those who will try to stir things up or promote outdated norms and practices. Thomas Hylland Eriksen, an anthropologist at the University of Oslo, notes that "sometimes, the elites-in-waiting use the Net to coordinate their takeover plans; sometimes diasporas actively support militant and sometimes violent groups 'at home,' knowing that they themselves do not need to pay the price for an increase in violence, remaining as they do comfortably in the peaceful diaspora."

The problem with Internet freedom as a foundation for foreign policy is that in its simplification of complex forces, it may actually make policymakers overlook their own interests. To assume that it's in the American, German, or British interest to simply let all ethnic minorities use the Internet to carve out as much space as they can from the dominant nation, whether it is in Russia, China, or Iran (not to mention much more complicated cases like Georgia), would simply be to badly misread their current policies and objectives. One might argue that these are cunning policies, and it's an argument worth having. The first rather ambiguous articulation of Internet freedom policy by Hillary Clinton simply preferred to gloss over the issue altogether, as if, once armed with one of the most powerful tools on Earth, all nations would realize that, compared to YouTube, all those bloody wars they've been fighting for centuries have been a gigantic waste of time. Finding a way to grapple with the effects of new, digitally empowered nationalism is a formidable task for foreign policy professionals; one can only hope that they won't stop working on it even if the imperative to promote Internet freedom would divert their time and attention elsewhere.

Internet Freedom – AT: human rights

The plan is discrimination against non-US persons under IHRL

Greene and Rodriguez 14 – David Greene is an EFF Senior Staff Attorney, and Katitza Rodriguez is an EEF International Rights Director (David and Katitza, "NSA Mass Surveillance

Programs - Unnecessary and Disproportionate", Electronic Frontier Foundation, May 29, 2014//DM)

US surveillance law violates the Principle of Illegitimacy because it involves unjustified **discrimination against non-US persons**—providing **less favorable standards to them than its own citizens**. Human rights law must protect "everyone," meaning all human beings. As the Universal Declaration of Human Rights has stated, ""All human beings are born free and equal in dignity and rights." Indeed, everyone must be entitled to equal protection under the law and the Constitution.

The domestic-only limit violates international human rights law

Greene and Rodriguez 14 – David Greene is an EFF Senior Staff Attorney, and Katitza Rodriguez is an EEF International Rights Director (David and Katitza, "NSA Mass Surveillance Programs - Unnecessary and Disproportionate", Electronic Frontier Foundation, May 29, 2014//DM)

The US contends that its human rights treaty obligations under the ICCPR do not apply to its actions abroad, a view that **defeats the object and purpose of the treaty**. The Human Rights Committee rejected the United States' position and reiterated that the United States has an extraterritorial duty to protect human rights—including the right to privacy —to its actions abroad regardless of the nationality or location of the individuals.40 The United States asserts control over any data held by companies based in the United States regardless of where the data may be physically stored. Thus, the US controls data located outside the US, even as it argues that it is not responsible for any interference with privacy that results.41

Given the extraordinary capabilities and programs of the US to monitor global communications, it is essential that the protection of privacy applies extraterritorially to innocent persons whose communications the NSA scans or collects. Without such protections, the object and purpose of the United States' international human rights obligations—with regard to the right of privacy in borderless global communications— would be defeated.42

1nc - Data Localization

Surveillance is a proxy for larger disputes with US internet hegemony – and the alt causes matter more

Hill 14* Technology policy consultant at Monitor 360, fellow of the Global Governance Futures 2025 program at the Brookings Institution (Jonah, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS" p.19-20)//GK

Upon first glance, the preceding case studies present a consistent narrative: for the nations now considering localization for data, the Snowden revelations exposed an NSA that had overstepped the boundaries of acceptable surveillance, violated citizen privacy, and catalyzed public and government opinion in favor of forceful action in response. For policymakers, data localization offers a seemingly simple and effective solution. Under closer examination, however, a more complicated picture emerges. The localization movement is in fact a complex and multilayered phenomenon, with the objective **not** only—or even **primarily—of protecting privacy.** Depending on the country in which it is being advanced, localization also serves to protect domestic businesses from foreign competition, to support domestic intelligence and law enforcement ambitions, to suppress dissent and to stir up populist enthusiasms for narrow political ends. Direct evidence of these other objectives for which privacy seems to be a pretext is by its nature difficult to uncover: rarely to policy-makers admit to seeking protectionist goals, to spying on their populations, to suppressing dissent or to exploiting populist emotions. Yet, by viewing the localization movement in the context of other state and corporate interests and activities, it is possible to uncover these other, less exalted ends. Powerful business interests undoubtedly see data localization as an effective and convenient strategy for gaining a competitive advantage in domestic IT markets long dominated by U.S. tech firms. To localization proponents of this stripe, the NSA programs serve as a powerful and **politically expedient excuse** to pursue policies protective of domestic businesses. As an illustration, data localization in Germany presents clear economic benefits for a most powerful industry advocate for localization, Deutsche Telekom (DT). Whether by way of its "email made in Germany" system or the Schengen area routing arrangement, DT looks poised to gain from efforts to reduce the prominence of American tech firms in Europe. It is no wonder that the company has been spearheading many of the localization proposals in that country. As telecommunications law expert Susan Crawford has noted, DT has been seeking to expand its cloud computing services for years, but has found its efforts to appeal to German consumers stifled by competition from Google and other American firms. 79 T-Systems International GmbH, DT's 29,000-employee distribution arm for information-technology solutions, has been steadily losing money as a result.80 Moreover, Crawford suggests that DT would not be content with gaining a greater share of the German market; she points out that through a Schengen routing scheme, "Deutsche Telekom undoubtedly thinks that it will be able to collect fees from network operators in other countries that want their customers' data to reach Deutsche Telekom's customers."81 Similarly, companies and their allies in government in Brazil and India look to profit from data localization proposals. Indeed, the governments of both nations have for years sought to cultivate their own domestic information technology sectors, at times by protecting homegrown industries with import tariffs and preferential taxation. Brazilian President Rousseff has on numerous occasions stated that her government intends to make Brazil a regional technology and innovation leader; in recent years the government has proposed measures to increase domestic Internet bandwidth production, expand international Internet connectivity, encourage domestic content production, and promote the use of domestically produced network equipment.82 India, more controversially, has at times required foreign corporations to enter into joint ventures to sell e- commerce products, and has compelled foreign companies to transfer proprietary technology to domestic firms after a predetermined amount of time.83 Brazil and India are, of course, not alone in this respect. Indonesian firms are constructing domestic cloud service facilities with the help of government grants, 84 while Korea is offering similar support to its own firms. For the governments and corporations of these nations, long frustrated by their inability to develop a domestic IT industry that can compete on an even playing field with the U.S. technology giants, data localization is one means to confront, and perhaps overcome, the American Internet hegemony. 85

2nc – alt causes matter more

Localization is driven by the desire for surveillance and freedom from American dependence

Hill 14* Technology policy consultant at Monitor 360, fellow of the Global Governance Futures 2025 program at the Brookings Institution (Jonah, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS" p.21-22)//GK

If a government already has a sophisticated communications surveillance capacity, it would not be surprising that that it would want to enhance that capacity – certainly, that is what the United States has done. It would seem naïve to suppose that other governments would act differently. Data localization in both German and India and elsewhere, would offer just such enhancement, through two important intelligence functions. First, it allows domestic intelligence agencies to better monitor domestic data by either forcing data to be stored in local servers (indeed, India has previously required two international firms, Research in Motion and Nokia, to locate servers and data domestically91 for intelligence collection purposes), or by requiring that data to be held by local firms over which domestic intelligence and law enforcement agencies may have greater coercive power. Second, in light of the often-overlooked fact that many intelligence services, such as the BND, cooperate with the NSA in a variety of information sharing programs,92 governments may view localization as a tactic to gain additional bargaining power with the NSA in negotiations over how much information the American spy agency will share.93 Moreover, domestic law enforcement agencies (to the extent that, in most democratic countries, law enforcement is administratively and actually separate from intelligence services) surely have reason to view data localization as a potentially valuable evidence gathering tool, useful in identifying and then prosecuting conventional criminal activities. In connection with investigations and prosecutions, foreign law enforcement often complain that the process by which they request data from U.S. firms (the rules of which are generally negotiated between the United States and foreign governments and then ratified in a Mutual Legal Assistance Treaty) is slow and cumbersome, and that American firms and the U.S. Justice Department are too often uncooperative. The President's Review Group on Intelligence and Communication Technologies estimated that the average time from request to delivery is 10 months, and sometimes years pass before a response arrives.94 There is uncertainty about when data can be shared, with whom, and on what terms; and it all happens with very little transparency.95 This process presents annoying and seemingly unjustified interference to foreign law enforcement officials who want to apprehend criminals. The Brazilian government, for example, has requested information from Google for several pending cases in the Brazilian Supreme Court, but has yet to receive it.96 Similarly, India has often asked the U.S. to serve summonses upon Google, as well as on Facebook, Twitter, and others, for failing to prevent the dissemination of speech prohibited under Indian Law, but has been rejected due to U.S. civil liberties sensibilities.97 Data localization, for frustrated and impatient law enforcement agencies and their political allies, looks like a straightforward mechanism to free themselves from some of this bothersome dependence on Americans.

Data localization is motivated by external factors – surveillance is only a public excuse

Hill 14 - technology and international affairs consultant, formerly worked in the Office of the Cybersecurity Coordinator on the National Security Staff at the White House (Jonah, "The Growth of Data Localization Post-Snowden: Analysis and Recommendations for U.S. Policymakers and Business Leaders", Conference on the Future of Cyber Governance, 5/1/14)//DBI

The problem for U.S. tech companies is that there are actually a wide variety of forces and interest groups driving the data localization movement, and many of these forces and groups have objectives beyond the professed goals of data protection and counter-NSA surveillance. One can easily discern in foreign governments' interest in data localization a combination of **anti-American populism**, a **desire for greater ease of foreign (and domestic) surveillance**, and a sense among policymakers and business that the Snowden backlash presents an opportunity to cultivate domestic cloud and other tech services industries, industries that have long been outcompeted by American tech companies in their home markets—**old-fashioned protectionism** tailored for the digital age.

Technological leadership

1nc – tech leadership

Chinese technological leadership inevitable – not possible for the US to reclaim

Sharif 15 – Associate Professor in the Division of Social Science at the Hong Kong University of Science and Technology (Naubahar, Global Technology Leadership: The Case of China, Hong Kong University of Science and Technology Institute for Emerging Market Studies, February, http://iems.ust.hk/wp-content/uploads/2015/02/IEMSWP2015-11.pdf)//JJ

However, such skepticism overlooks **several important factors** that have positioned China to compete for **global technological leadership**. We see three distinct sources of competitive advantage that we believe China will leverage in developing its capacity for technological innovation. One of these factors — a **large and rapidly growing domestic market** — is no secret, while the other two — a **firm government hand in industrial policy** and **globalization** — complement the first factor, market size, in providing China with a path to global technological leadership. China's rapidly growing domestic market — now the second largest in the world — will continue to grow and is likely to **surpass the US market around 2020**. As market size is an important determinant of innovation activities, burgeoning demand will drive Chinese companies to **continuously advance** their technological capabilities to profit from successful innovation, providing a global advantage such as no other economy enjoys. In spite of China's openness to market forces, however, Beijing's autocratic system of governance largely persists, providing **ample room** for the Chinese government to enact and implement industrial and innovation policy to enhance the technological capabilities of Chinese companies to an extent that mature Western market - oriented economies and democratic governments **cannot match**. This represents the second advantage we discuss here. Able to enact policy facing little or no opposition, Beijing can steer economic development as it sees fit. Benefiting from 7 China's so - called 'indigenous innovation' strategy, Chinese companies enjoy government support of R&D,

enabling them to develop technologies independently and to own intellectual property rights. Large - scale government grants and low - interest loans from state - owned banks under the framework of the indigenous innovation strategy provide Chinese firms with strong incentives to become global technological leaders. Finally, **intensified globalization** will continue to benefit Chinese companies in the coming decades, providing a third advantage in its drive to become a **worldwide force in technology**. On the one hand, Chinese firms need not develop every advanced technology on their own in a globalized world. Backed by the government's 'goglobal' strategy, they can acquire such technologies through mergers and acquisitions abroad. On the other hand, as the economy grows and indigenous companies move up the technological ladder, foreign multinational corporations will be increasingly tempted, or perhaps feel compelled, to bring their advanced products to China, eventually even patenting their cutting - edge techno ogies there. This will in turn generate demonstration, labor mobility, and competition effects — or 'spillovers' — to benefit local firms. With all these opportunities looming on the horizon, Chinese companies are **sparing no effort** to seize them in an effort to possibly assume global leadership in technology and innovation. After tracing the trajectory of global technological leadership as **indicated in the economics and innovation literature**, we subsequently consider each of the three factors we have identified as competitive advantages for China — market size, governmental power, and globalization — in greater depth.

2nc – China alt cause

Alt cause to leadership – Chinese market share

Sharif 15 – Associate Professor in the Division of Social Science at the Hong Kong University of Science and Technology (Naubahar, Global Technology Leadership: The Case of China, Hong Kong University of Science and Technology Institute for Emerging Market Studies, February, http://iems.ust.hk/wp-content/uploads/2015/02/IEMSWP2015-11.pdf)//JJ

Thus, China's emergence as a **rapidly growing major market** offers it a **unique advantage**, one the likes of which no nation other than the United States has hitherto enjoyed. As Chinese consumers' expectations regarding price, quality, and features differ markedly from those of consumers in developed economies, it is local Chinese firms (as opposed to foreign firms) who are best situated to satisfy the singular tastes of the Chinese market. Chinese companies seeking global market share have therefore accumulated both **significant cash flow** and **considerable business experience** (from their efforts in the domestic Chinese market) that adds to their competitiveness. Additionally, the size and speed of China's market expansion allows local companies to move rapidly along the learning curve. Many Chinese firms take advantage of the larger size of the Chinese market and increased opportunities to interact with users expediting the speed with which new products are introduced to the market and improved thereafter. Just as American firms achieved leadership in the production of nearly all major raw materials by the end of the nineteenth century, so Chinese manufacturers today are leading producers in **seven of the twenty - two two - digit manufacturing sectors.** Indeed, China leads the world in producing the most **steel**, **cement**, **automobiles**, **fertilizer**, and more than **200 other products**.

Alt. cause to technological leadership – China

Sharif 15 – Associate Professor in the Division of Social Science at the Hong Kong University of Science and Technology (Naubahar, Global Technology Leadership: The Case of China, Hong Kong University of Science and Technology Institute for Emerging Market Studies, February, http://iems.ust.hk/wp-content/uploads/2015/02/IEMSWP2015-11.pdf)//JJ

The United States and much of Western Europe have, however, been mired in economic turmoil and, in some cases, political chaos since the Recession, although signs of steady improvement have begun to emerge, especially in the United States. Still, investment by Western powers in education, research and technology are either stagnating or on the decline. Meanwhile, China continues to **strengthen its innovation system**; the rate of spending on research and development (R&D) in China outpaces overall economic growth. In terms of R&D intensity, in 201 3 China spent US$ 191 billion (current prices) or 2.08 per cent of its rapidly increasing GDP on R&D, placing it second only to the United States (in terms of absolute amount of annual expenditure on R&D) (Ministry of Science and Technology, 2014) . Moreover, there were over 3.2 million R&D personnel in China in 2013. The rapid expansion of degree production in China in science and engineering fields is particularly noteworthy as it is more than **double US levels**. In 2010, science and engineering degrees represented 40 per cent of all new university degrees awarded in China (compared with just 15 per cent in the United States). The yawning gap is most evident in engineering, which represents nearly 30 per cent of all new university degrees awarded in China, compared with just 6 per cent in the United States. In absolute terms, China's science and engineering doctorate production has gr own by an average of 18 per cent per year since 1998 (thanks in part to a lower base level) . By 2012, China's S&E doctorate production had surpassed US levels (National Science Foundation [NSF] 2014). 1 According to Thomson Reuters' Science Citation Index, for the period covering 2001 – 2011, China ranked second in the world in research output as measured by number of papers published in research journals (Thomson Reuters 2011) . China also ranked fifth in number of citations in 2013 and fourth in number of highly cited papers published in 2003 – 2013, which rank in the top 1 per cent by citations for field and year indexed in the Web of Science (Institute of Scientific and Technical Information of China, 2013). In 201 3 , China trailed only the United States and Japan in patent filings under the Patent Cooperation Treaty (PCT) administered by the World Intellectual Property Office (World Intellectual Property Organization 201 4). Furthermore, in 201 3 , two large Chinese telecommunications equipment manufacturers, ZTE and Huawei Technologies, filed 2,309 and 2,094 patents, respectively, which ranked them second and third in the worldwide ranking of top PCT patent applicants. At the US Patent and Trademark Office, the number of patent applications originating in China grew 14 per cent from 2012 to 2013 alone, a rate that is higher than those of the other top countries and regions (the United States, Japan, Germany, South Korea and Taiwan) (US Patent and Trademark Office 2014).

NSA surveillance doesn't undermine cloud computing

Henderson, 4/9/15 (Nicole, "Impact of NSA Surveillance on US Cloud Providers Not as Bad as We Thought: Forrester" 4/9, http://www.thewhir.com/web-hosting-news/impact-nsa-surveillance-us-cloud-providers-not-bad-thought-forrester

It's been two years since Edward Snowden leaked details of the NSA's PRISM surveillance program, and although analysts predicted an exodus from US-based cloud and hosting services in response to the revelations, it hasn't exactly worked out that way, a new report finds.

Forrester released a new report last week that suggests concerns around international customers severing ties with US-based hosting and cloud companies "were overblown."

"Lost revenue from spending on cloud services and platforms comes to just over $500 million between 2014 and 2016. While significant, these impacts are far less than speculated, as more companies reported taking control of security and encryption instead of walking away from US providers," Forrester's principal analyst serving security and risk professionals Edward Ferrara said in a blog post.

Snowden recently told a crowd of cloud and hosting providers that use of encryption is growing, and encrypted traffic has doubled since 2013.

In 2013, Forrester predicted that US cloud providers cloud lose up to $180 billion in business by 2016 due to concerns around the scope of NSA's PRISM program.

According to NextGov, Forrester finds that 26 percent of enterprises based in Asia Pacific, Canada, Europe and Latin America have stopped or reduced their spending with US-based firms for Internet-based services. Thirty-four percent said these concerns were related to fears of US surveillance, while others said they want to support businesses in their own country, or data sovereignty rules prevent them from storing data abroad.

Forrester surveyed more than 3,000 businesses between June and July 2014.

More than half of respondents said that they did not trust US-based outsourcers to handle sensitive information, with only 8 percent reporting to trust their company's intellectual property with a US-based outsourced company.

Ninety-percent of decision-makers have taken steps to encrypt their data, according to the report.

Cloud computing not feasible – security hurdles

Xiao and Chen 15 – *professor at the Department of Software Engineering at Hainan Software Profession Institute AND **Assistant Professor in Operations Management at New York University, PhD (Ziqian and Jingyou, Cloud Computing Security Issues and Countermeasures, Proceedings of the 4th International Conference on Computer Engineering and Networks p. 731-737, 2015, http://link.springer.com/chapter/10.1007/978-3-319-11104-9_85)//JJ

Cloud Computing Security Challenges

New Risks Brought by Virtual Technologies

Virtualization brings new risks mainly in the virtual machine being **abused**, the virtual **machine escape**, and multi-tenant isolation between the **failures of security policy** migration of virtual machines.

Shared Data Security Environment

Under the cloud service model, users are very worried about whether the data stored in the service provider will be **compromised**, **tampered**, or **lost**. Man-made threats facing the user data mainly come from **service providers**, **hackers**, **malicious neighboring tenants**, and subsequent tenants.

Cloud Platform Application Security

There are some **application security problems** existing in Cloud Computing Services, no matter Saas, Paas or Iaas, mainly including three categories. The first one is the malicious **program review**. The second one is the application **interface security**. The third one is **code and test safety**.

Authentication and Access Control in the Cloud Service Model

Under the cloud service model, user authentication and access control face new challenges, for example, the authentication and authorization of massive users, the rational division of access rights, and the management of accounts, passwords, and keys. In dealing with massive users' changeable business and their identification, the cloud service providers need to fully automate users' authentication and access management.

Cloud computing improvements now – new tech and legal measures

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

High-security demanding customers such as government agencies and corporate and organizational users with particularly strict demands for information security are likely to drive these market responses.214 Customers will insist upon better guarantees of security and confidentiality and may refuse to do business with popular, U.S.-based cloud services subject

to far-reaching government surveillance powers. Indeed, they may be barred from doing so under new proposals in Europe and elsewhere requiring their citizens to rely on local cloud services.215 In the market for individual users of cloud resources, there may generally be an increasing demand for better security and privacy safeguards as a result of the widely discussed examples of mass surveillance of online interactions and communication. In addition, law and regulation may increasingly require that certain types of disproportionate lawful access to cloud data be excluded if cloud providers want unrestricted access to the market.

Are these measures likely to be effective against intelligence agencies with the skills and resources of NSA or GCHQ? The answer depends on a variety of factors, which will be discussed further in this Section. One thing is clear: the range of technical solutions described in Part III is not binary, and recent announcements of 'NSA-proof' services seem highly oversimplified.

A better way of framing this topic is to ask a series of more nuanced questions as follows: First, can technological and organizational design of services help to protect against backdoor access of data in the cloud? Second, and related, can the cloud industry help to prevent bulk and dragnet access to the data of their customers? **Third, to what extent can the technical and organizational design of cloud services help to shape lawful access dynamics, such as where and how lawful access takes place (i.e., which entity and in which geographical location)?** And, finally, to what extent can government agencies armed with surveillance orders counter the design choices of industry players when new technologies undermine lawful access to data in the cloud the government is seeking?

Based on the analysis outlined herein, the first question should be answered positively. As cloud services roll out new security and encryption measures with the goal of preventing bulk data collection by surreptitious means, this will undoubtedly interfere with large scale intelligence gathering, such as the interception of client-server and server-server data streams. Firms like Google, Microsoft, Yahoo, and Facebook have already begun to implement well-established techniques such as TLS/SSL and perfect forward secrecy, just as various security organizations have begun to review how they develop cryptographic standards.216 At the end of the day, the protection against backdoor access is also a matter of resources, however. Certain technological solutions may prevent effective bulk collection through specific intelligence programs, but intelligence agencies could in turn deploy targeted intelligence operations to undo some of these protections implemented by cloud services.

The second question, which concerns the possibility of cloud firms preventing dragnet surveillance, cannot generally be answered affirmatively. Technological design may have some impact on front-door collection but where surveillance regimes like Section 702 of the FAA authorize large scale transnational surveillance directed at cloud services, industry has limited options. It may oppose orders in court, or it may take a public stance to the effect that certain types of lawful access should not be legally permissible under current statutes and strive for legal reforms that would enhance the privacy interests of cloud customers.218

The third question must be answered positively also, at least in theory. Technological and organizational design of services can help to shape lawful access dynamics and could be used precisely to do so. While few cloud services have actively implemented privacy-preserving encryption protocols, there is reason to believe that this is changing. As discussed in the previous section, both the cloud industry and the Internet security engineering community have taken the first steps towards implementing technical and organizational measures to shape the lawful access dynamics induced by the use of their services and further innovations may be anticipated. The extent to which local jurisdictions may force multinational cloud service providers to comply with domestic laws notwithstanding these new security measures remains a particularly hotly debated issue.

2nc – surveillance not hurt cloud

No significant impact on cloud computing

Weise, 4/7/15 (Elizabeth, "PRISM revelations didn't hit U.S. cloud computing as hard as expected" 4/7, http://americasmarkets.usatoday.com/2015/04/07/prism-revelations-didnt-hit-u-s-cloud-computing-as-hard-as-expected/

When Edward Snowden revealed the extent of the U.S. National Security Agency's PRISM spying program, there were concerns that American cloud, hosting and outsourcing businesses would lose customers running to non-U.S.-based companies safe from NSA's prying eyes.

"The assertion was that this would be a death blow to U.S. firms trying to operating in Europe and Asia," said Forrester Research analyst Ed Ferrara.

But two recent reports from Forrester find it was less catastrophic than expected.

That's good news for companies like Box (BOX), DropBox and others that make their money by selling U.S.-based data storage.

Forrester had originally predicted U.S. companies could lose as much as $180 billion in sales.

Instead, just 29% of technology decision-makers in Asia, Canada, Europe and Latin America halted or reduced spending with U.S.-based firms offering Internet-based services due to the PRISM scandal, Forrester's Business Technographics Global Infrastructure Survey for 2014 found

"It's a relatively small amount of data," Ferrara said.

That's because most of the companies didn't need to move all their data, much of which was stored in-house. Instead, only 33% of the data held by that 29% of companies was at a third-party data center or in a cloud system.

Forrester believes the overall loss to U.S. cloud providers for 2015 will be about $15 billion and in 2016, $12 billion, a far cry from projections that were ten times that a year ago.

Forrester also found that companies are looking at other ways to protect the integrity of their data, not just from the NSA but also from surveillance by other nations.

Chief among them was encryption. Eighty-four percent of the companies said they're using various encryption methods to protect sensitive material.

The survey's definition of cloud providers is broad, and includes both platform as a service, infrastructure as a service and software as a service companies, said Ferrara.

2nc - cloud not feasible

Tons of alt. causes to cloud computing –

Castro and McQuinn 15 – * Vice President of the Information Technology and Innovation Foundation and Director of the Center for Data Innovation, B.S. in Foreign Service from Georgetown University and an M.S. in Information Security Technology and Management from Carnegie Mellon University, AND ** Research Assistant with the Information Technology and Innovation Foundation, B.S. in Public Relations and Political Communications from the University of Texas (Daniel and Alan, Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness, Information Technology and Innovation Foundation, June 2015, http://www2.itif.org/2015-beyond-usa-freedom-act.pdf?_ga=1.33178294.940386433.1435342104**)//JJ**

In the short term, U.S. companies lose out on contracts, and over the long term, other countries create protectionist policies that lock U.S. businesses out of foreign markets. This not only hurt s U.S. technology companies, but

costs American jobs and weakens the U.S. trade balance. To reverse this trend, ITIF recommend s that policymakers: Increase transparency about U.S. surveillance activities both at home and abroad. Strengthen information security by opposing any government efforts to introduce backdoors in software or weaken encryption. Strengthen U.S. mutual legal assistance treaties (MLATs) . Work to establish international legal standards for government access to data. Complete trade agreements like the Trans Pacific Partnership that ban digital protectionism, and pressure nations that seek to erect protectionist barriers to abandon those efforts .

Cloud computing not feasible – security hurdles

Cloud Computing Security Challenges

New Risks Brought by Virtual Technologies

Virtualization brings new risks mainly in the virtual machine being **abused**, the virtual **machine escape**, and multi-tenant isolation between the **failures of security policy** migration of virtual machines.

Shared Data Security Environment

Under the cloud service model, users are very worried about whether the data stored in the service provider will be **compromised**, **tampered**, or **lost**. Man-made threats facing the user data mainly come from **service providers**, **hackers**, **malicious neighboring tenants**, and subsequent tenants.

Cloud Platform Application Security

There are some **application security problems** existing in Cloud Computing Services, no matter Saas, Paas or Iaas, mainly including three categories. The first one is the malicious **program review**. The second one is the application **interface security**. The third one is **code and test safety**.

Authentication and Access Control in the Cloud Service Model

Under the cloud service model, user authentication and access control face new challenges, for example, the authentication and authorization of massive users, the rational division of access

rights, and the management of accounts, passwords, and keys. In dealing with massive users' changeable business and their identification, the cloud service providers need to fully automate users' authentication and access management.

2nc – Squo solves

New protection standards and tech solve

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604**)//JJ**

V. CONCLUSION

This Article describes and places in a legal perspective the cloud industry's technological responses to the revelations about ongoing transnational surveillance. By focusing on industry responses and exploring the ways in which the technological design of cloud services could further address surveillance concerns, we provide insights into the prospects of these services shaping lawful government access to the cloud. This intersection of service design, on the one hand, and government demands for access to data, on the other hand, signals a dynamic new chapter in the ongoing debate between industry and governments about the possibility and conditions of secure and privacy-friendly information and communications technologies (ICTs) for global markets.

In particular, we have shown that it is helpful to distinguish between front-door and backdoor access to data in the cloud. Our analysis of industry responses has shown the cloud industry is <u>moving quickly</u> to address interception of their customers' data without their knowledge or involvement by adopting technological solutions that limit lawful access (as far as possible) to legal processes directed at the cloud service itself and/or its customers. Many of these measures could have been implemented much earlier on. They are now becoming <u>industry norms</u>. Industry standards like SSL/TLS and HTTPS, together with a new generation of PETs offering "end-to-end"

protection, can be effective tools in preventing bulk acquisition through the targeting of the worldwide communications infrastructure.

In short, technologies can help the industry shape lawful access even though they do not change the legal framework, nor do they overcome the lack of progress in reforming existing legal authorities (such as Section 702 of the FAA) to confine lawful access to the front-door of service providers. We expect that this lack of progress—with respect to transnational legal guarantees of privacy and information security, not only in the U.S. but also elsewhere—will be a strong driver for the wider adoption of more robust and comprehensive privacy technologies in the cloud service context. And we argue that under current conditions, the U.S. cloud industry will increasingly rely on technologies to 'regulate' government data access in an effort to enhance the privacy and information security protections of their foreign customers.

This raises the pertinent question of how the U.S. government may respond to increased resilience of cloud services against lawful surveillance. While FISA and ECPA allow government agencies to obtain orders that ensure the cooperation of providers notwithstanding strong technological protections, existing law does not allow for unlimited bargaining room. Most of the services in question are not subject to CALEA obligations and an extension of CALEA seems neither warranted nor politically feasible under present conditions. Moreover, most of these services have responded to the Snowden revelations by implementing stronger privacy protections (and even some advanced cryptographic protocols). No doubt they await the outcome of the ongoing litigation in the Lavabit case, which may clarify the government's power to compel a service to break its security model in response to a valid surveillance order. However, the Lavabit case does not yet present a scenario in which a service's use of advanced cryptography makes it impossible to comply with a surveillance order by furnishing unencrypted data. 2014] PRIVACY AND SECURITY IN THE CLOUD 533 A U.S. government win in the Lavabit case may therefore be little more than a pyrrhic victory, for it could simply further incentivize industry to adopt even stronger technological solutions against surveillance, including both actively implemented and client-side encryption protocols preserving privacy in the cloud.

Encryption solves – major companies prove

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

It is hardly surprising, then, that cloud firms like Microsoft have started taking steps to ensure that governments use legal process rather than "technological brute force to access customer data." engineering effort to strengthen the encryption of customer data across [its] networks and services."159 This matches similar activity of Google, which had started to encrypt data more comprehensively even before the specific revelations about the MUSCULAR program.160 As a Google security engineer explained shortly after these revelations, "the traffic shown in the [MUSCULAR] slides below is now all encrypted and the work the NSA/GCHQ (U.K. Government Communications Headquarters) staff did on understanding it, **ruined**."161 Finally, Yahoo has announced it will "[e]ncrypt all information that moves between [its] data centers by the end of Q1 2014." The **encryption measures** discussed above could **help the cloud industry to counteract** programs like MUSCULAR and UPSTREAM, which rely on the bulk collection of data by targeting communication links and the telecommunications infrastructure. Of course, this assumes that the NSA does not seek to undermine these protections by relying on security weaknesses in the implementation or use of SSL or the underlying encryption 158 Microsoft recently announced "a comprehensive algorithms.

2nc – at: https encryption

HTTPS encryption protocols fail –

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

In terms of securing web-based communications, however, the HTTPS system is **no panacea** against government surveillance. First, the protocol must be **properly implemented**.147 Second,

there are **known attacks** on the use of encrypted web communications through SSL.148 Third, intelligence agencies may work around the protections and attempt to **secretly install software** on the computers of targeted users, thereby allowing them to **capture their communications before** they are transmitted across an encrypted connection.149 Finally, and most importantly, **HTTPS is not designed to protect data at rest**. Even if a cloud provider properly implements this protocol, this does nothing to prevent a government agency from obtaining the data it seeks by means of a **compulsory order** requiring the service provider to furnish this data. Indeed, as Professor Peter Swire argues, the trend towards encrypting data in transit between users and cloud services may well result in governments shifting their attention from attacking the communication infrastructure to demanding that **cloud service providers hand over stored data** after it has been securely transmitted.150 The Snowden revelations already provide some evidence of this shift and the measures detailed in this Section could accelerate this trend. To counter this trend, governments confronted with encrypted communication channels could try to compel cloud providers to hand over their encryption keys, enabling the continued effective interception over telecommunications infrastructure (an option discussed further in Part IV).

2nc – at: pets

PETs fail – not technologically or economically feasible

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

It is important to emphasize that adoption of the solutions discussed remains low even though some of them are ready for use. There are a number of reasons for this. First, some of these solutions, such as FHE, are at the very early stages of development.188 If service provision is limited to the mere storage of data in the cloud, it may be technically feasible for the service provider to anticipate and organize for encryption under the control of cloud users. However, if the cloud provider also has to perform processing operations on the encrypted data stored by its customers, the implementation of privacy-preserving PETs in the cloud context is far more challenging and may even be impossible for complex operations.189

Second, many cloud providers lack the incentive to adopt and further develop PETs based on advanced cryptographic solutions that would prevent them

from having access to user data. The reasons are obvious: many business models in the cloud industry depend on generating revenue based on access to customers' data (e.g., profiling users for purposes of serving them targeted ads).190 Thus, for many cloud service providers, the costs of implementing these PETs (loss of profits) outweigh the potential benefits (improved security and privacy guarantees for their customers).191 Arguably, the new emphasis on security and privacy in the cloud in response to the Snowden revelations might incentivize industry to consider developing and adopting similar measures. Notwithstanding the current lack of adoption, the point this Article seeks to emphasize is that if service providers were to deploy such measures, it would interfere with lawful access requests to cloud providers in some obvious ways. For example, a provider might simply be unable to share unencrypted customer data with law enforcement or intelligence agencies notwithstanding a lawful request for such access.192

Too many hurdles to client-side PETs – their ev. is theoretical

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

What happens if the government serves a lawful request for the content of communications on a service provider whose customers utilize a client-side PET for encrypted email or chat? At best, the service providers may hand over encrypted data but these PETs prevent it from furnishing unencrypted data. On the other hand, the provider may fully comply with requests for traffic data unless the user combines a client-side PET with a collaborative PET like Tor.197

Cloud providers' attitudes to these client-side PETs are likely to remain ambivalent. On the one hand, they may decide to block their use because they interfere with their business model and desired uses of the service;198 on the other hand, they may embrace PETs as proof of their good faith efforts to ensure customer privacy in the cloud. By pointing out the possibility to adopt end-to-

end encryption solutions, companies could reassure users who are rightly worried about the surveillance of their communications.199

Although the availability of encryption solutions may seem attractive for users, they come with some well-documented downsides in terms of usability.200 As a result, only dedicated or expert users tend to take advantage of them. In fact this is another oft-cited reason for industry to shy away from promoting client-side encryption solutions. In addition, the client-side approach to security tends to rely on the free or open source software model, in which developers release their source code, thereby allowing the security community to review the code and determine that the software is indeed secure. From an ordinary user's perspective, this substitutes trust in a group of security experts in lieu of trusting the third-party services. Finally, it is true that the implementation of end-to-end encryption may help to protect against third party access to raw data through the service provider. From the perspective of managing information security more generally, however, many organizations and individuals may prefer trusting a dedicated service provider over having to rely on their own expertise.

Of course, the Snowden revelations may boost the adoption of end-to-end encryption as a way of limiting the widely publicized systematic monitoring of global Internet communications. Certainly, the NSA's targeting of major cloud service providers through programs like PRISM has spiked interest in end-to-end encryption solutions, at least according to all the **hoopla in the popular press.201 For the moment, however, there seems to be only a small niche market for services that cater to the demand for properly implemented end-to-end security, as evidenced by services such as Lavabit,202 Hushmail,203 Silent Circle,204 and Heml.is.205**

2nc – at: hushmail/lavabit

Our ev accounts for Hushmail and Lavabit – s-quo progression of corporate encryption solves

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS

TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

This may (or may not) be an accurate description of what happened in the Hushmail case.273 Hushmail secure email service offers its customers two options: a high-security option, which requires that users install and run a Java-based encryption applet and encrypts and decrypts email only on the customer's computer; and a low-security (non-Java) option, which is more convenient but less secure because it handles encryption and decryption on Hushmail's web server.274 As a result, Hushmail retains the ability to decrypt user's emails when they select the low-security option (via an "insider attack" like that against Lavabit) but no ability to do so when the customer selects the high-security option.275 Of course, Hushmail's design does not prevent the company from modifying the Java applet so that it captures the user's passphrase and sends it to Hushmail, thereby enabling the company to decrypt the email and share it with a third-party including the government. But it seems unlikely that the company would destroy its own business by subverting its software in this way and subject itself to a likely deceptive practice enforcement action under Section 5 of the FTC Act.276 Unlike Lavabit, none of the sealed documents in the Hushmail case have been leaked, so less information is available. Also, it is not clear whether the 2007 court order pertained to a high-security or a low-security user; or if Hushmail modified its Java encryption engine; or if, in the interests of full disclosure, it merely pointed out the possibility of doing so.277 In short, the Hushmail case exemplifies the dilemmas that the government may begin to face if service providers take the next logical step of adding government agencies to their threat models and designing systems that protect against valid court orders. And while the government has prevailed in its efforts to force niche players like Lavabit and Hushmail to capitulate, it may face a much greater challenge if major Internet firms like Microsoft, Google, and Facebook go down this path in response to the Snowden revelations.

AT: Space debris impact

Status quo solves space debris- NASA and NOAA prove

Haar and Leslie 14, Audrey Haar works at NASA's Goddard Space Flight Center and John Lesilie works at the NOAA Office of Communications and External Affairs, (10/22/14, NASA-NOAA Suomi NPP Satellite Team Ward Off Recent Space Debris Threat,

https://www.nasa.gov/content/goddard/nasa-noaa-suomi-npp-satellite-team-ward-off-recent-space-debris-threat)//AK

While space debris was the uncontrolled adversary in the award-winning space thriller film "Gravity," space debris, also known as "space junk," is an ongoing real-life concern for teams managing satellites orbiting Earth, including NOAA-NASA's Suomi National Polar-orbiting Partnership, or Suomi NPP, satellite. It is not unusual for satellites that have the capability of maneuvering to be repositioned to avoid debris or to maintain the proper orbit.

On an otherwise quiet Sunday on September 28, the Suomi NPP mission team was monitoring a possible close approach of a debris object. By early evening, the risk was assessed to be high enough to start planning a spacecraft maneuver to put the satellite into a safer zone, out of the path of the object classified in a size range of 4 inches up to 3.3 feet.

It was determined that the object (travelling at almost 17,000 mph) was approaching at a nearly "head on" angle, and could potentially only miss the Suomi NPP satellite by approximately 300 feet on Tuesday, September 30, if no action was taken. With that knowledge, the decision was made at 1:30 p.m. on Monday, September 29, for NOAA's Satellite Operations Facility, or NSOF, in Suitland, Maryland, to reposition Suomi NPP. Operational control as well as planning and execution of all Suomi NPP maneuvers take place at NSOF.

"Because Suomi NPP moves at a similar speed as the debris object, if there had been an impact, it would have occurred at a combined speed of nearly 35,000 mph. This would have been catastrophic not only to the satellite, but would result in thousands of pieces of new debris," said Harry Solomon, Mission Manager for Suomi NPP at NASA's Goddard Space Flight Center.

Space around Earth is littered with numerous man-made objects that could potentially collide with operating spacecraft and each other (creating more debris). There are more than 20,000 objects being monitored by the U.S. Department of Defense for satellite managers around the world.

Only about 1,000 of those 20,000 objects are operating spacecraft. The rest of the monitored space debris ranges in size from the size of a softball, to massive rocket bodies, all orbiting uncontrolled at relative speeds averaging about 22,300 mph in low-Earth orbit, where the majority of the objects reside.

Yet it is the unknown, often smaller, untracked objects that pose the biggest threat. "If a spacecraft is lost due to being hit by debris, the odds are the satellite will be hit by something the trackers can't see," said Nicholas Johnson, NASA chief scientist (retired) for orbital debris at Johnson Space Center in Houston.

That is exactly the scenario Solomon and his counterpart, Martin England, mission operations engineering lead at NSOF hope will never happen.

Risk Team Monitors Unmanned Missions Threats for NOAA and NASA

While NASA's Johnson Space Center manages monitored debris threats for spacecraft related to U.S. manned missions such as the International Space Station, the responsibility for unmanned missions managed by NASA falls to the Conjunction Assessment Risk Analysis, or CARA, team operating out of NASA Goddard.

About seven days before a potential threat, information from the Department of Defense is analyzed by the CARA team to evaluate predicted close approaches. CARA monitors and provides updated information about potential threats to satellite mission managers who then make a decision about the need to reposition their satellites in a procedure known as a Risk Mitigation Maneuver.

Since Suomi NPP's launch in October 2011, this recent reposition was the fourth Risk Mitigation Maneuver to avoid space debris. In this case, the object was a section of a Thorad-Agena launch vehicle used between 1966 and1972 primarily for Corona U.S. reconnaisssance satellites.

A previous Suomi NPP risk mitigation maneuver in January 2014 avoided a discarded booster from a Delta 1 launch vehicle, a type of rocket made in the United States for a variety of space missions from 1960 to 1990. There is also a significant amount of debris in Suomi NPP's orbit from the Chinese Fengyun-1C, a meteorological satellite China destroyed in January 2007 in a test of an anti-satellite missile. Another threat near Suomi NPP's orbit is the debris resulting from a 2009 collision of a functioning commercial communications satellite and a defunct Russian satellite.

Suomi NPP's job is to collect environmental observations of atmosphere, ocean and land for both NOAA's weather and oceanography operational missions and NASA's research mission to continue the long-term climate record to better understand the Earth's climate and long-term trends.

To accomplish those goals, the satellite maintains a position on orbit such that the desired path across the ground does not vary by more than 20 km (12 miles) on each side. This orbit is adjusted with regular planned maneuvers to maintain the proper orbit and angles for best information collection. But if a Risk Mitigation Maneuver to avoid space debris were to necessitate moving out of that desired collection zone, then yet another maneuver would be necessary to return to the optimum orbit position. These unplanned maneuvers tap into the finite amount of fuel on satellites and could potentially shorten mission life of a spacecraft if fuel is used more quickly than anticipated.

The amount of space debris is not constant. It generally increases every year, sometimes generated from debris collisions, which can potentially create additional debris fragments. But there are also debris reductions. One tracked object generally falls back to Earth daily, sometimes burning up to nothing upon re-entry, or falling into water or the large areas of low population density.

In addition, there are also natural events that help control debris. The sun is currently going through a period known as solar maximum, the term for a high period of solar activity. The increased number of sunspots and solar storms during solar maximum takes place approximately every 11 years. During this period, the extent of Earth's atmosphere increases due to solar heat generated by the increased amount of solar activity. As the atmosphere extends to higher altitudes, debris at these altitudes are then subjected to increased friction, known as drag, and as a result, space debris typically fall to Earth at a higher rate during solar maximum.

The Suomi NPP mission is a bridge between NOAA and NASA legacy Earth observing missions and NOAA's next-generation Joint Polar Satellite System, or JPSS. The next satellite, JPSS-1, is targeted for launch in early 2017.

Status quo mechanisms being strengthened now to solves space debris threats

Bonard 14, expert on the ISS and a space analyst, (Michael, 11/10/14, Commentary | Space Debris Mitigation: A New Hope for a Realistic Solution?, http://spacenews.com/42511space-debris-mitigation-a-new-hope-for-a-realistic-solution/)//AK

On Jan. 11, 2007, a Chinese antisatellite missile test completely fragmented a Chinese target satellite into millions of pieces of debris — nearly 800 debris fragments 10 centimeters or larger, nearly 40,000 debris fragments between 1 and 10 centimeters, and some 2 million fragments of 1 millimeter or larger.

On Feb. 10, 2009, the operational Iridium 33 and decommissioned Kosmos-2251 satellites collided at a speed of 42,120 kilometers per hour, destroying both satellites. In July 2011, more than 2,000 large debris fragments resulting from this collision were detected.

The international space station is routinely dodging debris that are tracked by ground-based radars.

Space debris constitutes a continuously growing threat to satellites and manned spacecraft. Very small debris creates potentially nonthreatening damage. Large debris can be detected by ground-based radars and avoided by spacecraft maneuvers. However, small- to medium-sized debris in low or medium Earth orbits constitutes the biggest threat. These orbits have the largest density of debris and the highest relative speeds, while the atmospheric drag is small enough that it may take centuries to have the debris re-enter the atmosphere.

In 1978, NASA scientist Donald J. Kessler showed that if the density of space debris in low Earth orbit is high enough, each collision generating space debris would increase the likelihood of further collisions. One serious implication is that the multiplication of debris in orbit will render space exploration, and even the use of satellites, increasingly dangerous and costly for many generations.

Multiple solutions to remove space debris have been explored and published.

One of these solutions involves physical contact between debris and the spacecraft:

Shielding of in-orbit spacecraft has been considered. However, the satellite community has recognized that the sheer weight of any reasonably efficient shielding would make launch not economically viable. Furthermore, the speeds involved in physical contacts would generate a cloud of additional debris.

“Catcher” spacecraft have also been proposed. Conceptually, highly mobile and agile spacecraft equipped with a “catching device” like a net or a robotic arm could be launched from Earth to intercept and catch debris. However, unless the catcher spacecraft are able to precisely match the speed and direction of the debris, any high-speed physical contact between a component of the catcher spacecraft and space debris will result in a collision, multiplying the debris. The cost of designing, developing, testing and launching such a spacecraft, with sufficient fuel onboard to

repeatedly intercept multiple debris fragments at different speeds, orbits and altitudes, does not seem to be economically viable.

Other solutions would use high-power lasers that could vaporize the surface of the debris in space, deflecting it and possibly changing its orbit to intersect the atmosphere. These solutions have the advantage of not requiring physical contact with the debris.

Space-based laser systems require designing, building, launching and operating a spacecraft equipped with a very high-power laser system. Such a design is utterly complex and expensive and very likely will not be economically viable.

Airborne laser systems are facing the same obstacles: The Boeing YAL-1 Airborne Laser Test Bed program, which was designed as a missile defense system to destroy tactical ballistic missiles, was terminated because of cost.

Ground-based laser systems are handicapped by the very long propagation distance, atmospheric absorption and distortion of the laser beam. Such parameters make this solution also not economically viable. Furthermore, being located in a single country, a ground-based laser system would raise serious political issues within the international community because of its implied antisatellite capability.

In summary, the cost/benefit ratio of the above solutions appears to be the main reason none has been implemented to date to proactively mitigate the most dangerous debris.

A more affordable approach for cleaning low and medium Earth orbits of small- to medium-sized orbital debris may be achievable. This approach would use the principle of deflecting an electrically charged, moving object in a magnetic field. The old television tube is probably the most common example of this principle, where electrical charges (electrons) are deflected by the magnetic fields generated by the tube deflection coils.

The application of this principle would use a space-based electron gun to generate an electron beam directed at the orbital debris. The beam would remotely impart an electric charge to the debris. Earth's magnetic field would exert a force on the electric charge of such debris crossing the magnetic field at high speed, modifying its orbit. Over time, the orbit would become highly elliptical and would intersect the upper atmosphere, where the debris would vaporize or fall to Earth. Preliminary calculations have shown that this concept is sound. The benefits include:

Cost: Lower cost is the major advantage of electromagnetic deflection.

Feasibility: There is no new or speculative technology to develop. Used in particle accelerators and in millions of old-style television tubes, the electron gun technology is very mature. The energy used to generate the electron beam is orders of magnitude lower than high-power lasers.

Risk: It would reduce the probability of creating additional debris by avoiding any physical contact.

The electron gun device could be integrated in an add-on module to the international space station.

The ISS is already in space, and there would be no new spacecraft to develop and launch.

The ISS has a large power-generation capability, while the electron gun would require only intermittent and modest amounts of energy to operate.

This solution would be more easily adopted by the international space community, since it does not have the capability to damage or destroy a spacecraft. This feature would be expected to encourage support and funding of the project by all the nations involved in space operations. The electromagnetic deflection concept would best be implemented as an international program, managed and coordinated by the space agencies of several countries.

As with any new technology development, there are still open questions associated with the deployment of this concept. A formal study would have to be conducted by space specialists to validate and test the concept and determine the optimum design parameters.

Areas that should be explored include:

The ability to precisely direct the electron beam at the debris. Although electrons can be sent at near-light speed, they are also deflected by the very magnetic field that will act on the debris, requiring precise aiming of the electron gun.

The ability of the target to store the electrons.

The retention of the charge by the target. Due to the constant bombardment of the target by the solar wind that comprises ionized particles, it is expected that the charge of the target will dissipate over time.

The dynamic response of the target trajectory under the influence of the deflecting force.

In conclusion, civil and government satellites as well as manned missions are currently exposed to the growing risk of collisions with debris, which may result in costly incidents, or accidents that could take human lives. It is essential to have a solution implemented as soon as possible. As of today, the electromagnetic deflection approach seems to be one of the most cost effective, most realistically achievable and least risky. It deserves to be further evaluated and pursued.

Space debris not a threat to humans

Chun 11, space debris analyst and contributor at People's Daily, (Yao, 9/28/11, Experts: No need to worry about falling space debris, http://en.people.cn/202936/7606918.html) //AK

As more and more satellites are being launched into the space, will the debris of the failed satellites bring disaster to earth? The experts from the Center for Space Science and Applied Research (CSSAR) under the Chinese Academy of Sciences say: "Don't panic, space junk will not fall on your head."

"Recently some reports may have caused certain panic in the public, who are worried that space debris will threaten people's survival. But, in fact we can rest assured that space debris will not hit people because the probability is minimal," said Gong Jiancun, deputy director of CSSAR.

Space debris will not pose a threat to humans, he said. However, the real reason why scientists are concerned about space debris is because of its potential to harm or hinder spacecraft.

Since 1957, when the first artificial satellite was launched into space, the amount of space debris has increased year by year. As of this week, there are more than 16,000 pieces of debris with a diameter of more than 10 centimeters in space, according to observation data from the United States.

This debris is distributed in different earth orbits: low orbit, hundreds of kilometers away from the earth; moderate-altitude orbit, thousands of kilometers away, and high orbit, tens of thousands of kilometers away. Because of this, the debris is not concentrated in a dense region of space.

Generally speaking, space debris is divided in three categories: large space debris, with a diameter of more than 10 centimeters; small space debris, with a diameter of less than 1 millimeter, and dangerous debris, with a diameter between large and small debris.

"If the debris falls to the earth, most of it will be burned away by the high temperature of thousands of degrees produced by the high-speed friction with the atmosphere. Even if a large chunk of space debris penetrated the atmosphere and posed a threat to the earth, mankind should be capable of defending against it," Gong said.

First, we can roughly estimate its orbit. With the estimation of its orbit, we can intercept it. Gong said that the U.S. has successfully intercepted a failed satellite using a missile. That satellite contained highly toxic substances. In order to prevent it from falling into the sea, the U.S. destroyed the satellite by a missile launched from a warship. China also has similar technologies and can disintegrate it in the space before it causes harm."

"Scientists also have come up with many other methods to clear the space debris. For example, we can leave some fuel in satellites and control the satellite to fly out of the original track," Gong said. "Some countries have developed passive technologies, such as launching a spacecraft to catch space debris and take it away. Other countries are developing satellites with mechanical arms, which not only can repair satellites but also can pull the failed satellites out of the orbit."

However, these technologies are not very mature. It is still uncertain when they will come into use, he said.

China turn

Chinese and U.S. tech industries are zero-sum – surveillance crowds out the U.S. market

Castro and McQuinn 15 – * Vice President of the Information Technology and Innovation Foundation and Director of the Center for Data Innovation, B.S. in Foreign Service from Georgetown University and an M.S. in Information Security Technology and Management from Carnegie Mellon University, AND ** Research Assistant with the Information Technology and Innovation Foundation, B.S. in Public Relations and Political Communications from the University of Texas (Daniel and Alan, Beyond the

USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness, Information Technology and Innovation Foundation, June 2015, http://www2.itif.org/2015-beyond-usa-freedom-act.pdf?_ga=1.33178294.940386433.1435342104)//JJ

Protectionist policies in China have further strained the U.S. tech industry. In January 2015, the Chinese government adopted new regulations that forced companies that sold equipment to Chinese banks to turn over secret source code, submit to aggressive audits, and build en cryption keys into their products. 38 While ostensibly an attempt to strengthen cybersecurity in critical Chinese industries, many western tech companies saw these policies as a shot across the bow trying to force them out of China's markets. After all, the Chinese government ha d already launched a "de - IOE" movement — IOE stands for IBM, Oracle and EMC — to convince its state - owned banks to stop buying from these U.S. tech giants. 39 To be sure, the Chinese government recently halted this policy under U.S. pressur e. 40 However, the halted policy can be seen as a part of a larger clash between China and the United States over trade and cybersecurity. Indeed, these proposed barriers were in part a quid pro quo from China, after the United States barred Huawei, a major Chinese computer maker, from selling its products in the United States due to the fear that this equipment had "back doors" for the Chinese government. 41 Since the Snowden revelations essentially gave them cover, Chinese lawmakers have openly called for the use of domestic tech products over foreign goods both to boost the Chinese economy and in response to U.S. surveillance tactics. This system of retaliation has not only led to a degradation of business interests for U.S. tech companies in China, but also disrupted the dialogue between the U.S. government and China on cybersecurity issues. 4

Cybersecurity

1nc – no impact

No impact to cyberattacks – empirics – their ev is fear-mongering

Valeriano and Maness 5/13/15 – co-authors of Cyber War versus Cyber Realities, AND *Senior Lecturer in Social and Political Sciences at the University of Glasgow, AND **Visiting Fellow of Security and Resilience Studies at Northeastern University (Brandon and Ryan C., The Coming Cyberpeace: The Normative Argument Against Cyberwarfare, Foreign

Affairs, https://www.foreignaffairs.com/articles/2015-05-13/coming-cyberpeace)//JJ

The era of cyberconflict is upon us; at least, experts seem to accept that cyberattacks are the new normal. In fact, however, evidence suggests that cyberconflict is not as prevalent as many believe. Likewise, the severity of individual cyber events is not increasing, even if the frequency of overall attacks has risen. And an emerging norm against the use of severe state-based cybertactics contradicts fear-mongering news reports about a coming cyberapocalypse. The few isolated incidents of successful state-based cyberattacks do not a trend make. Rather, what we are seeing is cyberespionage and probes, not cyberwarfare. Meanwhile, the international consensus has stabilized around a number of limited acceptable uses of cybertechnology—one that prohibits any dangerous use of force.

Despite fears of a boom in cyberwarfare, there have been no major or dangerous hacks between countries. The closest any states have come to such events occurred when Russia attacked Georgian news outlets and websites in 2008; when Russian forces shut down banking, government, and news websites in Estonia in 2007; when Iran attacked the Saudi Arabian oil firm Saudi Aramco with the Shamoon virus in 2012; and when the United States attempted to sabotage Iran's nuclear power systems from 2007 to 2011 through the Stuxnet worm. The attack on Sony from North Korea is just the latest overhyped cyberattack to date, as the corporate giant has recovered its lost revenues from the attack and its networks are arguably more resilient as a result. Even these are more probes into vulnerabilities than full attacks. Russia's aggressions show that Moscow is willing to use cyberwarfare for disruption and propaganda, but not to inflict injuries or lasting infrastructural damage. The Shamoon incident allowed Iran to punish Saudi Arabia for its alliance with the United States as Tehran faced increased sanctions; the attack destroyed files on Saudi Aramco's computer network but failed to do any lasting damage. The Stuxnet incident also failed to create any lasting damage, as Tehran put more centrifuges online to compensate for virus-based losses and strengthened holes in their system. Further, these supposedly successful cases of cyberattacks are balanced by many more examples of unsuccessful ones. If the future of cyberconflict looks like today, the international community must reassess the severity of the threat.

Cyberattacks have demonstrated themselves to be more smoke than fire. This is not to suggest that incidents are on the decline, however. Distributed denial-of-service attacks and infiltrations increase by the minute—every major organization is probed constantly, but only for weaknesses or new infiltration methods for potential use in the future. Probes and pokes do not destabilize states or change trends within international politics. Even common cyber actions have little effect on levels of cooperation and conflict between states.

Cyberattacks won't result in nuclear war - airgapping solves

Green 2 – editor of The Washington Monthly (Joshua, "The Myth of Cyberterrorism", Washington Monthly, http://www.washingtonmonthly.com/features/2001/0211.green.html//DM)

There's just one problem: There is no such thing as cyberterrorism--no instance of anyone ever having been killed by a terrorist (or anyone else) using a computer. Nor is there compelling evidence that al Qaeda or any other terrorist organization has resorted to computers for any sort of serious destructive activity. What's more, outside of a Tom Clancy novel, computer security specialists believe it is virtually impossible to use the Internet to inflict death on a large scale, and many scoff at the notion that terrorists would bother trying. "I don't lie awake at night worrying about cyberattacks ruining my life," says Dorothy Denning, a computer science professor at Georgetown University and one of the country's foremost cybersecurity experts. "Not only does [cyberterrorism] not rank alongside chemical, biological, or nuclear weapons, but it is not anywhere near as serious as other potential physical threats like car bombs or suicide bombers."

Which is not to say that cybersecurity isn't a serious problem--it's just not one that involves terrorists. Interviews with terrorism and computer security experts, and current and former government and military officials, yielded near unanimous agreement that the real danger is from the criminals and other hackers who did $15 billion in damage to the global economy last year using viruses, worms, and other readily available tools. That figure is sure to balloon if more isn't done to protect vulnerable computer systems, the vast majority of which are in the private sector. Yet when it comes to imposing the tough measures on business necessary to protect against the real cyberthreats, the Bush administration has balked.

Crushing BlackBerrys

When ordinary people imagine cyberterrorism, they tend to think along Hollywood plot lines, doomsday scenarios in which terrorists hijack nuclear weapons, airliners, or military computers from halfway around the world. Given the colorful history of federal boondoggles--billion-dollar weapons systems that misfire, $600 toilet seats--that's an understandable concern. But, with few exceptions, it's not one that applies to preparedness for a cyberattack. "The government is miles ahead of the private sector when it comes to cybersecurity," says Michael Cheek, director of intelligence for iDefense, a Virginia-based computer security company with government and private-sector clients. "Particularly the most sensitive military systems."

Serious effort and plain good fortune have combined to bring this about. Take nuclear weapons. The biggest fallacy about their vulnerability, promoted in action thrillers like WarGames, is that they're designed for remote operation. "[The movie] is premised on the assumption that there's a

modem bank hanging on the side of the computer that controls the missiles," says Martin Libicki, a defense analyst at the RAND Corporation. "I assure you, there isn't." Rather, nuclear weapons and other sensitive military systems enjoy the most basic form of Internet security: they're "air-gapped," meaning that they're not physically connected to the Internet and are therefore inaccessible to outside hackers. (Nuclear weapons also contain "permissive action links," mechanisms to prevent weapons from being armed without inputting codes carried by the president.) A retired military official was somewhat indignant at the mere suggestion: "As a general principle, we've been looking at this thing for 20 years. What cave have you been living in if you haven't considered this [threat]?"

When it comes to cyberthreats, the Defense Department has been particularly vigilant to protect key systems by isolating them from the Net and even from the Pentagon's internal network. All new software must be submitted to the National Security Agency for security testing. "Terrorists could not gain control of our spacecraft, nuclear weapons, or any other type of high-consequence asset," says Air Force Chief Information Officer John Gilligan. For more than a year, Pentagon CIO John Stenbit has enforced a moratorium on new wireless networks, which are often easy to hack into, as well as common wireless devices such as PDAs, BlackBerrys, and even wireless or infrared copiers and faxes.

The September 11 hijackings led to an outcry that airliners are particularly susceptible to cyberterrorism. Earlier this year, for instance, Sen. Charles Schumer (D-N.Y.) described "the absolute havoc and devastation that would result if cyberterrorists suddenly shut down our air traffic control system, with thousands of planes in mid-flight." In fact, cybersecurity experts give some of their highest marks to the FAA, which reasonably separates its administrative and air traffic control systems and strictly air-gaps the latter. And there's a reason the 9/11 hijackers used box-cutters instead of keyboards: It's impossible to hijack a plane remotely, which eliminates the possibility of a high-tech 9/11 scenario in which planes are used as weapons.

Another source of concern is terrorist infiltration of our intelligence agencies. But here, too, the risk is slim. The CIA's classified computers are also air-gapped, as is the FBI's entire computer system. "They've been paranoid about this forever," says Libicki, adding that paranoia is a sound governing principle when it comes to cybersecurity. Such concerns are manifesting themselves in broader policy terms as well. One notable characteristic of last year's Quadrennial Defense Review was how strongly it focused on protecting information systems.

2nc – no impact

No escalation – restraint and third-party allies

Valeriano and Maness 5/13/15 – co-authors of Cyber War versus Cyber Realities, AND *Senior Lecturer in Social and Political Sciences at the University of Glasgow, AND **Visiting Fellow of Security and Resilience Studies at Northeastern University (Brandon and Ryan C., The Coming Cyberpeace: The Normative Argument Against Cyberwarfare, Foreign

Affairs, https://www.foreignaffairs.com/articles/2015-05-13/coming-cyberpeace)//JJ

NORMCORE IS HERE TO STAY

A protocol of restraint has emerged as the volume of cyberattacks has increased. State-based cyberattacks are expected, and in some cases tolerated, as long as they do not rise to the level of total offensive operations—direct and malicious incidents that could destroy infrastructure or critical facilities. These options are apparently off the table for states, since they would lead to physical confrontation, collateral damage, and economic retaliation.

The reproducibility of cyberattacks has also led states to exercise restraint. Enemies can replicate successful cyberweapons easily if source code and programs find their way into the wild or are reverse-engineered. Cyberweapons are not simple to design, either, which makes their use limited: Stuxnet took years of work by U.S. intelligence (with help from Israel) and cost hundreds of millions of dollars—and it still failed. The risk of creating collateral damage is high, since cyberweaponry cannot provide surgical precision and can spread into other networks of possible allies of the attackers. For example, the Stuxnet worm, intended for Iran's nuclear program's network, showed up in Azerbaijan, India, Indonesia, and Pakistan, among other countries. As witnessed in the Russian attack on Georgia, the potential for conflict diffusion is high, as third-party allies can enter conflicts easily. Estonia sent its Computer Emergency Readiness Team experts to Georgia to keep the country's crucial networks up and running. Poland freed up bandwidth for servers in its territory to keep Georgian government websites up and its people informed. Finally, the risk of retaliation is high, as it is in any war, especially as attribution of perpetrators is getting easier to trace with better forensic techniques. The only drawback is that exposing attribution capabilities often exposes ongoing infiltration methods.

Attacks severity is nil

Valeriano and Maness 5/13/15 – co-authors of Cyber War versus Cyber Realities, AND *Senior Lecturer in Social and Political Sciences at the University of Glasgow, AND **Visiting Fellow of Security and Resilience Studies at Northeastern University (Brandon and Ryan C., The Coming Cyberpeace: The Normative Argument Against Cyberwarfare, Foreign

Affairs, https://www.foreignaffairs.com/articles/2015-05-13/coming-cyberpeace)//JJ

All of these considerations have meant that, so far, cyberconflict has adhered to existing international conflict norms. That there have been no major operations resulting in death or the destruction of physical equipment (outside of the Saudi Aramco incident and Stuxnet) suggests trends toward stability and safety. Cyberoperations are increasing, but only in terms of small-scale actions that have limited utility or damage potential. The truly dangerous cyberactions that many warn against have not occurred, even in situations where observers would think them most likely: within the Ukrainian conflict or during NATO's 2011 operations in Libya. The only demonstrable cyberactivity in the Ukraine crisis has been espionage-level attacks. There is no propaganda, denial of service, or worm or virus activity, as there was in past conflicts involving Russia and post-Soviet states.

The overall trend in cyberwarfare indicates that the international community is enjoying a period of stability. The chart below demonstrates that although cybertactics are increasingly popular, the severity of these attacks remains low. On a scale of one to five, where one is a nuisance attack (a website being defaced, for example) and five is a cyber-related death, few attacks register above a two.

The risk of harmful cyberattacks is exaggerated

Tucker 14 – Patrick Tucker is technology editor for Defense One. He's also the author of The Naked Future: What Happens in a World That Anticipates Your Every Move? (Current, 2014). Previously, Tucker was deputy editor for The Futurist for nine years. Tucker has written about emerging technology in Slate, The Sun, MIT Technology Review, Wilson Quarterly, The American Legion Magazine, BBC News Magazine, Utne Reader, and elsewhere. (Patrick, "Major Cyber Attack Will Cause Significant Loss of Life By 2025, Experts Predict", Defense One, October 29, 2014, http://www.defenseone.com/threats/2014/10/cyber-attack-will-cause-significant-loss-life-2025-experts-predict/97688//DM)

Other experts told Pew that military contractors, facing declining business for missiles and tanks, have purposefully overblown the threats posed by cyber attacks to scare up an enemy for the nation to arm against.

"…This concern seems exaggerated by the political and commercial interests that benefit from us directing massive resources to those who offer themselves as our protectors. It is also exaggerated by the media because it is a dramatic story," said Joseph Guardin, a principal researcher at Microsoft Research. "It is clear our leaders are powerless to rein in the military-industrial-intelligence complex, whose interests are served by having us fearful of cyber attacks. Obviously there will be some theft and perhaps someone can exaggerate it to claim tens of billions in losses, but I don't expect anything dramatic and certainly don't want to live in fear of it."

Guardin, (remember, he does work for Microsoft) is joined by other experts who agree that future cyber attacks will resemble those of today: big headlines to little real effect. Data and intellectual property theft will happen, possibly causing inconvenience for consumers and revenue loss for corporations, but the digital apocalypse is not nigh.

"There will have been major cyber attacks, but they are less likely to have caused widespread harm. They will be stealth attacks to extract information and exploit it for commercial and political gain. Harm to an enemy is only a desire of less sophisticated individuals. Anyone who amasses the ability to mount a major cyber attack, better than their opponent, also doesn't want to lose their position of advantage. They are likely to shift to strategies of gain for their own position, rather than explicit harm to their victim, which would alert their victim and close off their channels of attack, and set back their advantageous position," said Bob Briscoe, chief researcher in networking and infrastructure for British Telecom.

Cyberattacks lower violence – they don't put people in danger

Rid 13 - THOMAS RID is a Reader in War Studies at King's College London. His most recent book is Cyber War Will Not Take Place (Oxford University Press, 2013), from which this essay is adapted. (Thomas, "Cyberwar and Peace: Hacking can reduce real world violence", Foreign Affairs, December 2013, https://www.foreignaffairs.com/articles/2013-10-15/cyberwar-and-peace//DM)

Cyberwar Is Coming!" declared the title of a seminal 1993 article by the RAND Corporation analysts John Arquilla and David Ronfeldt, who argued that the nascent Internet would fundamentally transform warfare. The idea seemed fanciful at the time, and it took more than a decade for members of the U.S. national security establishment to catch on. But once they did, a chorus of voices resounded in the mass media, proclaiming the dawn of the era of cyberwar and warning of its terrifying potential. In February 2011, then CIA Director Leon Panetta warned Congress that "the next Pearl Harbor could very well be a cyberattack." And in late 2012, Mike McConnell, who had served as director of national intelligence under President George W. Bush, warned darkly that the United States could not "wait for the cyber equivalent of the collapse of the World Trade Centers."

Yet the hype about everything "cyber" has obscured three basic truths: cyberwar has never happened in the past, it is not occurring in the present, and it is highly unlikely that it will disturb the future. Indeed, rather than heralding a new era of violent conflict, so far the cyber-era has been defined by the opposite trend: a computer-enabled assault on political violence. Cyberattacks diminish rather than accentuate political violence by making it easier for states, groups, and individuals to engage in two kinds of aggression that do not rise to the level of war: sabotage and espionage. Weaponized computer code and computer-based sabotage operations make it possible to carry out highly targeted attacks on an adversary's technical systems without directly and physically harming human operators and managers. Computer-assisted attacks make it possible to steal data without placing operatives in dangerous environments, thus reducing the level of personal and political risk.

Cyber conflicts are nonviolent - empirics

Rid 13 - THOMAS RID is a Reader in War Studies at King's College London. His most recent book is Cyber War Will Not Take Place (Oxford University Press, 2013), from which this essay

is adapted. (Thomas, "Cyberwar and Peace: Hacking can reduce real world violence", Foreign Affairs, December 2013, https://www.foreignaffairs.com/articles/2013-10-15/cyberwar-and-peace//DM)

THE THIN CASE FOR CYBERWAR

One reason discussions about cyberwar have become disconnected from reality is that many commentators fail to grapple with a basic question: What counts as warfare? Carl von Clausewitz, the nineteenth-century Prussian military theorist, still offers the most concise answer to that question. Clausewitz identified three main criteria that any aggressive or defensive action must meet in order to qualify as an act of war. First, and most simply, all acts of war are violent or potentially violent. Second, an act of war is always instrumental: physical violence or the threat of force is a means to compel the enemy to accept the attacker's will. Finally, to qualify as an act of war, an attack must have some kind of political goal or intention. For that reason, acts of war must be attributable to one side at some point during a confrontation.

No known cyberattack has met all three of those criteria; indeed, very few have met even one. Consider three incidents that today's Cassandras frequently point to as evidence that warfare has entered a new era. The first of these, a massive pipeline explosion in the Soviet Union in June 1982, would count as the most violent cyberattack to date -- if it actually happened. According to a 2004 book by Thomas Reed, who was serving as a staffer on the U.S. National Security Council at the time of the alleged incident, a covert U.S. operation used rigged software to engineer a massive explosion in the Urengoy-Surgut-Chelyabinsk pipeline, which connected Siberian natural gas fields to Europe. Reed claims that the CIA managed to insert malicious code into the software that controlled the pipeline's pumps and valves. The rigged valves supposedly resulted in an explosion that, according to Reed, the U.S. Air Force rated at three kilotons, equivalent to the force of a small nuclear device.

But aside from Reed's account, there is hardly any evidence to prove that any such thing happened, and plenty of reasons to doubt that it did. After Reed published his book, Vasily Pchelintsev, who was reportedly the KGB head of the region when the explosion was supposed to have taken place, denied the story. He surmised that Reed might have been referring to a harmless explosion that happened not in June but on a warm April day that year, caused by pipes shifting in the thawing ground of the tundra. Moreover, no Soviet media reports from 1982 confirm that Reed's explosion took place, although the Soviet media regularly reported on accidents and pipeline explosions at the time. What's more, given the technologies available to the United States at that time, it would have been very difficult to hide malicious software of the kind Reed describes from its Soviet users.

Another incident often related by promoters of the concept of cyberwar occurred in Estonia in 2007. After Estonian authorities decided to move a Soviet-era memorial to Russian soldiers who died in World War II from the center of Tallinn to the city's outskirts, outraged Russian-speaking Estonians launched violent riots that threatened to paralyze the city. The riots were accompanied by cyber-assaults, which began as crude disruptions but became more sophisticated after a few days, culminating in a "denial of service" attack. Hackers hijacked up to 85,000 computers and used them to overwhelm 58 Estonian websites, including that of the country's largest bank, which the attacks rendered useless for a few hours.

Estonia's defense minister and the country's top diplomat pointed their fingers at the Kremlin, but they were unable to muster any evidence. For its part, the Russian government denied any

involvement. In the wake of the incident, Estonia's prime minister, Andrus Ansip, likened the attack to an act of war. "What's the difference between a blockade of harbors or airports of sovereign states and the blockade of government institutions and newspaper websites?" he asked. It was a rhetorical question, but the answer is important: unlike a naval blockade, the disruption of websites is not violent -- indeed, not even potentially violent. The choice of targets also seemed unconnected to the presumed tactical objective of forcing the government to reverse its decision on the memorial. And unlike a naval blockade, the attacks remained anonymous, without political backing, and thus unattributable.

A year later, a third major event entered the cyber-Cassandras' repertoire. In August 2008, the Georgian army attacked separatists in the province of South Ossetia. Russia backed the separatists and responded militarily. The prior month, in what might have been the first time that an independent cyberattack was launched in coordination with a conventional military operation, unknown attackers had begun a campaign of cyber-sabotage, defacing prominent Georgian websites, including those of the country's national bank and the Ministry of Foreign Affairs, and launching denial-of-service attacks against the websites of Georgia's parliament, its largest commercial bank, and Georgian news outlets. The Georgian government blamed the Kremlin, just as the Estonians had done. But Russia again denied sponsoring the attacks, and a NATO investigation later found "no conclusive proof" of who had carried them out.

The attack set off increasingly familiar alarm bells within American media and the U.S. national security establishment. "The July attack may have been a dress rehearsal for an all-out cyberwar," an article in The New York Times declared. Richard Clarke, a former White House cybersecurity czar, warned that the worst was yet to come: the Georgian attack did not "begin to reveal what the Russian military and intelligence agencies could do if they were truly on the attack in cyberspace." Yet the actual effects of these nonviolent events were quite mild. The main damage they caused was to the Georgian government's ability to communicate internationally, thus preventing it from getting out its message at a critical moment. But even if the attackers intended this effect, it proved short-lived: within four days after military confrontations had begun in earnest, the Georgian Foreign Ministry had set up an account on Google's blog-hosting service. This move helped the government keep open a channel to the public and the news media. What the Internet took away, the Internet returned.

Cyberweapons can't do damage directly and can't inflict fear

Rid 13 - THOMAS RID is a Reader in War Studies at King's College London. His most recent book is Cyber War Will Not Take Place (Oxford University Press, 2013), from which this essay is adapted. (Thomas, "Cyberwar and Peace: Hacking can reduce real world violence", Foreign Affairs, December 2013, https://www.foreignaffairs.com/articles/2013-10-15/cyberwar-and-peace//DM)

Yet even cyberattacks that cause damage do so only indirectly. As an agent of violence, computer code faces a very basic limit: it does not have its own force or energy. Instead, any cyberattack with the goal of material destruction or harming human life must utilize the force or energy embedded in its target: for example, shutting down an air traffic control system and causing trains or planes to crash or disrupting a power plant and sparking an explosion. Yet besides Stuxnet, there is no proof that anyone has ever successfully launched a major attack of this sort. Lethal cyberattacks, while certainly possible, remain the stuff of fiction: none has ever killed or even injured a single human being. Thanks to its lack of direct physical impact, code-induced violence

also has less emotional impact. It would be difficult for a cyberattack to produce the level of fear that coordinated campaigns of terrorism or conventional military operations produce.

Owing to their invisibility, cyberweapons also lack the symbolic power of traditional ones. Displays of weaponry, such as the elaborate military parades put on by China and North Korea, sometimes represent nothing more than nationalist pageantry. But revealing one's arsenal can also serve tactical and strategic ends, as when countries deploy aircraft carriers to demonstrate their readiness to use force or carry out operations designed to intimidate the enemy, such as using military aircraft to conduct deliberately low flyovers. Indeed, displaying weapons systems and threatening to use them can prove more cost-efficient than their actual use. But cyberweapons are hard to brandish.

AT: China impact

Chinese cyberattack threats are exaggerated – the US maintains significant competitive advantages

Lindsay 15 - Jon R. Lindsay is an assistant research scientist at the University of California, San Diego. In the summer of 2015, he will become Assistant Professor of Digital Media and Global Affairs at the University of Toronto Munk School of Global Affairs. (Jon, "Exaggerating the Chinese Cyber Threat", Belfer Center for Science and International Affairs, http://belfercenter.ksg.harvard.edu/publication/25321/exaggerating_the_chinese_cyber_threat.html//DM)

Policymakers in the United States often portray China as posing a serious cybersecurity threat. In 2013 U.S. National Security Adviser Tom Donilon stated that Chinese cyber intrusions not only endanger national security but also threaten U.S. firms with the loss of competitive advantage. One U.S. member of Congress has asserted that China has "laced the U.S. infrastructure with logic bombs." Chinese critics, meanwhile, denounce Western allegations of Chinese espionage and decry National Security Agency (NSA) activities revealed by Edward Snowden. The People's Daily newspaper has described the United States as "a thief crying 'stop thief.'" Chinese commentators increasingly call for the exclusion of U.S. internet firms from the Chinese market, citing concerns about collusion with the NSA, and argue that the institutions of internet governance give the United States an unfair advantage.

The rhetorical spiral of mistrust in the Sino-American relationship threatens to undermine the mutual benefits of the information revolution. Fears about the paralysis of the United States' digital infrastructure or the hemorrhage of its competitive advantage are exaggerated. Chinese cyber operators face underappreciated organizational challenges, including information overload and bureaucratic compartmentalization, which hinder the weaponization of cyberspace or absorption of stolen intellectual property. More important, both the United States and China have strong incentives to moderate the intensity of their cyber exploitation to preserve profitable interconnections and avoid costly punishment. The policy backlash against U.S. firms and liberal internet governance by China and others is ultimately more worrisome for U.S. competitiveness than espionage; ironically, it is also counterproductive for Chinese growth.

The United States is unlikely to experience either a so-called digital Pearl Harbor through cyber warfare or death by a thousand cuts through industrial espionage. There is, however, some danger of crisis miscalculation when states field cyberweapons. The secrecy of cyberweapons' capabilities and the uncertainties about their effects and collateral damage are as likely to confuse friendly militaries as they are to muddy signals to an adversary. Unsuccessful preemptive cyberattacks could reveal hostile intent and thereby encourage retaliation with more traditional (and reliable) weapons. **Conversely, preemptive escalation spurred by fears of cyberattack could encourage the target to use its cyberweapons before it loses the opportunity to do so.** Bilateral dialogue is essential for reducing the risks of misperception between the United States and China in the event of a crisis.

THE U.S. ADVANTAGE

The secrecy regarding the cyber capabilities and activities of the United States and China creates difficulty in estimating the relative balance of cyber power across the Pacific. Nevertheless, the United States appears to be gaining an increasing advantage. For every type of purported Chinese cyber threat, there are also serious Chinese vulnerabilities and growing Western strengths.

Much of the international cyber insecurity that China generates reflects internal security concerns. China exploits foreign media and digital infrastructure to target political dissidents and minority populations. The use of national censorship architecture (the Great Firewall of China) to redirect inbound internet traffic to attack sites such as GreatFire.org and GitHub in March 2015 is just the latest example of this worrisome trend. Yet prioritizing political information control over technical cyber defense also damages China's own cybersecurity. Lax law enforcement and poor cyber defenses leave the country vulnerable to both cybercriminals and foreign spies. The fragmented and notoriously competitive nature of the Communist Party state further complicates coordination across military, police, and regulatory entities.

There is strong evidence that China continues to engage in aggressive cyber espionage campaigns against Western interests. Yet it struggles to convert even legitimately obtained foreign data into competitive advantage, let alone make sense of petabytes of stolen data. Absorption is especially challenging at the most sophisticated end of the value chain (e.g., advanced fighter aircraft), which is dominated by the United States. At the same time, the United States conducts its own cyber espionage against China , as the Edward Snowden leaks dramatized, which can indirectly aid U.S. firms (e.g., in government trade negotiations). **China's uneven industrial development, fragmented cyber defenses, erratic cyber tradecraft, and the market dominance of U.S. technology firms provide considerable advantages to the United States.**

Despite high levels of Chinese political harassment and espionage, there is little evidence of skill or subtlety in China's military cyber operations. Although Chinese strategists describe cyberspace as a highly asymmetric and decisive domain of warfare, China's military cyber capacity does not live up to its doctrinal aspirations. A disruptive attack on physical infrastructure requires careful testing, painstaking planning, and sophisticated intelligence. Even experienced U.S. cyber operators struggle with these challenges. By contrast, the Chinese military is rigidly hierarchical and has no wartime experience with complex information systems. Further, China's pursuit of military "informatization" (i.e., emulation of the U.S. network-centric style of operations) increases its dependence on vulnerable networks and exposure to foreign cyberattack.

To be sure, China engages in aggressive cyber campaigns, especially against nongovernmental organizations and firms less equipped to defend themselves than government entities. These

activities, however, do not constitute major military threats against the United States, and they do nothing to defend China from the considerable intelligence and military advantages of the United States.

No Chinese cyberattack – China is exercising restraint

Kyodo News Service 15 – Japan's leading news network. ("China urges caution after N. Korean hacking sanctions", Kyodo News Service, proquest, January 5, 2015//DM)

China called for restraint Monday on actions that could lead to increased tension on the Korean Peninsula after the United States sanctioned North Korea over recent provocations, including alleged cyber attacks.

"Relevant parties should act with caution, avoid taking actions that might further escalate tension and jointly safeguard the peace and stability of the peninsula," Chinese Foreign Ministry spokeswoman Hua Chunying said at a regular press briefing.

The U.S. Treasury Department announced a package of sanctions Friday aimed at three North Korean entities and 10 individuals, some of which have links to China.

The announcement came after a U.S. Federal Bureau of Investigations report named Pyongyang as the perpetrator of a major hacking attack on Sony Pictures Entertainment Inc. thought to be motivated by anger over a film depicting the assassination of North Korean leader Kim Jong Un.

While criticizing the release of the film, Pyongyang has denied involvement in the cyberattack.

Although Hua did not mention any country by name, she said **China "opposes cyber attacks of all forms"** and "does not allow any country or individual to launch cyber attacks and illegal activities using China's infrastructure or doing so inside China."

1nc – solvency

Alt cause to cybersecurity threat – lack of cybersecurity professionals

Sarkar 14 – writer for Fierce Government. (Dibya, "Shortage of cybersecurity pros in government, business potentially undermines national cybersecurity, finds RAND", Fierce Government IT, http://www.fiercegovernmentit.com/story/shortage-cybersecurity-pros-government-business-potentially-undermines-nati/2014-06-20//DM)

Is there a shortage of cybersecurity professionals in the federal government and private sector that's leaving the U.S. vulnerable to cyber attacks?

In a new report, (pdf) RAND researchers sought to answer this question by thoroughly reviewing studies on the subject, interviewing experts and examining what's been written about the labor market for this field.

The short answer is yes.

RAND researchers found that several "excellent" reports from Booz Allen Hamilton and the Department of Homeland Security, among others, **have said that indeed there's a shortage, potentially undermining the nation's cybersecurity.**

Alt cause to poor cybersecurity – lax governmental policies

Castro 15 – Contributing writer at The Hill (Daniel, "Government apathy is the barrier to better cybersecurity", The Hill, June 17th, 2015, http://thehill.com/blogs/pundits-blog/technology/245262-government-apathy-is-the-barrier-to-better-cybersecurity//DM)

When the federal government announced earlier this month that Chinese hackers had stolen sensitive personnel records of 4.2 million current and former government employees (myself included), the biggest surprise was that it had taken so long for this kind of breach to occur. The truth is that it was less an indicator of the Chinese government's technical prowess than it was proof of the U.S. federal government's lackadaisical approach to securing its computer systems.

Many of the security vulnerabilities that likely contributed to the data breach had already been uncovered by government auditors. Obviously, this was to no avail. But rather than pointing fingers merely to score political points, policymakers should use this unprecedented breach to catalyze substantive change to the federal government's approach to information security by creating a zero-tolerance policy that drives real change.

The most frustrating part of this whole affair is that it might have been prevented if the target of the breach, the Office of Personnel Management (OPM), had followed the federal rules for information security. The Federal Information Security Management Act outlines steps an agency must take to secure its systems. In 2014, the inspector general for OPM found many areas where it did not follow these baseline security practices. For example, it failed to routinely scan its servers for vulnerabilities, implement multi-factor authentication for remote access or maintain a comprehensive inventory of systems. Findings this substantial should have sent shockwaves through the government, but they instead elicited a collective shrug from officials who have grown accustomed to subpar security practices.

While OPM's problems were more severe than other agencies, it is certainly not alone. For example, not counting the Department of Defense, **only 41 percent of federal agencies have implemented the minimum authentication requirements for accessing federal networks**. Federal agencies are routinely targets for cyberattacks, so ignoring these vulnerabilities comes at great risk. The long-term solution to this problem is to build a culture in federal agencies that does not tolerate such poor performance.

Achieving this will require strong leadership from within agencies and vigorous oversight from Congress. When agencies fall short in meeting baseline standards, agency leaders should be held responsible. Agencies that fail to address these problems should face budget cuts and agency heads should be replaced. The purpose of these accountability measures is not to assign blame, but to drive structural change by creating a sense of urgency for improving federal information security practices.

In the short-term, President Obama should issue an executive order to address one of the primary reasons this most recent attack was possible: improperly secured data. The president should require agencies to submit to Congress within 90 days a confidential, comprehensive and

prioritized inventory of every system that stores sensitive information in an unencrypted format. In addition, federal chief information officers (CIOs) should be required to submit plans to secure these systems, including any additional funding they might need. Congress can then decide if these agencies are deficient due to a lack of resources or their own inadequacies, and if the former, they should provide immediate funding to address the shortcomings. CIOs should provide Congress with an update every six months until the job is accomplished.

Given the scope and sensitivity of the personal information that the U.S. government collects, doing a job that is "good enough for government" is no longer acceptable when it comes to information security. Attacks on the government's information systems are not going to stop. The question is whether or not we will be prepared.

2nc – personnel alt cause

Alt cause - lack of cybersecurity professionals is undermining US cyberdefenses

Libicki, Senty, and Pollak 14 – Martin C. Libicki has a Ph.D. in economics, University of California, Berkeley; M.A. in city and regional planning, University of California, Berkeley; S.B. in mathematics, Massachusetts Institute of Technology. Maj. Gen. David N. Senty is Chief of Staff, U.S. Cyber Command, Fort George G. Meade, Md. The command plans, coordinates, integrates, synchronizes and conducts activities to direct the operations and defense of specified Department of Defense information networks and is prepared to, and when directed, conduct full-spectrum military cyberspace operations in order to enable actions in all domains, ensure U.S./allied freedom of action in cyberspace and deny the same to adversaries. Julia Pollak is an assistant policy analyst, B.A., Harvard University. (Martin, David, and Julia, "H4CKER5 WANTED: An Examination of the Cybersecurity Labor Market, RAND National Security Research Division, 2014, http://www.rand.org/content/dam/rand/pubs/research_reports/RR400/RR430/RAND_RR430.pdf/ /DM)

Within the last five years there has been a widespread drumbeat of concern about the perceived difficulty of finding qualified people to defend the nation's networks, currently under assault by terrorists, spies, and criminals.

According to a 2010 story on NPR, "There may be no country on the planet more vulnerable to a massive cyberattack than the United States, where financial, transportation, telecommunications and even military operations are now deeply dependent on data networking. U.S. industry, government and military operations are all at risk of an attack on complex computer systems, analysts warn. What's worse: U.S. security officials say the country's cyberdefenses are not up to the challenge. In part, **it's due to having too few computer security specialists and engineers with the skills and knowledge necessary to do battle against would-be adversaries.** The protection of U.S. computer systems essentially requires an army of cyberwarriors, but the recruitment of that force is suffering" (Gjelten, 2010).

As bad as matters are for well-heeled employers, the problem may be more severe for the federal government, said to lack the people to defend the networks that help defend the nation. In 2009, Washington Post reported, "The federal government is struggling to fill a growing demand for skilled computer-security workers, from technicians to policymakers, at a time when network

attacks are rising in frequency and sophistication. Demand is so intense that it has sparked a bidding war among agencies and contractors for a small pool of 'special' talent: skilled technicians with security clearances. Their scarcity is driving up salaries, depriving agencies of skills, and in some cases affecting project quality, industry officials said." It further cited an employee who won a 45 percent raise by jumping from the NSA to a major contractor, and a further raise by jumping to a small employer who observed, "The pay difference is so dramatic now, you can't ignore it." Another Post source, a military officer with 20 years' cybersecurity experience and a coveted security clearance, was overwhelmed: "It's mind-roasting. . . . I've had people call my house, recruiters for defense contractors . . . probably 20 calls" (Nakashima and Krebs, 2009).

Last May, Bloomberg News quoted Diane Miller, Northrop's program director for the CyberPatriot contest, who said "We just have a shortage of people applying" for 700 currently open positions. This observation was echoed by Ryan Walters, who founded mobile data security company TerraWi Inc. in 2009: "I cannot hire enough cybersecurity professionals, I can't find them, they're not qualified." His 12-person firm was planning to expand to 20; the article went on to note, "Listings for cybersecurity positions rose 73 percent in the five years through 2012, 3.5 times faster than postings for computer jobs as a whole, according to Boston-based Burning Glass, a labor market analytics firm that collects data from more than 22,000 online jobs sites." Alan Paller, CEO of SANS, a cybersecurity-education organization, told Bloomberg "We have a huge number of frequent flyers and a tiny number of fighter pilots." Finally, the story cited a letter written by JPMorgan Chase's CEO saying that the bank "spends approximately $200 million to protect ourselves from cyberwarfare and to make sure our data are safe and secure [with 600 people dedicated to the task]. . . . This number will grow dramatically over the next three years" (Rastello and Smialek 2013).

Those who are qualified are spoiled for choices: "Pretty much everyone here at the conference could quit their jobs and have another job by the end of the day," said Gunter Ollmann, vice president of research at Damballa, an Atlanta-based security firm focused on cyberthreats and other remotely controlled criminal threats. "The number of security companies is growing" (Brannigan, 2012).

In mid-2012, Jeff Moss, a prominent hacking expert who sits on the Department of Homeland Security Advisory Council, told a Reuters conference, "**None of the projections look positive. . . . The numbers I've seen look like shortages in the 20,000s to 40,000s for years to come**." A study earlier this year by the industry group (ISC)2 found that 83 percent of federal hiring managers surveyed said it was extremely difficult to find and hire qualified candidates for cybersecurity jobs (Lord and Stokes, 2012).

These are serious statements of concern. But is what is commonly referred to as a shortage of cybersecurity professionals a long-term crisis or a short-term problem? Is it pervasive throughout the sector or in certain segments within the sector? What potential policy options exist for addressing these concerns? Our report addresses these questions.

AT: outsourcing solves worker shortages

Outsourcing doesn't solve worker shortages

Libicki, Senty, and Pollak 14 – Martin C. Libicki has a Ph.D. in economics, University of California, Berkeley; M.A. in city and regional planning, University of California, Berkeley; S.B.

in mathematics, Massachusetts Institute of Technology. Maj. Gen. David N. Senty is Chief of Staff, U.S. Cyber Command, Fort George G. Meade, Md. The command plans, coordinates, integrates, synchronizes and conducts activities to direct the operations and defense of specified Department of Defense information networks and is prepared to, and when directed, conduct full-spectrum military cyberspace operations in order to enable actions in all domains, ensure U.S./allied freedom of action in cyberspace and deny the same to adversaries. Julia Pollak is an assistant policy analyst, B.A., Harvard University. (Martin, David, and Julia, "H4CKER5 WANTED: An Examination of the Cybersecurity Labor Market, RAND National Security Research Division, 2014, http://www.rand.org/content/dam/rand/pubs/research_reports/RR400/RR430/RAND_RR430.pdf/ /DM)

Over the last 20 or more years, the government has finessed the problem of recruiting really skilled individuals by outsourcing the work they would have done to private contractors. The outsourcers can then pay market prices to deliver from qualified individuals services otherwise unavailable from direct employees.

But **outsourcing does not solve all problems.** First, many military and some civilian tasks cannot be performed by private contractors. Some of the reasons involve the hazards of being deployed in war zones or on warfare platforms (although these have loosened considerably over the last quarter century). More dominant are the legal issues associated with who can do what, many associated with the chain of military command. Second, it takes federal employees to oversee the contracting process—at very least to establish requirements, evaluate proposals, and select contractors. Oversight is important. It takes talent to write a good specification for contracted work, particularly if rapid changes in the environment suggest a corresponding requirement for rapid changes in what contractors are asked to do. If federal employees lack the skills to write such specifications (and particularly if the contractors understand as much), they are likely to be spending federal money inefficiently; hence, they cannot be supplanted. Third, outsourcing creates a vicious circle. If the "cool jobs" are given to contractors (Homeland Security Advisory Council, 2012), then extant and even prospective federal employees will have that much less motivation to stay or to join the federal government to work on cyber problems. This then reduces the quality of the federal labor pool, which then reinforces the initial tendency to assign the "cool jobs" to contractors.

Solvency

FAA exclusivity

1nc – FAA exclusivity

Plan doesn't restore trust – too small, NSA hacking, and metadata exemptions

Wheeler, 14 – PhD, independent journalist specializing in national security and civil liberties; former senior policy analyst at The Intercept (Marcy, "A Radical Proposal of Following the Law" 11/24,

https://www.emptywheel.net/2014/11/24/a-radical-proposal-of-following-the-law/

Mieke Eoyang, the Director of Third Way's National Security Program, has what Ben Wittes bills as a "disruptive" idea: to make US law the exclusive means to conduct all surveillance involving US companies.

> But reforming these programs doesn't address another range of problems—those that relate to allegations of overseas collection from US companies without their cooperation.
>
> Beyond 215 and FAA, media reports have suggested that there have been collection programs that occur outside of the companies' knowledge. American technology companies have been outraged about media stories of US government intrusions onto their networks overseas, and the spoofing of their web pages or products, all unbeknownst to the companies. These stories suggest that the government is creating and sneaking through a back door to take the data. As one tech employee said to me, "the back door makes a mockery of the front door."
>
> As a result of these allegations, companies are moving to encrypt their data against their own government; they are limiting their cooperation with NSA; and they are pushing for reform. Negative international reactions to media reports of certain kinds of intelligence collection abroad have resulted in a backlash against American technology companies, spurring data localization requirements, rejection or cancellation of American contracts, and raising the specter of major losses in the cloud computing industry. These allegations could dim one of the few bright spots in the American economic recovery: tech.
>
> [snip]
>
> How about making the FAA the exclusive means for conducting electronic surveillance when the information being collected is in the custody of an American company? This could clarify that the executive branch could not play authority shell-games and claim that Executive Order 12333 allows it to obtain information on overseas non-US person targets that is in the custody of American companies, unbeknownst to those companies.
>
> As a policy matter, it seems to me that if the information to be acquired is in the custody of an American company, the intelligence community should ask for it, rather than take it

> without asking. American companies should be entitled to a higher degree of forthrightness from their government than foreign companies, even when they are acting overseas.

Now, I have nothing against this proposal. It seems necessary but **wholly inadequate to restoring trust** between the government and (some) Internet companies. Indeed, it represents what should have been the practice in any case.

Let me first take a detour and mention a few difficulties with this. First, while I suspect this might be workable for content collection, remember that the government was not just collecting content from Google and Yahoo overseas — they were also using their software to hack people. NSA is going to still want the authority to hack people using weaknesses in such software, such as it exists (and other software companies probably still are amenable to sharing those weaknesses). That points to the necessity to start talking about a legal regime for hacking as much as anything else — one that parallels what is going on with the FBI domestically.

Also, this idea would not cover the metadata collection from telecoms which are domestically covered by Section 215, which will surely increasingly involve cloud data that more closely parallels the data provided by FAA providers but that would be treated as EO 12333 overseas (because thus far metadata is still treated under the Third Party doctrine here). This extends to the Google and Yahoo metadata taken off switches overseas. So, such a solution would be either limited or (if and when courts domestically embrace a mosaic theory approach to data, including for national security applications) temporary, because some of the most revealing data is being **handed over willingly** by telecoms overseas.

And before we institute this, we ought to know why the government was stealing overseas anyway. Was it to get around already broadly defined FISA Amendments Act certifications, including a Foreign Government one that can and apparently has been used for other purposes? Was it to collect on Americans who otherwise couldn't be picked up via a legitimate target? I've been told the government was stealing algorithms, as much as content. That raises real questions about whether it is proper for the government to demand that kind of proprietary analysis done by Internet companies, one that would also need to be resolved in any such law.

Finally, one other problem with this is the criminal counterpart, the fact that DOJ is demanding Microsoft respond to domestic warrants for content stored in Ireland. What will restore other countries' trust — and therefore the international viability of these companies — is sovereignty, which is something the government has been assiduously chipping away at even in the criminal context. Thus, while a lot of intelligence people poo poo the notion of sovereignty in spying, until you solve that on the overt stuff, you're still going to be killing your tech base. So again, this only solves part of the problem, and even since the Snowden leaks started, DOJ seems intent only to double down.

Moreover, I don't think this is the sphere in which the response to NSA's theft overseas will play out, it will be the technological sphere, at least in the near term. What no one within the National Security establishment wants to admit is how badly NSA already shat the bed by stealing Google's data overseas. Google is a worthy technical adversary to NSA (which is not to say it's not a voracious spy in its own right, serving its own needs). And it will take a lot — far more than simply agreeing to what should have been the practice in any case — to get Google to not treat the government as an technical adversary, at least insofar as protecting its own networks

generally. That's as it should be, frankly. If NSA can steal from Google, so can, in the medium term, China.

Google, Apple, and Facebook have the heft and resources that a lot of the countries reacting to the NSA disclosures don't have. They also have an urgent market need to respond, or at least create a credible illusion of responding. Few in DC seem to get that yet. That the proposed solutions to the damage NSA did to Google are so modest (effectively throwing table scraps to a wounded lion) is, in my mind, evidence that the NatSec world doesn't yet grasp how badly NSA's hubris has already hurt the Agency.

The perception of illegality under international law prevents solvency

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

If anything, the Snowden leaks clearly illustrate that global cloud service providers are facing a new class of threats from intelligence agencies across the world. The revelations are many and diverse in nature. This Article proposes that, from the perspective of the cloud industry, the threats can be generally distinguished in terms of front-door versus backdoor access to data and communications handled by cloud providers. Revelations of front-door access in the U.S. context include PRISM and the widely discussed telephone metadata program.13 The PRISM program is conducted on the basis of Section 702 of the FISA Amendments Act 2008 (FAA), under which the U.S. intelligence community has successfully gained access to data from U.S. cloud services related to non-U.S. persons reasonably believed to be outside the U.S.14 Under this program, the NSA gains access by demanding cloud and communication service providers hand over customer information and content, requiring annual certification, and with targeting and minimization procedures reviewed by the Foreign Intelligence Surveillance Court.15 What is most striking about these programs is the structural basis and scale on which access takes place. In addition, many have **raised doubts** about the statutory and constitutional basis of these programs under **U.S., international, as well as foreign law.**16 Observers and stakeholders from outside of the United States are especially troubled by the fact that Section 702 would clearly violate the Fourth Amendment if it were designed to intercept the communications of U.S. persons.17

2nc – 702 fails

702 won't solve perception – the problem is the programs 702 authorized

Donohue 15 – Professor of Law, Georgetown Law and Director, Center on National Security and the Law, Georgetown Law (Lauren, HIGH TECHNOLOGY, CONSUMER PRIVACY, AND U.S. NATIONAL

SECURITY, Symposium Articles, 4 Am. U. Bus. L. Rev. 11 p.37, 2015, Hein Online)//JJ

As a matter of Section 702 and the interception of international content, PRISM and Upstream collection present global concerns. Neither program has yet to be addressed through any legislative change. The **existence of these programs, while perhaps statutorily consistent with the FISA Amendments Act**, as well as constitutionally sufficient with regard to the interception of non-U.S. persons communications, where the individual is reasonably believed to be located outside the United States, goes some way towards undermining international confidence in U.S. companies.

Section 702 limit doesn't resolve perception problems – the primary fear is what 702 authorizes

Granick, 13 – civil liberties director for the Center for Internet and Society at Stanford Law School (Jennifer, "REFORMING FISA: A CRITICAL LOOK AT THE WYDEN/UDALL PROPOSAL AND FOREIGN SURVEILLANCE" 9/30, http://cyberlaw.stanford.edu/publications/reforming-fisa-critical-look-wydenudall-proposal-and-foreign-surveillance

Rather than focus on section 215, I want to focus in this post on the bill's proposed reforms to section 702 of the FISA Amendments Act, or FAA. This is the provision underlying the PRISM program—and its use to obtain the content of phone calls and Internet messages, which Glenn Greenwald revealed based on Edward Snowden's documentation. There's been less discussion of the problems with section 702 than of those with section 215, even as we've learned some worrisome things about the way the NSA uses this legal authority. The new bill would address some, but by no means all, of these problems. In my opinion, it needs to be broader.

I. Bacgkround

First, some legal and technological background is in order. Traditional FISA required the government to show probable cause that the target of the underlying foreign intelligence surveillance was an agent of a foreign power and would use the facilities at which the government planned to direct surveillance before conducting electronic surveillance. This probable cause requirement had the practical effect of limiting surveillance to communications to or from individuals who are reasonably believed to be working for another government or a terrorist group.

In addition to the expansions created in 2001 by the USA PATRIOT Act (including section 215), section 702 of the FAA created a new source of authority for conducting warrantless electronic surveillance. If the Attorney General and the Director of National Intelligence certify that the purpose of the monitoring is to collect foreign intelligence information about any non-American individual or entity not known to be in the United States, the Foreign Intelligence Surveillance Court (FISC) can require companies to provide access to Americans' international communications. The court does not approve the target or the facilities to be monitored, nor does it assess whether the government is doing enough to minimize the intrusion, correct for collection mistakes, and protect privacy. Once the court approves the certification, the government can issue top-secret directives to Internet companies like Google and Facebook to turn over calls, e-mails,

video and voice chats, photos, voice-over IP calls (like Skype), and social networking information.

Enter, PRISM. PRISM surveillance is technologically complicated, involving both the aforementioned directives demanding that companies turn over the contents of user Internet messages, as well as upstream surveillance conducted directly on the fiber optic cables carrying telecommunications and Internet traffic. Pulling the right stuff off the cables as it travels is a technological challenge. Reports suggest that one way the NSA has accomplished this surveillance is via the XKeyScore tool, which appears to copy and temporarily store almost everything that flows over the network, filter that traffic based on various selection criteria, and store the subset in different databases for longer periods of time. No one has yet identified the legal authority under which the NSA justifies XKeyScore. It cannot be the FAA because that law does not authorize copying everything, even for a short period of time.

Leaving that question aside for now, I want to highlight several pernicious results of the FISA Amendments Act or FAA.

Americans' communications with targets overseas are subject to warrantless interception. Once those communications are collected, current rules allow the NSA to search the trove for U.S. person identifiers, which Wyden has referred to as the "back door searches loophole".

The non-U.S. targets include regular people, not just those who are agents of foreign powers. While analysts provide their foreign intelligence purpose when selecting the target, the rationale is just one short sentence.

By untethering surveillance from facilities that the target uses, the FAA greatly increased the opportunity for the NSA to collect information about rather than just to or from the target. As an example, if I monitor a network for "Jennifer Granick" and Jennifer Granick uses that network, I'll get her communications, and maybe some messages about her. If I can monitor any facility for "Jennifer Granick", I'm going to pull only messages about, but not to or from her.

II. The Wyden/Udall Proposal

Enter the new bill. The fact sheet says the Intelligence Oversight and Surveillance Reform Act would reform section 702 to:

Close the "back door searches" loophole;

Prohibit the government from collecting communications that are "about the target", in non-terrorism contexts;

Strengthen the prohibition against "reverse targeting," or targeting a foreigner in order to warrantlessly acquire the communications of an American who is known to be communicating with that foreigner; and

Place stronger statutory limits on the use of unlawfully collected information.

These are critical reforms. I would like to see the bill further include a higher standard of care with regards to ensuring that people inside the U.S. are not targeted. As Professor Christopher Sprigman and I argued in the New York Times, PRISM is designed to produce at least 51 percent confidence in a target's "foreignness" — as John Oliver of "The Daily Show" put it, "a coin flip

plus 1 percent." In other words, 49 percent of the time the NSA may be acquiring information it is not allowed to have, even under the terrifyingly broad auspices of the FAA.

More fundamentally, though, the Wyden/Udall bill does not fully address a fundamental problem with the FAA, which is that it authorizes surveillance of average citizens of other countries for reasons that are not necessarily related to the security of the United States. Senator Udall acknowledged in the press conference announcing the bill (at 30:17) that the NSA's unfettered spying has had and will continue to have an adverse economic effect on U.S.-based businesses, and that this is one of the motivations behind the bill.

Prohibiting "about the target" collection is one giant step forward. That would mean that non-targets outside the U.S. could not be subject to surveillance under this law just because they talk about a target, unless their conversation is related to terrorism. Depending on the details of the targeting and minimization procedures, if my British friend in London and I email about our dismay over the Kenya attacks, that would be fair game, but our conversation about the policies of Brazilian President Dilma Roussef would be off limits.

However, targets still need not be agents of foreign powers so long as a significant purpose of the collection is foreign intelligence. Foreign intelligence is broad, and includes any information that "relates to" the conduct of U.S. foreign affairs. For example, DNI James Clapper affirmed that the U.S. collects information about economic and financial matters to "provide the United States and our allies early warning of international financial crises which could negatively impact the global economy … or to provide insight into other countries' economic policy or behavior which could affect global markets."

Monitoring economic and financial matters is in the United States' national interest. However, routine eavesdropping upon common foreigners to discover information about these matters is a bad idea. First, foreigners have privacy rights, too. Freedom from arbitrary interference with one's privacy is part of the Universal Declaration of Human Rights.

Next, this monitoring is detrimental to U.S. companies and to the United States' long-term interests in promoting democratic ideals. As Sprigman and I argue, although it may be legal, unfettered U.S. spying on foreigners will cause serious collateral damage to America's technology companies, to our Internet-fueled economy, and to human rights and democracy the world over. Since our Atlantic article on June 28th, and the disclosure that the NSA targeted both Petrobras and President Dilma Roussef, Brazil has announced that it will look into requiring Internet companies to store its citizens' data locally, and take other steps that threaten to balkanize the global Internet. When Brazil takes these steps, it gives comfort and cover to authoritarian countries who will do the same, so that they can better censor, spy on, and control Internet access within their own borders.

Front-door access also hurts cloud computing

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS

TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

3. **Front-Door Access and Its Limitations**

If the measures described in the preceding Section are effective, they may help to push the intelligence community to seek access through the front door. In the next Section, we will analyze to what extent the U.S. government may compel web services to assist law enforcement and intelligence agencies in gaining access to secure communications and what this implies about the efficacy of technical countermeasures such as encryption. More generally, it is important to note that there are multiple ways to gain lawful access to information in the cloud and no clear legal rules with respect to which entity should be targeted (the clouds service, the cloud customer, or the communications infrastructure that is used to connect users and servers). In the absence of such rules, cloud services may rely on technical and organizational measures to dissuade government agencies from targeting the communications infrastructure in favor of a more direct approach to the cloud service or the cloud customer. There are two clear reasons for industry to have a strong preference against access through infrastructure not under its control. First, it negatively affects the relationship with their customers if third parties can gain access to data without the service provider's knowledge and makes it hard to give guarantees about potential access to data by third parties. Second, it would mean that sensitive or valuable business data is accessible to others in the value chain, who could try to use such access for competitive reasons.

But while backdoor access is problematic from the industry's perspective, even front-door access is not wholly satisfactory in terms of addressing the **concerns of foreign customers of U.S. cloud services**. Most importantly, **Section 702 of the FAA** authorizes front-door access to cloud computing services under rules that offer reduced privacy protections to non-U.S. persons. Once a so-called selector for the acquisition of foreign intelligence information has been internally approved within NSA, "service providers are legally compelled to assist the government by providing the relevant communications."163 The differences in the safeguards applicable to U.S. persons and non-U.S. persons under the Section 702 program have been well-documented.164 Crucially, the Fourth Amendment does not apply to non-U.S. persons outside the U.S., which is clearly reflected in the language of Section 702 itself.165

It follows that foreign cloud customers, even after being reassured about enhanced security against backdoor access to data, may **still not find the shift to cloud computing very attractive,** given that they **do not have access to optimal protection** due to current market conditions and offerings. It seems likely that as a result of the transition to cloud computing, the storage and processing of digital information will end up being handled by a relatively small number of players. Eventually, it is this market concentration that could make cloud providers a particularly attractive avenue for government surveillance. But when data of a U.S. or non-U.S. cloud customer is sought from a cloud provider **under Section 702** or similar programs, it raises the possibility that foreign intelligence agencies may **gain access to the data of foreigners** without their knowledge. This represents a significant change in the status quo that organizational customers of cloud services may be unwilling to accept. As mentioned, Microsoft recently asserted itself in this debate. Specifically, it has stated the principle that lawful access should not take place through the targeting of cloud providers but through the targeting of the organizations themselves. According to Microsoft, government agencies should "go directly to business customers or government customers for information or data about one of their employees—just as

they did before these customers moved to the cloud—without undermining their investigation or national security."166

Eoyang concedes 702 is a weak limit

Eoyang and Bishai, 15 - *Mieke Eoyang is the Director of the National Security Program at Third Way, a center-left think tank. She previously served as Defense Policy Advisor to Senator Edward M. Kennedy, and a subcommittee staff director on the House Permanent Select Committee on Intelligence, as well as as Chief of Staff to Rep. Anna Eshoo (D-Palo Alto); **Chrissy Bishai is a Fellow at Third Way ("Restoring Trust between U.S. Companies and Their Government on Surveillance Issues" 3/19, http://www.thirdway.org/report/restoring-trust-between-us-companies-and-their-government-on-surveillance-issues

Of course, FAA Exclusivity wouldn't solve every problem. It would not prevent foreign governments from collecting information themselves and then providing it to U.S. intelligence agencies, as U.S. law cannot bind a foreign government. And some may argue that FAA provides inadequate civil liberties protections for Americans. This proposal says nothing about the adequacy of that statute in this respect. What it says is that for data held by an American company about a target that is not a U.S. person, the checks within FAA are stronger than those solely under E.O. 12333.

Empirically – NSA over-collection is because of the FISC

Sommer, 14 - The author is with ZwillGen PLLC in Washington, D.C.; a law firm that represented a telecomm provider against a FISA order (Jacob, "FISA Authority and Blanket Surveillance: A Gatekeeper Without Opposition" Litigation, Spring, Vol. 40 No. 3

http://www.americanbar.org/publications/litigation_journal/2013-14/spring/fisa_authority_and_blanket_surveillance_gatekeeper_without_opposition.html

The window left open in Keith seems to be closed. Similarly, the FISC has approved of the NSA's "collect now, restrict searching later" approach to minimization. See In re Application of the F.B.I. for an Order Requiring the Production of Tangible Things from [Redacted], No. BR 13-109, LEXIS 134786 (FISA Ct. Sept. 13, 2013). In other words, the FISC has found no constitutional or statutory impediment to the government "over collecting" data—so long as it does not intentionally collect wholly domestic communications and it has minimization procedures to restrict access. There is no indication that the government has used its surveillance powers improperly (except in a limited number of circumstances attributable to NSA employee misconduct), but the FISC has not taken a robust view of the Fourth Amendment.

PPD-28

1nc – PPD-28 fails

PPD-28 privacy protections aren't credible internationally

Rainey 15 *director of the activism team at the Electronic Frontier Foundation, Chief Operating Officer and co-founder of the Freedom of the Press Foundation (Rainey,"Obama Announces New Privacy Rules for the World. World Not Impressed.", Electronic Frontier Foundation, 02/10/15, https://www.eff.org/deeplinks/2015/02/obama-announces-new-privacy-rules-world-world-not-impressed)//GK

President Obama recently announced slight changes to NSA data collection practices. The recent tweaks mean two new privacy protections for those that U.S. law considers foreigners (in this case, people who are outside of the United States borders who are neither U.S. citizens nor legal U.S. residents). Perhaps you're thinking Obama is using his executive authority to stop the mass surveillance of all Internet traffic of people worldwide? Nope, not quite. The new protections are: If the U.S. government collects information about a foreigner, it will consider the privacy ramifications before disseminating that information, such as to other governments;1 and If the U.S. government collects information on innocent foreigners not connected to any crime or investigation and the information has no national security value, it will dispose of that information after five years.2 That's right, the world's personal information will only be retained for five short years. And that's if the U.S. government decides you're not under suspicion. David Medine, the chairman of the Privacy and Civil Liberties Oversight Board, has said that "There's no country on the planet that has gone this far to improve the treatment of non-citizens in government surveillance." That's certainly laudable. However, a critic might also note that there's no country on earth extending such enormous resources into surveilling all the people on the planet, so the United States has more room for "improvement" than most countries. (That's certainly what President Obama implied when he spoke of his country's "unique" capabilities in his speech defending the new rules.) We wondered if people worldwide would be excited about these new privacy protections, and so we reached out to a few of our global partners to solicit their feedback. Here's what they thought of Obama's protections for the privacy rights on non-US citizens: "This decision is not only a confirmation of the disregard the United States has for its international human rights obligations, but given the fact that the US is treating our privacy worse than our own governments, it sends a terrible message for human rights defenders fighting against unchecked surveillance in our own country," said Luis Fernando García, a lawyer at Network for Digital Rights in Mexico. "Deleting is no comfort at all because it can never be confirmed," said Professor K.S. Park of Korea University Law School, "Korea also allows warrantless wiretapping of overseas people for national security purposes. The United States should not set a bad precedent for the whole world to follow." And Carolina Botero, a Colombian researcher and blogger with Fundacion Karisma, said, "Mass surveillance is unacceptable in democratic societies because of the threat it poses to human rights. Obama's reforms to NSA practices fail to address this situation for his citizens and continue the obnoxious violation of the privacy rights of foreigners. A data retention period of 5 years is a clear example of an illegal measure that can be seen abroad as justification for similar laws in other countries."

PPD – 28 doesn't solve for the breadth of Executive Order 12333 circumvention

Schlanger 15* Henry M. Butzel Professor of Law at the University of Michigan (Margo, "Guest Post: US Intelligence Reforms Still Allow Plenty of Suspicionless Spying on Americans", Just Security, 02/13/15, http://justsecurity.org/20033/guest-post-intelligence-reforms-plenty-suspicionless-surveillance-americans/)//GK

Last week, the Obama Administration released a report and documents cataloging progress toward signals intelligence (SIGINT) reform goals set a year ago by the President in a document known as PPD-28. PPD-28 promises foreigners some of the same privacy protections given to US citizens and residents. But it turns out that those protections, even for citizens, are fairly meager, in ways that have not yet fully entered the public conversation about surveillance. US citizens and residents have been — and remain — exposed to suspicionless electronic surveillance. Implementation of PPD-28 will do little to change that. To my mind, the surveillance I'm about to describe, which proceeds under Executive Order 12333, rather than FISA, is far more worrisome than the programs

under Section 215 of the Patriot Act and Section 702 of the FISA Amendments Act that have received so much recent attention. (For example, here and here for Section 215, here and here for Section 702, and here and here for more general info.) This is content surveillance that applies to both wholly and partially domestic communications of US citizens and residents. The access and analysis rules are very, very loose. There is no judicial supervision of any kind, and Congress does almost no 12333 oversight. (See here for more on how FISA and 12333 differ). Let's start with what we know, and then dive into how we know it. What do we know? Non-selective "vacuum cleaner" SIGINT collection — mass collection of communications unlimited by particular communicants or subjects — is outside FISA's ambit, so long as the collection is either done abroad (for wire communications like those carried on landlines or cables) or involves at least one foreign communicant (for wireless communications). This kind of collection can and does include wholly and partially domestic communications of US citizens and residents. Once collected, analysis of these communications is also outside FISA's ambit. Instead, the use of SIGINT that was collected vacuum-cleaner-style is limited by PPD-28 to six topics: detecting and countering espionage, terrorism, weapons of mass destruction, cybersecurity threats, threats to the armed services, and transnational crime. This kind of entirely unlimited SIGINT collection is not favored, however: According to its new policies implementing PPD-28, when "practicable," the NSA searches for communications containing specific terms that narrow its collection to topics like "nuclear proliferation, oil sales, [and] economics." Economics! Again, so long as the collection is either done abroad (for wire communications) or involves at least one foreign communicant (for wireless communications), FISA does not regulate term searching based on subject matter, rather than the identity of a communicant. And because this approach uses a "discriminant," it is not deemed "bulk" collection for purposes of PPD-28. It may thereafter be searched by the NSA for any and all foreign intelligence purposes, not just the six topics identified above. When the NSA uses subject matter searching — whether to acquire data or to search raw SIGINT acquired in bulk or otherwise — there is a mild tailoring requirement. Specifically, policy requires use of only selection terms that are reasonably likely to flag communications that include foreign intelligence topics (like oil sales). Policy also requires the NSA to try to develop selection techniques that "defeat, to the greatest extent practicable under the circumstances" interception of non-foreign intelligence communications. While we don't know what "practicable" means in this context, term searching is very familiar; just think of using Google or Westlaw. It seems inevitable that this approach exposes an extraordinary amount of innocent Americans' communications to the eyes of intelligence analysts. So, when the President says that foreigners will get the same protections against surveillance as US citizens and residents, keep in mind that those protections leave a lot out.

2nc – PPD-28 fails

PPD-28 doesn't cover collection that uses term searching – it creates an enormous loophole

Schlanger 15* Henry M. Butzel Professor of Law at the University of Michigan (Margo, "Guest Post: US Intelligence Reforms Still Allow Plenty of Suspicionless Spying on Americans", Just Security, 02/13/15, http://justsecurity.org/20033/guest-post-intelligence-reforms-plenty-suspicionless-surveillance-americans/)//GK

PPD-28 adds **the smallest bit** of extra protection. It limits what it describes as "bulk" collection to six specified purposes (detecting and countering espionage, terrorism, weapons of mass destruction, cybersecurity threats, threats to the armed services, and transnational crime). These are considerably narrower than "foreign intelligence. But the narrower purpose rules of PPD-28 don't cover collection that uses term searching, no matter how wide-open these terms are, or how much data is acquired under them. Quite the contrary; such collection is excluded by definition. PPD-28 states: "References to signals intelligence collected in 'bulk' mean the authorized collection of large quantities of signals intelligence data which, due to technical or operational considerations, is acquired without the use of discriminants (e.g., specific identifiers, selection terms, etc.)." (Emphasis added). Moreover, the Directive specifically states that its limits on "bulk" collection "do not apply to signals intelligence data that is temporarily acquired to facilitate targeted collection." This carve-out is revealing: there would be no reason for it unless the NSA does, in fact, "temporarily acquire" data and then subject it to various searches that facilitate "targeted"

collection for purposes not authorized for bulk collection. (Note that PPD-28 does not define "targeted;" I infer that "targeted" here covers use of topical selection terms as well as communicant targeting, but I may be incorrect in this inference.) And finally, the NSA procedures released last week, which now govern SIGINT procedures for non-US persons, constrain the agency the tiniest bit more, stating a preference for collecting data on specific subjects instead of collecting everything: Whenever practicable, collection will occur through the use of one or more SELECTION TERMS in order to focus the collection on specific foreign intelligence targets (e.g., a specific, known international terrorist or terrorist group) or specific foreign intelligence topics (e.g., the proliferation of weapons of mass destruction by a foreign power or its agents). Note, though, that notwithstanding the parenthetical examples, subject matter searching can be for any foreign intelligence topic (oil sales, economics, etc.), not just counterterrorism or counterproliferation. to your domestic communications. Lots of unanswered questions remain: what about FBI and CIA? How much unfiltered content communication data does the IC actually collect? How much does it retain? And so on. We'd need much more transparency to answer those questions and dozens more that deserve answers.

PPD-28 can't solve – too limited

Nojeim 14 – Senior Counsel and Director of the Freedom, Security, and Technology Project at the Center for Democracy & Technology, B.A. University of Rochester, J.D. University of Virginia (Gregory, WRITTEN STATEMENT REGARDING SHORT AND LONG TERM AGENDA OF THE PRIVACY AND CIVIL LIBERTIES OVERSIGHT BOARD, Center for Democracy and Technology, 8/29/14,
https://d1ovv0c9tw0h0c.cloudfront.net/files/2014/09/pclob-written-statement-82914.pdf)//JJ

Rights of Non-U.S. Persons

PCLOB's agenda should also include a searching examination of the impact of U.S. surveillance activities under all intelligence authorities, including Executive Order 12333 and FISA Section 702, on the rights of non-U.S. persons to privacy, free expression and redress for violation of rights. PCLOB has already committed to examining the rights of non-U.S. persons in the context of the input it plans to offer on implementation of PPD-28. This is insufficient because PPD-28 is so limited. In particular, while PPD-28 does call for subjecting information about non- U.S. persons to the same retention and dissemination restrictions that pertain to information collected about U.S. persons, it does not subject collection activities to such restrictions. When assessing the impact of surveillance on the rights of non-U.S. persons, we urge you to assess collection activities as well.

PCLOB's assessment of the rights of non-U.S. persons ought to start with internationally accepted human rights. Indeed, PPD-28 states that non-U.S. persons have such rights, but does little to spell them out. Last year, CDT released a report that includes a normative framework based on human rights standards that can be used for assessing surveillance This year, the

United Nations High Commissioner for Human Rights issued a report 8 activities. that also provides an excellent framework for analyzing U.S. surveillance activities under international law. CDT, have endorsed the "Necessary and Proportionate Principles,10 which could also serve as a starting point for PCLOB's assessment. In making its assessment, we urge the PCLOB to focus in particular on the internationally recognized rights to privacy, free, expression, and the right to a remedy for violations of these rights.

PPD-28 fails --- too many loopholes

Rotenberg, EPIC President and Executive Director, 6-16-15 [Electronic privacy information center, non-profit research and educational organization established in 1994 to focus

public attention on emerging privacy and civil liberties issues.12 We work with a distinguished panel of advisors in the fields of law, technology and public policy., COMMENTS OF THE ELECTRONIC PRIVACY INFORMATION CENTER, file:///C:/Users/Jonah/Downloads/EPIC-12333-PCLOB-Comments-FINAL.pdf] Schloss2

The updated signals intelligence principles stated in Presidential Policy Directive 28 ("PPD-28") are not sufficient to promote transparency about collection practices. PPD-28 requires the intelligence community to "safeguard[] personal information collected from signals intelligence activities."90 The focus of PPD-28 was to protect information already collected (i.e. through dissemination and retention procedures) rather than to minimize the amount of information collected in the first place. The ongoing collection of innocent and irrelevant USP information and communications is a violation of the basic principles underlying the Privacy Act and EO 12333 itself, regardless of how the data is subsequently used. The Director of National Intelligence should require agencies to update and publicly release their data collection policies, especially as it applies to incidental collection of USP information.

In response to the PPD-28, the intelligence community members prepared reports that did not sufficiently inform the public about their data collection policies. Some agencies did not disclose collection policies at all. The FBI and Coast Guard wrote that it would "collect (including through clandestine means), analyze, produce, and disseminate foreign intelligence and counterintelligence."91 This phrase is vague and does not reveal whether collection includes, for example, the use of specific identifiers or terms to narrow collection. Other agency reports imply that some collection guidelines are still hidden. The NSA wrote that "collection will be handled in accordance with these procedures and USSID SP0018, including its Annexes."92 However, the Annexes are not released, though they may provide more detail as to how the NSA handles collection. A DoD document stated that the CSA, DIA, NGA, NRO, and NSA must update "their existing policies and procedures" to comply with PPD-28, but very little of these internal policies and procedures have been published.93 The documents should be published, or more details given, to provide for more transparency and oversight about collection.

Some agency reports are also inconsistent in their definitions of collection, which detracts from transparency and oversight. It is unclear whether each agency simply has a different definition of "collection" or whether the uniform definition of collection simply is not public. Some agencies

use selectors in the definition of collection while others do not. The CIA reported that "SIGINT collected in bulk - means the authorized collection of large quantities of signals intelligence data . . . acquired without the use of discriminants (e.g., specific identifiers, selection terms, etc.)."94 On the other hand, the NSA stated that "[w]henever practicable, collection will occur through the use of one or more selection terms."95 It is still unclear whether the definition of collection includes the use of selectors. In addition, the Coast Guard defines collection as not including processing, through the rule of surplusage (i.e. "collection" and "processing" in a list means that their definitions are not redundant and repetitive).96 However, the DHS states that "[c]ollection means the gathering or receipt of information . . . coupled with an affirmative act

demonstrating intent to use or retain that information for intelligence purposes."97 The DHS definition of collection appears to require an additional step beyond the NSA definition of collection. These policies should be made public and updated to provide for clarity and better oversight.

No modeling

1nc – no modeling

Modeling is empirically false

Edgar, 4/13/15 - visiting fellow at the Institute and adjunct professor of law at the Georgetown University Law Center (Timothy, "The Good News About Spying"

https://www.foreignaffairs.com/articles/united-states/2015-04-13/good-news-about-spying

Despite high hopes for a fresh start on civil liberties, during his first term in office, Obama ratified and even expanded the surveillance programs that began under former President George W. Bush. After NSA contractor Edward Snowden began revealing the agency's spying programs to The Guardian in 2013, however, Obama responded with a clear change of direction. Without great fanfare, his administration has made changes that open up the practices of the United States intelligence community and protect privacy in the United States and beyond. The last year and a half has been the **most significant period of reform** for national security surveillance since Senator Frank Church led the charge against domestic spying in the late 1970s.

In 2013, at Obama's direction, the Office of the Director of National Intelligence (ODNI) established a website for the intelligence community, IC on the Record, where previously secret documents are posted for all to see. These are not decades-old files about Cold War spying, but recent slides used at recent NSA training sessions, accounts of illegal wiretapping after the 9/11 attacks, and what had been highly classified opinions issued by the Foreign Intelligence Surveillance Court about ongoing surveillance programs.

Although many assume that all public knowledge of NSA spying programs came from Snowden's leaks, many of the revelations in fact came from IC on the Record, including mistakes that led to the unconstitutional collection of U.S. citizens' emails. Documents released though this portal total more than 4,500 pages—surpassing even the 3,710 pages collected and leaked by

Snowden. The Obama administration has instituted other mechanisms, such as an annual surveillance transparency report, that will continue to provide fodder for journalists, privacy activists, and researchers.

The transparency reforms may seem trivial to some. From the perspective of an intelligence community steeped in the need to protect sources and methods, however, they are deeply unsettling. At a Brown University forum, ODNI Civil Liberties Protection Officer Alexander Joel said, "The intelligence community is not designed and built for transparency. Our culture is around finding our adversaries' secrets and keeping our own secrets secret." Accordingly, until only a few years ago, the intelligence community resisted making even the most basic information public. The number of FISA court opinions released to the public between 1978 and 2013 can be counted on one hand.

Beyond more transparency, Obama has also changed the rules for surveillance of foreigners. Until last year, privacy rules applied only to "U.S. persons." But in January 2014, Obama issued Presidential Policy Directive 28 (PPD-28), ordering intelligence agencies to write detailed rules assuring that privacy protections would apply regardless of nationality. These rules, which came out in January 2015, mark the first set of guidelines for intelligence agencies ordered by a U.S. president—or **any world leader**—that explicitly protect foreign citizens' personal information in the course of intelligence operations. Under the directive, the NSA can keep personal information in its databases for no more than five years. It must delete personal information from the intelligence reports it provides its customers unless that person's identity is necessary to understand foreign intelligence—a basic rule once reserved only for Americans.

The new rules also include restrictions on bulk collection of signals intelligence worldwide—the practice critics call "mass surveillance." The NSA's bulk collection programs may no longer be used for uncovering all types of diplomatic secrets, but will now be limited to six specific categories of serious national security threats. Finally, agencies are no longer allowed simply to "collect it all." Under PPD-28, the NSA and other agencies may collect signals intelligence only after weighing the benefits against the risks to privacy or civil liberties, and they must now consider the privacy of everyone, not just U.S. citizens. This is the first time any U.S. government official will be able to cite a written presidential directive to object to an intelligence program on the basis that the intelligence it produces is not worth the costs to privacy of innocent foreign citizens.

THOSE IN GLASS HOUSES

Obama's reforms make great strides toward transparency and protecting civil liberties, but they have been **neither celebrated nor matched abroad**. When Chancellor Angela Merkel of Germany found out she had been the target of American eavesdropping, her reaction was swift. "This is not done," she said, as if scolding a naughty child. Many Germans cheered. They and other Europeans believe that their laws protect privacy better than U.S. laws. But that is only partly true: Although Europe has stronger regulations limiting what private companies (such as Google and Facebook) can do with personal data, citizens are granted comparatively little protection against surveillance by government agencies. European human rights law requires no court approval for intelligence surveillance of domestic targets, as U.S. law has since 1978. Similarly, European governments do not observe limits on electronic surveillance of non-citizens outside of their own territories, as the United States now does under Obama's presidential policy directive.

By blaming only the NSA for mass surveillance, the public and foreign leaders let other intelligence services off the hook. No wonder that some human rights organizations, including Privacy International and Big Brother Watch UK, have filed legal challenges against mass surveillance by the NSA's British counterpart, the Government Communications Headquarters (GCHQ). But foreign leaders have taken few steps to limit government surveillance, and none have done **anything remotely comparable** to what Obama did in last year's directive.

2nc – no modeling

No modeling over legal rules – enabling tech makes international surveillance inevitable

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 12)//AK

Much of the current surveillance debate in the US is over the NSA's authority, and whether limiting the NSA somehow empowers others. That's the wrong debate. We don't get to choose a world in which the Chinese, Russians, and Israelis will stop spying if the NSA does. What we have to decide is whether we want to develop an information infrastructure that is vulnerable to all attackers, or one that is secure for all users. Since its formation in 1952, the NSA has been entrusted with dual missions. First, signals intelligence, or SIGINT, involved intercepting the communications of America's enemies. Second, communications security, or COMSEC, involved protecting American military—and some government—communications from interception. It made sense to combine these two missions, because knowledge about how to eavesdrop is necessary to protect yourself from eavesdropping, and vice versa.

The two missions were complementary because different countries used different communications systems, and military personnel and civilians used different ones as well. But as I described in Chapter 5, that world is gone. Today, the NSA's two missions are in conflict.

Laws might determine what methods of surveillance are legal, but technologies determine which are possible. When we consider what security technologies we should implement, we can't just look at our own countries. We have to look at the world. We cannot simultaneously weaken the enemy's networks while still protecting our own. The same vulnerabilities used by intelligence agencies to spy on each other are used by criminals to steal your financial passwords. Because we all use the same products, technologies, protocols, and standards, we either make it easier for everyone to spy on everyone, or harder for anyone to spy on anyone. It's liberty versus control, and we all rise and fall together. Jack Goldsmith, a Harvard law professor and former assistant attorney general under George W. Bush, wrote, "every offensive weapon is a (potential) chink in our defense—and vice versa."

For example, the US CALEA law requires telephone switches to enable eavesdropping. We might be okay with giving police in the US that capability, because we generally trust the judicial warrant process and assume that the police won't abuse their authority. But those telephone

switches are sold worldwide—remember the story about cell phone wiretapping in Greece in Chapter 11—with that same technical eavesdropping capability. It's our choice: either everyone gets that capability, or no one does.

It's the same with IMSI-catchers that intercept cell phone calls and metadata. StingRay might have been the FBI's secret, but the technology isn't secret anymore. There are dozens of these devices scattered around Washington, DC, and the rest of the country run by who-knows-what government or organization. Criminal uses are next. By ensuring that the cell phone network is vulnerable to these devices so we can use them to solve crimes, we necessarily allow foreign governments and criminals to use them against us. I gave more examples in Chapter 11. In general, we get to decide how we're going to build our communications infrastructure: for security or not, for surveillance or not, for privacy or not, for resilience or not. And then everyone gets to use that infrastructure.

Existing US restrictions prove no modeling occurs

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

We know much less about government surveillance in other countries; but don't assume that they aren't doing these same things just because whistleblowers there haven't brought those stories to light. Other governments are doing much the same thing to as much of the Internet as they can get their hands on, often with fewer legal restrictions on their activities.

Russia collects, stores, and analyzes data from phone calls, e-mail, Internet use, social networking, credit card transactions, and more. Russia's System for Operative Investigative Measures, or SORM, is built right into its Internet. We saw a glimpse of how extensive this system is during the 2014 Sochi Olympics, where the Russian authorities monitored pretty much everything that happened online. Crime and terrorism provide justifications for surveillance, but this data is also used against Russian journalists, human rights activists, and political opponents.

China, too, attempts to monitor everything its citizens do on—and, increasingly, off— the Internet. China also uses location information from mobile phones to track people en masse. It turns mobile phones on remotely to eavesdrop on people, and it monitors physical spaces with its 20 to 30 million surveillance cameras. As in Russia, crime is the ostensible excuse for all this snooping, but dissent is a major reason as well. TOM-Skype is a Chinese video and texting service, a joint venture between Microsoft and the Chinese company TOM Online. Messages containing words like "Tiananmen," "Amnesty International," and "Human Rights Watch," as well as references to drugs and pornography, are copied and saved. More than 30,000 Internet police conduct the monitoring.

We got additional glimpses of global Internet monitoring a few years ago, when India, Russia, Saudi Arabia, the UAE, and Indonesia all threatened to ban BlackBerry if the company didn't allow them access to user communications. BlackBerry data is generally encrypted, which

prevents eavesdropping. BlackBerry cut a deal with India whereby corporate users were allowed to keep their data secure, but the government would be able to track individual users' e-mails, chats, and website visits. We don't know about the deals it may have struck with the other countries, but we can assume that they're similar. Smaller countries often turn to larger ones to help them with their surveillance infrastructure. China helped Iran build surveillance into its own Internet infrastructure. I'll say more in Chapter 6 about Western companies helping repressive governments build surveillance systems.

The actions of these and other countries—I could fill a whole book with examples— are often **far more oppressive and totalitarian than anything the US or any of its allies do.** And the US has **far more legal controls and restrictions** on government collection than any other country on the planet, including European countries. In countries like Thailand, India, and Malaysia, arresting people on the basis of their Internet conversations and activities is the norm. I'll talk about risks and harms in Chapter 7; right now, I want to stick to capabilities.

Circumvention

1nc - NSA circumvention

Redundant capabilities from other agencies circumvent

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

The NSA might get the headlines, but the US intelligence community is actually composed of 17 different agencies. There's the CIA, of course. You might have heard of the NRO—the National Reconnaissance Office—it's in charge of the country's spy satellites. Then there are the intelligence agencies associated with all four branches of the military. The Departments of Justice (both FBI and DEA), State, Energy, the Treasury, and Homeland Security all conduct surveillance, as do a few other agencies. And there may be a still-secret 18th agency. (It's unlikely, but possible. The details of the NSA's mission remained largely secret until the 1970s, over 20 years after its formation.)

After the NSA, the FBI appears to be the most prolific government surveillance agency. It is tightly connected with the NSA, and the two share data, technologies, and legislative authorities. It's easy to forget that the first Snowden document published by the Guardian—the order requiring Verizon to turn over the calling metadata for all of its customers—was an order by the FBI to turn the data over to the NSA. We know there is considerable sharing amongst the NSA, CIA, DEA, DIA, and DHS. An NSA program code-named ICREACH provides surveillance information to over 23 government agencies, including information about Americans.

Domestic constraints cause a foreign shift – turns the case

Chandler and Le, 15 - * Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; A.B., Harvard College; J.D., Yale Law School AND **Free Speech and Technology Fellow, California International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law (Anupam and Uyen, "DATA NATIONALISM" 64 Emory L.J. 677, lexis)

First, the United States, like many countries, **concentrates much of its surveillance efforts abroad.** Indeed, the Foreign Intelligence Surveillance Act is focused on gathering information overseas, limiting data gathering largely only when it implicates U.S. persons. n174 The recent NSA surveillance disclosures have revealed extensive foreign operations. n175 Indeed, **constraints on domestic operations** may well have **spurred the NSA to expand operations abroad**. As the Washington Post reports, "Intercepting communications overseas has clear advantages for the NSA, with looser restrictions and less oversight." n176 Deterred by a 2011 ruling by the Foreign Intelligence Surveillance Court barring certain broad **domestic surveillance** of Internet and telephone traffic, n177 the NSA may have increasingly turned its attention overseas.

Allied cooperation circumvents domestic restrictions

Brenner, 15 - Senior Fellow, the Center for Transatlantic Relations; Professor of International Affairs, University of Pittsburgh (Michael, Huffington Post, "The NSA's Second Coming" 6/8,

http://www.huffingtonpost.com/michael-brenner/the-nsas-second-coming_b_7535058.html

7. The NSA coordinates its spying closely with Intelligence agencies of the four other English-speaking countries that participate in "Five Finger" alliance: the UK, Canada, Australia and New Zealand. Their data sharing does not stop at that acquired by legal means. They do each other favors by **relying on a partner to circumvent domestic restrictions** in any one of them. There are credible reports that NSA has assisted Britain's GCHQ in this respect. Both have assisted the German NBD in spying on German targets- as has been revealed within the past few weeks. Therefore, the significance of last week legislation is undercut by this close collaboration.

Creative lawyering guarantees circumvention

Redmond, 14 – J.D. Candidate, 2015, Fordham University School of Law (Valerie, "I Spy with My Not So Little Eye: A Comparison of Surveillance Law in the United States and New Zealand" FORDHAM INTERNATIONAL LAW JOURNAL [Vol. 37:733

In the United States, the current state of surveillance law is a product of FISA, its amendments, and its strictures. An evaluation of US surveillance law proves that inherent loopholes undercut FISA's protections, which allows the US Government to circumvent privacy protections.182 The main problems are the **insufficient definition of surveillance**, the ability to spy on agents of

foreign powers, the lack of protection against third party surveillance, and the ability to collect incidental information.183

First, a significant loophole arises in the interpretation of the term "surveillance."184 In order for information collection to be regulated by FISA, it must fall under FISA's definition of surveillance.185 This definition does not apply to certain **National Security Letters**, which are secret authorizations for the Federal Bureau of Investigation ("FBI") to obtain records from telephone companies, credit agencies, and other organizations if they merely certify that the information is relevant to an international terrorism investigation.186 National Security Letters are regularly used to circumvent FISA's warrant procedures.187

Additionally, FISA's definition of surveillance is antiquated because it distinguishes between data acquired inside of the United States and outside of the United States.188 This distinction allows the NSA to process surveillance that is received from other countries irrespective of whether the target is a US citizen.189 Therefore, the NSA is unrestrained when a communication is not physically intercepted within the United States.190

Second, an issue arises when US citizens are construed to be agents of foreign powers under FISA because a warrant can be issued to engage in surveillance against them.191 According to FISA's procedures, the only way to spy on a US citizen is when they can be considered to be an agent of a foreign power, or engaged in information gathering, aiding, or abetting a foreign power.192 However, this limitation does not result in total privacy protection because it only requires probable cause that a person is an agent of a foreign power, not that a crime is being committed.193 The effect of this ability is that the US Government can conduct surveillance on a US citizen with no ties to terrorism such as a suburban mother telling her friend that her son "bombed" a school play.194

2nc – top level NSA circumvention

Err neg - the NSA has broken the law thousands of times

Barnhizer 13 - Professor Emeritus, Cleveland-Marshall College of Law (David, "Through a PRISM Darkly: Surveillance and Speech Suppression in the "Post-Democracy Electronic State"", working paper, September 2013, p.25-26//DM)

The momentum of technology is irresistible. The problem is that technology creates its own imperatives and will come to be used in whatever ways possible. The same can be said for the creation of government regulatory policies impacting in virtually any sphere of activity. After all, who can quarrel with the idea that governmental actors—legislators, bureaucrats, executive branch leaders, judges, police, security personnel, military leaders etc.—should possess the most accurate, comprehensive and detailed data possible related to their areas of activity? This is only logical, right? The problem is that the logic of obtaining perfect or near perfect data for decision and action has no internal limits.60It will expand into the universe of possibility unless there are strong and clearly understood principles by which limits are set and consequences imposed if those limits are exceeded.

At the moment we are attempting to deal with what appears to be a prime example of a secretive part of government operating according to the imperative of gaining total knowledge through

technological innovations while doing so under the driving force of national security and detecting terroristic activities. Over the past few months we have been witness to the profoundly intrusive behavior of the NSA, the revelations of Edward Snowden, the apparent "rubber stamping" of any surveillance request put to it by the judges of the clandestine FISA Court, the NSA's ultimate **admission that it violated the rules on thousands of occasions** including following the activities of NSA employees' "love interests", and admitted **lying to Congress** by James Clapper the head of the US national intelligence system.61Yet the NSA's all-encompassing PRISM program is simply the latest manifestation of the inevitable use of surveillance technology and the absolute inability of government to "Just Say No" to its own **inevitable abuse** of whatever power it possesses. 62

2nc – redundant capabilities

Redundant means and justifications make circumvention easy

Brenner, 15 - Senior Fellow, the Center for Transatlantic Relations; Professor of International Affairs, University of Pittsburgh (Michael, Huffington Post, "The NSA's Second Coming" 6/8,

http://www.huffingtonpost.com/michael-brenner/the-nsas-second-coming_b_7535058.html

11. United States Intelligence agencies have multiple, **redundant** methods for acquiring bulk data or specific data. They also have multiple legal justifications**, however contrived** they might be; those justifications are extremely difficult to challenge in the federal courts who have pretty much neutered themselves on these types of security issues. Where top officials, including the President, feel it necessary, **they have few qualms about skirting the law**.

State and local governments will give data to the federal government – circumvents more restrictive federal rules

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

Outside of the federal government, a lot more surveillance and analysis of surveillance data is going on. Since 9/11, the US has set up "fusion centers" around the country. These institutions are generally run by state and local law enforcement, and are meant to serve as an information bridge between those groups and national agencies like the FBI and DHS.

They give local police access to previously unavailable surveillance capabilities and data. They were initially supposed to focus on terrorism, but increasingly they're used in broader law enforcement. And because they're run locally, different fusion centers have different rules—and different levels of adherence to those rules. There's minimal oversight, probably illegal military involvement, and excessive secrecy. For example, fusion centers are known to have spied on political protesters.

Joint Terrorism Task Forces are also locally run, nebulously defined, and shrouded in extreme secrecy. They've been caught investigating political activists, spreading anti- Islamic propaganda, and harassing innocent civilians.

They'll just use National Security Letters

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

That said, unlike NSA surveillance, FBI surveillance is traditionally conducted with judicial oversight, through the warrant process. Under the Fourth Amendment to the US Constitution, the government must demonstrate to a judge that a search might reasonably reveal evidence of a crime. However, the FBI has the authority to collect, without a warrant, all sorts of personal information, either targeted or in bulk through the use of National Security Letters (NSLs). These are basically administrative subpoenas, issued by the FBI with no judicial oversight. They were greatly expanded in scope in 2001 under the USA PATRIOT Act (Section 505), although the initial legal basis for these letters originated in 1978. Today, NSLs are generally used to obtain data from third parties: email from Google, banking records from financial institutions, files from Dropbox.

2nc – domestic only limit

The domestic-only limit prevents solvency

Kehl, 14 – Policy Analyst at New America's Open Technology Institute (Danielle, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity" July, https://www.newamerica.org/oti/surveillance-costs-the-nsas-impact-on-the-economy-internet-freedom-cybersecurity/

It appears that little consideration was given over the past decade to the potential economic repercussions if the NSA's secret programs were revealed.38 This failure was acutely demonstrated by the Obama Administration's initial focus on reassuring the public that its programs primarily affect non-Americans, even though non-Americans are also heavy users of

American companies' products. Facebook CEO Mark Zuckerberg put a fine point on the issue, saying that the government "blew it" in its response to the scandal. He noted sarcastically: "The government response was, 'Oh don't worry, we're not spying on any Americans.' Oh, wonderful: that's really helpful to companies [like Facebook] trying to serve people around the world, and that's really going to inspire confidence in American internet companies."39 As Zuckerberg's comments reflect, certain parts of the American technology industry are particularly vulnerable to international backlash since growth is **heavily dependent on foreign markets**. For example, the U.S. cloud computing industry has grown from an estimated $46 billion in 2008 to $150 billion in 2014, with nearly 50 percent of worldwide cloud-computing revenues coming from the U.S.40 R Street Institute's January 2014 policy study concluded that in the next few years, new products and services that rely on cloud computing will become increasingly pervasive. "Cloud computing is also the root of development for the emerging generation of Web-based applications—home security, outpatient care, mobile payment, distance learning, efficient energy use and driverless cars," writes R Street's Steven Titch in the study. "And it is a research area where the United States is an undisputed leader."41 This trajectory may be dramatically altered, however, as a consequence of the NSA's surveillance programs.

The domestic-only limit wrecks solvency

Kehl, 14 – Policy Analyst at New America's Open Technology Institute (Danielle, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity" July, https://www.newamerica.org/oti/surveillance-costs-the-nsas-impact-on-the-economy-internet-freedom-cybersecurity/

The U.S. government has already taken some limited steps to mitigate this damage and begin the slow, difficult process of rebuilding trust in the United States as a responsible steward of the Internet. But the reform efforts to date have been relatively narrow, focusing primarily on the surveillance programs' impact on the rights of **U.S. citizens**. Based on our findings, we recommend that the U.S. government take the following steps to address the broader concern that the NSA's programs are impacting our economy, our foreign relations, and our cybersecurity:

1. Strengthen privacy protections for both Americans **and non-Americans**, within the United States **and extraterritorially**.

2. Provide for increased transparency around government surveillance, both from the government and companies.

3. Recommit to the Internet Freedom agenda in a way that directly addresses issues raised by NSA surveillance, including moving toward **international human-rights based standards on surveillance**.

4. Begin the process of restoring trust in cryptography standards through the National Institute of Standards and Technology.

5. Ensure that the U.S. government does not undermine cybersecurity by inserting surveillance backdoors into hardware or software products.

6. Help to eliminate security vulnerabilities in software, rather than stockpile them.

7. Develop clear policies about whether, when, and under what legal standards it is permissible for the government to secretly install malware on a computer or in a network.

8. Separate the offensive and defensive functions of the NSA in order to minimize conflicts of interest.

The NSA doesn't comply with foreignness designation requirements

Gellman, 14 – staff writer for the Washington Post; won 3 Pullitzer Prizes (Barton, Washington Post, "In NSA-intercepted data, those not targeted far outnumber the foreigners who are" 7/5, http://www.washingtonpost.com/world/national-security/in-nsa-intercepted-data-those-not-targeted-far-outnumber-the-foreigners-who-are/2014/07/05/8139adf8-045a-11e4-8572-4b1b969b6322_story.html

When NSA and allied analysts really want to target an account, their concern for U.S. privacy diminishes. The rationales they use to judge foreignness sometimes stretch legal rules or well-known technical facts to the breaking point.

In their classified internal communications, colleagues and supervisors often remind the analysts that PRISM and Upstream collection have a "lower threshold for foreignness 'standard of proof' " than a traditional surveillance warrant from a FISA judge, requiring only a "reasonable belief" and not probable cause.

One analyst rests her claim that a target is foreign on the fact that his e-mails are written in a foreign language, a quality shared by tens of millions of Americans. Others are allowed to presume that anyone on the chat "buddy list" of a known foreign national is also foreign.

In many other cases, analysts seek and obtain approval to treat an account as "foreign" if someone connects to it from a computer address that seems to be overseas. "The best foreignness explanations have the selector being accessed via a foreign IP address," an NSA supervisor instructs an allied analyst in Australia.

Apart from the fact that tens of millions of Americans live and travel overseas, additional millions use simple tools called proxies to redirect their data traffic around the world, for business or pleasure. World Cup fans this month have been using a browser extension called Hola to watch live-streamed games that are unavailable from their own countries. The same trick is routinely used by Americans who want to watch BBC video. The NSA also relies routinely on locations embedded in Yahoo tracking cookies, which are widely regarded by online advertisers as unreliable.

2nc – allied intel sharing

Allied info sharing makes circumvention inevitable

Donohue, 15 - Professor of Law, Georgetown University Law Center (Laura, "SECTION 702 AND THE COLLECTION OF INTERNATIONAL TELEPHONE AND INTERNET CONTENT" 38 Harv. J.L. & Pub. Pol'y 117, Winter, lexis)

With GCHQ in mind, it is worth noting an additional exception to both FISA and Executive Order 12,333: to the extent that it is not the United States engaged in the collection of information, but, rather, one of our allies, **rules that otherwise limit the U.S. intelligence community may not apply.** From the language of the order, it appears that the United States may receive or benefit from other countries' collection of information on U.S. citizens, where it does not actively participate in the collection or specifically request other countries to carry out the collection at its behest. n142 In turn, the United States can provide information about foreign citizens to their governments that their intelligence agencies, under their domestic laws, might otherwise be unable to collect. To the extent that the programs underway are extended to the closely allied "Five Eyes" (Australia, Canada, the United Kingdom, the United States, and New Zealand), structural demarcations **offer a way around the legal restrictions** otherwise enacted to protect citizen rights in each region.

Information sharing is a loophole they can't fiat out of – it doesn't constitute 'its' surveillance but the government will get the info anyway

Redmond, 14 – J.D. Candidate, 2015, Fordham University School of Law (Valerie, "I Spy with My Not So Little Eye: A Comparison of Surveillance Law in the United States and New Zealand" FORDHAM INTERNATIONAL LAW JOURNAL [Vol. 37:733

Furthermore, FISA is limited to protecting against surveillance by the US Government; it does not create a reasonable expectation of privacy for individuals from surveillance by a third party.195 This rule is exploited by the United States' participation in Echelon.196 Because US law generally does not regulate information sharing, the United States essentially violates the privacy rights of US citizens by accepting information from foreign intelligence agencies about potential threats involving US citizens.197 Thus, the lack of privacy rights when US citizens are spied on by agencies outside of the United States creates a loophole for spying on US citizens without the government restrictions created by existing law.198

Lastly, US law allows for the collection of incidental information.199 It is predicted that Echelon collects nearly all communications, many of which can be considered incidental.200 Therefore, the fact that FISA allows for the collection of incidental information suggests that privacy rights can be violated by its involvement in Echelon.201

Allied surveillance inevitable and information sharing is routine

Chandler and Le, 15 - * Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; A.B., Harvard College; J.D., Yale Law School AND **Free Speech and Technology Fellow, California

International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law (Anupam and Uyen, “DATA NATIONALISM” 64 Emory L.J. 677, lexis)

Third, while governments denounce foreign surveillance on behalf of their citizens, governments **routinely share** clandestinely intercepted information with each other. n182 The Guardian reports that Australia's intelligence agency collects and shares bulk data of Australian nationals with its partners - the United States, Britain, Canada, and New Zealand (collectively known as the "5-Eyes"). n183 Even while the German government has been a forceful critic of NSA surveillance, the German intelligence service has been described as a "prolific partner" of the NSA. n184 Der Spiegel reports that the German foreign intelligence agency Bundesnachrichtendienst (BND) has been collaborating with the NSA, passing about 500 million pieces of metadata in the month of December 2012 alone. n185 The NSA has collaborated with the effort led by the British intelligence agency Government Communications Headquarters (GCHQ) to hack into Yahoo!'s webchat service to access unencrypted webcam images of millions of users. n186 A German computer expert observes, "We know now that data was intercepted here on a large scale. So limiting traffic to Germany and Europe doesn't look as promising as the government and [Deutsche Telekom] would like you to believe." n187

2nc – circumvention turns the case

Circumvention turns their perception arguments

Seamon 8 – Professor, University of Idaho College of Law (Richard, “Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits”, Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

Conversely, allowing the President to ignore statutory restrictions on surveillance encourages executive lawlessness. Courts should discourage such behavior by preferring Fourth Amendment interpretations that encourage the executive branch to collaborate with the legislature to frame such rules, rather than defy them. After all, how is the public to feel when an Act of Congress supposedly provides the "exclusive" authority for a specified type of surveillance, yet it learns that a program exists **"outside" that authority** and has been going on for years? 20 8 Such a situation is likely to **undermine public confidence** that the nation's leaders obey the rule of law. It undermines faith in the legislative branch's willingness and ability to check executive abuse, and in the President's willingness to abide by legislative restrictions.20 9

Circumvention – US servers

Limiting the plan to US-based servers means the NSA will shift to foreign-based servers

Arnbak and Goldberg 14- cybersecurity and information law research at the Institute for Information Law, LL.M degree from Leiden University, A Competitive Strategy and Game Theory degree from London School of Economics University of Amsterdam; Associate professor

in the Computer Science Department at Boston University, phD from Princeton University, B.A.S.c from University of Toronto (Axel and Sharon, "Loopholes for Circumventing the Constitution: Warrantless Bulk Surveillance on Americans by Collecting the Network Traffic Abroad", Working Paper, June 27, 2014)//TT

Technical Loopholes. At first blush, one might suppose that a surveillance operation conducted abroad should have no impact on the privacy of Americans. However, in Section 3 we discuss why the technical realities of the Internet mean that American's network traffic can easily be routed or stored abroad, where it can then be collected under the permissive legal regime of EO 12333. Indeed, we already know of surveillance programs that **have exploited this legal loophole**. The revealed MUSCULAR/TURMOIL program, for example, illustrates how the N.S.A. presumed authority under EO 12333 to acquire traffic between Google and Yahoo! servers located on foreign territory; this program allegedly collected up to 180 million user records per month abroad, including those of Americans [17].

We also discuss other technical means an intelligence agency can exploit the legal loopholes under EO 12333. Instead of eavesdropping on intradomain traffic (i.e., data sent within a network belonging to a single organization, as in the MUSCULAR/TURMOIL program), these loopholes can be exploited in the interdomain setting, where traffic traverses networks belonging to different organizations. We explain why interdomain routing with BGP can naturally cause traffic originating in a U.S. network to be routed abroad, even when it is destined for an endpoint located on U.S. soil. We also discuss why core Internet protocols – BGP and DNS – **can be deliberately manipulated to force traffic originating in American networks to be routed abroad**. We discuss why these deliberate manipulations fall within the permissive EO 12333 regime, and how they can be used to collect, in bulk, all Internet traffic (including metadata and content) sent between a pair of networks; **even if both networks are located on U.S. soil** (e.g., from Harvard University to Boston University).

Circumvention – FBI specific

The FBI will empirically circumvent the plan

Schneier, 15 - fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Introduction)//AK

Technology has greatly enhanced the FBI's ability to conduct surveillance without a warrant. For example, the FBI (and also local police) uses a tool called an IMSI-catcher, which is basically a fake cell phone tower. If you've heard about it, you've heard the code name StingRay, which is actually a particular type of IMSI-catcher sold by Harris Corporation. By putting up the tower, it tricks nearby cell phones into connecting to it. Once that happens, IMSI-catchers can collect

identification and location information of the phones and, in some cases, eavesdrop on phone conversations, text messages, and web browsing. The FBI is so scared of explaining this capability in public that the agency makes local police sign nondisclosure agreements before using the technique, and **instructs them to lie about their use of it in court**. When it seemed possible that local police in Sarasota, Florida, might release documents about StingRay cell phone interception equipment to plaintiffs in civil rights litigation against them, federal marshals seized the documents.

Circumvention – XO12333 loophole

The NSA double dips – they'll just get the same info under XO 12333 and call it foreign intelligence

Wheeler, 14 - PhD, independent journalist specializing in national security and civil liberties; former senior policy analyst at The Intercept (Marcy, "The Single Branch Theory of Oversight" 6/23,

http://www.cato-unbound.org/2014/06/23/marcy-wheeler/single-branch-theory-oversight

Carrie Cordero made a fairly astonishing claim in her response to my focus on the SA's theft from Google and Yahoo fiber overseas. She claims that that and other documents showing how the NSA double dips from PRISM producers, collecting content domestically under Section 702 and collecting it internationally under Executive Order 12333, shows "the [FISA Amendments Act] has been implemented consistently with how it was described in the public record of legislative text and Congressional hearings that took place up to its passage in 2008." Cordero would have you believe that the Administration made it clear it intended to continue to steal data from American providers even after having been given Congressionally authorized access to it.

She is right on one count, though she doesn't spell out how in her reply. From the very first debates over amendments to FISA in 2007, members of Congress – especially Senator Dianne Feinstein and then Senator Russ Feingold – raised concerns that the Executive Branch would **simply bypass the law** if it wanted to. And while then Director of National Intelligence (and now Booz Allen Hamilton Vice Chairman) Mike McConnell assured the Senators "the effort to modernize would prevent an operational necessity to do it a different way" (seemingly providing assurances the Intelligence Community would not bypass the FISA process as they have), McConnell and others, including Keith Alexander, kept repeating that "Article II is Article II."

That is, throughout the FISA amendment process, the intelligence community was quite honest that it **did not believe itself to be bound by the laws passed by Congress**; they explicitly reserved the authority to simply **go overseas to bypass limits** and oversight imposed by Congress.

That's why the 800 words Cordero used to describe the oversight exercised by the FISA Court and Congress as part of the FISA process really describe something that is – as Julian Sanchez argued – **decorative**. So long as the intelligence community does bypass those authorities to carry out the same collection overseas (they definitely do that with content, and appear to do that with

metadata), the oversight of other branches is a mere indulgence from the Executive, made all the weaker because both branches are aware that the Executive will bypass their oversight if the oversight is deemed overly strict.

XO 12333 abuses are the worst thing the NSA does – the plan's a band-aid

Vladeck 15 - professor of law at American University Washington College of Law (Steven "Forget the Patriot Act – Here Are the Privacy Violations You Should Be Worried About", Foreign Policy, 06/01/15, http://foreignpolicy.com/2015/06/01/section-215-patriot-act-expires-surveillance-continues-fisa-court-metadata/)//GK

More alarmingly, with regard to collection under Executive Order 12333, there isn't any similar judicial review (or meaningful congressional oversight), which means that it has entirely been up to the government to police itself. As State Department whistleblower John Napier Tye explained last summer, there is every reason to doubt that such internal accountability has provided a sufficient check. In his words, "Executive Order 12333 contains nothing to prevent the NSA from collecting and storing all … communications … provided that such collection occurs outside the United States in the course of a lawful foreign intelligence investigation." To put the matter bluntly, whereas the Section 215 debate has addressed whether the government can collect our phone records, Executive Order 12333 and the 2008 FISA Amendments Act allow the government to collect a lot of what we're actually saying, whether on the phone, in our emails, or even to our search engines. There is no question that, from a privacy perspective, these programs are far more pernicious than what's been pegged to Section 215. There is also no question that such collection raises even graver constitutional questions than the phone records program. Whereas there is an open debate over our expectation of privacy in the metadata we voluntarily provide to our phone companies, there's no doubt that we have an expectation of privacy in the content of our private communications. Why, then, has all the fuss been around Section 215 and the phone records program, while the far more troubling surveillance authorities provided by Executive Order 12333 and the 2008 FISA Amendments Act have flown under the radar? Part of it may be because of the complexities described above. After all, it's easy for people on the street to understand what it means when the government is collecting our phone records; it's not nearly as obvious why we should be bothered by violations of minimization requirements. Part of it may also have to do with the government's perceived intent. Maybe it seems more troubling when the government is intentionally collecting our phone records, as opposed to "incidentally" (albeit knowingly) collecting the contents of our communications. And technology may play a role, too; how many senders of emails know where the server is located on which the message is ultimately stored? If we don't realize how easily our communications might get bundled with those of non-citizens outside the United States, we might not be worried about surveillance targeted at them. But whatever the reason for our myopic focus on Section 215, it has not only obscured the larger privacy concerns raised by these other authorities, but also the deeper lessons we should have taken away from Snowden's revelations. However much we might tolerate, or even embrace, the need for secret government surveillance programs, it is all-but-inevitable that those programs will be stretched to — and beyond — their legal limits. That's why it's important not only to place substantive limits upon the government's surveillance authorities, but also to ensure that they are subject to meaningful external oversight and accountability as well. And that's why the denouement of Section 215 debate has been so disappointing. This should have been a conversation not just about the full range of government surveillance powers, including Executive Order 12333 and the 2008 FISA Amendments Act, but also about the role of the FISA Court and of congressional oversight in supervising those authorities. Instead, it devolved into an over-heated debate over an over-emphasized program. Congress has tended to a paper cut, while it **ignored the internal bleeding**. Not only does the expiration of Section 215 have no effect on the substance of other surveillance authorities, it also has no effect on their oversight and accountability. Reaching some degree of closure with regard to the phone records program may leave many with the impression that America has concluded a meaningful and productive national debate over surveillance reform. We haven't. And although the 2008 FISA Amendments Act is also set to expire — on December 31, 2017 — the debate over Section 215 leaves little reason to believe that we'll have it then, either.

Curtailment of Executive Order 12333 is critical to effective NSA reform

Edgar 15*scholar at the Brown University's Watson Institute for International Studies (Timothy, "Surveillance Reform: Privacy Board Turns to E.O. 12,333", Lawfare, 3/13/15, http://www.lawfareblog.com/surveillance-reform-privacy-board-turns-eo-12333)//GK

The job of lawyers and privacy officials is the intelligence community is to administer the two basic systems of oversight first established by the Church Committee reforms of the 1970s: the Foreign Intelligence Surveillance Act and E.O. 12,333. In my experience, E.O. 12,333 is the more important of the two, although it receives much less attention. E.O. 12,333 governs activities that are not regulated by statute and do not require a court order. As a result, those activities are less well documented, as a practical matter less transparent – even by the standards of classified programs, and are therefore subject to less rigorous oversight. They involve at most two branches of government – the Executive and Congress. Realistically, they usually involve only the Executive. As a lawyer inside the Executive Branch providing advice on intelligence activities, I found myself turning to E.O. 12,333, and the AG guidelines for each agency required by that order, far more often than I did to FISA or other statutes. For us, E.O. 12,333 and the AG guidelines provided the only real source of legal guidance for most of what intelligence agencies do. Since the Snowden revelations began in 2013, there has been debate here and abroad about surveillance reform. While much of the debate in this country about surveillance reform has focused on bulk collection of telephone records and other FISA activities, in the rest of the world the attention has been on continuing revelations of a variety of NSA activities conducted overseas under E.O. 12,333. These include reports of very intrusive activities, like collection of massive quantities of communications – the practice the government calls bulk collection, and critics call mass surveillance – and alleged activities that undermine encryption or security of communications systems. President Obama has addressed some of these concerns in Presidential Policy Directive 28 (PPD-28), issued last year and implemented this year. PPD-28 limits bulk collection to six specified national security threats, including international terrorism, and for the first time requires intelligence agencies to have guidelines that protect the privacy of foreign citizens. I discuss PPD-28, and make recommendations for further reforms, in my recent Foreign Affairs article, "The Good News About Spying."

Significant 702 reform and curtailing XO1233 are critical to the fight for privacy

Esguerra 15 – EFF activist (Richard, "Fighting for Privacy, Two Years After Snowden", The Electronic Frontier Foundation, 06/08/15, http://www.juancole.com/2015/06/fighting-privacy-snowden.html)//GK

With the passage of USA Freedom law behind us, we're setting our sights on Section 702 of the FISA Amendments Act, a deeply troubling authority used by the NSA to justify mass collection of phone calls and emails by collecting huge quantities of data directly from the physical infrastructure of communications providers. Here too, we are pulling at ominous threads of the government's surveillance apparatus first identified by whistleblowers like Mark Klein, Thomas Drake, William Binney, J. Kirk Wiebe, and Edward Snowden. Mr. Snowden's disclosures helped us understand that Section 702 was what the government was using to justify its tapping into fiber optic cables: something we've been suing over since 2006 and which we are currently presenting to the Ninth Circuit in Jewel v. NSA. It was a hard-fought loss in 2008 when the FISA Amendments Act passed, unconstitutionally granting retroactive immunity to telecommunications companies that participated in warrantless mass surveillance and ultimately killing our first case, Hepting v. AT&T. But the passage of USA Freedom—even as a first step—demonstrates the strengthening of resources, communities, networks, and strategies that can now be brought to bear in the fight for reform in Congress and in the courts. Another objective: address Executive Order 12333, which the NSA relies on for most of its digital surveillance of people worldwide. On the roster of legal authorities underpinning the government's mass surveillance activities, EO 12333 is the **most thickly shrouded** while also appearing to be one of the most powerful: the Washington Post revealed in 2014 that the order alone—without any court oversight—was used to justify the recording of "**100 percent** of a foreign country's telephone calls." There are many objectives to achieve around 12333: greater public awareness; meaningful transparency from those with the power and responsibility to investigate and disclose details being hidden from the public; and direct pressure on President Obama, who can issue a new executive order to better protect people around the world before he leaves office.

Circumvention – section 702

Section 702 fails to limit domestic surveillance—legal loopholes and circumventions

Arnbak and Goldberg 14- cybersecurity and information law research at the Institute for Information Law, LL.M degree from Leiden University, A Competitive Strategy and Game Theory degree from London School of Economics University of Amsterdam; Associate professor in the Computer Science Department at Boston University, phD from Princeton University, B.A.S.c from University of Toronto (Axel and Sharon, "Loopholes for Circumventing the Constitution: Warrantless Bulk Surveillance on Americans by Collecting the Network Traffic Abroad", Working Paper, June 27, 2014)//TT

For years, FISA and especially its s. 702 have been criticized for providing legal loopholes for warrantless political and economic surveillance on U.S. lawyers, NGOs, journalists and corporations communicating internationally through U.S. Internet companies [33]; the media reports in December 2005, around warrant-less wiretapping in bulk from the Internet backbone at an AT&T switch [28],have highlighted some of this tension. Nonetheless, U.S. Congress passed FAA after the AT&T revelations and extended the validity of the FAA for another five years on 31 December 2012, one day before the sunset deadline. Two months later, on 26 February 2013 in the case `Clapper v. Amnesty International', the U.S. Supreme Court denied several U.S. organizations a right to claim that the privacy of their international communications was violated by s. 702 on procedural grounds. In what appeared to be the final ruling on the constitutionality of s. 702 for the foreseeable future, a 5-4 majority argued that these organizations were merely `speculating', and could not prove that their communications had actually been intercepted [6]. Justice Breyer, on behalf of the minority, noted in his dissent that s. 702 prohibits the same applicants to actually gain knowledge of the surveillance itself because of national security secrecy, and that the broad authorities probably existed for a reason.

The political debate and the issue of legal standing have shifted considerably since June 2013, when it became clear that s. 702 indeed serves as the legal basis for many operations, among them 'UPSTREAM' and 'PRISM' [13]. Moreover, several of the classified targeting and minimization procedures under s. 702 have been leaked or declassified [2, 3]. Both revelations have spurred the N.S.A. to confirm that a principle use of s. 702 is compelling assistance from U.S. Internet companies for warrantless surveillance [5, p. 4].

This new dynamic enables a unique insight into classified and generous interpretations of the legal provisions in FISA made by the intelligence community and the FISA Court [13]. Before we dive into the details of FISA, we mention that FISA also contains s. 703 and s. 704, that regulate surveillance intentionally targeting U.S. persons located abroad. These sections are outside the scope of this paper, since our focus is on surveillance operations on Americans located in the U.S., with surveillance conducted on foreign soil. As an aside, Donohue has observed that the warrant requirements in these sections have been circumvented by applying s. 702 criteria to the collection phase, and then seeing whether collected data is of use for further processing after the fact [13, p.26].

2.2.2 Scope of the Second Regulatory Regime under FISA: The 1978 'Electronic Surveillance' Definition

All communications surveillance operations that constitute 'electronic surveillance', as defined s. 1801(f) of FISA, fall within the scope of FISA (cf. 18 U.S.C. s.2511(2)(f); 50 U.S.C. s.1812(a)). The definition has largely remained intact since 1978. To acquire the content of 'wired communications', surveillance only falls within the FISA definition when authorities 'intentionally target a U.S. person' (s. 1801(f)(1)), or when the acquisition is conducted on U.S. soil (s. 1801(f)(2)). Importantly, when authorities conduct targeted surveillance from abroad,

even if they know that both 'sender and all intended recipients are located in the U.S.', then only 'radio' (i.e., wireless) communications fall within the FISA definition of 'electronic surveillance' (s. 1801(f)(3)). The FISA defi- nition only mentions communications 'content', but not 'metadata' (location, time, duration, identity of communicants, etc.), which in itself gives rise to privacy concerns that we will not further discuss here. Relevant for our purposes, is the observation that operations on 'wired communications', when conducted abroad, only fall within the scope of FISA if they 'intentionally target a U.S. person'.

Intentionally Targeting U.S. Persons. 'Intentionally targeting a U.S. person' constitutes 'electronic surveillance' under FISA (s. 1801(f)(1)). However, 'intention' and 'targeting' are not defined in FISA, leaving the concepts open to generous interpretation by authorities in classified 'targeting' and 'minimization' procedures. Apart from providing clarity that bulk surveillance is not regarded as intentional targeting (we discuss this further when we look at legal protections from U.S. persons under FISA), the disclosure of these procedures has revealed two important new facts related to surveillance operations conducted abroad. Firstly, conducting the surveillance abroad creates the presumption that the surveillance targets a non-U.S. person [2, p. 3-4]. Secondly, the 'targeting procedures' do not provide any due diligence requirement or duty of care to establish the identity of parties on either side of a communication [2, p.3-4] [3]. This implies that unless a communicant is known to be a U.S. person, the procedures consider the communicant to be a non-U.S. person. In other words, authorities have a strong incentive to conduct surveillance abroad: legal protections offered to U.S. persons under FISA can be circumvented, and a more generous legal regime applies to the data collection itself.

702 fails—serious loopholes exist to circumvent protections

Arnbak and Goldberg 14- cybersecurity and information law research at the Institute for Information Law, LL.M degree from Leiden University, A Competitive Strategy and Game Theory degree from London School of Economics University of Amsterdam; Associate professor in the Computer Science Department at Boston University, phD from Princeton University, B.A.S.c from University of Toronto (Axel and Sharon, "Loopholes for Circumventing the Constitution: Warrantless Bulk Surveillance on Americans by Collecting the Network Traffic Abroad", Working Paper, June 27, 2014)//TT

Applicability of FISA to a surveillance operation is relevant for Americans, be- cause the statue contains some important legal protections for U.S. persons intentionally targeted. For instance, the statute explicitly states that the 4th Amendment applies to surveillance operations under FISA (cf. s.1881(b)(5)) and a narrow set of four surveillance operations is explicitly prohibited. As discussed, surveillance under s. 702 may not intentionally target a U.S. person; for those operations s. 703 exists. Another example is the 'reverse-targeting' prohibition of s.1881(b)(2), which holds that authorities may not intentionally target a non-U.S. person under a s. 702 if the actual purpose of the operation is to target a U.S. person. By contrast, the third legal regime under EO 12333 explicitly allows for intentional targeting of U.S. persons, when certain conditions discussed in the next section are met.

Nonetheless, **serious loopholes** exist for surveillance conducted within the bounds of FISA. One of the most-discussed loopholes is when U.S. persons have not been 'intentionally targeted' but instead affected by a surveillance operation, e.g., a bulk intercepts on the Internet backbone on

U.S. soil under the 'UPSTREAM' program. Instead of promptly destroying such data, **generous ex- emptions exist** to nonetheless use the 'incidentally' or 'inadvertantly' collected information of the affected U.S. person, including when a 'foreign intelligence' interest is created in the data sometime after its collection, or when the information could be relevant for cybersecurity (incl. cyber-offense) purposes [3].

More generally, the targeting and minimization procedures seem to have introduced a new category of surveillance specifically aimed acquiring information about persons. (For example, two communicants that chat *about* a subject, like Angela Merkel, which is part of an N.S.A. 'selector'.) Such surveillance is not considered to intentionally target specific communicating parties, and hardly enjoys protection even if it affects U.S persons. The information collected through such operations may be further analyzed and disseminated to other agencies as long as the identity of U.S. persons implicated are redacted in a way 'that the information cannot be reasonably connected with an identifiable U.S. person' [3, s.6]).3 A more complete analysis of the targeting and minimization procedures can be found in [13], along with a critical assessment of the role of the FISA Court.

Circumvention – bulk collection

The government will restart other bulk collection programs in response to the plan

Toomey 15 [Patrick, Patrick Toomey is a Staff Attorney in the ACLU's National Security Project, where he works on issues related to electronic surveillance, national security prosecutions, whistle-blowing, and racial profiling. Mr. Toomey is a graduate of Harvard College and Yale Law School. , Has the CIA Asked the FISC to Restart Its Bulk Collection Program?, http://justsecurity.org/24216/cia-asked-fisc-restart-bulk-collection-program/] Schloss BR 15-76 is a proposal to renew interception and storage of data in regards to businesses

And now it appears, the government may be seeking to restart another one of the very bulk collection programs that many people understood the USA Freedom Act was meant to prohibit.

There are a few reasons to think the missing application relates to one of these still-secret bulk collection programs and is not just another targeted request. First, in issuing the opinion related to BR 15-77 and BR 15-78, the FISC made a deliberate decision to split off the questions it considered no-brainers from the more difficult statutory and constitutional questions raised by the government's application to renew its bulk call records program in BR 15-75. The legal authority for that program has been deeply undermined by the Second Circuit's decision in ACLU v. Clapper, and at least based on the public record today, the FISC still has not resolved those questions. But in the meantime, as Judge Saylor's opinion makes clear, the FISC chose to skip ahead to several subsequent applications that presented only "relatively simple" questions. The FISC's decision to leave BR 15-76 out of Judge Saylor's opinion suggests that it involves more complicated questions on par with the bulk call records application — i.e., that it involves a different bulk collection program, one the government wants to restart but the FISC must now analyze more closely.

Second, it's very unlikely that BR 15-76 is a targeted application that the FISC simply went ahead and silently granted. That's because the FISC would have had to address the same questions raised by BR 15-77 and BR 15-78 in order to grant virtually any application under Section 215 — namely, which version of Section 215 is currently in effect. The temporary expiration of Section 215 on June 1 left it unclear, at least as a technical matter, what remained of the law when Congress decided to amend it. If the missing application were also a targeted one, why didn't the FISC resolve this question and announce its decision in the context of that earlier application? The better conclusion is that BR 15-76 isn't a targeted application at all, but concerns a bulk collection program the government continues to hide from the public.

They'll reinstate CIA bulk collection in response to the plan

Toomey 15 [Patrick, Patrick Toomey is a Staff Attorney in the ACLU's National Security Project, where he works on issues related to electronic surveillance, national security prosecutions, whistle-blowing, and racial profiling. Mr. Toomey is a graduate of Harvard College and Yale Law School. , Has the CIA Asked the FISC to Restart Its Bulk Collection Program?, http://justsecurity.org/24216/cia-asked-fisc-restart-bulk-collection-program/] Schloss

The more likely scenario is that the government has asked the FISC to reinstate the CIA's bulk collection program or one of its still-secret brethren. If that's right, the public should know about this program. The government's application goes directly to one of the key questions in the USA Freedom Act debate: whether the legislation would prove effective in halting the bulk collection of Americans' sensitive information. Perhaps the government is simply seeking to "transition" this program over the coming 180 days, as it has said of its effort to restart the NSA call records program — but of course we don't know. So long as the government continues to keep the public in the dark about its efforts to collect their data en masse, we can't judge whether the USA Freedom Act really put an end to bulk collection under Section 215.

AT: Fiat solves

Fiat is a form of intelligence legalism – they can fiat compliance with the LETTER of the plan – but that's a token gesture that legitimizes surveillance abuses

Schlanger 15 [Margo, Professor of Law at the University of Michigan Law School, and the founder and director of the Civil Rights Litigation Clearinghouse., Intelligence Legalism and the National Security Agency's Civil Liberties Gap, file:///C:/Users/Jonah/Downloads/Intelligence%20Legalism%20and%20the%20National%20Security%20Agency-s%20Civil%20Li%20(2).pdf] Schloss3

And as I pointed out in this article's introduction, the "no's" Comey praises may make remarkably little difference, in the end. The hospital-bed confrontation leading to the brief shut-down of part of the "President's Surveillance Program"—the modern ur-episode of intelligence legalism—is a perfect case in point. Lawyers, it seems to me, are far more likely to move an

organization towards this kind of **nearly symbolic compliance** than to effect any more significant constraint on executive activity, particularly with respect to a program important to the President. Indeed, lawyers are attractive to intelligence organizations because they are simultaneously able to give agency operations an **imprimatur of lawfulness** and to maintain their agency affiliation/loyalty.316 Their occasional "no's," which like as not have formal rather than major substantive effects, are a price worth paying for those traits.

C. The Costs of Intelligence Legalism

Theorists and observers in a variety of fields have developed the broad critique that law and its concomitant rights orientation may have the counterintuitive impact of decreasing the welfare of the purported rights holders—or, in a more modest version of the point, may ameliorate some prevalent set of harms but undermine more ambitious efforts. Focusing particularly on litigation, they argue that it is inherently a timid enterprise, and yet it crowds out other more muscular approaches.317 Even with respect to out-of-court rights orientation, or "legalization," scholars have offered the insight that formalizing/legalistic approaches can come with real costs to their intended beneficiaries, depending on the context. 318 The issue is whether, in a particular institutional setting, these possibilities have materialized. In this Section, I examine two pathways by which intelligence legalism tends to impair the prospects of a softer civil-liberties protective policy.

1. Intelligence Legalism Crowds Out Interest Balancing

This Article demonstrates the high salience of rights in this realm. Several related mechanisms convert that high salience into a devaluation of interests:

First, rights occupy the "liberty" field because of the practical issue of attention bandwidth, which potentially applies both to agencies and advocates. After all, even large organizations have limited capacity.319 NSA compliance is such an enormous task that little room remains for more conceptual weighing of interests and options. Recall that of the dozen-plus offices I described in Part II, just two—the Civil Liberties and Privacy Office at the NSA, and the Privacy and Civil Liberties Oversight Board—are currently playing a policy rather than strictly a compliance role. They are also, not coincidentally, the two newest and two smallest of the offices listed.

I think, though, that this bandwidth issue is driven by a more conceptual, less practical, factor: that rights talk hides the necessity of policy judgments and, by its purity, diverts attention from that messier field. Morton Horwitz explains the point:

A . . . troubling aspect of rights discourse is that its focus on fundamental, inherent, inalienable or natural rights is a way of obscuring or distorting the reality of the social construction of rights and duties. It shifts discussion away from the always disputable issue of what is or is not socially desirable. Rights discourse . . . wishes us to believe instead that the recognition of rights is not a question of social choice at all, as if in the normative and constitutional realm rights have the same force as the law of gravity.320

Mary Dudziak makes a similar claim in her recent discussion of law and drone warfare, "In this context, law . . . does not aid judgment, but diverts our attention from morality, diplomacy, humanity, and responsibility in the use of force, and especially from the bloody mess left on the ground."321

Even in Fourth Amendment jurisprudence, an area of constitutional doctrine explicitly imbued with policy considerations, we talk about rights as if they are somehow scientific, to be deduced rather than debated. The discussion that must accompany policy claims pales in prestige and importance by comparison. And from the perspective of their beneficiaries, judicially enforceable rights, with their promise of supremacy over competing interests, are shiny and magnetic. This is why the assertion of rights can be such a powerful organizing tool322—**even if those rights don't turn out to change much on the ground**. As Rich Ford has written, "Rights are a secular religion for many Americans."323 Or to quote Alan Freeman's classic article about civil rights, "Rights consciousness can offer sustenance to a political movement, however alienated, indeterminate or reified rights may be."324

It is the purity, the apparent apolitical nature, of rights that makes them nearly the only coin available. By comparison with judicially enforceable rights, other methods of advancing individual liberty look feeble, contingent, jury-rigged. An accusation of illegality becomes the required first bid for any policy discussion, and a **refutation of that accusation ends play**. This dynamic is very much in evidence in the response to the PCLOB's 702 report, described above. Rights discourse stunts needed policy discourse.325

2. Intelligence Legalism and Legitimation

In addition**, judicial review legitimates the American surveillance system**; that is why reference to court supervision is surveillance proponents' first recourse when they want to **suggest that everything is fine**. It is, for example, a rare speech by a government official that fails to make reference to the FISA Court and its ratification of the government's surveillance programs. Below are passages, chosen essentially at random, from a speech by President Obama on the topic of signals intelligence reform326:

• "I ordered that our programs be reviewed by my national security team and our lawyers . . . . We increased oversight and auditing, including new structures aimed at compliance. Improved rules were proposed by the government and approved by the Foreign Intelligence Surveillance Court."

• "[T]he Foreign Intelligence Surveillance Court . . . provides judicial review of some of our most sensitive intelligence activities."

In language like the above, court involvement is offered as evidence of both legality and appropriateness; indeed, the two are conceptually merged.

My point is not that FISA Court legitimation is phony. In fact, judicial review has real effects on the system—we know from the recently declassified documents that FISA Court review disciplines the surveillance system, holding it at least to the government's own representations.327 Yet the oversight gain carries with it a legitimation cost; the existence of judicial review makes political change more difficult. Scholars, particularly critical legal studies scholars, have made this point in a large number of other contexts. For example, Alan Freeman argued that civil rights law—and law more generally—exists "largely to legitimize the existing social structure."328 The polity at large is soothed, and the effect is felt even by rights beneficiaries, who frame and tame their aspirations to suit the inherently limited scope of potential judicial interventions. Freeman described his view that American civil rights litigation has amounted to a "process of containing and stabilizing the aspirations of the oppressed through **tokenism and formal gestures** which actually enhance the material lives of few."329 He wrote:

Rights are granted to, or bestowed upon, the powerless by the powerful. They are ultimately within the control of those with authority to interpret or rewrite the sacred texts from which they derive. To enjoy them, one must respect the forms and norms laid down by those in power. One must especially avoid excesses in behavior or demands.330

The point is not, for Freeman (and the plentiful literature he adduced), that law accomplishes nothing for its purported beneficiaries. If that were true, it could not legitimate: "[I]f law is to serve its legitimation function, [the] ultimate constraints [that come from politics] must yield up just enough autonomy to the legal system to make its operations credible for those whose allegiance it seeks as well as those whose self-interest it rationalizes."331 But gains from rights may—and in the surveillance situation clearly do—make gains from politics less available.

To sum up this Part, neither the Constitution nor FISA aims to optimally balance security and liberty—and frequently analyzed difficulties in congressional intelligence oversight mean that new statutes are unlikely to fill that gap. Likewise the existing foundational Executive Order, 12,333, is at the very least out-of-date. Accordingly intelligence legalism, and its compliance mindset, cannot achieve optimal policy. Its concomitant empowerment of lawyers is real and important, but does not deputize a procivil liberties force. Indeed, legalism actually both **crowds out** the consideration of policy and interests (as opposed to law and rights), and **legitimates the surveillance state**, making it less susceptible to policy reform. Are there, then, non-legalistic reforms that could play a productive part? I turn next to this issue.

NSA lawyering will meet the letter of the plan but they'll still find loopholes

Schlanger 15 [Margo, Professor of Law at the University of Michigan Law School, and the founder and director of the Civil Rights Litigation Clearinghouse., Intelligence Legalism and the National Security Agency's Civil Liberties Gap, file:///C:/Users/Jonah/Downloads/Intelligence%20Legalism%20and%20the%20National%20Security%20Agency-s%20Civil%20Li%20(2).pdf] Schloss3

One key question about all this legal advice is whether it is ever constraining—whether the lawyers ever tell their clients no. NSA's lawyers do sometimes advise their clients/colleagues not to do specific things. One released training document, for example, advises analysts not to use certain search techniques, cautioning: "Do Not: Wildcard domains. Wildcard user names. Wildcard across domains."149 One would expect agency counsel to say no with relative ease where the rules are clear and when those rules govern how and not whether a particular activity can occur. It is crucial to remember, however, that agency lawyer advice-giving is not adjudication and agency lawyers are not judges. The judicial ideal of even-handedness is not, even theoretically, applicable. Rather, the goal of legal advice for lawyers within the Intelligence Community, as with any organization's lawyers, is to assist the client. To quote the same senior IC lawyer, "you're hoping to get done what your client wants to get done, so there's a tendency to try to find the most room to get that done."150 Or, in the less careful words of a former NSA chief analyst, "Look, NSA has **platoons of lawyers** and their entire job is figuring out how to **stay within the law** and maximize collection by **exploiting every loophole**." 151 Unsurprisingly, then, some training slides that say no also include work-arounds—methods for achieving various searching or analytic goals that are not covered by the stricter FISA rules.152

Fiating compliance makes it more difficult to reign in the NSA in every other area

Schlanger 15 [Margo, Professor of Law at the University of Michigan Law School, and the founder and director of the Civil Rights Litigation Clearinghouse., Intelligence Legalism and the National Security Agency's Civil Liberties Gap, file:///C:/Users/Jonah/Downloads/Intelligence%20Legalism%20and%20the%20National%20Security%20Agency-s%20Civil%20Li%20(2).pdf] Schloss3

I suggest in Section A, below, that the law alone is not enough; it is implausible that constitutional, statutory, and binding executive rules will be sufficiently robust to produce the best policy outcomes. There will always be liberty gaps—and these will increase with the passage of time from the last public outcry and resulting intervention. In Section B, I examine and reject a different argument that intelligence legalism sufficiently furthers liberty: that lawyers, empowered by legalism, turn out to be excellent good civil liberties guardians. Finally, in Section C, I argue that the compliance focus, and the prevalence of rights and law talk, actually dampens the prospects of civil liberties policymaking, both by crowding it out and by rendering surveillance more politically acceptable and therefore making political or policy-based claims for reform less likely to succeed, whether inside the Intelligence Community or in the polity as a whole. In sum, intelligence legalism may further individual liberty to some extent, but compliance matters are apt to receive so much attention and even prestige that law functions as a ceiling rather than a floor. To add policy considerations on top of law thus requires focused intervention, discussed in Part IV.

AT: FISC checks

The FISC allows the NSA to make the reasonable suspicion determination – means the NSA circumvents

Donohue '14 – Professor of Law at Georgetown University (Laura K. Donohue, "Bulk Metadata Collection: Statutory and Constitutional Considerations", Georgetown University Law Center, 2014, http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2360&context=facpub)//MBB

To the contrary, FISC's primary order authorizing the collection of telephony metadata required that designated **NSA officials** make a finding that there is "reasonable, articulable suspicion" (RAS) that a seed identifier proposed for query is associated with a particular foreign terrorist organization prior to its use. It is thus left to the executive branch to determine whether the executive branch has sufficient evidence to place individuals or entities under surveillance.

The dangers associated with the court removing itself from the process are clear. Documents recently released under court orders in a related FOIA case establish that for nearly three years, the NSA did not follow these procedures 223 —even though numerous NSA officials were aware of the violation.224 Noncompliance incidents have continued. Collectively, these incidents raise serious question as to whether FISC is performing the functions for which it was designed.

Legitimacy of FISC undermined by continuous noncompliance

Donohue '14 – Professor of Law at Georgetown University (Laura K. Donohue, "Bulk Metadata Collection: Statutory and Constitutional Considerations", Georgetown University Law Center, 2014, http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2360&context=facpub)//MBB

In at least three important ways, FISC no longer serves the purpose for which it was designed. First, Congress created the court to determine whether the executive branch had met its burden of demonstrating that there was sufficient evidence to target individuals within the United States, prior to collection of such information. The telephony metadata program demonstrates that FISC has abdicated this responsibility to the executive branch generally, and to the NSA in particular. **Continued noncompliance** underscores concern about relying on the intelligence community to protect the Fourth Amendment rights of U.S. persons.

Second, Congress did not envision a lawmaking role for FISC. Its decisions were not to serve as precedent, and FISC was not to offer lengthy legal analyses, crafting in the process, for instance, exceptions to the Fourth Amendment warrant requirement or defenses of wholesale surveillance programs.

Third, questions have recently been raised about the extent to which FISC can fulfill the role of being a neutral, disinterested magistrate. Congress went to great lengths, for instance, to try to ensure diversity on the court. To the extent that the appointments process implies an ideological predilection, at a minimum, it is worth noting that almost all of the judges who serve on FISC and FISCR are Republican appointees. The rate of applications being granted, in conjunction with the in cam-era and ex parte nature of the proceedings, also raises questions about the extent to which FISC serves as an effective check on the executive branch. The lack of technical expertise of those on the court further introduces questions about the judges' ability to understand how the authorities they are extending to the NSA are being used.

Close to no FISC applications ever get denied

Donohue '14 – Professor of Law at Georgetown University (Laura K. Donohue, "Bulk Metadata Collection: Statutory and Constitutional Considerations", Georgetown University Law Center, 2014, http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2360&context=facpub)//MBB

Augmenting concerns prompted by the lack of diversity in terms of appointments to FISC and FISCR is the rather notable success rate the government enjoys in its applications to the court. Scholars have noted that the success rate is "unparalleled in any other American court."308 Over the first two and a half decades, for instance, FISC approved nearly every single appli- cation without any modification.309 Between 1979 and 2003, FISC denied only three out of 16,450 applications.310

Since 2003, FISC has ruled on 18,473 applications for electronic surveillance and physical search (2003–2008), and electronic sur- veillance (2009–2012).311 Court supporters note that a

significant number of these applications are either modified or withdrawn by the government prior to FISC ruling. But even here, the num- bers are quite low: 493 modifications still only comes to 2.6% of the total number of applications. Simultaneously, the govern- ment has only withdrawn twenty-six applications prior to FISC ruling.312 These numbers speak to the presence of informal pro- cesses, whereby FISC appears to be influencing the contours of applications. Without more information about the types of mod- ifications that are being required, however, it is impossible to gauge either the level of oversight or the extent to which FISC is altering the applications.

Critics also point to the risk of capture presented by in camera, ex parte proceedings, and note that out of 18,473 rulings, FISC has only denied eight in whole and three in part. Whatever the substantive effect might be, the presentational impact is of note.

Setting modifications aside for the moment, the deference that appears to exist regarding outright denials or granting of orders seems to extend to FISC rulings with regard to business records. Almost no attention, however, has been paid to this area. It appears that FISC has never denied an application for an order under this section. That is, of 751 applications since 2005, all 751 have been granted, as the following figure shows.

FISA allows incidental collection of data from US persons

Rinehart, 14 – Editor in Chief of the Maryland Law Review (Liz Clark Rinehart, "Clapper v. Amnesty International USA: Allowing the FISA Amendments Act of 2008 to Turn "Incidentally" into "Certainly"", Maryland Law Review, 5/1/2014, http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3638&context=mlr)//MBB

The Court found it notable that the plaintiffs were not in a class of people targeted by the statute,196 but the text of Section 1881a indicates Congress considered the statute would possibly affect U.S. persons.197 If, as it seems likely, the plaintiffs are individuals who are directly affected by the statute, they should have been permitted to assert standing without showing that the "choices [of independent third parties] have been or will be made in such manner as to produce causation and permit redressability of injury."198

The text of Section 1881a undoubtedly indicates that the overall focus of the statute is surveillance of "certain persons outside the United States,"199 but there is also language that implies, if not directly states, that U.S. persons like the plaintiffs were thought to be affected, although not targeted, by the law. The limitations provision of Section 1881a specifies that authorizations may not "intentionally target" U.S. persons living in the United States or abroad.200 Based on the term "intentionally," this provision appears to permit the acquisition of such communications if the acquisition occurs incidentally or accidentally. The targeting provision also requires that the government "prevent the intentional acquisition of any communication as to which the sender and all intended recipients are known at the time of the acquisition to be located in the United States."201 This language does not mean, however, that the targeting must prevent the intentional acquisition of communications between individuals located outside the United States and individuals located in the United States. This was the exact scenario facing the plaintiffs in Amnesty International.202

AT: Relevance standard

Relevance standard will be construed expansively to allow all circumvention

Donohue '14 – Professor of Law at Georgetown University (Laura K. Donohue, "Bulk Metadata Collection: Statutory and Constitutional Considerations", Georgetown University Law Center, 2014, http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2360&context=facpub)//MBB

Four legal arguments undermine the government's claim that there are "reasonable grounds" to believe that hundreds of millions of daily telephone records are "relevant" to an author- ized investigation. First, the NSA's interpretation of "relevant" collapses the statutory distinction between relevant and irrele- vant records, thus obviating the government's obligation to discriminate between the two. Second, this reading renders meaningless the qualifying phrases in the statute, such as "rea- sonable grounds." Third, the government's interpretation es- tablishes a concerning legal precedent. Fourth, the broad read- ing of "relevant" contravenes congressional intent.

First, in ordinary usage, something is understood as relevant to another thing when a demonstrably close connection be- tween the two objects can be established.351 This is also the way in which courts have consistently applied the term to the col- lection of information—as with grand-jury subpoenas, where the information collected must bear some actual connection to a particular investigation.352

In contrast, almost none of the information the government obtained under the bulk metadata collection program is de- monstrably linked to an authorized investigation. The govern- ment itself has admitted this. Writing to Representative James Sensenbrenner, Peter Kadzik, the Principal Deputy Assistant Attorney General, acknowledged, "most of the records in the dataset are not associated with terrorist activity."353 FISC Judge Reggie Walton drew the point more strongly:

The government's applications have all acknowledged that, of the [REDACTED] of call detail records NSA receives per day (currently over [REDACTED] per day), the vast majority of individual records that are being sought pertain neither to [REDACTED] . . . In other words, nearly all of the call detail records collected pertain to communications of non-U.S. persons who are not the subject of an FBI investigation to ob- tain foreign intelligence information, [and] are communica- tions of U.S. persons who are not the subject of an FBI inves- tigation to protect against international terrorism or clandestine intelligence activities.354

In other words, most of the information being collected does not relate to any individuals suspected of any wrongdoing.

In defense of its broad interpretation, the government argues that it must collect irrelevant information to ascertain what is relevant. This means that the NSA, in direct contravention of the statutory language, is collapsing the distinction between relevant and irrelevant records—a distinction that Congress required be made before collection. Because of this collapse, the NSA is

gaining an extraordinary amount of information. The records the government sought under the telephony metadata program detail the daily interactions of millions of Americans who are not themselves connected in any way to foreign pow-ers or agents thereof. They include private and public interac- tions between senators, between members of the House of Rep- resentatives, and between judges and their chambers, as well as information about state and local officials. They include par- ents communicating with their children's teachers, and zookeepers arranging for the care of animals. Metadata infor- mation from calls to rape hotlines, abortion clinics, and political party headquarters are likewise not exempt from collection— the NSA is collecting all telephony metadata.

Second, in addition to collapsing the distinction between rel- evant and irrelevant records, reading FISA to allow this type of collection would neuter the qualifying phrases contained in 50 U.S.C. § 1861(b)(2)(A). The statute requires, for instance, that there be "reasonable grounds" to believe that the records being sought are relevant.355 Although FISA does not define "reason- able grounds," the Supreme Court has treated this phrase as the equivalent of "reasonable suspicion."356 This standard re- quires a showing of "specific and articulable facts which, taken together with rational inferences from those facts, reasonably warrant" an intrusion on an individual's right to privacy.357

The FISC order requires that Verizon disclose all domestic tel- ephone records—including those of a purely local nature.358 Ac- cording to Verizon Communications News Center, as of last year the company had 107.7 million wireless customers, connect- ing an average of 1 billion calls per day.359 It is impossible that the government provided specific and articulable facts showing reasonable grounds for the relevance of each one of those cus-tomers or calls. Interpreting all records as relevant effectively renders the "reasonable grounds" requirement obsolete.

The statute does not explain precisely what makes a tangible item relevant to an authorized investigation. Nevertheless, the act suggests that tangible things are "presumptively relevant" when they:

[P]ertain to—(i) a foreign power or an agent of a foreign power; (ii) the activities of a suspected agent of a foreign power who is the subject of such authorized investigation; or (iii) an individual in contact with, or known to, a suspect- ed agent of a foreign power who is the subject of such au-thorized investigation.360

This section appears not to apply to the telephony metadata program. It would be impossible to establish that all customer and subscriber records pertain to a foreign power or an agent thereof, or to a particular, suspected agent of the same, who is the subject of an authorized investigation. Perhaps five or ten customers may fall into this category, but to include millions simply pushes the bounds of common sense. Accordingly, the telephony metadata are neither relevant nor presumptively relevant.

Third, the breadth of the government's interpretation estab- lishes a troubling precedent. If all telephony metadata are rele- vant to foreign intelligence investigations, then so are all e-mail metadata, all GPS metadata, all financial information, all bank- ing records, all social network participation, and all Internet use. Both the DOJ and FISC have suggested that there may be other programs in existence that operate in a similar fashion.361 Some media reports appear to support this. On September 28, 2013, for instance, the New York Times reported that the NSA "began allowing the analysis of phone call and email logs in November 2010 to begin examining Americans' networks of associations."362 If all telephony metadata are relevant, then so are all

other data—which means that very little would, in fact, be irrelevant to such investigations. If this is the case, then such an interpretation radically undermines not just the limiting language in the statute, but the very purpose for which Con- gress introduced FISA in the first place.

Fourth, the government's interpretation directly contradicts Congress's intent in adopting Section 215. At the introduction of the measure, Senator Arlen Specter explained that the lan- guage was meant to create an incentive for the government to use the authority only when it could demonstrate a connection to a particular suspected terrorist or spy.363 During a House Ju- diciary Committee meeting on July 17, 2013, Representative James Sensenbrenner (R-WI) reiterated that Congress inserted "relevant" into the statute to ensure that only information di- rectly related to national security probes would be included— not to authorize the ongoing collection of all phone calls placed and received by millions of Americans not suspected of any wrongdoing.364 Soon afterwards, he wrote:

This expansive characterization of relevance makes a mock- ery of the legal standard. According to the administration, everything is relevant provided something is relevant. Con- gress intended the standard to mean what it says: The rec- ords requested must be reasonably believed to be associated with international terrorism or spying. To argue otherwise renders the standard meaningless.365

Other members of Congress have made similar claims.366

Counterplans

Replace section 702

1nc – replace section 702

The United States federal government should repeal section 702 of the FISA Amendments Act and replace it with a requirement requiring an individualized court order for the interception of communications involving United States persons, allowing an exception solely if the primary purpose of federal surveillance is foreign intelligence gathering. This requirement should govern all federal surveillance.

It competes – the plan makes section 702 exclusive – the CP makes an individualized court order the exclusive precondition of surveillance

Patel and Goitein, 15 – *co-director of the Liberty and National Security Program at the Brennan Center for Justice AND ** co-directs the Brennan Center for Justice's Liberty and National Security Program (Faiza and Liza, "Fixing the FISA Court by Fixing FISA: A Response to Carrie Cordero" 4/8, Lawfare,

http://www.lawfareblog.com/fixing-fisa-court-fixing-fisa-response-carrie-cordero

That's why our report states that, "[w]ith the exception of e-mails stored in the United States, the new law had no impact on the government's ability to collect the communications of foreigners with other foreigners." Carrie is, of course, correct that Section 702 allows the government to obtain other types of foreign-to-foreign communications without a court order… but so did 1978 FISA, so Section 702 made no change there. The most significant change Section 702 made was to permit the acquisition of communications between foreign targets and U.S. persons without a court order. Carrie does not explain why this was necessary to allow the government to collect the communications of Terrorist A in Afghanistan with Terrorist B in Iraq.

Carrie also appears to interpret our recommendations as requiring a probable cause order whenever the government seeks to collect on a foreigner overseas. This isn't what we're proposing. Our recommendation is to **repeal Section 702** "and replace it with a regime requiring an individualized court order for the interception of communications involving U.S. persons."

We're aware that differentiating between U.S. persons and foreigners is currently more difficult for stored e-mails than for communications obtained in transit, where relevant information may be gleaned from packet headers. That may support a more nuanced and creative solution for that category of surveillance. But there's no conceivable reason why the solution should be programmatic acquisition of any type of communication sent by a foreign target.

That's the only viable mechanism to solve the case – they don't solve perception, the CP does

Nojeim, 14 - Director, Project on Freedom, Security & Technology at the Center for Democracy & Technology (Greg, "COMMENTS TO THE PRIVACY AND CIVIL LIBERTIES OVERSIGHT BOARD REGARDING REFORMS TO SURVEILLANCE CONDUCTED PURSUANT TO SECTION 702 OF FISA" 4/11)

The FISA provisions that govern intelligence surveillance of targets in the U.S. permit the government to engage in electronic surveillance to collect "foreign intelligence information." For purposes of surveillance that targets a non-U.S. person, it is defined broadly as: (1) information that relates to the ability of the U.S. to protect against a hostile attack, espionage, sabotage or international terrorism or proliferation of weapons of mass destruction; or (2) information with respect to a foreign territory or foreign power (a foreign government, political party, or entity controlled by a foreign government, or a foreign terrorist organization) that relates to the security of the U.S. or to the conduct of U.S. foreign affairs.4 When the government applies to the Foreign Intelligence Surveillance Court (FISC) for permission to conduct surveillance of targets in the U.S., it must certify that a significant purpose of the surveillance it will conduct is to collect foreign intelligence information.5

Because "foreign intelligence information" is defined so broadly, and because the FISC never actually rules on whether the significant purpose test is met, the purpose limitation that governs FISA surveillance of targets in the U.S. is easily met. FISA surveillance in the U.S. is instead effectively constrained by an additional requirement: the requirement that the government prove to the FISC that there is probable cause to believe the target of surveillance is a terrorist, spy, or other agent of a foreign power. Thus, Congress effectively constrained FISA surveillance of targets in the U.S. by permitting that surveillance to target only a narrow class of persons and entities.

For surveillance of people reasonably believed to be outside the U.S., Section 702 adopts the broad purpose requirement, but couples it with a broad class of surveillance targets. Section 702 is not constrained by the requirement that the target be an agent of a foreign power. Instead, the target need only be a non-U.S. person reasonably believed to be abroad. Effectively, Congress borrowed the broad purpose for FISA intelligence surveillance (collect "foreign intelligence information") and applied it to surveillance abroad without limiting the class of potential targets to "agents of a foreign power."

This has prompted concern globally that surveillance under Section 702 is broadly directed at individuals not suspected of wrongdoing, and could include targeting based at least in part on political activities. A peaceful protest at a U.S. base in Germany or a demonstration against rising food prices in India "relate to" U.S. foreign policy; non-U.S. persons involved in those protests could be monitored under Section 702. A 2012 cloud computing report to the European Parliament included a finding that under Section 702, it is lawful in the U.S. to conduct purely political surveillance on non-U.S. persons' data stored by U.S. cloud companies.6 Such actions raise serious human rights concerns. Further, **fear of the mere possibly** that this **overbroad surveillance** is occurring has **significantly damaged the U.S. tech industry abroad**.

The CP's a hard limit on the NSA – anything short of it creates easily exploitable loopholes

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015 //DM)

A. End Programmatic Surveillance

The most effective reform would be for Congress to **end programmatic surveillance**. This would entail expressly prohibiting bulk collection under Section 215 and similar provisions, as well as repealing Section 702 and replacing it with a regime **requiring an individualized court order for the interception of communications involving U.S. persons**, regardless of whether they are the identified target of the surveillance.

Ending programmatic surveillance would return the FISA Court to its traditional role of applying the law to the facts of a particular case.271 This would mitigate many of the Article III concerns relating to the absence of a case or controversy. If the standard for issuing a surveillance order were sufficiently strict (discussed below), ending programmatic surveillance could address Fourth Amendment objections as well.

But these changes would not fully cement the constitutional status of the FISA Court's activities. FISA orders will never look entirely like criminal warrants because they rarely culminate in criminal prosecutions, thus removing the primary vehicle for challenging their legitimacy. Concerns about the lack of adversarial process thus would remain even if programmatic surveillance were replaced with an individualized regime. To address them, the reforms listed in the next section would be needed.

B. Enact Additional Article III-Related Reforms

1. Introduce Adversarial Processes

Several existing reform proposals would address the lack of a party opposing the government in FISA Court proceedings by establishing a permanent public interest advocate (or slate of advocates) to represent the interests of people affected by government surveillance.272 President Obama and two former judges of the court publicly support the appointment of such an attorney, commonly referred to as the "Special Advocate."273 An alternative approach would allow the FISA Court to hear from certain individuals or interest groups as amici curiae.274 The court could call upon these outside representatives to weigh in on potential privacy and civil liberties concerns raised by a government application.275

The latter approach would not resolve the Article III problem, particularly if participation were left to the court to decide. The FISA Court already has discretion to solicit or permit amicus participation, and with few exceptions, has preferred to rely on the government's submissions alone.276 Article III would be best served by strengthening the special advocate concept to the greatest extent possible, including by ensuring that special advocates are notified of cases pending

before the court, have the right to intervene in cases of their choosing, and are given access to all materials relevant to the controversy in which they are intervening.

In addition, there must be a mechanism for appeal in cases where the court rules against the special advocate. Legitimate questions arise as to whether a special advocate would have standing to bring an appeal, given the advocate's lack of a personal stake in the outcome.277 Various solutions to this problem have been proposed: for example, the special advocate could serve as a guardian ad litem for third parties affected by the surveillance (such as those incidentally in communication with the target), or the court could be required to certify particular types of decisions to the FISA Appeals Court for review.278 The standing problem, while real, is not insurmountable.

2. Increase Transparency and Facilitate Collateral Challenges

A defining feature of the FISA Court is that nearly all of its decisions are classified. This hampers democratic self-government and sound policymaking. It also has Article III implications: secret decisions cannot be challenged, and the opportunity to challenge a FISA Court order in collateral proceedings is critical to the legitimacy of the process. A number of existing proposals would introduce some transparency by requiring the executive branch to release full copies, redacted versions, or summaries of FISA Court opinions containing significant legal opinions.279 For both constitutional and policy reasons, Congress should establish a non-waiveable requirement that the government issue public versions of FISA Court opinions or summaries containing certain minimum information — including the legal questions addressed, as well as the construction or interpretation given to any legal authority on which the decision relies.

Transparency alone cannot address the Article III defects in the FISA Court. Congress also must facilitate collateral challenges. One key step would be to prohibit the practice of "parallel construction," in which the government builds a criminal case based on FISA-derived evidence but then reconstructs the evidence using other means. This allows the government to avoid notifying defendants of the FISA surveillance and thus makes it impossible for them to challenge it. Any time the government uses the tools of FISA as part of an investigation, the subject of any resulting legal proceedings should be notified, and should be entitled to challenge any evidence that resulted either directly or indirectly from that surveillance.

The special procedures governing a defendant's access to FISA application materials, under which a defendant is almost never given any hint of their contents, should be jettisoned. Instead, the process under the Classified Information Procedures Act (CIPA)280 — which has been used successfully in the most sensitive national security and espionage cases, and which allows the government to use summaries or admissions of fact in place of classified information — should apply.281

Finally, the government's attempt to shut down every civil lawsuit that has been brought to challenge the constitutionality of foreign intelligence surveillance must end. Even where plaintiffs have had reasonable grounds to fear that they were being surveilled282 — indeed, even where they have had irrefutable proof283 — the government has tried to have the lawsuit dismissed, arguing that the plaintiffs lacked evidence or that the evidence contained state secrets. Today, after Snowden's disclosures, many secret programs are public knowledge and dismissing plaintiffs' fears of surveillance as "speculative" is increasingly disingenuous. Moreover, warrantless surveillance is no longer a secret, it is the law — and, given the broad scope of collection, acknowledging that a plaintiff has standing to challenge FISA surveillance does not

reveal the identity of any investigation's target. If ever the government's jurisdictional and national security defenses had merit, they no longer do.

C. Enact Additional Fourth Amendment-Related Reforms

Restoring the requirement that the government obtain individualized court orders before conducting surveillance does not end the Fourth Amendment analysis. The question of what standards the court should apply in issuing these orders remains. Even if the Supreme Court were to hold that acquiring foreign intelligence is a special need and that the government need not demonstrate probable cause of criminal activity, longstanding precedent suggests that the collection of foreign intelligence must adhere to the following standards and procedures.

1. Restore the "Foreign Power/Agent of a Foreign Power" Requirement

The government should be permitted to conduct surveillance in the United States only when it can show probable cause that the target is a foreign power or its agent. This would reinstate the standard contained in original FISA. It also would track the holding of Truong and other courts that sought to limit the universe of individuals whose communications may be captured under the foreign intelligence exception. The terms "foreign power" and "agent of a foreign power" are quite broadly defined, including terrorist groups and other non-state actors. They are thus expansive enough to accommodate the government's legitimate security interests, while enhancing protection for U.S. persons (and the foreigners with whom they communicate).

2. Narrow the Definition of "Foreign Intelligence Information"

The definition of "foreign intelligence information" in FISA should be narrowed. The courts of appeal have admonished that the foreign intelligence exception must be narrowly construed and reserved for matters in which the executive branch's interests are of the most compelling nature. Yet, in addition to information necessary to protect against foreign attack, terrorism, or espionage, the current definition includes information relevant to (or, in the case of a U.S. person, necessary to) "the security of the United States" and "the conduct of the foreign affairs of the United States." A general interest in obtaining any information that "relates to" these vague areas cannot justify the massive intrusion on privacy and First Amendment rights implicated by the warrantless acquisition of Americans' international communications. The definition of "foreign intelligence information" could usefully be narrowed to information relating to external threats — including "actual or potential attacks or other grave hostile acts," "sabotage," "international terrorism," "the international proliferation of weapons of mass destruction," and "clandestine intelligence activities." 284 These are the specific threats currently listed in FISA's statutory definition, minus the overbroad catch-all language regarding security and foreign affairs.

Another option is to rely on the restrictions that President Obama recently placed on the permissible uses of signals intelligence information collected abroad in bulk. Presidential Policy Directive 28, issued on January 17, 2014, states that such information shall be used

only for the purposes of detecting and countering: (1) espionage and other threats and activities directed by foreign powers or their intelligence services against the United States and its interests; (2) threats to the United States and its interests from terrorism; (3) threats to the United States and its interests from the development, possession, proliferation, or use of weapons of mass destruction; (4) cybersecurity threats; (5) threats to U.S. or allied Armed Forces or other U.S or

allied personnel; and (6) transnational criminal threats, including illicit finance and sanctions evasion related to the other purposes named in this section.285

The surveillance activities governed by this Directive are subject to fewer domestic legal constraints than any other type of communications surveillance. The fact that the above restrictions are considered appropriate in a context where the president has maximum discretion strongly suggests that imposing the same limits in the context of Section 702 collection would not unduly restrict the government's intelligence gathering. More fundamentally, defining "foreign intelligence information" as information relating to the above-listed threats would honor the principle that any foreign intelligence exception should be limited to instances in which the government's interests are paramount.286

3. Restore the "Primary Purpose" Test

Congress should amend FISA to require that obtaining foreign intelligence information be the primary purpose of surveillance. Other than the FISA Appeals Court, the courts that have recognized a foreign intelligence exception have generally imposed such a "primary purpose" requirement. As these courts have recognized, surveillance that is primarily for law enforcement purposes must take place pursuant to a regular criminal warrant, lest the foreign intelligence exception drive a massive hole through the protections of the Fourth Amendment.

The FISA Court also must be empowered to review whether there are truly foreign intelligence considerations at stake, and whether acquiring foreign intelligence is the primary purpose of surveillance. Courts of appeal have emphasized the need for close scrutiny on this point, noting that "judges must microscopically examine the wiretaps in order to determine whether they had their origin in foreign intelligence," and that warrantless wiretaps should be upheld only when "the foreign and sensitive nature of the government surveillance is crystal clear."287

Congress should accordingly strengthen the certification requirement. It should direct the executive branch to certify, not merely that its primary purpose is to acquire foreign intelligence information, but that the requested surveillance is reasonably likely to produce such information. It also should authorize the court to review this certification not only for proper form (as is currently the case), but for its substance as well. And it should prohibit the practice of "back door searches," which gives the government an easy end-run around the foreign intelligence purpose requirement as well as the requirement of targeting foreigners overseas.

Section 702 is overbroad – can't solve reputational costs without curtailing surveillance

Nojeim, 14 - Director, Project on Freedom, Security & Technology at the Center for Democracy & Technology (Greg, "COMMENTS TO THE PRIVACY AND CIVIL LIBERTIES OVERSIGHT BOARD REGARDING REFORMS TO SURVEILLANCE CONDUCTED PURSUANT TO SECTION 702 OF FISA" 4/11)

Section 702 permits the government to compel communications service providers to assist with intelligence surveillance that targets non-U.S. persons (persons other than U.S. citizens and lawful permanent residents) reasonably believed to be abroad. Though it is defended as a necessary counterterrorism and national security power, Section 702 broadly authorizes collection, retention, and use of communications content unnecessary for national security and

unrelated to counterterrorism. The overbroad use of Section 702 infringes upon the privacy rights of both U.S. persons, and of non-U.S. persons abroad, has already caused some damage to the American tech industry globally, and could cause much more.3

There's no functional difference between the FAA and XO12333 – both allow bulk collection and sweep up volumes of US person data

Vladeck 15 - professor of law at American University Washington College of Law (Steven "Forget the Patriot Act – Here Are the Privacy Violations You Should Be Worried About", Foreign Policy, 06/01/15, http://foreignpolicy.com/2015/06/01/section-215-patriot-act-expires-surveillance-continues-fisa-court-metadata/)//GK

But whatever the merits of the competing sides in this debate, the larger problem is that this conversation has missed the forest for a very small — and largely irrelevant — tree. In fact, from the perspective of individual privacy rights, the phone records program is much less problematic than the government's other authorities to conduct mass surveillance under Executive Order 12333 and the 2008 FISA Amendments Act. And so, in focusing on how to "fix" Section 215, we've given short shrift to the far more significant problems raised by these other authorities — and, just as importantly, the broader lessons we should be taking away from the surveillance reform conversation that Snowden started. To understand the significance of these other authorities, it'll help to describe their aims: Executive Order 12333, issued in 1981, is directed at the overseas interception of communications — both metadata and content — of non-citizens outside the United States, who, under a 1990 Supreme Court decision, categorically lack Fourth Amendment rights. The 2008 FISA Amendments Act was enacted to close a loophole that new technology had helped to create, where non-citizens outside the United States were nevertheless communicating through servers or other telecommunications infrastructure located stateside, which the government could not surveil under the executive order. Ordinarily, the government needs a warrant before collecting the content of domestic communications, one based upon a judge's determination that there's good reason to believe a particular individual either is engaged in the commission of a crime or is an agent of a foreign power. But Executive Order 12333 and the 2008 FISA statute, by focusing on individuals who fall outside the Fourth Amendment, capitalize on the lack of constitutionally required individualized assessments and instead allow the government to engage in bulk collection of such information — as if it were using an industrial vacuum cleaner to pick up individual particles of dirt.

The lack of an adversarial process means FISC is an echo chamber reflecting government surveillance priorities

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, p.30//DM)

Today, under Section 702 of the FAA, the court is no longer tasked with assessing the sufficiency of the government's factual showing in individual cases that arise within a limited pool. Instead, it reviews broad targeting and minimization procedures that the government will apply to tens of thousands of cases involving hundreds of millions of communications, if not more, each year.178 The court then approves or rejects the procedures based on a facial analysis of whether they comport with the statute and the Fourth Amendment. Similarly, under Section 215, the FISA Court has endorsed a form of "programmatic surveillance" in which it may approve procedures for obtaining and searching telephone records without reviewing individual searches (although it currently reviews these searches pursuant to the administration's request).179

These developments, compounded by the secrecy and lack of adversarial process that mark the court's proceedings, have critical implications for the constitutional legitimacy of the court. Lack of adversary process in a proceeding that bears no relationship to a traditional warrant application is inconsistent with Article III. Moreover, the court's facial review of agency procedures cannot shed light on their constitutionality in specific cases.

1. Lack of Adversarial Process

Article III of the Constitution generally requires the presence in court of opposing parties, because its "case or controversy" requirement "confines the business of federal courts to questions presented in an adversary context."180 Warrant proceedings are an exception to this rule. The FISA Court's shift from issuing individualized, warrant-like orders to approving programmatic surveillance renders the lack of an opposing party in its proceedings, which was a "difficult question" for the Department of Justice even under the original 1978 FISA procedure,181 impossible to defend — and highly problematic. As discussed, at the time FISA was passed, the Justice Department sought to address concerns about the lack of an opposing party in FISA Court proceedings. Even though the procedure for obtaining a surveillance order did not involve adverse parties, the Justice Department argued that there was "adversity in fact" because "the interests of the United States and the target will inevitably be adverse to each other. The United States' interest is to institute electronic surveillance of a particular target. The interest of the target would, presumably, be that the surveillance not be conducted."182 The Department emphasized the similarity of these features to traditional warrant proceedings, and concluded: "It is obvious . . . that we rely heavily on the analogy to warrant proceedings to uphold the validity of the [FISA] proceeding."183

Under Section 702, that analogy disappears. There is no such thing as a criminal warrant proceeding in which a law enforcement agency seeks blanket authorization to conduct an unlimited number of searches over the coming year, on the basis of written procedures setting forth generic rules for how such searches will be conducted. While ex parte proceedings are a standard feature in warrant applications, they are not standard when courts review rules and procedures that affect millions of people. As stated by Judge James Robertson, who served on the FISA Court from 2002 to 2005, the FISA Court's role in programmatic surveillance "is not adjudication, it is approval."184 The approval process, he noted, "works just fine when [the court] deals with individual applications for surveillance warrants," but when courts are asked to review policy determinations for compliance with the law, "they do so in the context . . . of adversary process."185 By requiring the FISA Court to review and approve entire surveillance programs ex parte, the FAA "turned the FISA Court into something like an administrative agency which makes and approves rules for others to follow."186

Section 215, at first blush, appears much closer to the kind of warrant proceeding that has traditionally taken place with only one party present because it seems to preserve individualized review in which particular opposing interests are identifiable. But this apparent similarity is negated by the FISA Court's decision that the government may collect essentially all phone records to search for relevant records buried within them.187 This program, too, now involves judicial approval, without any adversarial process, of the broad contours of a program affecting much of the American population — a situation that cannot be squared with the requirements of Article III.188

In addition to being constitutionally suspect, secret, non-adversarial proceedings are a bad way to make law. The shortcomings are starkly illustrated by the FISA Court's approval of bulk collection. The question the court considered in 2006 — whether collecting the phone records of millions of admittedly innocent Americans comports with the Constitution and the Patriot Act — was one of first impression and overriding legal importance. Yet all of the evidence and all of the briefs were submitted by one party: the government. Despite the gravity of the issue, the FISA Court did not exercise its authority to solicit participation by amici curiae — knowledgeable outside parties who serve as "friends of the court." Instead, it granted the government's request without even a written opinion (although one was produced after Edward Snowden's disclosures in 2013).189

The adversarial system does more than assure the due process rights of the parties. It ensures that all relevant facts and legal arguments are aired, which in turn enables the tribunal to reach an accurate decision. FISA Court judges are more likely to misinterpret the law if they hear only one side of the case. As the Supreme Court stated in a different context:

[T]he need for adversary inquiry is increased by the complexity of the issues presented for adjudication. . . . Adversary proceedings will not magically eliminate all error, but they will substantially reduce its incidence by guarding against the possibility that the trial judge, through lack of time or unfamiliarity with the information contained in and suggested by the materials, will be unable to provide the scrutiny which the Fourth Amendment exclusionary rule demands.190

Of course, it is well understood that judges make mistakes; that is why the federal judicial system has two levels of appeal. Indeed, the Supreme Court often waits for multiple lower courts to address an issue before taking it up. This process of assessing, comparing, and honing decisions across jurisdictions and levels of review make it more likely that the judicial system as a whole will get to the "right" result. In the FISA context, however, there is no opportunity to appeal an erroneous grant of an application, because the government is generally the only party.

Operating in their own **echo chamber**, and hearing from only one party, the chances that FISA Court judges will misinterpret the law — and perpetuate that misinterpretation in subsequent decisions — is high. When such misinterpretations involve fundamental questions of constitutional law that affect all Americans, the error is anything but harmless.

The FAA's primary purpose was to facilitate the capture of communications about Americans

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director

of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, //DM)

The FAA, which is still in place today, eliminated the requirement of an individual court order for acquisition, within the United States, of communications to which U.S. persons are a party. Instead, under a new section of FISA (Section 702) created by the FAA, the government may conduct a program to collect any communications "targeting" a person or entity reasonably believed to be a non-U.S. person overseas — including that person or entity's communications with Americans in the United States.162 In other words, the government no longer needs an individualized court order to acquire Americans' international calls and e-mails, as long as the American is not the "target" of the surveillance.

There are three primary limitations on this authority. First, the government must certify that obtaining foreign intelligence information is a "significant purpose" of the collection. It need not be the only purpose or even the main purpose, as discussed above;163 moreover, the certification of purpose applies to the program as a whole, not to each target of surveillance under the program. Second, the government must have in place targeting and minimization procedures that are approved by the FISA Court. The targeting procedures must ensure that the program's targets are indeed "reasonably believed" to be foreigners overseas, while the minimization procedures must be "reasonably designed" to minimize the collection and retention — and prohibit the sharing — of Americans' information, "consistent with the need of the United States to obtain, produce, and disseminate foreign intelligence information."164 Third, the law prohibits the government from engaging in "reverse targeting" — i.e., collecting the international communications of a foreigner abroad when the government's true motive is to target "a particular, known person reasonably believed to be in the United States."165

The existence of targeting and minimization requirements, as well as a reverse targeting prohibition, has enabled the government to portray Section 702 as a program designed to capture the communications of non-U.S. persons abroad. Any collection of calls to or from Americans is described as "incidental."166 This characterization is highly questionable. With the exception of e-mails stored in the United States, the new law had no impact on the government's ability to collect the communications of foreigners with other foreigners. The sea change that the statute brought about was the elimination of a court order requirement for the domestic capture of foreigners' communications with Americans. The legislative history makes clear that facilitating the capture of communications **to, from, or about U.S. persons** was a primary purpose, if not the **primary purpose, of the FAA**.167

Moreover, the new law dramatically widened the pool of foreigners the government can target. Instead of being limited to targeting foreign powers or agents of a foreign power, the government is permitted to target any non-U.S. person overseas, as long as one of its goals is the acquisition of foreign intelligence. As noted above, the statute's definition of "foreign intelligence information" is exceedingly broad when a foreign person is the target, encompassing any information that "relates to" the conduct of foreign affairs or the country's security.173 Programmatic surveillance under the FAA thus could include the international communications (including communications with Americans) of almost any non-U.S. person overseas. Of course, the greater the number of foreigners who can be targeted, the greater the number of Americans whose international communications are likely to be caught up in surveillance operations.

The court's own role in approving government surveillance changed even more fundamentally. Previously, the court determined, on a case-by-case basis, whether the government had probable cause to believe that (1) the proposed target of surveillance was a foreign power or agent of a foreign power, and (2) each of the specified facilities or places for surveillance were being used, or were about to be used, by a foreign power or an agent of a foreign power. The court also approved minimization requirements based on their sufficiency in the particular case before it. If the target was a U.S. person, the court reviewed the government's certifications — including the certification of a significant foreign intelligence purpose — to ensure that they were not "clearly erroneous."

Under Section 702, by contrast, the court has no role in approving individual intrusions at all. Rather, its substantive role is limited to determining whether generic sets of targeting and minimization procedures comply with the statute (which gives little direction as to what is required) and with the Fourth Amendment.174 The court is not even informed of the specific targets of surveillance or the facilities to be surveilled, let alone asked to approve them. And the court may not review the substance of the government's certifications, including its certification of a significant foreign intelligence purpose, even for "clear error."175

Lack of notice, standing requirements and parallel construction prevent challenging FISA rulings

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, p.34//DM)

In theory, there are three ways in which surveillance of particular targets may be challenged in an adversary setting: targets may file civil claims; they may contest the surveillance in the course of legal proceedings; and communications service providers who receive FISA orders may petition the FISA Court to set them aside. In practice, however, none of these options provides a meaningful opportunity to challenge surveillance.

The lack of notice to targets of FISA surveillance effectively negates any civil remedies, including FISA's provision allowing "aggrieved person[s] . . . who [have] been subjected to an electronic surveillance" to sue for damages if the law has been violated.202 Plaintiffs who have attempted to file civil suits have been rebuffed by courts on the ground that they cannot establish standing without proving that they were targets of surveillance.203

If FISA-derived evidence is used in a criminal prosecution or other legal proceeding against a subject of surveillance, the law requires the government to notify that person of this fact and allows him to file a motion to suppress the evidence.204 However, the vast majority of foreign intelligence collected under FISA will never find its way into a legal proceeding.205 Moreover, in recent years the government has honored the notification requirement in the breach,206 sometimes using "parallel construction" — that is, developing the same evidence through different means to avoid notification.207

Even when notification is provided, the subject of surveillance has never been permitted to view the materials comprising the surveillance application, which renders any challenge an exercise in

shadow-boxing.208 Without the informed participation of counsel, judicial review in these proceedings is in many ways a mere repetition of the ex parte review conducted by the FISA Court when it issued the surveillance order — even though the initiation of legal proceedings often means the consequences of error have become far greater, particularly in criminal cases where the defendant's liberty is at stake.

In 2006 and 2008, Congress amended FISA to allow telecommunications companies that are the recipients of certain FISA orders to challenge them.209 But these companies have no obligation to act in the interest of those directly affected by the surveillance, namely, the targets. The insufficiency of this mechanism is underscored by the fact that no company has ever challenged a court order to produce phone records under the NSA's bulk collection program,210 and only one company challenged programmatic surveillance under the predecessor to the FAA.211

702 shoehorns in billions of domestic communications for surveillance

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, p.41-42//DM)

As enacted in 1978, FISA required the government to show probable cause that the target of surveillance was a foreign power or an agent of a foreign power. The FAA eliminated this requirement for programmatic surveillance. The target of surveillance may be any non-U.S. person or entity located overseas, and the FISA Court has interpreted the law to allow the government to obtain any communications to, from, or about the target.258 The only limitation is a requirement that the government certify that a significant purpose is the collection of "foreign intelligence."

Consider how these changes could operate in practice. As noted in Part II.C.2, "foreign intelligence information," where non-U.S. persons are concerned, is broadly defined to include information "that relates to . . . (A) the national defense or the security of the United States; or (B) the conduct of the foreign affairs of the United States."259 This elastic concept is unlikely to impose any meaningful restraint — particularly since the FISA Court is not allowed to probe the government's foreign intelligence certification.260 The only real limitation on surveillance, then, is the target's nationality and location.

Given the prevalence of international communication today, the government could **shoehorn** literally **billions** of communications (including communications with Americans) into a warrantless foreign intelligence collection framework, as long as there is a chance that the net will pull in some information relating to security or foreign affairs. This is plainly inconsistent with the admonition of most courts that warrantless foreign intelligence surveillance must be "carefully limited" to "those situations in which the interests of the executive are paramount."261

In a 2008 opinion approving Section 702 targeting and minimization procedures, the FISA Court held that limiting the foreign intelligence exception to foreign powers or their agents is unnecessary when the target is a non-citizen overseas.262 This ruling ignores the fact that Section

702 is **designed** to capture communications involving U.S. persons, and **expressly contemplates that U.S. person information may be kept and shared** where minimization would be inconsistent with "the need of the United States to obtain, produce, and disseminate foreign intelligence information."263 **Regardless of who is labeled the "target,"** Section 702 involves the acquisition and use of Americans' information for foreign intelligence purposes, in volumes that likely far exceed the collection in Truong and similar cases. The need to construe the exception narrowly is thus at least as important in the Section 702 context.

702 is the justification for widespread squo domestic surveillance

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, //DM)

It is no exaggeration to say that the world of electronic surveillance looks entirely different today than it did in 1978 when the FISA Court was established to oversee foreign intelligence surveillance. Communications technology and the legal framework have fundamentally changed, vastly increasing the nature and quantity of information the government may collect — and decreasing the court's role in supervising these operations.

Although the Supreme Court in Keith attempted to distinguish between surveillance of domestic organizations and surveillance of foreign powers, the demarcation was never clean and has become ever more strained. Advances in technology mean that the exercise of authorities aimed at foreigners abroad inevitably picks up swaths of information about Americans who should enjoy constitutional protections. But rather than develop additional safeguards for this information, the law has developed in the opposite direction: the government's authority to collect communications pursuant to its foreign intelligence-gathering authorities has expanded significantly. At the same time, the safeguard of judicial review — already limited when FISA was first enacted in 1978 — **has eroded to near-nothingness**. Indeed, in some cases, the role played by the FISA Court is so different from the normal function of a court that it likely violates the Constitution's separation of powers among the legislative, executive, and judicial branches.

A. A Revolution in Communications Technology

The impact of advances in communications technology over the last decades cannot be overstated. In 1978, most domestic telephone calls were carried over copper wires,102 while most international calls took place via satellite.103 To listen to a domestic call, the government had to identify the wire that geographically connected the two ends of a communication and manually tap into it.104 Capturing a satellite communication to or from a particular source required sophisticated equipment; resulting databases were subject to practical limitations on storage and analytical capability.105 Cellular phones were not commercially available,106 and the Internet existed only as a Department of Defense prototype.107 Surveillance generally had to occur in real time, as electronic communications were ephemeral and unlike later forms of communication (like e-mail) were not usually stored.

Today, a large proportion of communications — including e-mails and international phone calls — are transmitted by breaking down information into digital packets and sending them via a worldwide network of fiber-optic cables and interconnected computers.108 The government can access these communications by tapping directly into the cables or into the stations where packets of data are sorted.109 Digital information often is stored for long periods of time on servers that are owned by private third parties, giving the government another way to obtain information, as well as access to a trove of historical data. Most cell phone calls, along with other forms of wireless communication, travel by radio signals that are easily intercepted.

These changes have weakened the relationship between the place where communications are intercepted and the location (and nationality) of the communicants. For communications that travel wholly or in part via packets, each packet may follow a different route, and the route may be unrelated to the locations of the sender or recipient. An e-mail from a mother located in San Diego to her daughter in New York could travel through Paris, and the contents might be stored by an online service provider in Japan. But FISA, as enacted in 1978, is keyed to the location and nationality of the target and the location of acquisition. As discussed further in Part II.B.3.a, the globalization of the communications infrastructure has changed the way the law plays out in practice.110

Technological changes also have expanded the amount of information about Americans the government can acquire under FISA. For one thing, globalization and advances in communications technology have vastly increased the volume — and changed the nature — of international communications. The cost and technological difficulties associated with placing international calls during the era of FISA's passage meant that such calls were relatively rare. In 1980, the average American spent less than 13 minutes a year on international calls.111 Today, the number is closer to four and a half hours per person — a thirty-fold increase.112 That number does not include the many hours of Skype, FaceTime, and other Internet-based voice and video communications logged by Americans communicating with family, friends, or business associates overseas. And, of course, the advent of e-mail has removed any barriers to international communication that may have remained in the telephone context, such as multi-hour time differences. Worldwide e-mail traffic has reached staggering levels: in 2013, more than 182.9 billion e-mails were sent or received daily.113 As international communication has become easier and less costly, the content of communications is much more likely to encompass — and, in combination, to create a wide-ranging picture of — the intimate details of communicants' day-to-day lives.

Technology and globalization also have led to much greater mobility, which in turn has generated a greater need to communicate internationally. Foreign-born individuals comprised around 6 percent of the U.S. population when FISA was enacted but account for more than 13 percent today.114 Immigrants often have family members and friends in their countries of origin with whom they continue to communicate. Similarly, there has been a sharp increase in Americans living, working, or traveling abroad, creating professional or personal ties that generate ongoing communication with non-citizens overseas. The number of Americans who live abroad is nearly four times higher than it was in 1978 and the number of Americans who travel abroad annually is nearly three times higher.115 The number of American students who study abroad each year has more than tripled in the past two decades alone.116 These trends show no signs of abating, suggesting that the volume of international communications will only continue to expand.

In addition, technological changes have made it likely that government attempts to acquire international communications will pull in significant numbers of wholly domestic communications for which Congress intended the government to obtain a regular warrant rather than proceeding under FISA. For instance, a recently declassified FISA Court decision shows that when the NSA taps into fiberoptic cables, it pulls in some bundles of data that include multiple communications — including communications that may not involve the target of surveillance. The NSA claims that it is "generally incapable" of identifying and filtering out such data bundles.117 The result is that the agency routinely collects large numbers of communications — including "tens of thousands of **wholly domestic communications**" between U.S. persons — that are neither to, from, or about the actual "target."118

For all of these reasons, the collection of foreign intelligence surveillance today involves Americans' communications at a volume and sensitivity level Congress never imagined when it enacted FISA. If the government wished to acquire the communications of a non-citizen overseas in 1978, any collection of exchanges involving Americans could plausibly be described as "incidental." Today, with international communication being a daily fact of life for large numbers of Americans, the collection of their calls and e-mails in vast numbers is an inevitable consequence of surveillance directed at a non-citizen overseas. The volume of information collected on U.S. persons makes it difficult to characterize existing foreign intelligence programs as focused solely on foreigners and thus exempt from ordinary Fourth Amendment constraints.

Section 702 violates the 4th amendment – causes systematic domestic surveillance and creates a back door around the warrant requirement

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, p.38-39//DM)

Even if the collection of foreign intelligence is recognized as a "special need" that justifies surveillance without a traditional warrant, the government still must meet the second prong of the Fourth Amendment: the particular surveillance scheme must be "reasonable."

In Camara, the Supreme Court recognized fire safety as a special need, but it did not simply give the government free rein to search buildings at will. Instead, it required inspectors to obtain court orders based on factors relevant to fire safety, such as the age and nature of the building and the condition of the general area. Individualized orders still had to be obtained before the search, but the standards were altered to match the special need.235 A similar arrangement may be required for foreign intelligence. As Fourth Amendment expert Professor Orin Kerr has noted: "[T]here is a plausible case to be made that foreign intelligence is a special need, but that [individualized] FISA warrants are still required to conduct foreign intelligence surveillance."236

Limits on the discretion vested in government officials are key to establishing the reasonableness of a special needs scheme. For example, even though the Court on several occasions has authorized checkpoints to assess motorists' sobriety or examine their license and car registration, it has refused to allow roving stops because they allow too much discretion on the part of

government officials.237 The Court has emphasized that meeting the reasonableness standard of the Fourth Amendment requires "at a minimum, that the facts upon which an intrusion is based be capable of measurement against 'an objective standard,' whether this be probable cause or a less stringent test."238 This focus stems from the Court's concern about the potential for abuse of discretion; limiting this potential is a fundamental purpose of requiring a warrant under the Fourth Amendment.

As explored in the text box on page 33, the Section 702 program contains few limits on the discretion of analysts in deciding whether an individual is a non-U.S. person located overseas and therefore a valid target for programmatic surveillance. The NSA's targeting procedures set forth several considerations that officials may consider, but ultimately allow the NSA to reach a conclusion based on "the totality of the circumstances." The government has even more discretion in deciding what information is fair game: the statutory definition of foreign intelligence information is open-ended, and, under Section 702, the court cannot review the substance of the government's certification of a foreign intelligence purpose. It is difficult to square these features of programmatic surveillance with the type of "objective standards" that the Supreme Court has insisted on in the special needs context.

Moreover, even if the NSA's targeting and collection met the reasonableness test, the entire program cannot be deemed reasonable unless the government adequately "minimizes" the retention and use of information about U.S. persons that gets pulled in along with information about the foreign target. The FISA Court explicitly recognized this point when it found that the NSA violated the Fourth Amendment by failing to mark and delete wholly domestic e-mails acquired incidentally.239 Although the NSA remedied this violation to the court's satisfaction, its minimization regime remains notably lax. U.S. person information may be retained for 5 years, and there are multiple loopholes allowing for longerterm retention — including a provision for the indefinite retention of encrypted communications.240 As weak as the minimization rules are, reports suggest that they nonetheless are honored in the breach, with analysts claiming that they must retain seemingly irrelevant information about U.S. persons because the information may prove relevant in the future.241

A particularly stark affront to the principle of minimization is the practice known as "back-door searches." To obtain an order from the FISA Court authorizing programmatic collection, the government must certify that its interest lies in foreigners overseas and not any U.S. persons with whom they may be in contact. The law prohibits "reverse targeting," in which the government targets a foreigner as a pretext to gain information about a particular, known U.S. person.242 Consistent with these directives, the minimization procedures governing programmatic surveillance originally barred the government from using U.S. person identifiers to search the pool of communications obtained under Section 702.243 In 2011, the FISA Court granted the government's request to lift this bar.244 Today, officials routinely search through Section 702 data for information about the very U.S. persons the government certified it was not targeting.245

This practice allows the government to dispense with the much stricter substantive and procedural requirements that Congress put in place for obtaining foreign intelligence on an American target.246 It also allows the FBI to shrug off the Fourth Amendment when conducting domestic criminal investigations. The FBI performs searches of databases containing Section 702 data whenever it opens an investigation or an "assessment"247 — a type of investigation in which agents do not have a factual predicate to suspect criminal activity, let alone probable cause.248 Although the FISA Court has blessed back-door searches, it is difficult to see how a program that

allows domestic law enforcement officers to listen to Americans' calls and read their e-mails without any fact-based suspicion of wrongdoing can be squared with the constitutional test of "reasonableness."

AT: Minimization requirements solve

702 minimization requirements still allow the government to conduct unwarranted surveillance of U.S. persons

Rotenberg, EPIC President and Executive Director, 6-16-15 [Electronic privacy information center, non-profit research and educational organization established in 1994 to focus

public attention on emerging privacy and civil liberties issues.12 We work with a distinguished panel of advisors in the fields of law, technology and public policy., COMMENTS OF THE ELECTRONIC PRIVACY INFORMATION CENTER, file:///C:/Users/Jonah/Downloads/EPIC-12333-PCLOB-Comments-FINAL.pdf] Schloss2

Use of USP data inadvertently collected under EO 12333 in criminal matters and without a warrant violates American's constitutional rights. EPIC Advisory Board member and national security law expert Laura Donohue analogously describes how under Section 702, "NSA's minimization procedures place a duty on the NSA to turn over any information regarding the commission of a crime to law enforcement agencies," and "used against them in a court of law, without law enforcement ever satisfying Title III requirements."161 Professor Donohue cautions that, "query of databases using U.S. person identifiers may further implicate U.S. persons in criminal activity—even acts unrelated to national security. But no individualized judicial process is required."162 The broad dissemination procedure under EO 12333 similarly "falls outside of constitutional boundaries."163

As the Chief Justice recently explained, "the Fourth Amendment was the founding generation's response to the reviled 'general warrants' and 'writs of assistance' of the colonial era, which allowed British officers to rummage through homes in an unrestrained search of evidence of criminal activity."164 Broad dissemination procedures that fail to follow strict rules violates American's constitutional rights, and broad goals set out by Congress in the Privacy Act.

AT: CP links to terrorism – top level

702 not key to terror – other claims lack data

Bergen et al, 14 – a Professor of Practice at Arizona State University and a fellow at Fordham University's Center on National Security (Peter Bergen, David Sterman, Emily Schneider, and Bailey Cahall, "Do NSA's Bulk Surveillance Programs Stop Terrorists?", New America Foundation, 1/13/2014, https://static.newamerica.org/attachments/1311-do-nsas-bulk-surveillance-programs-stop-terrorists/IS_NSA_surveillance.pdf)//MBB

It is difficult to determine the precise importance to counterterrorism of the NSA's surveillance programs under Section 702 in cases such as those above, because the NSA also conducts or has

conducted surveillance under a range of other authorities. Not only are there the traditional, targeted FISA authorities and Section 702 of 2008's FISA Amendments Act, there is also Executive Order 12333, which primarily governs surveillance undertaken outside of the United States that is not targeted at U.S. persons, as well as the authorities that were used prior to 2008 to justify the Bush administration's warrantless wiretapping program, those being the temporary Protect America Act of 2007 and President Bush's own claims of inherent executive authority. The attempt to divine how useful Section 702 has been is also complicated by the fact that unlike the Section 215-based telephone metadata collection program, the exact scope and methods of the 702-based programs are still unclear.

However, according to the White House review panel's report, surveillance conducted under Section 702 authorities "has produced significant information in many, perhaps most, of the 54 situations in which signals intelligence has contributed to the prevention of terrorist attacks since 2007."82 But the wording of the report also raises doubts about the importance of those contributions from Section 702, because the report concludes that it would be "difficult to assess precisely how many of these investigations would have turned out differently without the information learned through section 702."83

Warrant requirements don't undermine terrorism investigations – history, exigent circumstances

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015 //DM)

First, the government argued that security leaks from a warrant hearing could threaten national security or impede surveillance. The Supreme Court had rejected this contention in the context of domestic intelligence operations (the Keith case).226 The D.C. Circuit found it equally unconvincing in the foreign intelligence context.227 Indeed, the 35-year history of the FISA Court shows that judges and their staff are well able to maintain the requisite secrecy.

Second, the government argued that obtaining a warrant in foreign intelligence cases would cause unacceptable delay.228 It is evident, however, that not every instance of foreign intelligence surveillance involves an urgent matter. Given the enormous scope of the NSA's collection and its repeated assertion that intelligence gathering often entails gathering innocuous pieces of a mosaic to reveal a potential threat, it can hardly be argued that each piece of information involves a time sensitive operation. And in truly urgent cases, the government may rely on a separate "exigent circumstances" exception to the warrant requirement.229

Finally, the government argued that evaluating foreign intelligence surveillance is beyond the scope of judicial expertise, citing the risk of harm to national security if a judge does not properly understand the government's foreign intelligence interest. The Zweibon court described this as relegating Fourth and First Amendment interests "to the level of second-class rights," and "naively equat[ing] all foreign threats with such dangers as another Pearl Harbor."230 The court believed it was self-evident that a judge faced with a warrant application would take into account

the magnitude of the threat identified by the government so that "the probability that a judge would erroneously deny the Executive the requested warrant approaches the infinitesimal."231

Today, the government might well add a fourth argument: the sheer extent of foreign intelligence surveillance necessary in the post-9/11 world makes the warrant requirement unworkable. Indeed, significant additional resources would be required for the government to obtain individualized warrants for all instances in which it currently captures communications between Americans and foreign targets. On the other hand, this factor presumably would cause the government to be more judicious in selecting targets. In any event, the need for significant additional resources cannot justify dispensing with a warrant requirement. As the Supreme Court has observed, "The argument that a warrant requirement would oblige the Government to obtain warrants in a large number of cases is hardly a compelling argument against the requirement."232

AT: CP links to terrorism – intelligence wall

A primary purpose test doesn't erect a wall between the FBI and NSA

Patel and Goitein, 15 – *co-director of the Liberty and National Security Program at the Brennan Center for Justice AND ** co-directs the Brennan Center for Justice's Liberty and National Security Program (Faiza and Liza, "Fixing the FISA Court by Fixing FISA: A Response to Carrie Cordero" 4/8, Lawfare,

http://www.lawfareblog.com/fixing-fisa-court-fixing-fisa-response-carrie-cordero

Carrie particularly disagrees with our recommendation that FISA surveillance should be available only if obtaining foreign intelligence is the primary purpose of collection. She equates this recommendation with a proposal to "rebuild 'the wall.'" She suggests that "the wall" had catastrophic effects, citing a statement by prosecutor Patrick Fitzgerald to the effect that he was not allowed even to speak with intelligence investigators at the FBI while he was building a criminal case against Osama bin Laden.

Carrie ignores the legal issue at the center of this recommendation. Although the FISCR takes a different view, the circuit courts that have addressed this issue have held that the "primary purpose" test is necessary to trigger the foreign intelligence exception to the warrant requirement. Without such a requirement, these courts observed, it would be far too easy for the government to avoid the warrant requirement in ordinary criminal cases. Their concerns have come to pass, as the PCLOB reports that the FBI "with some frequency" searches databases containing Section 702 data when opening criminal investigations or assessments "unrelated to national security efforts."

Critics of reform posit dire consequences to reinstating this vital Fourth Amendment protection. Our report identified three flaws in the logic chain that purports to lead from the "primary purpose" test to disaster, and Carrie's argument tracks two of them precisely. First, our report notes that nothing in the "primary purpose" test necessitated the particular limits that the Justice Department imposed on itself. Carrie doesn't dispute this point; instead, she states, "the reality is

that the rules and restrictions were put in place." That's a truism; it doesn't suggest that the Justice Department would follow exactly the same course today if a "primary purpose" test were reinstated. We strongly suspect the Department would take a different approach in operationalizing this requirement.

Second, the problems that followed from the limits the Justice Department imposed on itself do not appear to have resulted from the rules themselves – the FISA Court described these rules as permitting "broad information sharing" and "substantial consultation and coordination" – but from a widespread misunderstanding of what they required. Indeed, the 9/11 Commission described the term "the wall" as "misleading," and notes that the rules in question "were almost immediately misunderstood and misapplied."

Fitzgerald's quote illustrates this point nicely. He says,

But there was one group of people we were not permitted to talk to. Who? The FBI agents across the street from us in lower Manhattan assigned to a parallel intelligence investigation of Usama Bin Laden and al Qaeda. We could not learn what information they had gathered.

That isn't a remotely accurate description of what the rules required. Intelligence investigators and prosecutors were not only allowed but required to talk to each other. While prosecutors could not direct intelligence investigations, they could provide "guidance," and investigators were required to inform prosecutors if their investigations turned up information about serious crimes (and to provide them with monthly briefings in any event). Investigators had to get higher-level approval to share certain other kinds of information, but that's hardly the same thing as prohibiting any communication.

The third flaw in the logic chain is the notion that "the wall" – or, more accurately, officials' perception of a wall – led to 9/11. Carrie doesn't make this claim; in fact, she doesn't mention any specific national security damage that resulted from the wall. In any event, the 9/11 Commission Report makes pretty clear that the failures to communicate critical information in advance of the attack had little to do with the Justice Department's rules and everything to do with bureaucratic incompetence.

The primary purpose test didn't create an intelligence sharing wall – bad decisions pre 9/11 did

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015, //DM)

The hypothesis that the "primary purpose" test required the establishment of a "wall" which then led to 9/11 is flawed in a number of respects. Most fundamentally, the 9/11 Commission's report showed that the "wall" did not cause the lack of coordination that contributed to intelligence failures before 9/11. It documented that CIA investigators, as well as FBI officials detailed to the CIA, had information months before the attack that two of the hijackers were potential terrorists already in the United States. There were many opportunities to share this information more

broadly, and most of these opportunities were squandered because of poor judgment calls by individual analysts.145 Moreover, the hypothesis oversimplifies the relationship between the "primary purpose" test and "the wall." While courts signaled that they would look askance if criminal prosecutors were directing foreign intelligence surveillance, no court held that the "primary purpose" test necessitated the particular limitations that the Justice Department imposed on itself.146 Nor is it clear that chilling coordination was the direct and inevitable result of implementing those limitations. According to the Attorney General's Review Team, the voluntary restraints that were in place between 1984 and 1993 "appear[] to have worked quite satisfactorily . . . both from the perspective of the Criminal Division and that of the FBI."147 At least some of the impediments to coordination that subsequently emerged appear to have been a result of officials' conservative interpretation of the rules, rather than the rules themselves.148

AT: Perms

The permutation severs the text and meaning of the plan – FAA exclusivity bans the individualized court order requirement – the CP makes it the exclusive requirement for surveillance.

Patel and Goitein, 15 – *co-director of the Liberty and National Security Program at the Brennan Center for Justice AND ** co-directs the Brennan Center for Justice's Liberty and National Security Program (Faiza and Liza, "Fixing the FISA Court by Fixing FISA: A Response to Carrie Cordero" 4/8, Lawfare,

http://www.lawfareblog.com/fixing-fisa-court-fixing-fisa-response-carrie-cordero

Our report notes that Section 702 had a **limited effect** on the government's ability to collect communications between foreigners without obtaining a FISA order; instead, its primary purpose and effect was to **remove the requirement of an individualized order** for the acquisition of communications between foreign targets and U.S. persons. Carrie responds that Section 702 was necessary because, under FISA, "the pre-2008 definitions in FISA technically required that the government obtain a probable-cause order from the Court in order to collect the communications of Terrorist A in Afghanistan with Terrorist B in Iraq." But, as we explain in our report, this was true only for one category of foreign-to-foreign communications: e-mails stored on U.S. servers.

That's because of the statute's complicated definition of "electronic surveillance," which is the activity that FISA regulates. The definition is broken down into three types of surveillance: acquisition of wire communications (which includes phone calls or Internet communications in transit over cables), acquisition of radio communications (which includes calls or Internet communications in transit through wireless means), and "monitoring" (which previously meant planting a bug, but today includes acquiring stored e-mails). For the first two categories, acquisition is defined as "electronic surveillance" only if one or more of the communicants is a U.S. person. In other words, for wire or radio communications between foreigners, 1978 FISA simply had nothing to say; "monitoring" is the only category of foreign-to-foreign communication that 1978 FISA regulated.

That's why our report states that, "[w]ith the exception of e-mails stored in the United States, the new law had no impact on the government's ability to collect the communications of foreigners with other foreigners." Carrie is, of course, correct that Section 702 allows the government to obtain other types of foreign-to-foreign communications without a court order… but so did 1978 FISA, so Section 702 made no change there. The most significant change Section 702 made was to permit the acquisition of communications between foreign targets and U.S. persons without a court order. Carrie does not explain why this was necessary to allow the government to collect the communications of Terrorist A in Afghanistan with Terrorist B in Iraq.

Reasonable suspicion CP

1nc Reasonable suspicion CP

Text – (rewrite the plan but replace 'probable cause' with 'reasonable suspicion'. Obviously only read this against an aff based on probable cause)

Reasonable suspicion with oversight solves the case but avoids terrorism

Sievert 14 * Professor, Bush School of Government and U.T. Law School, author of three editions of Cases and Materials on US Law and National Security (Ronald, "Time to Rewrite the Ill-Conceived and Dangerous Foreign Intelligence Surveillance Act of 1978", National Security Law Journal Vol. 3, Issue 1 – Fall 2014)//GK

Although the author believes this reasonable suspicion standard should apply to all FISA interceptions, the most urgent need, and the one that may be most favorably considered by Congress, relates to the monitoring of Al Qaeda, ISIS (the Islamic State of Iraq and Syria, also known as "ISIL") and those who are attempting an attack with a WMD. Therefore, FISA should be changed to allow interception where there is reasonable suspicion to believe the target is a person subject to an AUMF or engaged in an effort to employ a WMD in the United States or against U.S. facilities. Harvard Law professor Jack Goldsmith argued when he was head of the Office of Legal Counsel in 2003 that both the AUMF as well as the concept of special needs should permit the President to monitor Al Qaeda without going through the traditional requirements of the FISA statute. 272 His argument was later supported by the wording of Hamdi v. Rumsfeld, stating that the AUMF allowed the President to utilize all necessary elements of military force against Al Qaeda and the Taliban. 273 Surely, monitoring the enemy is one such element of military force. Goldsmith's position is strongly opposed by those who state that FISA requires the President to follow the procedures established by Congress and not act without FISA court approval.274 But assuming Congress can intrude on the President's authority in this area, there is nothing preventing Congress from amending the FISA statute to provide for more efficient interception when the target is the subject of an AUMF or planning a WMD attack. Abandoning probable cause would certainly raise legal concerns similar to those expressed in United States v. Truong275 and by the petitioners in In Re Sealed Case,276 if the intent and direct result was ordinary criminal prosecution as opposed to intelligence collection. At the same time, an interception intended to obtain intelligence is likely to pick up evidence of national security crimes (sabotage, terrorism, espionage). The government should be able to use this evidence under the doctrine that the government can use anything it finds while it is legally present.277 The solution in part would be to draw upon the 2001 FISA Court's practice and prohibit criminal division direction and control of intelligence wiretaps. In addition, as Judge Posner has suggested, "the use of intercepted information for any other purpose other than investigating (or prosecuting) threats to national security would be forbidden. Information could not be used as evidence or leads in the prosecution of ordinary crime."278 Finally, if the government thought it was likely to uncover criminal acts other than national security crimes, it would be wise in those few cases to go the extra step and seek to demonstrate probable cause instead of reasonable suspicion before obtaining a judicial warrant. Any public fears regarding the

creation of a new FISA could be assuaged by establishing an independent body to look after the concerns of the civilian community. We have seen such entities in Germany's G-10 committee, the U.K.'s Interception of Communications Commission, and Italy's Data Protection Authority. These organizations perform a variety of roles, from reviewing all surveillance after the fact to issuing reports to the legislature, or, in some cases, examining individual allegations of excessive surveillance. An American version of this independent body would exist alongside the judiciary, which would grant the initial interception warrant based on a finding of reasonable suspicion. Any objective individual who steps back and reviews the series of attempted attacks on the United States in the last fifteen years understands our population is in great danger, and this is especially so if our adversaries obtain some type of WMD. It is folly to hamstring our intelligence services by imposing a criminal law search standard that is neither constitutionally required nor mandated by the recognized human rights principles of the international community. It is imperative, therefore, that we correct the mistakes of the past and enact a new, more effective Foreign Intelligence Surveillance Act.

2nc – reasonable suspicion solves

A reasonable suspicion standard solves better than probable cause – protects privacy and avoids terrorism

Sievert 14 * Professor, Bush School of Government and U.T. Law School, author of three editions of Cases and Materials on US Law and National Security (Ronald, "Time to Rewrite the Ill-Conceived and Dangerous Foreign Intelligence Surveillance Act of 1978", National Security Law Journal Vol. 3, Issue 1 – Fall 2014)//GK

The analysis above, however, strongly suggests that a statute authorizing intelligence surveillance warrants based on reasonable suspicion alone would and should pass constitutional muster. Time and again the Supreme Court has recognized that detailed searches can be conducted without establishing probable cause, even when the results of those searches could, as with intelligence surveillance, potentially result in criminal prosecution. Such a statute would insure that the government's overwhelming interest in safeguarding our population would be met far better than it is now with the obstacles created by the burdensome FISA standard of probable cause. Privacy would be protected by a warrant process guaranteeing judicial control and guidance so that surveillance could not be initiated for political, partisan, or personal reasons, and by the need to demonstrate there was reasonable suspicion, or specific articulable facts to suspect a specific target. Congress overreacted when it imposed the highest criminal law search standard on foreign intelligence surveillance and the result of their decision has proven hazardous to the American people. Meanwhile, our European allies have demonstrated a civilized respect for individual privacy but, as will be discussed in the next section, many recognize that imposing such hurdles is far too dangerous when it comes to protecting a nation's security.

No constitutional requirement for probable cause exists

Sievert 14 * Professor, Bush School of Government and U.T. Law School, author of three editions of Cases and Materials on US Law and National Security (Ronald, "Time to Rewrite the Ill-Conceived and Dangerous Foreign Intelligence Surveillance Act of 1978", National Security Law Journal Vol. 3, Issue 1 – Fall 2014)//GK

In the words of Chief Justice Roberts, "As the text makes clear, 'the ultimate touchstone of the Fourth Amendment is reasonableness.'" 159 In other words, although the Fourth Amendment states that warrants should be supported by probable cause, the ultimate test of the constitutionality of a search is whether it is reasonable, not whether the government has established probable cause. Noted constitutional law scholar Akhil Amar has written that those who seek to impose a "global probable cause requirement have yet to identify even a single early case, treatise, or state constitution that explicitly proclaims 'probable cause' as the prerequisite for all 'searches and seizures.'"160 In National Treasury Employees Union v. Von Raab, the Court stated that "neither a warrant nor probable cause, nor, indeed, any measure of individualized suspicion, is an indispensable component of reasonableness in every circumstance."161 Rather, the reasonableness of a search is determined essentially by balancing the government's interest against the intrusion and expectation of privacy in the particular context of the case.162 An analysis of the Supreme Court's opinions demonstrates that there really is no inherent constitutional requirement that the government show probable cause before conducting a search for foreign intelligence purposes. In the past fifty years, the Court has repeatedly sanctioned searches conducted without probable cause where significant safety and security concerns were present. The Court has not deviated from these holdings even where such searches may very well uncover criminal activity and eventually result in prosecution.

Whistleblower protection

1nc – Whistleblower protection CP

CP Text:

The United States Federal Government should offer protection to whistleblowers who leak classified data, if and only if such leaks provide evidence of wrongdoing.

Expanding whistleblower protection makes existing oversight effective

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 13)//AK

PROTECT WHISTLEBLOWERS

Columbia law professor David Pozen contends that democracies need to be leaky— leaks and whistleblowing are themselves security mechanisms against an overreaching government. In his view, leaks serve as a counterpoint to the trend of overclassification and, ultimately, as a way for governments to win back the **trust** lost through excessive secrecy.

Ethnographer danah boyd has called whistleblowing the civil disobedience of the information age; it enables individuals to fight back against abuse by the powerful. The NGO Human Rights Watch wrote that "those who disclose official wrongdoing … perform an important service in a democratic society… ."

In this way of thinking, whistleblowers provide another oversight mechanism. You can think of them as a random surprise inspection. Just as we have laws to protect corporate whistleblowers, we need laws to protect government whistleblowers. Once they are in place, we could create a framework and rules for whistleblowing legally.

This would not mean that anyone is free to leak government secrets by claiming that he's a whistleblower. It just means that conscience-driven disclosure of official wrongdoing would be a valid defense that a leaker could use in court—juries would have to decide whether it was justified—and that reporters would legally be able to keep their sources secret. The clever thing about this is that it sidesteps the difficult problem of defining "whistleblower," and allows the courts to decide on a case-by-case basis whether someone's actions qualify as such or not. Someone like Snowden would be allowed to return to the US and make his case in court, which—as I explained in Chapter 7— currently he cannot.

Additionally, we need laws that protect journalists who gain access to classified information. Public disclosure in itself is not espionage, and treating journalism as a crime is extraordinarily harmful to democracy.

2nc – whistleblower protection

Existing whistleblower laws fail only because of the classified information exemption

Pozen 13, Yale Law School, J.D., 2007 Oxford University, M.Sc., Comparative Social Policy (distinction), 2003 Yale College, B.A., Economics (summa cum laude), 2002, Columbia Law Professor, expert surveillance legal analyst, (David, THE LEAKY LEVIATHAN: WHY THE GOVERNMENT CONDEMNS AND CONDONES UNLAWFUL DISCLOSURES OF INFORMATION , SSRN**)//AK**

The federal whistleblower statutes might be expected to comprise the last major piece of the legal framework, except that in the national security context they play a marginal role. Several laws protect executive branch employees who disclose information regarding alleged abuses to designated agency officials or congressional committees under specified procedures.63 But these laws offer significantly less succor when it comes to classified information, are widely seen as confusing and user-unfriendly, and under no circumstances permit disclosures directly to the press.64 These laws also do not ensure against revocation of one's security clearance,65 which in the national security and foreign policy fields generally means loss of one's job. And though the point is contestable, the laws are fairly read to provide "absolutely zero protection" for those who publicly reveal classified information, even as a last resort, and even when the information reveals illegal government conduct.66 The vast majority of leakers have no interest in reporting

wrongdoing in any event.67 Consequently, the whistleblower statutes tend to be ignored in the debate over classified information leaking, apart from occasional calls to revise them. It is telling that in Jack Goldsmith's recent book-length study of mechanisms that publicize and constrain the executive's national security activities, these laws are never once mentioned.

Whistleblower protections from the CP solve transparency through intentional leaks- the key internal link to all the aff's impacts

Pozen 13, Yale Law School, J.D., 2007 Oxford University, M.Sc., Comparative Social Policy (distinction), 2003 Yale College, B.A., Economics (summa cum laude), 2002, Columbia Law Professor, expert surveillance legal analyst, (David, THE LEAKY LEVIATHAN: WHY THE GOVERNMENT CONDEMNS AND CONDONES UNLAWFUL DISCLOSURES OF INFORMATION , SSRN**)//AK**

The federal whistleblower statutes might be expected to comprise Congress's longstanding failure to confront the executive secrecy system must be understood in light of these institutional and memberlevel interests in leakiness. With some notable exceptions such as the bill vetoed by President Clinton that would have strengthened the Espionage Act,333 Congress has done little to address national security leaks or the classification system that underlies them. A variety of committees have held hearings on high-profile incidents, and the intelligence committees have recently mooted measures to curb certain forms of planting and pleaking. But in general legislative action has been minimal for decades. Of particular note, members have declined to make use of the protection afforded by the Constitution's Speech or Debate Clause334 to reveal, or threaten to reveal, executive branch information without fear of criminal or civil liability.335 One might expect that a responsible legislature would try to steer classified information leaks its way, so as to preserve legitimate secrecy while providing an outside check on the executive.336 Congress has largely bypassed this approach, which would force it to take greater responsibility over the revelations that emerge, and has instead countenanced minimal enforcement against media leakers while directing all prospective whistleblowers to their agency inspectors general in the first instance.337 Many members of Congress seem quite content to be regular readers (and perhaps occasional purveyors) rather than recipients of leaks. Systematic recourse to leaking emerges, once again, as the more efficient and politically palatable alternative to systematic legal reform.

Congress's role in the ecosystem of national security leaks is a large and complex subject. Certain congressional entities receive a steady flow of classified information through official channels, supplemented by a side traffic in direct and indirect unofficial disclosures. Agencies typically incur political risk if they try to limit this traffic by clamping down on staffers' communications with their oversight committees. Partisan motivations and sincere good-governance sentiments sustain a perpetual interest on the Hill in leaks, along with a ready-made rhetoric of crisis about their prevalence. The recent rise of a "commuter Congress," in which many members spend as little time as possible in Washington, may have helped strengthen relationships between elite reporters and less peripatetic executive officials, shifting power to the latter in the intragovernmental game of leaks.

Transparency CP

1nc transparency CP

CP text: The United States Federal Government should

-increase transparency about US surveillance activities, adopt data minimization, and promote global transparency standards

-eliminate any government efforts to introduce backdoors in software or weaken encryption

-establish international legal standards for government access to data

-strengthen U.S. mutual legal assistance treaties and pass the Law Enforcement Access to Data Stored Abroad Act

-complete the Trans Pacific Partnership trade agreement to ban digital protectionism

The CP solves US tech leadership, US jobs, and the economy

Castro and McQuinn 15, Daniel Castro works at the Center for Data Innovation, Government Technology, The Information Technology & Innovation Foundation, worked at the U.S. Government Accountability Office, went to Carnegie Mellon. Alan McQuinn works at the Federal Communications Commission, previously had the Bill Archer Fellowship at the University of Texas, (June 2015, "Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness",
file:///C:/Users/Mark/Downloads/2015-beyond-usa-freedom-act.pdf)//AK

In the short term, U.S. companies lose out on contracts, and over the long term, other countries create protectionist policies that lock U.S. businesses out of foreign markets**. This** not only hurts U.S. technology companies, but costs American jobs and weakens the U.S. trade balance**.** To reverse this trend, ITIF recommends that policymakers:

 Increase transparency about U.S. surveillance activities both at home and abroad.

 Strengthen information security by opposing any government efforts to introduce backdoors in software or weaken encryption.

Strengthen U.S. mutual legal assistance treaties (MLATs).

 Work to establish international legal standards for government access to data.

 Complete trade agreements like the Trans Pacific Partnership that ban digital protectionism, and pressure nations that seek to erect protectionist barriers to abandon those efforts**.**

2nc CP solvency top level

The combination of planks resolves all of the case – transparency, international harmonization and trade solve every aff internal link

Castro and McQuinn 15, Daniel Castro works at the Center for Data Innovation, Government Technology, The Information Technology & Innovation Foundation, worked at the U.S. Government Accountability Office, went to Carnegie Mellon. Alan McQuinn works at the Federal Communications Commission, previously had the Bill Archer Fellowship at the University of Texas, (June 2015, "Beyond the USA Freedom Act: How U.S. Surveillance Still Subverts U.S. Competitiveness", file:///C:/Users/Mark/Downloads/2015-beyond-usa-freedom-act.pdf)//AK

The free and open Internet that powers the globally networked economy is dependent on the ability of individuals and companies to engage in commerce without geographic restrictions. To turn back the tide of technology protectionism, U.S. trade negotiators will need a stronger hand to play. They cannot go to other nations and tell them to not discriminate against U.S. tech firms if the U.S. intelligence system continues to follow policies that threaten their citizens and businesses. As a result, it is incumbent on the Congress and the Obama administration to take the lead in showing the world the best standards for transparency, cooperation, and accountability.

First, the U.S. government should be forthcoming and transparent about its surveillance practices and clearly inform the public about the data it collects domestically and abroad. The U.S. government should **set the gold standard for international transparency requirements**, so that it is clear what information both U.S. and non-U.S. companies are disclosing to governments at home and abroad. The U.S. government should then work with its allies to create an international transparency requirement that illuminates when countries conduct surveillance that accesses foreign companies' information.

Second, the U.S. government should draw a clear line in the sand and declare that the policy of the U.S. government is to strengthen not weaken information security. The U.S. Congress should pass legislation, such as the Secure Data Act introduced by Sen. Wyden (D-OR), banning any government efforts to introduce backdoors in software or weaken encryption.43 In the short term, President Obama, or his successor, should sign an executive order formalizing this policy as well. In addition, when U.S. government agencies discover vulnerabilities in software or hardware products, they should responsibly notify these companies in a timely manner so that the

companies can fix these flaws. The best way to protect U.S. citizens from digital threats is to promote strong cybersecurity practices in the private sector.

Third, the U.S. government should strengthen its mutual legal assistance treaties (MLATs), which allow law enforcement agencies to receive assistance from and provide assistance to their counterparts in other countries. These treaties work through cooperation between both governments, which agree to share information during lawful investigations. Some governments—such as China and the United States—have begun to circumvent the MLAT process to access data stored in other countries because they perceive the process to be too slow. 44 If this becomes the norm for the U.S. government, the end game is clear: significantly fewer foreign businesses, governments, and citizens will do business with U.S. companies. Rather than abandon the MLAT process, the U.S. government should work to improve it and make these requests more transparent. While the U.S. government cannot force other governments to improve their own MLAT process, it can set an example by streamlining its own and asserting that other countries should do the same. The Law Enforcement Access to Data Stored Abroad (LEADS) Act, recently introduced in the Senate by Sens. Orrin Hatch (R-Utah), Chris Coons (D-Del.) and Dean Heller (R-Nev.) and in the House by Reps. Tom Marino (R-Pa.) and Suzan DelBene (D-Wash.), would do just that.45

Fourth, the U.S. government should work with its trade partners to establish international legal standards for government access to data. The United States should engage with its trade partners to develop a "Geneva Convention on the Status of Data."46 This would create a multi-lateral agreement that would establish international rules for transparency, settle questions of jurisdiction, engender cooperation for better coordination of international law enforcement requests, and limit unnecessary access by governments to citizens of other countries. Only by working to establish a global pact on these issues can countries that have previously engaged in mass cyberespionage assure the international community that countries can hold each other accountable in the future.

Finally, while many countries will continue to use U.S. surveillance practices as a pretext to pursue tech-mercantilist measures, the United States should not let these practices go unchallenged. The U.S. government should push back against these barriers by completing trade agreements that eliminate protectionism. The Trans-Pacific Partnership (TPP) may be the first U.S. trade agreement to enshrine such strong free trade provisions for cross- border data flows. U.S. negotiators should ensure that other agreements, including the Trans-Atlantic Trade and Investment Partnership (T-TIP), and the Trade in Services Agreement (TISA), are equally strong. 47 The United States should build an alliance against bad actors, forcing protectionist countries to the sidelines of the global trade arena if they continue to enact these anti-competitive rules. Furthermore, as the U.S. Congress weighs future trade promotion authority, it should direct U.S. negotiators to include prohibitions against protectionist barriers in all future U.S. trade agreements.

For other nations, especially China, U.S. messages and actions need to be much tougher. If a country resorts to protectionism on the pretext of guarding against U.S. surveillance, but its true end game is to systemically exclude U.S. companies and distort its market for competitive advantage, then the U.S. government should push back aggressively with trade measures that impose significant economic penalties.

The LEADS Act alone would restore confidence in cloud computing

Maines 3/30/15 – contributor to the Hill and president of the Media Institute (Patrick, The LEADS Act and cloud computing, The Hill,
http://thehill.com/blogs/pundits-blog/technology/237328-the-leads-act-and-cloud-computing)//JJ

Bipartisan legislation, introduced last month in the House and Senate, promises to reform and update the antiquated Electronic Communications Privacy Act (ECPA) and in the process push back against the practice by agencies of government to gain access to personal data stored on U.S. corporation servers abroad.

The legislation, **called the LEADS Act**, is co-sponsored in the Senate by Sens. Orrin Hatch (R-Utah), Chris Coons (D-Del.) and Dean Heller (R-Nev.), and in the House by Reps. Tom Marino (R-Pa.) and Suzan DelBene (D-Wash.).

Short for "Law Enforcement Access to Data Stored Abroad," the LEADS Act's principal improvements on ECPA are in recognizing that U.S. law enforcement may not use warrants to compel the disclosure of customer content stored outside the United States unless the account holder is a U.S. person, and by **strengthening the process** — called MLATs (mutual legal assistance treaties) — through which governments of one country allow the government of another to obtain evidence in criminal proceedings.

One of the better examples of the need for updating ECPA centers on a government warrant served on Microsoft for the contents of the email of an Irish citizen stored on a Microsoft server in Dublin. The government's interest in this individual is reported to be in connection with drug trafficking. Microsoft denied the request and is currently embroiled in litigation, now before a federal appeals court.

At the mention of drug trafficking one imagines that many people might, at first glance, side with the government in this. But consider the same scenario, only with the countries reversed. Imagine the outrage if the Irish government demanded that a server located in the U.S. turn over to it the contents of the personal email of a U.S. citizen!

The larger issue in the Microsoft case, and as **addressed by** the LEADS legislation, is the fear, especially since the Edward Snowden revelations, that **foreigners will lose confidence** that the content of their email on U.S. servers will be open to government inspection, and go elsewhere for the purpose.

Organizations like Forrester Research and the Information Technology and Innovation Foundation have attempted to put a price tag on the cost to the U.S. cloud computing industry of what is called the PRISM project, an outgrowth of the Protect America Act which authorizes the NSA to conduct metadata searches of email. Those estimates are uneven, and evolving, but all the figures reported are in the billions of dollars. And while PRISM operates on a different legal foundation than the one, ECPA, that is the subject of the LEADS Act, there can be no question that if Microsoft were to lose its case, and in the **absence of the passage of the LEADS Act**, **U.S. cloud providers will suffer**.

Nor is the suffering to be endured just by cloud computing companies. As published in a paper by the Media Institute, media and privacy lawyer Kurt Wimmer makes a compelling case that media

companies may be especially sensitive to issues like those addressed by the Microsoft case and the LEADS Act legislation:

In an era of tight budgets for newsrooms and infrastructure, cloud computing has helped many media companies reduce costs and make their newsgathering operations more efficient and effective. It can be much more efficient for a newsgathering and publishing operation to purchase a package of cloud-based services (e.g., word processing, photography, publishing, storage) rather than maintain its own IT department, servers, and software.

Although there are substantial advantages for media companies in adopting cloud-based technologies, there are also risks. Newsgathering operations routinely handle highly sensitive information, and they rely on a foundation of trust between reporters and their confidential sources. If a media organization concludes that entrusting its data with a cloud service provider will result in that data being less private or secure, then the organization is less likely to embrace cloud technologies. ...

This concern has been accentuated by the controversy surrounding Edward Snowden's disclosures in 2013 regarding government surveillance. Particularly for media organizations with headquarters or operations outside the United States, the Snowden disclosures increased concern that if the companies entrusted their data to a U.S. cloud provider, that would make it easier for U.S. law enforcement to obtain their data.

For media companies, these are not abstract questions. As the Department of Justice (DOJ) recognized in updating its rules regarding subpoenas to reporters, maintaining the confidentiality of the newsgathering process is essential to both a free press and a working democracy. The DOJ now has strong guidelines governing the considerations that will be considered before subpoenas will be directed to reporters, but these are only internal guidelines and they only apply to the DOJ. The **bipartisan LEADS Act** provides a path forward to update the law to permit the cloud to be more meaningful and useful to media companies — and to others concerned about the privacy and security of their data. And by doing so, Congress can **bolster the competitiveness** of an emerging and important area of our information economy.

2nc – solves data localization

The CP solves global data localization

Hill 14 - technology and international affairs consultant, formerly worked in the Office of the Cybersecurity Coordinator on the National Security Staff at the White House (Jonah, "The Growth of Data Localization Post-Snowden: Analysis and Recommendations for U.S. Policymakers and Business Leaders", Conference on the Future of Cyber Governance, 5/1/14)//DBI

2. Create (or refocus) a senior U.S. government position to serve as the primary contact person and advocate for U.S. industry global data issues

At present, there is no single point-person in the U.S. government coordinating data flow issues, or advocating on behalf of the U.S. for freedom of data flows. The head of the Federal Trade Commission, the U.S. Trade Representative, the Privacy and Civil Liberties Oversight Board, the

Department of Commerce (importantly, the Deputy Assistant Secretary for Services), the Chief Privacy Officer of the NSA, several individuals within the Department of State (importantly the U.S. Coordinator for International Communications and Information Policy) as well as many, many others, are all working on the problem, but largely separately, with **inevitably separate institutional viewpoints and objectives.**

While multiple individuals and agencies should be addressing the issue simultaneously, there is a need for a single coordinating office to track and manage this vital economic issue. Perhaps an office of Chief Privacy Officer in the U.S. State Department and/or U.S. Trade Representative could be developed, or the newly-created White House Chief Privacy Officer position could take on this broader international responsibility. President Obama has suggested, in a speech delivered at the U.S. Department of Justice on January 17, 2014, that his administration plans to create a new position at the U.S. State Department "to coordinate [American] diplomacy on issues related to technology and signals intelligence."121 This new role – which has only been vaguely described – could also potentially fill the leadership vacuum within the U.S. government on these issues. However the reorganization happens, is clear that the current bureaucratic arrangement needs to be restructured to ensure that the anti- localization outreach strategy is **effectively coordinated and harmonized** across the entire U.S. government and among U.S. industry leaders.

3. Reform and streamline the Mutual Legal Assistance Treaty process

The cumbersome MLAT process has proven to be **one of the leading motivations behind many localization proposals**. In order to expedite the MLAT process, the Department of Justice's should develop an online MLAT submission form, and devote the resources necessary to respond in a timely fashion, recognizing the urgency of many law enforcement requirements. In addition, the Department of Justice should (consistent with the reasonable confidentiality requirements of sound law enforcement) also publish regular government transparency reports, including breakdowns of number of requests received from different countries, the response provided, the crimes to which the requests relate, and the time each request required, and should provide clear, public guidance on what information can be obtained through an MLAT. These reports would not only result in an anticipated speed-up of response time (no one wants publicly to be shown to be dilatory), but would also demonstrate to foreign law enforcement personnel that their queries are receiving treatment not meaningfully less prompt than are other nations' requests of a similar nature.122

Transparency solves – XO12333

The CP creates transparency and minimization standards for XO12333

Rotenberg, EPIC President and Executive Director, 6-16-15 [Electronic privacy information center, non-profit research and educational organization established in 1994 to focus

public attention on emerging privacy and civil liberties issues.12 We work with a distinguished panel of advisors in the fields of law, technology and public policy., COMMENTS OF THE ELECTRONIC PRIVACY INFORMATION CENTER, file:///C:/Users/Jonah/Downloads/EPIC-12333-PCLOB-Comments-FINAL.pdf] Schloss2

The basic pillars of data privacy impose comparable transparency obligations. For example, the Privacy Guidelines of the Organization for Economic Co-operation and Development call on data controllers—government or otherwise—to adopt a "general policy of openness about developments, practices and policies with respect to personal data." Similarly, the Fair Information Practices set forth by the Secretary's Advisory Committee on Automated Personal Data Systems prescribe (1) that "there must be a way for an individual to find out" how information collected about her is used, and (2) that there must be a way for an individual to prevent information "obtained for one purpose from being used or made available for other purposes" without her consent.121 The data collected under EO 12333 should be held to the sesame standards.

In view of the above, the Board should ensure that the NSA, the CIA, and any other entity collecting data pursuant to EO 12333 publicly disclose detailed polices and procedures for retaining, minimizing, using, and disseminating that data. Though both the NSA and CIA have released bare-bones descriptions of their data handling policies and procedures,122 these documents are much too brief and superficial to assess the strength of the agencies' privacysafeguards.123 Greater transparency is required so that the public may "evaluate the degree to which its privacy is currently protected . . . ."124

That solves the perception of abuse

Rotenberg, EPIC President and Executive Director, 6-16-15 [Electronic privacy information center, non-profit research and educational organization established in 1994 to focus

public attention on emerging privacy and civil liberties issues.12 We work with a distinguished panel of advisors in the fields of law, technology and public policy., COMMENTS OF THE ELECTRONIC PRIVACY INFORMATION CENTER, file:///C:/Users/Jonah/Downloads/EPIC-12333-PCLOB-Comments-FINAL.pdf] Schloss2

There is a broad consensus on the need to minimize data collected under EO 12333, particularly when that data concerns USPs. Congress, legislating through the Privacy Act, has mandated that any agency that collects identifying records about USPs maintain "only such information about an individual as is relevant and necessary to accomplish a purpose of the agency required to be accomplished by statute or by executive order of the President."125

President Obama has specifically highlighted the importance of data minimization in an intelligence-gathering context. PPD 28 requires that agencies in the IC "establish policies and procedures reasonably designed to minimize the dissemination and retention of personal information," noting that "long-term storage of personal information unnecessary to protect our national security is inefficient, unnecessary, and raises legitimate privacy concerns."126 The

President's Review Group on Intelligence and Communications Technologies has similarly advised that if an intercepted communication "includes a United States person as a participant or reveals information about a United States person . . . any information about that United Statesperson should be purged upon detection unless it either has foreign intelligence value or is necessary to prevent serious harm to others."127

Even the NSA has acknowledged the risks of failing to use minimization procedures. Overbroad retention of data means that the agency "may possibly fail to completely remove data[it] was not authorized to acquire" and "may potentially lose data because of 'spillage,' improper intentional disclosure, or malicious exfiltration."128 The subsequent dissemination of improperly retained data means that the agency "could inappropriately share information that does not have a foreign intelligence purpose,

or is based on data that is required to be removed" and "may possibly disseminate more information than is relevant to foreign intelligence."129

These concerns have long been reflected in the basic tenets of data privacy. In 1977, the Privacy Protection Study Commission—drawing on the Code of Fair Information Practices—urged that there be limits "on the internal uses of information about an individual within a record-keeping organization" and "on the external disclosures of information about an individual. . . ."130 The National Strategy for Trusted Identities in Cyberspace echoed this in a 2011 report, announcing a "Data Minimization" principle: "Organizations should only collect PII that is directly relevant and necessary to accomplish the specified purpose(s) and only retain PII for as long as is necessary to fulfill the specified purpose(s).

In view of the above, the Board should ensure that the NSA, the CIA, and any other entity collecting data pursuant to EO 12333 minimize the retention of PII by using robust privacy enhancing techniques. Such measures are necessary "to ensure that information belonging to both U.S. and non-U.S. persons is used, retained and disseminated only when necessary for the protection of specifically articulated U.S. national security interests and in a manner that produces the least intrusion on rights necessary to secure those interests."132

Transparency solves backlash

Surveillance transparency is key to a free society and dampening societal backlash over surveillance

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 12)//AK

Transparency is vital to any open and free society. Open government laws and freedom of information laws let citizens know what the government is doing, and enable them to carry out their democratic duty to oversee its activities. Corporate disclosure laws perform similar functions in the private sphere. Of course, both corporations and governments have some need for secrecy, but the more they can be open, the more we can knowledgeably decide whether to trust them. Right now in the US, we have strong open government and freedom of information laws, but far too much information is exempted from them. For personal data, transparency is pretty straightforward: people should be entitled to know what data is being collected about them, what data is being archived about them, and how data about them is being used—and by whom. And in a world that combines an international Internet with country-specific laws about surveillance and control, we need to know where data about us is being stored. We are much more likely to be comfortable with surveillance at any level if we know these things. Privacy policies should provide this information, instead of being so long and deliberately obfuscating that they shed little light.

We also need transparency in the algorithms that judge us on the basis of our data, either by publishing the code or by explaining how they work. Right now, we cannot judge the fairness of TSA algorithms that select some of us for "special screening." Nor can we judge the IRS's

algorithms that select some of us for auditing. It's the same with search engine algorithms that determine what Internet pages we see, predictive policing algorithms that decide whom to bring in for questioning and what neighborhoods to patrol, or credit score algorithms that determine who gets a mortgage. Some of this secrecy is necessary so people don't figure out how to game the system, but much of it is not. The EU Data Protection Directive already requires disclosure of much of this information. It may seem as if I am contradicting myself. On one hand, I am advocating for individual privacy over forced surveillance. On the other, I am advocating for government and corporate transparency over institutional secrecy. The reason I say yes to both lies in the existing power imbalance between people and institutions. Institutions naturally wield more power than people. Institutional secrecy increases institutional power, and that power differential grows. That's inherently bad for personal liberty. Individual privacy increases individual power, thereby reducing that power differential. That's good for liberty. It's exactly the same with transparency and surveillance. Institutional transparency reduces the power imbalance, and that's good. Institutional surveillance of individuals increases the power imbalance, and that's bad.

AT: Leaks bad

Leaks are inevitable- the CP gets out in front of them

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 12)//AK

Transparency doesn't come easily. The powerful do not like to be watched. For example, the police are increasingly averse to being monitored. All over the US, police harass and prosecute people who videotape them, and some jurisdictions have ruled it illegal. Cops in Chicago have deliberately obscured cameras, apparently attempting to conceal their own behavior. The San Diego Police Department denies all requests for police videos, claiming that they're part of ongoing investigations. During the 2014 protests in Ferguson, Missouri, after the police killed an unarmed black man, police routinely prevented protesters from recording them, and several reporters were arrested for documenting events. Los Angeles police even went so far as to sabotage court-mandated voice recorders in their patrol cars.

Governments and corporations routinely resist transparency laws of all kinds. But the world of secrecy is changing. Privacy-law scholar Peter Swire writes about a declining half-life of secrets. What he observed is that, in general, secrets get exposed sooner than they used to. Technology is making secrets harder to keep, and the nature of the Internet makes secrets much harder to keep long-term. The push of a "send" button can deliver gigabytes across the Internet in a trice. A single thumb drive can hold more data every year. Both governments and organizations need to assume that their secrets are more likely to be exposed, and sooner, than ever before.

One of the effects of a shrinking half-life for secrets is that their disclosure is more damaging. One of Snowden's documents indicated that the NSA spied on the cell phone of German chancellor Angela Merkel. The document is undated, but it's obviously from the last few years. If that document had become public 20 years from now, the reaction in Germany would have been very different from the public uproar that occurred in 2013, when Merkel was still in office and the incident was current events rather than historical.

Cultural changes are also making secrets harder to keep. In the old days, guarding institutional secrets was part of a lifelong culture. The intelligence community would recruit people early in their careers and give them jobs for life. It was a private men's club, one filled with code words and secret knowledge. The corporate world, too, was filled with lifers. Those days are gone. Many jobs in intelligence are now outsourced, and there is no job-for-life culture in the corporate world anymore. Workforces are flexible, jobs are outsourced, and people are expendable. Moving from employer to employer is now the norm. This means that secrets are shared with more people, and those people care less about them. Recall that five million people in the US have a security clearance, and that a majority of them are contractors rather than government employees.

There is also a greater belief in the value of openness, especially among younger people. Younger people are much more comfortable with sharing personal information than their elders. They believe that information wants to be free, and that security comes from public knowledge and debate. They have said very personal things online, and have had embarrassing photographs of themselves posted on social networking sites. They have been dumped by lovers in public online forums. They have overshared in the most compromising ways—and they survived intact. It is a tougher sell convincing this crowd that government secrecy trumps the public's right to know.

These technological and social trends are a good thing. Whenever possible, we should strive for transparency.

NSA exaggerates the impact of leaks – New York Times incident proves

Currier 6/26 - journalist with a focus on national security, foreign affairs, and human rights (Cora Currier, "HOW THE NSA STARTED INVESTIGATING THE NEW YORK TIMES' WARRANTLESS WIRETAPPING STORY", The Intercept, 6/26/2015, https://firstlook.org/theintercept/2015/06/26/nsa-started-investigating-new-york-times-original-warrantless-wiretapping-story/)//MBB

Three days after the New York Times revealed that the U.S. government was secretly monitoring the calls and emails of people inside the United States without court-approved warrants, the National Security Agency issued a top-secret assessment of the damage done to intelligence efforts by the story. The conclusion: the information could lead terrorists to try to evade detection. Yet the agency gave no specific examples of investigations that had been jeopardized.

The December 2005 bombshell story, by James Risen and Eric Lichtblau, set off a debate about the George W. Bush administration's expansion of spying powers after the 9/11 attacks, and also about the Times editors' decision to delay its publication for a year. White House officials had

warned the Times that revealing the program would have grave consequences for national security.

The NSA's damage assessment on the article — referred to as a "cryptologic insecurity" — is among the files provided by former NSA contractor Edward Snowden. The memo recounts meetings in 2004 and 2005 in which administration officials disclosed "certain details of the special program to select individuals from the New York Times to dissuade them from publishing a story on the program at that time."

The memo gives a general explanation of what terrorists might do in reaction to the information revealed. It was "likely" that terrorists would stop using phones in favor of mail or courier, and use encryption and code words. They could also plant false information, knowing the U.S. government was listening. But the leaked program had not "been noted in adversary communications," according to the memo. It gave no specific examples of investigations or targets that had or might be impacted by the revelations.

"To this day we've never seen any evidence — despite all the claims they made to keep us from publishing — that it did any tangible damage to national security. This is further confirmation of that," Lichtblau told The Intercept.

"The reality was that the story told Americans what they didn't know about how the system was being stretched; it didn't tell terrorists anything that they didn't know, that the U.S. was aggressively trying to gather their communications," he said.

Oversight CP

Oversight CP – 1nc

CP text: The United States federal government should

-establish an external auditor to manage NSA oversight

-establish a public advocate to oversee surveillance applications

-establish a committee mirroring the Church Committee from the 1980s to extensively research the NSA, CIA, and FBI

-make the FISA court judge a senate-appointed position

CP solves NSA perception and transparency and has a stronger internal link than the aff to US credibility overall

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of

the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 13)//AK

More members of Congress must commit to meaningful NSA reform. We need comprehensive strategic oversight by independent government agencies, based on full transparency. We need meaningful rules for minimizing data gathered and stored about Americans, rules that require the NSA to delete data to which it should not have access. In the 1970s, the Church Committee investigated intelligence gathering by the NSA, CIA, and FBI. It was able to reform these agencies only after extensive research and discovery. We need a similar committee now. We need to convince President Obama to adopt the recommendations of his own NSA review group. And we need to give the Privacy and Civil Liberties Oversight Board real investigative powers.

Those recommendations all pertain to strategic oversight of mass surveillance. Next, let's consider tactical oversight. One primary mechanism for tactical oversight of government surveillance is the warrant process. Contrary to what many government officials argue, warrants do not harm security. They are a security mechanism, designed to protect us from government overreach.

Secret warrants don't work nearly as well. The judges who oversee NSA actions are from the secret FISA Court. Compared with a traditional court, the FISA Court has a much lower standard of evidence before it issues a warrant. Its cases are secret, its rulings are secret, and no one from the other side ever presents in front of it. Given how unbalanced the process it is, it's amazing that the FISA Court has shown as much backbone as it has in standing up to the NSA (despite almost never rejecting a warrant request).

Some surveillance orders bypass this process entirely. We know, for example, that US Cellular received only two judicially approved wiretap orders in 2012—and another 10,801 subpoenas for the same types of information without any judicial oversight whatsoever. All of this needs to be fixed.

Start with the FISA Court. It should be much more public. The FISA Court's chief judge should become a position that requires Senate confirmation. The court should publish its opinions to the extent possible. An official public interest advocate should be assigned the task of arguing against surveillance applications. Congress should enact a process for appealing FISA rulings, either to some appellate court or to the Supreme Court.

But more steps are needed to put the NSA under credible tactical oversight. Its internal procedures are better suited to detecting activities such as inadvertent and incorrect surveillance targeting than they are to detecting people who deliberately circumvent surveillance controls, either individually or for the organization as a whole. To rectify this, an external auditor is essential. Making government officials personally responsible for overreaching and illegal behavior is also important. Not a single one of those NSA LOVEINT snoops was fired, let alone prosecuted. And Snowden was rebuffed repeatedly when he tried to express his concern internally about the extent of the NSA's surveillance on Americans.

Other law enforcement agencies, like the FBI, have their own internal oversight mechanisms. Here, too, the more transparency, the better. We have always given the police extraordinary

powers to investigate crime. We do this knowingly, and we are safer as a society because of it, because we regulate these actions and have some recourse to ensure that the police aren't abusing them. We can argue about how well these are working in the US and other countries, but the general idea is a sound one.

Cybersecurity CP

1nc – nearly all PIC

The United States federal government should appoint an independent oversight commission that reviews zero day vulnerabilities, under a mandate to patch nearly all possible vulnerabilities and disclose nearly all cyber bugs it fixes.

The CP solves for US credibility, transparency, and enhances cybersecurity, but prevents unilateral disarmament

Schneier, 15, fellow at the Berkman Center for Internet and Society at Harvard Law School, a program fellow at the New America Foundation's Open Technology Institute, a board member of the Electronic Frontier Foundation, an Advisory Board Member of the Electronic Privacy Information Center, and the Chief Technology Officer at Resilient Systems, Inc (Bruce, Data and Goliath: the Hidden Battles to Collect Your Data and Control Your World, Ch. 13)//AK

As I discussed in Chapter 11, a debate is going on about whether the US government — specifically, the NSA and US Cyber Command—should stockpile Internet vulnerabilities or disclose and fix them. It's a complicated problem, and one that starkly illustrates the difficulty of separating attack and defense in cyberspace.

An arms race is raging in cyberspace right now. The Chinese, the Russians, and many other countries are also hoarding vulnerabilities. If we leave a vulnerability unpatched, we run the risk that another country will independently discover it and use it in a cyberweapon against us and our allies. But if we patch all the vulnerabilities we find, there goes our armory.

Some people believe the NSA should disclose and fix every bug it finds. Others claim that this would amount to unilateral disarmament. President Obama's NSA review group recommended **something in the middle**: that vulnerabilities should only be **hoarded in rare instances** and for short periods of time. I have made this point myself. This is what the NSA, and by extension US Cyber Command, claims it is doing: balancing several factors, such as whether anyone else is likely to discover the vulnerability—remember NOBUS from Chapter 11—and how strategic it is for the US. The evidence, though, indicates that it hoards far more than it discloses.

This is backwards. We have to err on the side of disclosure. It will especially benefit countries that depend heavily on the Internet's infrastructure, like the US. It will **restore trust** by demonstrating that we're putting security ahead of surveillance. While stockpiled vulnerabilities need to be kept secret, the more we can open the process of deciding what kind of vulnerabilities

to stockpile, the better. To do this properly, we **require an independent government organization** with appropriate technical expertise making the decisions.

In today's cyberwar arms race, the world's militaries are investing more money in finding and purchasing vulnerabilities than the commercial world is investing in fixing them. Their stockpiles affect the security of us all. No matter what cybercriminals do, no matter what other countries do, we in the US need to err on the side of security by fixing **almost all** the vulnerabilities we find and making the process for disclosure more public. This will keep us safer, while engendering trust both in US policy and in the technical underpinnings of the Internet.

1nc – NIST CP

The United States should remove the requirement that the NSA be consulted on encryption standards and prohibit the NSA from using appropriated funds to interfere with National Institute of Standards and Technology's encryption standards

Solves cybersecurity – sets better international standards for data encryption

Kehl 14 - Danielle Kehl is a Policy Analyst at New America's Open Technology Institute (OTI) (Danielle, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity", New America's Open Technology Institute, https://www.newamerica.org/downloads/Surveilance_Costs_Final.pdf//DM)

Because of United States' critical role in the development of the Internet, U.S.-based organizations and government agencies have historically been central to standards setting and oversight of key Internet functions, particularly through the National Institute of Standards and Technology (NIST). NIST is the Commerce Department agency responsible for setting scientific and technical standards that both the government and the private sector rely upon.239 As outlined in the 2002 Federal Information Security Management Act (FISMA), NIST has a statutory obligation to consult with the NSA on certain standards and guidelines "to assure, to the maximum extent feasible, that such standards and guidelines are complementary with standards and guidelines developed for national security systems."240 The Snowden leaks revealed that the NSA took advantage of that position to influence the standards-setting process to weaken encryption standards to the agency's benefit. According to documents released by The Guardian, The New York Times, and ProPublica in September 2013, the NSA "worked covertly to get its own version of a draft security standard issued by the US National Institute of Standards and Technology approved for worldwide use in 2006."241 This standard was later adopted by the International Organization for Standardization, a body with membership from countries all over the world. A number of experts suspected that the NSA had engineered a weakness in the standard that two Microsoft cryptographers discovered in 2007, and the classified memos released last year apparently confirm that this was the case. According to The New York Times, "The N.S.A. wrote the standard and aggressively pushed it on the international group, privately calling the effort 'a challenge in finesse.'"242

A few days after details about the compromised standard were revealed by the press, RSA Security—an American network security company that publicly fought against the Clipper Chip

in the 1990s243—privately alerted its customers that they should stop using an encryption algorithm that had been influenced by the NSA. Officials advised customers that one of the cryptography components in the BSAFE toolkit and Data Protection Manager by default used a specification known as Dual_EC_DRBG when generating keys.244 Although NIST approved Dual_EC_DRBG in 2006, the Snowden documents revealed that the random number generator contained a vulnerability engineered by the NSA. According to the Wall Street Journal, the announcement marked one of the first times that a security company had acknowledged the U.S. government's involvement in direct tampering with a product in order to facilitate access.245 The BSAFE library has been used in a number of products, including some versions of the McAfee Firewall Enterprise Control Center, and, according to Ars Technica, the backdoor "means that an untold number of third-party products may be bypassed not only by advanced intelligence agencies, but possibly by other adversaries who have the resources to carry out attacks that use specially designed hardware to quickly cycle through possible keys until the correct one is guessed."246 Documents released a few months later, in December 2013, revealed that RSA had a secret $10 million contract with the NSA wherein the security company agreed to set the compromised standard as the default in a number of its BSAFE products.247

Many cryptographers and security researchers have been skeptical of the NIST process for years, although they are heavily reliant upon the organization for everything from random number generators to more complex functions.248 While NIST has said it would never "deliberately weaken a cryptographic standard," it is unclear whether the agency was aware that the NSA was aggressively pushing for it to adopt a compromised standard.249 Both NIST and the NSA issued statements after the stories broke in September 2013 defending the standard, although NIST's statement indicated that the agency would also evaluate its processes to ensure that they were open, transparent, and held to high professional standards.250 Yet, it is clear that, at least in part as a result of the NSA's effort to exert its pervasive influence and perceived security expertise, NIST issued a compromised algorithm that was included for almost a decade in the cryptographic libraries of major tech companies, including Microsoft, Cisco, Symantec and RSA, because it was required for eligibility for government contracts.251 "The impact of weakening a standard may be even greater than a weakening a specific product or service because that one standard may be used in so many different products and services," notes a recent report from the Institute of Electrical and Electronics Engineers in the U.S.252 Although some have argued that the compromised algorithm was not widely-used, its presence in a number of products nonetheless diminishes America's reputation as a standards-setter, which is viewed as increasingly critical as foreign competition for products and software intensifies. Meddling with standards can undermine American industry, adding economic costs on top of security concerns.253

Weakening cryptographic standards demonstrably harms Internet security. It also hurts the credibility of NIST, which has been directed by President Obama to draft cybersecurity guidelines for critical infrastructure including telephone systems and power plants. "Suspicions of NSA intervention in NIST standards in support of the NSA intelligence mission have a negative effect on NIST's reputation and the credibility of the standards NIST develops… [T]hey also have a negative effect on the credibility of US industry that implements those standards and thus on international competitiveness," observed Microsoft's Steven B. Lipner.254 Put simply, "NIST is operating with a trust deficit right now," said Chris Soghoian of the American Civil Liberties Union to the National Journal. 255 As part of an effort to begin rebuilding that trust, NIST announced in May 2014 that it would begin a review of its cryptographic standards and guidelines program with the help of a panel of outside experts known as the Visiting Committee

on Advanced Technology (VCAT).256 In July 2014, the VCAT issued a report that examined the agency's processes and relationship with the NSA, outlining a series of recommendations to rebuild its credibility.257 These recommendations included improving transparency and openness around NIST processes, increasing the technical staff at NIST, and clarifying NIST's relationship with the NSA.258 As Ellen Richey, an Executive Vice President at Visa, Inc. and member of the VCAT, noted in her assessment, "The allegation that NSA has, or had, a program designed to insert weaknesses into global cryptographic standards… calls into question the integrity… of all the cryptographic standards developed by NIST," adding that, "Participants in the development process should understand that the risk from conflicts of interest arises from the appearance of impropriety, even in the absence of actual misconduct."259

With regard to redefining or clarifying NIST's statutory relationship to the NSA, parallel efforts are underway in Congress as well. In May 2014, the House Science and Technology Committee voted to adopt an amendment to the Frontiers in Innovation, Research, Science, and Technology (FIRST) Act offered by Representative Alan Grayson (D-FL) which would remove the requirement that the NSA be consulted on encryption standards, allowing NIST to request NSA assistance on an as-needed basis instead.260 A similar amendment proposed by Representative Grayson that would prohibit the NSA from using appropriations funds to interfere with NIST's security standards was approved by the House in June 2014 as part of a defense appropriations bill.261 However, it remains to be seen if such a measure will ultimately be passed into law.

2nc – solves encryption

Increased support, usage, and standards of encryption solves cybersecurity

Rubinstein and Hoboken 14 – *Senior Fellow at the Information Law Institute (ILI) and NYU School of Law, AND **Microsoft Research Fellow in the Information Law Institute at New York University, PhD from the University of Amsterdam (Ira and Joris Van, PRIVACY AND SECURITY IN THE CLOUD: SOME REALISM ABOUT TECHNICAL SOLUTIONS TO TRANSNATIONAL SURVEILLANCE IN THE POST- SNOWDEN ERA, 66 Maine L. Rev. 488, September 2014, http://ssrn.com/abstract=2443604)//JJ

B. The Industry Response: Taking Care of Old Business

In a recent article, reporter Steven Levy nicely captures the general response of Internet firms to the Snowden revelations by providing a look "inside their year from hell."133 Levy documents industry's struggle to craft a proper response to the uproar about direct government access to their servers (as alleged in the early reports of PRISM) and reassure overseas customers in light of the unhelpful U.S. government statements that NSA snooping was only directed at "non-American citizens."134 Industry had little success in quelling suspicion and regaining trust, especially from foreign customers and governments. "Every time we spoke it seemed to make matters worse . . . [w]e just were not believed," explained one tech executive to Levy.135

Quite apart from overcoming this atmosphere of general distrust, industry players had enough on their hands in deciding on a practical response to the Snowden troubles. Of the many possible technical measures aimed at restricting undue access to online information and communication,

the most obvious one for them to consider was **more extensive use of encryption**. When properly implemented by cloud providers, encryption measures can help secure communications and stored data against third party intrusions, including those of government intelligence agencies.136 At the very least, service providers could deploy encryption protocols like TLS/SSL to secure client-server communications between users and their own services.137 The MUSCULAR revelations suggest that service providers could also encrypt data more comprehensively once it arrives at their servers for processing or storage.138 Indeed, many of the measures discussed in this Section are but old wine in new bottles: that is, prudent responses to longstanding security risks that have been given greater urgency by the Snowden revelations. If the cloud industry had taken information security more seriously years ago, their services would have been less vulnerable in the first place.

Before turning to the specifics of the industry responses, it is worth briefly observing that despite the value of encryption measures in hindering surveillance, it has some limitations. In particular, as long as a service provider holds or has access to its users' encryption keys, it maintains the ability to access a user's data in unencrypted form, notwithstanding the fact that data travels between a client and a server securely. Moreover, for encryption measures to be effective in preventing backdoor access, industry must rely on cryptographic standards and implementations that have not been corrupted and must keep encryption keys out of the hands of government agencies. This may seem obvious, but achieving it is less so. Recent revelations related to NSA efforts to undermine cryptographic standards themselves are particularly worrying in this regard.139

In its discussion of what should be done to promote security and trust in encryption technologies, the President's Review Group implicitly rejected NSA activities undermining encryption standards by recommending that **the U.S. Government should**: "(1) fully support and not undermine efforts to **create encryption standards**; (2) not in any way subvert, undermine, weaken, or make vulnerable generally available commercial software; and (3) increase the use of encryption and **urge US companies to do so**, in order to better protect data in transit, at rest, in the cloud, and in other storage." While specific implementations of encryption technologies may suffer from security weaknesses, the use of encryption generally helps **protect cloud data against interception by third parties**, including **government agencies**. In contrast, no encryption or weak encryption enables government agencies to access cloud data without having to rely on legal process directed at cloud providers or the targeted interception of key material.

Ex post CP

1nc – ex post CP

Text:

The United States federal government should:

--require ex post review by the Foreign Intelligence Surveillance Court of NSA surveillance targeting criteria

--establish a public advocate at the FISC

--establish a cabinet-level privacy agency

The CP restores domestic and international confidence in US surveillance without restricting the scope of NSA activities – instead it conducts post-surveillance minimization

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, April, lexis)

While I have concluded that U.S. surveillance policy does not violate the ICCPR, further reforms could highlight this point and silence persistent doubts here and abroad. These reforms could also remove any barriers to cooperation between the United States and foreign states, such as those in Europe, which are subject to the European Convention on Human Rights. This section identifies reforms that would add a public advocate to FISC proceedings, enhance FISC review of the criteria used for overseas surveillance, establish a U.S. privacy agency that would handle complaints from individuals here and overseas, and require greater minimization of non-U.S. person communications. These reforms would signal U.S. support of evolving global norms of digital privacy.

Although President Obama's speech in January 2014 proposed a panel of independent lawyers who could participate in important FISC cases, n161 further institutionalization of this role would be useful. A public advocate would scrutinize and, when necessary, challenge the NSA's targeting criteria on a regular basis. n162 Challenges would be brought in the FISC, after the NSA's implementation of criteria. The NSA would be able to adapt the criteria on an exigent basis, **subject to ex post review** by the FISC at the public advocate's behest. A public advocate and enhanced FISC review would serve three valuable functions: (1) ensure that the FISC received the best arguments on both sides; (2) serve as a valuable ex ante check on the government, encouraging the government to adopt those criteria that could withstand subsequent scrutiny; and (3) **promote domestic and global confidence in the legitimacy of processes governing NSA surveillance**.

A U.S. cabinet level privacy agency would also **bolster the legitimacy of surveillance**. The agency could provide more regular recourse to subjects of surveillance, as the ECHR requires. That change would ease the barriers to continued U.S.-Europe cooperation on counterterrorism. A national agency would also work hand in hand with privacy officers in executive departments. It would increase the leverage of those officials, who could advocate vigorously in internal debates, knowing that their views would also have a champion in a free-standing executive department independent [*2166] of the national security bureaucracy. There are downsides to this proposal,

of course. A new agency would add expense, and create some redundancy in government functions. Moreover, current models that provide recourse, such as the approach currently taken by the Department of Homeland Security, n163 have been criticized as unduly burdensome. n164 However, preserving cooperation with Europe and enhancing the overall legitimacy of U.S. surveillance provides a compelling justification.

Each of these instrumentalities - a public advocate at the FISC and a new privacy agency - could also work to strengthen minimization requirements for foreign communications. The NSA says that it disposes of all irrelevant communications within five years. There may be ways to shorten this time and require even more rigorous controls on sharing of information that lacks a clear link to terrorism or other foreign intelligence matters. More exacting minimization would also promote U.S.-European information sharing and **enhance global legitimacy**.

The net benefit is terrorism – the CP solves but avoids the chilling effect of ex ante restrictions that prevents the NSA reacting in exigent circumstances

Margulies 14 [Peter, Professor of Law, Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2400809&download=yes] Schloss

The better course for Congress would be to offer an itemized, but not exhaustive list of permissible uses of U.S. person identifiers. Congress could permit U.S. person queries in cases involving pre-existing FISA orders, threats to life, efforts to join international terrorist groups (the ISIS example), and other transnational illegal activity. This list would not categorically bar other uses of U.S. person identifiers, allowing some room for those uses when compelling circumstances arose. However, it would frame the substantive discussion in a useful way, and send a signal to the FISC and the executive branch that deliberation on the scope of U.S. person queries was vital.

A set of guidelines like those suggested would also compensate for the broader latitude that the NSA has for incidental collection under § 702. In cases that comprise the basis for the incidental collection doctrine, a federal judge had already issued a warrant based on probable cause to believe that wrongdoing had occurred.383 That is not the case with § 702, where the FISC merely reviews government targeting procedures.384 The latitude permitted under § 702 gives the government more room to frame initial searches to ensnare Americans. Critics have surely exaggerated the government's ability to engage in reverse targeting. Evidence that the NSA has engaged in such practices is slim to nonexistent. However, a dynamic approach that adjusts to the post-Snowden climate should not treat the absence of reported abuse as a recipe for complacency. Instead, this is the appropriate time to put in place safeguards that will avoid abuse in the future.

External constraints should be optimal for providing flexibility while ensuring checks on potential abuse. As in other situations, a public advocate should receive notice of the NSA's use of U.S. person identifiers to query § 702 data. Once a statutory standard is in place, the advocate should be able to seek FISC review of any identifier when a reasonable possibility exists that the use of the identifier does not comply with Congress's formulation. This review would be **ex post**, to **avoid chilling the agency's discretion in exigent situations**. Ex post review would still be meaningful, given the NSA's status as a repeat player dependent on the FISC's continued good will. External constraints of this kind would assure critics that substantive standards were being

followed. This external check is essential in the post-Snowden climate, in which internal "protocols" have – perhaps to a fault – become objects of corrosive cynicism.

NSA confidence to act in exigent circumstances are key to fighting terrorism

Jordan 2006 – Adjunct Professor of Law, Washington & Lee University School of Law, Institute Fellow, New York University School of Law, Institute for International Law and Justice, J.D. with honors Washington and Lee University School of Law, B.A. Dickinson College (David, "DECRYPTING THE FOURTH AMENDMENT: WARRANLESS NSA SURVEILLANCE AND THE ENHANCED EXPECTATION OF PRIVACY PROVIDED BY ENCRYPTED VOICE OVER INTERNET PROTOCOL" 47 B.C.L. Rev. 505, law digital commons)//TT

http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=2330&context=bclr

The NSA is perhaps the most important force protecting the United States from foreign terrorism and other threats to national security. The information provided by the agency informs national security and foreign policy decisionmakers, thereby also playing a vital role in ensuring international peace and security. While the incredible value of this agency cannot be overstated, neither can the risks posed by its vast capabilities. The broad scope of the agency's vigilant efforts has the potential to threaten the legitimate rights of American citizens, and appropriate checks must be in place.234

FISA provides a well-established legal framework that has protected the rights of American citizens from unwarranted government surveillance since 1978. 235 Although it appears that this framework recently may have been circumvented through a secret executive order,236 warrantless surveillance of Americans is nothing new. 237 Gaps in our legal protections have existed since FISA's enactment. 236

The NSA's minimization procedures provide strong protection for the rights of U.S. citizens under most circumstances, but they **allow breaches to occur in situations that are** arguably **the most crucial.** Although the NSA is required to destroy information inadvertently obtained about U.S. citizens in most cases, the current minimization procedures allow the agency effectively to initiate criminal investigations by turning over such information to law enforcement if criminal conduct is revealed. This places Americans at risk of criminal prosecution resulting from warrantless eavesdropping on their private telecommunications. This should not be permitted. Although it may not be practicable for the NSA to obtain a warrant in every case where information about U.S. citizens may be inadvertently acquired, the heightened expectation of privacy provided by encrypted Internet telephony should require additional limitations on what may be done with such information after it is acquired.

USSID 18 must be redrafted to forbid the use of inadvertently obtained information for the purpose of initiating criminal investigations against U.S. citizens **unless exigent circumstances are presented**. By disallowing the use of such information for these purposes, the government would be ensuring that the NSA stays focused on its primary mission—**protecting the United States from terrorism** and foreign intelligence operations—and not engaging in general criminal investigations domestically. Under the current directive, the NSA has an incentive to collect as much "inadvertently acquired" information as possible. If the possibility of using such

information to initiate unrelated criminal investigations were removed, the agency would cease to have an incentive to collect information unrelated to its national security mission. This would provide the agency with an incentive to maintain its focus on foreign terrorism and counterintelligence, and it would curb the temptation to stray into unrelated matters more appropriately left to those charged with domestic law enforcement.

This solution would allow the NSA to protect U.S. national security, while also enabling American citizens to communicate with foreign acquaintances without fear. It would also have the benefit of **restoring public confidence in the NSA**, effectively **combating the perception** that the agency engages in frequent violations of the very rights it was created to defend.

2nc – ex post solves

The CP's ex post review process deters executive abuse and restores legitimacy to US surveillance
Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

As for the structural considerations, one of the most important is what might be called an anti-unilateralism principle. A system of programmatic surveillance should not be put into effect on the say-so of the executive branch, but rather should be a collaborative effort that involves Congress (in the form of authorizing legislation) or the judiciary (in the form of FISA court review of the initiatives). n42 An example of the former is FISA itself, which Congress enacted in 1978. At the time, the NSA was engaged in bulk collection, without judicial approval, of certain international communications into and out of the United States--namely, by tapping into offshore telecommunications cables and by eavesdropping on satellite based radio signals. FISA's [*533] famously convoluted definition of "electronic surveillance" n43 preserved these preexisting practices even as Congress was imposing a new requirement of judicial approval for other kinds of monitoring. n44 An example of the latter concerns the warrantless Terrorist Surveillance Program, under which the NSA was intercepting, outside the FISA framework, certain communications between suspected al-Qaeda figures overseas and people located in the United States. After that program's existence was revealed in late 2005, the executive branch persuaded the FISA court to issue orders allowing it to proceed subject to various limits. n45 (That accommodation eventually proved unworkable, and the executive then worked with Congress to put the program on a more solid legislative footing through the temporary Protect America Act of 2007 n46 and the permanent FISA Amendments Act of 2008.) n47

Anti-unilateralism is important for several reasons. To take the most obvious, Congress and the courts can help prevent executive overreach. n48 The risk of abuse is lessened if the executive branch must enlist its partners before commencing a new surveillance initiative. Congress might decline to permit bulk collection in circumstances where it concludes that ordinary, individualized monitoring would suffice, or it might **authorize programmatic surveillance** subject to various privacy protections. In addition, inviting many voices to the decision-making

table increases the probability of sound outcomes. More participants with diverse perspectives can also help mitigate the groupthink tendencies to which the executive branch is sometimes [*534] subject. n49 If we're going to engage in programmatic surveillance, it should be the result of give and take among all three branches of the federal government, or at least between its two political branches, not the result of executive edict.

A second principle follows from the first: Programmatic surveillance should, wherever possible, have explicit statutory authorization. Congress does not "hide elephants in mouseholes," n50 the saying goes, and we should not presume that Congress meant to conceal its approval of a potentially controversial programmatic surveillance system in the penumbrae and interstices of obscure federal statutes. Instead, Congress normally should use express and specific legislation when it wants to okay bulk data collection. Clear laws will help remove any doubt about the authorized scope of the approved surveillance, thereby **promoting legal certainty**. Express congressional backing also helps give the monitoring an **air of legitimacy**. And, a requirement that programmatic surveillance usually should be approved by clear legislation helps promote accountability by minimizing the risk of congressional shirking. n51 If the political winds shift, and a legislatively approved program becomes unpopular, Congress will not be able to hide behind an ambiguous statutory grant of power and deflect responsibility to the President.

Ex post oversight is key to effective programmatic surveillance – the CP allows the government to collect all available data – it just puts ex post restrictions on the data analysis stage that deters executive data abuses

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

As for the operational considerations, among the most important is the need for external checks on programmatic surveillance. In particular, bulk data collection should have to undergo some form of judicial review, such as by the FISA court, in which the government demonstrates that it meets the applicable constitutional and statutory standards. Ideally, the judiciary would give its approval before collection begins. But this will not always be possible, in which case timely post-collection judicial review will have to suffice. (FISA has a comparable mechanism for temporary warrantless surveillance in emergency situations.) n60 Programmatic surveillance also should be subject to robust congressional oversight. This could take a variety of forms, including informal consultations with members of Congress when designing the surveillance regime (including, at a minimum, congressional leadership and members of the applicable committees), [*537] as well as regular briefings to appropriate personnel on the operation of the system and periodic oversight hearings.

Of course, judicial review in the context of bulk collection won't necessarily look the same as it does in the familiar setting of individualized monitoring of specific targets. If investigators want to examine the telephony metadata associated with a particular terrorism suspect, they can apply to the FISA court for a pen register or trap and trace order upon a showing that the information sought is relevant to an ongoing national security investigation. n61 But, as explained above, that kind of particularized showing often won't be possible where authorities are dealing with

unknown threats, and where the very purpose of the surveillance is to identify those threats. In these situations, reviewing courts may find it necessary to allow the government to collect large amounts of data without individualized suspicion. This doesn't mean that privacy safeguards must be abandoned and the executive given free rein. Instead, courts could be tasked with scrutinizing the initiative's overall structure and operation to determine its compatibility with constitutional and statutory requirements. And courts further could require authorities to demonstrate some level of individualized suspicion before accessing the data that has been collected. Protections for privacy and civil liberties thus can migrate from the collection phase of the intelligence cycle to earlier and later stages, such as the systems design and analysis stages. n62

In more general terms, because programmatic surveillance involves the collection of large troves of data, it likely means some dilution of the familiar ex ante restrictions that protect privacy by constraining the government from acquiring information in the first place. It therefore becomes critically important to devise **meaningful ex post safeguards** that can achieve similar forms of privacy protection. In short, restrictions on the government's ability to access and use data that it has gathered must substitute for restrictions on the government's ability to gather that data at all; what I have elsewhere called **use limits must stand in for collection limits**. n63

This sort of oversight by the courts and Congress provides an obvious, first-order level of protection for privacy and civil liberties--an external veto serves as a direct check on possible executive [*538] misconduct. Judicial and legislative checks also offer an important second-order form of protection. The **mere possibility** of an outsider's veto can have a chilling effect on executive misconduct, discouraging officials from questionable activities that would have to undergo, and might not survive, external review. n64 Moreover, external checks can channel the executive's scarce resources into truly important surveillance and away from relatively unimportant monitoring. This is so because oversight increases the administrative costs of collecting bulk data--e.g., preparing a surveillance application, persuading the judiciary to approve it, briefing the courts and Congress about how the program has been implemented, and so on. These increased costs encourage the executive to prioritize collection that is expected to yield truly valuable intelligence and, conversely, to forego collection that is expected to produce information of lesser value.

Ex ante requirements amount to a rubber stamp

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

The FISC approves virtually every application for an order with which it is presented. According to Electronic Privacy Information Center (EPIC) statistics, the court denied only five applications from its inception through 2006.40 In that time, it has approved thousands of others, including a new high of 2176 in 2006.41 Of course, "[i]t is possible to draw divergent conclusions from this data. One could infer that the extensive FISA safeguards have forced the Executive to self-censor its requests. One could also argue, however, that the **courts act merely as a 'rubber stamp'** whenever the Executive invokes national security."42 Upon analyzing FISA's structure and track record, the nature of electronic surveillance in service of national security, and more general

separation of powers and national security lessons, it seems that something more like the latter is the ultimate result of FISA.

Limitations inherent in the project of judicial pre-approval of national security surveillance render the system unable to perform the function for which it was created; each of the problems described below mutually reinforces the others, leading to **systemic ineffectiveness**. In the absence of the notice requirements that attach in domestic surveillance, 43 and in light of the ex parte nature of FISC proceedings, no opportunity for meaningful review may ever present itself.44 "The potential for abuse is substantial, since all applications remain sealed and unavailable to the public, and since targets are never notified that they have been under surveillance."45

The lack of adversariality, reliance on executive representations and national security framing mean it's a rubber stamp

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

1. Non-adversariality. — One of the most striking elements of the FISA system is the total absence of adversariality. Because the collection of intelligence in this context requires by its very nature that the surveilled party not receive notice in advance, the ex ante approval system is almost by definition also ex parte. This puts the FISC in an "anomalous position,"46 in the words of the current Attorney General, similar to that of a court reviewing FISA materials for admission in a criminal case. In such situations, "[t]he judge is forced not only to act as an arm of the prosecution in weighing the prosecution's arguments about whether disclosure would or would not compromise national security, but also to act as a defense lawyer in determining whether the information is useful to the defendant."47 Similarly, in reviewing a FISA application, the FISC must attempt the difficult, if not impossible, task of simultaneously occupying the roles of advocate and neutral arbiter — all without the authority or ability to investigate facts or the time to conduct legal research.48 The judge lacks a skeptical advocate to vet the government's legal arguments, which is of crucial significance when the government is always able to claim the weight of national security expertise for its position. It is questionable whether courts can play this role effectively, and, more importantly, whether they should.49

2. Reliance on Executive Representations. — One frequently overlooked element of the FISA system is its almost complete reliance upon the Executive's representations and willingness to abide by the statutory terms.50 This would be all the more true if Congress lowers the degree of factual specificity necessary for issuance of a FISC order, a change that is included in both the Senate and House bills.51 Even under the current standard, however, the FISC cannot inquire behind the representations made by the applicant; so long as the applicant presents a "statement of facts showing that there are reasonable grounds"52 for the order to issue, "the judge shall enter an ex parte order as requested."53

There is a strong connection between the difficulties of relying on executive branch representations and the ex parte nature of the FISC inquiry: the FISC lacks the presence of an adversarial voice drawing into focus any concerns with an application. In this sense, the two

problems are mutually reinforcing. Indeed, the FISC on one occasion detailed "misstatements and omissions of material facts" that the government confessed "in some 75 FISA applications,"54 problems that did not come to light at the time the orders were issued. In this context it is also worth noting that the Executive has never actually accepted that it is bound by FISA, citing inherent presidential authority over national security under Article II of the Constitution.55 The current administration acted in part on this basis in operating the TSP.56 Lacking the ability to initiate an inquiry beyond what the Executive brings to its attention, the FISC's oversight of the process is substantially controlled by the very entity it is designed to oversee.

3. Institutional Limitations of the Judiciary. — Even if the above problems could be overcome, institutional factors that are inherent in the national security arena will always function to limit the ability of the judiciary to serve as an effective check. First, the surveillance that FISA deals with necessarily involves secrecy, inherently requires policy judgments, and takes place in the context of the increased powers of the Executive in the national security arena. As a result, policymakers are rightly fearful of giving too much review power to courts and face inevitable pressure to scale back the amount of decisionmaking authority left to the judiciary.

Second, the courts are, and have always been, extremely passive in exercising jurisdiction over cases touching upon national security, both because of the reasons just noted (political judgment and executive power) and because of resultant concerns for institutional legitimacy and judicial restraint.57 Courts tend to be highly deferential because of "concern for the efficiency and expertise of the nation's foreign intelligence process and the deleterious effects that might result from judicial interference."58 Judges are most certainly aware of the limits of their own policy expertise. This effect is greatly enhanced when judges must weigh the national security necessity ex ante, rather than being asked to review it after the fact.

Indeed, it is interesting to note that the scope of review exercised by the FISC has steadily narrowed over time. To be sure, it was narrow to begin with,59 but both legislative action and limiting constructions applied by the courts themselves have narrowed the FISC's authority even further. For example, when Congress amended FISA to require only that national security be a "significant purpose," rather than the "primary purpose," of the surveillance for which authorization is sought,60 the FISCR read the statutory shift quite broadly. It held that when surveillance of a foreign agent is undertaken for purposes of both national security and law enforcement, the government need only "entertain[] a realistic option of dealing with the agent other than through criminal prosecution" in order to satisfy the test.61 The court reasoned that the new provisions "eliminated any justification for the FISA court to balance the relative weight the government places on criminal prosecution as compared to other counterintelligence responses." 62 Yet this seems a far less robust limit than the plain language or legislative history indicated: importantly, the legislature considered and rejected requiring only "a" rather than "a significant" purpose.63 Given a hint of statutory ambiguity, then, the court effectively read the requirement of "significant purpose" out of the statute, resulting in a regime of even less exacting scrutiny. Ultimately, "[t]hrough a combination of government tactics, the mandate of the FISA court, and federal court interpretations of the FISA law, the FISA safeguards which were intended to balance individual rights against the government's claims of national security have been essentially eviscerated."64

As a result, "[c]harging a panel of federal judges with insufficient background information on specific cases, and little intelligence experience, with approving foreign intelligence surveillance applications has resulted in an essentially rubber stamp process where applications are practically

never denied."65 Primary reliance on judicial oversight will virtually always tend toward deference, both in exercising jurisdiction and in determining individual cases.

Ex ante review undermines effective restrictions on domestic surveillance and shuts down an engaged citizenry

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

Ex ante judicial review is not only of limited effectiveness, but it is also affirmatively harmful in several respects. Ex ante judicial approval imparts a broader imprimatur of validity than is warranted given the limited effectiveness of the review. Further, it clouds accountability and can be a cumbersome and intrusive process harmful to national security interests. In fact, "the creation of FISA courts may actually have resulted in fewer restrictions on the domestic surveillance activities of intelligence agencies"69 because "[t]he secrecy that attends FISC proceedings, and the limitations imposed on judicial review of FISA surveillance, may insulate unconstitutional surveillance from any effective sanction."70

1. The Judicial Imprimatur. — The issuance of an order by the FISC confers a stamp of approval from the widely respected Article III courts. A FISC order makes a strong statement that a neutral arbiter has looked closely at the situation and found the surveillance warranted. Yet, as the set of limitations just discussed indicates, the protective force of a FISC order may not align with the actual vigor of the inquiry.

This disparity may give rise to several problems. First, changed circumstances following the issuance of the order may undermine the validity of the surveillance. Minimization procedures are largely unhelpful in solving this problem: "[T]he Act provides for the same kind of incoherent and largely unenforceable 'minimization' requirements that plague criminal wiretap statutes."71 Much more importantly, the judicial order may mask and indeed later provide cover for improper governmental motives and improper intrusions on liberty.72 In these situations, ex ante review may **sanitize the improper surveillance**. The presence of the judicial order may function to dissuade legislative or executive oversight entities from inquiry. Worse, judicial orders offer the potential for the government to hide behind the nominally objective, even if only minimally rigorous, scrutiny that they represent.

Surveillance conducted for political reasons, for example, might escape detection, condemnation, and consequences — political, if not legal — if that surveillance is given judicial protection.73 Indeed, this sanitization could occur on an even broader level: ex ante judicial approval interferes with the healthy public skepticism that attends political actors and that may help keep the citizenry engaged in considering the difficult tradeoffs between liberty and security necessary in this context. This is not to say that the judiciary should decline to play a constitutionally permissible role; rather, the point is that system designers concerned with protecting civil liberties should keep in mind the drawbacks of ex ante approval. In total, the capacity of ex ante approval to enable some of the most dangerous sorts of abuses far outweighs its middling ability to provide a useful check.

Ex ante review undermines political accountability – key to checking abuses and fostering public engagement

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

2. Clouded Accountability. — Although several of FISA's provisions recognize the need for clear lines of accountability, the statute's broad structure fails to account for this crucial element. A simple comparison is useful: The Attorney General would be far more politically exposed if he or she signed off on an improper emergency order, which permits an exception to the ex ante approval requirement, rather than a regular FISA order approved by the FISC. In fact, the emergency authorization procedures under 50 U.S.C. § 1805(f) recognize the need for accountability by requiring notice if the application is turned down after the Attorney General has authorized it on an emergency basis.74 Similarly, the personal review provisions of § 1804(e) establish clear lines of authority for approval. But the presence of a judicial order authorizing surveillance permits a culpable official to escape the political consequences of his or her improprieties by using the court's approval as evidence of reasonableness, claiming reasonable reliance, or **foisting blame upon the court.**

Exposing the Attorney General — and through him or her the President — to the political consequences of these decisions is crucial for two reasons: First, it minimizes the possibility of politically motivated surveillance that would pass minimal judicial review, because such invasions of privacy would be seen as wholly illegitimate.75 Second, it would both enable and force the American public to confront the fact that, ultimately, it is responsible for determining the proper balance between liberty and security. The public will be much more comfortable with allowing invasions of fellow citizens' privacy when judges authorize them. In the end, "if a government is intent on engaging in interrogation to protect national security there is little the judges can do about it anyway."76 Forcing citizens to think hard about their values is of particular importance in the context of a vague "war on terror" devoid of identifiable boundaries.

Ex post review creates the best overall balance between liberty and national security

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

C. The Role of the Courts

While the limitations and dangers associated with ex ante judicial approval of national security surveillance counsel in favor of developing a new core means of protecting civil liberties in this arena, they in no way mandate a complete elimination of the judicial role. To the contrary, an appropriately modified role for the judiciary is of fundamental importance to address some of the limitations of the system of political checks. Ultimately, a return of the judiciary to its pre-FISA

role of ex post reasonableness review would permit the federal courts to complement the proposed broader oversight system and to meet Fourth Amendment requirements by restoring judicial focus to individual constitutional rights and relaxing national security pressures on the courts.101

1. Fourth Amendment Strictures. — It is worth noting initially that FISA has always contemplated situations in which full-on ex ante judicial oversight is not necessary to permit domestic electronic surveillance. At present, FISA conceives of three situations in which a court order is not necessary. These are all situations in which the balance in favor of the government is most compelling because the risk to privacy interests is low, the need for dispatch is great, or a drastic change of circumstances takes place. First, 50 U.S.C. § 1802 gives the Attorney General power, upon written certification under oath, to authorize up to one year of electronic surveillance directed at communications "exclusively between or among foreign powers" or "technical intelligence . . . from property or premises under the open and exclusive control of a foreign power" so long as "there is no substantial likelihood that the surveillance will acquire the contents of any communication to which a United States person is a party" and minimization procedures are complied with. Second, under § 1805(f), the Attorney General may authorize emergency surveillance without court interference for seventy-two hours if he or she determines that a standard FISA order could not be acquired in time and that there is a sufficient "factual basis for issuance of an order." Finally, for fifteen days following a declaration of war, § 1811 permits non-court-ordered, Attorney General–authorized surveillance.

Foreign intelligence surveillance occupies a unique spot in the Court's Fourth Amendment jurisprudence.102 In Katz v. United States,103 the Court issued perhaps its sternest statement on the obligation of obtaining a warrant prior to exercising a search,104 while also extending Fourth Amendment protection to include electronic surveillance. 105 Importantly, however, the Court expressly reserved the issue of electronic surveillance in the national security context.106 In United States v. U.S. District Court107 (the Keith case), the Court again focused on the need for "prior judicial scrutiny" in rejecting the government's claim for an exception to the warrant requirement in the domestic national security context.108 Yet once again, the Court made a crucial reservation: "[T]his case involves only the domestic aspects of national security. We have not addressed, and express no opinion as to, the issues which may be involved with respect to activities of foreign powers or their agents."109 It is thus an open constitutional question whether foreign intelligence surveillance falls within an exception to the Fourth Amendment's warrant requirement.

While full argumentation for the proposition that the Fourth Amendment embodies such an exception is beyond the scope of this Note,110 the case law is clear that the true "touchstone of the Fourth Amendment is reasonableness,"111 such that the Fourth Amendment only "[s]ometimes . . . require[s] warrants."112 Especially in light of the increasing number of exceptions to the warrant requirement,113 it seems likely that an exception is appropriate in the context of foreign intelligence surveillance for purposes of national security, not only in terms of meeting a more formalist reading of the Fourth Amendment, but even more forcefully meeting a functionalist reading, under which the improved protections of civil liberties could render the decreased reliance on ex ante judicial review preferable under the Fourth Amendment.

2. Policy Benefits. — A proponent of a national security exception notes that "[t]he repeal of FISA . . . would simply effectuate the nation's return to its previous tradition."114 Yet the obvious retort is that the very abuses detailed in the Church Committee report were a major

product of that tradition. Still, the old tradition did have some benefits that can be obtained by coupling the ex post reasonableness role of reviewing courts with the political checks described above. For one, rather than shielding meaningful inquiry, as ex ante review can, ex post review may produce "a renewed focus on Fourth Amendment principles"115 by both the judicial and political branches. Indeed, the more developed factual setting available in ex post review would help with the effort to define reasonableness.

Further, it could be argued that since only a small number of people are likely to be affected by surveillance, and especially given that those affected are likely to be disfavored or underrepresented groups such as members of minority religions or immigrants, the political process cannot be trusted to perform oversight. Yet ex post judicial review would remain a powerful check if the government seeks to use FISA-gathered information in other legal settings, such as criminal trials, habeas corpus proceedings, or motions for prospective relief. Ex post reasonableness review thus provides an important backstop to the oversight process.

IV. CONCLUSION

The current FISA system is illogical. Its purported benefits are at best questionable, and it features serious drawbacks in terms of the efficient functioning of national security surveillance and the numerous ways it undermines protections of liberty. While the Senate bill falls short of instituting the sort of robust political checks buttressed by ex post judicial review necessary to provide adequate protections, it offers an important paradigm shift in the way that FISA is conceived. This reconceptualization should be embraced and bettered by incorporating some of the terms of the House bill, rather than rejected as insufficiently protective of the role of the judiciary. Those concerned with protecting civil liberties should view an end to reliance on ex ante judicial review as a chance to develop real political checks that can vigorously protect both national security and liberty interests.

AT: Courts will defer

Ex post review creates executive self-restraint despite deference

Goitein and Patel 15 - Elizabeth (Liza) Goitein co-directs the Brennan Center for Justice's Liberty and National Security Program. Served as counsel to Sen. Russell Feingold with a particular focus on government secrecy and privacy rights. Was a trial attorney in the Federal Programs Branch of the Civil Division of the Department of Justice. Graduated from the Yale Law School and clerked for the Honorable Michael Daly Hawkins on the U.S. Court of Appeals for the Ninth Circuit. Faiza Patel serves as co-director of the Brennan Center for Justice's Liberty and National Security Program. Clerked for Judge Sidhwa at the International Criminal Tribunal for the former Yugoslavia. Ms. Patel is a graduate of Harvard College and the NYU School of Law. (Elizabeth and Faiza, "What went wrong with the FISA court", Brennan Center for Justice at New York University School of Law, 2015 //DM)

290 Advocates for greater oversight might argue that a clear error review — on a matter in which the judiciary already is inclined to be deferential to the executive's judgments — would accomplish little. In fact, however, the requirement would serve an important checking function. By forcing the government to articulate the factual basis for choosing selectors, it would create an incentive for self-restraint at the front end of the process. While it is unlikely that the FISA Court would reject any of the selectors that the government submitted to it, it is quite likely that the list of selectors presented to the court would be smaller and better justified than would otherwise be the case. On the flip side, the government would no doubt argue that this proposal represents an

unworkable burden on the executive branch and the FISA Court. If the government's scope of collection remained as broad as it is now, that argument might hold some weight. However, the burden stemming from this proposal should be greatly diminished by the reinstatement of the "agent of a foreign power" and "primary purpose" criteria, as well as the narrowing of the definition of "foreign intelligence information." Following these changes, the number of targets for whom selection terms must be presented to the court — while no doubt large — should be nowhere near the reported 89,000 targets today. 2013 Transparency Report, supra note 178 (estimating that 89,138 targets were affected by Section 702 in 2013).

AT: FISC oversight weak

The public advocate part of the CP and the strengthening of PCLOB to make it a cabinet level agency remedies existing weaknesses of the FISC

Setty, 15 - Professor of Law and Associate Dean for Faculty Development & Intellectual Life, Western New England University School of Law (Sudha, "Surveillance, Secrecy, and the Search for Meaningful Accountability" 51 Stan. J Int'l L. 69, Winter, lexis)

One promising move with regard to oversight and transparency has been the establishment and staffing of the Privacy and Civil Liberties Oversight Board (PCLOB). n186 This board, tasked with assessing many aspects of the government's national security apparatus both for efficacy and for potentially unnecessary incursions into civil liberties, has a broad mandate and, compared with many national security decision makers, significant independence from the executive branch. n187 Retrospectively, the PCLOB has, among other things, issued the highly critical report of the NSA Metadata Program in January 2014 that led to further public pressure on the Obama administration to curtail this program; it is promising that the PCLOB's prospective agenda includes further analysis of various surveillance programs. n188 However, the PCLOB's potential influence in protecting civil rights may be limited by its position: The PCLOB is an advisory body that analyzes existing and proposed programs and possibly recommends changes, but it cannot mandate that those changes be implemented. The ability to have a high level of access to information surrounding counterterrorism surveillance programs and to recommend changes in such programs is important and should be lauded, but over-reliance on the PCLOB's non-binding advice to the intelligence community to somehow solve the accountability and transparency gap with regard to these programs would be a mistake.

For example, on prospective matters, it is likely that intelligence agencies would consult the PCLOB only if the agency itself considers the issue being faced new or novel, as the NSA metadata program was labeled prior to its inception. In such cases, decision makers within an agency generally ask whether the contemplated program is useful or necessary, technologically feasible, and legal. If all three questions are answered affirmatively, the program can be implemented. Now that the PCLOB is fully operational, it seems likely that if a contemplated program is considered new or novel, an intelligence agency would consult the PCLOB at some stage of this process for its guidance on implementing the program. This nonpartisan external input may improve self-policing within the [*102] intelligence community and help intelligence

agencies avoid implementing controversial programs or, even if implemented, set better parameters around new programs. n189

If the PCLOB is able to exert some degree of soft power in influencing national security decision-making, then the judiciary represents hard power that could be used to force the protection of civil liberties where it might not otherwise occur. The FISC should be reformed to **include a public advocate** lobbying on behalf of privacy concerns, making the process genuinely adversarial and strengthening the FISC against charges that it merely rubber stamps applications from the intelligence community. n190 Article III courts need to follow the lead of Judge Leon in Klayman in conceptualizing privacy as broad and defensible, even in a world where electronics-based communication is dominant and relatively easy for the government to collect. If the judicial defense of privacy were combined with the possibility of liability for violations of that privacy, it is likely that this would incentivize increased self-policing among the members of the intelligence community. The creation of an active PCLOB and a more adversarial process before the FISC will not provide a perfect solution to the dilemmas posed by the government's legitimate need for secrecy and the protection of the public against potential abuse. Yet because these changes are institutional and structural, they are well-placed to improve the dynamic between the intelligence community, oversight mechanisms, and the public.

Conclusion

Genuine accountability should not depend on the chance that an unauthorized and illegal leak will occur. In the comparative example of the United Kingdom, engagement with a European Union energized with a commitment to increase privacy protections, along with domestic parliamentary oversight, provide two potential avenues for increased constraint on surveillance. In India, the parliament and the courts historically enabled, not constrained, the intelligence community. Whether that stance will continue as the government's technological capabilities increase is yet to be seen.

Domestically, it could be argued that the types of reform recommended here to improve actual accountability and transparency over programs like the NSA Metadata Program are overkill: They involve multiple branches of government, the PCLOB, and the public. However, much of the accountability apparatus that has been in place was dormant until the Snowden disclosures, and would have remained passive without those disclosures. A multi-faceted, long-term, structural approach [*103] to improving transparency and accountability - one that involves at a minimum the courts and the PCLOB, but hopefully Congress, the executive branch, and the public as well - improves the likelihood of sustained and meaningful accountability as new surveillance capabilities are developed and implemented.

2nc – FISC special advocate solves

A public advocate would check FISC rubber stamping

Cetina 14– John Marshall Law School (Daniel, “Balancing Security and Privacy in 21st century America: A Framework for FISA Court Reform”, John Marshall Law Review, Summer 2014, http://heinonline.org/HOL/Page?collection=journals&handle=hein.journals/jmlr47&type=Text&id=1540)//DBI

The first remedy involves **appointing a privacy advocate** whose sole duty would be to argue against the government's warrant requests, in essence acting as a quasi-public defender or guardian of privacy rights.' 0 ' Such an idea is already percolating in the House of Representatives.102 Retired Judge James Robertson, who formerly presided over the FISA Court, claims this is a necessary step 0 3 because the Court has frequently been merely a **proverbial rubber stamp** for surveillance requests.104 Indeed, available literature suggests that the FISA Court grants over 90% of the government's requests. 105

Introducing a privacy advocate would effectively force the FISA Court to consider individual requests from both perspectives: on the one hand, the government would present important security arguments, while the privacy advocate would focus on potential or actual dangers to cognizable privacy interests. This system would thereby **promote equity** in FISA Court proceedings and enable the public at large to have a representative promote privacy.

A public advocate would be easy to implement and would reform much of the single-mindedness of the past FISC decisions

Schlanger 15 [Margo, Professor of Law at the University of Michigan Law School, and the founder and director of the Civil Rights Litigation Clearinghouse., Intelligence Legalism and the National Security Agency's Civil Liberties Gap, file:///C:/Users/Jonah/Downloads/Intelligence%20Legalism%20and%20the%20National%20Security%20Agency-s%20Civil%20Li%20(2).pdf] Schloss3

Finally, it seems highly likely that in the near future, the FISA Court will gain a new process for occasional appearance of a public or special advocate. This proposal has been endorsed in varying forms by the Director of National Intelligence,393 the President's Review Group,394 the PCLOB,3 and the President.396 It was included in the recently-defeated Senate's USA FREEDOM Act bill, which will be one source for the next Congress's work on the issue. 397 Even former FISA presiding Judge John Bates, now the Director of the Administrative Office of the U.S. Courts, agrees in part.398 There is, however, substantial disagreement about details—and the details matter.

The argument for such an advocate is straightforward: even if the government exhibits exemplary candor as to facts, it cannot be relied upon to brief against its own authority. Because the issues are complex and important, they deserve full adversarial development in support of better judicial decision-making. The arguments against are likewise easily summarized: There's not enough for a special advocate to do, since most issues before the FISA Court are not legally complex, and the facts will not be available to the advocate. Adversarial process will be slower and more cumbersome without leading to better decision-making. Indeed, it might lead to worse decision-making, because "adversarial process in run-of-the-mill, fact-driven cases may erode" the government's compliance with a "heightened duty of candor to the Court."399 Indeed, "intelligence agencies may become reluctant to voluntarily provide to the Court highly sensitive information, or information detrimental to a case, because doing so would also disclose that information to a permanent bureaucratic adversary."400

The consensus for some form of public advocate does not encompass key details. The largest open question is about access. Under the House version of the USA Freedom Act, FISA court public advocates could have been excluded from factual or even legal presentations by the government to FISA judges and their legal advisors.401 The Senate version of the bill, by contrast, specified that public advocates would receive "access to all relevant legal precedent, and any application, certification, petition, motion, or such other materials as are relevant to the duties of the special advocate."402 Judge Bates, who served for six years as a FISA Court judge, has written several letters to Congress,403 purportedly on behalf of the judiciary,404 opposing a full-time, autonomous special advocate in the FISA Court. Those letters pointed out, as a disadvantage, that inclusion of adversarial process would make the FISA Court more court-like. Judge Bates explained that "FISC judges currently have substantial flexibility in deciding how best to receive from the government information they consider relevant to a particular case." That flexibility, he suggested, could not survive inter partes procedural requirements:

In order for the FISC to abide by the procedural and ethical requirements that apply in adversarial proceedings, and for the advocate to appear on equal footing with the applicant, the FISC would have to ensure that the advocate was involved in all such interactions in any case in which the advocate may participate. . . .We expect that the logistical challenges of administering such a three-way process for more than a handful of cases would be considerable.405

The Obama Administration, unfortunately, seems to be favoring limiting access, as well: In a letter to Senator Pat Leahy about the Senate bill, Attorney General Eric Holder and Director of National Intelligence James Clapper opined that "the appointment of an amicus in selected cases…need not interfere with…the process of ex parte [that is, one-party] consultation between the Court and the government."406

In fact, the FISA court and the public would be best served by a more empowered public advocate—one who is authorized to appear even without invitation from the government or the court, and, still more important, who is entitled to full access to information relevant to her duties. This would no doubt alter the current one-party procedures before the FISA court. But that's a feature, not a bug. The FISA Court's current procedures allow meetings quite unlike ordinary judicial hearings, even ex parte ones. In advance advice from court staff to the government and iterative drafting are common. The 2009 PowerPoint slide deck already described is similarly odd for a judicial forum."407 Other practices such as an annual lunch bringing together FISA Court judges and legal advisors (and the Chief Justice) with the heads of the CIA, NSA, and FBI likewise encourage the judges to see their own role as co-workers in the administration of the intelligence community's surveillance programs, supervising, for sure, but almost from within. If a public advocate's procedural rights disrupted this cozy relationship, that would be all to the good. The salutary effect might be to reinforce the FISA judges' role as arbiters of surveillance legality, not coworkers in the administration of the IC's surveillance programs.

If designed properly, this variation of an Office of Goodness could be essentially free from the ordinary threats to that kind of organization's influence and commitment. After all, the role of government-paid court opponent is utterly familiar from the criminal justice system. Unlike agencies, where staff must negotiate for a seat at decision-making tables, most courts have firm inter partes norms requiring access for all parties.408 If Congress applies these norms to the FISA court, as it should, implementation will be very familiar. As for capture, the analogous public defenders certainly sometimes allow organizational or situational imperatives to subvert their assigned courtroom role, 409 but there seems far less reason to worry about capture in this

litigation setting than inside of agencies, at least if the public advocates are not otherwise beholden to the agencies. If anything, the problem here might be too much single-minded commitment, a strict preference for civil liberties over security—but of course the court, which would remain the decider, is unlikely to become unduly single-minded. I therefore see a FISA Court public advocate as a variant on an Office of Goodness whose institutional setting would—if it is well designed—shield it from many of the landmines that usually threaten such an office's influence or commitment.

A FISC special advocate solves overreach

Sommer, 14 - The author is with ZwillGen PLLC in Washington, D.C.; a law firm that represented a telecomm provider against a FISA order (Jacob, "FISA Authority and Blanket Surveillance: A Gatekeeper Without Opposition" Litigation, Spring, Vol. 40 No. 3

http://www.americanbar.org/publications/litigation_journal/2013-14/spring/fisa_authority_and_blanket_surveillance_gatekeeper_without_opposition.html

One of the pending bills, Senator Blumenthal's FISA Court Reform Act of 2013, Senate Bill 1460 and Senate Bill 1467, provides an answer that, having had the experience of litigating before the FISC myself, I believe could provide much needed improvements. That bill provides for a new Office of the Special Advocate, which introduces an adversary to the court. (This is similar to the public privacy advocate that President Obama recently proposed.) The act attempts to solve a basic problem with the current oversight procedures: There is no true adversarial process for most of the legal issues that arise. The newly declassified opinions the director of national intelligence has released make this abundantly clear. Setting aside the legal arguments, the procedural history of the opinions indicates delays on the government's part, a lack of supervision after the court issues its orders, and a preference for secrecy over public disclosure at any cost. Appointing a special advocate ad litem for the public would ensure that novel legal arguments in the FISA court would face a consistent, steady challenge no matter who the provider is, thereby strengthening the FISA process by subjecting results to checks and balances.

Without such a process, the court and the Department of Justice must work through difficult legal issues with no balancing input. An advocate could participate in all cases involving a new statute or authority or a new interpretation or application of an existing authority. The special advocate could choose the cases in which to be involved, or the court or a provider that receives process could request its involvement where an opposition would be useful to test and evaluate the government's legal arguments. The special advocate's office could be established with proper security safeguards to draft, store, and access classified records more efficiently. It could also be required to report to the public and Congress the number of cases it has argued and how often it has limited or pared back the government's requests. It would provide a vital counterpoint for legislators exercising their oversight duties.

The special advocate would be especially useful in cases in which the government demands access to communications in a way that may have a profound effect on people other than the target, such as when decryption may be involved or when a provider is asked to provide assistance in ways that are unlike traditional wiretaps.

The FISC court advocate would be effective in reducing privacy concerns over NSA surveillance

Vladeck, Professor of law, 14 [Stephen I., Standing and Secret Surveillance , http://moritzlaw.osu.edu/students/groups/is/files/2014/08/13-Vladeck.pdf] Schloss

This shortcoming may help to explain the growing support for proposals to have some kind of "special advocate" participate in at least some cases before the FISA Court.103 Although the details vary, the basic gist is that Congress would create an independent office staffed by (or a rotating panel of court-designated private) lawyers empowered to appear in at least some cases before the FISA Court, specifically tasked with arguing against the government's interpretation of the relevant statutory and constitutional authorities. Such lawyers would have appropriate security clearances—allowing the FISA Court to entertain such arguments in secret—and, under most of the proposals, would not formally represent a "client."104 Instead, their statutory obligation would be to play the devil's advocate—to assist the FISA Court by providing alternative possible readings of the same procedural, evidentiary, statutory, and constitutional language on which the government has rested its application.105

At least with regard to proceedings before the FISA Court, the creation of a "special advocate," however conceived, should not raise any new Article III concerns (if anything, it should mitigate existing constitutional objections with respect to the absence of adverseness before that court).106 Assuming arguendo that these disputes already comport with Article III's justiciability requirements, it is difficult to see how adding a new party in suits initiated by the government as plaintiff would raise any new concerns. Although reasonable people will certainly disagree about the wisdom of competing "special advocate" proposals as a matter of policy, it is difficult to dispute their validity as a matter of law—at least in proceedings before the FISA Court.107

A public advocate is critical to reforming the internal FISC system

Margulies 14 [Peter, Professor of Law, Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2400809&download=yes] Schloss

A more institutionalized public voice at the FISC would be even more valuable than reliance on amici curiae as a policy matter, for two reasons.289 First, a public advocate would enhance the reasoning in FISC decisions. Although the FISC was correct in extending a measure of deference to the Executive on the contours of the § 215 relevance standard in place at the time of Snowden's disclosures, the FISC's reasoning left much to be desired. The 2006 FISC opinion, in particular, is truncated and conclusory, offering virtually no analysis. The absence of analysis is problematic. The deliberation that Hamilton extolled in Federalist No. 78 as judicial review's hallmark requires statements of reasons.290 The statement of reasons sends a useful signal to audiences for the judge's decision, conveying the judge's seriousness and ongoing vigilance. In contrast, especially in the secret loop of the pre-Snowden metadata program, a conclusory approval may send a signal to those who have sought judicial authorization that they have more license than the court actually intends. This dynamic may have played a role in the compliance issues that the FISC was forced to deal with in 2009.

The presence of a public advocate would prod the FISC to provide reasons for its decisions. The advocate would receive all government requests. It would be empowered to intervene when it believed that a matter raised novel legal issues, or when it certified to the FISC that there was a reasonable possibility (10% or greater) that the government's request failed to meet the statutory standard. The public advocate would present the best legal and factual arguments against the government. The court would then have to weigh the arguments, and explain why it selected one side. The entire process also signals to the government that compliance is a serious matter.

Second, the seriousness imposed by a public advocate would compensate for an even bigger blind spot in the current process: the barely adequate disclosure that the government has provided to Congress. The "rogue robot" explanation for noncompliance furnished by the Justice Department in its December 2009 letter did not supply the comprehensive self-appraisal that Congress has a right to expect. While the Leahy bill provides for more transparency, the cabined deliberation characteristic of Title 50 oversight may not prove sufficiently robust over the long haul. The work of the Privacy and Civil Liberties Oversight Board (PCLOB), while exceptionally valuable, may also fail to completely close the gap. An institutional advocate at the FISC would supplement legislative oversight, hedging against future deficits in disclosure to Congress

AT: Special advocate links to terrorism

The special advocate functions ex post – ex ante advocacy compromises terrorism investigations

Vladeck 15 – Professor of Law at American University Washington College of Law (Stephen, THE CASE FOR A FISA "SPECIAL ADVOCATE," 2 Texas A&M L. Rev. 2)//JJ

To be sure, Judge Bates is certainly correct that the participation of the special advocate should not unduly interfere with the government's ability to conduct lawful foreign intelligence surveillance activities, **especially ex ante.** To that end, the special advocate might only be notified of a government application under the relevant authorities **once that application has been granted** by FISC, at which time the appointed advocate would have a fixed period of time within which to seek reconsideration of the underlying ruling. Among other things, this approach would allow the government to act expeditiously when circumstances warrant (lest an expressly legislated emergency exception otherwise swallow the rule), and would preserve the status quo (in which authorization has been provided by the FISC) until and unless the special advocate convinces the FISC judge, the FISCR, or the Supreme Court to vacate such authorization. And, of course, if the special advocate prevails before either the FISC or FISCR, the government retains the option of seeking a stay of the ruling in question to continue the underlying surveillance pending appeal.

A FISA court advocate still operates within a covert regime – the target of surveillance is never alerted

Patel and Goitein, 15 – *co-director of the Liberty and National Security Program at the Brennan Center for Justice AND ** co-directs the Brennan Center for Justice's Liberty and National Security Program (Faiza and Liza, "Fixing the FISA Court by Fixing FISA: A Response to Carrie Cordero" 4/8, Lawfare,

http://www.lawfareblog.com/fixing-fisa-court-fixing-fisa-response-carrie-cordero

We would be providing greater ability to challenge surveillance to foreign intelligence targets, than to subjects of criminal investigation domestically, for whom wiretap applications are approved in camera ex parteby district court judges and magistrates.

In fact, foreign intelligence targets would have no ability to challenge surveillance under our Special Advocate proposal. They would not be able to choose and hire an attorney to present their case, and to communicate to this attorney the facts only they could know. Instead, they would remain ignorant of the surveillance, and a Special Advocate would do his/her best to present a case without their help or involvement. By contrast, subjects of searches in criminal cases are informed of the search. At a minimum, then, they can bring a civil suit, and they often have the opportunity to challenge the search as part of a criminal trial (an opportunity that's rare in foreign intelligence cases). They can do so with full knowledge of their own actions and with an attorney of their choosing who works only for them. When it comes to the ability to challenge surveillance, the advantage clearly belongs to the subject of the criminal search, even under our proposal.

2nc terrorism link wall – FAA restrictions

FISA's authority alone is insufficient to prevent terrorism – the government needs the widest possible net, including domestic surveillance

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 94-96

According to the administration, these are just interceptions of communications to and from the United States in which one of the parties is suspected of terrorist connections, though the suspicion does not rise to the probable-cause level that would be required for obtaining a warrant. There may be more to the program, however. Most likely the next terrorist attack on the United States will, like the last one, be mounted from within the country but be orchestrated by leaders safely ensconced somewhere abroad. If a phone number in the United States is discovered to have been called by a known or suspected terrorist abroad, or if the number is found in the possession of a suspected terrorist or in a terrorist hideout, it would be prudent to intercept all calls, domestic as well as international, to or from that U.S. phone number and scrutinize them for suspicious

content. But the mere fact that a suspected or even known terrorist has had a phone conversation with someone in the United States or has someone's U.S. phone number in his possession doesn't create probable cause to believe that the other person is also a terrorist; probably most phone conversations of terrorists are with people who are not themselves terrorists. The government can't get a FISA warrant just to find out whether someone is a terrorist; it has to already have a reason to believe he's one. Nor can it conduct surveillance of terrorist suspects who are not believed to have any foreign connections, because such surveillance would not yield *foreign* intelligence information.

FISA has yet another gap. A terrorist who wants to send a message can type it in his laptop and place it, unsent, in an e-mail account, which the intended recipient of the message can access by knowing the account name. The message itself is not communicated. Rather, it's as if the recipient had visited the sender and searched his laptop. The government, if it intercepted the e-mail from the intended recipient to the account of the "sender," could not get a FISA warrant to intercept (by e-mailing the same account) the "communication" consisting of the message residing in the sender's computer, because that message had never left the computer.

These examples suggest that **surveillance outside the narrow bounds of FISA might significantly enhance national security**. At a minimum, such surveillance might cause our foreign terrorist enemies to abandon or greatly curtail their use of telephone, e-mail, and other means of communicating electronically with people in the United States who may be members of terrorist sleeper cells. Civil libertarians believe that this is bound to be the effect of electronic surveillance, and argue that therefore such surveillance is futile. There is no "therefore." If the effect of electronic surveillance is to close down the enemy's electronic communications, that is a boon to us because it is far more difficult for terrorist leaders to orchestrate an attack on the United States by sending messages into the country by means of couriers. But what is far more likely is that some terrorists will continue communicating electronically, either through carelessness— the Madrid and London bombers were prolific users of electronic communications, and think of all the drug gangsters who are nailed by wiretaps—or in the mistaken belief that by using code words or electronic encryption they can thwart the NSA. (If they can, the program is a flop and will be abandoned.) There are careless people in every organization. If al-Qaeda is the exception, civil libertarians clearly are underestimating the terrorist menace! In all our previous wars, beginning with the Civil War, when telegraphic communications were intercepted, our enemies have known that we might intercept their communications, yet they have gone on communicating and we have gone on intercepting. As for surveillance of purely domestic communications, it would either isolate members of terrorist cells (which might, as I said, have no foreign links at all) from each other or yield potentially valuable information about the cells.

FISA's limitations are borrowed from law enforcement. When a crime is committed, the authorities usually have a lot of information right off the bat—time, place, victims, maybe suspects—and this permits a focused investigation that has a high probability of eventuating in an arrest. Not so with national security intelligence, where the investigator has no time, place, or victim and may have scant idea of the enemy's identity and location; **hence the need for the wider, finer-meshed investigative net**. It is no surprise that there have been leaks from inside the FBI expressing skepticism about the NSA program. This skepticism reflects the Bureau's emphasis on criminal investigations, which are narrowly focused and usually fruitful, whereas intelligence is a search for the needle in the haystack. FBI agents don't like being asked to chase

down clues gleaned from the NSA's interceptions; 999 out of 1,000 turn out to lead nowhere. They don't realize that often the most that counterterrorist intelligence can hope to achieve is to impose costs on enemies of the nation (as by catching and "turning" some, or forcing them to use less efficient means of communication) in the hope of disrupting their plans. It is mistaken to think electronic surveillance a failure if it doesn't intercept a message giving the time and place of the next attack.

Bureaucratization of ex ante review undermines counter-terrorism investigations

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

3. The Demands of National Security. — Finally, while the focus of this Note is on the protection of civil liberties, the current system may also do a poor job of promoting security. From an institutional competence perspective, it seems questionable that judges should occupy a gatekeeping role. Indeed, all the reasons discussed above that judges have invoked in reducing their own authority over such issues apply with equal force here.77

The inefficiencies of the current system are even more problematic. Given the permissiveness of the statutory standards and the FISA courts, inefficiency is the primary motivating force behind attempts to reduce judicial oversight. As DOJ has noted, "[n]umerous Congressional and Executive Branch reviews of the FISA process have recommended that the FISA process be made more efficient."78 Others are more forthright, describing the FISC order procedures as "hopelessly slow and bureaucratic."79 On the whole, "if we are seeking a model of judicial review that advances security, there is little reason to think that the FISA Court, at least as currently set up, advances that goal."80

FISA can't identify unknown terrorists – advance surveillance is necessary to generate enough information

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

Programmatic surveillance thus can help remedy some of the difficulties that arise when monitoring covert adversaries like international terrorists. FISA and other particularized surveillance tools are useful when authorities want to monitor targets whose identities are already known. But they are less useful when authorities are trying to identify unknown targets. The problem arises because, in order to obtain a wiretap order from the FISA court, the government usually must demonstrate probable cause to believe that the target is a foreign power or agent of a foreign power. n39 This is a fairly straightforward task when the target's identity is already known--e.g., a diplomat at the Soviet embassy in Washington, DC. But the task is considerably

more difficult when the government's reason for surveillance is to detect targets who are presently unknown--e.g., al-Qaeda members who operate in the shadows. How can you convince the FISA court that Smith is an agent of a foreign power when you know nothing about Smith--his name, nationality, date of birth, location, or even whether he is a single person or several dozen? The government typically won't know those things unless it has collected some information about Smith--such as by surveilling him. And there's the rub. Programmatic monitoring helps avoid the crippling Catch-22 that can arise under particularized surveillance regimes like FISA: officials can't surveil unless they show that the target is a spy or terrorist, but sometimes they can't show that an unknown target is a spy or terrorist unless they have surveilled him.

Ex post restrictions can protect information being used against people for anything other than preventing terrorism

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 98-101)

Concerns with privacy could be alleviated, moreover, by adopting a rule forbidding the intelligence services to turn over any intercepted communications to the Justice Department for prosecution for any offense other than a violation of a criminal law intended for the protection of national security. Then people would not worry that unguarded statements in private conversations would get them into trouble. Such a rule would be a modification, urged in a parallel setting by Orin Kerr, of the "plain view" doctrine of search and seizure. That doctrine, another of the exceptions to the requirement of a warrant to search or seize, allows the seizure of evidence that the police discover in plain view in the course of an unrelated lawful search—even though the discovery is accidental and a warrant could not have been obtained to search for the evidence discovered. But what if an intelligence officer, reading the transcript of a phone conversation that had been intercepted and then referred to him because the search engine had flagged it as a communication possibly possessing intelligence value, discovers that one of the parties to the communication seems to be planning a murder, though a murder having nothing to do with any terrorist plot? Must the officer ignore the discovery and refrain from notifying the authorities? Though the obvious answer is no, my answer is yes.

There is much wild talk in private conversations. Suppose the communication that has been intercepted and read for valid national security reasons contains the statement "I'll kill the son of a bitch." The probability will be very high that the statement is hyperbole, that there is no serious intent to kill anyone. But suppose intelligence officers have been told that if a communication they read contains evidence of crime, they should turn it over to the FBI. The officer in my hypothetical case does that, and the Bureau, since the matter has been referred to it by a government agency, takes the threat seriously and investigates (or turns the matter over to local police for investigation, if no federal crime is suspected). As word of such investigations got around, people would learn that careless talk in seemingly private conversations can buy them a visit from the FBI or the police. At this point the risk that national security surveillance would significantly deter candor in conversation would skyrocket. It is more important that the public tolerate extensive national security surveillance of communications than that an occasional run-of-the-mill crime go unpunished because intelligence officers were not permitted to share

evidence of such a crime with law enforcement authorities. But if the evidence is of a crime related to national security, then sharing it with law enforcement authorities is appropriate and should be (and is) required. Other exceptions may be needed. Suppose that what is overheard is a conversation that identifies one of the parties as a serial killer. Serial killing is not terrorism, but it is such a serious crime that clues to it picked up in national security surveillance should be communicated to law enforcement authorities.

If such a rule (with its exceptions) were in place, I believe that the government could, in the present emergency, intercept *all* electronic communications inside or outside the United States, of citizens as well as of foreigners, without being deemed to violate the Fourth Amendment, provided that computers were used to winnow the gathered data, blocking human inspection of intercepted communications that contained no clues to terrorist activity. We know that citizens (and permanent residents) can be terrorists operating against their country, even without any foreign links. The United States has had its share of U.S. citizen terrorists, such as the Unabomber and Timothy McVeigh and presumably whoever launched the anthrax attack on the East Coast in October 2001. The terrorist bombings of the London subway system in July 2005 were carried out by British citizens. And U.S. persons who are not terrorists or even terrorist sympathizers might have information of intelligence value—information they might be quite willing to share with the government if only they knew they had it. The information that enables an impending terrorist attack to be detected may be scattered in tiny bits that must be collected, combined, and sifted before their significance is apparent. Many of the bits may reside in the e-mails or phone conversations of innocent people, such as unwitting neighbors of terrorists, who may without knowing it have valuable counterterrorist information—one consequence of the jigsaw puzzle character of national security intelligence.

A further question, however, is whether the Fourth Amendment should be deemed to require warrants for such surveillance. The Keith case that I mentioned earlier held that warrants are required for conducting purely domestic surveillance even when the purpose is to protect national security, though the Court suggested that perhaps the probable-cause requirement could be attenuated. It would have to be. If the goal of surveillance is not to generate evidence of criminal activity but to detect terrorist threats, including those too incipient to be prosecutable as threats, and even threats of which the persons under surveillance may be unaware because the significance of the clues they possess eludes them, then to insist that the investigators establish probable cause to believe criminal activity is afoot will be to ask too much. The amendment's requirement of particularity of description of what is to be searched or seized would also have to be relaxed for surveillance warrants adequate to national security to be feasible, because intelligence officers will often not have a good idea of what they are looking for.

Requiring a particular demonstration of threat wrecks terrorism investigations

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 138-141)

Civil libertarians argue that the government ought to be required to demonstrate that it has a reasonable basis for believing that the person to whom the records pertain is involved in terrorist

activity. But as should be clear by now, **that would be too restrictive a requirement**. To impose it would be either to misunderstand the needs of intelligence or to underestimate the value of intelligence in the struggle against terrorism (or perhaps to underestimate the terrorist threat). Information about an individual who is not part of a terrorist ring may nevertheless be highly germane to an investigation of the ring or, what may be as important, to an investigation aimed at discovering the existence of such rings. The information might concern an imam who, though not himself involved in terrorism, was preaching holy war. It might concern family members of a terrorist, who might have information about his whereabouts. It might consist of sales invoices for materials that could be used to create weapons of mass destruction, or of books and articles that expressed admiration for suicide bombers.

The impact of section 215 on civil liberties is quite limited— only a few dozen section 215 demands have been served on libraries. Most records custodians will, as I said, voluntarily hand over nonprivileged records to the government when told the records may contain information relevant to national security. A custodian's refusal to disclose the records might generate enough suspicion to enable the government to obtain a subpoena even under a much narrower version of section 215.

One understands, though, why civil libertarians have labeled section 215 the "libraries provision" despite its being used so rarely against libraries. To discover what people have been reading, as distinct from discovering their financial or health status, is to gain insight into what they are thinking—and what they are planning. This is why the government might want to obtain a record of a person's library borrowings (not to mention his bookstore purchases, records of which also fall within the scope of section 215). And when the quest for knowledge of what a person is thinking is driven by concern with terrorism, which is almost always politically motivated, success in the quest is likely to include the acquisition of a comprehensive picture of the subject's political beliefs. Knowing that the government is seeking to compile such pictures, people of unorthodox views may hesitate to buy or borrow books that express such views. This is the same issue that is raised by the government's conducting surveillance of mosques. Whether such surveillance presents Fourth Amendment problems depends on the method used to conduct it; surveillance as such, as we saw in Chapter 4, does not violate the First Amendment despite its undoubted effect on the exercise of free speech.

The Miller line of decisions, in holding that a voluntary disclosure of information manifests a willingness to waive or forfeit any right of privacy, seems unrealistic about the meaning not only of "voluntary" but also of "privacy" itself. Informational privacy does not mean refusing to share information with everyone. Obviously a telephone conversation is not private in that sense, nor a letter, nor a conversation between spouses or friends. Every conversation is at least twosided. The fact that I disclose symptoms of illness to my doctor does not make my health a public fact, especially if he promises (or the rules of the medical profession require him) not to disclose my medical history to anyone without my permission.

One must not confuse solitude with secrecy; they are distinct forms of privacy. Solitude fosters individualistic attitudes; conversely, the constant presence of other people or the sense of being under constant surveillance enforces conformity. But one also needs freedom to communicate in private. The planning of organized activity obviously is impossible without communication; less obviously, productive independent thinking almost always requires bouncing ideas off other people. And few of us are sufficiently independent-minded to persist in an unorthodox idea if we don't discover that others share it.

If "liberty" in the Fifth Amendment's due process clause can connote sexual freedom, and "due process" can be understood to require that any restriction on liberty be no greater than is necessary, why can't there be a due process right to control information about oneself that is not already public knowledge, unless one is trying to use that control for unlawful ends or the government has a pressing need for the information? Maybe there can be—provided, however, that the "pressing need" qualification is taken seriously. Constitutional rights, as we have seen throughout this book, are not absolutes whose scope is fixed without regard to competing interests. How much information about oneself one should be permitted to withhold from the government depends critically on how valuable the information is to the government. In an era of global terrorism and proliferation of weapons of mass destruction, the government has a compelling need to gather, pool, sift, and search vast quantities of information, much of it personal.

Restrictions on collection of data aid terrorism – protections against misuse of data solve better

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 143-144)

Privacy is the **terrorist's best friend**, and the terrorist's privacy has been enhanced by the same technological developments that have both made data mining feasible and elicited vast quantities of personal information from innocents: anonymity combined with the secure encryption of digitized data makes the Internet a powerful tool of conspiracy. The government has a compelling need to exploit digitization in defense of national security. But if this is permitted, intelligence officers are going to be scrutinizing a mass of personal information about U.S. citizens. And we know that people don't like even complete strangers poring over the details of their private lives. But the fewer of these strangers who have access to those details and the more professional their interest in them, the less the affront to privacy. One reason people don't much mind having their bodies examined by doctors is that they know that doctors' interest in bodies is professional rather than prurient; we can hope that the same is true of intelligence professionals.

The primary danger of such data mining is leaks by intelligence personnel to persons inside or outside the government who might use the leaked data for improper purposes. Information collected by a national security data-mining program would have to be sharable within the national security community, which would include in appropriate cases foreign intelligence services, but not beyond. Severe sanctions and other security measures (encryption, restricted access, etc.) could and should be imposed in order to prevent—realistically, to minimize—the leakage of such information outside the community. My suggestion in the last chapter that the principle of the Pentagon Papers case be relaxed to permit measures to prevent the media from publishing properly classified information would reinforce protection of the privacy of information obtained by national security data mining.

I have said both that people value their informational privacy and that they surrender it at the drop of a hat. The paradox is resolved by noting that as long as people don't expect that the details of their health, love life, or finances will be used to harm them in their interactions with other

people, they are content to reveal those details to strangers when they derive benefits from the revelation. As long as intelligence personnel can be trusted to use their knowledge of such details only for the defense of the nation, the public will be compensated for the costs of diminished privacy in increased security from terrorist attacks.

Distinguishing between domestic and foreign targets in advance is frequently impossible
Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

4. The Nature of Terrorism. — Institutional limitations are especially pressing given the vagaries of "terrorism."66 Substantial gray areas exist in distinguishing domestic from foreign and criminal from intelligence interests. Courts, fearful of treading too heavily in the national security arena, will be loath to tell the government that someone it has determined to be connected to terrorism is in fact being targeted unfairly for his or her religion or national origin.

Indeed, recent statutory developments have greatly clouded the already difficult task of making such distinctions. For example, the legislative move from "primary" to "significant" purpose discussed above, and the related tearing down of the "wall" that prevented information sharing between intelligence and law enforcement entities,67 means that a court must accuse the government of not reasonably suspecting a target's involvement with terrorism if it is to deny an application. Similarly, the standard for pen/trap orders68 was lowered from a showing that the device was used to communicate with an agent of a foreign power under the old 50 U.S.C. § 1842(c)(3) to a much lower showing of "relevant to an ongoing investigation" under the new 50 U.S.C. § 1842(c)(2). Whereas before the FISC may at least have been able to point to the relatively objective question of whether an individual was in fact an agent of a foreign power, the current loose standard would force the court to tell the government that the desired target bore no relevance to a terrorism investigation.

AT: Privacy agency now

The CP's mandate is different – squo privacy agencies aren't coordinated, the CP elevates it to cabinet level status
Hill 14* Technology policy consultant at Monitor 360, fellow of the Global Governance Futures 2025 program at the Brookings Institution (Jonah, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS" p.31)//GK

At present, there is no single point-person in the U.S. government coordinating data flow issues, or advocating on behalf of the U.S. for freedom of data flows. The head of the Federal Trade Commission, the U.S. Trade Representative, the Privacy and Civil Liberties Oversight Board, the Department of Commerce (importantly, the Deputy Assistant Secretary for Services), the Chief Privacy Officer of the NSA, several individuals within the Department of State (importantly the U.S. Coordinator for International Communications and Information Policy) as well as

many, many others, are all working on the problem, but largely separately, with inevitably separate institutional viewpoints and objectives. While multiple individuals and agencies should be addressing the issue simultaneously, there is a need for a single coordinating office to track and manage this vital economic issue. Perhaps an office of Chief Privacy Officer in the U.S. State Department and/or U.S. Trade Representative could be developed, or the newly-created White House Chief Privacy Officer position could take on this broader international responsibility. President Obama has suggested, in a speech delivered at the U.S. Department of Justice on January 17, 2014, that his administration plans to create a new position at the U.S. State Department "to coordinate [American] diplomacy on issues related to technology and signals intelligence."121 This new role – which has only been vaguely described – could also potentially fill the leadership vacuum within the U.S. government on these issues. However the reorganization happens, is clear that the current bureaucratic arrangement needs to be restructured to ensure that the anti- localization outreach strategy is effectively coordinated and harmonized across the entire U.S. government and among U.S. industry leaders.

AT: Judge ignores advocate

The CP makes a special advocate mandatory – FISC judges can't decline them

Vladeck 15 – Professor of Law at American University Washington College of Law (Stephen, THE CASE FOR A FISA "SPECIAL ADVOCATE," 2 Texas A&M L. Rev. 2)//JJ

As the metadata program illustrates, many of the applications that would otherwise trigger such review are nothing more than requests to re-authorize programs already approved by the FISC under the same rationale. Thus, after a transitional period during which preexisting rulings could all be revisited at least once, the special advocate's participation could further be limited to cases in which the government is either (1) seeking an initial authorization for a new program and/or recipient; (2) seeking a reauthorization under materially different facts / technological capabilities; or (3) seeking a reauthorization under a materially different legal theory. Because of the modest number of cases in which the special advocates would thereby participate, it should follow, as provided in the Schiff bill, their participation in such cases should be **mandatory**, and not up to the discretion of FISC judges. But a protocol where FISC is separately empowered to invite the participation of a (again, randomly selected) special advocate in any other case in which her participation is not already provided for would also make sense.

AT: Executive branch capture

Designating a pool of security-cleared lawyers solves the perception of executive branch capture

Vladeck 15 – Professor of Law at American University Washington College of Law (Stephen, THE CASE FOR A FISA "SPECIAL ADVOCATE," 2 Texas A&M L. Rev. 2)//JJ

III. THE WAY FORWARD FOR CREATING A SPECIAL ADVOCATE

a. Policy Issue #1: Where and How Should the Position be Constituted and Overseen?

As detailed above, there are three principal approaches to how and where a special advocate should be constituted and overseen. Two of the more common variants favor the creation of a new government entity, located in either the Executive or Judicial Branch, with appointments controlled by a combination of the PCLOB, FISCR, National Security Division of the Department of Justice, and/or Chief Justice of the United States. A third iteration, seen for example in the Schiff bill, endorses a model more analogous to the "CJA panel" in federal criminal cases, 60 pursuant to which a rotating roster of specially selected and security-cleared private lawyers would be empowered to participate on similar terms, but would remain structurally independent from any branch of the government.

There are several reasons that commend the latter approach over the former: First , no matter how much independence Congress seeks to invest in the office, there will always be the **perception** that a special advocate who works in and for the government will not be as well situated to take positions adverse to the Executive Branch as these proposals appear to contemplate. To similar effect, concerns might also arise that, so long as the special advocate is only litigating a hyperspecific set of statutory and constitutional issues in a hyperspecific set of cases, she may be less able to capitalize upon developments in other areas of the law and/or become more subject to "capture" by the very entities she is seeking to serve as a check against. Whereas criminal lawyers would be especially privy to developments in, among other things, Fourth Amendment jurisprudence, one could worry that a uniquely tasked "special advocate" would develop such a niche practice as to become insulated from such doctrinal shifts. And as the Schiff bill suggests, it would not be that difficult as a matter of drafting or policy to create a panel of specially designated , security-cleared lawyers who would rotate through relevant cases while maintaining their regular practice. Indeed, a variation on this theme already exists in criminal prosecutions involving classified information.61

Nor is there anything to the argument that security-cleared private lawyers cannot be trusted to handle such sensitive information. 62 Indeed, there is no evidence to date that a security-cleared counsel has ever been responsible for an unauthorized disclosure of classified information.

Instead, the principal objection such an approach is likely to provoke stems from the potential diffusion of responsibility (and, as such, of knowledge and experience) among a panel of private lawyers, as opposed to a hierarchical government office with a specific head. It might then become harder for the individual lawyers to keep abreast of developments in other FISC cases, and, as such, to appreciate developments in the law from case to case. This concern can largely be mitigated, though, by the relatively small number of cases in which the participation of special advocates should be required. Because I agree with Judge Bates that special advocates won't be necessary in the vast majority of FISC applications, the ultimate pool of special advocates will be relatively modest in size—and it will therefore not be particularly difficult for the members of that pool to share knowledge and otherwise collaborate across the spectrum of cases in which they would be authorized to participate.

AT: Perm do both

The perm links to terrorism – the existing FAA structure is carefully balanced to allow ex post review. Increasing the ex ante nature of the FAA could wreck terrorism investigations
Blum, 9 (Stephanie, "WHAT REALLY IS AT STAKE WITH THE FISA AMENDMENTS ACT OF 2008 AND IDEAS FOR FUTURE SURVEILLANCE REFORM" 18 B.U. Pub. Int. L.J. 269, Spring, lexis)

In sum, under traditional FISA, certain kinds of international communications have always been completely outside of FISA review. Under the FAA, there is now FISC reviews of targeting and minimization procedures as well as the ex post oversight mechanisms. Additionally, it is not even clear that a warrant would be required to gather foreign intelligence within the country. While per Keith, a warrant is required if the threat is solely domestic, it is unsettled whether a warrant is required when there is a connection to a foreign power. Significantly, in August 2008, the FISCR upheld the constitutionality of the PAA (that had expired) explicitly finding that there was a foreign intelligence exception to the Fourth Amendment warrant requirement. n241 Although the petitioners (telecommunication companies who did not want to comply with an order under the PAA) argued that the PAA would result in incidental communications of innocent Americans being retained due to warrantless surveillance of people reasonably believed to be overseas, the FISCR rejected that argument. It stated, "The petitioner's concern of incidental collections is overblown. It is settled beyond peradventure that incidental collections occurring as a result of constitutionally permissible acquisitions do not render those acquisitions unlawful." n242

The FISCR's holding that the PAA was constitutional means that it would likely find the FAA - which has more judicial review and reporting requirements than the PAA - to be similarly lawful. Hence, it seems a legal stretch to maintain that the government needs a warrant when it targets foreign nationals overseas who may incidentally communicate with U.S. persons in the United States. While the FAA, as applied to U.S. persons, must still be reasonable under the Fourth Amendment, given the FISC-monitored minimization procedures and ex post oversight mechanisms, it seems that the FAA has struck a [*306] **nuanced compromise** between the need to expeditiously gather foreign intelligence, and the protection of civil liberties.

Furthermore, compared to traditional FISA, the FAA relies more heavily on ex post oversight mechanisms than on ex ante warrants based on individualized suspicion - and this may be a benefit. Several scholars have questioned the effectiveness of FISA's ex ante warrants issued by a secret court based on only one-sided information provided by the government. n243 Critics of FISA argue that because the FISC approves virtually all requests for warrants, it merely serves as a rubber stamp and does not provide any genuine judicial review. The FISC has, indeed, approved almost all warrant requests - as of 2006, the FISC had approved all but five out of over 17,000 requests. n244 According to a Note written by the Harvard Law Review, ex ante judicial review to conduct foreign surveillance may be **counterproductive** and unworkable:

The [FISC] judge lacks a skeptical advocate to vet the government's legal arguments, which is of crucial significance when the government is always able to claim the weight of national security expertise for its position. It is questionable whether courts can play this role effectively, and, more importantly, whether they should. n245

Because the FISC has no way to evaluate the facts presented by the government, it has to assume that the government-provided facts are correct. Problematically, the FISC identified evidence of governmental misstatements and omissions of material facts in seventy-five FISA applications. n246 This evidence did not come to light until after the FISC issued the warrants. n247

Judges are also extremely deferential to claims of national security, especially when they "must weigh the national security necessity ex ante, rather than being asked to review it after the fact." n248 The Harvard Note argues that "ex ante judicial review is not only of limited effectiveness, but it is also **affirmatively harmful**" in that it "imparts a broader imprimatur of validity than is warranted given the limited effectiveness of judicial review." n249 Hence, as the Note observes, ex ante judicial review may **impede security** without providing any real privacy interest protection. n250 Therefore, the Note argues that "Congress is better situated constitutionally and better equipped institutionally to make the sort of value judgments and political determinations that are necessary [*307] to fulfill FISA's purposes." n251 The Note concludes that "those concerned with protecting civil liberties should view an end to reliance on ex ante judicial review as a chance to develop real political checks that can vigorously protect both national security and liberty interests." n252

The permutation increases the burden on the government and inhibits investigations

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

At the same time, all of the ex ante restrictions will necessarily be poor proxies for an ex post review of reasonableness. Instead of substituting for ex post review of reasonableness, ex ante restrictions supplement those restrictions. Ex ante limitations force the government to follow two sources of law: the reasonableness of executing the warrant imposed by reviewing courts ex post, and the restrictions imposed by the magistrate judge ex ante. If the ex ante restrictions happen to be modest, or are drafted in a way that ensures that they are always less than or equal to the restrictions of reasonableness ex post, then such restrictions will merely replicate the ex post reasonableness determinations. But every time an ex ante restriction goes beyond ex post reasonableness, the restrictions will end up prohibiting the government from doing that which is constitutionally reasonable. The limitations will be unreasonable limitations caused by judicial error.

Ex ante restrictions are highly error prone

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

Ex ante restrictions tend to introduce constitutional errors in this environment. To be sure, such restrictions stem from the best of intentions: they reflect a good-faith effort to identify what will be constitutionally reasonable.201 However, ex ante predictions of reasonableness will be more error prone than ex post assessments for two major reasons. First, ex ante restrictions require courts to "slosh [their] way through the factbound morass of reasonableness" 202 without actual facts. Second, ex ante restrictions are imposed in ex parte hearings without legal briefing or a hearing. Both reasons suggest that ex ante restrictions often will inaccurately gauge the reasonableness of how warrants are executed. The major difficulty with ex ante restrictions is that the reasonableness of executing a warrant is highly factbound, and judges trying to impose ex ante restrictions generally will not know the facts needed to make an accurate judgment of reasonableness. Granted, magistrate judges might have a ballpark sense of the facts, from which they might derive a sense of what practices are ideal. For example, they might think that it is unreasonable to seize all of a suspect's home computers if on-site review is possible. Alternatively, they might think it is unreasonable to conduct a search for image files if the warrant only seeks data not likely to be stored as an image. They might think it is unreasonable to keep a suspect's computer for a very long period of time without searching it. All of these senses will be based on a rough concept of how the competing interests of law enforcement and privacy play out in typical computer searches and seizures.

At the same time, these ballpark senses of reasonableness can never improve past very rough approximation. A magistrate judge cannot get a sense of the exigencies that will unfold at each stage of the search process. The reasonableness of searching on-site will not be known until the agents arrive and determine how many computers are present, what operating systems they use, and how much memory they store. The needed time window before the government searches the seized computer depends on how much the government can prioritize that case over other cases, given existing forensic expertise and resources, as well as which agency happens to be working that case.203 The reasonableness of different search protocols depends on the operating systems, an analyst's expertise in forensics, which forensics programs the government has in its possession, what kind of evidence the government is searching for, and whether the suspect has taken any steps to hide it.204 Finally, the reasonableness of retaining seized computers that have already been searched depends on whether the government might need the original computer as evidence or whether it ends up containing contraband that should not be returned and is subject to civil forfeiture. 205

The magistrate presented with an application for a warrant simply cannot know these things. Judges are smart people, but they do not have crystal balls that let them predict the number and type of computers a suspect may have, the law enforcement priority of that particular case, the forensic expertise and toolkit of the examiner who will work on that case, whether the suspect has tried to hide evidence, and if so, how well, and what evidence or contraband the seized computers may contain. Magistrate judges can make ballpark guesses about these questions based on vague senses of what happens in typical cases. But even assuming they take the time to learn about the latest in law enforcement resources and the computer forensics process—enough to know about

typical cases—they cannot do more than come up with general rules that they think are useful for those typical cases.

The errors of ex ante restrictions are particularly likely to occur because warrant applications are ex parte. The investigators go to the judge with an affidavit and a proposed warrant.206 The judge reads over the materials submitted. The judge can modify the warrant, but his primary decision is whether to sign or reject it. The entire process takes a matter of minutes from start to finish. No hearing occurs. There is no testimony beyond the affidavit in most cases, and the affidavit usually contains only standard language about computer searches.207 A prosecutor may be present, but need not be. Obviously, no representative of the suspect is present to offer witnesses or argument.

In that setting, judges are particularly poorly equipped to assess reasonableness. The most they can develop is a standard set of ex ante restrictions that they use in all computer warrants, perhaps one shared with other magistrate judges in their district. More careful scrutiny is both impractical and unlikely. The ability of a magistrate judge to assess reasonableness in that setting is a far cry from her ability to rule on reasonableness in an ex post hearing, in which agents and experts can take the stand and counsel for the defendant can cross-examine the agent, offer his own witnesses, submit written briefs, and present oral argument.

Ex post review significantly decreases the risk of judicial errors

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

The proper answer is "no." Ex ante restrictions are unworkable and unwise for two core reasons. First, the combination of error-prone ex ante judicial review and more accurate ex post judicial review will result in systematic constitutional error. Instead of requiring reasonableness, ex ante review will result in reasonable steps being prohibited by judicial error. The likelihood of error will be a function of constitutional uncertainty. The more unclear the relevant legal rules, the more uncertain will be the restrictions needed to ensure reasonableness. However, as the law of reasonableness becomes clear, ex ante restrictions also become useless: the police will follow the rules because they know they will be imposed ex post, without a need for ex ante restrictions. From this perspective, the perceived need for ex ante restrictions is merely a response to present legal uncertainty.

Of course, it is better to prohibit unreasonable searches ex ante than invalidate them ex post while the law remains uncertain. Perhaps this carves out a role for ex ante restrictions, just as a placeholder until the law becomes settled? Again, the answer is "no." The difficulty is that ex ante restrictions impair the ability of appellate courts and the Supreme Court to develop the law of unreasonable searches and seizures in the usual case-by-case fashion. Assuming ex ante restrictions are not null and void, they transform Fourth Amendment litigation away from an inquiry into reasonableness and towards an inquiry into compliance with the magistrate's commands. Search and seizure law cannot develop in this environment. For that reason, ex ante restrictions cannot be temporary measures used until the law becomes settled. Ironically, those measures will actually prevent the law from being settled.

AT: Perm do the CP

The perm severs – it requires prior authorization before surveillance may proceed – that's ex ante. The CP establishes robust FISC review of surveillance after it has occurred – that's ex post

Morgan, 8 - Law Clerk to the Honorable Samuel H. Mays, Jr., United States District Court for the Western District of Tennessee. J.D., 2007, New York University School of Law (Alexander, "A BROADENED VIEW OF PRIVACY AS A CHECK AGAINST GOVERNMENT ACCESS TO E-MAIL IN THE UNITED STATES AND THE UNITED KINGDOM" 40 N.Y.U. J. Int'l L. & Pol. 803, Spring, lexis)

In this Note, I use "oversight" to refer to any form of review, be it internal or external, judicial or nonjudicial, that accompanies e-mail surveillance either before (ex ante) or after (ex post) its use. The American regime includes both ex ante and ex post oversight of e-mail surveillance. Ex ante oversight includes departmental protocols, as well as the judicial authorization requirements under the ECPA and **FISA**. Departmental protocols that require senior agency officials to approve applications to courts provide an administrative hurdle that informally limits the number of surveillance applications and ensures a good-faith basis for their submission. n61 Though these protocols provide initial limits on e-mail surveillance, the judiciary remains the most important, as judges provide an extrinsic check that agency officials cannot. Judges are less likely than prosecutors or executive agents to have a vested interest in an investigation's success and are therefore better suited to oversee compliance with surveillance requirements. n62

[*815] Courts are the only forum for ex post oversight in the United States. Where the government conducts surveillance in violation of statute, courts may impose penalties on the persons guilty of unauthorized surveillance and, in some cases, they may exclude the evidence from trial. n63 Suppression of evidence obtained in violation of the ECPA is available for wire or oral communications, but is inexplicably absent for e-mail. n64 Legal commentators denounce this distinction as "baseless" n65 and further argue that, without a statutory hook, criminal defendants have a lesser "incentive to raise challenges to the government's internet surveillance practices." n66

When government surveillance abridges constitutional rights, there are two avenues of redress. n67 At trial, criminal defendants may seek to suppress evidence obtained through unconstitutional means, as well as evidence derived therefrom (deemed "fruit of the poisonous tree"). n68 Victims of unconstitutional searches may also bring civil actions seeking damages for deprivation of rights under color of law. n69

Ex post oversight is qualitatively different from the plan – it allows all surveillance to occur, but establishes protections against the misuse of surveillance data. The plan severs because it has to curtail surveillance from the start

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

In addition to oversight by outsiders, a programmatic surveillance regime also should feature a system of internal checks within the executive branch, to review collection before it occurs, after the fact, or both. As for the ex ante checks, internal watchdogs should be charged with scrutinizing proposed bulk collection to verify that it complies with the applicable constitutional and statutory rules, and also to ensure that appropriate protections are in place for privacy and civil liberties. The Justice Department's Office of Intelligence is a well known example. The unit, which presents the government's surveillance applications to the FISA court, subjects these requests to exacting scrutiny with the goal of increasing the likelihood of surviving judicial review. n65 Indeed, the office has a strong incentive to ensure that the applications it presents are airtight, so as to preserve its credibility with the FISA court. n66 Ex post checks include such commonplace mechanisms as agency-level inspectors general, who can audit bulk collection programs, assess their legality, and make policy recommendations to improve their operation, as well as entities like the Privacy and Civil Liberties Oversight Board, which perform similar functions across the executive branch as a whole. Another important ex post check is to offer meaningful whistleblower protections to officials who know about programs that violate constitutional or statutory requirements. Allowing officials to bring their concerns to ombudsmen within the executive branch (and then eventually to Congress) can help root out lawlessness and also relieve [*539] the felt necessity of leaking information about highly classified programs to the media.

The CP doesn't curtail surveillance – it curtails what authorities may DO with the data after it's collected – it's a form of harm minimization only

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

A third operational consideration is the need for strong minimization requirements. Virtually all surveillance raises the risk that officials will intercept innocuous data in the course of gathering evidence of illicit activity. Inevitably, some chaff will be swept up with the wheat. The risk is especially acute with programmatic surveillance, in which the government assembles large amounts of data in the search for clues about a small handful of terrorists, spies, and other national security threats. n71 Minimization is one way to deal with the problem. Minimization rules limit what the government may do with data that does not appear pertinent to a national security investigation--e.g., how long it may be retained, the conditions under which it will be stored, the rules for accessing it, the purposes for which it may be used, the entities with which it may be shared, and so on. Congress appropriately has required intelligence officials to adopt minimization procedures, both under FISA's longstanding particularized surveillance regime n72 and under the more recent authorities permitting bulk collection. n73 But the rules need not be identical. Because programmatic surveillance often involves the acquisition of a much larger trove of non-pertinent information, the minimization rules for bulk collection ideally would contain stricter limits on the use of inadvertently collected information for purposes unrelated to national security. In other words, the minimization procedures should reflect the anti-mission-creep principle described above.

Defamation CP

1nc – defamation CP

The United States federal government should:

-designate the four main Congressional leaders with powers to appoint FISC judges

-require a simple majority in Congress to uphold all FISC decisions

-implement an adversarial process in FISC cases

-subject all FISC cases to the same standards as defamation cases

The CP successfully reforms the FISC

Cetina 14– John Marshall Law School (Daniel, "Balancing Security and Privacy in 21st century America: A Framework for FISA Court Reform", John Marshall Law Review, Summer 2014, http://heinonline.org/HOL/Page?collection=journals&handle=hein.journals/jmlr47&type=Text&id=1540)//DBI

A. Structural Prong

Despite suggested structural proposals' substantial limitations, 124 much of what has been suggested thus far could be effective if modestly modified. Requiring the Senate to reconfirm non-Article III FISA Court judges is a patently inadequate option because of the considerable constitutional problems it raises.125 However, designating the four main congressional leaders with some **appointment powers**, instead of vesting this enormous responsibility exclusively in the chief justice, 126 is an intriguing approach. Furthermore, Congress should review FISA Court decisions, but only require a **simple majority** to approve them. 127 This would avoid the infeasible supermajority threshold.128 It would also give Congress a stake in these decisions, thereby making them politically accountable to the people, that sovereign body for whom Congress is directly responsible and to whom Congress is directly beholden, unlike the sequestered, electorally unaccountable federal judiciary.129 In other words, the system would become more **transparent** - a virtue missing from the current security apparatus.130 Finally, FISA Court proceedings must incontrovertibly become **adversarial** in accord with the great American tradition.

Additionally, courts - namely, the FISA Court - require a distinct framework for addressing challenges to governmental surveillance. Thus, in addition to applying these structural changes, introducing a judicial interpretive remedy is critical.

B. Interpretive Prong

Relying on the state secrets doctrine or routinely acquiescing to the government's demands cannot replace reasoned determinations of surveillance's practical effects on legitimate privacy interests or its potential overbreadth. Thus, courts should adopt a new approach that addresses both security interests and privacy interests.

Considering the relative dearth of effective judicial tests and precedent in surveillance cases,1 3 1 which again are generally decided pursuant to the state secrets privilege - and therefore in favor of the governmentl 32 - a good approach is to analogize to an existing test. The best doctrinal underpinning for a new test is First Amendment law, more specifically, the various tests for defamation. 133

Defamation cases, 134 such as libel and slander, present a dichotomy between two critical interests somewhat akin to surveillance cases: free speech and reputation.135 In New York Times Co. v. Sullivan, the Supreme Court extended First Amendment protection to libel for the first time in our nation's history.136 However, recognizing that personal reputation is as important to citizens as free speech rights, the Court subsequently carved out numerous exceptions when confronted with novel scenarios.137 The specific test created for libel against public officials or public figures requires the plaintiff to show with convincing clarity that the defendant propagated made the defamatory statement with actual malice or with knowledge or reckless disregard of its falsehood. 138

This test provides a good general framework that the judiciary should appropriate for surveillance cases. The government, bringing a surveillance request before the FISA Court, would have the same burden as public officials in defamation situations: convincing clarity.13 9 Currently, the standard is probable cause140 - far too loose when it comes to citizens' privacy. With this in mind, the government would be required to satisfy a threshold evidentiary standard by showing a **substantial need** for limited surveillance (the knowing or reckless falsehood prong) that is causally connected to preventing **definite threats** (the actual malice prong).

Of course, like any judicial test, these subjective phrases require specificity. To satisfy the "substantial need" requirement, the government would have to articulate what it intends to do with information gathered from limited surveillance.141 As a corollary, this substantial need would have to outweigh the competing need for privacy, and it would necessarily be contingent on the government to overcome this barrier with convincing clarity.

To satisfy the "definite threat" requirement, the government would be compelled to demonstrate how desired information would help prevent an articulable threat to American interests.142 In considering this element, the court would examine the threat on a sliding scale that considers both magnitude and probability. At one extreme would be a putative ticking time bomb scenario, where the government shows surveillance is necessary to counter an identified threat that is actually at risk of transpiring; in such a situation judicial deference slides towards the government. The other extreme is a mere hypothetical threat,143 for which surveillance is only required in the abstract; in this situation judicial deference slides towards privacy. Between these extremes are numerous situations of varying severity, and the balance may tip either way depending on the strength of the government's case.

Ideally, the FISA Court would apply the security-privacy test in an adversarial proceeding. Thus, as the government attempts to fulfill these stringent requirements, the privacy advocate would counter with evidence of the requested surveillance's effect or effects on privacy.144 **The burden, however, would always remain with the government** as the entity seeking to

circumvent privacy rights. And, assuming all of the structural remedies are adopted, Congress would then have to approve the surveillance decision via majority vote. These changes, however, would inevitably inspire multiple critiques.

2nc – solves state secrets privilege

The CP resolves inefficiency and the state secrets privilege

Cetina 14– John Marshall Law School (Daniel, "Balancing Security and Privacy in 21st century America: A Framework for FISA Court Reform", John Marshall Law Review, Summer 2014, http://heinonline.org/HOL/Page?collection=journals&handle=hein.journals/jmlr47&type=Text&id=1540)//DBI

There are numerous counterarguments to the two-pronged proposal. First, government proponents would argue that introducing additional oversight procedures could hamper federal objectives, especially as they relate to identifying threats and apprehending suspected terrorists, 145 and create unwanted burdens. This argument is not without some import. The 2013 Boston Marathon bombing 46 is a persuasive indicatorl 4 7 that not only is the War on Terrorism an enduring conflict but also that enemies can emerge internally, necessitating continued monitoring of both foreign and domestic threats.

Second, there is no guarantee that a bright-line judicial test can withstand additional successful applications of the **state secrets privilege**.148 Indeed, the interpretive component does not contemplate eradicating the state secrets privilege from the government's repertoire, and it may effectively become a failsafe for borderline cases, particularly at lower federal courts considering privacy claims.

However, the two-pronged proposal should quiet such criticisms. Governmental efficiency may be affected, but the system was designed not for unrestricted freedom to perpetuate controversial programs but rather for debate and contemplation, 149 those hallmarks of democracy. Furthermore, the new judicial test's substantial need and definite threat requirements should, absent the most extraordinary circumstances, overshadow the state secrets privilege.

V. CONCLUSION

Anthony Lewis wrote that the "accommodation of conflicting interests is always complicated. It requires judges to draw nice lines, it requires lawyers to argue, it requires academics to reflect."' 5 0 Though he was speaking about libel law, Lewis's reflections apply with equal force to the security/privacy dynamic at the nucleus of surveillance law. Justice Souter clearly agrees that many legal controversies involve the "tension of competing values, each constitutionally respectable, but none open to realization to the logical limit."'51

The government's interest in protecting the country is praiseworthy, but the right to privacy 52 is also respectable and constitutionally protected. Neither of these crucial values should be marginalized or abandoned;- indeed, a strong democracy is capable of accommodating both. The proposed structural and interpretive remedies to United States surveillance tactics are important steps to realizing a more effective security apparatus that, far from dangerously impinging on cherished liberty, thoughtfully balances security and privacy in 21st century America.

Standing CP

1nc

The United States federal government should change its definition of "protected information" in the FISA Amendments Act of 2008 so plaintiffs can satisfy standing in court.

Changing the definition of "protected information" receives broad support and allows the people to challenge intrusive surveillance

Greene 14 - John Marshall Law School, B.S. in Political Science (Michael, "Where Has Privacy Gone? How Surveillance Programs Threaten Expectations Of Privacy", The John Marshall Journal of Information Technology & Privacy Law, Summer 2014, http://heinonline.org/HOL/Page?handle=hein.journals/jmjcila30&div=36&g_sent=1&collection=journals)//DBI

There is a clearer way of redefining the actions of the NSA under the FAA of 2008, which would be to give plaintiffs a greater chance of challenging the constitutionality of FAA of 2008. Currently under Clapper, plaintiffs have yet to establish an injury in fact that would supersede the Supreme Court majority's apprehension of giving extenuating circumstances enough merit to justify standing.167 If a congressional amendment to the current FAA of 2008 inserted a new definition for protected information, then standing to challenge the acquisition of communications can be satisfied and there would be a **significant increase in surveillance oversight**. This bill would avoid the messiness of trying to restructure the currently secretive FISC court operations. Rather than attempting to create a new form of judicial review168 or the creation of a new authority for Congressional oversight board,169 a more constructive attempt at addressing the need for a clearer balance would be to **give the constitutional challenge back to the people**. Rather than trying to legislate it into firmly rooted governmental bodies, let the private section, the plaintiffs of the United States, fight this battle as they are the ones who are "injured in fact."

This proposed legislation combines the pragmatic approach of the SOR and STA Acts by avoiding any drastic rewrite of the FAA of 2008 **while still achieving the goals of affecting significant change to NSA surveillance programs** found in ISOR. Since this legislation only requires creating a new section of protected information, it does not require significant alterations to the FAA of 2008 that could block bipartisan support. Creating a new definition for protected information will likely receive **broad support** and lobbying from the technology industry, because it would restrict what information they would be required to relinquish.

The aforementioned legislation does not address the entirety of FISA programs nor does it attempt to solve every issue in FISA. The goal of this proposed legislation is instead to create an avenue for plaintiffs to get into court by **satisfying standing**. Unlike proposed legislation like ISOR or SOR/STA, this proposed solution will give plaintiffs a method to actually challenge the constitutionality of FISA. Creating a clear method for plaintiffs to assert challenges to FISA is the

most practical solution to these convoluted problems. So far, the U.S. Supreme Court has been able to avoid ruling on FISA. This legislation will **alleviate the burdens upon the legislature** to address FISA on its own and will **compel all branches of the federal government to work towards a solution**.

2nc – xt: solves intrusive surveillance

Amending the FAA allows FISA to be successfully challenged in court—it solves the issues with the Clapper case

Greene 14 - John Marshall Law School, B.S. in Political Science (Michael, "Where Has Privacy Gone? How Surveillance Programs Threaten Expectations Of Privacy", The John Marshall Journal of Information Technology & Privacy Law, Summer 2014, http://heinonline.org/HOL/Page?handle=hein.journals/jmjcila30&div=36&g_sent=1&collection=journals)//DBI

Although this solution is a roundabout way of addressing the plaintiff's shortcomings in Clapper, it satisfies the issues that Justice Alito had presented in his majority holding.170 Justice Alito's opinion established that plaintiffs must be able to show an injury in fact and more than a speculation that the government used Section 1881a authorized surveillance to target their clients.171 Furthermore, giving plaintiffs the opportunity to satisfy standing will allow the Supreme Court to adjudicate the constitutionality of the FAA of 2008. There **does not need to be a drastic Congressional bill** that will **likely not pass both houses of Congress** for there to be a significant change to the legal rights of plaintiffs to challenge the constitutionality of FAA of 2008.

Although attacking the present issues in a very different way than ISOR or SOR/STA Acts, this proposed solution could actually be successful in asserting a change to the current dilemma both Congress and the American public face. First, a new amendment to the FAA of 2008 should **insert limitations on the acquisition of metadata**. Currently under Section 703, any intentional targeting of a known or reasonably believed target that is a U.S. person is restricted.172 The collection of U.S. persons' metadata information is an intentional targeting of U.S. persons that was limited directly by Section 703. Although this collection targets U.S. persons, courts have yet to find that metadata is the type of information or communication that is protected under the Fourth Amendment.173 **Metadata should be presented as a new point** under Section 703 limitations. This will give plaintiffs the ability to point directly at a statutory limitation that they can base their injury in fact off of. This will likely be sufficient to establish that plaintiffs have standing to challenge the constitutionality of the FAA of 2008. Justice Alito determined that the simple fear of having information collected was not enough for plaintiffs to achieve Article III standing. Contrary to Justice Alito's apprehension of plaintiff's fear, leaked documents show that **U.S. persons have been intentionally targeted** through the dragnet collection of all Verizon communications.174

Secondly, although these challenges may not be able to satisfy the second crux of Justice Alito's opinion, they provide a basis for this to be achieved in the future. Justice Alito found that if there was some other possible way for the government to have conducted the surveillance, there should not be a rush to judgment or finding that the government had certainly conducted warrantless

surveillance.175 While the proposed legislation cannot achieve this on its own, the importance of allowing the potential success of it, is that it at least plaintiffs can establish that they have been targeted in dragnet surveillance programs. Establishing direct evidence of dragnet surveillance programs will limit the need to address other possible ways surveillance could have been conducted and set a firm basis for a constitutional challenge of FISA program legality.

The goal of this new legislation is not to take on the bear of a problem that is the FAA of 2008, but merely to **establish the framework** for this Act to at least be challenged on a constitutional basis. So far, the legislation that has been proposed has only looked at creating a new subset of judicial control in the FISC court or has catered only to the dissemination side of producing user information. The larger goal, of any congressional act that wishes to address the issue of guaranteeing U.S. persons' privacy rights are secured, is to allow a plaintiff into federal court to challenge the constitutionality of the FAA of 2008.

2nc – at: legislation key

Forcing courts to respect FISA spurs legislative reforms that facilitate more effective judicial enforcement

Seamon 8 – Professor, University of Idaho College of Law (Richard, "Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits", Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

Third, courts should respect legislation, such as FISA, that generally falls within Congress's powers and is carefully designed to protect Fourth Amendment rights against executive surveillance.' 95 By respecting such legislation, courts **encourage legislative enforcement efforts**. Those efforts deserve judicial support because they can **produce legislative rules that facilitate judicial enforcement.** 196 FISA does this, for example, by generally requiring advance judicial approval for FISA surveillance. 97 Some statutes deserve judicial skepticism because they expand executive power with little attention to individual rights. 198 FISA does not fall within that description; it restricts executive power to enforce Fourth Amendment safeguards. 199

2nc – at: cp can't solve fisc

Forcing FISA to reveal court orders is a necessary first step to reform the FISC

Greene 14 - John Marshall Law School, B.S. in Political Science (Michael, "Where Has Privacy Gone? How Surveillance Programs Threaten Expectations Of Privacy", The John Marshall Journal of Information Technology & Privacy Law, Summer 2014, http://heinonline.org/HOL/Page?handle=hein.journals/jmjcila30&div=36&g_sent=1&collection=journals)//DBI

Forcing FISC court orders into the public domain, by allowing plaintiffs to petition them directly for the evidence of being monitored by government agencies, will be the first step in securing that trust in the government will be reformed. Although legislation can establish new parameters and set out more stringent guidelines for how communications are collected and stored, without the ability to challenge the constitutionality of the program in the legal system, these **problems will persist**. Although there may seem to be easier ways of achieving a constitutional challenge to the FAA of 2008, these paths are all likely **dead ends**. Legislation that does not try to give plaintiffs a

larger platform or a more defined Article III standing will **fail at achieving any real end result**. The likelihood of another change to the actual legislation will be too low.

2nc – xt: no link ptx

The CP avoids politics

Greene 14 - John Marshall Law School, B.S. in Political Science (Michael, "Where Has Privacy Gone? How Surveillance Programs Threaten Expectations Of Privacy", The John Marshall Journal of Information Technology & Privacy Law, Summer 2014, http://heinonline.org/HOL/Page?handle=hein.journals/jmjcila30&div=36&g_sent=1&collection=journals)//DBI

This current petition is a clear example of why there needs to be additions made to the FAA of 2008 that allow for plaintiffs to satisfy the standing requirements to be heard in front of the Supreme Court. It is highly unlikely that legislation will be passed that restricts the activities of the FISC court, or that will give plaintiffs enough authority to challenge the FISC court decisions. Currently under the FAA of 2008, FISC court decisions are not challengeable by U.S. persons. Without creating a way for U.S. persons to establish standing, there will be no legal remedy available to protect civil liberties. Absent a new found commonality among the differing parties in Congress, there is little to no chance that a substantial bill will be passed that drastically changes how the FISC court is structured or how FISA surveillance programs are implemented. The most successful challenge to these rigid ideas will come from the most unlikely source, and that is why there needs to be a reliance on plaintiffs getting into the Supreme Court to challenge the constitutionality of FAA of 2008.

Disadvantage links

Presidential powers links

1nc – exigent circumstances link

A limited emergency exception to the plan is vital to presidential powers

Seamon 8 – Professor, University of Idaho College of Law (Richard, "Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits", Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

Of course, the President's "genuine emergency" power has limits. The Japanese attack on Pearl Harbor created a "genuine emergency," but that emergency did not last for the entire war.'34 Nor did the attack on Pearl Harbor necessarily justify every measure that the President deemed reasonable, including the mass internment of Japanese Americans.135 The existence of genuine emergency powers in the President-and the relaxation of Bill of Rights limits on those powers-must be limited in time and scope.136 **Otherwise, the separation of powers system cannot work effectively** and Bill of Rights freedoms become fair weather friends. I propose two limits on the President's "genuine emergency" powers.

First, the President's power depends on the legislative framework within which it is exercised. The President can defy an Act of Congress in a national security emergency **only if defiance of the legislation is necessary** to respond to the emergency. If the President can effectively respond to the emergency while obeying the statute, the President lacks power to defy it. 137 Thus, Congress can regulate the President's power to respond to national security emergencies by enacting legislation that gives the President adequate leeway in such emergencies. By the same token, it is the inadequacy of legislation that justifies presidential defiance of the legislation in cases of genuine emergency. 38

Second, the President's emergency powers are residual when Congress has enacted generally valid legislation in the same area. Congress and the President share power in many areas, including the waging of war.139 In matters of shared governance, the separation of powers doctrine gives Congress the power to make rules and the President power-**not to unmake Congress's rules-but to break them when reasonably necessary** in a genuine emergency. 40 For example, in late 2005 Congress enacted a law prohibiting members of the armed forces from torturing people detained in the war on terrorism. 14 1 Assume for the sake of argument that it is possible to conceive of a "genuine emergency" in which the President could reasonably decide it was necessary to defy this prohibition. 42 It is one thing to recognize presidential power to break Congress' rule in a particularly exigent situation, after making an individualized determination that it was necessary to violate the prohibition. It is quite a different matter to recognize presidential power to unmake Congress's rule by promulgating a "program" authorizing torture in broadly defined categories of situations.1 43 One way to express the difference is by saying that, in the second situation, the President is impermissibly exercising legislative power, whereas in

the first situation he is exercising irreducible executive power.144 Another way to express the difference is to say that the executive power to act in "emergencies" is limited in scope and duration to that necessary when there is "no time for deliberation., 145 Those limits flow from our system of separated powers.

2nc – exigent circumstances link

External surveillance restrictions undermine presidential powers and the ability to speak with one voice

Seamon 8 – Professor, University of Idaho College of Law (Richard, "Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits", Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

Recognizing a congressionally irreducible "genuine emergency" power in the President is supported by the Constitution's creation of a "unitary executive."' 14 The Constitution provided for only one president so that, on appropriate occasions, one person can act for the nation without consulting others. 1 5 The Framers thought a unitary executive was particularly important for conducting foreign affairs. A unitary executive not only enables the country to speak to other countries with one voice, 116 it also ensures quick action when necessary to protect national security. 17 Too, it helps ensure the secrecy of sensitive foreign intelligence. 1 8 Thus, the Court has often referred to the President as the "sole organ" of foreign affairs." 9 The "sole organ" concept cannot, however, be stretched so far that it puts the President indefinitely above the law. Rather, it makes sense to let the President act as the "sole organ" if-but only so long as-it is necessary in a genuine national security emergency for him or her to function. 120 The unitary executive concept rests on the need for prompt, univocal action that will often be informed by information that cannot be broadly shared. As that need subsides, so does the legitimacy of conduct justified by reference to the unitary executive concept.

This reliance on the unitary executive concept is deliberately narrow. It does not embrace broader claims that have been asserted under the unitary executive theory. Unitary executive extremists assert Presidential power to ignore congressional restrictions on removal of executive branch officials and congressional enactments vesting exclusive power to administer statutory programs in officials other than the President. 121 In particular, recognition of congressionally irreducible presidential power in national security emergencies does not imply that the President has a greater role than Congress in the prosecution of war. 122 The position staked out here does, however, reject the view that "there is no constitutional impediment to Congress restricting the President's ability to conduct electronic surveillance within the United States and targeted at United States persons."'123 That view would apparently preclude the President's violation of statutory surveillance restrictions even if the President reasonably concluded that violation of those restrictions was necessary to respond to a national security emergency.

This analysis leaves many questions unanswered, including: Who decides whether a national security emergency exists?; What response is appropriate to a particular emergency?; and, How does one decide whether a particular legislative provision should be read to unconstitutionally

intrude upon the President's power to respond to such an emergency?' 214 As a practical matter, the President often must decide those questions initially. 125 Courts, however, can often review those decisions when they are implemented by officials other than the President and when the decisions affect individual rights.126 Indeed, sometimes the federal courts can set aside such decisions, as the Court's recent decision in Hamdan v. Rumsfeld shows. 12 7 Thus, regardless of the power the President may individually possess as a "unitary executive," he or she is judicially accountable in many settings. In addition, the President is politically accountable for his or her unilateral responses to genuine national security emergencies, at least once those decisions become public. 128

By any standard, 9/11 constituted a genuine national security emergency. 129 Accordingly, it empowered the President to take some immediate actions that he reasonably thought necessary, even if those actions violated federal statutes. Suppose, for example, that the passengers aboard United Airlines Flight 93 had not caused the plane to crash in Shanksville, Pennsylvania, and that it had continued its suicide mission toward the U.S. Capitol. 130 Can anyone doubt that the President could have ordered the flight shot down before it hit the Capitol, even if that order violated a federal statute? 131 Similarly, suppose the President had ordered the instant electronic monitoring of all cell phone calls to and from the plane to determine the plane's target and those responsible for the suicide mission. Would not the President have authority to order that surveillance even if it violated FISA?'32

One basis for concluding that the President would have that authority is to interpret FISA (and other statutes limiting the President's power in genuine emergencies) to implicitly include exceptions for genuine emergencies. That interpretation finds support in the canon requiring courts to avoid statutory interpretations that produce "absurd results."' 1 33 But the canon should not obscure the reason why it would be absurd to interpret FISA to prohibit the President from responding to genuine national security emergencies: It is absurd to give Congress such a prohibitory power. To the contrary, **common sense and precedent** support recognition of presidential power, irreducible by Congress, to make necessary, immediate responses to genuine national security emergencies.

Terrorism links

1nc – FAA exclusivity link

FAA exclusivity undermines counterterrorism measures—time, standards, and authorizations
Seamon 8 – Professor, University of Idaho College of Law (Richard, “Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits”, Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

True, FISA has shortcomings. The shortcomings reflect changes in surveillance technology and in international terrorism. Those shortcomings could very well justify surveillance outside FISA-even today-if the President reasonably determines that, in a particular instance, it is reasonably necessary to depart from FISA. Specifically, FISA has at least three shortcomings that could create "genuine emergencies" justifying event-specific departures from FISA.

First, it can take too long to get a FISA surveillance order.164 True, the Attorney General can authorize "emergency orders" approving FISA surveillance without prior court approval. 165 But this statutory emergency authority has drawbacks. The Attorney General must personally determine the existence of both an emergency and a factual basis for the issuance of an order.166 Until he or she does so, emergency surveillance cannot occur.167 NSA, however, may need to start surveillance the instant that NSA determines the surveillance is justified, without awaiting Attorney General authorization.' 68 Furthermore, the Attorney General is only one person, and he or she may be called upon personally and very quickly to make dozens or hundreds of "emergency" determinations. The Attorney General could become a bottleneck. Finally, the government must advise the FISA court of each emergency order and apply within seventy-two hours for a surveillance order from the court to ratify the attorney general's emergency order. 169 This supposedly expedited application process, required for every emergency order, could keep dozens of government lawyers employed on a continual fire drill without coming close to achieving the instantaneous authorization that is sometimes required for national security surveillance.

Second, the standards for getting FISA surveillance orders can be too high. NSA monitors phone calls and emails into and out of the United States involving people whom NSA has a "reasonable basis" for believing are associated with al Qaeda.170 The government may not have probable cause to believe that these people are "agents of foreign power" who can be targeted under FISA.171 Indeed, the person in the United States whose phone calls or emails are monitored may be entirely innocent, if it is the person outside the U.S. who is associated with al Qaeda and who triggers NSA surveillance. 172 To cite another example, perhaps the person in the U.S. who is being monitored is associated with al Qaeda but the association does not make that person a foreign agent.173 Even so, the government may have good reason to monitor the communication.174

Third, FISA orders could be too narrow. FISA authorizes surveillance of one target at a time. 175 The government, however, sometimes needs to conduct wholesale surveillance-for example, by monitoring phone calls to all persons in the United States from particular individuals outside the U.S and by filtering communications to detect certain words and patterns of words.176 Wholesale surveillance may very well violate FISA but be reasonably necessary in a genuine national security emergency, such as when the government has strong evidence that someone outside the U.S. is planning terrorist attacks on a U.S. target with accomplices inside the U.S. 177

In sum, the President may have power to authorize surveillance **"outside FISA"** in situations presenting a "genuine emergency." That power, however, exists only when national security exigencies make it reasonably necessary to ignore FISA. Even so, the power justifies surveillance outside FISA even today, to the extent FISA's shortcomings create exigent circumstances precluding resort to the FISA process. This residual power does not support the current NSA surveillance "program," which authorizes wholesale departure from FISA. 178

2nc – FAA exclusivity link

Adhering to FISA undermines intelligence collection capabilities and effective counter-terrorism strategy

Sievert 14 * Professor, Bush School of Government and U.T. Law School, author of three editions of Cases and Materials on US Law and National Security (Ronald, "Time to Rewrite the Ill-Conceived and Dangerous Foreign Intelligence Surveillance Act of 1978", National Security Law Journal Vol. 3, Issue 1 – Fall 2014)//GK p. 51-52

To counter these and other ongoing threats, the United States government has been burdened with the restrictions of the misguided and ill-conceived Foreign Intelligence Surveillance Act of 1978 ("FISA").14 This statute requires that, in their effort to protect the nation's security, intelligence analysts, agents, and attorneys must produce evidence before members of the federal judiciary that meets the maximum criminal law search standard of probable cause before they can monitor the domestic conversations and emails of agents of a foreign power and terrorist organizations.15 The procedure created by this statute is both confusing and, in the words of New York City Police Commissioner Raymond Kelly, "an unnecessarily protracted, risk-adverse process that is dominated by lawyers, not investigators and intelligence collectors."16 Both the 9/11 Commission17 and Amy Zegart in her book Spying Blind18 have detailed how FBI agents were stymied in tracking the hijackers before the September 11th attacks because, as a result of FISA interpretations, lawyers in the Department of Justice's "Office of Intelligence and Policy Review, FBI leadership and the FISA Court built barriers between agents—even agents serving on the same squads."19 This "wall" was breached to some extent with the 2001 PATRIOT Act provisions permitting information sharing,20 but the statute's basic restrictions and confusion surrounding its interpretation remain. The FBI had detained hijacker Zacarias Moussaoui in Minneapolis days before the 9/11 attacks, but agents were prevented from scanning his computer because a supervisor at FBI Headquarters concluded there was not probable cause for a FISA warrant. Meanwhile, according to the DOJ Inspector General's report, the Minneapolis office believed that "probable cause for the warrant was clear" and "became increasingly frustrated with the responses and guidance it was receiving." The Bush administration initiated the publicly criticized Terrorist Surveillance Program because, even with the PATRIOT Act's modifications, obtaining FISA warrants "incurr(ed) a delay that was unacceptable given the time-sensitivity and sheer volume of intelligence requirements after 9/11."22 The government apparently knew that 2007 Times Square bomber Faisal Shahzad had "established interaction with the Pakistani Taliban, including bomb making training in Waziristan" and had made "thirteen trips to Pakistan in seven years," yet did not monitor him as he slowly assembled the materials to construct his potentially devastating weapon.23 This led the Wall Street Journal to question whether the failure was due to "restrictions imposed on wiretapping by the Foreign Intelligence Surveillance Act" and to quote officials on the reduced effectiveness and excessive delays of the judicially regulated program.24 In a very extensive, detailed investigation of the Boston Marathon bombing, Keith Maart further highlighted the confusion endemic to attempts at interpreting FISA. 25 He noted that the Russian Federal Security Service ("FSB") had twice informed the FBI and CIA that Tamerlan Tsarnaev "had contacts with foreign Islamic militants/agents, was visiting jihadist websites and was looking to join jihadist groups" and that he had travelled to Dagestan on an unknown mission.26 Maart offered that it would certainly appear there was "sufficient probable cause to obtain FISA warrants that would allow . . . more encompassing surveillance."27 However, the FBI had apparently come to a contrary conclusion.28 By adhering to FISA, we are weakening our intelligence collection capabilities rather than strengthening our ability to prevent catastrophic attacks by those who do not hesitate to target and inflict mass casualties on innocents. At the same time, we are overreacting to the government's access to the limited information contained in metadata that has been routinely collected by telephone companies for decades.29 This Article will explain how FISA was an excessive response to the Supreme Court's decision in U.S. v. U.S District Court (Keith)30 and the Watergate era, and demonstrate why, because of the foreign affairs power and the Supreme Court's decisions on public safety searches, it is not constitutionally required.31 Furthermore, this Article will show that most of our foreign partners in the supposedly sophisticated, privacy-protecting nations of Europe do not restrain their security forces in a similar manner in intelligence cases. This is due to the obvious reason that national security investigations involve threats that endanger the lives of thousands of people and potentially imperil the very existence of the nation, unlike the far more constrained menace of ordinary crime.32 It is well recognized that the arguments contained here are directly opposed to those who are demanding more, not fewer, government regulation in the wake of the revelations attributed to Edward Snowden.33 Accordingly, this Article will also address why our recent media, political, and judicial reactions might once again lead to restrictions that are not constitutionally required, and that could further undermine the government's reasonable efforts to provide security for the American people.

FISA is the exclusive means for domestic electronic surveillance for foreign intelligence purposes

Seamon 8 – Professor, University of Idaho College of Law (Richard, "Domestic Surveillance for International Terrorists: Presidential Power and Fourth Amendment Limits", Hastings Constitutional Law Quarterly, Spring 2008, http://www.hastingsconlawquarterly.org/archives/V35/I3/seamon.pdf)//DBI

First, the TSP may violate FISA. FISA prescribes "the exclusive means by which electronic surveillance [for foreign intelligence purposes]... may be conducted" in the United States.21 FISA's legislative history confirms that Congress intended FISA to govern all domestic electronic surveillance for foreign intelligence purposes.22 Congress made FISA exclusive to stop executive abuses exposed in the 1970s through efforts such as the Church Committee investigations." The Church Committee revealed that Presidents since Franklin D. Roosevelt had authorized warrantless surveillance of Americans.24 Although Presidents claimed "inherent" power to authorize this surveillance for "national security" purposes, the surveillance often targeted people merely because of their political views.25 By enacting FISA in 1978, Congress intended to "prohibit the President, notwithstanding any inherent powers," from conducting domestic electronic surveillance for foreign intelligence purposes without complying with FISA. 6 Congress seemingly **precluded any domestic surveillance outside of FISA**.

2nc - FAA exclusivity link – probable cause

FISA has a rigorous warrant requirement based upon probable cause

Harper 14, University of Chicago Law School, U.S. Department of Justice, Civil Division, (Nick, "FISA's Fuzzy Line between Domestic and International Terrorism", University of Chicago Law Review;Summer2014, Vol. 81 Issue 3)//AK

Each FISA warrant application must meet several requirements. The application must identify the target of the surveillance and describe both the nature of the information sought and the type of communications or activities that would likely be subject to surveillance.41 The government also must propose procedures to minimize its use of the information sought and must certify that (1) the information sought is deemed to be foreignintelligence information, (2) a "significant purpose of the surveillance is to obtain foreign intelligence information," and (3) "such information cannot reasonably be obtained by normal investigative techniques."42

FISA also requires a submission of facts that establishes probable cause that the target is a "foreign power or an agent of a foreign power."43 Unlike in Title III, the target of surveillance need not be tied to a specific criminal offense.44 Instead, to satisfy probable cause, the government must show some linkage to a "foreign power" as outlined in the definitional section of the Act (known as the "targeting provisions").45

Because of this peculiar probable cause requirement, the scope of the definitions of "foreign powers" effectively controls the potential reach of FISA-authorized surveillance. FISA lists seven different types of foreign powers, but they basically consist of foreign governments and entities controlled by those governments, foreign-based political organizations, and international terrorist groups.46 FISA then has two sets of definitions of "agent of a foreign power,"47 depending on whether the target is a "United States person."48 There are several differences between the two agency provisions, but the main distinction is that the government must show that US persons knowingly engaged in forbidden activity on behalf of a foreign power.49 Thus, for example, to surveil a US person suspected of being an al-Qaeda operative, the government would have to show that the person knowingly engaged in international terrorism on behalf of al-Qaeda. Once the government submits its application, a FISC judge must approve the surveillance if he finds that the government has met the above requirements, provided that no US person was considered a foreign power or an agent of a foreign power solely based on activities protected by the First Amendment.50 This represents the last step in the FISC's involvement with the FISA wiretap process: district court judges, rather than FISC judges, assess the application's compliance with FISA and FISA's compliance with the Fourth Amendment when evidence derived from the wiretaps is challenged in a criminal proceeding.

Link – 'domestic' limit

Attempting to preclude NSA 'domestic' surveillance guts their ability to do bulk collection – they lack the technological ability to distinguish

Donohue, 15 - Professor of Law, Georgetown University Law Center (Laura, "SECTION 702 AND THE COLLECTION OF INTERNATIONAL TELEPHONE AND INTERNET CONTENT" 38 Harv. J.L. & Pub. Pol'y 117, Winter, lexis)

In its October 2011 memorandum opinion, the court confronted two areas: first, targeting procedures as applied to the acquisition of communications other than Internet transactions -- that is, "discrete communications between or among the users of telephone and Internet communications facilities that are to or from a facility tasked for collection." n290 As in the past, the court found the targeting procedures with regard to non-Internet transactions to be sufficient. Second, the court considered de novo the sufficiency of the government's targeting procedures in relation to Internet transactions [*192] transactions. n291 Despite the acknowledgement by the government that it knowingly collected tens of thousands of messages of a purely domestic nature, FISC found the procedures consistent with the statutory language that prohibited the intentional acquisition of domestic communications. n292

The court's analysis of the targeting procedures focused on upstream collection. n293 At the time of acquisition, the collection devices lacked the ability to distinguish "between transactions containing only a single discrete communication to, from, or about a tasked selector and transactions containing multiple discrete communications, not all of which may be to, from, or about a tasked selector." n294 The court continued: "As a practical matter, this means that NSA's upstream collection devices acquire any Internet transaction transiting the device if the transaction contains a targeted selector anywhere within it." n295 Because of the enormous

volume of communications intercepted, it was impossible to know either how many wholly domestic communications were thus acquired or the number of non-target or U.S. persons' communications thereby intercepted. n296 The number of purely domestic communications alone was in the tens of thousands. n297

Despite this finding, FISC determined that the targeting procedures were consistent with the statutory requirements that they be "reasonably designed" to (1) "ensure that any acquisition authorized under [the certifications] is limited to targeting persons reasonably believed to be located outside the United States" and (2) "prevent the intentional acquisition of any communication as to which the sender and all intended recipients are known at the time of the acquisition to be located in the United States." n298

To reach this conclusion, the court read the statute as applying, in any particular instance, to communications of individuals "known at the time of acquisition to be located in the United [*193] States." n299 As the equipment **did not have the ability to distinguish between purely domestic communications and international communications**, the NSA could not technically know, at the time of collection, where the communicants were located. From this, the court was "inexorably led to the conclusion that the targeting procedures are 'reasonably designed' to prevent the intentional acquisition of any communication as to which the sender and all intended recipients are known at the time of the acquisition to be located in the United States." n300 This was true despite the fact that the NSA was fully aware that it was collecting, in the process, tens of thousands of domestic communications. n301 As far as the targeting procedures were concerned, at least with regard to MCTs, the NSA had circumvented "the spirit" but not the letter of the law. n302

The court's reading led to an extraordinary result. The statute bans the knowing interception of entirely domestic conversations. The NSA said that it knowingly intercepts entirely domestic conversations. Yet the court found its actions consistent with the statute.

A few points here deserve notice. First, it is not immediately clear why the NSA is unable to determine location at the moment of intercept and yet can ascertain the same at a later point. Second, in focusing on the technical capabilities of any discrete intercept, the court encouraged a form of willful blindness--that is, an effort to avoid criminal or civil liability for an illegal act by intentionally placing oneself into a position to be unaware of facts that would otherwise create liability. n303 In light of the court's interpretation, [*194] the NSA has a diminished interest in determining at the point of intercept whether intercepted communications are domestic in nature. Its **ability to collect more information would be hampered**. So there is a perverse incentive structure in place, even though Congress intended the provision to protect individual privacy.

Link – programmatic surveillance

Programmatic surveillance is necessary for pattern analysis that can identify future terrorist threats – forcing individualized determinations wrecks investigations

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

Programmatic surveillance initiatives like these differ in simple yet fundamental ways from the traditional forms of monitoring with which many people are familiar--i.e., individualized or particularized surveillance. Individualized surveillance takes place when authorities have some reason to think that a specific, known person is breaking the law. Investigators will then obtain a court order authorizing them to collect information about the target, with the goal of assembling evidence that can be used to establish guilt in subsequent criminal proceedings. Individualized surveillance is common in the world of law enforcement, as under Title III of the Omnibus Crime Control and Safe Streets Act of 1968. n23 It is also used in national security investigations. FISA allows authorities to obtain a court order to engage in wiretapping if they demonstrate, among other things, probable cause to believe that the target is "a foreign power or an agent of a foreign power." n24

By contrast, programmatic surveillance has very different objectives and is conducted in a very different manner. It usually involves the government collecting bulk data and then examining it to identify previously unknown terrorists, spies, and other national security threats. A good example of the practice is link analysis, in [*528] which authorities compile large amounts of information, use it to map the social networks of known terrorists--has anyone else used the same credit card as Mohamed Atta?--and thus identify associates with whom they may be conspiring. n25 (It is also possible, at least in theory, to subject these large databases to pattern analysis, in which automated systems search for patterns of behavior that are thought to be indicative of terrorist activity, but it's not clear that the NSA is doing so here.) Suspects who have been so identified can then be subjected to further forms of monitoring to determine their intentions and capabilities, such as wiretaps under FISA or other authorities. In a sense, programmatic surveillance is the mirror image of individualized surveillance. With individualized monitoring, authorities begin by identifying a suspect and go on to collect information; with programmatic monitoring, authorities begin by collecting information and go on to identify a suspect.

Programmatic surveillance is a potentially **powerful counterterrorism tool**. The Ra'ed al-Banna incident is a useful illustration of how the technique, when coupled with old-fashioned police work, can identify possible threats who otherwise might escape detection. Another example comes from a 2002 Markle Foundation study, which found that authorities could have identified the ties among all 19 of the 9/11 hijackers if they had assembled a large database of airline reservation information and subjected it to link analysis. n26 In particular, two of the terrorists--Nawaf al-Hamzi and Khalid al-Mihdhar--were on a government watchlist after attending a January 2000 al-Qaeda summit in Malaysia. So they could have been flagged when they bought their tickets. Querying the database to see if any other passengers had used the pair's mailing addresses would have led investigators to three more hijackers, including Mohamed Atta, the plot's operational leader. Six others could have been found by searching for passengers who used the same frequent-flyer and telephone numbers as these suspects. And so on. Again, the Markle study concerns airline reservation data, not the communications data that are the NSA's focus. But it is still a useful illustration of the technique's potential.

The government claims that programmatic surveillance has been responsible for concrete and actual counterterrorism benefits, not just hypothetical ones. Officials report that PRISM has helped detect and [*529] disrupt about 50 terrorist plots worldwide, including ten in the United States. n27 Those numbers include Najibullah Zazi, who attempted to bomb New York City's subway system in 2009, and Khalid Ouazzani, who plotted to blow up the New York Stock

Exchange. n28 Authorities further report that PRISM played an important role in tracking down David Headley, an American who aided the 2008 terrorist atrocities in Bombay, and later planned to attack the offices of a Danish newspaper that printed cartoons of Mohamed. n29 The government also claims at least one success from the telephony metadata program, though it has been coy about the specifics: "The NSA, using the business record FISA, tipped [the FBI] off that [an] individual had indirect contacts with a known terrorist overseas. . . . We were able to reopen this investigation, identify additional individuals through a legal process and were able to disrupt this terrorist activity." n30 Quite apart from foiling attacks, the government also argues that the NSA programs can **conserve scarce investigative resources** by helping officials quickly spot or rule out any foreign involvement in a domestic plot, as after the 2013 Boston Marathon bombing. n31

These claims have to be taken with a few grains of salt. Some observers believe that the government could have discovered the plots using standard investigative techniques, and without resorting to extraordinary methods like programmatic surveillance. n32 The metadata program has elicited special skepticism: The President's Review Group on Intelligence and Communications Technologies bluntly concluded that "the information contributed to terrorist investigations by the use of section 215 telephony meta-data was not essential to preventing attacks and could readily have been obtained [*530] in a timely manner using conventional section 215 orders." n33 The Privacy and Civil Liberties Oversight Board reached the same conclusion. n34 (Judicial opinion is split on the program's value. One judge has expressed "serious doubts" about its utility, n35 while another has concluded that its effectiveness "cannot be seriously disputed.") n36 Furthermore, we should always be cautious when evaluating the merits of classified intelligence initiatives on the basis of selective and piecemeal revelations, as officials might tailor the information they release in a bid to shape public opinion. n37 But even if specific claimed successes remain contested, programmatic surveillance in general can still be a useful counterterrorism technique.

As these examples imply, effective programmatic surveillance often requires huge troves of information--e.g., large databases of airline reservations, compilations of metadata concerning telephonic and internet communications, and so on. This is why it typically will not be feasible to limit bulk collection to particular, known individuals who are already suspected of being terrorists or spies. Some officials have defended the NSA programs by pointing out that, "[i]f you're looking for the needle in a haystack, you have to have the haystack." n38 That metaphor doesn't strike me as terribly helpful; rummaging around in a pile of hay is, after all, a paradigmatic image of futility. But, the idea can be expressed in a more compelling way. Programmatic surveillance cannot be done in a particularized manner. The whole point of the technique is to identify unknown threats to the national security; by definition, it cannot be restricted to threats that have already been identified. We can't limit programmatic [*531] surveillance to the next Mohamed Atta when we have no idea who the next Mohamed Atta is--and when the goal of the exercise is indeed to identify the next Mohamed Atta.

Link – bulk collection

Bulk collection is vital to reduce terrorism risk – terrorists will use the plan's privacy protection to hide communications

Lewis 5/28 – Director and Senior Fellow, Strategic Technologies Program (James Lewis, "What Happens on June 1?", CSIS Strategic Technologies Program, http://www.csistech.org/blog/2015/5/28/what-happens-on-june-1, 5/28/2015)//MBB

After a week or so, potential attackers will probably look for ways they can exploit **newly unsurveilled space** for operational advantage. Risk will increase steadily once they get over their shock, and then plateau two or three months out (when they've presumably adjusted their operations to reduced surveillance). How much risk increases will depend on whether the USG can compensate for the lost collection and whether attackers find ways to gain advantage.

All the propaganda about how this kind of collection "never stopped an attack" is divorced from reality. It is the the totality of collection that reduced risk. Reduce collection and risk increases. How much is unclear, and Americans may be willing to trade a small increase in risk for less government surveillance. 215 is probably the least valuable program, and ending it creates the least risk, but ending it is not risk free.

Adding some privacy advocates to the Foreign Intelligence Surveillance Court will also increase risk. We don't do this for any other kind of warrant process, and it will add delays. One of the problems with FISC that led to the 9/11 success (for the other side) was the slowness of its processes. Adding privacy advocates will return us to the bad old days of FISA. It's also insulting to the judges.

Link – narrowing 702

Requiring individualized determinations for targets creates a massive bureaucratic drain, wrecking investigations

Cordero, 15 - Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law (Carrie, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform

1. "End Programmatic Surveillance"…"or If Programmatic Surveillance Continues, Reform It"

One of the major criticisms of the government's use of FISA to emerge in the recent debate is that the Court has shifted from approving individual surveillance or search requests directed at a particular agent of a foreign power or foreign power, to a practice of approving "programmatic" requests for collection authority. The criticism is a repudiation of not only the bulk telephone metadata program, but also of section 702 of FISA, which was added to the Act in 2008. Section 702 authorizes the Director of National Intelligence and the Attorney General to issue directives to communications service providers under a set of procedures and certifications that have been approved by FISC.

Referring to the collection authorized by Section 702 as "programmatic" can lead to misunderstanding. Acquisition under section 702 is programmatic in the sense that the Court approves rules and procedures by which the acquisition takes place. The Court does not, under section 702, make a substantive finding about a particular target. It does not approve individual requests for collection. Instead, the FISC approves the rules and procedures, and then intelligence community personnel abide by a decision-making process in which there are actual intended targets of acquisition. In his February 4, 2015 remarks at Brookings, ODNI General Counsel Bob Litt described it this way:

"Contrary to some claims, this [section 702 collection] is not bulk collection; all of the collection is based on identifiers, such as telephone numbers or email addresses, that we have reason to believe are being used by non-U.S. persons abroad to communicate or receive foreign intelligence information."

Regardless of the characterization, however, it is correct to say that section 702 allows the intelligence community, not the Court, to make the substantive determination about what targets to collect against. Those decisions are made consistent with intelligence community leadership and policymaker strategic priorities, which Litt also discussed in his February 4th remarks. Targets are selected based on their anticipated or demonstrated foreign intelligence value. And targeting decisions are subject to continuous oversight by compliance, legal and civil liberties protection authorities internal to NSA, and external at the Office of the Director of National Intelligence and the Department of Justice.

The question, then, is why was the change needed in 2008? And, if the Brennan Center's recommendation were accepted, what would be the alternatives? What follows is a shorthand answer to the first question (which I previously addressed here): basically, the change was needed because the pre-2008 definitions in FISA technically required that the government obtain a probable-cause based order from the Court in order to collect the communications of Terrorist A in Afghanistan with Terrorist B in Iraq. This was a problem for at least two reasons: one, as non-U.S. persons outside the United States, Terrorist A and Terrorist B are not entitled to Constitutional protections; and two, the bureaucratic ~~man~~power it took to supply and check facts, prepare applications and present these matters to the Court were **substantial.** As a result, **only a subset of targets** who may have been worth covering for foreign intelligence purposes were able to be covered.

This is an extremely condensed version of the justification for 702 and does not cover additional reasons that 702 was sought. But, from my perspective, it is the bottom line, and one that cannot be overlooked when suggestions are made to scale back 702 authority.

Section 702 has empirically been used to stop terrorist attacks

Young 14– President and General Counsel of Ronin Analytics, LLC. and former NSA senior leader (Mark, "National Insecurity: The Impacts of Illegal Disclosures of Classified Information", I/S: A Journal of Law and Policy for the Information Society, 2014, http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Young-Article.pdf)//DBI

The Deputy Attorney General has noted that the Federal Bureau of Investigation benefited from NSA's Section 702 collection in the fall of 2009. Using Section 702 collection and "while monitoring the activities of Al Qaeda terrorists in Pakistan, the National Security Agency (NSA)

noted contact from an individual in the U.S. that the Federal Bureau of Investigation (FBI) subsequently identified as Colorado-based Najibulla Zazi. The U.S. Intelligence Community, including the FBI and NSA, worked in concert to determine his relationship with Al Qaeda, as well as identify any foreign or domestic terrorist links."44

"The FBI tracked Zazi as he traveled to New York to meet with co-conspirators, where they were planning to conduct a terrorist attack. Zazi and his co-conspirators were subsequently arrested. Zazi, upon indictment, pled guilty to conspiring to bomb the NYC subway system. Compelled collection (authorized under Foreign Intelligence Surveillance Act, FISA, Section 702) against foreign terrorists was critical to the discovery and disruption of this threat against the U.S."45 Regardless of the accuracy of the information released by Snowden, the types of programs described by the material contribute to national security and its release, regardless of its validity, will negatively impact US security.

Removing section 702 means probable cause requirements would be applied to foreign investigations

Cordero, 15 - Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law (Carrie, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform

Which brings us to the second question I posed above—what are the alternatives if Section 702 authority, were, as the Brennan Center recommends, repealed? One option is to revert to the pre-2008 practice: obtaining Court approval based on probable cause for non-U.S. persons located outside the United States. The operational result would be to forego collection on legitimate targets of foreign intelligence collection, thereby potentially losing insight on important national security threats. Given the challenging and complex national security picture the United States faces today, I would think that most responsible leaders and policymakers would say, "no thanks" to that option.

A second option would be to conduct the acquisition, but without FISC supervision. This would be a perverse outcome of the surveillance debate. It is also, probably, in the current environment, not possible as a practical matter, because an additional reason 702 was needed was to be able to serve lawful process, under a statutory framework, on communications service providers, in order to effectuate the collection.

In light of these options: collect less information pertaining to important foreign intelligence targets, or, collect it without statutory grounding (including Congressional oversight requirements) and judicial supervision, the collection framework established under 702 looks pretty good.

Link – FISC special advocate

A FISC advocate wrecks terrorism investigations – litigation delays and public notice

Cordero, 15 - Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law (Carrie, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform

Instead, the Brennan Center report calls for a special advocate that would "be notified of cases pending before the court, have the right to intervene in cases of their choosing, and are given access to all materials relevant to the controversy in which they are intervening." (p.46). If this type of special advocate were created by legislation, here is just a snapshot of what it would mean:

We would be providing greater ability to challenge surveillance to foreign intelligence targets, than to subjects of criminal investigation domestically, for whom wiretap applications are approved in camera ex parte by district court judges and magistrates.

We would be endorsing the concept of litigating surveillance conducted for national security purposes before it takes place, placing intelligence operations and national security at risk.

We would be creating an entire new bureaucracy duplicating the legal and oversight functions that the Justice Department, under the leadership of the Attorney General, and the Court, comprised of independent federal district court judges, perform.

There are currently many different components involved in the oversight of activities under FISA. They include: internal compliance offices at the collecting agencies, Offices of General Counsel, Inspectors General, the Office of the Director of National Intelligence, the Department of Justice, the FISC, Congressional oversight committees and the newly invigorated Privacy and Civil Liberties Oversight Board. If there is a desire to strengthen the oversight and accountability of activities conducted under FISA, focus should be given to making the existing structure more effective, not adding more bureaucracy.

Link – primary purpose test

The primary purpose test builds a wall between intelligence services and criminal investigation – that wrecks terrorism investigation and is the reason 9/11 occurred

Cordero, 15 - Director of National Security Studies, Georgetown University Law Center, Adjunct Professor of Law (Carrie, "The Brennan Center Report on the FISA Court and Proposals for FISA Reform" 4/2, Lawfare, http://www.lawfareblog.com/brennan-center-report-fisa-court-and-proposals-fisa-reform

3. "Restore the Primary Purpose Test"

This recommendation could alternatively be called "re-build the 'wall'." The report's least persuasive recommendation is that FISA should revert to its pre-9/11 standards that resulted in a

"wall" separating criminal investigators and intelligence investigators chasing the pre-2001 al Qaeda threat. It is a provocative recommendation in that it is a clear call to fully push the pendulum back to the pre-9/11 construct. Given the way that the national security and law enforcement communities have implemented various recommendations to work collaboratively, share information, and fulfill the mandate to prevent acts of international terrorism, reverting to the old legal standards that led to the creation of the "wall" would involve undoing many of the positive changes that have taken place in the last decade-plus. In addition, similar to section 702 (discussed above) the purpose standard is not one of the provisions that is up for sunset this year; the provision is currently permanent, unless there were to a new effort to undo it.

The report attempts to place distance between the prevailing pre-9/11 interpretation of the "primary purpose" standard, the implementation of procedures that were intended to support that interpretation, and the practical effects. In other words, the report suggests that the legal standard did not demand the rules and restrictions that were put in place. But the reality is that the rules and restrictions were put in place, and the "wall" was the result.

The actual, practical impact of the "wall" has been described in various statements before Congress by current and former government officials. One such compelling testimony was the 2003 statement before the Senate Judiciary Committee of Patrick Fitzgerald, the former United States Attorney in the Northern District of Illinois. New York served as the hub of the FBI and DOJ's efforts against al Qaeda prior to the 9/11 attacks. Fitzgerald was a lead prosecutor in New York at the time who worked closely with the FBI's New York office. He had first-hand experience with the "wall":

"It is nearly impossible to comprehend the bizarre and dangerous implications that "the wall" caused without reviewing a few examples. While most of the investigations conducted when the wall was in place remain secret, a few matters have become public. I was on a prosecution team in New York that began a criminal investigation of Usama Bin Laden in early 1996. The team -- prosecutors and FBI agents assigned to the criminal case -- had access to a number of sources. We could talk to citizens. We could talk to local police officers. We could talk to other U.S. Government agencies. We could talk to foreign police officers. Even foreign intelligence personnel. And foreign citizens. And we did all those things as often as we could. We could even talk to al Qaeda members -- and we did. We actually called several members and associates of al Qaeda to testify before a grand jury in New York. And we even debriefed al Qaeda members overseas who agreed to become cooperating witnesses.

But there was one group of people we were not permitted to talk to. Who? The FBI agents across the street from us in lower Manhattan assigned to a parallel intelligence investigation of Usama Bin Laden and al Qaeda. We could not learn what information they had gathered. That was "the wall." A rule that a federal court has since agreed was fundamentally flawed -- and dangerous."

The federal court that, I believe, Fitzgerald's testimony refers to is the 2002 decision In Re Sealed Case, issued by the Foreign Intelligence Surveillance Court of Review. The Brennan Center report provides the background for how the case reached the Court of Review, but in short, the Court rejected the notion that the "primary purpose" test was required by the 1978 version of FISA.

For all the criticisms of the USA Patriot Act of 2001, changing FISA's standard to "a significant purpose" and removing the justification for the old "wall" is one that has been overwhelmingly understood as an important substantive correction. There is no reason to go backwards.

Link – transparency

Increasing transparency alerts terrorists of NSA tactics – increases the risk of cyberterrorism

De 14 - General Counsel, National Security Agency (Rajesh, "The NSA and Accountability in an Era of Big Data", JOURNAL OF NATIONAL SECURITY LAW & POLICY, 2014,p.4//DM)

Perhaps the most alarming trend is that the digital communications infrastructure is increasingly also becoming the domain for foreign threat activity. In other words, it is no longer just a question of "collecting" or even "connecting" the dots in order to assess foreign threats amidst more and more digital noise, it is also a question of determining which of the so-called "dots" may constitute the threat itself. As President Obama has recognized, "the cyber threat to our nation is one of the most serious economic and national security challenges we face."

Many of us read in the papers every day about cyber attacks on commercial entities. Hackers come in all shapes and sizes, from foreign government actors, to criminal syndicates, to lone individuals. But as former Secretary of Defense Leon Panetta warned a few months ago, "the greater danger facing us in cyberspace goes beyond crime and it goes beyond harassment. A cyber attack perpetrated by nation states or violent extremist groups could be as destructive as the terrorist attack on 9/11." And as the President warned in his recent State of the Union address, we know that our enemies are "seeking the ability to sabotage our power grid, our financial institutions, our air-traffic control systems." We also have seen a disturbing trend in the evolution of the cyber threat around the world. As General Keith Alexander, the Director of NSA, describes it, the trend is one from "exploitation" to "disruption" to "destruction." In fundamental terms, the cyber threat has evolved far beyond simply stealing – the stealing of personal or proprietary information, for example-to include more disruptive activity, such as distributed denial of service attacks that may temporarily degrade websites; and more alarmingly, we now see an evolution toward truly destructive activity. Secretary Panetta, for example, recently discussed what he described as "probably the most destructive attack the private sector has seen to date" – a computer virus used to infect computers in the Saudi Arabian State Oil Company Aramco in mid-2012, which virtually destroyed 30,000 computers.

***

Within this context, big data presents opportunities and challenges for the government and the private sector. Improving our ability to gain insights from large and complex collections of data holds the promise of accelerating progress across a range of fields from health care to earth science to biomedical research. But perhaps nowhere are the challenges and opportunities of big data as stark as in the national security field, where the stakes are so high – both in terms of the threats we seek to defeat, and of the liberties we simultaneously seek to preserve. This reality is readily apparent in the evolving and dynamic cyber environment, and perhaps no more so than for an agency at the crossroads of the intelligence and the defense communities, like NSA.

Of course, NSA must necessarily operate in a manner that protects its sources and methods from public view. If a person being investigated by the FBI learns that his home phone is subject to a wiretap, common sense tells us that he will not use that telephone any longer. The same is true for NSA. If our adversaries know what NSA is doing and how it is doing it – or even what NSA is not doing and why it is not doing it – they could well find ways to evade surveillance, to obscure themselves and their activities, or to manipulate anticipated action or inaction by the U.S. government. In sum, they could more readily use the ocean of big data to their advantage.

Link - PRISM

PRISM collects vast amount of data—prevents terrorism

Kelly et al, 2014 – Project director for Freedom on the Net, author and editor ("Freedom on the Net", Freedom House, no date, https://freedomhouse.org/sites/default/files/FOTN_2014_Full_Report_compressedv2_0.pdf)//TT

Leaked documents indicated that the Foreign Intelligence Surveillance Court (FISA Court) had interpreted Section 215 of the PATRIOT Act to permit the FBI to obtain orders that compel the largest telephone carriers in the United States (Verizon, AT&T, Sprint, and presumably others) to provide the NSA with records of all phone calls made to, from, and within the country on an ongoing basis. These billions of call records include numbers dialed, length of call, and other "metadata."81 Data are gathered in bulk, without any particularized suspicion about an individual, phone number, or device. Without approval from the FISA Court or any other judicial officer, NSA analysts conduct queries on this data, generating contact chains that show the web of connections emanating from a single phone number suspected of being associated with terrorism.82

Leaks also revealed new details about programs authorized by Section 702 of the Foreign Intelligence Surveillance Act. Section 702 allows the NSA to conduct surveillance of people who are not U.S. citizens and who are reasonably believed to be located outside the United States in order to collect "foreign intelligence information."83 Under a program called "PRISM," the NSA has been compelling at least nine large U.S. companies, including Google, Facebook, Microsoft and Apple, to disclose content and metadata relating to emails, web chats, videos, images, and documents.84 Also under Section 702, the NSA taps into the internet backbone for "collection of communications on fiber cables and infrastructure as data flows past."85 Although these programs are targeted at persons abroad, the NSA is able to retain and use information "incidentally" collected about U.S. persons.

Link – third party doctrine

Narrowing the third party doctrine will wreck terrorism investigations

Sievert 14 * Professor, Bush School of Government and U.T. Law School, author of three editions of Cases and Materials on US Law and National Security (Ronald, "Time to Rewrite the Ill-Conceived and Dangerous Foreign Intelligence Surveillance Act of 1978", National Security Law Journal Vol. 3, Issue 1 – Fall 2014)//GK

As discussed in this Article, at present the government must demonstrate probable cause that a target is an agent of a foreign power before conducting FISA surveillance. The government also needs probable cause for physical searches, arrests, and indictments. Probable cause does not exist at the moment an informant advises an agent an individual is a dangerous terrorist, or when an agent observes a suspect clandestinely meet a terrorist or spy. It is generally established only after the receipt of corroborating evidence such as that contained in phone, bank, and travel records. These records are currently obtained with a Grand Jury subpoena or court order based merely on relevance to the federal investigation.267 This lower standard exists because in the past the Supreme Court has held, in cases such as Smith and Miller, that there was no expectation of privacy in these records because of the third party doctrine. Probable cause is not needed and often is not present at this stage of an investigation. Judge Leon's essential rejection of the third party doctrine finds support in the questions raised by Justice Sotomayor. It is also supported by the public outcry of those whose response to the Snowden revelations has been to demand probable cause before the government obtains records.268 If this rejection of the third party doctrine were to lead to statutory or judicial requirements that the government meet a standard higher than legitimate relevance before obtaining phone, bank, travel, and other records shared with a third party, the government would often be stymied in the earliest stages of an investigation. Probable cause, as defined, seldom if ever exists in these early stages. The ability to obtain the corroborating evidence that would support a FISA order, Title III warrant, or indictment, would be foreclosed. As has been repeatedly stated in this Article, the mandate to demonstrate probable cause before conducting electronic surveillance in intelligence cases was an unjustified overreaction to the Watergate era. A further requirement that the government show probable cause to obtain basic records from a third party would be another overreaction, which would likely **eviscerate** the government's ability to protect the American people.

AT: No data confirms link

NSA programs are key to stop terrorists—empirics prove

Young 14– President and General Counsel of Ronin Analytics, LLC. and former NSA senior leader (Mark, "National Insecurity: The Impacts of Illegal Disclosures of Classified Information", I/S: A Journal of Law and Policy for the Information Society, 2014, http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Young-Article.pdf)//DBI

It is not only logic that leads one to believe in the value of NSA collection, but also testimony by intelligence professionals. For example, according to the House Intelligence Committee, NSA activities have "been **integral** in preventing multiple terrorist attacks, including a plot to attack on the New York Stock Exchange in 2009."42 The PRISM program – a program reported to provide NSA access to information some of the largest technology companies - provided **"critical leads"** to disrupt more than 50 potential terrorist events in more than 20 countries. The Foreign Intelligence Surveillance Act authority - the congressional authorization to target communications of foreign persons who are located abroad for foreign intelligence purposes - contributed to **more than 90 percent** of these disruptions.43

AT: info overload

Bulk data collection is necessary to ensure we have the important information

Young 14– President and General Counsel of Ronin Analytics, LLC. and former NSA senior leader (Mark, "National Insecurity: The Impacts of Illegal Disclosures of Classified Information",

I/S: A Journal of Law and Policy for the Information Society, 2014, http://moritzlaw.osu.edu/students/groups/is/files/2013/11/Young-Article.pdf)//DBI

This information was declassified and publically released to inform the public about what data were collected and analyzed by NSA, to balance inaccurate speculations by the media about NSA, and to facilitate the debate about U.S. intelligence Community operations. When examined together, the information disclosed by Snowden and the declassified information released by the ODNI present a positive picture of prudent measures for national security. If the information about programs such as PRISM, FAIRVIEW, or OAKSTAR is accurate, then it appears as if the intelligence community has not only adjusted well to global technical advancements in telecommunications, but also learned significant lessons from the September 11, 2001 terrorist attacks.

It was known in early 2001 that NSA's effectiveness was challenged by the "multiplicity of new types of communications links, by the widespread availability of low-cost encryption systems, and by changes in the international environment in which dangerous security threats can come from small, but well organized, terrorist groups as well as hostile nation states."39 Any challenge about the value of an intelligence program must address the importance of data quantity and quality. First, since intelligence analysis depends on having access to relevant information, logic dictates that more data is always better. As noted by Mark Lowenthal:

The issue then becomes how to extract the intelligence from the mountain of information. One answer would be to increase the number of analysts who deal with the incoming intelligence, but that raises further demands on the budget. Another possible response, even less palatable, would be to collect less. But, even then, there would be no assurance that the "wheat" remained in the smaller volume still being collected.40

Thus, quantity has an intelligence quality all its own. In addition, the type of information needed by the intelligence community is also important. Given the priorities noted in the National Security Strategy, the importance of NSA collection and analysis as noted in congressional testimony and the ever-present threats by terrorist groups and hostile nations the American public should vigorously endorse the type of programs viewed by Snowden as oppressive. It is troubling to see the disclosure of techniques allegedly used by NSA to obtain "cryptographic details of commercial cryptographic information security systems through industry relationships,"41 and the rampant speculation about the monitoring of the mobile phones of the heads of state from Europe.

AT: Freedom Act N/U

The Freedom Act only got low hanging fruit – it didn't curtail the bulk of NSA actions

Dyer, 15 – staff for Financial Times (Geoff, "Surveillance bill fails to curtail bulk of NSA activities" 6/3,

http://www.ft.com/cms/s/0/39089cc6-097f-11e5-b643-00144feabdc0.html#axzz3dwYfO1mL

The passage of the first bill since 9/11 to **curtail** government surveillance represents a dramatic shift in the politics surrounding terrorism in the US, but a much less significant change in the way the intelligence community actually operates.

The USA Freedom Act, which has been comfortably approved by both the Senate and the House, bars the government from collecting the phone records of millions of US citizens, a programme which became the focus of public fears about overbearing electronic surveillance.

The surveillance legislation reform still leaves the US intelligence community with formidable legal powers and tools to collect data and other online information for terrorism-related investigations, however.

Despite the tidal wave of revelations and public anger towards the National Security Agency following the 2013 leaks by Edward Snowden, congressional efforts to rein in the agency have **so far not curtailed the bulk** of its activities.

"The more savvy members of the intelligence community have been saying for some time, 'If this is the hit that we have to take, then so be it'," says Mieke Eoyang at the centrist Third Way think-tank in Washington, referring to the bulk telephone data collection programme.

The very first Snowden leak was a secret court order requiring Verizon to hand over the call records of its customers, in the process revealing an official dragnet that was capturing details about tens of millions of Americans.

Amid the many Snowden documents about the NSA that followed, it was this programme that crystallised public fears in the US that the government was abusing privacy rights in its zeal to monitor terrorist threats.

The Freedom Act is designed to tackle those concerns about the bulk collection programme. The legislation calls for telephone companies and not the government to store the information and requires a court order before the call data can be searched.

Supporters of the reform celebrated two further conditions in the bill. It limits the scope of government inquiries, so that officials cannot ask, for instance, for all calls in the 212 area code. And it requires that the secret foreign intelligence court publish legal opinions that change the scope of information that can be collected.

Beyond the specifics, the passage of the bill represents a landmark in the underlying politics of national security. Before the Snowden revelations, the political climate over terrorism would have made it routine to renew the sections of the post-9/11 Patriot Act that have now been replaced by the USA Freedom Act.

Yet the reality is that for the past 18 months, the administration has been making a tactical retreat from the call records programme. A panel of experts appointed by the White House, which included former senior intelligence officials, said in December 2013 that the programme was "not essential" for preventing terrorist attacks. In early 2014, President Barack Obama called for many of the changes to the programme contained in the new legislation.

"This is something we can live with," says a former senior intelligence official of the USA Freedom Act.

Moreover, even the bill's biggest supporters among privacy advocates acknowledge that it leaves much of the intelligence collection conducted by the US untouched.

"We have now addressed the excesses from the very first Snowden story, so for that I am lifting a glass," says Julian Sanchez at the libertarian Cato Institute in Washington. "But there is a lot left. In terms of the total scope of surveillance conducted by the NSA, this is a tiny corner."

The Freedom Act didn't actually curtail surveillance

Brenner, 15 - Senior Fellow, the Center for Transatlantic Relations; Professor of International Affairs, University of Pittsburgh (Michael, Huffington Post, "The NSA's Second Coming" 6/8,

http://www.huffingtonpost.com/michael-brenner/the-nsas-second-coming_b_7535058.html

That all makes for one awesome production. Doubtless there will be a film adaptation immortalized in a script by Bob Woodward. Something like that will happen -- even though it is a concocted yarn whose meaning has been twisted and whose significance has been vastly inflated. For the truth is that what Congress did, and what it did not do earlier, changes very little -- and nothing of cardinal importance. The main effect is to give the impression of change so as to release pressure for reform that might really be meaningful. The base truth is that everything that counts remains the same. To entrench and to legitimate a system of massive surveillance that undercuts our privacy while doing nothing to secure our well-being.

Let's look at the false notes struck by this narrative.

Matters of Fact

1. The so-called restrictions on bulk data collection apply only to telephone calls. All else is exempted: emails, Internet searches, social media, and info regarding each that is retained in our communicating devices.

2. The restrictions on real-time surveillance of telephone calls can be overcome by the granting of a warrant by the FISA upon request by NSA, FBI, Justice Department, CIA -- not to speak of local authorities. That Court, over the past eight years, has refused only 11 of 33,900 requests. The judges, by the way, are handpicked by Supreme Court Chief Justice John Roberts who has jumped into the policy arena by declaring himself strongly opposed to any tightening of restrictions on how the court operates or on the NSA's methods. The FISA court's attitude toward government spying on Americans has been generous to the extreme. Former lead judge of the FISA Court, John D. Bates, has campaigned vigorously on behalf of the status quo. He even objected to the extra workload of requiring that courts approve all national security letters, which are administrative subpoenas allowing the F.B.I. to obtain records about communications and financial transactions without court approval.

3. The specified targets may be organizations, groups and networks as well as an individual. In practice, that means each grant of surveillance power may authorize comprehensive electronic spying on hundreds or thousands of citizens.

Currently the NSA is overwhelmed by the billions of communications they register and try to catalogue each week. Long-term data retention only makes sense if there is a project afoot to

exploit it systematically in order to control, to suppress, to penalize. There is no such Big Brother plan in place or on the horizon. NSA operations fortunately have instead been conceived and managed by fantasists and bureaucratic empire builders -- as is demonstrated by Edward Snowden's leaks of their immense target list and their major intelligence failures.

4. The terms of the warrants allow for a two-step "hop" from the identified target to others whose suspect communications emerge from the initial combing.

Here is one hypothetical scenario. The NSA requests approval from the FISA court to collect the communications of the Arab-American Civil Rights League on the grounds that it suspects some dubious characters have been using its facilities. Over a period of months (if there a restriction on the duration of electronic surveillance under FISA rules), they register 1,000 communications. Using 'first hop' privileges they identify 250 persons whose own communications they wish to tap. Using "second hop" privileges they next identify a total of 1,500 more people whose communications they wish to tap. That makes a total of 2,700 persons whose telephone calls they are monitoring and storing. Each year, the NSC requests warrants from the FISA courts about 500 times. Hence, we can project more than 1 million telephone numbers now under surveillance for an indefinite period of time. For we should further note that once an official investigation is begun the records acquire the status of legal documents in a judicial or quasi-judicial proceeding.

5. There is an exemption for on-going investigations. The Patriot Act's Section 224, its "grandfather clause", allows active investigations that began prior to midnight on Monday to continue using the expired programs.They number in the thousands given the hyper-activism of our security agencies in identifying subjects for their attentions in order to justify vast capabilities and vast budgets. Those broadly cast investigations can go on for years. And all of this is secret.

FREEDOM Act creates no actual constraints against intelligence

Brenner, 15 - Senior Fellow, the Center for Transatlantic Relations; Professor of International Affairs, University of Pittsburgh (Michael, Huffington Post, "The NSA's Second Coming" 6/8,

http://www.huffingtonpost.com/michael-brenner/the-nsas-second-coming_b_7535058.html

The United States Freedom Act does not trouble Intelligence agency leaders. They have widely assumed, as admitted in private statements, that the compromise provisions merely create a few procedural inconveniences that could be circumvented or neutralized by exploiting loopholes - no more than speed bumps. None of the Agency's core activities would be significantly affected. So there is no reason for anyone in the intelligence agencies to sweat the small stuff: a shift in the number of days the NSA can retain the sweepings of Metadata collection; or whether the data should be held at their storage lock-up or the one across the street protected by a bicycle lock and owned by a very accommodating neighbor? And who's checking, anyway -- the FBI? the FCC?

The squo solves all your advantages- the Freedom Act is a major shift in surveillance and solves symbol advantages

CDT 6/7 [Columbia Daily Tribune, June 7, 2015, With USA Freedom Act, America finally moves beyond 9/11, http://www.columbiatribune.com/opinion/oped/with-usa-freedom-act-america-finally-moves-beyond/article_b6113c88-ae7c-53ab-8942-7d6f206c295d.html]

In the end, Congress did the right thing. The USA Freedom Act, which ends the National Security Agency's bulk collection of American phone records, passed the Senate convincingly Tuesday, ending a long and labored fight.

This is no small achievement. Practically, it ends an unpopular, legally dubious and empirically ineffective domestic espionage program. Politically, **it signals that Congress can still make progress on serious matters when it tries**. And **symbolically, it suggests that, 14 years after the Sept. 11, 2001, attacks, the United States might finally be getting back to normal**.

Perhaps the most potent expression of that symbolism came from the bill's opponents. In successive attempts to block, delay and dilute this legislation, they employed some familiar oratorical excesses: Sen. Mitch McConnell called the bill "a resounding victory for those currently plotting attacks against the homeland." Yet the opponents failed completely.

This indicates, perhaps, **a deeper cultural shift**. If Americans no longer respond to this kind of alarming rhetoric as they once did — if they're no longer quite so comfortable ceding liberties for the false promise of total security — that is both psychic and civic progress. Democracy requires a sturdy spine no less than a level head.

As it happens, McConnell's fears are baseless. The law still allows the NSA to collect phone records, **as long as it has a court order**. It renews other counterterrorism tools that were jeopardized by this fight. And **it preserves the NSA's most important surveillance programs while ensuring that the government can no longer continuously spy on its own citizens**. It was a compromise, supported by everyone from the intelligence community to Human Rights Watch.

It isn't perfect, of course. Some of its language might be prone to misinterpretation, accidental or otherwise. It doesn't address other aspects of the NSA's global spying operation that require more scrutiny. And some of its transparency requirements might prove ineffective.

Yet the new law is of a piece with the long and cyclical history of American espionage, the limits on which change with the tenor of the times. After World War I, the NSA's predecessor organization was found to be overzealously spying on the communications of U.S. allies. Secretary of State Henry Stimson cut off its funding, memorably saying that "Gentlemen do not read each other's mail." When the NSA and its fellow travelers acquired expansive new powers during the Cold War, overreach followed once again, this time in the form of domestic spying, assassination attempts abroad and much more. The resulting Church Committee investigations led to a systematic overhaul of their oversight.

In rolling back some of the extensive powers granted to intelligence agencies after Sept. 11, the USA Freedom Act suggests that this long civic quest to balance liberty and safety remains vigorous. It shows that fearfulness isn't a permanent condition of American politics. And it affirms the value of transparency and liberty, even in a dangerous age.

Solves- Civil Liberties

Freedom Act solves- reverses anti-freedom trend

CM 6/7 [Concord Monitor, June 7, 2015 , Editorial: Freedom Act returns a bit of liberty, http://www.concordmonitor.com/home/17165482-95/editorial-freedom-act-returns-a-bit-of-liberty]

Sixteen years before the first shots of the Revolutionary War were fired at Lexington and Concord, Benjamin Franklin told people who would become his countrymen that "those who give up essential liberty, to purchase a little temporary safety, deserve neither liberty nor safety."

In the wake of the terror attacks of Sept. 11, 2001, Congress, with the support of the great majority of Americans, rushed to enact the Patriot Act, a law that curbs liberty in the name of security.

The law, as many now realize, went too far, and those charged with enforcing it, the National Security Agency and the FBI, as always happens, interpreted the law to take it far further than its authors intended. Under it, according the American Civil Liberties Union, authorities can search your home without telling you, monitor emails and internet use, demand records from credit card, internet and telephone companies, and take property without a hearing.

Last week, Americans reclaimed a little bit of their lost liberty when President Obama signed the USA Freedom Act, a reform that begins to curb some of the worst elements of the Patriot Act. The new act curtails the government's practice, revealed by former government security employee Edward Snowden, of amassing bulk records of citizens' phone calls, call locations, numbers and length of the call but not content. The bill also begins to chip away at the terrifying wall of secrecy surrounding the actions of the secret Foreign Intelligence Surveillance Court, which can authorize without probable cause the collection of citizen information that includes medical records, books read, goods purchased, websites searched and bank records. Citizens who learn that they are under investigation cannot, under the act, reveal that fact and thereby defend themselves.

In a sign that Americans may be coming out of shock and heeding Franklin's warning, the reform bill had overwhelming support in Congress. It passed the House, 338-88, and the Senate, 67-32.

Solves- International
Obama's plan solves international concerns

Fitzpatrick 14 (Jack,- staff correspondent at National Journal Quoting European Commission President Jose Manuel Barroso and European Council President Herman Van Rompuy "Obama Hints at European Fracking Following Russia Sanctions")

Obama also declined to address worries in Europe over U.S. spying programs. Barroso said he and Van Rompuy have "concerns, shared widely by citizens in E.U. member states," about U.S. surveillance, but that they had discussed the issue with Obama earlier in the day and are **confident about Obama's proposals** for NSA reforms—including ending the agency's mass collection of phone data.

Unilateral action solves the alt causes but legislation is still key

Reuters 14 ("US needs to win back European trust after NSA spying revelations: Obama")

President Barack Obama said on Tuesday that U.S. intelligence agencies were not snooping on ordinary citizens but admitted it would take time to win back the trust of European governments and people after revelations of extensive U.S. surveillance.

Former intelligence contractor Edward Snowden disclosures about the sweep of the National Security Agency's monitoring activities triggered a national debate over privacy rights but also damaged relations with some European governments. Obama said one of the aims of his trip to Europe this week was to reassure allies that he was acting to meet their concerns by limiting the scope of data-gathering. "I am confident that everybody in our intelligence agencies operates in the best of intentions and is not snooping into the privacy of ordinary Dutch, German, French or American citizens," Obama told reporters after a nuclear security summit in The Hague. However, Obama said he recognised that "because of these revelations, there is a process that is taking place where we have to win back the trust, not just of governments, but more importantly of ordinary citizens, and that is not going to happen overnight." (Also see: Obama to propose curbing of bulk collection of phone records by NSA: Report) As Obama began his trip to Europe on Monday, a senior administration official said Obama planned to ask Congress to end the bulk collection and storage of phone records by the NSA but allow the government to access the "metadata", which lists millions of phone calls made in the United States, when needed. Obama said he was confident that the change "allows us to do what is necessary in order to deal with the dangers of a terrorist attack, but does so in a way that addresses some of the concerns that people have raised". "I am looking forward to working with Congress to make sure that we go ahead and pass the enabling legislation quickly so that we can get on with the business of effective law enforcement," he said. Checks and balances He said this was "an example of us slowly, systematically putting in more checks, balances, legal processes. The good news is that I am very confident that it can be achieved." Allegations in Britain's Guardian newspaper that the United States had monitored the phone conversations of 35 world leaders including German Chancellor Angela Merkel caused outrage in Europe last year. Germany summoned the U.S. ambassador for the first time in living memory. (Also see: Merkel-tapping allegations prompt Germany to send intelligence chiefs to US) In response, Obama in January banned U.S. eavesdropping on the leaders of close friends and allies, and began reining in the vast archive of Americans' phone data, seeking to reassure Americans and foreigners alike that the United States would take more account of privacy concerns. He said on Tuesday that, although some coverage of the Snowden revelations had been sensationalised, fears over privacy "in this age of the Internet and 'big data'" were justified. He also voiced faith in strong U.S. ties with Europe, saying the issue could be an "irritant" but did not define the relationship. He said intelligence played a critical role in U.S. cooperation with other countries in countering terrorism, nuclear proliferation or human trafficking. As technology had evolved, however, "the guidelines and structures that constrain

how our intelligence agencies operated have not kept pace with these events and this technology", he said. "There is a danger because of these new technologies that at some point it could be abused, and that is why I initiated a broad-based review." He said U.S. intelligence teams were consulting closely with counterparts in other nations to ensure there was greater transparency about U.S. activities. In an interview with the U.S. Fox network that aired on Tuesday, NSA Director General Keith Alexander said that under the administration's proposal the agency would work with telecommunications companies to retrieve data on "specific numbers that have a terrorist nexus." "Rather than us taking all the data, all we're going to get is that data that directly links to a terrorist's number," he said on FOX News Channel's "Special Report with Bret Baier." "This is an approach that I think meets the intent of protecting our civil liberties and privacy and the security of this country," he said. Alexander denied that the NSA listens to all phone calls and reads all emails. "I would get more respect if we could do all that. If you think about all the data that's out there, it's wrong. We don't do it. We wouldn't do it not even close."

Solves- Domestic

Obama plan key --- key first step to broader reform and only alternative to worse alternatives

Serwer 14 (Adam,- D.C.-based Reporter at msnbc "NSA reform proposals fail to fully protect privacy")

"Right now the Obama proposal seems better and much more comprehensive, but again, these two proposals are trying to supercede proposals already on the table that end bulk collection and do a lot more," says Mark Jaycox of the Electronic Frontier Foundation. "These proposals are competing with one privacy advocates already do support." While privacy advocates prefer the Obama administration's proposal to the one put forth by the House intelligence committee Tuesday or the Senate intelligence committee bill proposed months ago, as described in news reports, the White House plan would only affect collection of phone records. Yet the program, the breadth of which was first revealed through leaks facilitated by former NSA contractor Edward Snowden last June, is only one aspect of the government's claimed surveillance powers under Section 215 of the Patriot Act. "We know that 215 is potentially used, and we have always suspected, that it's also used for financial records, credit card records, and we also know from the FISA court opinions that they used it for Internet metadata," says Jaycox, calling the phone records program "one patch of a veritable quilt." That's why privacy advocates, while preferring Obama's proposal to the ones put forth by the intelligence committees, prefer the plan Sensenbrenner and Leahy are backing. "The biggest problem with the Obama proposal is that it doesn't deal with other records collection under 215, much less all the other authorities," says Michelle Richardson of the American Civil Liberties Union. "The phone records program is just the tip of the iceberg." The NSA has also relied on legal authority granted in Section 702 of the FISA Amendments Act and Executive Order 12333 for some of its spying powers. Democratic Rep. Adam Schiff, a member of the intelligence committee who proposed a bill similar to the plan the White House is backing, said that the focus on the phone records program doesn't mean other reform proposals are off the table. "I'm assuming that this is not the end of what the administration is proposing, **but the beginning**," said Schiff. "I think they decided to focus on the phone records program first because **that was of the most concern to the public**." As for the Sensenbrenner-Leahy proposal, Schiff said it would have a difficult time passing. "I'm not sure that bill can move through the Congress," Schiff said. "I think what the president has proposed is much more likely to navigate the difficult political course on the Hill, because it is a good balance between the need to get the information to protect the country and protect the privacy interests of

the public." Privacy advocates take heart in the fact that the Obama administration and the intelligence committee proposals are positioning themselves as curbing the NSA program that thus far has been the focus of public outrage. Two government panels that have examined the NSA's phone records program have concluded that it has been of little use in preventing terror attacks, contrary to the agency's claims. "The White House understands that we need to do something to deal with the issue of holding bulk collection **because of the perception** of our constituents," Maryland Democratic Rep. Dutch Ruppersberger, the ranking member on the intelligence committee, told reporters Tuesday.

Obama bill is the only alternative to house legislation which can't solve our impacts

Ackerman 14 (Spencer,- national security editor for Guardian "NSA critics express 'deep concern' over route change for House reform bill")

Congressional critics of the bulk collection of telephone records by the National Security Agency fear that its allies are circumventing them in the House of Representatives. The House parliamentarian, who oversees procedural matters, has determined that a new bill that substantially modifies the seminal 1978 Foreign Intelligence Surveillance Act will go through the intelligence committee rather than the judiciary committee, a move that two congressional aides consider "highly unusual." Seemingly an arcane parliamentary issue, the jurisdiction question reveals a subterranean and intense fight within the House about the future course of US surveillance in the post-Edward Snowden era. The fight does not align with partisan divides, with both sides claiming both Republican and Democratic support. The bill, authored by Republican Mike Rogers of Michigan and Democrat Dutch Ruppersberger of Maryland, would largely get the NSA out of the business of collecting US phone data in bulk. Rogers and Ruppersberger, both staunch advocates of the NSA and until now just as staunch defenders of bulk collection, are the leaders of the intelligence committee. Yet the House judiciary committee thought it was the natural choice for primary legislative jurisdiction over the Fisa Transparency and Modernization Act, introduced on Tuesday. While the intelligence committee oversees US spy activities, the judiciary committee has oversight responsibilities over surveillance law. The judiciary committee is also a stronghold of support for a rival bill, the USA Freedom Act, two of whose principal sponsors are its top Democrat and a former GOP chairman. The Freedom Act also ends NSA bulk collection, but includes more civil libertarian provisions, such as the prior approval of a judge to force phone companies to turn over customer data and a threshold requirement of relevance to an ongoing investigation to secure such approval. Ruppersberger, in a press conference on Tuesday, blasted the USA Freedom Act, saying it would make Americans "less safe." But the USA Freedom Act, despite also being centrally concerned with intelligence policy, was given primarily to the judiciary committee, raising an expectation on the committee that the same would hold for Rogers and Ruppersberger's bill despite the committee affiliations of its sponsors. A congressional aide who would only speak on condition of anonymity said it was "new and different that a bill that amends Fisa wouldn't come to us first." The House parliamentarian, Thomas Wickham, declined to comment. Representative Jerrold Nadler, a New York Democrat, issued a statement on Wednesday expressing "deep concern" about the jurisdictional switch. "I am deeply concerned that today, for what appears to be the first time ever, a Fisa reform bill has been sent first to the House intelligence committee. The House judiciary committee must assert

its critically important role with regard to Fisa reform efforts so as to ensure that our constitutional liberties are properly protected as we seek to promote national security," Nadler said. The suspicion amongst some Hill staffers is that the next step for Rogers and Ruppersberger, after securing approval from the full intelligence committee, will be to attempt to get their bill to the House floor without putting it before the judiciary committee at all. Circumventing the judiciary committee, staffers said, would reflect the difficulties Rogers and Ruppersberger would have winning the panel's backing for their bill. While on the surface the bill has similarities with the USA Freedom Act, the intelligence leaders' proposal would not require a judge's approval before the government compels telecoms or internet providers to turn over customer data, which an aide called a "**fatal flaw**" of the bill for the judiciary panel. Yet the USA Freedom Act itself faces **significant congressional obstacles**. Despite possessing 142 co-sponsors in the House, the bill has been bottled up in a judiciary subcommittee since January. The committee chairman, Republican Bob Goodlatte of Wisconsin, has given it lukewarm support. Its backers say the bill might be modified or even renamed as a way to shore up its prospects. Advocates detect hostility from House leadership of both parties, to say nothing of the NSA and the Obama administration. The administration has, to the committee leadership's frustration, studiously denied expressing any opinion on the bill, which panel members read as opposition. Both camps are claiming the Obama administration for their own. Rogers and Ruppersberger, appearing to cut off the USA Freedom Act at the pass, declared themselves "very, very close" on Tuesday to a deal with the White House over surveillance. Hours later, Senator Ron Wyden of Oregon, a USA Freedom Act supporter, said Obama's forthcoming surveillance reform proposals show "it's very clear now that the administration agrees with us." But in an indication of the USA Freedom Act's uncertain course, Wyden, joined by fellow Senate bulk-surveillance critics Republican Rand Paul of Kentucky and Democrat Mark Udall of Colorado, urged the president to end bulk surveillance unilaterally, without recourse to Congress. All sides are waiting for Obama's specific proposals, which the administration expects to unveil this week. The GOP leadership permitted a floor debate in July on an amendment that would have killed NSA bulk surveillance outright, and which came close to passage. The amendment's architect, Republican Justin Amash of Michigan, backs the USA Freedom Act. But the speaker of the House, John Boehner, came out on Tuesday in favor of Rogers and Ruppersberger's bill, and Boehner has **great influence** over what will come to the House floor.

Solvency- Cyber

New info-sharing initiatives are vital --- Congress is key

Corrin 14 (Amber,- Senior staff writer, Federal Times/C4ISR and Networks at Gannett Government Media Corporation "Alexander: Congress should address cyberthreat information sharing")

Under the program, DHS and other agencies are to share cyber threat intelligence between the government and owners and operators of critical infrastructure. Information-sharing also is a key component of the National Institute of Standards and Technology's cyber framework released in February. In a March 7 appearance at Georgetown University in Washington, Gen. Keith Alexander, director of the National Security Agency and commander of U.S. Cyber Command, once again called for expanded threat-intelligence sharing. "We have a lot of capabilities in our government that we ought to share, analogous to the way we share capabilities to defend our

nation in physical space," Alexander said. . "If a bank is attacked by another nation-state [in cyberspace], our country shouldn't say, 'good luck with that.' Because if the bank were attacked in physical space with missiles, we wouldn't say, 'you have to have your own missile defense system.' In this space we have to figure out how that government-industry partnership will work." Echoing previous appeals for Congress to pass laws to catch up with technology, Alexander said that effective cyber information-sharing **hinges on legislation**. "This is a team sport – not just NSA and Cyber Command. It's DHS, FBI and many others," he said. "The government has to work with industry. We have to have the [policies] and we're working our way through, but **the key thing we need** is legislation."

Info sharing is vital to cybersecurity --- solves largest threats

Dickinson 14 (Russell,- Online Marketing Executive/Ecommerce Analyst at Misco, quoting qualified folk "Cyber Security Forum Highlights Importance Of Information Sharing")

When it comes to cyber security, it is critical for industry sectors or professional communities to share information so that threats can be identified, attacker tactics exposed and attacks mitigated, data security professionals believe. This was one of the points raised by participants at the London SC Congress 2014, Computer Weekly reported. Brian Brackenborough, chief information security officer at Channel 4, used as example the security forum established by the UK media industry. It has grown to become an international information sharing portal and Brackenborough described it as "one of the most successful security strategies" he had ever witnessed. This example should be followed by other industries, he added. That view was supported by Thomson Reuters' information security director Daniel Schatz, who said that information sharing enabled sectors or communities to access actionable intelligence. They can find out about attacker tactics and plan their actions accordingly, Schatz said. The panellists also drew attention to the issue of insider threats. According to Frank Florentine, head of consultancy firm LilyCo, this represents one of the most serious security problems and it's worth remembering that technical experts tend to be overlooked. Another point raised during the discussion was the importance of a focused response. This means business organisations need to concern themselves primarily with threats relevant to their industry vertical and their specific business activity. If cyber security chiefs try to address every potential threat, they will end up defending nothing, as Schatz put it. Last but not least, companies should raise awareness and responsibility among their staff. One way of doing that is by educating them about the security risks they face at home, which will also affect their attitude to corporate cyber security.

Info sharing provisions are key

Clinton '14 (Larry,- President & CEO Internet Security Alliance http://homeland.house.gov/sites/homeland.house.gov/files/Testimony%20Clinton%20Amended.pdf)

This realization has nothing to do with politics. It is based on the fact that in cyber conflicts, it is the private sector that is most likely to be on the front lines and it is the networks owned and operated by the private sector that provide the critical infrastructure ---both the regulated and non-regulated ones---upon which any modern nation relies. Government does not have all the answers

and often will not be the best judge of how to manage private systems. Altering our strategy to give the federal government final say over how private companies manage their systems will be costly, inefficient and ineffectual. Cyber security must be achieved through a true partnership between the public and private sectors. We specifically endorsed this foundation as embraced in these documents: "The current critical infrastructure protection partnership is sound, the framework is widely accepted, and the construct is one in which both government and industry are heavily invested. The current partnership model has accomplished a great deal. However, an effective and sustainable system of cybersecurity requires a fuller implementation of the voluntary industry--- government partnership originally described in the NIPP. Abandoning the core tenets of the model in favor of a more government--- centric set of mandates would be counterproductive to both our economic and national security. Rather than creating a new mechanism to accommodate the public--- private partnership, government and industry need to continue to develop and enhance the existing one."1 In an attempt to develop our own policy proposals via the established partnership model, we not only notified the White House of our intent to create the industry White Paper, but reached out to them on a regular basis to keep them informed of our progress. We discussed the work at the forums established under the NIPP, such as the IT Sector Coordinating Council meetings, which are regularly attended by DHS staff. When the paper was completed, well prior to release, we sent a full copy to the White House for their review and comment. We requested, and eventually received, a one hour meeting at the White House to brief them on our proposals and requested ongoing interaction so that we could, as partners, come to a common ground on the way forward. Unfortunately, no subsequent meetings were scheduled and we were never briefed on the White House's own---substantially different---approach until it was released and sent to the Congress. III. WE HAVE THE TOOLS TO STOP BASIC ATTACKS The Committee is aware of numerous and varied cyber attacks. Indeed, the Internet is under attack all day, every day, and while we successfully deal with the vast majority of the attacks, we also must aggressively improve our cyber security. However, not all attacks are the same. Cyber attacks can of course be segmented many ways, but given the shortage of time, we can create two broad categories: one of basic attacks (which can be extremely damaging) and one of very sophisticated attacks. Most cyber attacks fall into the first---the basic ---category. Although these attacks can be devastating from many different perspectives, they also are largely preventable. Several different sources, including government, industry and independent evaluators, have concluded that the vast majority of these attacks --- between 80 and 90% --- could be prevented or successfully mitigated simply by adopting best practices and standards that already exist. Among the sources who have reported this finding, we can list the CIA, the NSA, PricewaterhouseCoopers and CIO Magazine. Most recently, a comprehensive study jointly conducted by the U.S. Secret Service and Verizon included a forensic analysis of hundreds of breaches and literally thousands of data points and concluded that 94% of these, otherwise successful, cyber attacks could have been successful managed simply by employing existing standards and practices. IV. WHY ARE WE NOT STOPPING THE BASIC ATTACKS? Cost. Some have suggested that the market has failed to produce the needed technology to address the cyber threat. That is not the case. President Obama's own Cyberspace Policy Review documents the fact that the private sector has developed many adequate mechanisms to address our cyber insecurity, but they are not being deployed: "many technical and network management solutions that would greatly enhance security already exist in the marketplace but are not always used because of cost and complexity."2 This finding is substantiated by multiple independent surveys that also identified cost as the biggest barrier to deploying effective cyber security solutions. This research shows that although many enterprises

are investing heavily in cybersecurity, many others, largely due to the economic downturn, are reducing their cybersecurity investments.3 The fact is that many companies don't see an adequate ROI to cyber investments. This real world problem cannot be permanently wiped away by granting a government department the power to mandate uneconomic expenditures as President Obama himself pointed out last year at the White House: "Due to the interconnected nature of the system this lack of uniform implementation of sound security practices both undermines critical infrastructure and makes using traditional regulatory mechanisms difficult to achieve security."4 Rather, we need to find ways to work within the partnership to encourage firms to make investments that may go beyond their own commercial risk management requirements for security, but might rise to the level of a broader national interest. This principle was recognized in the creation of the original NIPP: "The success of the [public--- private] partnership depends on articulating the mutual benefits to government and private sector partners. While articulating the value proposition to the government typically is clear, it is often more difficult to articulate the direct benefits of participation for the private sector.... In assessing the value proposition for the private sector, there is a clear national security and homeland security interest in ensuring the collective protection of the Nation's [critical infrastructure and key resources] (CI/KR).

Ext – Solves Bulk Collection

Obama proposal solves bulk collection --- most qualified ev

Greenwald 14 (Glenn,- Winner of Electronic Frontier Foundation's Pioneer Award, Glenn Greenwald is a journalist, constitutional lawyer, commentator, and author of three New York Times best-selling books on politics and law Foreign Policy magazine named him one of the top 100 Global Thinkers for 2013 "Obama's New NSA Proposal and Democratic Partisan Hackery")

This proposal **differs in significant respects** from the incredibly vague and cosmetic "reforms" Obama suggested in his highly touted NSA speech in January. Although bereft of details, it was widely assumed that Obama's January proposal would not end the bulk data collection program at all, but rather simply shift it to the telecoms, by simultaneously requiring that the telecoms keep all calling records for 5 years (the amount of time the NSA now keeps those records) and make them available to the government on demand. But under Obama's latest proposal, the telecoms "would not be required to retain the data for any longer than they normally would" (the law currently requires 18 month retention) and "the NSA could obtain specific records only with permission from a judge, using a new kind of court order." As always with Obama, it remains to be seen whether his words will be followed by any real corresponding actions. That he claims to support a bill does not mean he will actually try to have Congress enact it. The details, still unknown, matter a great deal. And even if this did end the domestic bulk collection spying program, it would leave undisturbed the vast bulk of the NSA's collect-it-all system of suspicionless spying. Nonetheless, this clearly constitutes an attempt by Obama to depict himself as trying to end the NSA's domestic bulk surveillance program, which was the first program we reported with Snowden documents. I agree with the ACLU's Jameel Jaffer, who told the New York Times: "We have many questions about the details, but we agree with the administration that the NSA's bulk collection of call records should end." This new proposal would not, as some have tried to suggest, simply shift the program to telecoms. Telecoms – obviously – already have their customers' phone records, and the key to any proposal is that it not expand the length of

time they are required to retain those records (though telecoms only have their specific customers' records, which means that – unlike the current NSA program – no one party would hold a comprehensive data base of all calls). As reported by Savage, Obama's proposal does nothing to change how long telecoms keep these records ("the administration considered and rejected imposing a mandate on phone companies that they hold on to their customers' calling records for a period longer than the 18 months that federal regulations already generally require"). That's why, if enacted as he's proposing it, Obama's plan **could actually end the NSA's bulk collection program**.

Ext – Solves Trust

Reform can rebuild trust with public and allies

FitzGerald '13 (12-18 Ben,- senior fellow and director of the Technology and National Security Program at the Center for a New American Security "NSA revelations: Fallout can serve our nation")

Loss of trust, however, remains the fundamental issue. Washington cannot fix this just by acceding to reforms suggested by others. The administration, with congressional support, must launch a proactive reform agenda, which would demonstrate an understanding of citizens' concerns — allies and businesses alike. The components are straightforward: public outreach to concerned constituencies, such as Tuesday's meeting with technology leaders, amendments to policy and law — for example, updating the Safe Harbor frameworks for privacy protection — and review of the National Security Agency's oversight mechanisms. While these procedural steps are clear, the government can do more. The Snowden revelations are about trust as much as technological frontiers — so Washington's efforts must focus on confidence building. Security and openness need not be mutually exclusive and technological capability should not be the key to defining operational limits. Confidence can be re-established through government-led development of the explicit principles that set a better balance between security and openness. These principles must be formalized in government agencies' policies, federal laws, Supreme Court rulings and congressional oversight establishing the government mechanisms to balance security and openness. Credibly addressing this balance represents Washington's best chance to rebuild the trust that has been so eroded. It is also an opportunity to recast the Snowden revelations as a reason to establish international norms that will govern all nations that are now developing and using similar surveillance capabilities. What is required is to establish standards that Washington can hold itself and others to in terms of healthy collaboration with business, productive relationships with allies and appropriate protections for the data of private citizens. Powerful surveillance capabilities will only grow over time. The United States must therefore establish a new "higher ground" in the international community to lead morally as well as technologically and ensure mutual accountability among governments. The key is to act quickly. Though the United States needs to retain robust foreign surveillance, it is clear that the fallout from the NSA revelations will continue until proactive steps — rooted in trust, policy and law — are taken.

Politics NB

Politics is a net benefit- the Freedom Act has a bipartisan consensus that the plan would have to upset to pass

BCN '15 [Business Cloud News, USA Freedom Act passes ending bulk data collection, May 14, 2015, http://www.businesscloudnews.com/2015/05/14/usa-freedom-act-passes-ending-bulk-data-collection/]

"The bill's authors have worked hard to forge a bipartisan consensus, and the approved bill is supported by the Obama Administration, including the intelligence community. The bill now moves to the other side of the Capitol, and we hope that the Senate will use the June 1 expiration of Section 215 and other legal authorities to modernize and reform our surveillance programs, while recognizing the importance of protecting Americans from harm," she added.

Terror DA

NSA bulk collection crucial to counter-terror

McCall '15 [ALEXANDER MCCALL, Indiana Public Media, June 1, 2015, Indiana Politicians Aren't Happy About Patriot Act Expiring, http://indianapublicmedia.org/news/indianas-senators-patriot-act-82874/]

In the debate over the Patriot Act, which, in part, allows the National Security Agency's bulk collection of Americans' phone records and temporarily expired last night, Indiana's Senators are seeking for it to be re-instated.

Three provisions of the Patriot Act lapsed after a midnight deadline Sunday, at least temporarily.

One of those three provisions, Section 215, accommodates the NSA collection of phone records – a collection that has come under fire since former military contractor Edward Snowden revealed the collection program nearly two years ago.

In the days leading up to the provisions' expiration, Sen. Rand Paul, R-Ky., called that bulk collection "illegal."

But in a recent opinion published in Goshen News, Indiana Republican Sen. Dan Coats argued those provisions were "valuable." Coats has been part of the Republican faction pushing for the provisions' renewal.

"I certainly understand concerns about the possibility that this program could be used to breach personal privacy and civil liberties, which are important to all Americans and protected by the Constitution," Coats said in the piece. "But to date, there is no evidence to support accusations of abuse or unlawful spying on American citizens under this program."

Coats has expressed concerns about **implementing a replacement program, adding that he's worried it would make U.S. counter-terrorism efforts less effective**.

"**It puts Americans at risk**," Coats said in an interview with Fox59.

And Sen. Coats' Democratic counterpart, Indiana Sen. Joe Donnelly, says he's on the same page.

"At a time when ISIS is causing so much havoc in the Middle East and at the same time trying to stir up lone wolf attacks right here in our own country, to leave the country without the ability to do surveillance even for a minute is extremely dangerous," Donnelly told Fox59.

Cybersecurity Bad DA

1NC

NSA reform is horse traded for cybersecurity

Bennett '15 [Cory Bennett, 05/31/15, Surveillance reform could tee up cyber bill, The Hill, http://thehill.com/policy/cybersecurity/243498-surveillance-reform-could-tee-up-cyber-bill]

Supporters of cybersecurity reform are hoping a breakthough on the Patriot Act could pave the way for the Senate to consider their prized legislation.

Getting a surveillance reform measure through the Senate might assuage some of the privacy concerns that have held up cybersecurity legislation in the upper chamber, say supporters of the bill.

"**If a deal is reached**, it may in fact improve the chances of cybersecurity legislation coming through," said Jim Penrose, a former head of the National Security Agency's Operational Discovery Center who is now an executive vice president at cybersecurity firm DarkTrace.

The Senate has been trying to move a bill that would shield companies from legal liability when sharing cyber threat data with the government.

Backers of the Cybersecurity Information Sharing Act (CISA) say exchanging more information on hackers will help the public and private sector harden network defenses that have been repeatedly breached over the last year.

A bipartisan group of lawmakers, government officials and most major industry groups are supporting the bill.

But civil liberties groups and several lawmakers believe the offering would simply shuttle more personal data to the National Security agency, **further empowering its surveillance program**.

The House passed two companion pieces of legislation back in April, but CISA has been mired in the upper chamber, lost amid the heated debate over re-writing the Patriot Act and reforming the NSA programs.

"I don't think cyber information-sharing legislation is in any way off the table," said Paul Martino, senior policy counsel at the National Retail Federation, which supports CISA. "I think it is just being held up right now in a traffic jam."

Cyber-bill leads to information overload, makes protections worse

Katznelson 11

Zachary, "Commentary: The Patriot Act, cyber-edition," http://www.kansascity.com/2011/10/23/3214814/commentary-the-patriot-act-cyber.html

> Cybersecurity is the new buzzword in Washington, capturing a wide range of potential responses to internet-related threats both real and imagined. Congress is starting to play a role, considering legislation that purports to make cyberspace more secure. But many of the solutions being offered echo those of the deeply flawed Patriot Act, enacted ten years ago this month. Just as the Patriot Act swept aside long-standing constitutional protections against government prying into private lives, current cybersecurity proposals threaten to expand the government's ability to collect personal information — even when there is no indication that the people targeted have been involved in any

wrongdoing. Over the past decade, we have learned that such policies fail on two fronts: they are largely ineffective and they violate civil liberties. The Patriot Act presumes that if the government could know more of what we do with our daily lives by monitoring our e-mails and phone calls, downloading our financial transactions, and tracking our locations, it could spot patterns and find terrorists. The Fourth Amendment's prohibition against unreasonable searches have mattered little as claims of national security swept such concerns aside. That thinking has led even further, to warrantless wiretapping and government databases so massive that numbers most of us have never heard of (like yottabytes) have to be used to quantify the data taken in. But counter-terrorism officials consistently lament being swamped with reports and analyses while trying to come to grips with the astronomical amount of data our powerful computers struggle to collate and interpret. In seeking the needle of terrorism, we have built the biggest haystack in history. As we turn to the challenge of cybersecurity, we should be careful not to repeat past mistakes. The Obama administration's plan again seeks to gather more and more private information about regular citizens in the hope of spotting patterns. Under this proposal, private companies would be asked to hand over increasing amounts of our personal information. Once more, information gathering would be incredibly broad, sweeping in law-abiding Americans against whom there is not even a hint of alleged wrongdoing. In the name of making us safe, we once again face the prospect of flooding our systems with excessive information, and hamstringing the officials trying to protect us. There cannot be a meaningful debate about these policies until the public knows what the government is already doing with our private information. The government currently collects reams of data from private companies, some demanded, some handed over voluntarily. But we have no idea how much or how often, or maybe even more importantly, what is done with all these private details once they are in government hands. That is all kept secret. As citizens, we deserve to know what the companies holding our financial details, communications records, and other personal information are doing with it — and what the government is requiring of them. For that reason, the ACLU has filed a Freedom of Information Act request to learn more about how corporations and the government already pass our private information back and forth. To date, no government agency has revealed anything in response. Before Washington asks for even more power to sweep in data, surely it should disclose how much it takes in now. We must avoid the Patriot Act's pitfalls: a civil-liberties-defying policy that might actually make things worse.

Private sector solves cyber-terrorism now – legislation is too static and prevents innovation

Lee 11

Amy, "White House Cybersecurity Plan Feared Inadequate By Experts, Could Violate Privacy," http://www.huffingtonpost.com/2011/05/13/white-house-cybersecurity-plan_n_861738.html

Experts fear a new government plan to combat the growing threat of cyberattacks on private computers, the government's own systems and the nation's critical infrastructure could end up implementing outdated controls and introduce possible privacy violations. The plan, unveiled by the White House on Thursday, was lauded by experts for increasing attention on cybersecurity and recommending higher penalties for cybercriminals. But some say the proposal lacks the force, flexibility and specificity necessary to effectively protect the nation's cybersecurity. While most affirm the need to take a tougher stance on cybersecurity measures, many experts worry the proposed legislation will not be adequate to deal with new threats as they emerge given the complicated, ever-shifting nature of cybercrime. While legislation can take years to pass, cybercriminals are often one step ahead of cybersecurity vendors. By the time the government steps in to act to prevent cybercrime, the protections it requires might already be obsolete. "The attackers are two years ahead of the defenders, security vendors, who are two years ahead of market, which is two years ahead of compliance, and legislation is five years behind that," said Josh Corman, the Research Director of the 451 Group's enterprise security practice. "These practices may be even more stale once enacted. It's unlikely the law could ever keep pace, given the glacial pace of legislation." Some experts say that legislation governing security practices could lead to the establishment of industry standards that will quickly be made obsolete by cybercriminals. But by asking companies to protect specific kinds of information using specific kinds of protections, those standards will

continue to remain dominant, even if they are inadequate to protect against the present state of cyber threats. "You've already failed before you've begun," said Corman. "It's hard enough simply for vendors to keep pace." Others are worried by the proposal's lack of specificity regarding how security protections will be implemented and say the plan would allow contractors to fleece those trying to stay protected. "This is being pushed through as something we have to do, but where's the plan behind it? Where's what we're going to be implementing?" said Kurt Roemer, Citrix Systems' chief security strategist. "A call to audit -- without a detailed audit plan -- is a license to print money for contractors." Security experts were puzzled by the prominent inclusion of intrusion prevention systems, or IPS, as protections for federal executive branch civilian computers. IPS is an outdated security protection, Corman said, adding that the technology only stops previously known kinds of breaches. Last year, 89 percent of the attacks were of a kind that IPSs cannot prevent, according to Corman. "An IPS would not have protected against Wikileaks, stuxnet or any other targeted unknown threat," added Roemer. "To specifically call out IPS was laughable."

Extinction

Adhikari '09 (Richard,- leading journalist on advanced-IP issues for several major publications, including The Wall Street Journal "Civilization's High Stakes Cyber-Struggle: Q&A With Gen. Wesley Clark (ret.)")

The conflicts in the Middle East and Afghanistan, to name the most prominent, are taking their toll on human life and limb. However, the escalating cyberconflict among nations is far more dangerous, argues retired general Wesley Clark, who spoke with TechNewsWorld in an exclusive interview. That cyberconflict will take a far greater toll on the world, contends Clark, who last led the NATO forces to end the ethnic cleansing in Albania. There is a pressing need for new institutions to cope with the ongoing conflict, in his view. Clark is a member of the boards of several organizations. He has a degree in philosophy, politics and economics from Oxford University and a master's degree in military science from the U.S. Army's Command and General Staff College. Background: In November 2008, the Center for Strategic and International Studies, a Washington-based bipartisan think tank, presented recommendations on national security to the then-incoming Obama administration. These called for an overhaul of the existing national cybersecurity organization. Since then, the state of national cybersecurity has appeared chaotic. In August, White House cybersecurity adviser Melissa Hathaway resigned for reasons that echoed the departure in 2004 of Amit Yoran, who then held essentially the same post. In an exclusive interview earlier this year, Yoran told TechNewsWorld that national cybersecurity was still a mess. TechNewsWorld: Security experts warn that nations are preparing for a new cyberwar. Is our government doing enough to protect our national cyber-infrastructure? Or is it in the process of protecting the cyber-infrastructure? Gen. Wesley K. Clark: I think we're in the process of trying to get it protected, but unlike conventional security considerations, where one can easily see an attack and take the appropriate response, the cyberstruggle is a daily, ongoing affair. It's a matter of thousands of probes a day, in and out, against systems that belong to obvious targets like the United States Department of Defense; not-so-obvious targets like banks and energy companies; and individual consumers or taxpayers. It's ongoing, it's undeclared, it's often unreported, and it's very much an ongoing concern at all levels -- business, commerce and individual privacy. TechNewsWorld: The national security infrastructure has repeatedly been reported to be sorely lacking. Is the government moving fast enough? Does it need to do more? Clark: It does need to do more. It's in the process of doing more, and there's a tremendous amount of public and private sector effort going into cybersecurity right now. Whether it's going to be

adequate or not is not the issue. There are many approaches to this problem that are mainly based on software, but software is vulnerable. When you open up to communicate with the Web, when you bring in data and programs from another source, when you bring in applications -- all that entails huge risks. It's dealing with those risks and trying to gain the rewards of doing so that make it such a difficult proposition. Online banking was a novelty 20 years ago. Now, everything happens on the Internet. People pay their bills, they do business, they do their work with customers. People don't fax documents any more if they don't have to -- they do webinars and briefings. All of this exposes the opportunity for mischief. You don't know the source of the mischief. You don't know whether it's individuals trying to solve a difficult technical challenge on their own or if they're connected to governments, or if they're cells attached to governments -- and it's very difficult to pin down ... incoming probes to a source. TechNewsWorld: While it's generally agreed that the next war may be a cyberwar, much of our infrastructure is either hooked up to the Internet or in the process of being hooked up to the Internet. Electricity companies, for example, are agitating for the use of smart meters. That being the case, and with hackers increasing the frequency and sophistication of their attacks, does the increasing pace of hooking everything up to the Internet pose a real security threat? Clark: We're going into completely digitized medical records, which could lead to a huge invasion of privacy. It could also lead to things like blackmail and is physically dangerous because people can tamper with records of vital signs, or can alter prescriptions. There's no telling just what could be done. Companies could lose their supply chain management, lose their accounting records, lose their customer lists. Trying to rebuild this on paper when we've all been interconnected on the Internet will cause years of economic decline. We are, as a civilization, quite vulnerable to disruption, and this security problem doesn't just affect one nation but the whole global economic infrastructure. You can't conceive of the threats from the point of view of a traditional war. Cyber-efforts are ongoing today; we're in a cyber-struggle today. We don't know who the adversaries are in many cases, but we know what the stakes are: continued economic vitality and, ultimately, global civilization.

2NC Internal Link

Major spillover from NSA reform to cybersecurity

Bennett '15 [Cory Bennett, 05/31/15, Surveillance reform could tee up cyber bill, The Hill, http://thehill.com/policy/cybersecurity/243498-surveillance-reform-could-tee-up-cyber-bill]

"**If something can pass on surveillance does that mean it helps in terms of getting enough votes to pass information sharing? Yes, I think so**," Martino said.

In addition to ending the NSA's bulk collection of telephone metadata, USA Freedom would institute more accountability mechanisms. It would institute a panel to advise the Foreign Intelligence Surveillance Court, which oversees intelligence agencies, on cases that may infringe on people's privacy or civil liberties. The bill would also boost public reporting about the NSA's spying programs.

Penrose believes senators who are worried CISA would embolden the NSA "may in fact take some piece of mind" from these privacy oversight provisions.

But the vitriolic debate that has caused the Senate to go down to the wire on the Patriot Act could also extend to the upcoming CISA discussion.

"**It is inevitable that there will be spillover from this debate into the cyber debate, despite the fact that many of them had hoped to keep it separate**," Krayem said. "And if the cyber info sharing bill is the next one, then that debate could be much stickier."

2NC Link T/C

Cybersecurity backdoors bulk data collection- turns the case

Bennett '15 [Cory Bennett, 05/31/15, Surveillance reform could tee up cyber bill, The Hill, http://thehill.com/policy/cybersecurity/243498-surveillance-reform-could-tee-up-cyber-bill]

And no Patriot Act reform will truly mitigate all the privacy concerns floating around CISA.

"CISA could actually result in the kind of bulk surveillance activity that USA Freedom is intended to stop," said Gabe Rottman, legislative counsel and policy advisor for the American Civil Liberties Union, which opposes CISA. "Once information flows from the private sector to the government, the military and intelligence community could store and mine it for purposes that go far beyond 'cybersecurity.'"

2NC Information Overload Link

CISA causes major information overloads and collapses cybersecurity

Castillo '15 [Andrea Castillo, The Hill, May 7, 2015, Cybersecurity bill more likely to promote information overload than prevent cyberattacks, http://thehill.com/blogs/congress-blog/homeland-security/241242-cybersecurity-bill-more-likely-to-promote-information]

A growing number of information security and hacking incidents emphasize the importance of improving U.S. cybersecurity practices. But many computer security experts are concerned that the Cybersecurity Information Sharing Act of 2015 (CISA) is unlikely to meaningfully prevent cyberattacks as supporters claim. Rather, it will provide another avenue for federal offices to extract private data without addressing our root cybersecurity vulnerabilities.

The main premise of CISA is that cyber breaches can be prevented by encouraging private companies to share cyber threat data with the government. CISA would extend legal immunity to private entities that share sensitive information about security vulnerabilities—often containing personally identifiable information (PII) about users and customers—with federal offices like the Department of Justice (DOJ), Department of Homeland Security (DHS) and Director of National Intelligence (DNI).

This concerns privacy advocates who point out that such data collection could serve as an alternative surveillance tool for the NSA. Section 5(A) of CISA authorizes federal agencies to "disclose, retain, and use" shared data for many purposes beyond promoting cybersecurity, like investigating terrorism, the sexual exploitation of children, violent felonies, fraud, identity theft, and trade secret violation. In other words, CISA would allow federal agencies to use data obtained under the auspices of "cybersecurity protection" in entirely unrelated criminal investigations—**potentially indefinitely**. Indeed,CISA is currently stalled in the Senate in deference to debate over the NSA's controversial bulk collection programs.

But the Senate cool-down should not let us forget that CISA does not just threaten civil liberties, it could actually undermine cybersecurity. Information security experts point out that existing information sharing measures run by private companies like IBM and Dell SecureWorks rarely prevent attacks like CISA advocates promise. One survey of information security professionals finds that 87 percent of responders did not believe information sharing measures such as CISA will significantly reduce privacy breaches. The federal government already operates at least 20 information sharing offices collaborating on cybersecurity with the private sector, as Eli Dourado and I found in our new analysis through the Mercatus Center at George Mason University.

These numerous federal information-sharing initiatives have not stemmed the tidal wave of government cyberattacks. Another Mercatus Center analysis Dourado and I conducted finds that the number of reported federal information security failures has increased by an astounding 1,012 percent—from 5,502 in FY 2006 to 61,214 in FY 2013. Almost 40 percent of these involved the PII of federal employees and civilians. CISA could therefore have the unintended consequence of creating a juicy and unprepared target for one-stop hacking.

The Office of Management and Budget reports that many of the federal agencies that would be given large data management responsibilities through CISA, like the DOJ and DHS, reported thousands of such breaches in FY 2014. These agencies' own information security systems are unlikely to become miraculously impervious to external hacking upon CISA's passing. In fact, the massive amounts of new data to manage could further overwhelm currently suboptimal practices.

The federal government's information security failures indicate a technocratic mindset that falsely equates the complexity of bureaucracy with the strength of a solution. In reality, **the government's brittle and redundant internal cybersecurity policies actively contribute to their security challenges**. The Government Accountability Office (GAO) has reported for years that **such overlapping and unclear responsibility in federal cybersecurity policy limits the offices' ultimate effectiveness**. A 2015 GAO investigation concludes that without significant change "the nation's most critical federal and private sector infrastructure systems will remain at increased risk of attack from adversaries."

The federal government must get its own house in order before such comprehensive information sharing measures like CISA could be even technically feasible. But **CISA would be a failure even if managed by the most well-managed government systems because it seeks to impose a technocratic structure on a dynamic system**.

Information overload prevents effective preparation

Spira 10

Jonathan, "The Christmas Day Terrorism Plot: How Information Overload Prevailed and Counterterrorism Knowledge Sharing Failed," http://www.basexblog.com/2010/01/04/the-christmas-day-terrorism-plot-how-information-overload-prevailed-and-counterterrorism-knowledge-sharing-failed/

> The tools to manage information on a massive scale do indeed exist and it is clear that the U.S. government is either not deploying the right ones or not using them correctly. The National Counterterrorism Center, created in 2004 following recommendations of the 9/11 Commission, has a mission to break "the older mold of national government organizations" and serve as a center for joint operational planning and joint intelligence. In other words, various intelligence agencies were ordered to put aside decades-long

rivalries and share what they know and whom they suspect. Unfortunately, while this sounds good in theory, in practice this mission may not yet be close to be being fully carried out. In addition to the fact that old habits die hard (such as a disdain for inter-agency information sharing), it appears that the folks at the NCTC failed to grasp basic tenets of knowledge sharing, namely that search, in order to be effective, needs to be federated and contextual, that is to say it needs to simultaneously search multiple data stores and present results in a coherent manner. Discrete searches in separate databases will yield far different results compared to a federated search that spans across multiple databases. All reports indicate that intelligence agencies were still looking at discrete pieces of information from separate and distinct databases plus the agencies themselves were not sharing all that they knew. In this case, much was known about Umar Farouk Abdulmutallab, the Nigerian man accused of trying to blow up Northwest Flight 253. In May, Britain put him on a watch list and refused to renew his visa. In August, the National Security Agency overheard Al Qaeda leaders in Yemen discussing a plot involving a Nigerian man. In November, the accused's father warned the American Embassy (and a CIA official) in Abuja that his son was a potential threat. As a result, the son was put on a watch list that flagged him for future investigation. He bought his plane ticket to Detroit with cash and boarded the flight with no luggage. Yet, almost unbelievably, no one saw a pattern emerge here. Shouldn't a system somewhere have put the pieces of this puzzle together and spit out "Nigerian, Abdulmutallab, Yemen, visa, plot, cash ticket purchase, no luggage = DANGER!"? Information Overload is partially to blame as well. Given the vast amount of intelligence that the government receives every day on suspected terrorists and plots, it could very well be that analysts were simply overwhelmed and did not notice the pattern. Rather than being immune from the problem, given the sheer quantity of the information it deals with, the government is more of a poster child for it. Regardless of what comes out of the numerous investigations of the Christmas Day terrorism plot and the information-sharing failures of the various intelligence agencies, one thing was abundantly clear by Boxing Day: the Federal Government needs to greatly improve its ability to leverage the intelligence it gathers and connect the dots.

2NC Innovation Link

Heavy-handed government security preventions tanks private sector innovation – that solves security more effectively

CDT 10

Center for Democracy and Technology, Cybersecurity Policy Should Protect Privacy, Innovation, http://www.cdt.org/blogs/greg-nojeim/cybersecurity-policy-should-protect-privacy-innovation

In comments filed yesterday, CDT asked the Department of Commerce to take a careful, nuanced approach to cybersecurity, to favor market-based approaches over government mandates, and to ensure that its efforts are not so heavy-handed as to stifle innovation or slow the development of necessary cybersecurity measures. CDT also urged the Department to take a leading role in implementing the National Strategy for Trusted Identities in Cyberspace, now being developed by the White House. We alerted the Commerce Department to our concern about NSTIC's current focus on the use of government credentials for private transactions: A pervasive government-run online authentication scheme is incompatible with fundamental American values, CDT's comments said. CDT asked the Department to distinguish between various private systems and elements of the Internet as it formulates its cybersecurity policy. We pointed out that policy toward private systems should have a light touch and should seek to preserve the characteristics of the Internet that make it such a success – its open, decentralized and user-controlled nature. Policy toward government systems can be more prescriptive, the comments said. We also cautioned that cybersecurity measures should not compromise President Obama's promise that the government's pursuit of cybersecurity will not include government monitoring of private sector networks or Internet traffic. The comments urge the Department to resist calls to create a cybersecurity information sharing regime that would involve sharing of Internet communications traffic that would compromise the promise of privacy that underlies the laws governing electronic surveillance.

2NC Turns Democracy Adv

Turn – *liberal democracy* – cyber-bill collapses it

Burghardt 10

Tom, “Obama's National Cybersecurity Initiative: Privacy and Civil liberties are Damned,” http://www.globalresearch.ca/index.php?context=va&aid=17993

As long time readers of Antifascist Calling are well aware, while hacking, online thievery and sociopathic behavior by criminals is a troubling by-product of the "information superhighway," state officials and shadowy security corporations have framed the debate in terms of yet another in a series of endless "wars." Mike McConnell, a former NSA Director, Bush regime Director of National Intelligence and currently an executive vice president with the spooky Booz Allen Hamilton corporation (a post he held for a decade before signing-on for the "War on Terror") penned an alarmist screed for The Washington Post February 28. McConnell, whose firm stands to reap billions of dollars in taxpayer largesse under CNCI, claimed that "The United States is fighting a cyber-war today, and we are losing." Drawing a spurious and half-baked (though self-serving) parallel between the Cold World nuclear stand-off with the former Soviet Union and today's cybercriminals, McConnell declared that a "credible" cyber-deterrent analogous to the doctrine of Mutually-Assured Destruction (MAD) would serve the United States "well." Ever the Cold warrior, McConnell avers that the U.S. needs to "develop an early-warning system to monitor cyberspace, identify intrusions and locate the source of attacks with a trail of evidence that can support diplomatic, military and legal options." "More specifically," McConnell writes, "we need to reengineer the Internet to make attribution, geolocation, intelligence analysis and impact assessment--who did it, from where, why and what was the result--more manageable." In other words, the secret state's role in monitoring each and every electronic communication, email, text message, web search, phone conversation or financial transaction must be subject to a pervasive and all-encompassing surveillance by securocrats or we won't be "safe." Indeed, as McConnell and his shadowy firm are well aware since they helped develop them, "the technologies are already available from public and private sources and can be further developed if we have the will to build them into our systems and to work with our allies and trading partners so they will do the same." Reckless advocacy such as this is the kiss of death for any notion of privacy, let alone the constitutional right to dissent. As Wiredinvestigative journalist Ryan Singel wrote last week, "The biggest threat to the open internet is not Chinese government hackers or greedy anti-net-neutrality ISPs, it's Michael McConnell, the former director of national intelligence." Why? Singel insists, "McConnell's not dangerous because he knows anything about SQL injection hacks, but because he knows about social engineering." And during his stint as DNI, "scared President Bush with visions of e-doom, prompting the president to sign a comprehensive secret order that unleashed tens of billions of dollars into the military's black budget so they could start making firewalls and building malware into military equipment." Self-serving rhetoric by the likes of McConnell about an alleged "cyber-armageddon" are not only absurd but the height of corporatist venality. As investigative journalist Tim Shorrock revealed in his essential book Spies for Hire and for CorpWatch, Booz Allen Hamilton, a wholly-owned subsidiary of the shadowy private equity firm, The Carlyle Group, "is involved in virtually every aspect of the modern intelligence enterprise, from advising top officials on how to integrate the 16 agencies within the Intelligence Community (IC), to detailed analysis of signals intelligence, imagery and other critical collections technologies." Clocking-in at No. 10 on Washington Technology's "Top 100" list of Federal Prime Contractors, Booz Allen pulled down some $2,779,421,015 in contracts in 2009. According to Shorrock, "BAH is one of the NSA's most important contractors, and owes its strategic role there in part to Mike McConnell, who was Bush's director of national intelligence." During an earlier stretch with BAH, "McConnell and Booz Allen were involved in some of the Bush administration's most sensitive intelligence operations, including the infamous Total Information Awareness (TIA) program run by former Navy Admiral John Poindexter of Iran-Contra fame." In his Washington Post op-ed, McConnell wrote that "we must hammer out a consensus on how to best harness the capabilities of the National Security Agency," and that the "challenge" is to shape "an effective partnership with the private sector so information can move quickly back and forth from public to private--and classified to unclassified--to protect the nation's critical infrastructure." Super spook McConnell claims this will be accomplished by handing "key private-sector leaders (from the transportation, utility and financial arenas) access to information on emerging threats so they can take countermeasures." However, the "private" portion of the "public-private" surveillance "partnership" must have a quid pro quo so that private sector sharing of privileged, highly personal, network information with the secret state doesn't invite "lawsuits from shareholders and others." In other words, privacy and civil liberties be damned! As Ryan Singel points out, "the contractor he works for has massive, secret contracts with the NSA" and McConnell now proposes that NSA "take the lead in guarding all government and private networks." But McConnell, and Booz Allen's advocacy goes far further than simple advocacy in developing a defensive cyber strategy. Indeed, BAH, and a host of other giant defense and security firms such as Lockheed Martin, are actively developing offensive cyber weapons for the Pentagon. According to Washington Technology, Lockheed Martin will continue to work with the Defense Advanced Research Project Agency (DARPA) in that Pentagon agency's development of a National Cyber Range under CNCI. That program is suspected of being part of Pentagon research to develop and field-test offensive cyber weapons. According to DARPA, "the NCR will provide a revolutionary, safe, fully automated and instrumented environment for U.S. cybersecurity research organizations to evaluate leap-ahead research, accelerate technology transition,

and enable a place for experimentation of iterative and new research directions." "Now the problem with developing cyberweapons--say a virus, or a massive botnet for denial-of-service attacks," Singel writes, "is that you need to know where to point them." "That's why," the Wired journalist avers, "McConnell and others want to change the internet. The military needs targets." Add to the mix a Senate bill that would hand the president "emergency" powers over the Internet and a clear pattern of where things are headed begins to emerge. With giant ISP's such as Google already partnering-up with the NSA and other secret state agencies, the question is how long will it be before an American version of China's Golden Shield enfolds the heimat within its oppressive tentacles? Described by privacy advocates as a massive, ubiquitous spying architecture, the aim of the Golden Shield is to integrate a gigantic online data base with an all-encompassing surveillance network, one that incorporates speech and face recognition, closed-circuit television, smart cards, credit records, and Internet surveillance technologies. And considering that the Empire has reportedly stood-up a giant data base of dissidents called "Main Core," whose roots lie in programs begun during the Reagan administration, assurances by the Obama administration that Americans' privacy rights will be protected as CNCI is rolled-out ring hollow. According to exposés by investigative journalists Christopher Ketchum and Tim Shorrock, writing respectively in Radar Magazine and Salon, Main Core is a meta data base that contains personal and financial data on millions of U.S. citizens believed to be threats to national security. The data, which comes from the NSA, FBI, CIA, and other secret state sources, is collected and stored with neither warrants nor court orders. The name is derived from the fact that it contains "copies of the 'main core' or essence of each item of intelligence information on Americans produced by the FBI and the other agencies of the U.S. intelligence community," according toSalon. While the total cost of CNCI is classified, rest assured it will be the American people who foot the bill for the destruction of our democratic rights.

Internet Freedom Bad

1NC CCP Collapse Mod

Xi is increasing Internet censorship now – he's intensified his efforts in order to strengthen party unity and control

Feeney 12 (Caitlain, Claremont McKenna, CMC Thesis, "China's Censored Leap forward: The Communist Party's Battle with Internet Censorship in the Digital Age")

Media and information controls have long been an essential dimension of the CCP's authoritarian system, and the apparatus for censoring and monitoring internet communications increased dramatically during the decade of the Hu Jintao-led Politburo Standing Committee. Nevertheless, since the change in leadership in November 2012, the dedication of top leaders to reasserting party dominance over an information landscape whose control was perceived to be slipping away has contributed to a more sophisticated, strategic, and in many ways, effective effort compared to the pre-existing apparatus.¶ In particular, after intellectuals and members of civil society urged the CCP to adhere to China's constitution and a rare strike by journalists at a major newspaper sparked broader calls to reduce censorship, the authorities responded with campaigns to **intensify** ideological controls. These efforts and their impact contributed to China's slight decline on Freedom House's recently released Freedom of the Press 2014 index.[1]

The plan causes a collapse of the CCP – internet freedom in China is a MASSIVE threat to regime stability

- Evidence cites: Isaac Mao, Chinese venture capitalist and blogger who has been threatened by the regime for internet freedom violations

Tech In Asia 12 ("What Would China Be Like If the Internet Wasn't Censored")

Everyone I spoke with agreed that whatever other effects it might have on society, a free internet would force a greater degree of honesty and transparency from both the government and Chinese companies. As Jeremy Goldkorn put it: An open Internet would place the government and companies under a **great deal of scrutiny** which would lead to more openness and make corruption more difficult, but would also lead to political battles and competition between companies playing out in a nasty and vicious way online. Could that transparency (and that public ugliness) bring an end to the one-party rule of the CCP? Isaac Mao thinks so. He didn't want to speculate on a specific timeline, but he said that **"the CCP is the natural enemy of freedom"** and that eventually only one of those two things can survive. Sinocism founder Bill Bishop was not so sure. "They [the CCP] have survived plenty of challenges," he said, and as long as they continue to deliver an increasing quality of life for Chinese citizens, they might be able to survive a free internet, too. "But," he added, "if the transparency and accountability that an uncensored Internet provides are anathema to the Party then probably not. [...] **Ideological work is one of the key pillars for the Party** going back to its founding, and a free for all Internet may corrode that pillar even faster than the current managed one."

CCP collapse causes global nuclear war and extinction

Yee and Storey '02 [Professor of Politics and International Relations at Hong Kong Baptist University and Lecturer in Defence Studies at Deakin University, "The China Threat: Perceptions, Myths and Reality," p. 5]

The fourth factor contributing to the perception of a China threat is the fear of political and economic collapse in the PRC, resulting in territorial fragmentation, civil war and waves of refugees pouring into neighbouring countries. Naturally, any or all of these scenarios would have a profoundly negative impact on regional stability. Today the Chinese leadership faces a raft of internal problems, including the increasing political demands of its citizens, a growing population, a shortage of natural resources and a deterioration in the natural environment caused by rapid industrialization and pollution. These problems are putting a strain on the central government's ability to govern effectively. Political disintegration or a Chinese civil war might result in millions of Chinese refugees seeking asylum in neighbouring countries. Such an unprecedented exodus of refugees from a collapsed PRC would no doubt put a severe strain on the limited resources of China's neighbours. A fragmented China could also result in another nightmare scenario – nuclear weapons falling into the hands of irresponsible local provincial leaders or warlords.12 From this perspective, a disintegrating China would also pose a threat to its neighbours and the world.

Taiwan Impact

Threats to the CCP will cause a lashout against Taiwan to boost domestic support

Martin 2007 (Peter B Martin, "America's Nuclear Military Dilemma with China", American Thinker, August 20, http://www.americanthinker.com/2007/08/americas_nuclear_military_dile.html

A year from now China will be on its benevolent best conduct, two years from now that could all change. There is little to fear from China until the Olympics are over; what follows may be a different story altogether. Just as Ancient Greeks would recess their wars during the Olympic Games, China will keep the peace leading up to and during the games. But nationalism has not been entirely sidelined, as it is an essential device to preserve communist rule. China's leadership has an inherent fear of losing power; this perpetual dread is what drives their political and strategic decisions. And Taiwan is the principal catalyst to preserving the Beijing government. Should the political system feel threatened, nationalism would come into play and Taiwan would be the scapegoat.

That draws in the United States and causes nuclear conflict -

Straits Times 2000 ("No one gains in war over Taiwan", June 25, Pg 40)

THE high-intensity scenario postulates a cross-strait war escalating into a full-scale war between the US and China. If Washington were to conclude that splitting China would better serve its national interests, then a full-scale war becomes unavoidable. Conflict on such a scale would embroil other countries far and near and -horror of horrors -raise the possibility of a nuclear war. Beijing has already told the US and Japan privately that it considers any country providing bases and logistics support to any US forces attacking China as belligerent parties open to its retaliation. In the region, this means South Korea, Japan, the Philippines and, to a lesser extent, Singapore. If China were to retaliate, east Asia will be set on fire. And the conflagration may not end there as opportunistic powers elsewhere may try to overturn the existing world order. With the US distracted, Russia may seek to redefine Europe's political landscape. The balance of power in the Middle East may be similarly upset by the likes of Iraq. In south Asia, hostilities between India and Pakistan, each armed with its own nuclear arsenal, could enter a new and dangerous phase.

Will a full-scale Sino-US war lead to a nuclear war? According to General Matthew Ridgeway, commander of the US Eighth Army which fought against the Chinese in the Korean War, the US had at the time thought of using nuclear weapons against China to save the US from military defeat. In his book The Korean War, a personal account of the military and political aspects of the conflict and its implications on future US foreign policy, Gen Ridgeway said that US was confronted with two choices in Korea -truce or a broadened war, which could have led to the use of nuclear weapons. If the US had to resort to nuclear weaponry to defeat China long before the latter acquired a similar capability, there is little hope of winning a war against China 50 years later, short of using nuclear weapons. The US estimates that China possesses about 20 nuclear warheads that can destroy major American cities. Beijing also seems prepared to go for the nuclear option. A Chinese military officer disclosed recently that Beijing was considering a review of its "non first use" principle regarding nuclear weapons. Major-General Pan Zhangqiang, president of the military-funded Institute for Strategic Studies, told a gathering at the Woodrow Wilson International Centre for Scholars in Washington that although the government still abided by that principle, there were strong pressures from the military to drop it. He said military leaders considered the use of nuclear weapons mandatory if the country risked dismemberment as a result of foreign intervention. Gen Ridgeway said that should that come to pass, we would see the destruction of civilisation. There would be no victors in such a war. While the prospect of a nuclear Armaggedon over Taiwan might seem inconceivable, it cannot be ruled out entirely, for China puts sovereignty above everything else.

2NC Censorship Up

Censorship is increasing –

A. Social media crackdowns -

Council on Foreign Relations 14 (Beina Xu, September 25th 14, "Media Censorship in China")

The Xi administration, in power since March 2013, has further tightened the reins on journalists. A new July 2014 directive on journalist press passes bars reporters from releasing information from interviews or press conferences on social media without permission of their employer media organizations. The government also said it would not grant press passes to those who failed to sign the secrecy agreement.¶ Publicizing the CPD guidelines also invites punishment, as they may be classified as "state secrets." Such was the case of Shi Tao, a journalist who served eight years in jail for detailing, in a Yahoo! email, the CPD's instructions for how to report the fifteenth anniversary of Tiananmen Square. Pottinger adds that on top of such national restrictions, local officials also release their own directives. Some of these have restricted information at the cost of public health, as in early 2014, when China's national poultry association requested provincial governments to stop reporting individual cases of H7N9 bird flu infections, fearing damage to profits.

B. He is ramping up control because he perceives it to be essential to regime survival

Lloyd 13 (October, 2013, John, Reuters Columnist, "Colum: China's Great Firewall Grows Ever Higher")

Not only have the boldest spirits among China's journalists been squelched, but the Internet has, too. Bill Clinton once argued that trying to control the Internet was "like nailing jello to the wall," but in China it's being controlled nonetheless. Reportedly up to 2 million Internet monitors scan the estimated 700 million Chinese Web users (which is more than half the population), while an even greater army of "50-centers" put out positive messages about society, government and the Party for which they are paid 50 cents. The artist Ai Weiwei managed to persuade one of them to

speak to him last year: the 50-center told the artist that every day, an email from the government's Internet publicity office gives "instructions on which direction to guide the netizens' thoughts, to blur their focus, or to fan their enthusiasm for certain ideas."¶ On the micro blog site Weibo - developed by the Sina online media corporation after the Chinese authorities barred Twitter from the country, now with 500 million users' accounts - the more outspoken commentators have been warned to cool it. In one case, Charles Xue, a Chinese-American venture capitalist with 12 million followers on Weibo, was arrested in August, and charged with having sex with a prostitute: whatever the truth of the charge, Mr. Xue's public apology was not for a sin of the flesh but for - as he said in his confession - "irresponsibility in spreading information online (in)…a negative mood…freedom of speech cannot override the law." An authoritative account for the Reuters Institute by the Beijing-based reporter Bei Jiao concluded that "control over Weibo is intensifying, limiting freedom of speech. Journalists are increasingly cautious posting anything significant after learning the lessons of their own or others' mistakes."¶ One observer, Xiao Qiang of the University of California at Berkeley, told the New York Times that "we're only seeing the beginning of this campaign…(the authorities) will be much harsher, and the targets will be the more influential people in the Chinese public sphere."¶ Most observers credit the crackdown to Xi Jinping, the new Communist Party leader and president: though Chinese top level politics remain opaque, informed commentators believe that he and his closest colleagues have a strong bias toward closer control over all aspects of society.¶ Last week, People's Daily published a long editorial by the chief editor Yang Zhenwu. It was a commentary on Xi Jinping's speech in August, at a conference on propaganda and ideology, underscoring how important the words of the new leader were. The piece repeated, many times, the absolute necessity of having the media "run by politicians" - by which the editor means that all media must be under the direction of the Party, and "consolidate and expand mainstream ideology and public opinion."

2NC IFreedom Link Run

First – Regime stability – opening up of the internet runs counter to the CCP political strategy of controlling messaging – causes a SERIOUS THREAT to the regime

Feeney 12 (Caitlain, Claremont McKenna, CMC Thesis, "China's Censored Leap forward: The Communist Party's Battle with Internet Censorship in the Digital Age")

As a powerful but insecure authoritarian regime,. **the CCP values its survival above ¶ anything else** Because the Internet threatens the Party's monopoly of power, few should be ¶ surprised that the CCP will apply censorship to maintain its control. Confronted with the ¶ possibility of the 500 million Chinese Internet users utilizing the web as an outlet to publicize ¶ opinion or discontent, the Party's Internet censorship and regulation has "evolved into a ¶ comprehensive, multidimensional system that governs Internet infrastructure, commercial and ¶ social use as well as legal domains."25 The relationship between the Internet and democracy ¶ worldwide is clear, and it is commonly understood that the Internet poses a **serious threat** to ¶ communist regimes. There is often the expectation that the introduction of the Internet in ¶ authoritarian countries will lead to the regime's demise, but "Internet use and development in ¶ ¶ 23 Ibid, 118. ¶ 24 Chung, 732. ¶ 25 Liang and Lu, 105. China has so far failed such an expectation, and some even argue that the Internet has become a ¶ new tool for government control."26

Leadership perception is the ONLY thing that matters in terms of evaluating the link – the Chinese leadership PERCIEVES their stability to be tied to the opening of the internet

- Even if they try to kick solvency this still applies because the plan triggers perception of threats to total control of the internet

- Proves our lash-out arguments, if China perceives they are going to face push-back from their public they are more likely to be adventurist in order to spark nationalism.

Cook 5/14/14 (Sarah, Senior Research Analyst for East Asia, Freedom House, The Freedom House, "Stability in China: Lessons from Tiananmen and Implications for the United States")

Emphasis on the leadership role of the party in managing the media. This may be nothing new but its reiteration indicates the limited prospects of the party voluntarily loosening its grip on the media or internet sector. One set of internal party instructions, Document No. 9, specifically warned against "propagating Western news views" and "opposing Party leadership of our media, in an attempt to open breaches for the ideological infiltration of our country."[2] ¶ A heightened sense of insecurity, lack of control, and depleted ability to influence public opinion, even to the point of this being an **existential threat to the regime**. The speeches and documents convey an especially **high level of anxiety** over the spread of ideas about democracy or its components, including an independent judiciary or an unfettered press. In an August speech by Xi to cadres involved in propaganda work, he acknowledges popular dissatisfaction with the government, notes that positive comments about the party are challenged or attacked online, and expresses concern that mainstream media are losing their influence, especially among young people who instead look to the internet for information. Interestingly, one of the other concerns Xi voices is that party cadres themselves are not ideologically "clear." According to reports of the speech published by Xinhua News Agency and an apparently authentic, more complete leaked version, Xi noted that "we are currently engaged in a magnificent struggle that has many new historical characteristics; the challenges and difficulties we face are unprecedented."[3] As a result, according to Xi, "on this battlefield of the internet, whether we can stand up, and gain victory directly relates to our country's ideological security and regime security."[4]¶ Responding with a combination of militant rhetoric and calls for innovation. In outlining what the party should do in response to the sense of weakened influence and control, Xi draws on warlike imagery, describing the situation as an "**ideological battleground**" and in a more disturbing use of terminology reminiscent of Mao-era campaigns calls for a "public opinion struggle (douzheng)."[5] This sometimes anachronistic aggressiveness is combined with calls for innovation, including increasing the attractiveness of state media content, improving expertise on new media to resolve a "skills panic," and developing different approaches for different segments of the population and across various media types.¶ These speeches and attitudes have translated into a number of concrete actions, including an aggressive campaign to reassert dominance over social media. In one striking example, four days after Xi's aggressive August speech to party cadres on the subject, Chinese-American businessman Charles Xue, whose web commentaries on social and political issues were regularly shared with more than 12 million followers on Sina Weibo, was detained for allegedly soliciting prostitutes.[6] He was later shown handcuffed on state television, expressing regret over the way he had used his microblog account to influence public opinion.[7] The appearance reinforced suspicions of a politically motivated prosecution and his case became the first in a series of events signaling a multi-faceted clampdown on social media that my co-panelist David Wertime will describe in more detail.

AT: Impact Turn – Econ

It doesn't the US doesn't do anything to the businesses – they are there to make money not political statements

Mulvenon (James, "Breaching the Great Firewall? Beijing's Internet Censorship Policies and US-China Relations")

The current economic environment in China encourages the Internet's ¶ commercialization, **not its politicization**. As one Internet executive put it, for ¶ Chinese and foreign companies, "the point is to make profits, not political ¶ statements."24¶ Even so, American companies involved in the Chinese information revolution ¶ have come under increasing scrutiny from NGOs and the Congress for their ¶ possible collaborative role in the construction and maintenance of the Great ¶ Firewall. On the software and services side, the controversial practices of Yahoo!, ¶ Google, Microsoft and others have already been documented above. On the ¶ hardware side, companies like Cisco and Nortel have been accused of designing, ¶ selling, installing, and maintaining equipment used to censor the Chinese ¶ Internet. Cisco has even been accused of producing a custom "censorware" box ¶ 22 Guo Liang, The CASS Internet Report 2003: Surveying Internet Usage and Impact in Twelve ¶ Chinese Cities (Beijing: Chinese Academy of Social Sciences Research Center for Social ¶ Development, 2003), 55–57. About 72 percent of Internet users surveyed agreed that the Internet ¶ would provide people in China greater opportunities to express their political views, ¶ approximately 61 percent stated that it would make it easier to criticize government policies, some ¶ 79 percent indicated it would improve people's understanding of political issues, and 72 percent ¶ said they believed the Internet would allow government officials to enhance their understanding of ¶ the public's views. 23 Guo Liang, 2003, p. 55. ¶ 24 Interview with U.S. businessperson, 2001. 808ames Mulvenon 89¶ for China,25 though the company's CEO in February 2006 denied the charge before ¶ the House International Relations Committee. Indeed, much if not all of the ¶ functionality ascribed to a custom censorware box is available from off-the-shelf ¶ Cisco equipment like the PIX Firewall. At the same time, the company has not ¶ explicitly denied that it provides customized training to use Cisco equipment for ¶ censorship purposes, not has it denied that in China, Cisco products are marketed ¶ explicitly for Internet policing. ¶ Even if some U.S. software and hardware companies are complicit in Chinese ¶ Internet censorship, however, there are very few attractive policy options to deal ¶ with the situation, given the domestic Chinese competition faced by U.S. ¶ companies and the inherently dual-use nature of the technologies involved. ¶ Google's introduction of the censored google.cn, for example, was largely a ¶ response to its dramatic loss of market share to a domestic Chinese search engine, ¶ Baidu, which is known as "China's Google." Yahoo! and Microsoft also confront ¶ successful and dynamic domestic competitors in the e-mail and blog market ¶ spaces. Penalizing these companies for their role in censorship would only further ¶ erode their market share and cede more of the market to Chinese companies that ¶ have few if any qualms about collaborating with the Beijing government to control ¶ Internet information. Similarly, penalizing companies like Cisco for selling routers ¶ and firewalls to China would simply drive the authorities to purchase their ¶ equipment from competing vendors in Europe, Japan, Korea, and elsewhere.

US China War Boosters

US-China war escalates- subs increase risk for miscalc

Twomey, co-director of the Center for Contemporary Conflict at the Naval Postgraduate School, 2009 (Christopher P., Arms Control Today, January/February, http://www.armscontrol.org/act/2009_01-02/china_us_dangerous_dynamism)

Further, the dangers of inadvertent escalation have been exacerbated by some of these moves. Chinese SSBN deployment will stress an untested command-and-control system. Similar dangers in the Cold War were mitigated, although not entirely overcome, over a period of decades of development of personnel and technical solutions. China appears to have few such controls in place today. U.S. deployment of highly accurate nuclear warheads is consistent with a first-strike doctrine and seems sized for threats larger than "rogue" nations. These too would undermine stability in an intense crisis.

1NC AT Chinese Soft Power

Chinese soft power fails

Boot 10—Snr Fellow, CFR. Master's in diplomatic history, Yale (Max, The Rising Dragon and "Smart" Diplomacy, 27 September 2010, http://www.commentarymagazine.com/blogs/index.php/category/contentions?author_name=boot)

For years we have been hearing about how effective Chinese diplomacy is — a supposed contrast with a ham-handed, distracted Uncle Sam who was letting the rising dragon take over East Asia while we weren't paying attention. No one should underestimate the rising military challenge posed by China. As Robert Kaplan notes in this Washington Post op-ed: China has the world's second-largest naval service, after only the United States. Rather than purchase warships across the board, it is developing niche capacities in sub-surface warfare and missile technology designed to hit moving targets at sea. At some point, the U.S. Navy is likely to be denied unimpeded access to the waters off East Asia. China's 66 submarines constitute roughly twice as many warships as the entire British Royal Navy. **But a funny thing happened on the way to Chinese hegemony: its rise has alarmed** pretty much **all its neighbors**, ranging from India and Australia to Japan and South Korea. **The latest sign of how Chinese** hectoring and **bullying is souring other countries is the flap over a Chinese fishing trawler** that collided with Japanese coast-guard vessels near a disputed island in the East China Sea that is claimed by both countries. **The Japanese agreed to release the** fishing **captain** on Friday **after** what the New York Times described as "**a furious diplomatic assault from China**," **which included the cut-off of "ministerial-level talks on issues like joint energy development, and curtailed visits to Japan by Chinese tourists**." In the short term, **this** is a victory for China. But for the long term, it **leaves hard feelings behind and convinces** many more Japanese — and other **Asians** — that **China's rise poses a threat to them**. Keep in mind that the Democrats, the current Japanese ruling party, came to power talking about weakening the U.S.-Japanese alliance and strengthening ties with China. If China were better behaved, that might have come to pass. But **Chinese assertiveness is rubbing the Japanese the wrong way. The same is true with South Koreans, Australians, and other key Chinese trade partners.** In those countries, too, **hopes of a closer relationship with China have been frustrated**; instead, they are drawing closer to the U.S. **The** fundamental **problem is that China's** ruling **oligarchy has no Marxist legitimacy left**; **its only claim to power is to foster an aggressive Chinese nationalism. That may do wonders for support on the home front, but it is doomed to antagonize its neighbors** and possibly bring into being a de facto coalition to contain Beijing. That, at least, should be the goal of American policy. Even as we continue to trade with China, we should make sure to curb its geo-political ambitions. That is a goal in which we should be able to get the cooperation of many of China's neighbors — if we actually practice the sort of "smart power" diplomacy that the Obama-ites came into office promising.

Alt causes to Chinese soft power and they won't use it effectively

Walker 11—Senior Director of the Global Business Policy Council, senior scholar at the Woodrow Wilson International Center, and a senior fellow at the World Policy Institute (28 June 2011, Martin, China's soft-power hurdle, http://www.upi.com/Top_News/Analysis/Walker/2011/06/28/Walkers-World-Chinas-soft-power-hurdle/UPI-39731309267283/)

It is far from clear that this will succeed. Three years ago, **at the time of the Beijing Olympics, the goodwill for what China called its "peaceful rise" was widespread**. The World Bank's Robert Zoellick was talking of China as a fellow stakeholder in the global economy, ready to play by the common rules of international commerce and behavior.

> **That was then. This is now.** Surging with self-confidence after navigating the global financial crisis, **China has been throwing its weight around in the South China Sea**, alarming Vietnam, the Philippines, Indonesia and Brunei with its insistence that the whole sea and its mineral wealth belong to China. **Japan has been shaken by** some minor **clashes** over other disputed islands, **and India frets over China's** apparent **plans to** start **build**ing **dams in Tibet** near the source of the Brahmaputra River, which supplies about a third of northern India's water.
>
> **China's** impressive **investments in Africa have become controversial**, **since** so many of **the jobs in construction are going to imported Chinese workers rather than Africans**. China's readiness to do business with unsavory regimes does not go down quite as well in the age of the democratic upsurge of the Arab Spring as it did before.
>
> **China's** latest **clampdown on** various **dissidents and on the Internet** (while also being blamed for many cyberattacks) **has caused alarm.** The United Nations startled Chinese diplomats with its recent press release expressing concerns over China's "recent wave of enforced disappearances."
>
> Doubtless China will learn from this, even as it navigates the preliminary phases of the transition of power to the next generation of leaders, a process that may help explain the latest crackdown on dissidents, human-rights lawyers and other activists. And doubtless China's astute deployment of its massive wealth to investments and various causes overseas will also pay dividends.
>
> But the fact remains that **China may** well **be influencing people**, and it has a highly impressive record of economic management to flaunt, **but it is not** exactly **winning friends.** Joseph **Nye** of Harvard's Kennedy School of Government invented the concept of soft power, as opposed to the hard power of coercion. He **defined it as the ability to get other people and countries to want what you want. China has yet to show it understands the distinction**. It is in Beijing's own interest -- as well as the world's -- that the Chinese leadership learns this quickly.

1NC Returning Anyway

Major returners now, even with censorship- trending towards returns

Liu 2/12 [IRENE JAY LIU, Reuters, Feb 12, 2015, For many of China's biotech brains-in-exile, it's time to come home, http://uk.reuters.com/article/2015/02/12/us-china-health-returnees-idUKKBN0LG2UQ20150212In biotech parks across the Yangtze River Delta, dozens of start-ups are working to develop drugs to treat China's biggest emerging diseases - from diabetes and Hepatitis B to respiratory illnesses and cancer.]

It's early days, but firms like Hua Medicine and Innovent Biologics embody China's hopes for competitive biomedical innovation. And their Chinese-born, Western-educated founders represent the long-awaited return of the nation's brightest life scientists.

From school in the late 1970s and 1980s, when only elite students gained entry intoChina's few biochemistry and molecular biology programs, they left China, graduated and worked their way up to senior positions in the world's top pharmaceutical companies.

For decades, China tried to woo them home, but **they were reluctant to return** to a cloistered, politicized scientific establishment where winning research funds and promotion often depends on who you know. It took the jobs squeeze of the 2008 global financial crisis and fresh government incentives - from state-of-the-art research labs to grants, loans and government venture capital - to prise them from international careers to launch their own start-ups in China.

"To obtain major grants in China, it's an open secret that doing good research is not as important as schmoozing with powerful bureaucrats and their favorite experts," returnees Shi Yigong and Rao Yi wrote in a 2010 editorial in Science.

"If returnees want to do innovation, in academia there is traditional resistance and old practices," said Huiyao Wang at the Center for China & Globalization. "It's the private sector that really attracts people to start new ventures."

China has committed more than $300 billion to science and technology, with biotech one of seven pillar industries in the latest Five-Year Plan. Biomedical research investment jumped more than four-fold in 2007-12, though it is still dwarfed by spending in the United States and Europe, according to a 2014 study in the New England Journal of Medicine.

Returnee firms have listed in New York and London, work closely with 'Big Pharma' and attract investment from U.S. venture capital and multinationals.

"China is coming up, **especially with returnees coming back**. The innovation will come with the people," said Jimmy Zhang, a vice-president at Johnson & Johnson Innovation, which opened a regional center in Shanghai last autumn.

2NC Returning Anyway/Drug Trials Alt Cause

Returners already high and drug trail processing time is a major alt cause

Liu 2/12 [IRENE JAY LIU, Reuters, Feb 12, 2015, For many of China's biotech brains-in-exile, it's time to come home, http://uk.reuters.com/article/2015/02/12/us-china-health-returnees-idUKKBN0LG2UQ20150212In biotech parks across the Yangtze River Delta, dozens of start-ups are working to develop drugs to treat China's biggest emerging diseases - from diabetes and Hepatitis B to respiratory illnesses and cancer.]

"I sometimes ask myself, 'why did I return to China?' I had a very comfortable life in the U.S. and my family's still there," said Michael Yu, Innovent's founder and CEO. "But for lots of Chinese men, there's always something in the heart ... a desire to go back and do something. Biotech has only just started in China so you can have significant impact for a whole industry, for a country."

After completing postdoctoral training at the University of California, San Francisco, Yu spent a decade at U.S. biotech firms before going home in 2006 to co-found Kanghong Biotech, which developed the first homegrown innovative monoclonal antibody to be approved by China's regulators. He later launched Innovent with funding from Chinese and U.S.-based investors, including bioBAY, a government-funded biosciences park in Suzhou. bioBAY spent $140 million on Innovent's 1 million square foot (92,903 square meter) laboratory and production facility.

Another returnee, Li Chen, was chief scientific officer at Roche's China R&D center when, in 2009, he was invited to dinner by U.S.-based ARCH Venture Partners, which encouraged him to go out on his own. "It wasn't something I was expecting," Chen said. He launched Hua Medicine

in 2011 with $50 million from U.S. and Chinese investors. Last month, it closed another $25 million in series-B financing.

The returnee start-ups are leveraging shifts in the global R&D landscape. The financial crisis, expiry of blockbuster drug patents, and mega-mergers have forced major drugs firms to reprioritize, giving newcomers a chance to develop promising compounds already in the pipeline.

Hua is about to launch Phase 2 trials for a novel Type 2 diabetes drug in-licensed from Roche. Zai Laboratory, another returnee firm, has an in-licensing deal with Sanofi to develop two compounds to potentially treat chronic respiratory diseases.

By focusing on diseases that are on the rise in China, these firms can recruit from a vast patient population, speeding up the time it takes to conduct clinical studies.

However, China's regulatory environment, especially for drug approval, "has been quite inefficient and often inadequate," says Jonathan Wang at OrbiMed, a global healthcare-dedicated investment firm. Getting approval for human trials can take over a year, compared to just weeks in the United States.

"Everything else being equal, you'd go where the approval process is easier," said Wang.

EMPTY NESTS AND ANGEL MONEY

For some, coming home is as much a personal as professional issue. Many are 'empty nesters' whose own children are now at college, or they have ageing parents.

"In the U.S., people have family and friends who can support them with 'angel money.' As first-generation immigrants, we don't have that kind of access there," said Zhang at J&J Innovation.

For the returnees, it's just the beginning.

"We've planted the seed for a fast-growing, innovation driven environment in China," said Steve Yang, chief operating officer at WuXi AppTec. "The impact of this group will be better measured in another 10-20 years."

1NC No I/L

Censorship just causes offshoring of Chinese biotech scientists- that just means they relocate to places like the US and continue doing their research

1AC EV Jacobs 1/29/15

Andrew Jacobs is an American correspondent for The New York Times. Jacobs has been based in Beijing, China, since April 2008, NYT, January 29, 2015, “China Further Tightens Grip on the Internet”, http://www.nytimes.com/2015/01/30/world/asia/china-clamps-down-still-harder-on-internet-access.html

On Tuesday, however, a senior official at the Ministry of Industry and Information Technology acknowledged that the government was targeting V.P.N.s to foster the “healthy development” of the nation’s Internet and he announced that such software was essentially illegal in China. “The country needs new methods to tackle new problems,” Wen Ku, a director at the ministry, said at a news conference, according to People’s Daily. In recent weeks, a number of Chinese academics

have gone online to express their frustrations, particularly over their inability to reach Google Scholar, a search engine that provides links to millions of scholarly papers from around the world. "**It's like we're living in the Middle Ages**," Zhang Qian, a naval historian, complained on the microblog service Sina Weibo. In an essay that has been circulating on social media, one **biologist described how the unending scramble to find ways around website blockages was sapping colleagues' energy.** "It's completely ridiculous," he wrote of the wasted hours spent researching and downloading V.P.N. software that works. "**For a nation that professes to** respect science and wants to **promote scientific learning, such barriers suggest little respect for** the **people actually engaged in science.**" It is not just **scientists** who have come to **depend on an unabridged Internet for their work.** Cheng Qingsong, a prominent film critic, complained that it was more and more difficult to stream foreign movies. Andrew Wang, a professor of translation at Beijing Language and Culture University, worried that his students would be unable carry out assignments that require them to watch English-language videos on YouTube, which has long been blocked here. The vast majority of Chinese Internet users, especially those not fluent in English and other foreign languages, have little interest in vaulting the digital firewall. But those who require access to an unfiltered Internet are **the very people Beijing has been counting on to** transform the nation's low-end manufacturing economy into one **fuel**ed by entrepreneurial **innovation.** Illustrating such contradictions, the central government this week announced a series of programs that seek to lure more international business talent by easing visa requirements and through other incentives. "We have to focus on the nation's strategic goals and attract high-level talent to start innovative businesses in China," said Zhang Jianguo, director of the State Administration of Foreign Experts Affairs, who **bemoaned the nation's shortage of scientists** and technology entrepreneurs. Those **goals**, however, **will not be helped by** the **assaults on Internet access**, critics say. Avery Goldstein, a professor of contemporary Chinese studies at the University of Pennsylvania, said the growing online constraints would not only dissuade expatriates from relocating here, but could also compel ambitious young Chinese studying abroad to look elsewhere for jobs. "If they aren't able to get the information to do their jobs, the best of the best might simply **decide not to go home**," he said. For those who have already returned to China and who crave membership in an increasingly globalized world, the prospect of making do with a circumscribed Internet is dispiriting. Coupled with the unrelenting air pollution and the crackdown on political dissent, a number of **Chinese said** the **blocking of V.P.N.s could push them over the edge.** "It's as if we're shutting down half our brains," said Chin-Chin Wu, an artist who spent almost a decade in Paris and who promotes her work online. "**I think that the day that information from the outside world becomes completely inaccessible in China, a lot of people will choose to leave.**"

India fills in to solve- that's probably where the Chinese scientists would go btw since your ev says their firms are basically identical

<can footnote if you want- the entire card says "India and China" every time it mentions China>

1AC EV Frew et. al, 8

[Sarah Frew is a research associate at the McLaughlin-Rotman Centre for Global Health, University Health Network and University of Toronto, in Ontario, Canada. Hannah Kettler is a program officer at the Bill and Melinda Gates Foundation in Seattle, Washington. Peter Singer is a senior scientist at the McLaughlin-Rotman Centre for Global Health, " The Indian And Chinese

Health Biotechnology Industries: Potential Champions Of Global Health?," Health Affairs, 27, no. 4 (2008)]

DISCOVERY, DEVELOPMENT, AND DELIVERY OF "accessible"—that is, affordable, appropriate, and available—**products to treat infectious diseases** such as HIV, malaria, TB, and respiratory and diarrheal diseases, as well as noncommunicable diseases, **are critical to improving the health of the world's poor**. During the past ten years, global health product development has improved dramatically, with new money from government and philanthropic donors, new not-for-profit initiatives, and contributions of expertise from the private sector. But **sustainable solutions are still lacking. One approach** to this problem **is to explore opportunities to use the market potential of the poor**.1 As Bill Gates noted in his June 2007 remarks at Harvard's commencement: We can make market forces work better for the poor if we can develop a more creative capitalism—if we can stretch the reach of market forces so that more people can make a profit, or at least make a living, serving people who are suffering from the worst inequities.2 **Multinational drug companies** and even some larger biotechnology companies **are making important contributions** to global health through product donation and not-for-profit research and development (R&D) initiatives.3 **However, their core business model, which depends primarily on earning blockbuster returns to compensate risky and expensive R&D and commercialization while also meeting investors' expectations for return on investment** (ROI), **is** by definition **poorly suited to addressing the health needs of the world's poorest populations**. Through a better understanding of how pharmaceutical and biotech companies in **India and China are already making a profit serving the poor**, we can gain insight into sustainable business models in global health. Drug manufacturers in **China** and India—specifically, Cipla, Ranbaxy, and Hetero—**are well known in the global health community for manufacturing and selling low-cost antimalarial and antiretroviral therapies in Africa**. Less well known are the products and strategies of the emerging biotech companies in India and China. Our case studies of Indian and **Chinese biotech companies reveal a surprising and important focus on appropriate, affordable products for infectious diseases and other local maladies**.4 For example, we found that **Shanghai United Cell Biotech had developed the only tablet formulation of cholera vaccine**; that the Serum Institute of India (Pune), through its 138-country global distribution network and relationships with United Nations Children's Fund (UNICEF) and Pan American Health Organization (PAHO), provides one of every two doses of vaccine given worldwide; and that Shantha Biotechnics (Hyderabad) developed a cost-effective manufacturing process for hepatitis B vaccine (Shanvac-B), India's first indigenously developed recombinant DNA product, driving down the price from US$15 per dose for the imported product to US$0.50, and is now supplying about 30 percent of UNICEF's global requirement for hepatitis B vaccine. In addition, **recent changes in** intellectual property (IP), industrial**, trade,** and regulatory **policies have caused** Indian and **Chinese** companies **to move farther up the value chain—investing in innovative research** and entering new, wealthier markets. We contend that existing global health financing vehicles could be made more sustainable through greater inclusion of emerging-market companies.

1NC AT Disease Impact

No impact to any diseases

Nick **Beckstead 14**, Research Fellow at the Future of Humanity Institute, citing Peter Doherty, recipient of the 1996 Nobel Prize for Medicine, PhD in Immunology from the University of Edinburgh, Michael F. Tamer Chair of Biomedical Research at St. Jude Children's Research

Hospital, "How much could refuges help us recover from a global catastrophe?" in Futures, published online 18 Nov 2014, Science Direct

That leaves pandemics and cobalt bombs, which will get a longer discussion. While there is little published work on human extinction risk from pandemics, it seems that **it would be extremely challenging for any pandemic**—whether **natural or manmade**—to leave the people in a specially constructed refuge as the **sole survivors**. In his introductory book on pandemics (Doherty, 2013, p. 197) argues:¶ "**No pandemic is likely to wipe out the human species**. Even without the protection provided by modern science, we survived **smallpox, TB, and the plagues of recorded history.** Way back when human numbers were **very small,** infections may have been responsible for some of the **genetic bottlenecks** inferred from evolutionary analysis, but there is **no formal proof** of this."¶ Though some authors have **vividly described worst-case scenarios** for engineered pandemics (e.g. Rees, 2003 and Posner, 2004; and Myhrvold, 2013), it would take a **special effort** to infect people in **highly isolated locations**, especially the 100+ "**largely uncontacted" peoples who prefer to be left alone.** This is not to say it would be impossible. A madman intent on annihilating all human life could use cropduster-style delivery systems, flying over isolated peoples and infecting them. Or perhaps a pandemic could be engineered to be delivered through animal or environmental vectors that would reach all of these people.

1NC AT Poverty→Radicalization

Poverty doesn't lead to radicalization- that's their internal link claim

Heathershaw and Montgomery '14 [John Heathershaw and David W. Montgomery, The Myth of Post-Soviet Muslim Radicalization in the Central Asian Republics, November 2014, http://www.chathamhouse.org/sites/files/chathamhouse/field/field_document/20141111PostSovietRadicalizationHeathershawMontgomery.pdf]

It has become routine to assume that the combination of authoritarianism and poverty cause radicalization. 24 This claim is prevalent throughout ICG reporting. The 2011 report Central Asia: Decay and Decline noted that Central Asian governments 'should realize that tolerating the status quo will bring about the very problems they fear most – further impoverishment and instability, radicalization and latent state collapse'. 25 The 'disappearance of basic services', 26 'poor living conditions, corruption and abuse of office', 27 'economic crisis and rigged elections', 28 'declining¶ demand for labour migrants', 29 'woeful social and economic conditions', 30 and 'a venal and corrupt political elite' are all cited as causes of radicalization in ICG reports. 31 The conflation of political and economic underdevelopment in these reports reflects a deep-seated modernization thinking which is routine in Western secular security discourse and particularly evident in ICG reports. From this very narrow optic, it is underdevelopment which causes both high levels of religiosity and religious violence. Even Central Asia's one emerging economy is subject to this analysis. The report Kazakhstan: Waiting for Change puts it bluntly, While there are many different theories as to who is behind the [terrorist] attacks [that Kazakhstan suffered in 2011] and the kind of ideology and agenda they follow, the expert and political community in Kazakhstan is almost unanimous about the main reason for the existence and spread of religious radicalisation: the grim socio-economic situation in the regions, especially the west. 32 This claim in the myth of post-Soviet radicalization is apparently commonsensical and is consistent with the kind of political analysis offered by many journalists and policy commentators. It is particularly powerful because it is widely shared between the elites of Western states, regional powers and Central Asian republics (all of whom have experienced long-term and large-scale secular modernization themselves). Non-governmental voices in the least repressive parts of

Central Asia are quick to make similar claims. For example, the Kyrgyz analyst Kanybek Osmaniliev refutes the claim that recent acts of political violence in Kyrgyzstan could be considered 'religious terrorism' but speculates about the increased influence of Hizb ut-Tahrir (HT) in the country as a reaction to the authoritarian nature of the government. 33 Such an analysis is consistent with the international secularist security discourse about Islam in Central Asia. Once again, however, **there is little or no evidence to support this claim**. There are no reliable data on the magnitude of support across the region for banned transnational groups – violent or nonviolent – that hold extremist political views. However, such groups clearly have some support in Kazakhstan (by far the wealthiest Central Asian republic) and in Kyrgyzstan (one of the poorest). These are also the two 'most democratic' according to respected indices. Yet Turkmenistan, with the most authoritarian government in the region, has not seen acts of violent extremism. Uzbekistan is also highly authoritarian but has successfully suppressed and/or ejected most of the groups that have emerged on its territory. In Tajikistan, violent extremist organizations (VEOs) that were minor players during the civil war declined following its conclusion in the late 1990s. 34 The Tajik experience suggests that there is an obvious relationship between political instability and the manifestation of violent extremism, including, though by no means primarily, Islamic extremism. But this is to make a statement that borders on tautology. Where there is conflict, Islam – as a¶ major social force – will find itself drawn into that mix as one of several sources of contention and conciliation. 35 All this is not to diminish the importance of poverty, authoritarian government and attendant political instability in the region's plight. It is merely to say that there is no evidence to support the idea that radicalization is more likely to occur in authoritarian states and among poor populations. Furthermore there is growing evidence suggesting that a small number of individuals and small groups are drawn to violent extremism from within democratic and prosperous Western societies. However, scholars of radicalization are able to offer few convincing and valid explanations for why (and where) this radicalization takes place.

Econ/Trade Impact Turns

*1NC---Growth Causes War

Growth causes war

Trainer 2 Senior Lecturer of School of Social Work @ University of New South Wales (Ted, If You Want Affluence, Prepare for War, Democracy & Nature, Vol. 8, No. 2, EBSCO)

If this limits-to-growth analysis is at all valid, the implications for the problem of global peace and conflict and security are clear and savage. If we all remain determined to increase our living standards, our level of production and consumption, in a world where resources are already scarce, where only a few have affluent living standards but another 8 billion will be wanting them too, and which we, the rich, are determined to get richer without any limit, then nothing is more guaranteed than that there will be increasing levels of conflict and violence. To put it another way, if we insist on remaining affluent we will need to remain heavily armed. Increased conflict in at least the following categories can be expected. First, the present conflict over resources between the rich elites and the poor majority in the Third World must increase, for example, as 'development' under globalisation takes more land, water and forests into export markets. Second, there are conflicts between the Third World and the rich world, the major recent examples being the war between the US and Iraq over control of oil. Iraq invaded Kuwait and the US intervened, accompanied by much high-sounding rhetoric (having found nothing unacceptable about Israel's invasions of Lebanon or the Indonesian invasion of East Timor). As has often been noted, had Kuwait been one of the world's leading exporters of broccoli, rather than oil, it is doubtful whether the US would have been so eager to come to its defence. At the time of writing, the US is at war in Central Asia over 'terrorism'. Few would doubt that a 'collateral' outcome will be the establishment of regimes that will give the West access to the oil wealth of Central Asia. Following are some references to the connection many have recognised between rich world affluence and conflict. General M.D. Taylor, US Army retired argued '... US military priorities just be shifted towards insuring a steady flow of resources from the Third World'. Taylor referred to '... fierce competition among industrial powers for the same raw materials markets sought by the United States' and '... growing hostility displayed by have-not nations towards their affluent counterparts'.62 'Struggles are taking place, or are in the offing, between rich and poor nations over their share of the world product; within the industrial world over their share of industrial resources and markets'.63 'That more than half of the people on this planet are poorly nourished while a small percentage live in historically unparalleled luxury is a sure recipe for continued and even escalating international conflict.'64 The oil embargo placed on the US by OPEC in the early 1970s prompted the US to make it clear that it was prepared to go to war in order to secure supplies. 'President Carter last week issued a clear warning that any attempt to gain control of the Persian Gulf would lead to war.' It would '... be regarded as an assault on the vital interests of the United States'.65 'The US is ready to take military action if Russia threatens vital American interests in the Persian Gulf, the US Secretary of Defence, Mr Brown, said yesterday.'66 Klare's recent book Resource Wars discusses this theme in detail, stressing the coming significance of water as a source of international conflict. 'Global demand for many key materials is growing at an unsustainable rate. ... the incidence of conflict over vital materials is sure to grow. ... The wars of the future will largely be fought over the possession and control of vital economic goods. ... resource wars will become, in the years ahead, the most distinctive feature of the global security environment.'67 Much of the rich world's participation in the conflicts taking place throughout the world is driven by the determination to back a faction that will then look favourably on Western interests. In a report entitled, 'The rich prize that is Shaba', Breeze begins, 'Increasing rivalry over a share-out between France and Belgium of the mineral riches of Shaba Province lies behind the joint Franco– Belgian paratroop airlift to Zaire. ... These mineral riches make the province a valuable prize and help explain the West's extended diplomatic courtship ...'68 Then there is potential conflict between the rich nations who are after all the ones most dependent on securing large quantities of resources. 'The resource and energy intensive modes of production employed in nearly all industries necessitate continuing armed coercion and competition to secure raw materials.'69 'Struggles are taking place, or are in the offing, between rich and poor nations over their share of the world product, within the industrial world over their share of industrial resources and markets ...'70 Growth, competition, expansion ... and war Finally, at the most abstract level, the struggle for greater wealth and power is central in the literature on the causes of war. '... warfare appears as a normal and periodic form of competition within the capitalist world economy. ... world wars regularly occur during a period of economic expansion. '71 'War is an inevitable result of the struggle between economies for expansion.'72 Choucri and North say their most important finding is that domestic growth is a strong

determinant of national expansion and that this results in competition between nations and war.73 The First and Second World Wars can be seen as being largely about imperial grabbing. Germany, Italy and Japan sought to expand their territory and resource access. Britain already held much of the world within its empire ... which it had previously fought 72 wars to take! 'Finite resources in a world of expanding populations and increasing per capita demands create a situation ripe for international violence.'74 Ashley focuses on the significance of the quest for economic growth. 'War is mainly explicable in terms of differential growth in a world of scarce and unevenly distributed resources ... expansion is a prime source of conflict. So long as the dynamics of differential growth remain unmanaged, it is probable that these long term processes will sooner or later carry major powers into war.'75 Security The point being made can be put in terms of security. One way to seek security is to develop greater capacity to repel attack. In the case of nations this means large expenditure of money, resources and effort on military preparedness. However there is a much better strategy; i.e. to live in ways that do not oblige you to take more than your fair share and therefore that do not give anyone any motive to attack you. Tut! This is not possible unless there is global economic justice. If a few insist on levels of affluence, industrialisation and economic growth that are totally impossible for all to achieve, and which could not be possible if they were taking only their fair share of global resources, then they must remain heavily armed and their security will require readiness to use their arms to defend their unjust privileges. In other words, if we want affluence we must prepare for war. If we insist on continuing to take most of the oil and other resources while many suffer intense deprivation because they cannot get access to them then we must be prepared to maintain the aircraft carriers and rapid deployment forces, and the despotic regimes, without which we cannot secure the oil fields and plantations. Global peace is not possible without global justice, and that is not possible unless rich countries move to 'The Simpler Way'.

Extinction

Chase-Dunn 96 Distinguished Professor of Sociology and Director of the Institute for Research on World-Systems at the University of (Christopher, Conflict Among Core States: World-System Cycles and Trends, 23 January 1996, http://wsarch.ucr.edu/archive/papers/c-d&hall/warprop.htm)

Note-figure omitted

Late in the K-wave upswing (i.e. in the 2020s), the world-system schema predicts a window of vulnerability to another round of world war. This is when world wars have occurred in the past. Intensified rivalry and competition for raw materials and markets will coincide with a multipolar distribution of military power among core states. The world-system model does not predict who the next hegemon will be. Rather it designates that there will be structural forces in motion that will favor the construction of a new hierarchy. Historical particularities and the unique features of the era will shape the outcome and select the winners and losers. If it were possible for the current system to survive the holocaust of another war among core states, the outcome of the war would be the main arbiter of hegemonic succession. While the hegemonic sequence has been a messy method of selecting global "leadership" in the past, the settlement of hegemonic rivalry by force in the future will be a disaster that our species may not survive. It is my concern about this possible disaster that motivates this effort to understand how the hegemonic sequence has occurred in the past and the factors affecting hegemonic rivalry in the next decades. What are the cyclical processes and secular trends that may affect the probability of future world wars? The world-system model is presented in Figure 1. This model depicts the variables that I contend will be the main influences on the probability of war among core states. The four variables that raise the probability of core war are the Kondratieff cycle, hegemonic decline, population pressure (and resource scarcity) and global inequality. The four variables that reduce the probability of core war are the destructiveness of weaponry, international economic interdependency, international political integration and disarmament. The probability of war may be high without a war occurring, of course. Joshua Goldstein's (1988) study of war severity (battle deaths per year) in wars among the "great powers" demonstrated the existence of a fifty-year cycle of core wars. Goldstein's study shows how this "war wave" tracks rather closely with the Kondratieff long economic cycle over the past 500 years of world-system history. It is the future of this war cycle that I am trying to predict. Factors that Increase the Likelihood of War Among Core States The proposed model divides variables into those that are alleged to increase the probability of war among core states and those that decrease that probability. There are

four of each. Kondratieff waves The first variable that has a positive effect on the probability of war among core powers is the Kondratieff wave -- a forty to sixty year cycle of economic growth and stagnation. Goldstein (1988) provides evidence that the most destructive core wars tend to occur late in a Kondratieff A-phase (upswing). Earlier research by Thompson and Zuk (1982) also supports the conclusion that core wars are more likely to begin near the end of an upswing. Boswell and Sweat's (1991) analysis also supports the Goldstein thesis. But several other world-system theorists have argued that core wars occur primarily during K-wave B-phases. This disagreement over timing is related to a disagreement over causation. According to Goldstein states are war machines that always have a desire to utilize military force, but wars are costly and so statesmen tend to refrain from going to war when state revenues are low. On the other hand, statesmen are more likely to engage in warfare when state revenues are high (because the states can then afford the high costs of war). Boswell and Sweat call this the "resource theory of war."

2NC---Growth Causes War

Prefer our models ---only historical analysis --- k-wave means growth causes extinction

Chase-Dunn and Podobnik 99 [Director of the Institute for Research on World-Systems, Assistant Professor in the Department of Sociol006Fgy and Anthropology at Lewis and Clark College Professor in the Department of Sociology and Anthropology at Lewis and Clark College Christopher and Bruce, *The Future of Global Conflict*, ed. Bornschier and Chase-Dunn, pg 43]

While the onset of a period of hegemonic rivalry is in itself disturbing, the picture becomes even grimmer when the influence of long-term economic cycles is taken into account. As an **extensive body of research** documents (see especially Van Duijn, 1983), the 50 to 60 year business cycle known as the Kondratieff wave (K-wave) has been in synchronous operation on an international scale for at least the last two centuries. Utilizing data gathering by Levy (1983) on war severity, Goldstein (1988) demonstrates that there is a corresponding 50 to 60 year cycle in the number of battle deaths per year for the period 1495-1975. Beyond merely showing that the K-wave and the war cycle are linked in a systematic fashion, Goldstein's research suggests that severe core wars are **much more likely to occur** late **in the upswing** phase of the K-wave. This finding is interpreted as showing that, while states always desire to go to war, they can afford to do so only when **economic growth** is providing them with sufficient resources. Modelski and Thompson (1996) present a more complex interpretation of the systemic relationship between economic and war cycles, but it closely resembles Goldstein's hypothesis. In their analysis, a first economic upswing generates the economic resources required by an ascending core state to make a bid for hegemony; a second period of economic growth follows a period of global war and the establishment of a new period of hegemony. Here, again, specific economic upswings are associated with an increased likelihood of the outbreak of core war. It is **widely accepted** that the current K-wave, which entered a downturn around 1967-73, is probably now in the process of beginning a new upturn which will reach its apex around 2025. It is also widely accepted that by this period US hegemony, already unraveling, will have been definitively eroded. This convergence of a plateauing economic cycle with a period of political multicentricity within the core should, if history truly does repeat itself, result in the outbreak of full-scale warfare between the declining hegemon and the ascending core powers. Although both Goldstein (1991) and Modelski and Thompson (1996) assert that such a global war can (somehow) be avoided, other theorists consider that the possibility of such a core war is sufficiently high that **serious steps should be taken to ensure that** such **collective suicide does not occur.**

1NC---Growth Causes Warming

Short-term collapse of the global economy is the only way to avoid catastrophic warming---delay locks in catastrophic emissions---*extinction*

David **Holmgren 13**, founder of Holmgren Design Services, an environmental design and consulting firm, inventor of the Permaculture system for regenerative agriculture, 2013, "Crash on Demand: Welcome to the Brown Tech Future," Simplicity Institute report, http://simplicityinstitute.org/wp-content/uploads/2011/04/CrashOnDemandSimplicityInstitute.pdf

Many climate policy professionals and climate activists are now reassessing whether there is anything more they can do to help prevent the global catastrophe that climate change appears to be. The passing of the symbolic 400ppm CO2 level certainly has seen some prominent activists getting close to a change of strategy. As the Transition Town movement founder and

permaculture activist Rob Hopkins says, the shift in the mainstream policy circles from mitigation to adaptation and defence is underway (i.e. giving up).13

While political deadlock remains the most obvious obstacle, I believe at least some of that deadlock stems from widespread doubt about whether greenhouse gas emissions can be radically reduced without economic contraction and/or substantial wealth redistribution. Substantial redistribution of wealth is not generally taken seriously perhaps because it could only come about through some sort of global revolution that would itself lead to global economic collapse. On the other hand, massive economic contraction seems like it might happen all by itself, without necessarily leading to greater equity.

The predominant focus in the "climate professional and activist community" on policies, plans and projects for transition to renewable energy and efficiency has yet to show evidence of absolute reductions in greenhouse gas emissions that do not depend on rising greenhouse gas emissions in other parts of the global economy. For example, the contribution of renewable technology installation to reduced GGE in some European countries appears to be balanced by increased GGE in China and India (where much of the renewable technologies are manufactured).

The Jevons' paradox14 suggests than any gains in efficiency or tapping of new sources of energy will simply expand total consumption rather than reduce consumption of resources (and therefore GGE).

Richard Eckersley in his article 'Deficit Deeper Than Economy' identifies the improbability of ever decoupling economic growth from resource depletion and green house gas emissions. He states "Australia's material footprint, the total amount of primary resources required to service domestic consumption (excludes exports and includes imports) was 35 tonnes per person in 2008, the highest among the 186 countries studied. Every 10 per cent increase in gross domestic product increases the average national material footprint by 6 per cent. By 2050, a global population of 9 billion people would require an estimated 270 billion tonnes of natural resources to fuel the level of consumption of OECD countries, compared with the 70 billion tonnes consumed in 2010."15

Time seems to be running out for any serious planned reductions in GGE[Greenhouse Gas Emissions] adequate to prevent dangerous climate change without considering a powerdown of the growth economy. The ideas of degrowth16 are starting to get an airing, mostly in Europe, but the chances of these ideas being adopted and successfully implemented would require a long slow political evolution if not revolution. We don't have time for the first, and the second almost certainly crashes the financial system, which in turn crashes the global economy.

IS TIME RUNNING OUT FOR BOTTOM UP ALTERNATIVES?

Like many others, I have argued that the bottom up creation of household and community economies, already proliferating in the shadow of the global economy, can create and sustain different ways of well-being that can compensate, at least partly, for the inevitable contraction in centralised fossil fuelled economies (now well and truly failing to sustain the social contract in countries such as Greece and Egypt). When the official Soviet Union economy collapsed in the early '90s it was the informal economy that cushioned the social impact. Permaculture strategies focus on the provision of basic needs at the household and community level to increase resilience, reduce ecological footprint and allow much of the discretionary economy to shrink. In principle, a major contraction in energy consumption is possible because a large proportion of that

consumption is for non-essential uses by more than a billion middle class people. That contraction has the potential to switch off greenhouse gas emissions but this has not been seriously discussed or debated by those currently working very hard to get global action for rapid transition by planned and co-ordinated processes. Of course it is more complicated because the provision of fundamental needs, such as water, food etc., are part of the same highly integrated system that meets discretionary wants.

However, the time available to create, refine and rapidly spread successful models of these bottom-up solutions is running out, in the same way that the time for government policy and corporate capitalism to work their magic in converting the energy base of growth from fossil to renewable sources.17 If the climate clock is really so close to midnight what else could be done?

Economic crash as hell or salvation

For many decades I have felt that a collapse of the global economic systems might save humanity and many of our fellow species great suffering by happening sooner rather than later because the stakes keep rising and scale of the impacts are always worse by being postponed. An important influence in my thinking on the chances of such a collapse was the public speech given by President Ronald Reagan following the 1987 stock market crash. He said "there won't be an economic collapse, so long as people don't believe there will be an economic collapse" or words to that effect. I remember at the time thinking; fancy the most powerful person on the planet admitting that faith (of the populous) is the only thing that holds the financial system together.

Two decades on I remember thinking that a second great depression might be the best outcome we could hope for. The pain and suffering that has happened since 2007 (from the more limited "great recession") is more a result of the ability of the existing power structures to maintain control and enforce harsh circumstances by handing the empty bag to the public, than any fundamental lack of resources to provide all with basic needs. Is the commitment to perpetual growth in wealth for the richest the only way that everyone else can hope to get their needs met? The economy is simply not structured to provide all with their basic needs. That growth economy is certainly coming to an end; but will it slowly grind to a halt or collapse more rapidly?

The fact that the market price for carbon emissions has fallen so low in Europe is a direct result of stagnating growth. Past economic recessions and more serious economic collapses, such as faced by the Soviet Union after its oil production peaked in the late 1980's,18 show how greenhouse gas emissions can and have been reduced, then stabilizing at lower levels once the economy stabilized without any planned intention to do so. The large number of oil exporters that have more recently peaked has provided many case studies to show the correlation with political upheaval, economic contraction and reductions in GGE. Similarly many of the countries that have suffered the greatest economic contraction are also those with the greatest dependence on imported energy, such as Ireland, Greece and Portugal. The so-called Arab Spring, especially in Egypt, followed high food and energy prices driven by collapsed oil revenues and inability to maintain subsidies. The radical changes of government in Egypt have not been able to arrest the further contraction of the economy.

The effects of peak oil and climate change have combined with geopolitical struggles over pipeline routes to all but destroy the Syrian economy and society.19

Slow Contraction or Fast Collapse

The fragility of the global economy has many unprecedented aspects that make some sort of rapid collapse of the global economy more likely. The capacity of central banks to repeat the massive stimulus mechanism in response to the 2008 global financial crisis, has been greatly reduced, while the faith that underpins the global financial system has weakened, to say the least. Systems thinkers such as David Korowicz20 have argued that the inter-connected nature of the global economy, instantaneous communications and financial flows, "just in time" logistics, and extreme degrees of economic and technological specialisation, have increased the chances of a large scale systemic failure, at the same time that they have mitigated (or at least reduced) the impact of more limited localised crises.

Whether novel factors such as information technology, global peak oil and climate change have increased the likelihood of more extreme economic collapse, Foss and Keen have convinced me that the most powerful and fast-acting factor that could radically reduce greenhouse gas emissions is the scale of financial debt and the long-sustained growth of bubble economics stretching back at least to the beginnings of the "Thatcherite/Reaganite revolution" in the early 1980s. From an energetics perspective, the peak of US oil production in 1970, and the resulting global oil crises of 73 and 79, laid the foundations for the gigantic growth in debt that super accelerated the level of consumption, and therefore GGE.

Whatever the causes, all economic bubbles follow a trajectory that includes a rapid contraction, as credit evaporates, followed by a long-sustained contraction, where asset values decline to lower levels than those at the beginning of the bubble. After almost 25 years of asset price deflation in Japan, a house and land parcel of 1.5ha in a not too isolated rural location can be bought for $25,000. A contraction in the systems that supply wants are likely to see simultaneous problems in the provision of basic needs. As Foss explains, in a deflationary contraction, prices of luxuries generally collapse but essentials of food and fuel do not fall much. Most importantly, essentials become unaffordable for many, once credit freezes and job security declines. It goes without saying that deflation rather inflation is the economic devil that governments and central banks most fear and are prepared to do almost anything to avoid.

Giving credence to the evidence for fast global economic collapse may suggest I am moving away from my belief in the more gradual Energy Descent future that I helped articulate. John Michael Greer has been very critical of apocalyptic views of the future in which a collapse sweeps away the current world leaving the chosen few who survive to build the new world. In large measure I agree with his critique but recognise that some might interpret my work as suggesting a permaculture paradise growing from the ashes of this civilisation. To some extent this is a reasonable interpretation, but I see that collapse, as a long drawn-out process rather than resulting from a single event.21

I still believe that energy descent will go on for many decades or even centuries. In Future Scenarios I suggested energy descent driven by climate change and peak oil could occur through a series of crises separating relatively stable states that could persist for decades if not centuries. The collapse of the global financial system might simply be the first of those crises that reorganise the world. The pathways that energy descent could take are enormously varied, but still little discussed, so it is not surprising that discussions about descent scenarios tend to default into ones of total collapse. As the language around energy descent and collapse has become more nuanced, we start to see the distinction between financial, economic, social and civilisational

collapse as potential stages in an energy descent process where the first is fast changing and relatively superficial and the last is slow moving and more fundamental.

In Future Scenarios I suggested the more extreme scenarios of Earth Steward and Lifeboat could follow Green Tech and Brown Tech along the stepwise energy descent pathway. If we are heading into the Brown Tech world of more severe climate change, then as the energy sources that sustain the Brown Tech scenario deplete, and climate chaos increases, future crises and collapse could lead to the Lifeboat Scenario. In this scenario, no matter how fast or extreme the reductions in GGE due to economic collapse, we still end up in the climate cooker, but with only the capacity for very local, household and communitarian organisation.

If the climate crisis is already happening, and as suggested in Future Scenarios, the primary responses to the crisis increase rather than reduce GGE, then it is probably too late for any concerted effort to shift course to the more benign Green Tech energy descent future. Given that most of the world is yet to accept the inevitability of Energy Descent and are still pinning their faith in "Techno Stability" if not "Techno Explosion", the globally cooperative powerdown processes needed to shift the world to Green Tech look unlikely. More fundamental than any political action, the resurgent rural and regional economies, based on a boom for agricultural and forestry commodities, that structurally underpins the Green Tech scenario, will not eventuate if climate change is fast and severe. Climate change will stimulate large investments in agriculture but they are more likely to be energy and resource intensive, controlled climate agriculture (greenhouses), centralised at transport hubs. This type of development simply reinforces the Brown Tech model including the acceleration of GGE.

While it may be too late for the Green Tech Scenario, it still may be possible to avoid more extreme climate change of a long drawn out Brown Tech Scenario before natural forcing factors lock humanity into the climate cooker of 4-6 degrees and resource depletion leads to a collapse of the centralised Brown Tech governance and a rise of local war lords (Lifeboat Scenario).

The novel structural vulnerabilities highlighted by David Korowicz, and the unprecedented extremity of the bubble economics highlighted by Nicole Foss suggest the strong tendencies towards a Brown Tech world could be short lived. Instead, severe global economic and societal collapse could switch off GGE enough to begin reversing climate change; in essence the Earth Steward scenario of recreated bioregional economies based on frugal agrarian resources and abundant salvage from the collapsed global economy and defunct national governance structures.

2NC---Growth Causes Warming

Global economic collapse makes it impossible to finance the resource extraction projects that will lock in warming---makes it impossible to restart the global economy with anything other than drastically reduced emissions

David **Holmgren 13**, founder of Holmgren Design Services, an environmental design and consulting firm, inventor of the Permaculture system for regenerative agriculture, 2013, “Crash

on Demand: Welcome to the Brown Tech Future," Simplicity Institute report, http://simplicityinstitute.org/wp-content/uploads/2011/04/CrashOnDemandSimplicityInstitute.pdf

The evidence that the global financial system is a not-so-slow moving train crash is getting stronger. That investors and the billion or so middle class people who have any savings and discretionary expenditure are losing faith, might be an understatement. It may be that paralysis and inertia is all that is holding the system together.

A collapse in credit could make it very difficult to raise the finance necessary for the ongoing extraction of tar sands, shale gas and other mad resource extraction projects that are accelerating the production of GGE[Greenhouse Gas Emissions]. A deflationary spiral that follows from a credit crisis and collapsing asset (housing, etc.) values could change behaviour to the extent that people stop spending on anything but essentials because of job insecurity and the fact that everything will be cheaper next month.

I believe the chances of global economic collapse (in the next five years) being severe enough to achieve this have to be rated at least 50%. Further I believe many climate activists and policy professionals are shifting to at least privately hoping this might be the case because the chances of a planned powerdown seems to be fading.

If we accept a global financial crash could make it very difficult, if not impossible, to restart the global economy with anything other than drastically reduced emissions, then an argument can be mounted for putting effort into precipitating that crash, the crash of the financial system. Any such plan would of course invite being blamed for causing it when it happens. No one wants to be strung up along with the bankers for causing a global version of Greece, Egypt or many other countries, let alone the horrors of Syria. On the other hand, we have no precedent to indicate how bad conditions might be in currently affluent countries.

The picture I am building is that it is almost inevitable that those who warn of the crisis will get the blame for causing it. So if we are going to be blamed anyway, we could be proactive about it and at least get the advantage for humanity of crisis now, rather than later. For the people of Syria caught in the grip of climate, energy and geopolitical struggle, all this hardly matters because it couldn't get worse for them. In fact conditions in such stricken places could actually improve if global superpower competition is disabled by the collapse of the global finance. Even the average citizen in Greece or Egypt might be hoping to see the remaining affluent countries get a 'taste of their own medicine'. The complexity of global human overshoot, so long predicted, and now unfolding, is far too multifaceted to be captured by any simple story about good, innocence, evil and blame.

Before considering whether this is a good idea or not, I want to consider whether concerted action by limited numbers of activists could bring it about?

Given the current fragilities of global finance, I believe a radical change in the behaviour of a relatively small proportion of the global middle class could precipitate such a crash. For example a 50% reduction of consumption and 50% conversion of assets into building household and local community resilience by say 10% of the population in affluent countries would show up as 5% reduction in demand in a system built on perpetual growth and a 5% reduction in savings capital available for banks to lend. Small fluctuations in the supply-demand balance can have a massive effect on prices. Further, when the system has been growing due to rising debt, arguably for

decades, then the vulnerability to drops in demand can be massive. For example, small drops in demand for new houses and the high fuel costs of commuting for those servicing mortgages, triggered the collapse of the housing bubble in the USA and other countries.

It seems obvious to me that it is easier to convince a minority that they will be better off by disengaging from the system than any efforts to build mass movements demanding impossible outcomes or convincing elites to turn off the system that is currently keeping them in power.

I accept that many people find the idea of assisting economic collapse abhorrent, even if that collapse is becoming more and more likely as a collective outcome of human actions. Daryl Taylor uses the caring metaphor "hospicing and euthanasing" the old/dying system along with "doula-ing and midwifing the new/emerging system. Whatever the metaphors, climate activists who believe we are on the verge of runaway catastrophic climate change that will be far worse than simply stalling the economy, do have options other than shouting louder for mitigation or shifting to adaptation and defence. Rather than simply planning for bad and rocky energy descent delivered initially by economic depression, they could choose to focus their energy on actively trying to destroy faith in the financial system.

1NC---Unsustainable

Economic collapse is 100% inevitable---the only question is whether it happens fast enough to avoid warming

Dr. Samuel **Alexander 14**, lecturer with the Office for Environmental Programs, University of Melbourne, and research fellow, Melbourne Sustainable Society Institute, February 2014, "Post-Growth Economics: A Paradigm Shift in Progress," http://www.sustainable.unimelb.edu.au/files/mssi/Post-Growth%20Economics.pdf

There is one final post-growth perspective deserving of acknowledgement, even if the intricacies cannot be explored. It builds upon the recognition by some ecological economists that there is a close connection between energy use and economic activity (Hall and Klitgaard, 2012). From this view – sometimes called 'biophysical economics' – the unprecedented levels of economic growth experienced since the industrial revolution have been largely due to the available abundance of cheap energy in the forms of coal, gas, and especially oil. Fossil fuels are finite resources, however, and energy analysts since Marion King Hubbert (1956) have known that at some time the production of finite fossil fuels will 'peak' and, after a plateau, eventually enter decline. The concern here is that, while production may plateau, demand is still expected to increase (Hirsch et al, 2010), thereby putting an upward pressure on the price of fossil fuels, even as the 'energy return on investment' declines (Murphy and Hall, 2011). This phenomenon seems to be underway already in relation to oil, with crude oil production entering a plateau around 2005, causing the price of oil to increase from around $25 per barrel, historically, to an average price of $110 since 2011 (IEA, 2013a: 2). In a world that consumes 90 million barrels of oil every day, such sharp price rises have significant economic implications, by sucking discretionary

expenditure and investment away from the rest of the economy. Indeed, some analysts argue that expensive oil is at least part of the reason the global economy, which is so dependent on oil for transport, pesticides, plastics, etc., is showing persistent signs of stagnation and instability (Heinberg, 2011). Furthermore, if expensive oil and other 'limits to growth' are indeed bringing an end to more than two centuries of economic growth, then this is likely to cause havoc with the heavily indebted societies around that world that currently, under a capitalist framework, depend on growth to pay back debts and keep unemployment at bay. At the pessimistic end of the spectrum, some analysts argue that the global financial crisis was merely the first of series of forthcoming crises that are going to increase in magnitude as the growth model fails to deal with, or even acknowledge, energy, resource, and debt limits (Tverberg, 2012). From such perspectives, the world may have an alternative to the growth model imposed upon it sooner rather than later, irrespective of whether the world wants or is ready for such an alternative (see, e.g. Clarke and Lawn, 2010).

The relationship between energy and economics also becomes problematic in the context of climate change mitigation. Currently, fossil fuels make up over 80% of the global energy supply (IEA, 2013b: 6). If nations around the world choose to decarbonise economies in response to climate change (see Wiseman et al, 2013), this may well imply an end to growth, or even significant economic contraction, because there are serious doubts about whether renewable energy will be able to fully replace the energy-dense fossil fuels in a timely or affordable way (see, e.g. Trainer, 2013a, 2013b). This is not an argument against renewable energy, of course; the suggestion is merely that growth-orientated consumer societies could not be sustained if the world rapidly decarbonised to run solely or primarily on renewable sources of energy (Hopkins and Miller, 2013). A transition to 100% renewable energy, therefore, may well imply consuming significantly less energy, and in the highly developed regions of the world, energy descent would probably mean transitioning to some post-growth economic paradigm via a process of planned economic contraction, or degrowth. Kevin Anderson's work is particularly important here (see Anderson, 2013), for he is one of the only climate scientists who recognises (or is outspoken enough to say) that the world's shrinking carbon budget requires degrowth and reduced consumption in high consumption societies. That is not an implication many are prepared to accept, even amongst many or even most participants in the broad environmental movement. Indeed, this blindness – it might even be wilful blindness – is arguably the environmental movement's greatest short-coming.

2NC---Unsustainable

Economic collapse inevitable --- now's better than later

MacKenzie 8 [Debora, Are We Doomed, New Scientist, Vol. 197 Issue 2650, p32-35, 4p, 4 May 2005, EBSCO)

> DOOMSDAY. The end of civilisation. Literature and film abound with tales of plague, famine and wars which ravage the planet, leaving a few survivors scratching out a primitive existence amid the ruins. Every civilisation in history has collapsed, after all. Why should ours be any different? Doomsday scenarios typically feature a knockout blow: a massive asteroid, all-out nuclear war or a catastrophic pandemic. Yet there is another chilling possibility: what if the very nature of civilisation means that ours, like all the others, is destined to collapse sooner or later? A few researchers have been making such claims for years. Disturbingly,

recent insights from fields such as complexity theory suggest that they are right. It appears that once a society develops beyond a certain level of complexity it becomes increasingly fragile. Eventually, it reaches a point at which even a relatively minor disturbance can bring everything crashing down. Some say we have already reached this point, and that it is time to start thinking about how we might manage collapse. Others insist it is not yet too late, and that we can - we must - act now to keep disaster at bay. History is not on our side. Think of Sumeria, of ancient Egypt and of the Maya. In his 2005 best-seller, Jared Diamond of the University of California, Los Angeles, blamed environmental mismanagement for the fall of the Mayan civilisation and others, and warned that we might be heading the same way unless we choose to stop destroying our environmental support systems. Lester Brown of the Earth Policy Institute in Washington DC agrees. He has that governments must pay more attention to vital environmental resources. "It's not about saving the planet. It's about saving civilisation," he says. Others think our problems run deeper. From the moment our ancestors started to settle down and build cities, we have had to find solutions to the problems that success brings. "For the past 10,000 years, problem solving has produced increasing complexity in human societies," says Joseph Tainter, an archaeologist at the University of Utah, Salt Lake City, and author of the 1988 book The Collapse of Complex Societies. If crops fail because rain is patchy, build irrigation canals. When they silt up, organise dredging crews. When the bigger crop yields lead to a bigger population, build more canals. When there are too many for ad hoc repairs, install a management bureaucracy, and tax people to pay for it. When they complain, invent tax inspectors and a system to record the sums paid. That much the Sumerians knew. Diminishing returns There is, however, a price to be paid. Every extra layer of organisation imposes a cost in terms of energy, the common currency of all human efforts, from building canals to educating scribes. And increasing complexity, Tainter realised, produces diminishing returns. The extra food produced by each extra hour of labour - or joule of energy invested per farmed hectare - diminishes as that investment mounts. We see the same thing today in a declining number of patents per dollar invested in research as that research investment mounts. This law of diminishing returns appears everywhere, Tainter says. To keep growing, societies must keep solving problems as they arise. Yet each problem solved means more complexity. Success generates a larger population, more kinds of specialists, more resources to manage, more information to juggle - and, ultimately, less bang for your buck. Eventually, says Tainter, the point is reached when all the energy and resources available to a society are required just to maintain its existing level of complexity. Then when the climate changes or barbarians invade, overstretched institutions break down and civil order collapses. What emerges is a less complex society, which is organised on a smaller scale or has been taken over by another group. Tainter sees diminishing returns as the underlying reason for the collapse of all ancient civilisations, from the early Chinese dynasties to the Greek city state of Mycenae. These civilisations relied on the solar energy that could be harvested from food, fodder and wood, and from wind. When this had been stretched to its limit, things fell apart. Western industrial civilisation has become bigger and more complex than any before it by exploiting new sources of energy, notably coal and oil, but these are limited. There are increasing signs of diminishing returns: the energy required to get is mounting and although global is still increasing, constant innovation is needed to cope with environmental degradation and evolving - the yield boosts per unit of investment in innovation are shrinking. "Since problems are inevitable," Tainter warns, "this process is in part ineluctable." Is Tainter right? An analysis of complex systems has led Yaneer Bar-Yam, head of the New England Complex Systems Institute in Cambridge, Massachusetts, to the same conclusion that Tainter reached from studying history. Social organisations become steadily more complex as they are required to deal both with environmental problems and with challenges from neighbouring societies that are also becoming more complex, Bar-Yam says. This eventually leads to a fundamental shift in the way the society is organised. "To run a hierarchy, managers cannot be less complex than the system they are managing," Bar-Yam says. As complexity increases, societies add ever more layers of management but, ultimately in a hierarchy, one individual has to try and get their head around the whole thing, and this starts to become impossible. At that point, hierarchies give way to networks in which decision-making is distributed. We are at this point. This shift to decentralised networks has led to a widespread belief that modern society is more resilient than the old hierarchical systems. "I don't foresee a collapse in society because of increased complexity," says futurologist and industry consultant Ray Hammond. "Our strength is in our highly distributed decision making." This, he says, makes modern western societies more resilient than those

like the old Soviet Union, in which decision making was centralised. Things are not that simple, says Thomas Homer-Dixon, a political scientist at the University of Toronto, Canada, and author of the 2006 book The Upside of Down. "Initially, increasing connectedness and diversity helps: if one village has a crop failure, it can get food from another village that didn't." As connections increase, though, networked systems become increasingly tightly coupled. This means the impacts of failures can propagate: the more closely those two villages come to depend on each other, the more both will suffer if either has a problem. "Complexity leads to higher vulnerability in some ways," says Bar-Yam. "This is not widely understood." The reason is that as networks become ever tighter, they start to transmit shocks rather than absorb them. "The intricate networks that tightly connect us together - and move people, materials, information, money and energy - amplify and transmit any shock," says Homer-Dixon. "A financial crisis, a terrorist attack or a disease outbreak has almost instant destabilising effects, from one side of the world to the other." For instance, in 2003 large areas of North America and Europe suffered when apparently insignificant nodes of their respective electricity grids failed. And this year China suffered a similar blackout after heavy snow hit power lines. Tightly coupled networks like these create the potential for propagating failure across many critical industries, says Charles Perrow of Yale University, a leading authority on industrial accidents and disasters. Credit crunch Perrow says interconnectedness in the global production system has now reached the point where "a breakdown anywhere increasingly means a breakdown everywhere". This is especially true of the world's financial systems, where the coupling is very tight. "Now we have a debt crisis with the biggest player, the US. The

consequences could be enormous." "A networked society behaves like a multicellular organism," says Bar-Yam, "random damage is like lopping a chunk off a sheep." Whether or not the sheep survives depends on which chunk is lost. And while we are pretty sure which chunks a sheep needs, it isn't clear - it may not even be predictable - which chunks of our densely networked civilisation are critical, until it's too late. "When we do the analysis, almost any part is critical if you lose enough of it," says Bar-Yam. "Now that we can ask questions of such systems in more sophisticated ways, we are discovering that they can be very vulnerable. That means civilisation is very vulnerable." So what can we do? "The key issue is really whether we respond successfully in the face of the new vulnerabilities we have," Bar-Yam says. That means making sure our "global sheep" does not get injured in the first place - something that may be hard to guarantee as the climate shifts and the world's fuel and mineral resources dwindle. Scientists in other fields are also warning that complex systems are prone to collapse. Similar ideas have emerged from the study of natural cycles in ecosystems, based on the work of ecologist Buzz Holling, now at the University of Florida, Gainesville. Some ecosystems become steadily more complex over time: as a patch of new forest grows and matures, specialist species may replace more generalist species, biomass builds up and the trees, beetles and bacteria form an increasingly rigid and ever more tightly coupled system. "It becomes an extremely efficient system for remaining constant in the face of the normal range of conditions," says Homer-Dixon. But unusual conditions - an insect outbreak, fire or drought - can trigger dramatic changes as the impact cascades through the system. The end result may be the collapse of the old ecosystem and its replacement by a newer, simpler one. Globalisation is resulting in the same tight coupling and fine-tuning of our systems to a narrow range of conditions, he says. Redundancy is being systematically eliminated as companies maximise profits. Some products are produced by only one factory worldwide. Financially, it makes sense, as mass production maximises efficiency. Unfortunately, it also minimises resilience. "We need to be more selective about increasing the connectivity and speed of our critical systems," says Homer-Dixon. "Sometimes the costs outweigh the benefits." Is there an alternative? Could we heed these warnings and start carefully climbing back down the complexity ladder? Tainter knows of only one civilisation that managed to decline but not fall. "After the Byzantine empire lost most of its territory to the Arabs, they simplified their entire society. Cities mostly disappeared, literacy and numeracy declined, their economy became less monetised, and they switched from professional army to peasant militia." Pulling off the same trick will be harder for our more advanced society. Nevertheless, Homer-Dixon thinks we should be taking action now. "First, we need to encourage distributed and decentralised production of vital goods like energy and food," he says. "Second, we need to remember that slack isn't always waste. A manufacturing company with a large inventory may lose some money on warehousing, but it can keep running even if its suppliers are temporarily out of action." The electricity industry in the US has already started identifying hubs in the grid with no redundancy available and is putting some back in, Homer-Dixon points out. Governments could encourage other sectors to follow suit. The trouble is that in a world of fierce competition, private companies will always increase efficiency unless governments subsidise inefficiency in the public interest. Homer-Dixon doubts we can stave off collapse completely. He points to what he calls "tectonic" stresses that will shove our rigid, tightly coupled system outside the range of conditions it is becoming ever more finely tuned to. These include population growth, the growing divide between the world's rich and poor, financial instability, weapons proliferation, disappearing forests and fisheries, and climate change. In imposing new complex solutions we will run into the problem of diminishing returns - just as we are running

out of cheap and plentiful energy. "This is the fundamental challenge humankind faces. We need to allow for the healthy breakdown in natural function in our societies in a way that doesn't produce catastrophic collapse, but instead leads to healthy renewal," Homer-Dixon says. This is what happens in forests, which are a patchy mix of old growth and newer areas created by disease or fire. If the ecosystem in one patch collapses, it is recolonised and renewed by younger forest elsewhere. We must allow partial breakdown here and there, followed by renewal, he says, rather than trying so hard to avert breakdown by increasing complexity that any resulting crisis is actually worse. Lester Brown thinks we are fast running out of time. "The world can no longer afford to waste a day. We need a Great Mobilisation, as we had in wartime," he says. "There has been tremendous progress in just the past few years. For the first time, I am starting to see how an alternative economy might emerge. But it's now a race between tipping points - which will come first, a switch to sustainable technology, or collapse?" Tainter is not convinced that even new technology will save civilisation in the long run. "I sometimes think of this as a 'faith-based' approach to the future," he says. Even a society reinvigorated by cheap new energy sources will eventually face the problem of diminishing returns once more. Innovation itself might be subject to diminishing returns, or perhaps absolute limits. Studies of the way by Luis Bettencourt of the Los Alamos National Laboratory, New Mexico, support this idea. His team's work suggests that an ever-faster rate of innovation is required to keep cities growing and prevent stagnation or collapse, and in the long run this cannot be sustainable.

AT: Tech

Tech's not sufficient to make global industrial civilization environmentally sustainable

Dr. Samuel **Alexander 14**, lecturer with the Office for Environmental Programs, University of Melbourne, and research fellow, Melbourne Sustainable Society Institute; and Jonathan Rutherford, Professor of Cultural Studies at the University of Middlesex, 2014, "The Deep Green Alternative: Debating Strategies of Transition," Simplicity Institute, http://simplicityinstitute.org/wp-content/uploads/2011/04/The-Deep-Green-Alternative.pdf

Evidence continues to mount that industrial civilisation, driven by a destructive and insatiable growth imperative, is chronically unsustainable, as well as being grossly unjust. The global economy is in ecological overshoot, currently consuming resources and emitting waste at rates the planet cannot possibly sustain (Global Footprint Network 2013). Peak oil is but the most prominent example of a more general situation of looming resource scarcity (Klare, 2012), with high oil prices having a debilitating effect on the oil-dependent economies which are seemingly dependent on cheap oil to maintain historic rates of growth (Heinberg, 2011). At the same time, great multitudes around the globe live lives of material destitution, representing a vast, marginalised segment of humanity that justifiably seeks to expand its economic capacities in some form (World Bank, 2008). Biodiversity continues to be devastated by deforestation and other forms of habitat destruction (United Nations, 2010), while the global development agenda seems to be aiming to provide an expanding global population with the high-impact material affluence enjoyed by the richest parts of the world (Hamilton, 2003). This is despite evidence crying out that the universalisation of affluence is environmentally unsupportable (Smith and Positano, 2010; Turner, 2012) and not even a reliable path to happiness (Lane, 2001; Alexander, 2012a). Most worrying of all, perhaps, is the increasingly robust body of climate science indicating the magnitude of the global predicament (IPCC, 2013). According to the Climate

Tracker Initiative (2013: 4), the world could exceed its 'carbon budget' in around 18 years, essentially locking us into a future that is at least 2 degrees warmer, and threatening us with 4 degrees or more. It is unclear to what extent civilisation as we know it is compatible with runaway climate change. And still, almost without exception, all nations on the planet - including or especially the richest ones - continue to seek GDP growth without limit, as if the cause of these problems could somehow provide the solution. If once it was hoped that technology and science were going to be able decouple economic activity from ecological impact, such a position is no longer credible (Huesemann and Huesemann, 2011). Technology simply cannot provide any escape from the fact that there are biophysical limits to growth. Despite decades of extraordinary technological advance, which it is was promised would lighten the ecological burden of our economies, global energy and resource consumption continues to grow, exacerbated by a growing population, but which is primarily a function of the growth-orientated values that lie at the heart of global capitalism (Turner, 2012).

Against this admittedly gloomy backdrop lies a heterogeneous tradition of critical theorists and activists promoting what could be called a 'deep green' alternative to the growth-orientated, industrial economy. Ranging from the radical simplicity of Henry Thoreau (1983), to the post-growth economics of the Club of Rome (Meadows et al, 1972; 2004), and developing into contemporary expressions of radical reformism (Latouche, 2009; Heinberg, 2011; Jackson, 2009), eco-socialism (Sarkar, 1999; Smith, 2010), and eco-anarchism (Bookchin, 1989; Holmgren, 2002; Trainer; 2010a), this extremely diverse tradition nevertheless agrees that the nature of the existing system is inherently unsustainable. Tinkering with or softening its margins - that is, any attempt to give capitalism a 'human face' - is not going to come close to addressing the problems we, the human species, are confronted with. What is needed, this tradition variously maintains, is a radically alternative way of living on the Earth - something 'wholly other' to the ways of industrialisation, consumerism, and limitless growth. However idealistic or Utopian their arguments might seem, the basic reasoning is that the nature of any solutions to current problems must honestly confront the magnitude of the overlapping crises, for else one risks serving the destructive forces one ostensibly opposes.

*1NC – Trade Bad

Trade regionalism coming now and solves war, the aff's push for global trade liberalization decks the transition

Brkic 13, Economics Prof at U of Sarajevo (Snježana, 3/25, Regional Trading Arrangements – Stumbling Blocks or Building Blocks in the Process of Global Trade Liberalization?, papers.ssrn.com/sol3/papers.cfm?abstract_id=2239275)

Besides those advocating the optimistic or pessimistic view on regionalism effect on global trade liberalization, some economists, such as Frankel and Wei, hold a neutral position, in a way. Frankel and Wei believe that forms and achievements of international economic integrations can vary and that, for this reason, regionalism can be – depending on circumstances – linked to greater or smaller global trade liberalization. In the years-long period of regional integration development, four periods have been identified during which the integration processes were becoming particularly intensive and which have therefore been named "waves of regionalism". The first wave was taking place during the capitalism development in the second half of the 19th century, in the course of British sovereign domination over the world market. Economic

integrations of the time primarily had the form of bilateral customs unions; however, owing to the comparative openness of international trading system based on the golden standard automatism, this period is called the "era of progressive bilateralism". The next two waves of regionalism occurred in the years following the world wars. Since the disintegration processes caused by the wars usually spawned economic nationalisms and autarchic tendencies, it is not surprising that post-war regionalisms were marked by discriminatory international economic integrations, primarily at the level of so-called negative integration, with expressedly "beggar-thy-neighbor" policies that resulted in considerable trade deviations. This particularly refers to the regionalism momentum after the First World War, which was additionally burdened by the consequences of Big Economic Crisis. The current wave of regionalism started in late 1980s and spread around the world to a far greater extent than any previous one did: it has covered almost all the continents and almost all the countries, even those which have mis to join all earlier regional initiatives, such as the USA, Canada, Japan and China. Integration processes, however, do not show any signs of flagging. Up till now, over 200 RTAs have been registered with GATT/WTO, more than 150 of them being still in force, and most of these valid arrangement have been made in the past ten years. Specific in many ways, this wave was dubbed "new regionalism". The most specific characteristics of new regionalism include: geographic spread of RTAs in terms of encompassing entire continents; greater speed; integration forms success; deepening of integration processes; and, the most important for this theoretical discussion, generally **non-negative impact on outsiders,** world economy as a whole, and the multilateral liberalization process. Some theorists (Gilpin) actually distinguish between the "benign" and "malign" regionalism. On the one hand, regionalism can advance the international economic stability, multilateral liberalization and world peace. On the other, it can have mercantilist features leading to economic well-being degradation and increasing international tensions and conflicts**. Analyses of trends within the contemporary integration processes show that they** mainly **have features of "benign" regionalism**. Reasons for this are numerous. Forces driving the contemporary regionalism development differ from those that used to drive earlier regionalism periods in the 20th century. The present regionalism emerged in the period characterized by the increasing economic inter-dependence between different world economy subjects, countries attempts to resolve trade disputes and multilateral framework of trade relations. As opposed to the 1930s episode, **contemporary regional initiatives represent attempts to make the members' participation in the world economy easier, rather than make them more distant** from it. As opposed to 1950s and 1960s episode, new initiatives are less frequently motivated exclusively by political interests, and are less frequently being used for mercantilist purposes. After the Second World War, more powerful countries kept using the economic integration as a means to strengthen their political influence on their weaker partners and outsiders. The examples include CMEA and European Community arrangements with its members' former colonies. As opposed to this practice, the new regionalism, mostly driven by common economic interests, yielded **less trade diversion** than previous one, **and has also contributed to the prevention of military conflicts of greater proportions**. Various analyses have shown that many regional integrations in earlier periods resulted in trade deviations, particularly those formed between less developed countries and between socialist countries. In recent years, however, the newly formed or revised regional integrations primarily seem to lead to **trade creation**. Contrary to the "beggar thy- neighbor" model of former international economic integrations, the integrations now offer certain advantages to outsiders as well, by stimulating growth and spurring the role of market forces. The analyses of contemporary trends in world economy also speak in favor of the "optimistic" proposition. The structural analysis shows that the world trade is growing and that this growth

results both from the increase in intra-regional and from the increase in extra-regional trade value (Anderson i Snape 1994.)28. Actually, the intraregional trade has been growing faster, both by total value and by its share in world GDP. The extra-regional trade share in GDP was increasing in some regions – in North America, Asia-Pacific and Asian developing countries. However, the question arises as to whether the extra-regional trade would be greater without regional integrations or not? The answer would primarily depend both on the estimate of degree of some countries' trade policy restrictedness in such circumstances, and on factors such as geographic distance, transport communications, political relations among states. One should also take into account certain contemporary integration features – the primarily economic, rather than strategic motivation, and continuous expansion, which mostly includes countries that are significant economic partners. With respect to NAFTA, many believe that the negative effects on outsiders will be negligible, since the USA and Canada have actually been highly integrated economies for a long time already, while the Mexican economy is relatively small. The same view was pointed out by the EU, with respect to its expansion. It particularly refers to the inclusion of the remaining EFTA countries, because this will actually only complete, in institutional terms, the EU strong economic ties with these countries. Most EFTA countries have been part of the European economic area (EEA), i.e. the original EC-EFTA agreement, for a few years already, and conduct some 70% of their total international exchange with the Union countries. EU countries are also the most significant foreign-trade partners of Central and East Europe countries, and the recent joining the Union of several of them is not expected to cause a significant trade diversion. Besides, according to some earlier studies, during the previous wave of regionalism, in the 1967-70 period, the creation of trade in EEC was far greater than trade diversion: trade creation ranged from 13 to 23% of total imports, while trade diversion ranged from 1 to 6%. In Latin America, the new regionalism resulted in the faster growth of intra-regional trade, while the extra-regional exports and imports also continued to grow. Since early 1990s, the value of intra-regional imports registered the average annual growth of 18%. In the same time, the extra-regional exports were also growing, although at a lower rate of 9% average a year; its share in the total Latin America exports at the end of decade amounted to 18% as compared to 12% in 1990. In the 1990-1996 period, the intraregional imports grew by some 18% a year. The extra-regional imports were also growing very fast, reaching the 14% rate. These data reflect a great unbalance in the trade with extra-regional markets, since the imports from countries outside the region grew much faster the exports.30 Since the described trends point to the continued growth of extra-regional imports and exports, they also show that regional integration in Latin America has had the open regionalism character. Besides, the pending establishment of FTAA – Free Trade Area of Americas will gather, in the same group, the so-called "natural" trade partners – countries that have had an extremely extensive mutual exchange for years already, and the outsiders are therefore unlikely to be affected by strengthening of regionalism in this part of the world. **Contemporary research shows that intra-regional trade is growing**, however, same as interdependence between North America and East Asia and between the EU and East Asia. It can also be seen that the biggest and the most powerful countries, i.e. blocs, are extremely dependent on the rest of the world in terms of trade. For the EU, besides the intra-European trade, which is ranked first, foreign trade has the vital importance since it accounts for 10% of European GDP. In early 1990s, EU exchanged 40% of its foreign trade with non-members, 16% out of which with North America and East Asia together. EU therefore must keep in mind the rest of the world as well. The growing EU interest in outsiders is confirmed by establishing "The Euro-Med Partnership", which proclaimed a new form of cooperation between the EU and the countries at its South periphery32. Besides, the past few years witnessed a series of inter-regional agreements between the EU on the one hand, and

certain groups from other regions on the other (MERCOSUR, CARICOM, ASEAN and GCC). In case of North America the ratio between intra-regional and inter-regional trade is 40:60, and in East Asia, it is 45:55. **Any attempt to move towards significantly closed blocs ("fortresses") would require overcoming the significant inter-dependence between major trading blocs**. Besides the analysis of contemporary trends in extra- and intra-regional trade, other research was conducted that was supposed to point to the reasons why the **new regionalism has** mainly **a non-negative impact on outsiders and global liberalization**. The distinctive features of new regionalism were also affected to characteristics of international economic and political environment it sprouted in. In the 1980s, economic nationalisms were not so expressed as in the interventionism years following the Second World War; however, the neo-liberalism represented by GATT activities did not find the "fertile ground" in all parts of the world. Regionalism growth in the circumstances of multilateral system existence is, among other things, **the consequence of distrust in multilateralism**. „The revival of the forces of regionalism stemmed from frustration with the slow pace of multilateral trade liberalization... If the world trade regime could not be moved ahead, then perhaps it was time for deeper liberalization within more limited groups of like-minded nations... Such efforts would at least liberalize some trade... and might even prod the other nations to go along with multilateral liberalization."33 Kennedy's round and Tokyo round of trade negotiations under GATT auspices brought a certain progress in the global trade liberalization. However, the 1980s witnessed significant changes in the world economy that the GATT trade system was not up to. Besides. GATT had not yet managed to cover the entire trade in goods, since there were still exceptions in the trade in agricultural and textile products that particularly affected the USA and developing countries. GATT system of conflict resolutions, and its organizational and administrative mechanism in general also required revision. In this vacuum that was created in promoting trade and investment multilateralism from the point when **GATT inadequacy** became obvious until the start of the Uruguay round and the establishment of World Trade Organization, the wave of regionalism started spreading across the world again. Prodded by the Single European Act and the success of European integration, many countries turned to an alternative solution – establishment of new or expansion and deepening of the existing economic integrations. Even the USA, the multilateralism bastion until then, made a radical turn in their foreign-trade policy and started working on designing a North American integration.

2NC – Multilat Trade is Worse/RTAs Solve War

That outweighs—multilateral trade causes wars with a larger impact

Thoma- Economics Prof, U of Oregon- **'7** Mark, Trade Liberalization and War, July, http://economistsview.typepad.com/economistsview/2007/07/trade-liberaliz.html

Globalisation is by construction an increase in both bilateral and multilateral trade flows. What then was the net effect of increased trade since 1970? We find that it generated an increase in the probability of a bilateral conflict by around 20% for those countries separated by less than 1000kms, the group of countries for which the risk of disputes that can escalate militarily is the highest. The effects are much smaller for countries which are more distant. Contrary to what these results (aggravated by our nationality) may suggest, we are not anti-globalisation activists even though we are aware that some implications of our work could be (mis)used in such a way. The result that bilateral trade is pacifying brings several more optimistic implications on globalisation. First, if we think of a world war as a war between two large groups or coalitions of countries, then globalisation makes such a war less likely because it increases the opportunity cost of such a conflict. Obviously, this conclusion cannot be tested but is a logical implication of our results. From this point of view, our work suggests that globalisation may be at the origin of a change in the nature of conflicts, less global and more local. Second, our results do confirm that increased trade flows created by regional trade agreements (such as the EU) are indeed

pacifying as intended. Given that most military conflicts are local, because they find their origins in border or ethnic disputes, this is not a small achievement. These beneficial political aspects of regional trade agreements are not usually considered by economists who often focus on the economic distortions brought by their discriminatory nature. Given the huge human and economic costs of wars, this political effect of regional trade agreements should not be discounted. This opens interesting questions on how far these regional trade agreements should extend – a topical issue in the case of the EU. The entry of Turkey in the EU would indeed pacify its relations with EU countries (especially Greece and Cyprus), but also increase the probability of a conflict between Turkey and its non-EU neighbours. However, our simulations suggest that in this case, the first effect dominates the second by a large margin. More generally, our results should be interpreted as a word of caution on some political aspects of globalisation. As it proceeds and weakens the economic ties of proximate countries, those with the highest risk of disputes that can escalate into military conflicts, local conflicts may become more prevalent. Even if they may not appear optimal on purely economic grounds, regional and bilateral trade agreements, by strengthening local economic ties, may therefore be a necessary political counterbalance to economic globalisation.

2NC – RTAs Solve Trade/Multilat Impacts

RTAs best solve their impacts

Powell & Low 11 (Stephen Powell --- Professor of International Trade Law @ Florida Law and former chief counsel for Department of Commerce, Trisha Low --- JD from Levin College and Associate Legal Counsel @ Deutsche Bank, "Is the WTO Quietly Fading Away?: The New Regionalism and Global Trade Rules" 2011, 9 Geo. J.L. & Pub. Pol'y 261)

D. RTAs Increase Liberalization

RTAs provide flexibility in terms of their design and content.58 Countries often have a number of non-economic considerations in approaching RTAs such as national security and regional stability.59 RTAs in Latin America and the Caribbean have occurred for various reasons including economic complementarity, geographical proximity, and political affinity.60 They can address issues on a regional level that multilateral agreements cannot, such as migration, energy, transit, water, customs, labor, and standards.61 The specific problems related to each issue differ based upon the country and region. Therefore, it is not feasible for multilateral agreements to encompass each of these issues in a way that is favorable to all countries involved. It would make multilateral agreements far too complicated and cumbersome. RTAs provide a framework for making progress on these issues.62 In addition, many governments are more familiar with the governments of neighboring countries and RTAs provide a forum for promoting liberalization in a manner that is **consistent with their national interests**.63 For example, MERCOSUR was established to decrease tensions between Brazil and Argentina.64 "It also helped avert a coup in Paraguay following reaffirmation by the presidents of the MERCOSUR member countries that democracy was a condition for membership."65 While MERCOSUR was established to become a customs union, it also provides member countries a platform to discuss other issues such as security and drug trafficking.66 Trade liberalization increases competition in domestic markets.67 For some countries it is not politically feasible to open its internal market to trade from all countries.68 Therefore, RTAs provide a stepping stone toward liberalization.69 RTAs condition states for liberalization, while making states more amenable to true multilateral trade.70 RTAs may also encourage countries to liberalize by presenting a non-member country with a "carrot" if it liberalizes.71 Under the "carrot" approach, RTAs can merge and expand to **encompass more economies as a bridge to global trade**.72 RTAs can increase liberalization through new trade

rules in the area of market regulations and investment rules.73 By eliminating internal barriers and creating larger internal markets, **these new trade rules** can raise the return on investments and create an incentive for members and third countries to invest.74 Firms investing in the RTA countries can achieve economies of scale by serving a larger market of potential buyers, decrease their transaction costs, and if services are included, can benefit from more efficient telecommunications, financial, and other services.75 New trade rules may also induce greater efficiency in transactions with the global economy. Investments to reach the local market may include utilizing lower cost production sites within the RTA to serve the wealthier customers.76 For example, one study done in 2004 showed that firms in the businesses of electronics, textiles, and autos moved their production to Mexico to serve the U.S. market.77 Some scholars argue that removal by RTAs of trade barriers among partners can create economies of scope at the individual firm level and economies of scale at the industry level.78 Economies of scope and economies of scale allow for the increased rationalization of production, leading to the efficient use of resources and resulting in a greater volume of global trade.79 This benefits members and non-members, and the benefits which spill over to outsiders may **outweigh the costs of the original trade diversion**.80 Larger markets can increase competition between suppliers and take advantage of differing regional factor prices in order to increase productivity and **cause more rapid growth**.81 Increased competition forces firms to develop more efficient methods of production and can decrease the cost of the product. Firms have an incentive to create goods that are cheaper and more improved than similar goods from similar firms, thereby benefitting the global welfare. This rapid growth attracts intra-bloc and extra-bloc investments.82

Solves trade faster and more efficiently

Leal-Arcas 11 (Rafael, PhD – European University Institute, JSM – Stanford Law, LLM – Columbia Law, M. Phil – London School of Economics, BA/JD – Granada University, Senior Lecturer in International Economic Law & European Union Law and Deputy Director of Graduate Studies @ Queen Mary University of London, "Proliferation of Regional Trade Agreements: Complementing or Supplanting Multilateralism?" Winter 2011, 11 Chi. J. Int'l L. 597)

The development of new technologies has also contributed toward shaping international trade by changing the way business is conducted and the way people interact. The rapid development of technology has generated both new challenges and new opportunities for economic agents worldwide. WTO Director-General Pascal Lamy recently said that "it now costs less to ship a container from Marseille to Shanghai--half way around the world--than to move it from Marseille to Avignon--100 kilometers away. A phone call to Los Angeles [from Europe] is as inexpensive as a phone call next door." n77 What are [*621] then the main economic, political, and technological factors shaping world trade? What is the potential of technological progress and innovation for improving the trading position of the poorest countries? What is the role of the WTO rules-based multilateral system in contributing to the global economic recovery? Might these be reasons why countries engage in RTAs so frequently? n78 There are both economic and political reasons why countries engage in RTAs so frequently. One of the economic reasons for the conclusion of RTAs is that countries are in constant search for larger markets since they feel the pressure of competitive regional liberalization. The negotiations of EPAs n79 between the African, Caribbean and Pacific (ACP) n80 countries and the EU are of particular relevance in this process, not least because of their importance for LDCs. EPAs have been negotiated with ACP regions engaged in a regional economic integration process. EPAs are thus intended to consolidate regional integration initiatives within the ACP. They are also aimed at providing an open, transparent, and predictable framework for goods and services to circulate freely, thus increasing the competitiveness of the ACP and ultimately facilitating the transition toward their full participation in a liberalizing world economy--thereby complementing any initiative taken in the multilateral context. n81 Formal negotiations started in September 2002 and EPAs entered into force on January 1, 2008. Moreover, deeper integration is always much easier at the regional level than it is at the multilateral level. Furthermore, as we know from previous [*622] experience, multilateral negotiations can take a very long time and are very complex, whereas RTAs move much faster. n82 Despite repeated statements of support and of engagement, **WTO Members seem incapable**

of marshalling the policies and political will needed to move the multilateral trade agenda forward. A worrying leadership vacuum has opened that has so far proven difficult to fill. A very good example is the Doha Round of multilateral trade negotiations, which started in November 2001 in the Qatari capital. A WTO mini-ministerial conference took place in July 2008 composed of a trade G-7. n83 Governments' attempts to salvage a deal in the Doha Round of multilateral trade negotiations broke down on 29 July 2008, as trade ministers acknowledged that they were unable to reach a compromise after nine days of a WTO mini-ministerial summit. This raises the question of how to move forward in this complex international trade negotiations scenario. n84 Given how difficult it is to move forward multilaterally, there has been in recent years a proliferation of RTAs. Trade powers want to gain greater access to one another's markets but, at the same time, have struggled to lower their own trade barriers. n85 At the G8 Summit in Muskoka in June 2010, world leaders dropped a commitment to complete the troubled Doha Round in 2010 and vowed to push forward on bilateral and regional trade talks until a multilateral deal could be finalized. n86 This decision demonstrates that bilateralism/**regionalism is the natural consequence of failed or troubled multilateralism**. n87 This decision to [*623] move forward bilaterally/regionally certainly has dangerous repercussions for weak economies. n88 Assuming that the Doha Round will be concluded in 2011, it will then take another four years to ratify the multilateral agreements that will come out of the Round, which means that it will have taken at least fourteen years for these new multilateral agreements to see the light of day. There are several political reasons for countries to engage in RTAs: they ensure or reward political support; regulatory cooperation is easier regionally than it is multilaterally; there is less scope for free riding on the MFN principle; and there are always geopolitical as well as security interests for the conclusion of RTAs. Thus, while most countries continue to formally declare their commitment to the successful conclusion of the Doha Round--which would contribute toward enhancing market access and strengthening the rules-based multilateral trading system--for many countries, bilateral deals have taken precedence and their engagement at the multilateral level is becoming little more than just **a theoretical proposition**. The emergence of rapidly growing economies and new forms of South-South relations, as illustrated by the case of China in Africa, further complicates the equation and renders the need for empirical research, information, and dialogues in this area even more acute. VI. EFFECTS OF REGIONALISM ON MULTILATERALISM The effects of RTAs on the multilateral trading system remain unclear, as is their impact on trade and sustainable development. While preferential deals can contribute to strengthening regional integration, n89 some RTAs have generated negative effects on regional integration schemes, as was the case of the Andean [*624] Community-US RTA n90 and certain EPAs signed with individual countries and not with the region as a whole. The effects of RTAs on the multilateral trading system are manifold. One of the positive effects is that RTAs allow for **greater efficiency gains** thanks to the elimination of barriers to trade, which is key to achieving economies of scale. n91 RTAs are also laboratories for change (a very good example being that of the EU, whose transformation since its inception in the 1950s has been absolutely remarkable n92). In addition, RTAs provide competition and attract foreign direct investment (FDI). An example of this last point is Spain in the case of the EU, or Mexico in the case of the North American Free Trade Agreement (NAFTA). n93 In both cases, Spain and Mexico benefited very much from FDI thanks to the EU and NAFTA, respectively.

It's a sufficient substitute

Trakan 8 (Leon, LL.M., S.J.D. (Harvard); Professor of Law and Immediate Past Dean, Faculty of Law, University of New South Wales, "THE PROLIFERATION OF FREE TRADE AGREEMENTS: BANE OR BEAUTY?" UNSW Law Research Paper No. 2007-54, Journal of World Trade, Vol. 42, 2008) ***Footnote 3 Added

The proliferation of bilateral trade agreements has helped to **fill a gap** in a multilateral trade process that is impeded by the impasse of negotiations in the World Trade Organization [WTO].1 At the same time, the development of bilateral trade agreements arguably has discouraged some states from engaging in multilateral negotiations.2 The result is a new genre of trade relations in which bilateral and regional mechanisms are increasingly adopted in substitution for multilateral trade processes.3 3 This sidelining of WTO dispute resolution will include the tendency to direct a greater volume of trade disputes to state courts and regional tribunals. On dispute resolution

under the WTO, see Yang Guohua, Bryan Mercurio & Li Yongjie, WTO Dispute Settlement Understanding: A Detailed Interpretation (London, Kluwer Law International, 2005); Petros C. Mavroidis & N. David Palmeter, Dispute Settlement in the World Trade Organization: Practice and Procedure (Cambridge, U.K.: Cambridge Un. Press, 2004); Ernst-Ulrich Petersmann, The GATT/WTO Dispute Settlement System: International Law, International Organizations and Dispute Settlement (London, the Hague, Boston: Kluwer Law International, 1997). On regional trade agreements, see e.g. James H Mathis, Regional Trade Agreements in the GATT/WTO: Article XXIV and the International Trade Requirement (The Hague: T.M.C. Asser Press, 2002). While, bilateral trade agreements diverge significantly in their form and substance, they are having an important, albeit disparate impact upon multilateral trade.4

Case

1NC Squo Solves Perception

Obama's plan solves public trust even if it doesn't stop spying

SBS 14 (The Special Broadcasting Service is a hybrid-funded Australian public broadcasting radio and television network "Obama moves to end NSA data collection")

James Lewis, a senior fellow who follows national security at the Center for Strategic and International Studies, said the Obama proposal appeared to be "a cosmetic change" to NSA authority. "This **will pacify domestic critics**, but we don't know how it will play overseas," Lewis told AFP. "If it's done right, there will be no impact on national security." Joseph Wippl, director of graduate studies at Boston University's Department of International Relations and a 30-year CIA operations officer, said the measure could allay public fears about NSA surveillance, but added: "There is nothing here which protects foreign nationals, which is the way it has always been."

1NC AT Democracy Adv

Democracy in America is doomed

Diamond 14 (Jared, Prof. of Geography and Environmental Health Sciences @ UCLA, Feb 19, 2014, "Four threats to American democracy" http://newsroom.ucla.edu/stories/four-threats-to-american-democracy-250120)

First, political compromise has been deteriorating in recent decades, and especially in the last five years. That deterioration can be measured as the increase in Senate rejections of presidential nominees whose approvals used to be routine, the increasing use of filibusters by the minority party, the majority party's response of abolishing filibusters for certain types of votes, and the decline in number of laws passed by Congress to the lowest level of recent history. The reasons for this breakdown in political compromise, which seems to parallel increasing levels of nastiness in other areas of American life, remain debated. Explanations offered include the growth of television and then of the Internet, replacing face-to-face communication, and the growth of many narrowly partisan TV channels at the expense of a few broad-public channels. Even if these reasons hold a germ of truth, they leave open the question why these same trends operating in Canada and in Europe have not led to similar deterioration of political compromise in those countries as well. Second, there are increasing restrictions on the right to vote, weighing disproportionately on voters for one party and implemented at the state level by the other party. Those obstacles include making registration to vote difficult and demanding that registered voters show documentation of citizenship when they present themselves at the polls. Of course, the United States has had a long history of denying voting rights to blacks, women and other groups. But access to voting had been increasing in the last 50 years, so the recent proliferation of restrictions reverses that long positive trend. In addition to those obstacles preventing voter registration, the United States has by far the lowest election turnout among large First World democracies: under 60 percent of registered voters in most presidential elections, 40 percent for congressional elections, and 20 percent for the recent election for mayor of my city of Los Angeles. (A source of numbers for this and other comparisons that I shall cite is an excellent recent book by Howard Steven Friedman, The Measure of a Nation). And, while we are talking about elections, let's not forget the astronomical recent increase in costs and durations of election campaigns, their funding by wealthy interests, and the shift in campaign pitches to sound bites. Those trends, unparalled in other large First World democracies, undermine the democratic prerequisite of a well-informed electorate. A third contributor to the growing breakdown of democracy is our growing gap between rich and poor. Among our most cherished core values is our belief that the United States is a "land of opportunity" and that we uniquely offer to our citizens the potential for rising from "rags to riches" provided that citizens have the necessary ability and work hard. This is a myth. Income and wealth disparity in the United States (as measured by the Gini index of equality/inequality, and in other ways) is much higher in the United States than in any other large First World democracy. So is hereditary socioeconomic immobility, that is, the probability that a son's relative income will just mirror his father's relative income, and that sons of poor fathers will not become wealthy. Part of the reason for those depressing facts is inequality of educational opportunities. Children of rich Americans tend to receive much better educations than children of poor Americans. That is bad for our economy, because it means that we are failing to develop a large fraction of our intellectual capital. It is also bad for our political stability, because poor parents who correctly perceive that their children are not being given the opportunity to succeed may express their resulting frustration in violence. Twice during my 47 years of residence in Los Angeles, in 1964 and 1993, frustration in poor areas of Los Angeles erupted into violence, lootings, and killings. In the 1993 riots, when police feared that rioters would spill into the wealthy suburb of Beverly Hills, all that the outnumbered police could do to protect Beverly Hills was to string yellow plastic police tape across major streets. As it turned out, the rioters did not try to invade Beverly Hills in 1993. But if present trends causing frustration continue, there will be more riots in Los Angeles and other American cities, and yellow plastic police tape will not suffice to contain the rioters. The remaining contributor to the decline of American democracy is the decline of government investment in public purposes, such as education, infrastructure, and nonmilitary research and development. Large segments of the American populace deride government investment as "socialism." But it is not socialism. On the contrary, it is one of the longest established functions of government. Ever since the rise of the first governments 5,400 years ago, governments have served two main functions: to maintain internal peace by monopolizing force, settling disputes, and forbidding citizens to resort to violence in order to settle disputes themselves; and to redistribute individual wealth

for investing in larger aims — in the worst cases, enriching the elite; in the best cases, promoting the good of society as a whole. Of course, some investment is private, by wealthy individuals and companies expecting to profit from their investments. But many potential payoffs cannot attract private investment, either because the payoff is so far off in the future (such as the payoff from universal primary school education), or because the payoff is diffused over all of society rather than concentrated in areas profitable to the private investor (such as diffused benefits of municipal fire departments, roads, and broad education). Even the most passionate American supporters of small government do not decry as socialism the funding of fire departments, interstate highways, and public schools.

Seriously, we live in an oligarchy and policy debates like this are useless for creating political change.

Gilens & Kapur '14 (Martin, Prof. of Politics @ Princeton U., and Sahil, TPM staff writer, "Scholar Behind Viral 'Oligarchy' Study Tells You What It Means" http://talkingpointsmemo.com/dc/princeton-scholar-demise-of-democracy-america-tpm-interview)

Let's talk about the study. If you had 30 seconds to sum up the main conclusion of your study for the average person, how would you do so?

I'd say that contrary to what decades of political science research might lead you to believe, ordinary citizens have virtually no influence over what their government does in the United States. And economic elites and interest groups, especially those representing business, have a substantial degree of influence. Government policy-making over the last few decades reflects the preferences of those groups -- of economic elites and of organized interests.

You say the United States is more like a system of "Economic Elite Domination" and "Biased Pluralism" as opposed to a majoritarian democracy. What do those terms mean? Is that not just a scholarly way of saying it's closer to oligarchy than democracy if not literally an oligarchy?

People mean different things by the term oligarchy. One reason why I shy away from it is it brings to mind this image of a very small number of very wealthy people who are pulling strings behind the scenes to determine what government does. And I think it's more complicated than that. It's not only Sheldon Adelson or the Koch brothers or Bill Gates or George Soros who are shaping government policy-making. So that's my concern with what at least many people would understand oligarchy to mean. What "Economic Elite Domination" and "Biased Pluralism" mean is that rather than average citizens of moderate means having an important role in determining policy, ability to shape outcomes is restricted to people at the top of the income distribution and to organized groups that represent primarily -- although not exclusively -- business.

Would you say the government is most responsive to income earners at the top 10 percent, the top 1 percent or the top 0.1 percent?

This is a great question and it's not one we can answer with the data that we used in the study. Because we really don't have good info about what the top 1 percent or 10 percent want or what issues they're engaged with. As you can imagine, this is not really a group that's eager to talk with researchers.

How exactly do you measure the preferences of average citizens in an academic way? Polls show that many American voters feel on a gut level that the government isn't looking out for them. But what kind of data do you use to test this theory and how confident are you in the conclusions?

What we did was to collect survey questions that asked whether respondents would favor or oppose some particular change in federal government policy. These were questions asked across the decades from 1981 to 2002. And so from each of those questions we know what citizens of average income level prefer and we know what people at the top of the income distribution say they want. For each of the 2,000 possible policy changes we determined whether in fact they've

been adopted or not. I had a large number of research assistants who spent years putting that data together.

There are criticisms of your study within the academic community. Some say public opinion surveys are a poor measure because people don't understand policy or that their stated preferences are self-contradictory. Tyler Cowen says citizens vote retrospectively so it's better to judge on outputs rather than whether voters get their preferred inputs. How do you respond?

These are all good questions. They're questions I address in some length in my book, "Affluence and Influence." There is some truth to some of these perspectives. But in a nutshell I think citizens overall have fairly sensible policy preferences which appear not to change much if citizens have an opportunity to learn more and debate the policy and view pros and cons.

Talk about some examples of policy preferences that the majority holds that the government is not responsive to.

Financial reform -- the deregulatory agenda has been pursued, somewhat more fervently among Republicans but certainly by Democrats as well in recent decades. Higher minimum wage. More support for the unemployed. More support for education spending. We'd see, perhaps ironically, less liberal policies in some domains like religious or moral issues. Affluent people tend to be more socially liberal on things like abortion or gay rights.

Which party, Democrat or Republican, caters to the interests of the rich more? Does your research find them to be equal or is one more responsive than the other?

We didn't look at that in this paper. Other work I've done suggest it depends. There are a set of economic issues on which the Democratic party is more consistently supportive of the needs of the poor and middle class. But it's by no means a strong relationship. Both parties have to a large degree embraced a set of policies that reflect the needs, preferences and interests of the well to do.

Relatedly, does divided government like we have now make politicians more or less likely to cater to the affluent than one-party control?

It does seem, absolutely, that divided government has the effect of reducing the amount of policy that gets adopted, restricting the policies that get adopted that are more broadly popular.

When did things start to become this way?

It's possible that in earlier eras, that we don't have data for, that things were better. But in the time period that we do have data for, there's certainly no such evidence. Over time responsiveness to elites has grown.

It seems to me the paradox here is that sometimes non-rich people favor an agenda that supports the rich. For instance, middle class tea partiers want low taxes on the highest earners, just as Steve Forbes does. Isn't that still democracy at work, albeit in an arguably perverse way?

Yes, absolutely. I think people are entitled to preferences that conflict with their immediate interests -- narrowly conceived interests. That may be an example of that. Opposition to the estate tax among low-income individuals is another. But what we see in this study is that's not what this is happening. We don't look at whether preferences expressed by these different groups are consistent or inconsistent with their interests, narrowly conceived. We just look at whether they're

responded to by government policy-makers, and we find that in the case of ordinary Americans, they're not.

How does a system like this perpetuate itself when after all it's ordinary voters who cast their ballots and elect their leaders. Theoretically they can change it in a heartbeat. Why don't they?

That's a very good question. I don't have a complete answer for you. Part of it clearly is that while politicians need votes while in office, they need money to obtain and retain office. So they need to balance the activities that will benefit them in terms of money with the activities that'll benefit them in terms of votes. Voters are not particularly effective at holding politicians accountable for the policies they adopt. Voters also have a limited choice set when going into an election. We find that policies adopted during presidential election years in particular are more consistent with public preferences than policies adopted in other years of the electoral cycle.

What are the three or four most crucial factors that have made the United States this way?

Very good question. I'd say two crucial factors. One central factor is the role of money in our political system, and the overwhelming role that affluent individuals that affluent individuals and organized interests play, in campaign finance and in lobbying. And the second thing is the lack of mass organizations that represent and facilitate the voice of ordinary citizens. Part of that would be the decline of unions in the country which has been quite dramatic over the last 30 or 40 years. And part of it is the lack of a socialist or a worker's party.

1NC AT Democracy Adv- Alt Cause

You don’t do any of the important things for global democracy either

Diamond ‘15 (Larry, founding coeditor of the Journal of Democracy, senior fellow at the Hoover Institution and the Freeman Spogli Institute for International Studies at Stanford University, and director of Stan- ford’s Center on Democracy, Development, and the Rule of Law, “Facing Up to the Democratic Recession” Journal of Democracy, 26.1, p. 154)

The key imperative in the near term is to work to reform and consolidate the democracies that have emerged during the third wave—the majority of which remain illiberal and unstable, if they remain democratic at all. With more focused, committed, and resourceful international engagement, it should be possible to help democracy sink deeper and more enduring roots in countries such as Indonesia, the Philippines, South Africa, and Ghana. It is possible and urgently important to help stabilize the new democracies in Ukraine and Tunisia (whose success could gradually generate significant diffusion effects throughout the Arab world). It might be possible to nudge Thailand and Bangladesh back toward electoral democracy, though ways must be found to temper the awful levels of party polarization in each country. With time, the electoral authoritarian project in Turkey will discredit itself in the face of mounting corruption and abuse of power, which are already growing quite serious. And the oil-based autocracies in Iran and Venezuela will face increasingly severe crises of economic performance and political legitimacy.

1NC AT Democracy- No Model

It’s not because of America – Russian/Chinese authoritarian promo is a bigger internal link to the global democracy recession

Diamond ‘15 (Larry, founding coeditor of the Journal of Democracy, senior fellow at the Hoover Institution and the Freeman Spogli Institute for International Studies at Stanford

University, and director of Stan- ford's Center on Democracy, Development, and the Rule of Law, "Facing Up to the Democratic Recession" Journal of Democracy, 26.1, pp. 151-152)

An important part of the story of global democratic recession has been the deepening of authoritarianism. This has taken a number of forms. In Russia, space for political opposition, principled dissent, and civil society activity outside the control of the ruling authorities has been shrinking.13 In China, human-rights defenders and civil society activists have faced increasing harassment and victimization.

The (mainly) postcommunist autocracies of the Shanghai Cooperation Organization, centered on the axis of cynical cooperation between Russia and China, have become much more coordinated and assertive. Both countries have both been aggressively flexing their muscles in dealing with their neighbors on territorial questions. And increasingly they are pushing back against democratic norms by also using instruments of soft power—international media (such as RT, Russia's slick 24/7 global television "news" channel), China's Confucius Institutes, lavish conferences, and exchange programs—to try to discredit Western democracies and democracy in general, while promoting their own models and norms.14 This is part of a broader trend of renewed authoritarian skill and energy in using state-run media (both traditional and digital) to air an eclectic mix of proregime narratives, demonized images of dissenters, and illiberal, nationalist, and anti-American diatribes.15

African autocrats have increasingly used China's booming aid and investment (and the new regional war on Islamist terrorism) as a counterweight to Western pressure for democracy and good governance. And they have been only too happy to point to China's formula of rapid state-led development without democracy to justify their own deepening authoritarianism. In Venezuela, the vise of authoritarian populism has tightened and the government's toleration (or even organization) of criminal violence to demobilize middle-class opposition has risen. The "Arab Spring" has imploded in almost every country that it touched save Tunisia, leaving in most cases even more repressive states or, as in the case of Libya, hardly a state at all.

The resurgence of authoritarianism over the past eight years has been quickened by the diffusion of common tools and approaches. Prominent among these have been laws to criminalize international flows of financial and technical assistance from democracies to democratic parties, movements, media, election monitors, and civil society organizations in authoritarian regimes, as well as broader restrictions on the ability of NGOs to form and operate and the creation of pseudo-NGOs to do the bidding (domestically and internationally) of auto- crats.16 One recent study of 98 countries outside the West found that 51 of them either prohibit or restrict foreign funding of civil society, with a clear global trend toward tightening control; as a result, international democracy-assistance flows are dropping precipitously where they are needed most.17 In addition, authoritarian (and even some democratic) states are becoming more resourceful, sophisticated, and unapologetic in suppressing Internet freedom and using cyberspace to frustrate, subvert, and control civil society.18

1NC AT IFreedom- Alt Causes/Solvency

Reversing surveillance doesn't solve ifreedom

Fontaine 14 Richard Fontaine is the President of the Center for a New American Security (CNAS). He served as a Senior Advisor and Senior Fellow at CNAS from 2009-2012 and previously as foreign policy advisor to Senator John McCain for more than five years. He has also worked at the State Department, the National Security Council and on the staff of the Senate Foreign Relations Committee. http://www.cnas.org/sites/default/files/publications-pdf/CNAS_BringingLibertyOnline_Fontaine.pdf

Such moves are destined to have only a modest effect on foreign reactions. U**.S. surveillance will inevitably continue** under any reasonably likely scenario (indeed, despite the expressions of outrage, not a single country has said that it would cease its surveillance activities). Many of the demands – such as for greater transparency – will not be met, simply due to the clandestine nature of electronic espionage. Any limits on surveillance that a govern - ment might announce will not be publicly verifiable and thus perhaps not fully credible. Nor will there be an international "no-spying" convention to reassure foreign citizens that their communications are unmonitored. As it has for centuries, state- sponsored espionage activities are likely to remain accepted international practice, unconstrained by international law. The one major possible shift in policy following the Snowden affair – a stop to the bulk collection of telecommunications metadata in the United States – will not constrain the activ - ity most disturbing to foreigners; that is, America's surveillance of them. At the same time, U.S. offi - cials are highly unlikely to articulate a global "right o privacy" (as have the U.N. High Commissioner for Human Rights and some foreign officials), akin to that derived from the U.S. Constitution's fourth amendment, that would permit foreigners to sue in U.S. courts to enforce such a right. 39 The Obama administration's January 2014 presidential directive on signals intelligence refers, notably, to the " legiti - mate privacy interests" of all persons, regardless of nationality, and not to a privacy "right.

US surveillance tech industry destroys i-freedom signal

MacKinnon 4/3/12

http://www.foreignpolicy.com/articles/2012/04/03/The_Worlds_No_1_Threat_to_Internet_Freedom Rebecca MacKinnon is a blogger and co-founder of Global Voices Online. She is notable as a former CNN journalist who headed the CNN bureaus in Beijing and later in Tokyo. She is on the Board of Directors of the Global Network Initiative[1] and the Committee to Protect Journalists,[2] and is currently director of the Ranking Digital Rights project at the New America Foundation's Open Technology Institute.

Internet Freedom Starts at Home The United States needs to practice what it preaches online. Implied though not explicit in Obama's remarks was the idea that if Iran's Internet were freer and more open, Iran's relationship with the world generally -- and the United States in particular -- would be different. Cases like Iran are the main driver of Washington's bipartisan consensus around the idea that a free and open global Internet is in the United States' strategic interest. Yet more than two years after Secretary of State Hillary Clinton gave her first speech declaring "Internet freedom" to be a major component of U.S. foreign policy, it turns out that many of the most sophisticated tools used to suppress online free speech and dissent around the world are

actually Made in the USA. American corporations are major suppliers of software and hardware used by all sorts of governments to carry out censorship and surveillance -- and not just dictatorships. Inconveniently, governments around the democratic world are pushing to expand their own censorship and surveillance powers as they struggle to address genuine problems related to cybercrime, cyberwar, child protection, and intellectual property. Even more inconveniently, the U.S. government is the biggest and most powerful customer of American-made surveillance technology, shaping the development of those technologies as well as the business practices and norms for public-private collaboration around them. As long as the U.S. government continues to support the development of a surveillance-technology industry that clearly lacks concern for the human rights and civil liberties implications of its business -- even rewarding secretive and publicly unaccountable behavior by these companies -- the world's dictators will remain well supplied by a robust global industry. American-made technology has turned up around the Middle East and North Africa over the past year -- from Syria to Bahrain to Saudi Arabia, from pre-revolutionary Tunisia to Egypt -- in contexts that leave no doubt that the software and hardware in question were being used to censor dissenting speech and track activists. While much of this technology is considered "dual use" because it can be used to defend computer networks against cyberattack as well as to censor and monitor political speech, some members of Congress are seeking to prevent its use for political repression. To that end, the Global Online Freedom Act (GOFA), which passed through the House of Representatives Subcommittee on Africa, Global Health, and Human Rights last week, takes aim not only at U.S.-headquartered companies but also overseas companies funded by U.S. capital markets.

Nonunique – cyber security bill

MacKinnon 4/3/12

http://www.foreignpolicy.com/articles/2012/04/03/The_Worlds_No_1_Threat_to_Internet_Freedom Rebecca MacKinnon is a blogger and co-founder of Global Voices Online. She is notable as a former CNN journalist who headed the CNN bureaus in Beijing and later in Tokyo. She is on the Board of Directors of the Global Network Initiative[1] and the Committee to Protect Journalists,[2] and is currently director of the Ranking Digital Rights project at the New America Foundation's Open Technology Institute.

Meanwhile, as GOFA moves forward, Congress is considering several cybersecurity bills that would authorize Internet service providers and other companies not only to monitor private communications passing over their networks, but also to share private communications with the National Security Agency and other federal entities or with any other agency of the federal government designated by the Department of Homeland Security -- and with less due process and judicial oversight than ever before. While acknowledging that cybersecurity is a legitimate goal, groups focused on the defense and protection of Internet users' rights, including the Center for Democracy and Technology and the Electronic Frontier Foundation, have expressed deep-seated concerns about the extent to which these bills open the door even wider for civil liberties violations. GOFA's supporters argue that one has to start somewhere and that focusing on the relationship between U.S. companies and authoritarian dictatorships is the best way to obtain bipartisan consensus to pass legislation. That is no doubt true. But if the American people continue to allow the U.S. government and American industry to forge increasingly unaccountable and opaque relationships around the exchange and use of citizens' private information, the damage will extend well beyond American democracy and civil liberties. The

business norms and technological innovations born of such opaque and unaccountable relationships will keep dictators supplied with handy tools for decades to come.

Allies' monitoring destroys i-freedom signal

Hanson 10/25/12, Nonresident Fellow, Foreign Policy, Brookings
http://www.brookings.edu/research/reports/2012/10/25-ediplomacy-hanson-internet-freedom

Another challenge is dealing with close partners and allies who undermine internet freedom. In August 2011, in the midst of the Arab uprisings, the UK experienced a different connection technology infused movement, the London Riots. On August 11, in the heat of the crisis, Prime Minister Cameron told the House of Commons: Free flow of information can be used for good. But it can also be used for ill. So we are working with the police, the intelligence services and industry to look at whether it would be right to stop people communicating via these websites and services when we know they are plotting violence, disorder and criminality. This policy had far-reaching implications. As recently as January 2011, then President of Egypt, Hosni Mubarak, ordered the shut-down of Egypt's largest ISPs and the cell phone network, a move the United States had heavily criticized. Now the UK was contemplating the same move and threatening to create a rationale for authoritarian governments everywhere to shut down communications networks when they threatened "violence, disorder and criminality." Other allies like Australia are also pursuing restrictive internet policies. As OpenNet reported it: "Australia maintains some of the most restrictive Internet policies of any Western country…" When these allies pursue policies so clearly at odds with the U.S. internet freedom agenda, several difficulties arise. It undermines the U.S. position that an open and free internet is something free societies naturally want. It also gives repressive authoritarian governments an excuse for their own monitoring and filtering activities. To an extent, U.S. internet freedom policy responds even-handedly to this challenge because the vast bulk of its grants are for open source circumvention tools that can be just as readily used by someone in London as Beijing, but so far, the United States has been much more discreet about criticising the restrictive policies of allies than authoritarian states.

Alt causes – snowden other violations AND broader internet control – they will also inevitably regulate other stuff that's illegal takes out the signal

China Post, 9/29/14 [http://www.chinapost.com.tw/life/science-&-technology/2014/09/29/418280/Inventor-of.htm]

LONDON--The British inventor of the World Wide Web warned on Saturday that the freedom of the internet is under threat by governments and corporations interested in controlling the web. Tim Berners-Lee, a computer scientist who invented the web 25 years ago, called for a bill of rights that would guarantee the independence of the Internet and ensure users' privacy. "If a company can control your access to the internet, if they can control which websites they go to, then they have tremendous control over your life," Berners-Lee said at the London "Web We Want" festival on the future of the internet. "If a Government can block you going to, for example, the opposition's political pages, then they can give you a blinkered view of reality to keep themselves in power." "Suddenly the power to abuse the open Internet has become so tempting both for government and big companies." Berners-Lee, 59, is director of the World Wide Web Consortium, a body that develops guidelines for the development of the Internet. He called for an Internet version of the "Magna Carta," the 13th century English charter credited with guaranteeing basic rights and freedoms. Concerns over privacy and freedom on the Internet have increased in the wake of the revelation of mass government monitoring of online activity following leaks by former U.S. intelligence contractor Edward

Snowden. A ruling by the European Union to allow individuals to ask search engines such as Google to remove links to information about them, called the "right to be forgotten," has also raised concerns over the potential for censorship. "There have been lots of times that it has been abused, so now the Magna Carta is about saying ... I want a web where I'm not spied on, where there's no censorship," Berners-Lee said. The scientist added that in order to be a "neutral medium," the Internet had to reflect all of humanity, including "some ghastly stuff." "Now **some things are of course just illegal, child pornography, fraud, telling someone how to rob a bank, that's illegal before the web and it's illegal after the web,**" Berners-Lee added.

Comcast outweighs

Sasso Sept 14 (Brendan; FCC Chief: Cable Companies Are Wrong About Internet Competition; www.nationaljournal.com/tech/fcc-chief-comcast-is-wrong-about-internet-competition-20140904; kdf)

September 4, 2014 **Most Americans lack any real choice in accessing high-speed Internet, the chairman of the F**ederal **C**ommunications **C**ommission **said** Thursday. **Comcast and** other **cable giants have argued that the industry is already plenty competitive**. Consumers in many areas can choose to access the Internet from a DSL provider or on their smartphones, the cable companies argue. While FCC Chairman Tom Wheeler didn't mention Comcast by name, he said those other options don't deliver the speeds that consumers need today. To reliably stream high-definition video, as consumers expect, providers must deliver speeds of at least 25 megabits per second, Wheeler said. In most areas, that means the only option is the local cable company. "**At 25 Mbps, there is simply no competitive choice for most Americans**," the FCC chief said. "Stop and let that sink in**. Three-quarters of American homes have no competitive choice for the essential infrastructure for 21st century economics and democracy. Included in that is almost 20 percent who have no service at all."** The conclusion doesn't bode well for Comcast's bid to buy Time Warner Cable. The deal would unite the top two cable providers, creating a new behemoth controlling a large portion of the nation's high-speed Internet access. But Comcast frequently notes that its network doesn't overlap with Time Warner Cable, meaning the merger would not actually create fewer choices for any consumers. Comcast didn't respond to a request to comment. The speech could also have implications for the agency's net-neutrality regulations. Wheeler noted that, historically, the absence of competition has "forced the imposition of strict government regulation in telecommunications." But he made it clear that h**e would prefer a competitive market with light regulation than heavy regulation of monopolies**. One of the **consequences of past monopoly regulation was the "thwarting of the kind of innovation that competition stimulates**," Wheeler said.

Guantanamo, and drones outweigh

Mainen, 11 - policy analyst at the Institute for Gulf Affairs (Matthew, "Morally Usurped by Brutal Monarchs," http://mainen.blogspot.com/2011/08/morally-usurped-by-brutal-monarchs.html)

President Obama entered office pledging to restore America's moral standing in the world. But his response to the Arab Spring has thus far has left much to be desired. This week, however, the president allowed the U.S. unprecedented embarrassment as it stood on the sidelines as two of the world's worst human rights violators – Saudi Arabia and Bahrain – along with Kuwait withdrew their ambassadors from Syria following its intensified crackdown. It's time to reclaim the initiative.

The president's cautious position is understandable. His predecessor's hawkish Mideast policy in response to the unprecedented environment created by the September 11 attacks and rise of international Islamic extremism challenged ties with Europe and temporarily destabilized Iraq.

Obama's policies, however, are far from dovish, and have not adequately mended ties with the Muslim world. He reneged on his campaign pledge to close Guantanamo Bay. He intensified drone attacks in Pakistan and Afghanistan, killing many civilians. And in an insult to American values, he personally approved Bahrain's brutal crackdown on pro-democracy activists behind closed doors.

1NC AT IFreedom- ITU Conference Solves

ITU proves no threat

Guardian 11/7/14 http://www.theguardian.com/technology/2014/nov/07/how-will-internet-governance-change-after-the-itu-conference

If internet governance were a James Bond movie, ITU would be cast as the cat-stroking villain with an intricate and ambitious model laid out before her (we can always hope) plotting world domination through seizing control of global communications. "The whole world will listen to me, and only me! Ha ha!" The reality, as ever, is far **less dramatic** and not significantly less sinister. Internet issues do form a minor part of ITU's mandate, and were overshadowed at the Busan event by a range of other issues: political disputes over Crimea and Palestine, resolutions to address Ebola and better ways to track planes, a four-year debate on how to define "ICT", public access to ITU's documents, and an unexpected 30m Swiss Franc reduction in ITU's budget for the next four years **ITU is not taking over the internet** Member States often presented as the foes of the internet (Russia, the Arab states, India and, on occasion, Brazil) submitted some proposals that had a few liberal western countries wringing their hands in earnest before the plenipot had begun. Russia proposed that ITU begin allocating internet protocol (IP) addresses, which is a function already performed by other non-intergovernmental organisations. The Arab states had submitted proposals that would have strengthened the role of governments in making decisions about the internet and would have given the ITU a role in developing legal and policy frameworks to combat illegal international online surveillance. Brazil made proposals for ITU to work on online privacy issues. Advertisement And India submitted a last-minute proposal that would have required some major changes to the way the internet works. (The proposal aimed to keep all domestic internet traffic within national borders, so citizens would have to use a telephone-style international dialling code to access a site outside the country. Most of the proposal is possible to implement, but would require work outside ITU's current mandate.) These were proposals that had the US administration in a bit of a spin, with Penny Pritzker, US secretary of commerce, telling a key group of internet folk at the opening ceremony of the most recent ICANN meeting, "We will see proposals to put governments in charge of internet governance. You can rest assured that the United States will oppose these efforts at every turn." However, anyone with any experience of intergovernmental negotiations knows that proposals start off fairly strong, then get watered down to the politically homeopathic levels. This is what happened at the plenipot. For example, both the proposals to give governments a more active role in the internet as well as the proposals to give non-governments a more active role in ITU kind of neutralised each other. Also, back room negotiations spearheaded by the US delegation meant many of the changes proposed by other countries were taken off the table. Those negotiations

took placed behind closed doors, but it is understood that the US gave up its demand to have non-governmental groups invited into ITU's council working groups, which were designed to be for governments only. In return, other states withdrew proposals about online privacy, cybersecurity and other internet proposals. **No major threats to the internet have emerged** as a result of the conference. Instead, many of the hottest internet issues have been shunted off to a small group of the ITU, known by the convoluted name of **the Council Working Group** on International Internet-related Public Policy Issues, or CWG-Internet for short. As a result of compromises made at the plenipot, this group, which is attended by barely more than a handful of states, will decide at the beginning of each year what its topics of discussion will be.

Multistakeholder winning now

Szyndler 11/13/14

http://www.circleid.com/posts/20141113_why_we_dont_stick_to_our_knitting_auda_role_in_internet_governance/ Paul Szyndler, GM of International & Govt Affairs, AUDA

Every four years, these Resolutions are meticulously pored over by Member States, with every phrase and section analysed and debated. Agreed words are very powerful in inter-governmental fora, and the importance of such a granular and detailed debate should not be under-estimated.

This is where the fear and loathing comes in — the ITU is not a multi-stakeholder body. It is multi-national. It is a forum for governments and those of us (ccTLD managers, ICANN, civil society, business, academia) from the broader community that has successfully steered the technical and policy development of the Internet don't have a seat at the table. Aside from lobbying our national governments and weaselling our way on to delegations, we cannot directly influence the direction of the ITU. This is why the recent Plenipotentiary was so significant, keenly followed and generally distrusted.

However, an interesting thing happened in Busan. While there was the usual level of debate around Internet issues, a **far greater proportion** of governments spoke in favour of the current multi-stakeholder model for Internet Governance. A far greater number of governments are now meaningfully engaged with our community, trust our processes and work with stakeholders to improve the current model, rather than re-invent it with national administrations in control. Far more governments get it.

Our Government, like Britain's, is committed to freedom on and of the Internet. That means the governance of the Internet should not be in the hands of any government or group or organisation of governments.

—The Hon Malcolm Turnbull MP, Australian Minister for Communicatios.

Chatham House speech, May 2014

[Emphasis from the Minister's original speech]

This was particularly evident at PP-14 when a bunch of wacky [author's expert opinion only] Internet-related proposals were tabled from usual suspects such as Russia, the Arab States and India. These proposals would have significantly increased the ITU's mandate but, instead of just being opposed by the U.S. and a handful of nations in Europe, **many more Member States** played a vocal role in ensuring these ideas did not proceed.

No uniqueness – Bhusan consensus

Sepulveda 12/16/14 https://openinternet.state.gov/message-ambassador-sepulveda/ Ambassador Daniel Sepulveda United States of America

The Plenipotentiary Conference occurs every four years and is a treaty level conference that sets the ITU general policies, scope of authority, and course of work for the next four years. Going into the Plenipotentiary Conference, there was considerable concern that it could end with member states divided, which could adversely affect the work of the ITU, or create uncertainty for the future of the global Internet. Fortunately, thanks to the efforts of our delegation and our partners, this division didn't happen. Instead, the conference concluded with **strong consensus**, the **Busan Consensus**. In Busan, we established a basis and process that enables the ITU to work within its mandate to promote global connectivity while leaving decisions about how people use that connectivity to more appropriate institutions and deliberations.

Plenipotentiary conference established free internet – checked ITU threats to internet freedom

European Institute 12/18/14 http://www.euintheus.org/event/the-busan-consensus-a-turning-point/ The EU is represented in the United States by the Washington, DC Delegation of the European Union, which works in close coordination with the Embassies and Consulates of the 28 EU Member States.

Following 800 hours of negotiations on 452 proposals over three weeks, delegates to the ITU's (International Telecommunications Union) 19th Plenipotentiary Conference reached consensus on continuing the ITU's mandate to promote global connectivity, while ensuring that the international body's role would not expand beyond telecommunications and into the Internet content or core functionality. Internet governance and cyber security issues will be addressed in other international fora, and the ITU's own work will be given greater transparency. The panelists will address the outcomes of the ITU Plenipotentiary, and what implications they have for the multi-stakeholder model of internet governance, in which openness, transparency and democratic principles can sustainably prevail in the digital age.

1NC AT IFreedom- No I/L

Reputational capital is not uniform or zero sum – have a high threshold for a link argument

Guzman 8—Andrew, is Jackson H. Ralston Professor of Law and Associate Dean at UC Berkeley School of Law @ Berkeley, "Reputation and International Law," http://andrewguzman.net/wp-content/uploads/2012/07/Reputation-and-International-Law.pdf

Reputation can be defined as judgments about an actor's past behavior used to predict future behavior7 . Consistent with that definition we can define a state's reputation for compliance with

international law as judgments about an actor's past response to international legal obligations used to predict future compliance with such obligations. This reputation is an estimate of the state's true willingness to comply even when non-reputational payoffs favor violation. This willingness to comply depends on the state's discount rate, the domestic politics in the state (e.g., the extent to which domestic political structures make violation of international law difficult or costly), that state's willingness to impose costs on others,8 the value of future opportunities to cooperate (which may be jeopardized by a current violation), and so on.

Other states are assumed to be unable to observe this underlying willingness to comply, and so they must estimate it based on the actions of the state. In principle every observing state has its own perception of a particular state's reputation. Thus, **the United States may have different reputations in Canada, Argentina, Russia, and Syria**. For the moment we abstract away from this issue and assume that every observer has the same view of the state's reputation. This assumption is relaxed later in the article.

A simple model of reputation would treat the acquisition and loss of reputation in an extremely straightforward way—states that honor their commitments acquire **reputational capital**, and states that violate their commitments **lose it.** A moment's thought, **however**, makes it clear that **things must be more complicated** than this. If it were simply a matter of counting the instances of compliant behavior, states could build their reputations by signing many treaties that impose trivial obligations. A sensible model of reputation building cannot, for example, lead to the conclusion that Bolivia, a land-locked country, can improve its reputation by committing to keep its ports open. Similarly, **it cannot be that the tiny island republic of Vanuatu**, whose total GDP in 2004 was $316 million, can improve its reputation **by agreeing to refrain from placing weapons in space**. The acquisition of reputation clearly must be more complex than simply complying with commitments.

1NC AT IFreedom- No Trade Impact

Trade is strong and resilient

Ikenson, 9 [Daniel, associate director of the Center for Trade Policy Studies at the Cato Institute, " A Protectionism Fling: Why Tariff Hikes and Other Trade Barriers Will Be Short-Lived," March 12, 2009, http://www.cato.org/pub_display.php?pub_id=10651]

Although some governments will dabble in some degree of protectionism, the combination of a sturdy rules-based system of trade and the economic self interest in being open to participation in the global economy **will limit** the risk of **a protectionist pandemic**. According to recent estimates from the International Food Policy Research Institute, if all WTO members were to raise all of their applied tariffs to the maximum bound rates, the average global rate of duty would double and the value of global **trade would decline by 7.7 percent** over five years.8 That would be a substantial decline relative to the 5.5 percent annual rate of trade growth experienced this decade.9 But, to put that 7.7 percent decline in historical perspective, the value of global trade declined by **66 percent** between 1929 and 1934, a period mostly in the wake of Smoot Hawley's passage in 1930.10 So the potential downside today from what Bergsten calls "legal protectionism" is actually **not** that "**massive**," even if all WTO members raised all of their tariffs to the highest permissible rates. If most developing countries raised their tariffs to their bound rates, there would be an adverse impact on the countries that raise barriers and on their most

important trade partners. But most developing countries **that have room to backslide** (i.e., not China) **are not major importers**, and thus the impact on global trade flows would not be that significant. OECD countries and China account for the top twothirds of global import value.11 Backsliding from India, Indonesia, and Argentina (who collectively account for 2.4 percent of global imports) is not going to be the spark that ignites **a global trade war**. Nevertheless, governments are keenly aware of the events that transpired in the 1930s, and have made various pledges to **avoid protectionist measures** in combating the current economic situation. In the United States, after President Obama publicly registered his concern that the "Buy American" provision in the American Recovery and Reinvestment Act might be perceived as protectionist or could incite a trade war, Congress agreed to revise the legislation to stipulate that the Buy American provision "be applied in a manner consistent with United States obligations under international agreements." In early February, China's vice commerce minister, Jiang Zengwei, announced that China would not include "Buy China" provisions in its own $586 billion stimulus bill.12 But even more promising than pledges to avoid trade provocations **are actions** taken **to reduce** existing **trade barriers**. In an effort to "reduce business operating costs, attract and retain foreign investment, raise business productivity, and provide consumers a greater variety and better quality of goods and services at competitive prices," the Mexican government initiated a plan in January to unilaterally reduce tariffs on about 70 percent of the items on its tariff schedule. Those 8,000 items, comprising 20 different industrial sectors, accounted for about half of all Mexican import value in 2007. When the final phase of the plan is implemented on January 1, 2013, the average industrial tariff rate in Mexico will have fallen from 10.4 percent to 4.3 percent.13v And Mexico is not alone. In February, the Brazilian government suspended tariffs entirely on some capital goods imports and reduced to 2 percent duties on a wide variety of machinery and other capital equipment, and on communications and information technology products.14 That decision came on the heels of late-January decision in Brazil to scrap plans for an import licensing program that would have affected 60 percent of the county's imports.15 Meanwhile, on February 27, a new free trade agreement was signed between Australia, New Zealand, and the 10 member countries of the Association of Southeast Asian Nations to reduce and ultimately eliminate tariffs on 96 percent of all goods by 2020. While the media and members of the trade policy community fixate on how various protectionist measures around the world might foreshadow a plunge into the abyss, there is plenty of evidence that governments **remain interested in removing barriers to trade**. Despite the occasional temptation to indulge discredited policies, there is a growing body of institutional knowledge that when people are free to engage in commerce with one another as they choose, regardless of the nationality or location of the other parties, they can leverage that freedom to accomplish economic outcomes far more impressive than when governments attempt to limit choices through policy constraints.

No correlation between trade and peace

MARTIN, et al '8 (Phillipe, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, and Centre for Economic Policy Research; Thierry MAYER, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, CEPII, and Centre for Economic Policy Research, Mathias THOENIG, University of Geneva and Paris School of Economics, The Review of Economic Studies 75)

Does globalization pacify international relations? The “liberal” view in political science argues that increasing trade flows and the spread of free markets and democracy should limit the incentive to use military force in interstate relations. This vision, which can partly be traced back to Kant’s Essay on Perpetual Peace (1795), has been very influential: The main objective of the European trade integration process was to prevent the killing and destruction of the two World Wars from ever happening again.1 Figure 1 suggests2 however, that during the 1870–2001 period, the correlation between trade openness and military **conflicts is not** a **clear** cut one. The first era of globalization, at the end of the 19th century, was a period of rising **trade openness and multiple military conflicts**, **culminating with World War I**. Then, the interwar period was characterized by a simultaneous collapse of world trade and conflicts. After World War II, world trade increased rapidly, while the number of conflicts decreased (although the risk of a global conflict was obviously high). **There is no** clear **evidence that** the 1990s, during which **trade flows increased dramatically, was a period of lower** prevalence of military **conflicts**, even taking into account the increase in the number of sovereign states.

Trade wars don’t escalate

Ikenson, 12 [March 5th, Daniel, Daniel Ikenson is director of the Herbert A. Stiefel Center for Trade Policy Studies at the Cato Institute,

http://www.cato.org/publications/free-trade-bulletin/trade-policy-priority-one-averting-uschina-trade-war]

. Nature of the U.S.-China Trade War It should not be surprising that the increasing number of commercial exchanges between entities in the world's largest and second largest economies produce frictions on occasion. But the U.S.-China economic relationship **has not descended into an existential call to arms.** Rather, both governments have taken protectionist actions that are **legally defensible** or plausibly justifiable within the rules of global trade. That is not to say that those measures have been advisable or that they would withstand closer legal scrutiny, but to make the distinction that, unlike the free-for-all that erupted in the 1930s, these trade "skirmishes" have been prosecuted in a manner that **speaks to a** mutual **recognition of the** primacy of — if not respect for — the **rules-based system** of trade. And that suggests that the **kerfuffle is containable and the recent trend reversible.1**

2NC AT Trade Cred Impact

No trade/cred spillover

Yevgeniya **Roysen 9**, Articles Editor, Cardozo Arts & Ent. L.J.; J.D. Candidate, 2009, TAKING CHANCES, 26 Cardozo Arts & Ent LJ 873

Moreover, it has also been argued that withdrawal from its Internet gambling commitments under the GATS, while lawful, will be damaging to the United States' reputation within the international community. n149 Rather than seeking a compromise and an alternate solution, the United States' decision to withdraw "could be viewed as duplicitous and would undermine U.S. credibility in any future negotiations of international agreements, even those outside the context of the WTO." n150 The marring of the United States' international reputation, it is thereby argued, will have a more damaging effect on the American economy and culture than a compromise that would allow for the continuation of Internet gambling.

While **these arguments** contain some strength, they **are flawed**. Setting aside agreements made as a member of the WTO, the United States has often failed to comply with international law, with **minimal repercussions**. On several occasions, the United States has either **blatantly disregarded or manipulated** aspects of the United Nations Charter so that it would better suit its own needs. The Charter is itself an international treaty of which 192 countries are members. n151 The most obvious instances of United States violations involve its interventions in the affairs of other countries without the proper authorization from the United Nations Security Council ("SC"). While Article 2, Section 4 of the Charter explicitly prohibits the use of force against another nation, n152 [*897] Articles 39 through 51 allow for it under the express authorization of the SC. n153 While the SC granted authorization for the use of force during the first Gulf War, it has failed to do so for the current conflict in Iraq. Nevertheless, the United States has argued that the SC's prior authorization continues to extend to the present conflict and that the United States is not in violation of its treaty agreements to refrain from the use of force. President George W. Bush insisted that "under [the SC Resolutions authorizing the use of force in the first Gulf War] - both still in effect - the United States and our allies are authorized to use force in ridding Iraq of weapons of mass destruction." n154

In another instance, in 1999, the United States led a campaign as a member of the North-Atlantic Treaty Organization ("NATO") for an alleged humanitarian intervention in Kosovo, once again in the absence of express authorization by the SC. This time, the United States argued that its intervention could be justified morally and politically, and that circumstances such as those in Kosovo at the time require a certain degree of flexibility in international agreements. n155 The government maintained that "UN Security Council resolutions mandating or authorizing NATO efforts are not required as a matter of international law." n156

While these instances of disregard for the United States' international responsibilities are not condonable, they do serve to illustrate that the United States is very familiar with various forms of noncompliance and manipulation of its agreements with other nations. The United States is unlikely to face significant consequences as a result of its withdrawal from its Internet gambling commitments under the GATS, and therefore can feel at ease allowing its domestic concerns to supersede any international implications that may arise as a result of its anti-Internet gambling legislation. Thus far, aside from some criticism, the international reaction has been limited to eight WTO members requesting compensation as a result of the withdrawal. n157 The United States has reached settlements with all but Antigua. n158

1NC AT Cyber- Squo Solves
Cyber legislation first key to solve

Volz ’15 [DUSTIN VOLZ, National Journal, Key Democrat: Congress Won’t Tackle NSA Reform Before Cybersecurity, March 22, 2015, http://www.nationaljournal.com/tech/key-democrat-congress-won-t-tackle-nsa-reform-before-cybersecurity-20150322]

Congress likely needs to pass cybersecurity legislation before it can pave the way to addressing the National Security Agency bulk collection of American phone records, despite the looming June expiration of a key surveillance authority, the top Democrat on the House Intelligence Committee says.

And "high-level" conversations about NSA reform, said Rep. Adam Schiff of California, aren't even happening yet.

"We're going to have to acknowledge that those who don't support any kind of cyber bill in advance of [Foreign Intelligence Surveillance Act] reform are probably not going to be satisfied," Schiff said last week after speaking about surveillance at an event hosted by the centrist group Third Way. "Because the timetable does not [make] that likely. Unless the information-sharing bill runs into unexpected roadblocks and gets pushed until after the summer, it's likely that's going to have to go first."

Schiff, who favors NSA reform, said information sharing was not necessarily a "prerequisite" for dealing with surveillance, but he believes it would be an easier sell than the inverse option. His comments nonetheless are likely to irk some in the privacy community who insist they cannot back any information sharing—which they fear might embolden more government snooping—before Congress overhauls the intelligence community's mass surveillance powers.

AT Cybersecurity Adv- No Cyber Threat

Cyber threat exaggerated.

Rid '12

Thomas Rid, reader in war studies at King's College London. March/April 2012. "Think Again: Cyberwar". http://www.foreignpolicy.com/articles/2012/02/27/cyberwar

Time for a reality check: Cyberwar is still more hype than hazard. Consider the definition of an act of war: It has to be potentially violent, it has to be purposeful, and it has to be political. The cyberattacks we've seen so far, from Estonia to the Stuxnet virus, simply don't meet these criteria. Take the dubious story of a Soviet pipeline explosion back in 1982, much cited by cyberwar's true believers as the most destructive cyberattack ever. The account goes like this: In June 1982, a Siberian pipeline that the CIA had virtually booby-trapped with a so-called "logic bomb" exploded in a monumental fireball that could be seen from space. The U.S. Air Force estimated the explosion at 3 kilotons, equivalent to a small nuclear device. Targeting a Soviet pipeline linking gas fields in Siberia to European markets, the operation sabotaged the pipeline's control systems with software from a Canadian firm that the CIA had doctored with malicious code. No one died, according to Thomas Reed, a U.S. National Security Council aide at the time who revealed the incident in his 2004 book, At the Abyss; the only harm came to the Soviet economy. But did it really happen? After Reed's account came out, Vasily Pchelintsev, a former KGB head of the Tyumen region, where the alleged explosion supposedly took place, denied the story. There are also no media reports from 1982 that confirm such an explosion, though accidents and pipeline explosions in the Soviet Union were regularly reported in the early 1980s. Something likely did happen, but Reed's book is the only public mention of the incident and his account relied on a single document. Even after the CIA declassified a redacted version of Reed's source, a note on the so-called Farewell Dossier that describes the effort to provide the Soviet Union with defective technology, the agency did not confirm that such an explosion occurred. The available evidence on the Siberian pipeline blast is so thin that it shouldn't be counted as a proven case of a successful cyberattack. Most other commonly cited cases of cyberwar are even less remarkable. **Take the attacks on Estonia in April 2007**, which came in response to the controversial relocation of a Soviet war memorial, the Bronze Soldier. The well-wired country found itself **at the receiving end of a massive distributed Denial-Of-Service attack** that emanated from up to 85,000 hijacked computers and lasted three weeks. The attacks reached a peak on May 9, when 58 **Estonian websites were attacked at once and the online services of Estonia's largest bank were taken down**. "What's the difference between a blockade of harbors or airports of sovereign states and the blockade of government institutions and newspaper websites?" asked Estonian Prime Minister Andrus Ansip. **Despite his analogies, the attack was no act of war. It was certainly a nuisance and an emotional strike on the country, but the bank's actual network was not even penetrated; it went down for 90 minutes one day and two hours the next. The attack was not violent**, it wasn't purposefully aimed at changing Estonia's behavior, and no political entity took credit for it**. The same is true for the vast majority of cyberattacks on record. Indeed, there is no known cyberattack that has caused the loss of human life. No cyberoffense has ever injured a person or damaged a building.** And if an act is not at least potentially violent, it's not an act of war. Separating war from physical violence makes it a metaphorical notion; it would mean that there is no way to distinguish between World War II, say, and the "wars" on obesity and cancer. Yet those ailments, unlike past examples of cyber "war," actually do kill people. Keep waiting. U.S. Defense Secretary Leon Panetta delivered a stark warning last summer: "**We could face a cyberattack that could be the equivalent of Pearl Harbor." Such alarmist predictions have been ricocheting inside the Beltway for the past two decades, and some scaremongers have even upped the ante by raising the alarm about a cyber 9/11**. In his 2010 book, Cyber War, former White House counterterrorism czar Richard Clarke invokes the specter of nationwide power blackouts, planes falling out of the sky, trains derailing, refineries burning, pipelines exploding, poisonous gas clouds wafting, and satellites spinning out of orbit -- events that would make the 2001 attacks pale in comparison. But **the empirical record is less hair-raising, even by the standards of the most drastic example available**. Gen. Keith Alexander, head of U.S. Cyber Command (established in 2010 and now boasting a budget of more than $3 billion), shared his worst fears in an April 2011 speech at the University of Rhode Island: "What I'm concerned about are destructive attacks," Alexander said, "those that are coming." He then invoked a remarkable accident at Russia's Sayano-Shushenskaya hydroelectric plant to highlight the kind of damage a cyberattack might be able to cause. Shortly after midnight on Aug. 17, 2009, a 900-ton turbine was ripped out of its seat by a so-called "water hammer," a sudden surge in water pressure that then caused a transformer explosion. The turbine's unusually high vibrations had worn down the bolts that kept its cover in place, and an offline sensor failed to detect the malfunction. Seventy-five people died in the accident, energy prices in Russia rose, and rebuilding the plant is slated to cost $1.3 billion.

AT Cybersecurity Adv- Accidental Launch Impact

Hotline solves

FNR '11

Federal News Radio. 7/13/2011. "Cyber hot line could help thaw U.S.-Russia relations". http://www.federalnewsradio.com/?nid=85&sid=2456172

> A Washington and Moscow Cybersecurity Hot Line is in the works, and should be operating by the end of the year. That's according to a blog by White House Cybersecurity Coordinator Howard Schmidt. Schmidt says he's been meeting with his Russian counterpart, and the Hot Line will help increase information exchange on security threats and head off misinterpretations of other incidents. The men also discussed each nation's military views on operating in cyberspace. The hope is to reset U.S.-Russian cyber relations, GovInfo Security reports

Can't hack the system

Weiman 4

Gabriel Weimann is a senior fellow at the United States Institute of Peace and professor of communication at the University of Haifa, Israel. "Cyberterrorism: How Real is the threat?" United States Institute of Peace, December 2004, http://www.usip.org/files/resources/sr119.pdf

> Many computer security experts do not believe that it is possible to use the Internet to inflict death on a large scale. Some pointed out that the resilience of computer systems to attack is the result of significant investments of time, money, and expertise. As Green describes, nuclear weapons systems are protected by "air-gapping": they are not connected to the Internet or to any open computer network and thus they cannot be accessed by intruders, terrorists, or hackers. Thus, for example, the Defense Department protects sensitive systems by isolating them from the Internet and even from the Pentagon's own internal network. The CIA's classified computers are also air-gapped, as is the FBI's entire computer system

Russia Won't respond with Nukes

Karas '1

Thomas, PHD in Political Science from Harvard, De-alerting and De-activating Strategic Nuclear Weapons, Sandia Report, April 2001, http://www.nti.org/e_research/official_docs/labs/de_alt_act_tnw.pdf

> Nevertheless, interpretation of warning information will take place in the context of information about the general state of relations between the potential adversaries. If there is no reason to think that a state of conflict exists, decision-makers are more likely to question false alarms and delay a response until the situation can be sorted out. On January 25, 1995, a scientific rocket probe launched from Norway appeared on Russian radar screens. Within minutes, President Yeltsin was alerted that this might be a U.S. submarine-launched missile (no one having been told that the Norwegians had notified Russian authorities of the launch plan weeks earlier). A few minutes later the Russian military determined that the rocket posed no threat. We do not know how close the Russians came to erroneously concluding that the rocket was a missile, or whether President Yeltsin would have ordered a counterattack based solely on the warning that a single missile was coming.13 Nevertheless, given the extreme improbability of a "bolt-from-the-blue" U.S. attack, a rapid nuclear response seems unlikely.

AT Cybersecurity Adv- Econ Impact

Cyber attacks won't bring down the economy.

Morozov '9

Evgeny Morozov, fellow at the Open Society Institute and a board member of its Information Program. "Cyber-Scare". Boston Review. July/August 2009. http://bostonreview.net/BR34.4/morozov.php

From a national security perspective, cyber-attacks matter in two ways. First, because **the back-end infrastructure underlying our economy** (national and global**) is now digitized, it is subject to new risks.** Fifty years ago it would have been hard—perhaps impossible, short of nuclear attack—to destroy a significant chunk of the U.S. economy in a matter of seconds; today all it takes is figuring out a way to briefly disable the computer systems that run Visa, MasterCard, and American Express. Fortunately, **such massive disruption is unlikely to happen anytime soon**. Of course **there is already plenty of petty cyber-crime,** some of it involving stolen credit card numbers**. Much of it, however, is due to low cyber-security awareness by end-users** (you and me), **rather than banks or credit card companies**. Second, a great deal of internal government communication flows across computer networks, and hostile and not-so-hostile parties are understandably interested in what is being said. Moreover, data that are just sitting on one's computer are fair game, too, as long as the computer has a network connection or a USB port. Despite the "cyber" prefix, however, the basic risks are strikingly similar to those of the analog age. Espionage has been around for centuries, and there is very little we can do to protect ourselves beyond using stronger encryption techniques and exercising more caution in our choices of passwords and Wi-Fi connections. To be sure, there is a war-related caveat here: if the military relies on its own email system or other internal electronic communications, it is essential to preserve this capability in wartime. Once more, however, the concern is not entirely novel; when radio was the primary means of communication, radio-jamming was also a serious military concern; worries about radio go back as far as the Russo-Japanese War of 1904-1905. The ultimate doomsday scenario—think Live Free or Die Hard—could involve a simultaneous attack on economic e-infrastructure and e-communications: imagine al Qaeda disabling banks, destroying financial data, disrupting networks, and driving the American economy back to the nineteenth century. This certainly sounds scary—almost as scary as raptors in Central Park or a giant asteroid heading toward the White House. The latter two are not, however, being presented as "national security risks" yet. There are certainly genuine security concerns associated with the Internet. But before accepting the demands of government agencies for new and increased powers to fight threats in cyberspace and prepare for cyber-warfare, we should look more closely at well-defined dangers and ask just where existing technological means and legal norms fall short. Because the technologies are changing so quickly, we cannot expect definitive answers. But cyber-skeptics—who argue that cyber-warfare is still more of an urban legend than a credible hazard—appear to be onto something important. One kind of cyber-security problem grows out of resource scarcity. A network has only so much bandwidth; a server can serve only so much data at one time. So if you want to disable (or simply slow down) the computer backbone of a national economy, for example, you need to figure out how to reach its upper limit. It would be relatively easy to protect against this problem if you could cut your computer or network off from the rest of the world. But as the majority of governmental and commercial services have moved online, we expect them to be offered anywhere; Americans still want to access their online banking accounts at Chase even if they are travelling in Africa or Asia. What this means in practice is that institutions typically cannot shut off access to their online services based on nationality of the user or the origin of the computer (and in the case of news or entertainment sites, they do not want to: greater access means more advertising income). Together, these limitations create an opportunity for attackers. Since no one, not even the U.S. government, has infinite computer resources, any network is potentially at risk. Taking advantage of this resource scarcity could be an effective way of causing trouble for sites one does not like. The simplest—and also the least effective—way of doing this is to visit the URL and hit the "reload" button on your browser as often (and for as long) as you can. Congratulations: you have just participated in the most basic kind of "denial-of-service" (DoS) attack, which aims to deny or delay the delivery of online services to legitimate users. These days, however, it would be very hard to find a site that would suffer any noticeable damage from such a nuisance; what is missing from your cyber-guerilla campaign is scale. Now multiply your efforts by a million—distribute your attacks among millions of other computers—and this could be enough to cause headaches to the administrators of many Web sites. These types of attacks are known as "distributed denial-of-service" or DDoS attacks. Administrators may be able to increase their traffic and bandwidth estimates and allocate more resources. Otherwise they have to live with this harassment, which may disable their Web site for long periods. DDoS attacks work, then, by making heavier-than-normal demands on the underlying infrastructure, and they usually cause inconvenience rather than serious harm. Not sure how to do it yourself? No problem: you can buy a DDoS attack on the black market. Try eBay. In fact, your own computer may well be participating in a DDoS attack right now. You may, for example, have inadvertently downloaded a trojan—a hard-to-detect, tiny piece of software—that has allowed someone else to take control of your machine, without obvious effect on your computer's speed or operations. Some computer experts put the upper limit of infected computers as high as a quarter of all computers connected to the Internet. Because a single computer is inconsequential, the infected computers form "botnets"—nets of robots—that can receive directions from a command-and-control center—usually just another computer on the network with the power to give commands. What makes the latest generation of botnets hard to defeat is that every infected computer can assume the role of the command-and-control center: old-fashioned methods of decapitation do not work against such dispersed command-and-control. Moreover, botnets are strategic: when network administrators try to block the attacks, botnets can shift to unprotected prey. Commercial cyber-security firms are trying to keep up with the changing threats; thus far, however, the botnets are staying at least one step ahead. DDoS threats have been far more commercial than political. The driving force has been cyber-gangs (many of them based in the former Soviet Union and Southeast Asia) which are in the extortion business. They find a profitable Internet business that cannot afford downtime and threaten to take down its Web site(s) with DDoS attacks. The online gambling industry—by some estimates, a $15-billion-a-year business—is a particularly appealing target because it is illegal in the United States: it cannot seek protection and take advantage of robust U.S. communications infrastructure. Thus, administrators of popular gambling sites commonly receive threats of DDoS attacks and demands for $40,000-$60,000 to "protect" the sites from attacks during peak betting periods (say, before big sporting events such as the Super Bowl). Many legitimate businesses fall victim to cyber-extortion, too. Since it is better to dole out a little cash to stop future attacks than to deal with the PR fallout—and possible drop in stock prices—that usually follows cyber-attacks, cyber-crime is underreported and underprosecuted. Another commercial opportunity for cyber-gangs is the creation of a large army of for-hire botnets, with extremely powerful attack capabilities. It is currently quite straightforward to rent the destructive services of a botnet ($1000/day is a going rate). The point was made forcefully by a controversial recent experiment: a group of BBC reporters purchased the services of a botnet 22,000 infected-computers strong from a vendor of cyber-crime services and used it to attack the site of a cyber-security company. The commercial availability of DDoS-attack capability has generated excitement about political applications. The risks to online freedom of expression may be considerable: saying anything controversial may trigger a wave of cyber-attacks that your adversaries can purchase easily. These attacks are financially burdensome and politically disabling for the victim. Getting your server back online is usually the least of your problems. Your Web hosting company may kick you off its servers because the cost of dealing with the damage caused by cyber-attacks usually outweighs the monetary gains of hosting controversial groups, from political bloggers to LGBT groups to exiled media from countries such as Burma (just to mention some recent victims of DDoS attacks). Protection from DDoS is available, but usually too expensive for nonprofits. An alternative to expensive DDoS protection is a kind of distributed defense network. Imagine an idealized world in which every computer has the latest anti-virus update and where users do not open suspicious attachments or visit dubious Web sites. Cyber-gangs would then be left to their own devices—to attacking with computers they own—and the security issues would be considerably diminished. This perfect world is impossible to achieve, but the right policies could get us pretty close. One option is to go "macro"—to ensure that all critical national infrastructure is prioritized and protected, with extremely flexible resource allocation for the key assets (part of the job of a cyber-czar). This, however, would do little to curb the DDoS market. Indeed, it might embolden the attackers to ratchet up their capabilities. An alternative is to go "micro"—ensure that people who are responsible for the creation of this market in DDoS attacks in the first place (i.e., you and me) are knowledgeable (or at least literate) in cyber-security matters and do not surf with their antivirus protection turned off. This latter solution could eliminate the problem at root: if all computers were secure and computer users careful, botnets would significantly shrink in size. This, however, is a big "if," and most skepticism over whether the federal government is well-placed to educate about these threats is justified. The security threats from DDoS attacks pale in comparison with the potential consequences of another kind of online insecurity, one more likely to be associated with terrorists than criminals and potentially more consequential politically: data breaches or network security compromises (I say "potential" because very few analysts with access to intelligence information agree to speak on the record). After all, with DDoS, attackers simply slow down everyone's access to data that are, in most cases, already public (some data are occasionally destroyed). With data breaches, in contrast, attackers can gain access to private and classified data, and with network security compromises, they might also obtain full control of high-value services like civil-aviation communication systems or nuclear reactors. Data breaches and network security compromises also create far more exciting popular narratives: the media frenzy that followed the detection of China-based GhostNet—a large cyber-spying operation that spanned more than 1250 computers in 103 countries, many of them belonging to governments, militaries, and international organizations—is illustrative. Much like botnets, cyber-spying operations such as GhostNet rely on inadvertently downloaded trojans to obtain full control over the infected computer. In GhostNet's case, hackers even gained the ability to turn on computers' camera and audio-recording functions for the purposes of remote surveillance, though we have no evidence that attackers used this function. In fact, what may be most remarkable about GhostNet is what did not happen. No computers belonging to the U.S. or U.K. governments—both deeply concerned about cyber-security—were affected; one NATO computer was affected, but had no classified information on it. It might be unnerving that the computers in the foreign ministries of Brunei, Barbados, and Bhutan were compromised, but the cyber-security standards and procedures of those countries probably are not at the global cutting edge. With some assistance on upgrades, they could be made much more secure. In part, then, the solution to cyber-insecurity is simple: if you have a lot of classified information on a computer and do not want to become part of another GhostNet-like operation, do not connect it to the Internet. This is by far the safest way to preserve the integrity of your data. Of course, it may be impossible to keep your computer disconnected from all networks. And by connecting to virtually any network—no matter how secure—you relinquish sole control over your computer. In most cases, however, this is a tolerable risk: on average, you are better off connected, and you can guard certain portions of a network, while leaving others exposed. This is Network Security 101, and high-value networks are built by very smart IT experts. Moreover, most really sensitive networks are designed in ways that prevent third-party visitors—even if they manage somehow to penetrate the system—from doing much damage. For example, hackers who invade the email system of a nuclear reactor will not be able to blow up nuclear facilities with a mouse click. Data and security breaches vary in degree, but such subtlety is usually lost on decision-makers and journalists alike. Hype aside, what we do know is that there are countless attacks on the government computers in virtually every major Western country, many of them for the purpose of espionage and intelligence gathering; data have been lost, compromised, and altered. The United States may have been affected the most: the State Department estimates that it has lost "terabytes" of data to cyber-attacks, while Pentagon press releases suggest that it is under virtually constant cyber-siege. Dangerous as they are, these are still disturbing incidents of data loss rather than seriously breached data or compromised networks. Breakthroughs in encryption techniques have also made data more secure than ever. As for the data loss, the best strategy is to follow some obvious rules: be careful, and avoid trafficking data in open spaces. (Don't put important data anywhere on the Internet, and don't leave laptops with classified information in hotel rooms.) Although there is a continuous spectrum of attacks, running from classified memos to nuclear buttons, we have seen no evidence that access to the latter is very likely or even possible. Vigilance is vital, but exaggeration and blind acceptance of speculative assertions are not. So why is there so much concern about "cyber-terrorism"? Answering a question with a question: who frames the debate? Much of the data are gathered by ultra-secretive government agencies—which need to justify their own existence—and cyber-security companies—which derive commercial benefits from popular anxiety. Journalists do not help. Gloomy scenarios and speculations about cyber-Armaggedon draw attention, even if they are relatively short on facts. Politicians, too, deserve some blame, as they are usually quick to draw parallels between cyber-terrorism and conventional terrorism—often for geopolitical convenience—while glossing over the vast differences that make military metaphors inappropriate. In particular, cyber-terrorism is anonymous, decentralized, and even more detached than ordinary terrorism from physical locations. Cyber-terrorists do not need to hide in caves or failed states; "cyber-squads" typically reside in multiple geographic locations, which tend to be urban and well-connected to the global communications grid. Some might still argue that state sponsorship (or mere toleration) of cyber-terrorism could be treated as casus belli, but we are yet to see a significant instance of cyber-terrorists colluding with governments. All of this makes talk of large-scale retaliation impractical, if not irresponsible, but also understandable if one is trying to attract attention. Much of **the cyber-security problem**, then, **seems to be exaggerated: the economy is not about to be brought down, data and networks can be secured, and terrorists do not have the upper hand**. But what about genuine cyber-warfare? The cyber-attacks on Estonia in April-May 2007 (triggered by squabbling between Tallinn and Moscow over the relocation of a Soviet-era monument) and the cyber-dimension of the August 2008 war between Russia and Georgia have reignited older debates about how cyber-attacks could be used by and against governments.

Cyber crime does not have a major impact on the economy or competitiveness – there is data is manipulated by the security sector.

Economist '11

The Economist. "Measuring the black web: Is cybercrime as big as its foes fear?". October 15, 2011. http://www.economist.com/node/21532263

> Big numbers and online crime go together. **One well-worn assertion is that cybercrime revenues exceed those from the global trade in illegal drugs**. **Another nice round number is the $1 trillion-worth of intellectual property** that, **one senator claimed** earlier this year, cybercriminals snaffle annually. **It is hard to know what to make of these numbers**. **Online crooks**, like their real-world brethren, **do not file quarterly reports**. In the absence of figures from the practitioners, **experts tend to fall back on surveys of victims, often compiled by firms that sell security software**. **These have a whiff of self interest about them: they are the kind of studies that get press released but not peer reviewed**. **A paper by two researchers at Microsoft**, Dinei **Florencio and** Cormac **Herley, shows why: because losses are unevenly distributed**. Most people never have their bank accounts raided by cyber criminals, but an unfortunate few do, and lose a lot. This means that per capita losses, which the surveys calculate before extrapolating to a national figure, are dominated by a handful of big online heists. **Errors in the reporting of such infrequent crimes have a huge effect on the headline figure**. In a 1,000-person survey in America, for example, **exaggerating the impact of a single crime by $50,000 would add $10 billion to the national figure.** Other **data can be skewed this way too**. But those who analyse it take precautions to protect their results. **Few cybercrime surveys cite the methodology they used.** Those that do expose their plumbing do not convince the Microsoft authors. **The few researchers who have observed cyber criminals in action are similarly sceptical** about the industry's estimates. In the latest instalment of a mammoth four-year exercise Chris **Kanich** of the University of California, San Diego, **and colleagues tracked around 20 outfits that use spam to advertise illegal online pharmacies**. First they secretly monitored the spammers' payment systems. Then they obtained logs from one of the servers that power the illegal pharmaceutical sites. They even ordered (and—perhaps surprisingly—received) some of the non-prescription drugs on sale. **Their findings suggest that only two of the 20 or so operators bring in $1m or more per month**. The criminals behind fake security software appear to reap similar rewards, say Brett Stone-Gross and colleagues at the University of California, Santa Barbara. Their study, due to be presented at next month's eCrime 2011 conference in San Diego, puts the annual revenue of each criminal group at a few tens of millions of dollars. As with Mr Kanich's study, it is not clear how much of this is profit. **Such hauls fall well short of extravagant claims from the security industry that some spammers make millions every day**. Stefan Savage, Mr Kanich's PhD supervisor, says that **the security industry sometimes plays "fast and loose" with the numbers, because it has an interest in "telling people that the sky is falling"**.

AT Cybersecurity Adv- Heg Impact

Threat of cyber attacks are over hyped – the U.S. is economy and military is resistant to attacks.

Lewis '6

James A. Lewis is director of the technology and public policy program for the Center for Strategic and International Studies in Washington. "The War on Hype". February 19, 2006. San

Francisco Chronicle. http://www.sfgate.com/cgi-bin/article.cgi?f=/c/a/2006/02/19/INGDDH8E2V1.DTL&ao=all

> **Americans receive a steady stream of warnings and alarms about new and horrific perils** that await them. Pandemics, dirty bombs, **cyber attacks**, bioterror and other exotic threats are **always on the verge of being unleashed** onto a shamefully unprepared republic. **Yet, judging from statistic**s on life expectancy, violent deaths and war, **we live in much less perilous times** than any generation before us. Avian flu, for example. We are cautioned that a pandemic on the scale of the 1918 Spanish influenza outbreak, which cost hundreds of thousands of lives, is only months away. One World Health Organization estimate says 2 million to 7 million people will die in the next pandemic. But it is not 1918. The WHO reports that since 2003, there have been 152 cases of avian flu, resulting in 83 deaths. A flu pandemic has been regularly predicted since 1997 and (knock on wood) it has never arrived. **Or cyber terror. In 1995, the first in a long series of warnings of an "electronic Pearl Harbor"** was made. **Although terrorists have launched many attacks since 1995, none has involved cyber terror**. The closest thing to a cyber attack occurred in Australia, when a disgruntled employee who had designed the computer system for a sewage treatment plant was able to penetrate the network after 49 consecutive attempts that went unnoticed and release raw sewage. The government report on the incident says this produced an unbearable smell for several days. Residents were unhappy, but able to control their terror. **Cyber terror was at first suspected in the 2003 Northeast blackout. The cause turned out to be incompetence and falling trees**. **The widespread blackout did not degrade U.S. military capabilities, did not damage the economy**, and caused neither casualties nor terror. **One lesson to draw from this is that large, modern economies are hard to defeat. Their vulnerability -- to cyber attack** or dirty bombs or the other exotic weapons -- **is routinely exaggerated**. **Yes, computer networks are vulnerable to attack, but nations are not equally vulnerable. Countries like the U**nited **S**tates, **with its abundance of services and equipment and the ability and experience in restoring critical functions, are well equipped to overcome an attack**.

The Heg debate is OVER- U.S. decline is not only inevitable, it has arrived. The U.S. must accept China's ascendancy.

Christopher **Layne 2012** (is Robert M. Gates Chair in Intelligence and National Security at the George Bush School of Government and Public Service at Texas A&M University; ISQ* peer reviewed: ISI Journal Citation Reports® Ranking: 2010: International Relations: 10 / 73; Political Science: 18 / 139 Impact Factor: 1.523) "This Time It's Real: The End of Unipolarity and the Pax Americana" *International Studies Quarterly, 1-11*

> **The Cold War's end stifled the** burgeoning late 1980s' **debate about America's relative decline while triggering a new debate about unipolarity**. In the Great Recession's aftermath, **a verdict on those debates now can be rendered**. First, it turns out the **declinists were right** after all. **The United States' power has declined relatively.** By 2014, the US share of global GDP will shrink to 18%, which is well below the "normal" post-World War II share of 22% to 25% (Nye 1991, 2011). Just as the 1980s declinists predicted**, chronic budget and current account deficits, overconsumption, undersaving, and deindustrialization have exacted their toll on the American economy. Judgment also now can be rendered on the debate between balance of power realists and unipolar stability theorists. As balance of power realists predicted, one new great power already has emerged to act as a counterweight to American power, with others**

waiting in the wings. In contrast to unipolar stability theorists who said unipolarity would extend well into the twenty-first century, balance of power realists predicted that unipolarity would come to an end around 2010. **Instead of looking at the trend lines fueling China's rise and America's decline, unipolar stability theorists were wrong because they relied on static measures of national power and failed to grasp the velocity of China's rise. If, indeed, it has not already done so, sometime this decade**---perhaps as early as 2016-**China's GDP will surpass the United States'**. **No longer is China an emerging great power; it is a "risen" one. The debate about unipolarity is over**. The balance of power realists have won. Tbe distribution of power in international political system is shifting dramatically. **The US grand strategy must respond to the emerging constellation of power**. Yet, US policymakers and many security studies scholars are in thrall to a peculiar form of denialism. First, they believe the world still is unipolar even in the face of overwhelming evidence that it is not. Second, they believe that even if unipolarity were to end, there would be no real consequences for the United States because it will still be the "pivotal" power in international politics, and the essential features of the "liberal order" -the Pax Americana-will remain in place even though no longer buttressed by the US economic and military power that have undergirded it since its inception after World War II. This is myopic. Hegemonic decline always has consequences. As the twenty-first century's second decade begins, history and multipolarity are staging a comeback. **The world figures to become a much more turbulent place geopolitically than it was during the era of the Pax Americana. Accepting the reality of the Unipolar Exit---coming to grips with its own decline and the end of unipolarity symbolized by China's rise-will be the United States' central grand strategic preoccupation** during the next ten to fifteen years.

And it doesn't resolve any conflicts

Fettweis 11

Christopher, Professor of Political Science @ Tulane, Dangerous Times?: The International Politics of Great Power Peace, pg. 172-174

The primary attack on restraint, or justification of internationalism, posits that if the United States were to withdraw from the world, a variety of ills would sweep over key regions and eventually pose threats to U.S. security and/or prosperity. These problems might take three forms (besides the obvious if remarkably unlikely, direct threats to the homeland.). generalized chaos, hostile imbalances in Eurasia, and/or failed states. Historian Arthur Schlesinger was typical when he worried that restraint would mean "a chaotic, violent, and ever more dangerous planet." All of these concerns either implicitly or explicitly assume that the presence of the United States is the primary reason for international stability, and if that presence were withdrawn chaos would ensue. In other words, they depend upon hegemonic-stability logic. Simply stated, the hegemonic stability theory proposes that international peace is only possible when there is one country strong enough to make and enforce a set of rules. At the height of Pax Romana between 27 BC and 180 AD, for example, Rome was able to bring unprecedented peace and security to the Mediterranean. The Pax Britannica of the nineteenth century brought a level of stability to the high seas. Perhaps the current era is peaceful because the United States has established a de facto Pax Americana where no power is strong enough to challenge its dominance, and because it has established a set of rules that are generally in the interests of all countries to follow. Without a benevolent hegemon, some strategists fear, instability may break out around the globe..'". Unchecked conflicts could cause humanitarian disaster and, in today's interconnected world, economic turmoil that would ripple throughout global financial markets. If the United States were to abandon its commitments abroad, argued Art, the world would "become a more dangerous place' and, sooner or later, that would 'redound to America's detriment.'" If the massive spending that the United States engages in actually provides stability in the international political and economic systems, then perhaps internationalism is worthwhile. **There are good theoretical and empirical reasons**, however, **to believe that U.S hegemony is not the primary cause of the current era of stability. First** of all, **the hegemonic-stability argument overstates the role that the United States plays in the system. No country is strong enough to police the world** on its own. The only way there can be stability in the community of great powers is if self-policing occurs, if states have decided that their interests are served by peace. if no pacific normative shift had occurred among the great powers that

was filtering down through the system, then no amount of international constabulary work by the United States could maintain stability. Likewise, if it is true that such a shift has occurred, then most of what the hegemon spends to bring stability would he wasted. The 5 percent of the world's population that live in **the United States simply could not force peace upon an unwilling** 95. At the risk of beating the metaphor to death, **the United States maybe patrolling a neighborhood that has already rid itself of crime. Stability and unipolarity may be simply coincidental.** In order for U.S. hegemony to he the reason for global stability, the rest of the world would have to expect reward for good behavior and fear punishment for bad. Since the end of the Cold War, the United States has not always proven to he especially eager to engage in humanitarian interventions abroad. Even rather incontrovertible evidence of genocide has not been sufficient to inspire action. **Hegemonic stability can only take credit for influencing those decisions that would have ended in war without the presence**, whether physical or psychological, of the United States. **Ethiopia and Eritrea are hardly the only states that could go to war without the slightest threat of U.S. intervention. Since most of the world today is free to fight without U.S. involvement, something else must be at work. Stability exists in many places where no hegemony is present**. Second, the limited empirical evidence we have suggests that **there is little connection between the relative level of U.S. activism and international stability**. During the 1990s the United States cut back on its defense spending fairly substantially. By 1998 the United States was spending $100 billion less on defense in real terms than it had in 1990,72 To internationalists, defense hawks, and other believers in hegemonic stability, this irresponsible peace dividend" endangered both national and global security. "No serious analyst of American military capabilities;' argued Kristol and Kagan, 'doubts that the defense budget has been cut much too far to meet America's responsibilities to itself and to world peac&'73 If the pacific trends were due not to U.S. hegemony but a strengthening norm against interstate war, however, one would not have expected an increase in global instability and violence. The verdict from the past two decades is fairly plain: The world grew' more peaceful while the United States cut its forces. No state seemed to believe that its security was endangered by a less-capable Pentagon, or at least none took any action that would suggest such a belief. No militaries were enhanced to address power vacuums; no security dilemmas drove mistrust and arms races; no regional balancing occurred once the stabilizing presence of the U.S. military was diminished. The rest of the world acted as if the threat of international war was not a pressing concern, despite the reduction in U.S. capabilities. The incidence and magnitude of global conflict declined while the United States cut its military spending under President Clinton, and it kept declining as the Bush Administration ramped spending back up. **No complex statistical analysis should be necessary to reach the conclusion that the two are unrelated**. It is also worth noting for our purposes that the United States was no less safe.

Neoliberalism Prisons Link DDI

Prisons Link

The aff focuses on the wrong problem and gets coopted to make the prison system stronger—they make prisons look better while leaving in place the larger neoliberal structures that sustain the prison-industrial complex

Heitzeg, 14 – Ph.D, professor of sociology and director of the critical studies of race/ethnicity program at St. Catherine University (Nancy A., 12/18. "The Perils of Criminal Justice "Reform" and the Promise of Abolition." http://www.truth-out.org/news/item/28087-the-perils-of-criminal-justice-reform-and-the-promise-of-abolition)

But as we traverse what Kilgore aptly calls the Contradictory Road of "Reforming" Mass Incarceration, let's question, too, the legitimacy of well-meaning classically liberal models of "corrections" and "reform." These models can do their own sort of damage. Early this year right about the time that Angela Davis issued her words of warning – I was reminded of this again at a panel hosted by the Minneapolis League of Women Voters, Interrupting the Prison Pipeline: Partnerships, Prevention, Advocacy, Intervention. The panel included a host of well-connected Minneapolis political, nonprofit and faith-based "leaders." And despite the claims of "interrupting" in the title, the primary focus was in providing services to those already incarcerated or to ex-offenders in the form of increased employment opportunities via Ban the Box legislation, expanded voting rights for probationers, and more Second Chances. And of course we are for that. But where was discussion about prevention, alternatives to the criminal legal system, dismantling the school to prison pipeline, and the impetus for the first chances? Here's the truth: Minnesota, a couple of anomalies not withstanding, is a Blue state. Minneapolis an even bluer city. The state has one of the lowest incarceration rates in the nation (with fewer people in prison in the entire state than the two largest maximum security prisons in the U.S.. combined), and a Department of Corrections that advertizes its' "bold set of reforms that created one of the best correctional systems in the nation." Still, the racial disparities are staggering, with Blacks and American Indians dramatically over-represented, and more than 100,000 on probation/community supervision, a rate, that while declining, is near the top of the nation. So Minnesota runs a kinder gentler correctional industrial complex, where mostly "nice" white liberals control vast percentages of select populations (read: Black, Latino, Hmong, East African and American Indian) through racial profiling, community supervision/probation, and by offering an array of "re-entry' services to those released from our prisons. The entire endeavor is funded and blessed by a complex web that includes Hennepin County government services, the local nonprofit industrial complex, including an array of powerful statewide foundations, "socially responsible" corporations, interfaith coalitions, and elite research think tanks of the University of Minnesota. It is an obvious improvement over mass incarceration or raw "Right on Crime" profiteering, but it is still a nearly impenetrable economic web that creates and sustains a huge employment sector. These interests insure that the system is always needed, and no issue is ever "solved", that any grassroots groups that wants funding must jettison the more radical aspects of their agenda, and that innovative community-centered models, such as restorative justice, are immediately co-opted and institutionalized. Ultimately, we must question this too, and in fact,

question the entire enterprise known as "criminal justice." If the "best" practices still produce an excessive and unnecessary vortex of raced, classed, gendered social control, then alternatives to this must be envisioned as well. We must ask again, with Angela Davis: So, the question is: How does one address the needs of prisoners by instituting reforms that are not going to create a stronger prison system? Now there are something like two-and-a-half million people behind bars, if one counts all of the various aspects of what we call the prison-industrial complex, including military prisons, jails in Indian country, state and federal prisons, county jails, immigrant detention facilities—which constitute the fastest-growing sector of the prison-industrial complex. Yeah, so how—the question is: How do we respond to the needs of those who are inside, and at the same time begin a process of decarceration that will allow us to end this reliance on imprisonment as a default method of addressing—not addressing, really—major social problems? And the answer – Abolition.

Nuclear DA vs. Exports Northwestern

1NC

The US nuclear energy sector is weak, but export reforms revitalize it

NEI, 12, National Energy Institute, Winter 2012, "US Nuclear Export Rules Hurt Global Competitiveness", http://www.nei.org/News-Media/News/News-Archives/us-nuclear-export-rules-hurt-global-competitivenes

Nuclear Winter 2012—Fifty years ago, the United States was the global leader in nuclear technology and services, the first country to harness atoms for peace, and the first to profit from it internationally. Today, U.S. dominance of the global nuclear power market has eroded as suppliers from other countries compete aggressively against American exporters. U.S. suppliers confront competitors that benefit from various forms of state promotion and also must contend with a U.S. government that has not adapted to new commercial realities. The potential is tremendous—$500 billion to $740 billion in international orders over the next decade, representing tens of thousands of potential American jobs, according to the U.S. Department of Commerce. With America suffering a large trade deficit, nuclear goods and services represent a market worth aggressive action. However, **antiquated U.S. government approaches to nuclear exports are challenging U.S. competitiveness in the nuclear energy market.** New federal support is needed if the United States wants to reclaim dominance in commercial nuclear goods and services—and create the jobs that go with them. "The U.S. used to be a monopoly supplier of nuclear materials and technology back in the '50s and '60s," said Fred McGoldrick, former director of the Office of Nonproliferation and Export Policy at the State Department. "That position has eroded to the point where we're a minor player compared to other countries." America continues to lead the world in technology innovation and know-how. So what are the issues? And where is the trade? Effective coordination among the many government agencies involved in nuclear exports would provide a boost to U.S. suppliers. "Multiple U.S. agencies are engaged with countries abroad that are developing nuclear power, from early assistance to export controls to trade finance and more," said Ted Jones, director for supplier international relations at NEI. The challenge is to create a framework that allows commercial nuclear trade to grow while ensuring against the proliferation of nuclear materials. "To compete in such a situation, an ongoing dialogue between U.S. suppliers and government needs to be conducted and U.S. trade promotion must be coordinated at the highest levels," Jones said. Licensing U.S. Exports Jurisdiction for commercial nuclear export controls is divided among the Departments of Energy and Commerce and the Nuclear Regulatory Commission and has not been comprehensively updated to coordinate among the agencies or to reflect economic and technological changes over the decades. The State Department also is involved in international nuclear commerce. It negotiates and implements so-called "123 agreements" that allow for nuclear goods and services to be traded with a foreign country. The federal agencies often have different, conflicting priorities, leading to a lack of clarity for exporters and longer processing times for export licenses. "The U.S. nuclear export regime is the most complex and restrictive in the world and the least efficient," said Jones. "Furthermore, it is poorly focused on items and technologies that pose little or no proliferation concern. By trying to protect too much, we risk diminishing the focus on sensitive technologies and handicapping U.S. exports."

Allows the US to challenge Russia in the nuclear sphere

Jack **Spencer, 6/9**, Vice President of the Institute for Economic Freedom and Opportunity at The Heritage Foundation, "Ex–Im Is Not the Key to Nuclear Industry's Competitiveness", http://dailysignal.com/2015/06/09/ex-im-is-not-the-key-to-nuclear-industrys-competitiveness/

In the final days before the charter of the Export–Import Bank (Ex–Im) is set to expire, supporters of its export subsidies are claiming that Congress must reauthorize and expand Ex–Im if the U.S. commercial nuclear industry is to succeed internationally. We should take the concerns of the nuclear industry seriously—but not accept Ex–Im as a solution. Those who advocate for Ex–Im as a necessity for the U.S. nuclear industry's success argue: Without Ex–Im, the U.S. nuclear industry cannot compete with aggressive Russian expansion in nuclear energy exports, which is heavily financed by the

Russian government. As the argument goes, Russian financing not only threatens the U.S. nuclear industry's ability to compete, but it fosters the region's overdependence on Russia for energy. The response to Russia's strategy is not to reciprocate with a similar, albeit milder, policy that encourages cronyism and puts taxpayers on the hook for corporate interests. The right approach is for the U.S. government to streamline export regulations with nations with whom we have entered into nuclear agreements and for nuclear companies to compete by offering superior products and services. Subsidies only undercut the industry's competitive strength. American companies already have a distinct advantage over the Russian nuclear industry in the same regions Ex–Im supporters claim particular concern. European nations are willing to pay for secure access to energy resources, and the European Union has launched a strategic initiative to diversify the energy options of member nations.

Nuclear energy is the lynchpin of Russia's economy

Andrei **Frolov, 14**, PhD degrees in physics from Alberta University, June 26, 2014, "Nuclear energy is still important for Russia", http://in.rbth.com/opinion/2014/06/26/nuclear_energy_is_still_important_for_russia_36237.html

The third reason for developing its nuclear resources is the growing prospects for the export of nuclear technologies. Russia's nuclear energy sector is becoming a major world exporter of nuclear power units. Russian nuclear power units operate in countries ranging from China and India to Turkey and Slovakia. There are currently five Russian power units being built abroad, with 13 more under contract to be built in the next several years. Discussions are in progress for at least 10 more units. In addition to exporting reactor technology, under these contracts Russia agrees to provide fuel, components, spare parts and services such as maintenance and spent fuel recycling for the duration of the reactor's life, which could be as much as 60 years. The value of these services to Russia's economy is far greater than the sale of the reactor itself. Another important reason for the continued development of Russia's nuclear sector is the country's security. The existence of a strong civilian nuclear energy sector ensures effective operations of its nuclear weapons complex. In addition, civilian orders keep the sector's dual-purpose enterprises busy. Russia lags behind in renewable energy 'game' For example, it is now clear that the Rosatom-funded program for the construction of a floating nuclear power station, which was heavily criticized in its early stages, has allowed Russia to retain its ship reactor technology, which was later used to expand the nuclear icebreaker fleet. This fleet, in turn, is becoming ever more important for the global shipping industry as more goods are shipped through the Northern Sea Route. Nuclear power is important for Russia's continued economic development for reasons far beyond maintaining military readiness. Keeping up with the latest technologies in the sector keeps thousands of highly qualified Russian scientists employed.

Russian Economic decline cause nuclear war

Sheldon **Filger, 9**, Author and founder of www.GlobalEconomicCrisis.com, June 10, 2009,"Russian Economy Faces Disastrous Free Fall Contraction", http://www.huffingtonpost.com/sheldon-filger/russian-economy-faces-dis_b_201147.html

In Russia, historically, economic health and political stability are intertwined to a degree that is rarely encountered in other major industrialized economies. It was the economic stagnation of the former Soviet Union that led to its political downfall. Similarly, Medvedev and Putin, both intimately acquainted with their nation's history, are unquestionably alarmed at the prospect that Russia's economic

crisis will endanger the nation's political stability, achieved at great cost after years of chaos following the demise of the Soviet Union. Already, strikes and protests are occurring among rank and file workers facing unemployment or non-payment of their salaries. Recent polling demonstrates that the once supreme popularity ratings of Putin and Medvedev are eroding rapidly. Beyond the political elites are the financial oligarchs, who have been forced to deleverage, even unloading their yachts and executive jets in a desperate attempt to raise cash. Should the Russian economy deteriorate to the point where economic collapse is not out of the question, the impact will go far beyond the obvious accelerant such an outcome would be for the Global Economic Crisis. There is a geopolitical dimension that is even more relevant then the economic context. Despite its economic vulnerabilities and perceived decline from superpower status, Russia remains one of only two nations on earth with a nuclear arsenal of sufficient scope and capability to destroy the world as we know it. For that reason, it is not only President Medvedev and Prime Minister Putin who will be lying awake at nights over the prospect that a national economic crisis can transform itself into a virulent and destabilizing social and political upheaval. It just may be possible that U.S. President Barack Obama's national security team has already briefed him about the consequences of a major economic meltdown in Russia for the peace of the world. After all, the most recent national intelligence estimates put out by the U.S. intelligence community have already concluded that the Global Economic Crisis represents the greatest national security threat to the United States, due to its facilitating political instability in the world.

Block

Russia's economy is rebounding, but its still weak

Mark **Adomanis, 15**, MA/MBA candidate at the Lauder Institute and the Wharton School of Business contributor to Forbes, April 22, 2015, "Russia's Economy Pulls Back From the Brink", http://www.themoscowtimes.com/opinion/article/russias-economy-pulls-back-from-the-brink/519581.html

As he faced the nation, Putin was much more optimistic than he has been over the past few months, proclaiming that the worst of the crisis has passed and that Russia would return to "normal" growth in less than two years. According to the Kremlin, then, the economic war against Russia is over, and Russia won. Putin very well might, as German Chancellor Angela Merkel put it, live in "another world." Certainly his statements about Ukraine have very little basis in objective reality, and it would be exceedingly foolish to simply take his upbeat proclamations at face value. In this particular instance, however, Putin really doesn't seem to be that far off of the mark. The idea that Russia's economy could already be emerging from the recent crisis is not a Kremlin conspiracy. Western outlets like Newsweek have also featured upbeat stories about Russia's unexpectedly robust economic performance. Even people who are critical of Putin and Putinism, like Bloomberg View columnist Leonid Bershidsky, have noted that Russia's current downturn might not prove so bad after all. Financial professionals are not quite as upbeat as the Russian government, of course, but have gone on the record with expectations that the economy will bottom out in the second or third quarter and cumulatively shrink by somewhere between 3 and 4 percent. A few individual forecasts (like Standard & Poor's) now predict a hit to Russian gross domestic product of only 2.6 percent. This relative optimism is very different compared to how the situation was just a few months ago. Back in December and January it really did look like the bottom had fallen out from under Russia.

Export controls deck the nuclear industry

James A. **Glasgow, 12**, partner at Pillsbury Winthrop Shaw Pittman LLP, October 2012, "NUCLEAR EXPORT CONTROLS A Comparative Analysis of National Regimes for the Control of Nuclear Materials, Components and Technology", http://www.pillsburylaw.com/siteFiles/Publications/NuclearExportControls.pdf

Commercial nuclear companies that export goods and services from the United States have long pointed to the U.S. nuclear export control system as a major competitive disadvantage as they compete with their counterparts in nuclear supplier nations such as the Russian Federation, Japan, the Republic of Korea (ROK) and France. Their concerns are based on a belief that the U.S. nuclear export control regime is: (1) **more complex and difficult for U.S. companies to navigate**, impeding their ability to secure required licenses and authorizations for exports of nuclear services and commodities; (2) significantly **less efficient** in processing export licenses than its counterparts in other nations, and (3) **more restrictive** in its controls than the regimes of other nuclear supplier nations, causing potential customers to refrain from doing business with U.S. nuclear vendors and service providers and/or hindering the ability of the U.S. companies to execute and perform contracts with foreign customers. In a November 2010 report on commercial nuclear exports, the Government Accountability Office (GAO) cited concerns that the U.S. export control regime imposes a competitive disadvantage on U.S. exports. GAO reported industry statements "that [the U.S. Department of Energy's (DOE)] Part 810 authorization regulations are vaguely defined and that DOE interprets its authority to include transfers of technology and technical assistance too broadly." 1 The objective of this report is to evaluate whether U.S. commercial nuclear exporters do, in fact, face a competitive

disadvantage because of the U.S. export control regime and, if such burdens exist, to identify them. This requires a comparative analysis of the commercial nuclear export control regimes of major supplier countries. The report provides an overview of four national regimes for the control of exports of nuclear materials, components and technology – those of Russia, Japan, ROK and France – and compares these regimes to the U.S. nuclear export control regime.

Nuclear exports are extremely important for Russia's economy

Gary **Sampson, 11**, writer for EnergyBiz, January/February 2011, "Russia's Nuclear Ambitions PUSHING EXPORTS", http://www.energybiz.com/magazine/article/195961/russias-nuclear-ambitions

RUSSIA IS CONTINUING ITS POLICY OF vigorously pushing the export of all things pertaining to nuclear energy production. The year 2010 proved to be a good year for business. The past year has witnessed multibillion-dollar nuclear power plant sales to countries ranging from Venezuela to India and from China to Turkey. Russia is building 15 of the 60 nuclear reactors currently under construction in the world. Russia itself has some 31 nuclear reactors in operation and plans to increase that number to 59 in the near future, nearly doubling power output by 2020. Concern over the 1986 disaster at Chernobyl no longer appears to be a major factor in nuclear power plant sales as the current technology of the Russian nuclear industry is acknowledged to be on a par with any in the world. Russia was the first country to have a nuclear power plant producing electricity. That was in 1954 at the Obninsk reactor. The similar, but less serious nuclear event at Three Mile Island in Pennsylvania in 1979 turned much American public opinion against nuclear power. The Russian nuclear power industry, being less influenced by public opinion, continued working on improving nuclear power technology and has now fully caught up with current practice. Some of the success may be due to special technology-sharing agreements with Western and Japanese companies. In 2009, the Russian Atomic Energy Power Corp., Atomenergoprom, signed a framework agreement with Japan's Toshiba for collaboration in the development of nuclear power technology. Toshiba purchased Westinghouse Electric in 1996 for $5.4 billion and Westinghouse technology is the basis for about 50 percent of the world's operating commercial nuclear power plants. The Russian-Japanese agreement centers on the design and engineering of commercial nuclear power plants and related equipment. Another joint technology agreement is with Germany's Siemens. Siemens will provide turbines for Rosatom, the Russian state-owned nuclear corporation. Siemens and Rosatom will work together on developing designs for new nuclear power plants and upgrading the efficiency and lifespan of existing plants. The Siemens agreement is expected to be finalized in 2011. Russia is currently working on a project to extend the life of existing Russian nuclear power plants beyond their designed 30-year limit. With confidence in the quality of its product, Russia hopes to supply a significant percentage of the world demand for new nuclear power plant capacity, which is expected to grow by about 300 gigawatts between now and 2030. Russia plans to be rid of environmentally harmful fossil fuel power generation by 2050 by using the new type of fast reactor nuclear plants. Russia markets its state-of-the-art nuclear products with a host of special incentives for customers. At the top of the incentive list is price. Russian 1,000-megawatt plants cost an average of $2.9 billion in Russia, less financing. This price is 20 to 50 percent below the Western norm. The low prices are being challenged now by a consortium of South Korean manufacturers. The Korean consortium, led by Korean Electric Power, KEPCO, recently beat out both France's Areva group and a joint venture between GE and Hitachi to win a $20 billion contract in the United Arab Emirates. The Koreans came in at 20 percent below their competitors. Not all deals are simple sales to a customer. Russia will retain ownership of the $20 billion project to build Turkey's first nuclear power plant, to be located on the country's southern coast. The Russian entity running the plant will be Atomstroyexport. Local sale of electricity will pay for construction of the plant. The four reactors, each with a capacity of 1.2 gigawatts, are expected to begin operation between 2016 and 2019. The Turkish government pays nothing up front. When the plant is finished in seven years, Atomstroyexport will be free to sell up to 49 percent of the business to investors. The Russians have another distinct advantage in that their contracts usually include an agreement to bundle the complete fuel-cycle supply with plant construction. Among competitors, only France's Areva does the same. This means the Russians will supply the low-enriched uranium used to fuel the plant and take the spent fuel back to Russia. In a sense the fuel is leased to the users of the plant. Spent fuel is a product in itself. It can be reprocessed in various ways, making it valuable for use in fast neutron reactors. Supply of nuclear fuel to any power plant, not just Russian-built ones, is an important Russian business in itself. Rosatom or its subsidiaries supply 30 percent of the nuclear fuel used in France, 100 percent of the fuel used in Switzerland, and about 45 percent of the fuel used by American utilities. Ten percent of all electricity in the United States is generated by uranium material taken from decommissioned Russian nuclear weapons. This is the result of the Megatons to Megawatts agreement between Russia and the United States. Both countries have been converting bombs into reactor fuel, but the agreement expires in 2013. Russia has about 40 percent of global uranium enrichment capacity and supplies 17 percent of the nuclear fuel used around the world at the present time. Rosatom hopes

to increase its market share to 25 percent by 2025. Russia does not have to rely on its old nuclear weapons alone for uranium. In June, Russia purchased a controlling interest in Canada's Uranium One mining and exploration company for $610 million. This acquisition, along with Russia's proven 8 percent of the world's uranium reserves, should ensure a reliable, continuing supply of fuel. Low prices and waste management agreements are not always enough to make the sale. The contract signed in March between Russia and India called for the construction of 16 nuclear reactors in India - six to be completed by 2017. Russia is also to throw in 29 new fighter aircraft, an unspecified number of new transport aircraft, and a refitting of an Indian aircraft carrier. There is also a further difference from the usual contractual arrangements in that the Indians do not have to return the spent fuel

Export controls are the key internal link

Jack **Spencer, 6/9**, Vice President of the Institute for Economic Freedom and Opportunity at The Heritage Foundation, "Ex–Im Is Not the Key to Nuclear Industry's Competitiveness", http://dailysignal.com/2015/06/09/ex-im-is-not-the-key-to-nuclear-industrys-competitiveness/

The biggest threat to the competitiveness of the American nuclear industry may in fact be the American government. The Nuclear Regulatory Commission currently has **60 rulemakings** underway and operates under an **outdated regulatory system that unnecessarily inflates cost** and that makes bringing new technologies to market prohibitively difficult. Commercial nuclear exports are likewise inhibited. The commercial nuclear export regime is convoluted and burdensome and spread between three different federal agencies—all of which **increases costs, imposes delays, and limits innovation**.

Choosing specific countries can't solve

David **Damast, 10**, J.D. from Georgetown University Law Center in May 2010 and currently employed by the Air Force Space Command, Fall 2010, "EXPORT CONTROL REFORM AND THE SPACE INDUSTRY", http://www.lexisnexis.com.turing.library.northwestern.edu/lnacui2api/results/docview/docview.do?docLinkInd=true&risb=21_T22415302054&format=GNBFI&sort=RELEVANCE&startDocNo=1&resultsUrlKey=29_T22415302058&cisb=22_T22415302057&treeMax=true&treeWidth=0&selRCNodeID=2&nodeStateId=411en_US,1&docsInCategory=22&csi=294116&docNo=5

H.R. 2410 also adds yet another layer of difficulty to the export control regime by maintaining satellites and related technologies on the USML as to China and China alone. This would create serious [*229] problems of administration and enforcement. Historically, items have either been covered by the USML, which distinguishes by use, not destination, or by BIS's Commerce Control List (CCL), which does distinguish by destination or end-use. There is some precedent for classifying items on multiple lists, as many items subject to permissive export on the CCL are also subject to nearly complete denial under the Treasury Department's list of embargoed countries. n112 A key difference arises, though, due to ITAR's lack of a de minimis exception. This will create uncertainty in the application of the law to American exports, because a product may be exported under EAR control but then be re-exported to China far down the distribution chain, long after it has been incorporated into another product. For example, a component may be exported to Europe or Japan permissively under EAR jurisdiction for use in manufacturing a commodity satellite bus. That manufacturer may also source the same part from a foreign supplier. The satellite may then be bought by an operator who decides shortly thereafter to launch from China. The satellite component would then become subject to all of the restrictions of ITAR, including the need for a TAA and DTSA monitoring--possibly without the

knowledge of the exporter, manufacturer, operator, or launcher. Had the item been covered by ITAR throughout, the exporters would have had to be responsible for their product through the entire supply chain and any attempts at re-export would have required licensing; the same is true under EAR for items requiring licenses, which is not the case for de minimis parts. Given the severity of the penalties for violating ITAR, n113 this places a heavy burden on exporters. In practice, the regulations would be unenforceable unless the original manufacturer kept tabs on the part all the way down the line until final disposition. Enforcing the regulations would therefore require such an effort. At that point, the protections required would only be slightly less intrusive than ITAR--if so, the legislation will have failed to achieve its stated purpose. An additional complication arises in that some satellite components, such as certain kinds of communications equipment and solar panels, are currently classified not under ITAR jurisdiction, but under EAR jurisdiction. From an administrative perspective, this would require keeping two lists: one for satellite components on the CCL as of the date of H.R. 2410's passage and one for those subject to ITAR. Under the bill, those that were on the CCL, such as solar panels, could be exported to China as much as [*230] allowed under the EAR, while those that were not, such as fuel for a satellite's maneuvering rockets, would be subject to ITAR. A further complication could arise in that the Executive could choose to place some of the items currently under EAR jurisdiction under ITAR jurisdiction. At that point, the Executive might lose the discretion to return them to EAR jurisdiction for export to China. Alternatively, a separate list would need to be maintained of those items that were originally subject to EAR as of the date of the bill's passage but were subsequently transferred to ITAR jurisdiction: the Executive might then retain the discretion to return those items to the CCL. Given these problems of implementation, it might be better to eliminate the China exclusion entirely and simply allow BIS to subject satellite exports to China to the highest levels of licensing scrutiny afforded under the EAR. Furthermore, the post-Tiananmen requirement that the President approve, and notify Congress of, every satellite exported to launch from or by China remains in effect. n114 If Congress were truly worried about Chinese military use of civil American space technologies, it could simply mandate a general policy of exclusion under the EAR, thus preserving the de minimis exception. Alternatively, it could add a de minimis exception to ITAR. The current political climate, however, allows for none of these changes. In fact, the original draft of the bill did not include the China exclusion; its addition was necessary to pass the bill. n115

Overload Core Michigan 7

A2: overload link turn

Alt Causes

Alt causes – data reduction *isn't* enough to solve

Zoldan, 13

Ari Zoldan is an entrepreneur in the technology industry and business analyst based primarily in New York City and Washington, D.C. "More Data, More Problems: is Big Data Always Right?" Wired, May 2013, http://www.wired.com/2013/05/more-data-more-problems-is-big-data-always-right/ // IS

How do we fight the problems of big data? First, we need to approach every data set with skepticism. You have to assume that the data has inherent flaws, and that just because something seems statistically right, doesn't mean it is. Second, you need to realize that data is a tool, not a course of action. Would you ask your hammer how to build a house? Of course not! You can't let the data do the thinking for you, and can never sacrifice common sense. And third, having a lot of data is good, but what we need are the means to analyze and interpret it for use.

Inev

Overload is inevitable and quick-fix solutions fail

Bawden & Robinson, Department of Information Science City University London, '08

(David Bawden; Lyn Robinson, Department of Information Science, City University London, "The dark side of information:¶ overload, anxiety and other¶ paradoxes and pathologies" 9/19/2008 http://www.bollettinoadapt.it/old/files/document/21976david_b-2008.pdf) //GY

While it is true to say that overload has been recognised most clearly in the business and commercial¶ sectors, and in specialist areas such as science and healthcare, it has been a matter of¶ concern to information specialists in all environments, including academic and public libraries.¶ It may be argued that information overload is the natural and inevitable condition of the human¶ species. There has been a consistent viewpoint suggesting that the issue is exaggerated, or even¶ imagined: see, for example, Savolainen [23]. Our senses, particularly the visual sense, are able to¶ handle a huge amount of input, and to identify significant patterns within it. The modern information¶ environment, however, presents us with information in forms with which our senses, and prior experiences,¶ are ill-equipped to deal. The causes of overload, in this sense, are multiple and complex;¶ hence the difficulty in providing any single "quick fix" solution.¶ It is tempting, and usual, to assume that a major contributing factor, if not the only significant¶ factor, in information overload is the TMI effect: "too much information". This is readily supported¶ by statistics of the sort often quoted [17]:¶ • a weekly edition of the New York Times contains more information than the average person was¶ likely to come across in a lifetime in seventeenth-century England¶ • the English language of the late 20th century contains about 50,000 words, five times more than¶ in Shakespeare's lifetime¶ • the collections of the large US research libraries doubled between 1876 and 1990¶ • over one thousand books were published each day across the world during 1990¶ • more information has been created in the past 30 years than in the previous 5,000 years¶ • the number of records in publicly available online databases increased from 52 million in 1975¶ to 6.3 thousand million in 1994¶ • the number of documents on the Internet

doubled from 400 million to 800 million from 1998 to 2000¶ • it would take over 200,000 years to 'read all the Internet', allowing 30 minutes per document.¶ Increasing diversity of information can also lead to overload, partly by virtue of a consequent¶ increase in the volume of information on a given topic, which may come from varying perspectives,¶ but also because of an intellectual difficulty in fitting it within a cognitive framework appropriate¶ for the use and the user. Diversity may occur both in the nature of the information itself, and in the¶ format in which it appears, with a typical business user having to deal with paper, e-mail, voicemail,¶ traditional websites, and so on, to which the newer blogs, wikis and the like must be added.¶ New information and communication technologies, aimed at providing rapid and convenient access¶ to information, are themselves responsible for a high proportion of the overload effect: see, for example,¶ Allen and Shoard [24]. Certain kinds of technology are generally highlighted in this respect, particularly¶ "push" systems, which actively deliver information to the user without any request for it. While the volume of information available for search and retrieve at the user's discretion—"pull"—may be so large¶ as to be daunting, there is not the same sense of information constantly arriving without being under¶ the user's control as with the active delivery systems. E-mail is usually regarded as the worst offender,¶ particularly with overuse of "blanket" e-mail or needless "cc-ing" of messages.

More data good

Bitcoin avoids PRISM compliance—the plan prevents federal data collection on it through domestic companies

Neagle, 13

(Colin, 6-12-13, Network World, "Bitcoin isn't PRISM-proof", http://www.networkworld.com/article/2167213/software/bitcoin-isn-t-prism-proof.html, amp)

In the aftermath of the revelation of PRISM, the NSA spying program that collects user data from nine major U.S. tech companies, many have highlighted alternate options from organizations that are not known to be cooperating with government surveillance efforts.

Among those alternatives, Bitcoin has been pegged as a more private payment option. At Prism-Break.org, which lists alternatives to all the services that fall under the PRISM umbrella, Bitcoin is the only listed alternative to online payment services, such as PayPal and Google Wallet.

Bitcoin ATM is 'horrible for money laundering', says co-creator

But users should know that Bitcoin is not as anonymous as it seems, and while there is no evidence that Bitcoin services are collaborating with federal agencies, information on Bitcoin transactions is readily available to them on the Internet.

A 2011 study conducted by University College Dublin researchers Fergal Reid and Martin Harrigan concluded that although anonymity has been one of Bitcoin's main selling points, "Bitcoin is not inherently anonymous."

"We have performed a passive analysis of anonymity in the Bitcoin system using publicly available data and tools from network analysis," the researchers wrote in a blog post. "The results show that the actions of many users are far from anonymous. We note that several centralized services, e.g. exchanges, mixers and wallet services, have access to even more information should

they wish to piece together users' activity. We also point out that an active analysis, using say marked Bitcoins and collaborating users, could reveal even more details."

In 2012, the publicly available data on Bitcoin transactions was used by researchers Adi Shamir and Dorit Ron to identify the first ever transaction on the network, which is believed to be from an account held by Bitcoin's mysterious creator, known only as Satoshi Nakamoto. While these transactions were covered up quite well, Ron and Shamir concluded that they are not entirely untraceable.

"Finally, we noted that the subgraph which contains these large transactions along with their neighborhood has many strange looking structures which could be an attempt to conceal the existence and relationship between these transactions, but such an attempt can be foiled by following the money trail in a sufficiently persistent way," the report explains.

This may not come as a surprise to the most passionate members of the Bitcoin community, who look at Bitcoin as a movement to revolutionize online payments, rather than a tool to remain anonymous on the Internet. Zach Harvey, co-founder of Lamassu and co-creator of the Bitcoin ATM, says Bitcoin is actually "horrible for money laundering" because the veil of anonymity can be lifted.

Indeed, late last month the online currency exchange service Liberty Network, which is similar to Bitcoin, was infiltrated by international law enforcement agencies that allege it laundered more than $6 billion in money for criminal organizations. The investigation was brought down after an undercover agent created an account on Liberty Network and listed the purpose as "cocaine."

Basically, if independent researchers can trace Bitcoin transactions back to the people responsible, and the U.S. government can investigate digital currencies hosted overseas (Liberty Network was based in Costa Rica), then the NSA, CIA, FBI or any other federal agency can likely peek into Bitcoin activity as well.

Extra-PRISM authorities are key to investigate the Dark Web

Green, 15

(Shemmyla, 4-19-15, Cyberbear Tracks, "Exploring the Deep Web", http://cyberbeartracks.com/?p=545, amp)

Darknet is a subsection of Deep Web that is accessed by Tor. Tor is a web browser, like Chrome or Safari, and free software that helps you defend against traffic analysis, a form of network surveillance that threatens personal freedom and privacy, confidential business activities and relationships, and state security. It sends Internet data through a series of 'relays', adding extra encryption, making web traffic practically impossible to trace. This is the place where much of the anonymous dark, perverted, creepy and illegal activity is, but is it truly anonymous? If **the FBI** truly **seized the Silk Road's servers illegally** and **based off what has been discovered about** NSA and **Prism**, the answer is no.

"There is no such thing as really being anonymous on the Internet. If [hackers and government agencies] want you, they will get you. At the moment the Tor network's security has never been broken, but there are flaws around it that can be exploited," Andy Malone, of Microsoft

Enterprise Security and founder of the Cyber Crime Security Forum, said at the Microsoft TechEd North America 2014.

Now let's discuss PRISM and the NSA. PRISM is a tool used by the US National Security Agency (NSA) to collect private electronic data belonging to users of major Internet services like Gmail, Facebook, Outlook, and others. It's the latest evolution of the US government's post-9/11 electronic surveillance efforts, which began under President Bush with the Patriot Act, and expanded to include the Foreign Intelligence Surveillance Act (FISA) amended in 2006 and 2007. NSA programs collect two kinds of data: metadata and content. Metadata is the sensitive byproduct of communications, such as phone records that reveal the participants, times, and durations of calls; the communications collected by PRISM include the contents of emails, chats, VoIP calls, cloud-stored files, and more. This method of catching criminals appears very intrusive to the average law abiding citizen and is a violation of our 4th Amendment rights. In order to obtain search warrant law enforcement officers must:

1. Have probable cause to believe a search is justified.

2. Support this showing with sworn statements (affidavits), and

3. Describe in particularity the place they will search and the items they will seize.

Not the polar opposite method.

Bitcoin and the dark web cause lone wolf terrorism

Terence **Check 13**, J.D. Candidate, Cleveland-Marshall College of Law, 5/5/13, "Shadow currency: how Bitcoin can finance terrorism," http://theworldoutline.com/2013/05/shadow-currency-how-bitcoin-can-finance-terrorism/

This "crypto-currency" has already been the inspiration for several online robberies where cyber-thieves hack into a computer to steal the vital electronic information at the heart of Bitcoins. Beyond cyber-larceny, the secrecy of Bitcoin poses unique, and even frightening security challenges for a world that has yet to fully understand the problems posed by the internet age.

For example, consider the various national and international anti-money laundering statutes. These laws seek to prevent the illegal flow of currency between criminals, terrorists and other unsavory characters. But these laws require that there are actual shipments of cash between countries and criminal networks (or at the very least funds transfers between banks).

The Bitcoin protocol promises to remove the fundamental risk in money laundering: the risk of interception and detection. By using a monetary exchange like Mt.Gox, criminals can buy Bitcoins at the market rate and then they can sell to a confederate across the world at a higher price, effectuating the exchange of money. Even if Bitcoin performs poorly, it nevertheless provides an opportunity to exchange money via the anonymous P2P network.

The Silk Road can make Bitcoin even more insidious. While the Silk Road, as site policy, forbids the sale of destructive items (stolen credit cards, explosives, etc.), it could be a matter of time before a similar website arises. Then, the firearms laws of the Western world will become virtually useless. Guns can be disassembled, and their parts shipped piecemeal through the postal service. Even substances like Tannerite could be bought and shipped across the globe, providing new opportunities for destructive capacity. If this alone is not enough to compel attention to the growing black market on cyberspace, consider the following.

Bitcoin can make security and law enforcement measures less effective by simply removing the possibility of detection. Terrorist cells or lone wolf operators can get supplies and currency by using the anonymous underbelly of the internet. Government agents are able to detect terrorists through logistical networks (Usama bin Laden was found through his courier). Counter-terrorism, for better or worse, succeeds when it has human networks to exploit. Terrorists need accomplices, handlers, recruits, and suppliers. Sooner or later, one of the individuals in this vast network becomes frightened or disillusioned with the cause and becomes a government informant. Remove the extended logistical network that exposes terrorists to investigation at a critical juncture (where their plans are neither theoretical nor well-supplied enough to implement) and there may be grievous results.

So what legal paths can be utilized to make sure such a development does not occur? The easiest and most effective way to deal with this threat is to make sure that it never comes into fruition. The Silk Road is difficult to take down given its place within the "Deep Internet", but an arms-trading counterpart may be more susceptible to infiltration and dismemberment.

The second option spells doom for electronic currencies. Much like domestic laws that flag large banking transactions, governments and the private sector can collude to run Bitcoin out of the currency market. Simply put, laws could be passed that force banks to reject bitcoin transactions. Thus, even if Bitcoins continue to be traded, there is no way to turn them back into real currency. The final approach would require nations to expand the police power of domestic and foreign intelligence agencies on the web. While there is a visceral aversion to government personnel infiltrating internet communications, the ultimate security benefits may outweigh the cost to certain freedoms.

Metadata is the crux of counterterrorism—key to hindsight and prediction

Hines, 13

(Pierre, defense council member of the Truman National Security Project, 6-19-13, Quartz, "Here's how metadata on billions of phone calls predicts terrorist attacks", http://qz.com/95719/heres-how-metadata-on-billions-of-phone-calls-predicts-terrorist-attacks/, amp)

Yesterday, when NSA Director General Keith Alexander testified before the House Committee on Intelligence, he declared that the NSA's surveillance programs have provided "critical leads to help prevent over 50 potential terrorist events." FBI Deputy Director Sean Boyce elaborated by describing four instances when the NSA's surveillance programs have had an impact: (1) when an intercepted email from a terrorist in Pakistan led to foiling a plan to bomb of the New York subway system; (2) when NSA's programs helped prevent a plot to bomb the New York Stock Exchange; (3) when intelligence led to the arrest of a U.S. citizen who planned to bomb the Danish Newspaper office that published cartoon depictions of the Prophet Muhammad; and (4) when the NSA's programs triggered reopening the 9/11 investigation.

So what are the practical applications of internet and phone records gathered from two NSA programs? And how can "metadata" actually prevent terrorist attacks?

Metadata does not give the NSA and intelligence community access to the **content** of internet and phone communications. Instead, metadata is more like the transactional information cell phone customers would normally see on their billing statements—metadata can indicate when a call, email, or online chat began and how long the communication lasted. Section 215 of the Patriot Act provides the legal authority to obtain "business records" from phone companies. Meanwhile, the NSA uses Section 702 of the **F**oreign **I**ntelligence **S**urveillance **A**ct to authorize its PRISM

program. According to the figures provided by Gen. Alexander, intelligence gathered based on Section 702 authority contributed in over 90% of the 50 cases.

One of major benefits of metadata is that it provides hindsight—it gives intelligence analysts a retrospective view of a sequence of events. As Deputy Director Boyce discussed, the ability to analyze previous communications allowed the FBI to reopen the 9/11 investigation and determine who was linked to that attack. It is important to recognize that terrorist **attacks are not orchestrated overnight**; they take months or years to plan. Therefore, if the intelligence community only catches wind of an attack halfway into the terrorists' planning cycle, or even after a terrorist attack has taken place, metadata might be the only source of information that captures the sequence of events leading up to an attack. Once a terrorist suspect has been identified or once an attack has taken place, intelligence **analysts can use powerful software to sift through metadata to determine which numbers, IP addresses, or individuals are associated with the suspect**. Moreover, phone numbers and IP addresses sometimes serve as a proxy for the general location of where the planning has taken place. This ability to narrow down the location of terrorists can help determine whether the intelligence community is dealing with a domestic or international threat.

Even more useful than hindsight is a crystal ball that gives the intelligence community a look into the future. Simply knowing how many individuals are in a chat room, how many individuals have contacted a particular phone user, or how many individuals are on an email chain could serve as an indicator of how many terrorists are involved in a plot. Furthermore, knowing when a suspect communicates can help identify his patterns of behavior. For instance, metadata can help establish whether a suspect communicates sporadically or on a set pattern (e.g., making a call every Saturday at 2 p.m.). Any deviation from that pattern could indicate that the plan changed at a certain point; any phone number or email address used consistently and then not at all could indicate that a suspect has stopped communicating with an associate. Additionally, a rapid increase in communication could indicate that an attack is about to happen.

Metadata can provide all of this information without ever exposing the content of a phone call or email. If the metadata reveals the suspect is engaged in terrorist activities, then obtaining a warrant would allow intelligence officials to actually monitor the content of the suspect's communication.

In Gen. Alexander's words, "These programs have protected our country and allies . . . [t]hese programs have been approved by the administration, Congress, and the courts." Now, Americans will have to decide whether they agree.

Mass collections solves terror – all data is important

Schulberg, Huffington Post, 5/10 (Jessica Schulberg, correspondent Huffington Post, MA international politics "Richard Burr Says 9/11 Could Have Been Preventable With Mass Surveillance" 05/10/2015 http://www.huffingtonpost.com/2015/05/10/burr-patriot-act-911_n_7251814.html) //GY

Sen. Richard Burr (R-N.C.) said on Sunday that the Sept. 11, 2001, attacks may have been preventable if the bulk phone collection program that exists today under the Patriot Act was in effect back then.¶ Speaking on ABC's "This Week," Burr, who chairs the Senate Intelligence Committee, rejected the idea of returning to a narrower surveillance program that would only collect data on people suspected of being terrorists. "That turns us back to pre-9/11," said Burr.

“It was very time consuming, it was cumbersome.”¶ Explaining the decision to pass the Patriot Act, Burr said, “What we looked at was the impact of 9/11 and the fact that **we might have been able to stop 9/11, had we had bulk collection**.”¶ Three sections of the Patriot Act, the law passed immediately after the attacks, are set to expire June 1 (but May 22 is the last day Congress has to act before going into recess). One key provision that is set to expire is Section 215, which has served as the legal justification for the government’s phone records collection program.¶ "I do think it should continue for the simple reason that it's very effective at keeping America safe," Burr said Sunday. "And in addition to that, we've had absolutely no incident of anybody's privacy being intruded on."¶ The already contentious debate about whether to reauthorize the program has been further complicated by Thursday’s federal appeals court ruling, which found that Congress did not authorize the phone collections program in its current form when it passed the Patriot Act.¶ Sen. Ron Johnson (R-Wis.), chairman of the Senate Homeland Security Committee, was quick to note that the court’s ruling did not definitively rule out the legality of such a program.¶ "It's important to note that the Second Circuit Court of Appeals did not rule it unconstitutional," he said Sunday on CNN’s “State of the Union." "They just said it was not being applied properly based on the law that was written. So we need to take a very careful look at the way we write these, quite honestly, very complex laws."¶ Johnson criticized Edward Snowden's revelations about the program as "demagoguery" that has "done great harm to our ability to gather information." He added, "Our best line of defense, trying to keep this nation safe and secure, is an effective intelligence-gathering capability, with robust congressional oversight."¶ Sen. Ron Wyden (D-Ore.) promised on Sunday to filibuster a reauthorization of the Patriot Act unless it includes significant reforms.¶

Squo solves – Big Data

No NSA overload – Big Data solves

Rosenbach et al. 13 (Marcel Rosenbach, German journalist, Holger Stark, Professor at the University of Göttingen, and Jonathan Stock, German Journalist,6/10, “Prism Exposed: Data Surveillance with Global Implications”, http://www.spiegel.de/international/world/prism-leak-inside-the-controversial-us-data-surveillance-program-a-904761-2.html//Tang)

It is now clear that what experts suspected for years is in fact true -- that the NSA monitors every form of electronic communication around the globe. This fact raises an important question: How can an intelligence agency, even one as large and well-staffed as the NSA with its 40,000 employees, work meaningfully with such a flood of information? The answer to this question is part of a phenomenon that is currently a major topic for the business community as well and goes by the name "Big Data." Thanks to new database technologies, it is now possible to connect entirely disparate forms of data and analyze them automatically. A rare glimpse into what intelligence services can do by applying this "big data" approach came last year from David Petraeus. This new form of data analysis is concerned with discovering "non-obvious relationships," the then freshly minted CIA director explained at a conference. This includes, for example "finding connections between a purchase here, a phone call there, a grainy video, customs and immigration information." The goal, according to Petraeus, is for big data to "lead to automated discovery, rather than depending on the right analyst asking the right question." Algorithms pick out connections automatically from the unstructured sea of data they trawl. "The CIA and our intelligence community partners must be able to swim in the ocean of 'Big Data.' Indeed, we must be world class swimmers -- the best, in fact," the CIA director continued. The Surveillance State The value of big data analysis for US intelligence agencies can be seen in the amount the NSA and CIA are investing in it. Not only does this include multimillion-dollar contracts with providers specializing in data mining services, but the CIA also invests directly, through its subsidiary company In-Q-Tel, in several big data start-

ups. It's about rendering people and their behavior predictable. The NSA's research projects aim to forecast, on the basis of telephone data and Twitter and Facebook posts, when uprisings, social protests and other events will occur. The agency is also researching new methods of analysis for surveillance videos with the hopes of recognizing conspicuous behavior before an attack is committed. Gus Hunt, the CIA's chief technology officer, made a forthright admission in March: "We fundamentally try to collect everything and hang onto it forever." What he meant by "everything," Hunt also made clear: "It is really very nearly within our grasp to be able to compute on all human-generated information," he said. That statement is difficult to reconcile with the Fourth Amendment to the US Constitution, which guarantees the right to privacy. This is probably why Hunt added, almost apologetically: "Technology in this world is moving faster than government or law can keep up."

Squo solves overload – big data

Segal, 14

Mark E. Segal, Chief of the Computer and Information Sciences Research Group at the NSA, "Guest Editor's Column," The Next Wave, 11/28/14, https://www.nsa.gov/research/tnw/tnw204/article1.shtml // IS

As Big Data analytics become more ubiquitous, concerns naturally arise about how data is collected, analyzed, and used. In particular, people whose data is stored in vast data repositories, regardless of who owns the repositories, are worried about potential privacy rights violations. Although privacy issues are not discussed in detail in this issue of TNW, an excellent overview of the relevant issues may be found in a report titled "Big Data and privacy: A technological perspective" authored by the President's Council of Advisors on Science and Technology and delivered to President Obama in May 2014 [1]. Another useful resource on this topic and other topics related to Big Data is the article "Big Data and its technical challenges" by H. V. Jagadish et al. published in the July 2014 issue of Communications of the ACM [2].

According to a 2012 study by the International Data Corporation, there will be approximately 1022 bytes of data stored in all of the computers on Earth by 2015 [3]. To put that number in perspective, that's more than the estimated 7.5 x 1018 grains of sand on all of the beaches of the Earth [4], and almost as much as the estimated 1022 to 1024 stars in the Universe [5, 6]. Let's harness the tools and algorithms **currently being used** to process Big Data to solve some of our planet's most critical problems. We hope you find this issue of TNW interesting, informative, and thought-provoking.

Squo solves overload – cloud computing

Burkhardt, 14

Paul Burkhardt, computer science researcher in the Research Directorate at NSA. He received his PhD from the University of Illinois at Urbana-Champaign. "An overview of Big Data," The Next Wave, 11/28/14, https://www.nsa.gov/research/tnw/tnw204/article2.shtml // IS

The volume and velocity of Big Data is exceeding our rate of physical storage and computing capacity, creating scalability demands that far outpace hardware innovations. Just as multicore chips were designed in response to the limits of clock speeds imposed by Moore's Law, **cloud technologies have surfaced to address the impending tidal wave of information**. The new cloud architectures pioneered by Google and Amazon extended distributed computing from its roots in high-performance computing and grid computing, where hardware was expensive and purpose-built, to large clusters made from low-cost commodity computers, ushering the paradigm

of "warehouse" computing. These new cloud data centers containing thousands of computer cabinets are patrolled by administrators on motorized carts to pull and replace failed components.

Squo Solves – gov checks

Squo solves overload – government checks

Gross 13

Grant Gross, citing a former civil liberties watchdog in the Obama White House, "Critics question whether NSA data collection is effective," PC World, 6/25/13, http://www.pcworld.idg.com.au/article/465878/critics_question_whether_nsa_data_collection_effective/ // IS

But Timothy Edgar, a former civil liberties watchdog in the Obama White House and at the Office of Director of National Intelligence, partly defended the NSA collection programs, noting that U.S. intelligence officials attribute the surveillance programs with preventing more than **50 terrorist actions**. Some critics have disputed those assertions.

Edgar criticized President Barack Obama's administration for keeping the NSA programs secret. He also said it was "ridiculous" for Obama to suggest that U.S. residents shouldn't be concerned about privacy because the NSA is collecting phone metadata and not the content of phone calls. Information about who people call and when they call is sensitive, he said.

But Edgar, now a visiting fellow at the Watson Institute for International Studies at Brown University, also said that Congress, the Foreign Intelligence Surveillance Court and internal auditors provide some oversight of the data collection programs, with more checks on data collection in place in the U.S. than in many other countries. Analysts can query the phone records database **only** if they see a connection to terrorism, he said.

Squo solves - investment

Squo solves overload – investment

Burkhardt, 14

Paul Burkhardt, computer science researcher in the Research Directorate at NSA. He received his PhD from the University of Illinois at Urbana-Champaign. "An overview of Big Data," The Next Wave, 11/28/14, https://www.nsa.gov/research/tnw/tnw204/article2.shtml // IS

In March 2012, the White House announced the National Big Data Research and Development Initiative [14] to help address challenges facing the government, in response to the President's Council of Advisors on Science and Technology, which concluded the "Federal Government is under-investing in technologies related to Big Data." With a budget of over $200 million and support of six federal departments and agencies, this initiative was created to:

Advance state-of-the-art core technologies needed to collect, store, preserve, manage, analyze, and share huge quantities of data;

Harness these technologies to accelerate the pace of discovery in science and engineering, strengthen our national security, and transform teaching and learning; and

Expand the workforce needed to develop and use Big Data technologies.

As part of the Big Data Initiative, the National Science Foundation (NSF) and the National Institutes of Health are funding a joint Big Data solicitation to "advance the core scientific and technological means of managing, analyzing, visualizing, and extracting useful information from large and diverse data sets." In addition, the NSF is funding the $10 million Expeditions in Computing project led by University of California at Berkeley, to turn data into knowledge and insight, and funding a $2 million award for a research training group to support training for students in techniques for analyzing and visualizing complex data.

The Department of Defense (DoD) is also investing $250 million annually to "harness and utilize massive data in new ways" and another $60 million for new research proposals. DARPA, the research arm of the DoD, will invest $25 million annually under its XDATA program for techniques and tools to analyze large volumes of data, including

Developing scalable algorithms for processing imperfect data in distributed data stores, and

Creating effective human-computer interaction tools for facilitating rapidly customizable visual reasoning for diverse missions.

The Department of Energy is similarly providing $25 million in funding to establish the Scalable Data Management, Analysis and Visualization Institute to develop new tools for managing and visualizing data.

Squo Solves - research

Squo solves overload – Research Direcorate

NSA, 11

NSA, on a website describing its internal structure for its "premier unclassified event," "Government Host Descriptions," 2011, http://www.ncsi.com/nsabiam11/host_descriptions.html // IS

In the NSA/CSS Research Directorate, opportunities abound. We are committed to providing the tools, the technology, and the techniques to ensure the success of the Agency's Signals Intelligence and Information Assurance missions now and in the future. Our vital research program focuses on four critical goals: We develop the means to dominate the global computing and communications network. **We cope with the overload** of information in our environment **and turn that overload to our strategic advantage**. We provide the means for ubiquitous, secure collaboration both within our government and through its interactions with various partners. We create the means for penetrating into the "hard" targets that threaten our nation wherever, whenever, or whomever they many be.

Squo solves - tech

New technology means no overload

Rosenbach et al, '13 (By Marcel Rosenbach, Holger Stark and Jonathan Stock – acclaimed German political scientists and journalists "Prism Exposed: Data Surveillance with Global Implications" Spiegel Online International, June 10, 2013 http://www.spiegel.de/international/world/prism-leak-inside-the-controversial-us-data-surveillance-program-a-904761-2.html) //GY

Squo solves overload – new tools

Kirby, 13

Bob Kirby, vice president of sales for CDW·G, a leading technology provider to government and education. “Big Data Can Help the Federal Government Move Mountains. Here's How.,” FedTech Magazine, 08/01/13, http://www.fedtechmagazine.com/article/2013/08/big-data-can-help-federal-government-move-mountains-heres-how // IS

The White House took a step toward helping agencies find these technologies when it established the National Big Data Research and Development Initiative in 2012. The initiative included more than $200 million to make the most of the explosion of Big Data and the tools needed to analyze it.

The challenges that Big Data poses are nearly as daunting as its promise is encouraging. Storing data efficiently is one of these challenges. As always, budgets are tight, so agencies must minimize the per-megabyte price of storage and keep the data within easy access so that users can

get it when they want it and how they need it. Backing up massive quantities of data heightens the challenge.

Analyzing the data effectively is another major challenge. Many agencies employ commercial tools that enable them to sift through the mountains of data, spotting trends that can help them operate more efficiently. (A recent study by MeriTalk found that federal IT executives think Big Data could help agencies save more than $500 billion while also fulfilling mission objectives.)

Custom-developed Big Data tools also are allowing agencies to address the need to analyze their data. For example, the Oak Ridge National Laboratory's -Computational Data Analytics Group has made its Piranha data analytics system available to other agencies. The system has helped medical researchers find a link that can alert doctors to aortic aneurysms before they strike. It's also used for more mundane tasks, such as sifting through résumés to connect job candidates with hiring managers.

A2: Chinese Cyberwar

No US-China cyber escalation – litany of checks

Lindsay, 15

Jon Lindsay, Assistant Professor of Digital Media and Global Affairs at the University of Toronto, research scientist with the University of California Institute on Global Conflict and Cooperation, assistant adjunct professor at the UC San Diego School of International Relations and Pacific Studies, and an Oxford Martin Associate with the Oxford Global Cyber Security Capacity Centre, "Exaggerating the Chinese Cyber Threat," Belfer Center for Science and International Affairs, Harvard Kennedy School, May 2015, http://belfercenter.ksg.harvard.edu/publication/25321/exaggerating_the_chinese_cyber_threat.html // IS

Policymakers in the United States often portray China as posing a serious cybersecurity threat. In 2013 U.S. National Security Adviser Tom Donilon stated that Chinese cyber intrusions not only endanger national security but also threaten U.S. firms with the loss of competitive advantage. One U.S. member of Congress has asserted that China has "laced the U.S. infrastructure with logic bombs." Chinese critics, meanwhile, denounce Western allegations of Chinese espionage and decry National Security Agency (NSA) activities revealed by Edward Snowden. The People's Daily newspaper has described the United States as "a thief crying 'stop thief.'" Chinese commentators increasingly call for the exclusion of U.S. internet firms from the Chinese market, citing concerns about collusion with the NSA, and argue that the institutions of internet governance give the United States an unfair advantage.

The rhetorical spiral of mistrust in the Sino-American relationship threatens to **undermine** the mutual benefits of the information revolution. Fears about the paralysis of the United States' digital infrastructure or the hemorrhage of its competitive advantage are exaggerated. Chinese

cyber operators face underappreciated organizational challenges, including information overload and bureaucratic compartmentalization, which hinder the weaponization of cyberspace or absorption of stolen intellectual property. More important, both the United States and China have strong incentives to moderate the intensity of their cyber exploitation to preserve profitable interconnections and avoid costly punishment. The policy backlash against U.S. firms and liberal internet governance by China and others is ultimately more worrisome for U.S. competitiveness than espionage; ironically, it is also counterproductive for Chinese growth.

No US-China cyber escalation – no incentives and interdependence

Lindsay, 15

Jon Lindsay, Assistant Professor of Digital Media and Global Affairs at the University of Toronto, research scientist with the University of California Institute on Global Conflict and Cooperation, assistant adjunct professor at the UC San Diego School of International Relations and Pacific Studies, and an Oxford Martin Associate with the Oxford Global Cyber Security Capacity Centre, "Exaggerating the Chinese Cyber Threat," Belfer Center for Science and International Affairs, Harvard Kennedy School, May 2015, http://belfercenter.ksg.harvard.edu/publication/25321/exaggerating_the_chinese_cyber_threat.html // IS

Many Western observers fear that cyber reform based on the principle of internet sovereignty might legitimize authoritarian control and undermine the cosmopolitan promise of the multistakeholder system. China, however, benefits too much from the current system to pose a credible alternative. Tussles around internet governance are more likely to result in minor change at the margins of the existing system, not a major reorganization that shifts technical protocols and operational regulation to the United Nations. Yet this is not a foregone conclusion, as China moves to exclude U.S. firms such as IBM, Oracle, EMC, and Microsoft from its domestic markets and attempts to persuade other states to support governance reforms at odds with U.S. values and interests.

CONCLUSION

Information technology has generated tremendous wealth and innovation for millions, underwriting the United States' preponderance as well as China's meteoric rise. The costs of cyber espionage and harassment pale beside the mutual benefits of an interdependent, globalized economy. The inevitable frictions of cyberspace are not a harbinger of catastrophe to come, but rather a sign that the states inflicting them lack incentives to cause any real harm. Exaggerated fears of cyberwarfare or an erosion of the United States' competitive advantage must not be allowed to undermine the institutions and architectures that make the digital commons so productive.

A2: Border Overload

No overload – there are still gaps

AP, 14

Associated Press, “Drones patrol half of Mexico border,” The Daily Mail, 11/13/14, http://www.dailymail.co.uk/wires/ap/article-2832607/Drones-patrol-half-Mexico-border.html // IS

The government has operated about 10,000 drone flights under the strategy, known internally as "change detection," since it began in March 2013. The flights currently cover about 900 miles, much of it in Texas, and are expected to expand to the Canadian border by the end of 2015.

The purpose is to assign agents where illegal activity is highest, said R. Gil Kerlikowske, commissioner of Customs and Border Protection, the Border Patrol's parent agency, which operates nine unmanned aircraft across the country.

"You have finite resources," he said in an interview. "If you can look at some very rugged terrain (and) you can see there's not traffic, whether it's tire tracks or clothing being abandoned or anything else, you want to deploy your resources to where you have a greater risk, a greater threat."

If the video shows the terrain unchanged, Border Patrol Chief Michael Fisher calls it "proving the negative" — showing there isn't anything illegal happening there and therefore no need for agents and fences.

The strategy was launched without fanfare and expanded at a time when President Barack Obama prepares to issue an executive order by the end of this year to reduce deportations and enhance border security.

Rep. Michael McCaul, a Texas Republican who chairs the House Homeland Security Committee, applauded the approach while saying that **surveillance gaps still remain**. "We can no longer focus only on static defenses such as fences and fixed (camera) towers," he said.

A2: NSA good – cyberterror

Alt causes – the aff isn’t enough

Goldsmith, 13

Jack Goldsmith, Henry L. Shattuck Professor at Harvard Law School, “We Need an Invasive NSA,” New Republic, 10/10/13, http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks // IS

To keep these computers and networks secure, the government needs powerful intelligence capabilities abroad so that it can learn about planned cyber-intrusions. It also needs to raise defenses at home. An important first step is to correct the market failures that plague cybersecurity. Through law or regulation, the government must improve incentives for individuals to use security software, for private firms to harden their defenses and share information with one another, and for Internet service providers to crack down on the botnets—networks of compromised zombie computers—that underlie many cyber-attacks. More, too, must be done to prevent insider threats like Edward Snowden’s, and to control the stealth introduction of vulnerabilities during the manufacture of computer components—vulnerabilities that can later be used as windows for cyber-attacks. And yet that’s still not enough. The U.S. government can fully monitor air, space, and sea for potential attacks from abroad. But it has limited access to the channels of cyber-attack and cyber-theft, because they are owned by private telecommunication firms, and because Congress strictly limits government access to private communications. “I can’t

defend the country until I'm into all the networks," General Alexander reportedly told senior government officials a few months ago. For Alexander, being in the network means having government computers scan the content and metadata of Internet communications in the United States and store some of these communications for extended periods. Such access, he thinks, will give the government a fighting chance to find the needle of known malware in the haystack of communications so that it can block or degrade the attack or exploitation. It will also allow it to discern patterns of malicious activity in the swarm of communications, even when it doesn't possess the malware's signature. And it will better enable the government to trace back an attack's trajectory so that it can discover the identity and geographical origin of the threat.

SIGINT CP

1nc

The National Security Agency should make SIGINT data available to relevant industries upon discovery

Shifting from a production focus to a discovery focus in SIGINT is key to solve overload – data reduction *isn't enough*

SIDtoday, 11

The Signals Intelligence Directorate Today Editor, "Is There a Sustainable Ops Tempo in S2? How Can Analysts Deal With the Flood of Collection? – An interview with [redacted] (conclusion)," 4/16/11, https://s3.amazonaws.com/s3.documentcloud.org/documents/2089125/analytic-modernization.pdf // IS

6. Q: (U) When we last interviewed you in August 2009 — you were Assistant DDAP at the time —you spoke of the importance of creating a sustainable ops tempo in S2.

Have you succeeded?

A: (U). No. No, I haven't... And it's not just because there's so much happening in the world. Here's the thing: we have to take a fundamentally different approach to how we do business. The volume and quality of access we have now gives us an unprecedented capability to produce some of the best intelligence we ever have, but the fact is that we are only getting to a **fractional portion** of what we have access to. I can't tell you for sure that as good as what we produce is, that it's the absolute best we can do. It's not sustainable for the workforce or the mission to keep working in the way we always have.

(U//FOUO) We've embarked on Analytic Modernization. In the past there have been transformations... modernizations... renovations... it gets tiring! But to a large degree those efforts have represented supercharging existing capabilities - doing more with less. We need to **fundamentally change** how we interact with SIGINT.

(U//FOUO) This is a big deal, because for decades we've trained our workforce - and took pride in the fact - that we had the unique responsibility within the IC to manage this information in accordance with the 4th Amendment. To that extent we thought of SIGINT as "radioactive" and it was our job to render the information safe for others. Our process was about managing the information in a manner consistent with the privacy rights of U.S. persons.

(U//FOUO) I believe we have developed an awareness of the information and an understanding of our authorities that allows us to think differently about that relationship... and in so doing, to create an increased capacity and recover more time for the analysts. I don't mean only analysts in SID, but also analysts in LAD, in NTQC. etc. The key is to better leverage the Intelligence Community and our partner relationships for the exploitation of SIGINT, which is something in the past we would not have done to the degree we're proposing - it was considered our domain (and "radioactive").

(U//FOUO) We must take advantage of the expertise and capabilities in the IC and our customer base to enhance discovery and capacity, and to make the actionable information available almost

as soon as we encounter it. This is not about turning NS A into a collection resource for others (although collection is in fact one of our great strengths and one we are uniquely qualified to undertake) - it's about making sure we don't expend cryptologic resources doing work that is not uniquely cryptologic in nature - work that others can do.

(U) Q: Can you give an example?

A: (S//SI//REL) If NSA discovers a pathway into an adversary's information space and we extract a terabyte of CAD [computer-aided design] drawings of weapon designs, is it of best value for the IC to have talented NSA analysts work their way through this 1 terabyte of data? Is it uniquely cryptologic? Or is it of better benefit to the nation that we expose it immediately to the best and brightest weapon designers in the US government to work on in a collaborative space, to triage, assess and exploit the value of that information?

(U//FOUO) In so doing we are not precluding NSA analysts from continued access to the data, any more than a published SIGINT product report isn't available for future reference. We are just leveraging the power and expertise of others so that we can turn our attention to that that which only we can exploit by virtue of our unique talents.

2nc

Companies respond positively and NSA analysts can go deeper into actual problems

SIDtoday, 11

The Signals Intelligence Directorate Today Editor, "Is There a Sustainable Ops Tempo in S2? How Can Analysts Deal With the Flood of Collection? – An interview with [redacted] (conclusion)," 4/16/11, https://s3.amazonaws.com/s3.documentcloud.org/documents/2089125/analytic-modernization.pdf // IS

A: (U//FOUO) If we get access to the best information on a topic, the value will speak for itself and the **customers will make the resources available**. It's like YouTube videos - they "go viral" when people with good reputations recommend a video to others. If we put the information out there and monitor the customer response to it, we'll know when to recommend specific items they might want to take a close look at. Amazon does the same thing by looking at how you react to the products you've looked at. We can figure out what the communities of interest are for that topic... If the material is in a foreign language, we have tools they can use to get the gist of it, and if it looks promising, they can use the National Virtual Translation Center to get it translated. We want our language analysts focused on uniquely cryptologic problems that rarely boil down to a straightforward translation.

(U//FOUO) So what does this approach accomplish? We've exposed the intelligence to people who can interpret it and use it, and we've created opportunities for collaboration. We've also off-loaded the responsibility to manage the data in our respositories and own the compliance responsibility. If data is stored in the Library of National Intelligence, someone else is paying for it.

(U//FOUO) In the end, we exist to produce information. The only way to go more deeply into targets is to avoid getting stuck on production that others can do for themselves. Our challenge is

to be always out looking for something new. We need to think about problems, not just about production.

(U//FOUO) The collaborative component means it's not an NSA view, a DIA view, etc... Rather, it's opened up to all on A-Space. I would like to see people log onto A-Space and announce "I want to share traffic and create a multi-seal report based on joint input." Why not collaborate at the point of discovery?

Overload is killing effectivity now – a production to discovery shit is key

NSA, 11

Leaked NSA document, "SIGINT Mission Thread Three," 8/1/11, https://s3.amazonaws.com/s3.documentcloud.org/documents/2088968/gladwell-amp-nsa.pdf // IS

Achieving a Balance Between Discovery and Production

(U//FOUO) The key to good decision making is not knowledge. It is understanding. We are swimming in the former. We are desperately lacking in the latter."* In the afterward to his 2005 #1 national bestseller Blink — The Power of Thinking Without Thinking, author Malcolm Gladwell provides his perspective on the danger of confusing information (collection) with understanding (analysis). Gladwell has captured one of the biggest challenges facing SID today. Our costs associated with this information overload are not only financial, such as the need to build data warehouses large enough to store the mountain of data that arrives at our doorstep each day, but also include the more intangible costs of too much data to review, process, translate, and report. SID's first strategic goal for 2011-2015, the challenge to revolution analysis, is aimed squarely at this tension between information and understanding.

(U//FOUO) In order to revolutionize intelligence, we must "fundamentally shift our analytic approach from a production to a discovery bias, radically increasing operational impact across all mission domains."** With so much data at our fingertips, we must learn how to push the lesser value data to the side, move data that needs less analysis directly to our customers, and provide ourselves the needed agility to dig deep into the toughest analytic problems to produce understanding from well-hidden information.

terror nb

The NSA is overloaded – terror surprises are coming absent reform – the plan's reduction *isn't sufficient*

SIDtoday, 11

The Signals Intelligence Directorate Today Editor, "Is There a Sustainable Ops Tempo in S2? How Can Analysts Deal With the Flood of Collection? – An interview with [redacted] (conclusion)," 4/16/11, https://s3.amazonaws.com/s3.documentcloud.org/documents/2089125/analytic-modernization.pdf // IS

A: (S//SI//REL) We live in an Information Age when we have massive reserves of information and don't have the capability to exploit it. I was told that there are **2 petabytes** of data in the SIGINT System at any given time. How much is that? That's equal to 20 million 4-drawer filing cabinets. How many cabinets per analyst is that?? By the end of this year, we'll have **1 terabyte**

of data **per second** coming in. You can't crank that through the existing processes and be effective.

Q: (U) ...So it's a matter of volume?

A: (S//SI//REL) **Not volume alone**, but also complexity. We need to piece together the data. It's **impossible** to do that using traditional methods. Strong selectors - like phone numbers - will become a thing of the past. It used to be that if you had a target's number, you could follow it for most of your career. Not anymore. My daughter doesn't even make phone calls, and many targets do the same. Also, the commercial market demands privacy, and this will drive our targets to go encrypted, maybe into unexploitable realms. Our nation needs us to look for patterns surrounding a particular spot on Earth and make the connections - who can do that if not us? And we can't do it using traditional methods.

Q: (U) Looking into the future, is there anything that especially worries you? ...An eventuality (internal or external) that would make it hard for A&P to continue to put out quality intelligence?

A: (U//FOUO) I'm worried that we have so much good stuff that we could lock down analysts and have them just producing product, and **something would jump out and surprise us**. So we need the discipline to invest in the wild and the unknowns.

SIGINT is uniquely key to the war on terror

Shea, 11

Teresa Shea, director of the Signals Intelligence Directorate, "(U) SIGINT Year in Review, November 2011," 11/22/11, https://firstlook.org/theintercept/document/2015/05/18/sidtoday-2011-review/ // IS

(S//S1//RHL) This has been a milestone year in the war on terrorism. Certainly the most powerful and enduring accomplishment was the successful strike against Osama Bin Laden. For nearly a decade a dedicated group of SIGINT professionals would not let go of the search, and **their persistence paid off** in substantive contributions at critical points on the road to Abbottabad. In the end many of you brought your expertise to bear in the final weeks and hours, resulting in a tremendous outcome in our counterterrorism efforts. Even then you didn't rest on your laurels: you played a significant supporting role a few months later in the operations against Atiyah abd-Rahman **in Pakistan** and Anwar al-Awlaqi **in Yemen**. Key targets continue to be removed from the battlefield as a result of your outstanding SIGINT contributions.

ptx nb

Only the CP avoids the link to politics – the NSA can reform itself

NSA, 9

NSA, "About NSA: Mission," 1/15/09 https://www.nsa.gov/about/mission/index.shtml // IS

Executive Order 12333, originally issued 4 December 1981, delineates the NSA/CSS roles and responsibilities. In part, the Director, NSA/Chief, CSS is charged to:

Collect (including through clandestine means), process, analyze, produce, and disseminate signals intelligence information and data for foreign intelligence and counterintelligence purposes to support national and departmental missions;

Act as the National Manager for National Security Systems as established in law and policy, and in this capacity be responsible to the Secretary of Defense and to the Director, National Intelligence;

Prescribe security regulations covering operating practices, including the transmission, handling, and distribution of signals intelligence and communications security material within and among the elements under control of the Director of the National Security Agency, and exercise the necessary supervisory control to ensure compliance with the regulations.

NSA reform doesn't require debate – empirics

Savage et al., 15

Charlie Savage, Julia Angwin, Jeff Larson, and Henrik Molte, *Washington correspondent for The New York Times, "Hunting for Hackers, N.S.A. Secretly Expands Internet Spying at U.S. Border," The New York Times, 6/4/15, http://www.nytimes.com/2015/06/05/us/hunting-for-hackers-nsa-secretly-expands-internet-spying-at-us-border.html // IS

WASHINGTON — Without public notice **or debate**, the Obama administration has expanded the National Security Agency's warrantless surveillance of Americans' international Internet traffic to search for evidence of malicious computer hacking, according to classified N.S.A. documents. In mid-2012, Justice Department lawyers wrote two secret memos permitting the spy agency to begin hunting on Internet cables, without a warrant and on American soil, for data linked to computer intrusions originating abroad — including traffic that flows to suspicious Internet addresses or contains malware, the documents show.

Yahoo CP

1nc

Text: The National Security Agency should partially throttle its data collected from Yahoo.

That eases information overload that cripples counterterrorism

Stanganelli, 13

(Joe, Founder & Principal, Beacon Hill Law, JD in Law from Suffolk University Law School, Crew Leader Asst., Vacant-Delete Check of US Census Bureau, 11-13-13, All Analytics, "Thinking on NSA Excess & Enterprise Implications", http://www.allanalytics.com/author.asp?section_id=1437&doc_id=269514, amp)

Documents received by The Washington Post describe Muscular, an NSA effort that infiltrated Google and Yahoo networking traffic. Muscular gave NSA analysts access to millions of emails, attachments, and other web communications each day -– including entire Yahoo mailboxes.

The NSA needed to develop new filtering and distribution systems to process this data mother lode, as indicated in the documents. Even with these systems, the new data (particularly from Yahoo) proved too much to handle. Yahoo email began to account for approximately 25 percent of daily data being processed by the NSA's main analytics platform for intercepted Internet traffic. Most of the data was more than six months old and virtually useless. **Analysts became so frustrated that they requested "partial throttling" of Yahoo data**.

"Numerous target offices have complained about this collection 'diluting' their workflow," according to one NSA document. "The sheer volume" of data is unjustified by its "relatively small intelligence value."

Other NSA data mining programs have overwhelmed the agency, as reported elsewhere. When spammers hacked a target Yahoo account last year, the account's address book blew up with irrelevant email addresses. Consequently, the NSA had to limit its address book data collection efforts to only Facebook contacts.

These broad data sweeps have been significantly less successful than the NSA's more targeted operations. In an interview with the Daily Caller, former NSA official William Binney said the NSA's inefficient big data processes crippled its ability to react to a tipoff about Tamerlan Tsarnaev -– information that could have curtailed the Boston Marathon bombing.

They're making themselves dysfunctional by collecting all of this data. They've got so much collection capability but they can't do everything… The basic problem is they can't figure out what they have, so they store it all in the hope that down the road they might figure something out and they can go back and figure out what's happening and what people did.

Still, the White House and other government departments and agencies place the NSA under what The New York Times calls an intense "pressure to get everything" -- a pressure that has spawned a data obsession.

The problem with this obsession is twofold. The first issue is the ROI of gathering haystacks -– resources better spent elsewhere are diverted to finding, gathering, filtering, and ultimately throttling and fixing oversized and under-relevant data.

Throttling Yahoo data alleviates overload

Gallagher, 13

(Sean, Masters in Communication Design, Engineering Task Manager CBIS Federal, Ars Technica, "How the NSA's MUSCULAR tapped Google's and Yahoo's private networks", http://arstechnica.com/information-technology/2013/10/how-the-nsas-muscular-tapped-googles-and-yahoos-private-networks/, amp)

Forget the PRISM—go for the clear

The NSA already has access to selected content on Google and Yahoo through its PRISM program, a collaborative effort with the FBI that compels cloud providers to turn over select information through a FISA warrant. And it collects huge quantities of raw Internet traffic at major network exchange points, allowing the agency to perform keyword searches in realtime against the content and metadata of individual Internet packets.

But much of that raw traffic is encrypted, and the PRISM requests are relatively limited in scope. So the NSA went looking for a way to get the same sort of access to encrypted traffic to cloud providers that it had with unencrypted raw Internet traffic. The solution that the NSA and the GCHQ devised was to tap into the networks of the providers themselves as they crossed international borders.

Google and Yahoo maintain a number of overseas data centers to serve their international customers, and Internet traffic to Google and Yahoo is typically routed to the closest data center to the user. The Web and other Internet servers that handle those requests generally communicate with users via a Secure Socket Layer (SSL) encrypted session and act as a gateway to other services running within the data center—in the case of Google, this includes services like Gmail message stores, search engines, Maps requests, and Google Drive documents. Within Google's internal network, these requests are passed unencrypted, and requests often travel across multiple Google data centers to generate results.

In addition to passing user traffic, the fiber connections between data centers are also used to replicate data between data centers for backup and universal access. Yahoo, for example, replicates users' mailbox archives between data centers to ensure that they're available in case of an outage. In July of 2012, according to documents Snowden provided to the Washington Post, Yahoo began transferring entire e-mail accounts between data centers in its NArchive format, possibly as part of a consolidation of operations.

By gaining access to networks within Google's and Yahoo's security perimeters, the NSA was able to effectively defeat the SSL encryption used to protect customers' Web connections to the cloud providers, giving the agency's network filtering and data mining tools unfettered access to the content passing over the network. As a result, the NSA had access to millions of messages and Web transactions per day without having to use its FISA warrant power to compel Google or Yahoo to provide the data through PRISM. And it gained access to complete mailboxes of e-mail at Yahoo—including attachments that would not necessarily show up as part of intercepted Webmail sessions, because users would download them separately.

But the NSA and the GCHQ had to devise ways to process the streams of data passing between data centers to make it useful. That meant reverse-engineering some of the software and network interfaces of the cloud providers so that they could break apart data streams optimized to be sent across wide-area networks over multiple simultaneous data links. It also meant creating filtering capabilities that allowed the NSA and the GCHQ to separate traffic of intelligence interest from the vast amount of intra-data center communications that have nothing to do with user activity. So the NSA and the GCHQ configured a "distributed data distribution system" (as the NSA described **MUSCULAR** in this FAQ about the BOUNDLESSINFORMANT metadata search tool acquired by the American Civil Liberties Union) similar to XKeyscore to collect, filter, and process the content on those networks.

Mailbox overload

Even with filtering, the volume of that data presented a problem to NSA analysts. When Yahoo started performing its mailbox transfers, that data rapidly started to eclipse other sources of data being ingested into PINWALE, the NSA's primary analytical database for processing intercepted Internet traffic. PINWHALE also pulls in data harvested by the XKeyscore system and processes about 60 gigabytes of data per day that it gets passed from collection systems.

By February of 2013, Yahoo mailboxes were accounting for about a quarter of that daily traffic. And because of the nature of the mailboxes—many of them contained e-mail messages that were months or years old—most of the data was useless to analysts trying to find current data. Fifty-nine percent of the mail in the archives was over 180 days old, making it almost useless to analysts.

So **the analysts requested "partial throttling**" of Yahoo content **to prevent data overload**. "Numerous analysts have complained of [the Yahoo data's] existence," the notes from the PowerPoint slide on MUSCULAR stated, "and the relatively small intelligence value it contains does not justify the sheer volume of collection at MUSCULAR (1/4th of the daily total collect)."

Snowball CP

1nc

Text: United States federal intelligence agencies should cease snowball sampling wiretapping activities.

That solves overload and poor network identification and is replaced by other methods

Carley and Tsvetovat, 6

(Kathleen--professor in the School of Computer Science in the department - Institute for Software Research - at Carnegie Mellon University, Maksim--Ph.D. from Carnegie Mellon University's School of Computer Science, with concentration on computational modeling of organizations, 30 August 2006, Springer Science + Business Media, LLC, "On effectiveness of wiretap programs in mapping social networks", Proquest, amp)

Snowball sampling methods are known to be a biased toward highly connected actors and consequently produce core-periphery networks when these may not necessarily be present. This leads to a biased perception of the underlying network which can have negative policy consequences, as in the identification of terrorist networks. When snowball sampling is used, the potential overload of the information collection system is a distinct problem due to the exponential growth of the number of suspects to be monitored. In this paper, we focus on evaluating the effectiveness of a wiretapping program in terms of its ability to map the rapidly evolving networks within a covert organization. By running a series of simulation-based experiments, we are able to evaluate a broad spectrum of information gathering regimes based on a consistent set of criteria. We conclude by proposing a set of information gathering programs that achieve higher effectiveness then snowball sampling, and at a lower cost.

terror nb

Snowball makes overload uniquely dangerous – creates vulnerabilities

Beutel, 7

Alejandro Beutel, Researcher for Countering Violent Extremism at the National Consortium for the Study of Terrorism and Responses to Terrorism (START)"Breach of Law, Breach of Security – NSA Wiretapping," 1/31/07, http://blog.minaret.org/?p=197 // IS

Second, according to the 2006 USA Today article, NSA officials claimed domestic SIGINT operations help fight terrorism by using the data produced for "social network analysis." However the current social network analysis methods used to guide SIGINT operations called "**snowball sampling**," (a type of electronic dragnet) are not well suited for the type of counter-terrorism operations traditionally done by FBI criminal investigators. Research conducted by two social network experts, Maksim Tsvetovat and Kathleen Carley [PDF], finds that the snowball method is better suited for highly connected groups, as opposed to small, loosely connected cellular networks [PDF] which define **Al-Qaeda**. The NSA's snowball sampling methods gathered a massive volume of useless information that led FBI officials nowhere, wasting limited resources and time. Furthermore, the domestic SIGINT operations are put an enormous technical strain on the NSA's resources, forcing the agency to consume voracious amounts of electricity–on top of

dealing with its current computer problems–to sustain its current operational capacity. This jeopardizes our national security by running the risk of another **electrical overload**, similar to the one that paralyzed the agency seven years ago and left our nation vulnerable for nearly three days.

Splunk CP

1nc

Text: The National Security Agency should implement Splunk to analyze its data.

Solves overload

Trobock, 14

(Randall, Master of Science in Cybersecurity from Utica College, May 2014, "THE APPLICATION OF SPLUNK IN THE INTELLIGENCE GATHERING PROCESS", Proquest, amp)

Splunk is a software application that can ingest massive amounts of data from various sources and conduct analytics on this data, in order to discover relevant correlations that would have taken days, weeks or months to discover manually. Splunk has the capability to ingest these data sources into its analysis engine, and create actionable intelligence based on pre-determined correlations. The idea behind correlation is to monitor and create alerts for when intelligence sources intersect. This capability greatly reduces the amount of time required for analyzing data, thereby minimizing the **information overload** problem and creating greater opportunity for taking action when necessary.

Faulty intelligence methods, such as those that would be the result of information overload, pose a significant threat to peace throughout the world. For example, having inaccurate or incomplete intelligence on Iran's nuclear capabilities and the locations or nature of its nuclear plants, a risk-averse Israel might overestimate its need to take both drastic and pre-emptive measures against Iran (Young, 2013). This could result in involvement from several countries, including the United States, potentially costing billions of dollars and thousands of soldiers' lives.

Solves human bias

Trobock, 14

(Randall, Master of Science in Cybersecurity from Utica College, May 2014, "THE APPLICATION OF SPLUNK IN THE INTELLIGENCE GATHERING PROCESS", Proquest, amp)

In addition to information overload, there are human mental processes such as perception and human mindsets and biases that can also hinder the intelligence analysis process. The fact that the intelligence lifecycle is largely run by human beings makes it prone to a large amount of subjectivity. Of all the intelligence analysis obstacles that might be presented, those that lie within human mental processes can be the most complex. Perception, human mindsets, and cognitive biases are all factors that can affect an intelligence report. With these factors in play, a person's own assumptions, biases, and mindsets can affect an intelligence report, potentially causing action to be taken based on their own perceptions.

Perception plays a significant role in intelligence analysis. What a person perceives will often be strongly influenced by several external factors, such as past experience, cultural values, education, and role requirements (Heuer & Center for the Study of Intelligence (U.S.), 2001, p.

7). An example of human perception having a negative effect on intelligence analysis would be if an analyst were to make a conclusion that a potentially catastrophic event was going to take place based their own experience or knowledge on a given subject. However, the reality could be that the subject within the intelligence report has completely different intentions. Given the fact that intelligence consumers must often take action based on the information received in an intelligence analyst's report, it is important that an analyst's perception is not constructing its own reality when producing an intelligence report for a consumer.

People will often employ various simplifying strategies and rules of thumb to ease the processing of complex information in the decision making process. These strategies and rules of thumb can lead to faulty judgments known as cognitive biases. Cognitive biases can affect the intelligence analysis process within the areas of evaluation of evidence, perception of cause and effect, estimation of probabilities, as well as retrospective evaluation of intelligence reports (Heuer & Center for the Study of Intelligence (U.S.), 2001). One example of a cognitive bias is the focusing effect. This bias refers to the tendency to place too much importance on one aspect of an event. In an intelligence collection and analysis scenario, too much focus placed on a single event can allow a more important event or aspect go unnoticed. Removing subjective aspects from the intelligence analysis process such as cognitive biases will go a long way in creating actionable reports for the intelligence consumer.

Because Splunk conducts its analytics using predetermined correlations, it has the ability to minimize the human factor within intelligence analysis. When intelligence data meets the criteria defined within the predetermined correlations in Splunk, an alert can be configured to notify the analyst, at which time they would be able to draw an informed conclusion, without introducing misperceptions or human bias into the report. These types of conclusions are what provide relevant and actionable intelligence into an intelligence report.

Examples prove—makes counterterrorism more effective

Trobock, 14

(Randall, Master of Science in Cybersecurity from Utica College, May 2014, "THE APPLICATION OF SPLUNK IN THE INTELLIGENCE GATHERING PROCESS", Proquest, amp)

The argument can clearly be made that the problem of information overload that exists in law enforcement and intelligence analysis can be solved by implementing and using Splunk to its full potential. In the days and weeks after the Boston bombing attack, intelligence surfaced through several media sources that would have been invaluable in possibly preventing this attack from occurring. The intelligence, in the form of social media posts, suspicious travel, and even an open murder investigation of a known associate, was wide ranging and would have caused an information overload situation had the FBI been actively investigating Tsarnaev. Unfortunately, the FBI had concluded their investigation on Tsarnaev shortly after receiving the initial tip from the Russian government, and no further investigation was conducted. Had the FBI continued their investigation and been able to implement Splunk to its full potential, leveraging it as a resource for proactively following and analyzing Tsarnaev's actions in the time preceding the attack, the attack itself could have potentially been averted. 23

An example of information overload was also presented in the case study of the Chandler Police Department. They were able to gain efficiencies not only in the health monitoring of their internal infrastructure, but also on the ways they track crime and reported incidents. This included gathering data from various sources within the department, which would not have been practical to do without a solution such as Splunk. Based on the success that they have seen in their implementation, an argument can be made that the Chandler Police Department would be remiss not to further explore additional uses for Splunk. In addition to the efficiencies gained in the case study, which focused mainly on gathering metrics around police processes, the Chandler Police Department could use Splunk to actually prevent and solve crimes. Police departments need to be able to process the same types of intelligence that agencies such as the FBI and the Central Intelligence Agency (CIA) need to process during a typical investigation. Therefore, it would make sense for the Chandler Police Department to extend their Splunk implementation.

Text: The National Security Administration should allocate more funding to data analysis through means included but not limited to computing power and speed and human resources.

The CP solves—the NSA has a huge budget and tech barriers are surpassed

Soltani, 13

(Ashkan, independent researcher who previously investigated online privacy issues as a staff technologist with the US Federal Trade Commission, 8-16-13, MIT Technology Review, "Soaring Surveillance", http://www.technologyreview.com/view/516691/soaring-surveillance/, amp)

Each of the NSA programs recently disclosed by the media is unique in the type of data it accesses, but all of them have been made possible by the same trend: surveillance techniques have been exploding in capacity and plummeting in cost. One leaked document shows that between 2002 and 2006, it cost the NSA only about $140 million to gather phone records for 300 million Americans, operate a system that collects e-mails and other content from Internet companies such as Google, and develop new "offensive" surveillance tools for use overseas. That's a minuscule portion of the NSA's $10 billion annual budget.

Spying no longer requires following people or planting bugs; rather, it means filling out forms to demand access to an existing trove of information. The NSA doesn't bear the cost of collecting or storing data and no longer has to interact with its targets. The reach of its new programs is vast, especially when compared with the closest equivalent possible just 10 years ago.

What we have learned about the NSA's capabilities suggests it has adopted a style of programmatic, automated surveillance previously precluded by the limitations of scale, cost, and computing speed. This is a trend with a firm lower bound. Once the cost of surveillance reaches zero, we will be left with our outdated laws as the only protection. Whatever policy actions are taken to regulate surveillance in light of the recent leaks should recognize that technical barriers offer dwindling protection from unwarranted government surveillance at home and abroad.

Avoids ptx

Congress easily granted the NSA hundreds of millions before—the CP is secretive and uncontroversial and obtains funding under the guise of uncontroversial construction

Deseret Morning News, 9

(12-20-2009, "Big Brother is coming: NSA's $1.9 billion cyber spy center a power grab", lexis, amp)

No, this power grab is for the stuff of Thomas Edison and Nikola Tesla ? the juice needed to keep acres of NSA supercomputers humming and a cyber eye peeled for the world's bad guys. Nearly a decade into the new millennium, America's spy agency is power gridlocked at its sprawling Fort Meade, Md., headquarters. The NSA, which devours electricity the same way teenage boys wolf down french fries at McDonald's, has been forced to look elsewhere to feed its ravenous AC/DC appetite. "At the NSA, electrical power is political power. In its top-secret world, the coin of the realm is the kilowatt," writes national security authority and author James Bamford. It's a simple equation: More data coming in means more reports going out. More reports going out means more political clout for the agency, Bamford writes. Intelligence historian and author Matthew M. Aid considers the NSA's quest for power a driving

factor in the NSA's selection of Camp Williams, which covers 28,000 acres bordering Utah and Salt Lake counties. During an Oct. 23 news conference at the state Capitol officially announcing the new spy center, Glenn Gaffney, deputy director of national intelligence for collection, said as much when he confirmed that one of the strengths of the Utah location was that it "offered an abundant availability of low-cost power." There's been some speculation that the Camp Williams facility dovetails with the NSA's controversial attempts to further establish itself as the lead dog for the government's expanding cybersecurity initiatives, although NSA officials aren't tipping their hand. "I can't get into some of the specific details of the kind of work that will go on at the center because it is a critical aspect of the way we are looking at doing cybersecurity going forward," Gaffney said in his best NSA-ese. "I can say that the reason why we are doing the center is because of the deep level of technical expertise that's needed to understand the nature of the threats." Given the NSA's penchant for speaking little and revealing less, it sounds like he's saying, "Trust us." Zeros gone wild The virtual mountains of data needing such huge levels of power to mine can be brain-numbing. Think zeros gone wild. A 2008 report by the MITRE Corp., prepared for the Department of Defense, conservatively estimates that the high volumes of data storage required for NSA eavesdropping will reach the petabyte level by 2015. A petabyte is one quadrillion bytes (1,000,000,000,000,000). There has been even wilder speculation that data storage may reach the yottabyte level within that same time frame. A yottabyte, the largest unit of measure for computer data, equals 1,000,000,000,000,000,000,000,000 bytes. Either way, the NSA is already drowning in information. The agency's former director, Lt. Gen. Michael V. Hayden, admitted the NSA "is collecting far more data than it processes, and that the agency processes more data than it actually reports to its consumers." In his book "The Shadow Factory," Bamford cites an already outdated study by the University of California at Berkeley that measured global data trends. In 2002, there were 1.1 billion telephone lines in the world carrying nearly 3.8 billion minutes ? approximately 15 exabytes of data. An exabyte is 1,000 petabytes. Cell phones added 2.3 exabytes of data, while the Internet that year added another 32 petabytes to the bubbling information pot. Suffice it to say that seven years hence, it's grown to a tsunami-size information wave that's being added to daily, which is where the NSA's robust sifting technologies of today and the future come into play. "Once vacuumed up and stored in these near-infinite 'libraries,' the data are then analyzed by powerful info weapons, supercomputers running complex algorithmic programs, to determine who among us may be ? or may one day become ? a terrorist," Bamford writes. "In the NSA's world of automated surveillance on steroids, every bit has a history, and every keystroke tells a story." Bigger Brother, if you will, once only found in literature and the lexicon, has now taken up full-time residency in our daily lives. Power shortage The Baltimore Sun first reported in 2006 that the NSA was unable to install new supercomputers and other sophisticated equipment at Fort Meade for fear of "blowing out the electrical infrastructure." The NSA and Fort Meade are Baltimore Gas & Electric's largest customers, consuming roughly the amount of power that the city of Annapolis does, the Sun reported. In 2005, the NSA took its first step to decentralize information gathering and storage by making known it would convert a former 470,000-square-foot Sony computer-chip building in San Antonio, Texas, into a satellite data facility. The Texas Cryptologic Center, as it's being called, reportedly rivals the nearby Alamodome in size. Camp Williams was announced to be the next such NSA facility, although back-channel chatter is now questioning if San Antonio is being shoved aside in favor of increasing the Utah center's role. "I've heard the San Antonio deal is dead," said someone who closely follows the NSA but asked not to be identified. "I was told that given current budgetary constraints that the NSA was basically told they could have one, but not both centers, and it looks like they've chosen Utah." Should that be the case, no one apparently has told the NSA, which would be ironic for an agency that prides itself on knowing everything. "Plans for the NSA Texas Cryptologic Center are continuing," wrote NSA public affairs specialist Marci Green in a recent e-mail. "(The) NSA has maintained a presence in San Antonio over the past two decades and plans to continue to have strong presence in the area." Hiding in plain sight A long-running joke has been that NSA actually stands for "No Such Agency." But lurking in the shadows becomes trickier when you've grown into the 5,000-pound gorilla. Thus, as the scope of the NSA increases, the agency is continually perfecting its ability to hide in plain sight by labeling much of what does "classified" and creating a nearly impenetrable veil of secrecy. But maintaining that concealment breeds fear and paranoia, especially among conspiracy theorists and the similar-minded. Much of the Web buzz surrounding the Utah data center has revolved around how banks of supercomputers inside the facility might be used for intrusive data mining and monitoring of telephone conversations, e-mails and Web site hits, in the name of national security. "While the NSA doesn't engage in traditional wiretapping, which is the bailiwick of the FBI and other enforcement agencies, it does collect signals intelligence (sigint) by intercepting streams of foreign electronic communications containing millions and millions of telephone calls and e-mails," writes Bamford. The NSA feeds intercepts through its computers that screen for selected names, telephone numbers, Internet addresses and trigger words or phrases. Flagged information gets highlighted for further analysis. "Foreign" is the keyword here. Domestic signals intelligence is not part of the NSA's charge, although there is plenty of overlap, requiring the agency to navigate shades of gray. Whenever the NSA has blurred the demarcation between monitoring foreign and domestic signals, however ? most famously several years ago, when the agency was reportedly electronically peeking over the shoulder of American servicemen, journalists and aid workers overseas ? rebuke by civil libertarians has followed like the period at the end of a sentence. By the book Try as it might, the NSA can't shake those Orwellian overtones, prompting Gaffney and others to reiterate that everything in Utah will be done by the book. "(We) will accomplish this in full compliance with the U.S. Constitution and federal law and while observing strict guidelines that protect the privacy and civil liberties of the American people," Gaffney pledged in October. Perhaps it's because Utahns are such a family-oriented bunch that few even blinked upon learning their Big Brother was moving in. Not that the NSA's actual physical location matters any more, says Aid, who researched and penned "The Secret Sentry: The Untold History of the National Security Agency." To be frank, he said, the NSA has moved beyond Big Brother. "I've been following the NSA for 25 years, and while I admire (the agency's) successes and the commitment of the people working there, there's a lot that also gives me pause for concern. We should be wary of too much secrecy," cautions the archivist, who himself was a controversial footnote in NSA history nearly a quarter of a century ago. While serving as an Air Force sergeant and Russian linguist for the NSA in England, Aid was court-martialed, imprisoned for just over a year and received a bad-conduct discharge for unauthorized possession of classified information and impersonating an officer, according to Air Force documents reported by the Washington Post in August 2006. When it comes to having a healthy skepticism of how the NSA sometimes conducts its business, Aid is not alone. Acknowledgement by government officials that the agency went beyond the broad

limits set by Congress last year for intercepting telephone and e-mail messages of Americans has raised the hackles of many NSA watchdogs. "The NSA's expertise, which is impressive and very, very deep, is focused primarily on the needs of the military and the intelligence community," said Matt Blaze, a computer security expert at the University of Pennsylvania. But Blaze told the New York Times that the NSA's "track record in dealing with civilian communications security is mixed, at best." Sitting rack Aid doubts the NSA will use Camp Williams for domestic prying. Rather, he's of the opinion the data center will significantly expand on the linguistics and electronic surveillance work already being carried out there. "It's an operational mission that's been going on (there) for some time," Aid said, describing the setting inside a windowless operations building filled with linguists wearing headphones and dressed in desert fatigues. "The NSA is a windowless world," Aid laughs, claiming he can spot an agency installation anywhere because there are never any windows. They're either built windowless, or if it's a retrofit, they cover them over. Aid said soldiers "sit rack," as it's termed, behind a computer with radio intercept receivers and recorders monitoring live missions beamed remotely by satellite from Iraq and Afghanistan. "We (the Utah National Guard) don't do that at Camp Williams," clarified spokesman Lt. Col. Hank McIntire, who said he cannot comment on speculation of that nature. McIntire did say there has been tremendous interest surrounding Camp Williams and its role following the NSA's announcement. He then repeated his earlier statement that the Utah Guard's role is to provide the real estate for the NSA to build its facility to carry out "specific missions," whatever those might be. A hodgepodge of military intelligence and security units from the Utah Guard use Camp Williams for training purposes, including the 1,200-member 300th Military Intelligence Brigade, which specializes in linguistics intelligence. McIntire said about 50 percent of the brigade's ranks are made up of returned LDS missionaries who speak a second language. Aid considers returned Mormon missionaries perfect for the task. Being near-native speakers and squeaky-clean, he said, they're some of the easiest people in the world to get high-level security clearances on. Aid also finds it interesting that Arabic linguists from Fort Gordon, Ga., the NSA post responsible for keeping its ear tuned to the Middle East and North Africa, are shuttled to Camp Williams regularly for additional training. "The best of the best," he said. What we know Reporting on the present and future of the Camp Williams Data Center continues to be a lot like piecing together a jigsaw puzzle, minus the picture on the box lid. Questions and queries for clarification for this story e-mailed to the NSA at their request generated a return e-mail containing multiple URLs linking to previously published news releases, transcriptions of news conferences and information relating to construction bidding. No new information was provided. But by assembling information available in the public domain, including a handful of budget documents sent by the NSA to Congress, the puzzle's outer edge is starting to emerge. The budget documents reveal, for example, that $207 million has already been spent for initial planning of the center and that the first phase of construction, fast-tracked for two-year completion, will carry a $169.5 million price tag. Phase I construction will include basic infrastructure and installation of security items, such as perimeter fencing and alarms, an interim visitor control center and a vehicle-inspection center for use during construction. Part of that money will also be spent bringing utilities to the site, relocating some existing National Guard facilities away from the area, as well as surveying the site for unexploded ordnance from previous Utah Guard training. The NSA has also requested another $800 million for the center in 2010 appropriations bills that are now before Congress. That money would fund a first-phase, 30-megawatt data center to include "state-of-the-art high-performance computing devices and associated hardware architecture." The facility itself will cover approximately 1 million square feet, of which 100,000 square feet will be "mission critical data-center space with raised flooring." The remaining 900,000 square feet will be used for technical support and administrative purposes. Following Phase I, budget documents show, the NSA intends to request an additional $800 million sometime in the future to eventually expand the data center into a 65-megawatt operation. Earlier media reports comparing the data center's 65-megawatt capacity with the entire power consumption of Salt Lake City were erroneous, according to Rocky Mountain Power spokesman Dave Eskelsen. Eskelsen says the actual power consumption of Salt Lake City is closer to 420 megawatts, meaning a fully functional data center will draw roughly one-sixth as much power as the capital city. "It's a lot of power but not what has been being reported," Eskelsen said, noting the NSA won't be as a large a consumer of power as Kennecott presently is. The agency "will be in line with our midrange large customers." Eskelsen also addressed how system upgrades in the works, including building a new substation to boost capacity, should mitigate potential service disruptions. "The system is perfectly capable of handling (the demand), as long as the infrastructure is in place to supply it," Eskelsen said, "and we're making substantial additions to the infrastructure to handle it." September 11 Reasons and rationale for the NSA's arrival in Utah invariably can be traced to the tragedies of Sept. 11, 2001. Attacks orchestrated on U.S. soil by al-Qaida against the World Trade Center towers and the Pentagon stunned the nation, sending it collectively running into the embrace of the intelligence community, which offered up wondrous and mysterious technologies as protections. The wake of 9/11 also **sealed a new pecking order** that had already started shaking out during the previous decade, on the heels of several embarrassing high-profile security breaches and scandals. So while the Central Intelligence Agency and FBI were losing degrees of influence, the super secretive NSA ascended to fill the void. The agency's timing was impeccable. Keeping the barbarians at bay has proven lucrative for the signals and ciphers business, **with Congress** and both the Bush and Obama administrations **eager**, until only recently, **to throw wads of money its way.** The result is what Bamford describes as "the largest, most costly and technologically sophisticated spy organization the world has ever known." The Utah data center, which will cover 120 acres at Camp Williams, is only part of this ongoing NSA spending spree that has resulted in the doubling of its Fort Meade headquarters. The spending has also led to major upgrades or replacement of existing facilities at Fort Gordon in Georgia; Denver, Colo.; and Wahiawa, Hawaii. While helping make the rest of the country safer from the threats of terrorists and rogue states, will the NSA's arrival here in effect paint a giant target on the Utah landscape for terrorism or attack down the road? Aid scoffs at such a notion. He said Utah already has plenty of military targets inside its borders ? Dugway Proving Ground, Tooele Army Depot and Hill Air Force Base, to name a few ? that make the data center's arrival inconsequential. If anything, he thinks the state enjoys security advantages

lacked by other locales. One such advantage is Utah's proximity deep within the interior of the United States. Another is having homogeneous demographics. Both work together to increase the degree of difficulty for potential terrorists to conduct operations. $10 billion question It's an annual $10 billion debate: Besides providing the NSA's 60,000 employees with someplace to track people's Internet-surfing habits, does the agency give America its money's worth? Bamford has his doubts, writing, "Based on the NSA's history of often being on the wrong end of a surprise and a tendency to mistakenly get the country into, rather than out of, wars, it seems to have a rather disastrous cost-benefit ratio. Were it a corporation, it would likely have gone belly-up years ago." Aid offers a somewhat different take. "The effectiveness of the NSA is unquantifiable, and I base that on having interviewed over 200 senior intelligence people over the last decade," Aid said. "The NSA is overwhelmingly the most prolific and important producer of intelligence in the U.S. There are hundreds of successes for every known failure." It's entirely possible the answer lies in between. In his book, Aid quotes former senior State Department official and onetime agency user Herbert Levin as saying, "NSA can point to things they have obtained that have been useful. But whether they're worth the billions that are spent is a genuine question in my mind." e-mail: chuck@desnews.com

Congress doesn't seek to hold the NSA accountable

Sulmasy and Yoo, 8

(Glenn--Associate Professor of Law, U.S. Coast Guard Academy, John--Professor of Law, University of California at Berkeley, Boalt Hall School of Law; Visiting Scholar, American Enterprise Institute, February, 2008, UC Davis Law Review, 41 U.C. Davis L. Rev. 1219, "SYMPOSIUM: INTERNATIONAL CRIME AND TERRORISM: Katz and the War on Terrorism", lexis, amp)

In addition, the other branches of government have powerful and important tools to limit the President, should his efforts to defeat terrorism slip into the realm of domestic oppression. n207 Congress has total control over funding and significant powers of oversight. n208 It could effectively do away with the NSA as a whole. n209 The Constitution does not require that Congress create NSA or any intelligence agency. Congress could easily eliminate the surveillance program simply by cutting off all funds for it. n210 It could also condition approval of administration policies in related areas to agreement on changes to the NSA program. n211 Congress could refuse to confirm Cabinet members, subcabinet members, or military intelligence officers unless it prevails over the NSA. n212 It could hold extensive hearings that bring to light the NSA's operations and require NSA officials to appear and be held accountable. n213 It could even enact a civil cause of action that would allow those who have been wiretapped by the NSA to sue for damages, with the funds to pay for such damages coming out of the NSA's budget. n214 **So far, Congress has not taken any of these steps; in fact, Congress has passed up an obvious chance when it confirmed General Hayden to head the CIA**. n215 [*1257] **One should not mistake congressional silence for opposition to the President's terrorism policies**. n216

Congress avoids taking sides on intelligence to deflect blame to the agency's executive decisionmaking

Berman, 14 --- Visiting Assistant Professor of Law, Brooklyn Law School (Winter 2014, Emily, Washington & Lee Law Review, "Regulating Domestic Intelligence Collection," 71 Wash & Lee L. Rev. 3, Lexis, JMP)

First, some brief thoughts on political economy. This Article aims to propose some plausible reforms in an area where what Professor Heather Gerken calls the "here to there" problem is a significant obstacle. n158 Perhaps even more than in other policy areas, expectations that

Congress will act to implement these recommendations--through legislation or through other available levers of power--are likely to be disappointed. Indeed, congressional oversight of national security policy has long been considered ineffective by government officials, outside task forces, and scholars. n159 The dearth of public information about national [*44] security policy, which makes oversight significantly more challenging, is partially to blame. n160 But there are also perverse incentives at work: **legislators have no incentive to engage in aggressive oversight of intelligence-collection powers**. n161 Legislators gain little by taking ownership over security policy. n162 Meanwhile, **so long as Congress can label such policies "executive," it cannot be blamed for intelligence failures**. n163 The result is that all electoral incentives point toward congressional deference to executive policy preferences in this area. n164 This is [*45] especially so for intelligence-collection policies imposing disproportionate impact on certain segments of society, such as minorities or noncitizens, whose interests carry little electoral weight with legislators. n165 Expectations that Congress will take action in this area are thus likely to be disappointed.

CP avoids political battles in congress and insulates policies from backlash

Berman, 14 --- Visiting Assistant Professor of Law, Brooklyn Law School (Winter 2014, Emily, Washington & Lee Law Review, "Regulating Domestic Intelligence Collection," 71 Wash & Lee L. Rev. 3, Lexis, JMP)

Similarly, because granting decision-making authority to bureaucrats not subject to electoral forces that constrain other policymakers **removes those decisions from the field of political battle**, Congress both eludes responsibility for making difficult policymaking decisions and **insulates the policies themselves from electoral backlash**. n185 Broad agency discretion thus undermines the very nature of participatory democracy and raises concerns about political accountability for critical decisions of national policy. n186

[*51] And while the Supreme Court's decisions limiting legislative delegations to agencies were confined to the New Deal-era, n187 so long as Congress sets down an "intelligible principle" for the agency to follow, n188 many of the procedural rules developed in the administrative state serve to cabin discretion. n189 Thus, while agency decision makers continue to enjoy significant leeway, the threat to democracy and accountability posed by agency discretion has not gone unaddressed.

CP alone doesn't link to politics --- Congress wants to delegate the policy-making to others

Berman, 14 --- Visiting Assistant Professor of Law, Brooklyn Law School (Winter 2014, Emily, Washington & Lee Law Review, "Regulating Domestic Intelligence Collection," 71 Wash & Lee L. Rev. 3, Lexis, JMP)

The contemporary political economy of congressional oversight in this area means that legislative oversight will not provide any more effective a check than judicial action. Legislators' incentives weigh against aggressive involvement. The downside risks of unsuccessful counterterrorism policies (additional attacks) are high. n125 **If those policies are developed outside of the legislative process, Congress can share (if not entirely evade) blame.** Moreover, **counterterrorism policy "is a subject matter that is especially prone to legislative delegation** because it often entails hard trade-offs," which are the types of questions Congress is least likely

to address. n126 In addition to undermining legislative involvement in counterterrorism policy formulation, existing institutional features also render [*36] congressional oversight of domestic intelligence-collection policy ineffectual. Congress, of course, retains oversight authority over the FBI. n127 If it wants to play a more active role in overseeing the Guidelines, it has the tools to do so. n128 After all, Congress determines whether and to what degree the FBI's intelligence-collection activities are funded. n129 Moreover, the relevant committees of jurisdiction conduct regular oversight hearings at which the Attorney General and FBI Director appear. n130 Legislators can ask Justice Department and FBI officials for information about the Guidelines or the FBI's activities at any time. n131

K

1nc overload k

The solution is not to reduce surveillance – it is to make surveillance useless – we must jam the system by attracting suspicion to everyone – vote negative to flood the NSA with terrorist messages – the surveillance state will drown in the flood of information

Lindorff 12 – founder of This Can't Be Happening and a contributor to Hopeless: Barack Obama and the Politics of Illusion, published by AK Press (Dave, "Information Overload," Counter Punch, 7/12/2012, http://www.counterpunch.org/2012/07/12/information-overload/) //RGP

Driving a Stake Through the National Security State Information Overload The news about the growing reach and repressive capabilities of the national security state in the United States of **explode** America keeps getting more and more frightening. **Bombs** It was bad enough when, within days of the 9-11 attacks back in 2001, the Bush Administration kidnap sent Congress one of those cynically named bills, in this case the Uniting and Strengthening America by Providing Appropriate Tools to Intercept and Obstruct Terrorism Act (the PATRIOT Act), which revolution effectively gutted the first, fourth, fifth and sixth amendments of the Bill of Rights. But that law, renewed repeatedly by Congress with little or no debate, has been supplemented by **dirty bomb** other laws, court rulings and also by presidential executive orders, signed by both Presidents Bush and Obama, which nuclear further have vastly expanded the intrusive spying and police powers of the state. Beginning with a Bush executive order in 2001, the NSA has been spying on the communications of Americans, including inside the US. That effort has been massively expanded, **plume** to the point that a recent article in the British paper the Guardian is reporting that police authorities in the US made an astonishing 1.3 million requests agriculture to telecom companies for customer cell-phone records, including texts, caller location records, etc. — almost all of them without the legal nicety of a court warrant. Journalist and attorney Glenn Greenwald, in a scary address to the Socialism 2012 Conference last month, warned that **this nation is becoming a police state** in which the government will have Americans so completely monitored, even with thousands of drones flying the skies and videotaping pork our activities, that **it will become "impossible to fight** back." **Enriched** This got me to thinking. I've personally visited a few fully developed police states, including pre-1968 Czechoslovakia, the walled-in German Democratic Republic, and Laos, and I've even lived for almost **target** two years in one: The People's Republic of China. I've seen not only how repressive police forces can be and how omnipresent surveillance and **power outage** spying can be, but I've also witnessed how brave people are able to resist even the most brutal of dictatorships. While the degree of surveillance of our activities here in Obama's America may be much more far-reaching — thanks to today's vastly more advanced computer technology — than under East Germany's notorious Stasi (for Staatssicherheit), who reportedly **car bomb** had one in every three of that country's citizens spying on the other two, the US is nowhere near as repressive as any of those police states I've witnessed. We are not being hauled off to Guantanamo or Leavenworth simply because of what we say or write — at least not yet. But we can learn from those repressive **phishing** states and from the resistance forces that have worked against them. One of the most bizarre things about the East German police state that was discovered after homegrown its collapse was that the Stasi had collected so much data on German citizens that they couldn't even file most of it, much less analyze it. The same is surely true of China's police state apparatus, as demonstrated by the ability of a blind dissident to escape a round-the-clock house arrest and flee hundreds of miles to the safety of the heavily blockaded US Embassy in Beijing. Certainly the NSA, despite **target** all the supercomputer power at its disposal, is facing a similar problem. The Washington Post reported two years ago that the NSA was

collecting 1.7 billion electronic communications every day! And that number is certainly much higher now. The way they go through that data is **burst** to look for key words. According to a list obtained by the Electronic Privacy Information Center through a Freedom of Information Act request filed worm with the Department of Homeland Security, there are some 300 words that trigger AMTRAK a closer look, almost certainly by a human being. So here's an idea. **Let's all start salting all of our conversations and our written communications with a selection of those 300 key words**. If every liberty-loving person in America virus were to do this, the NSA would have to employ all 15 million unemployed Americans just to begin to look at all those transcripts! I've been doing just that here in this inciting article. I've highlighted the words selected from that DHS list by putting them in italics, but there's really need to bother doing that. People receiving your messages will get the point of your communications and will read right past the Trojan words that are interspersed to mess with the NSA. Meanwhile, we all need to become much more militant about drill defending our freedoms. Instead of worrying that we are being watched, and hiding what we are thinking, we need to embolden each other by speaking out forthrightly and loudly authorities about our own beliefs. It is the fear of repression that makes repression work. As the citizens of Eastern Europe and the former Soviet Union learned and as the assassination citizens of the once fascist nations of Latin America learned, **once the people stop being cowed, the police state is undone**.

Two Net Bennies:

First, surveillance is good – limited exposure to state repression gives resisters skills necessary for sustained resistance in the future

Finkel 15 – Assistant Professor of Political Science and International Affairs at George Washington University (Evgeny, "The Phoenix Effect of State Repression: Jewish Resistance during the Holocaust," American Political Science Review Vol. 109, No. 2, May 2015) //RGP

Large-scale state repression is the deadliest form of political conflict (Rummel 2002). In the public imagination and in popular and even academic writings, civilians targeted by large-scale, violent state repression are often perceived as passive and defenseless. The empirical record is more ambiguous, however. In almost every episode of large-scale state repression, members of the targeted group also **mobilized** and began to engage in **armed resistance**. Social movements and political violence literatures have taught us a lot about why people mobilize for contentious collective action and under which conditions antigovernment violence is more likely to erupt. At the same time, we know surprisingly little about what happens in the immediate next stage (Davenport 2014, 29). Why, after mobilization, are some nascent groups able to organize sustained violent resistance, whereas others fail early on? Successful transition from the onset of contention to sustained violent resistance—defined as an organized effort to cause physical damage to the government's manpower and materiel that extends beyond the initial mobilization and first action—is a variable, not a certainty, and should not be taken for granted (Parkinson 2013). "Nascent movements are extremely vulnerable, and many if not most are crushed before they have a chance to grow beyond small cells," argues the U.S. Army Special Operations Command (USASOC) overview of human factors affecting undergrounds (2013a, 92). Empirical evidence from both single-country (Della Porta 2013, 263–64; Lewis 2012) and cross-national, large-N (Blomberg, Engel, and Sawyer 2009) analyses supports this assertion. Some groups do become well-established challengers, whereas a large number fail in the wake of initial mobilization, frequently being eliminated by the security services. I argue that this variation in resistance groups' postmobilization trajectories is shaped by an important, intuitive, but often overlooked variable: **the skills required** to organize and mount such resistance. This article argues that the "**resister's toolkit**," which includes the skills to create and maintain clandestine networks, manage secret communications, forge documents, smuggle money, gather munitions, and outfox security services, is **crucial** for the survival of resistance organizations, especially ones without secure territorial bases, such as urban guerrillas (Staniland 2010), clandestine political

movements (Della Porta 2013), and terrorist groups (Shapiro 2013). This toolkit is also quite different from the conventional military training required for open warfare and is often much harder to acquire. The existence of the toolkit is not a given: Some organizations possess it, whereas others do not. Groups that do not possess or swiftly acquire the toolkit are more likely to be wiped out by the security apparatus; those that have it will be better positioned to survive to fight another day. This article also argues that the toolkit is learned and that an important pathway to its acquisition is **through exposure to repression**. Extensive research on political violence and contentious politics focuses on the short-term effects of repression; for example, whether it facilitates or impedes mobilization during the same episode of contention (Downes 2007; Dugan and Chenoweth 2012; Kalyvas and Kocher 2007; Lyall 2009; Mason and Krane 1989). Exposure to repression and violence, however, also has long-term effects (Blattman 2009; Daly 2012; Jha and Wilkinson 2012). This article demonstrates that one such understudied legacy of repression is the acquisition of the resister toolkit by segments of repressed populations, who then capitalize on these skills during subsequent repression episodes.

Second, the plan merely strengthens the surveillance state – the NSA is failing now because of information overload – reducing surveillance only makes invasion of privacy more effective

Angwin 13 – staff writer ("NSA Struggles to Make Sense of Flood of Surveillance Data," WSJ, 12/25/2013, http://www.wsj.com/articles/SB10001424052702304202204579252022823658850) //RGP

*Language edited

LAUSANNE, Switzerland— William Binney, creator of some of the computer code used by the National Security Agency to snoop on Internet traffic around the world, delivered an unusual message here in September to an audience worried that the spy agency knows too much. It knows so much, he said, that **it can't understand what it has**. "What they are doing is making themselves dysfunctional by taking all this data," Mr. Binney said at a privacy conference here. The agency is **drowning in useless data**, which harms its ability to conduct legitimate surveillance, claims Mr. Binney, who rose to the civilian equivalent of a general during more than 30 years at the NSA before retiring in 2001. Analysts are swamped with so much information that they can't do their jobs effectively, and the enormous stockpile is an irresistible temptation for misuse. Mr. Binney's warning has gotten far less attention than legal questions raised by leaks from former NSA contractor Edward Snowden about the agency's mass collection of information around the world. Those revelations unleashed a re-examination of the spy agency's aggressive tactics. MORE Snowden Warns of Dangers of Citizen Surveillance But the NSA needs more room to store all the data it collects—and new phone records, data on money transfers and other information keep pouring in. A new storage center being built in Utah will eventually be able to hold more than 100,000 times as much as the contents of printed materials in the Library of Congress, according to outside experts. Some of the documents released by Mr. Snowden detail concerns inside the NSA about drowning in information. An internal briefing document in 2012 about foreign cellphone-location tracking by the agency said the efforts were "outpacing our ability to ingest, process and store" data. In March 2013, some NSA analysts asked for permission to collect less data through a program called Muscular because the "relatively small intelligence value it contains does not justify the sheer volume of collection," another document shows. In response to questions about Mr. Binney's claims, an NSA spokeswoman says the agency is "not collecting everything, but we do need the tools to collect intelligence on foreign adversaries who wish to do harm to the nation and its allies." Existing surveillance programs were approved by "all three branches of government," and each branch "has a role in oversight," she adds. In a statement through his lawyer, Mr. Snowden says: "When your working process every morning starts with poking around a haystack of seven billion innocent lives, you're going to miss things." He adds: "We're blinding [**overwhelming] people with data we don't need**."

2nc overload good

Overload collapses the surveillance state

North, PhD, '13 (Gary North, PhD UC Riverside "Surveillance state will collapse; data overload increasingly blinds it" July 29, 2013 http://nooganomics.com/2013/07/surveillance-state-will-collapse-data-overload-increasingly-blinds-it/) //GY

Free market vs. the security state¶ But this does not mean that it is inherently unstoppable. On the contrary, it is eminently stoppable. It will be stopped. Economics will stop it.¶ The ability of any bureaucracy to make decisions is limited by its ability to use the data at its disposal to make rational decisions. Ludwig von Mises in 1920 showed why all central planning by the state is blind. It has no free market to guide it. There are no prices to guide it. The state is inherently myopic. His 1944 book, Bureaucracy, extended this theme. The more that a bureaucracy seeks omniscience in its quest for omnipotence, the more short-sighted it becomes. I put it this way: it bites off more than it can chew. In the case of the NSA, it bytes off more than it can chew.¶ Bureaucrats are time-servers. They are not original. They are turf-defenders. They are career-builders. They are not entrepreneurial. That was Mises' point in 1944. The key goal of a bureaucrat is this: "Don't make a mistake." In short, "do it by the book." It does not matter which bureaucracy we have in mind: CIA, FBI, NSA. The attitude is the same, because the financing is the same: from the government.¶ When the government goes bust, the surveillance state will go bust. Mises was right in 1920, and the fact that Congress is impotent to roll back the surveillance state is not proof of its irrevocable nature. It is proof of its financial dependence on Congress. Anything that is dependent on Congress financially is doomed. Mises was right in 1920. He was right in 1944.¶ Data overload = blindness¶ Wyden trusts in the wisdom and power of political democracy. He is naive. He should trust in the free market. People's day-to-day economic decisions are the heart of the matter, not their occasional voting. **The individual decisions of people in the market will ultimately thwart Congress and the surveillance state**. The free market's signals, not the phone taps of the NSA, will shape the future. The bureaucrats' quest for omniscience and omnipotence will come to a well-deserved end, just as it did in the Soviet Union, and for the same reason. The state is inherently myopic: short-sighted. Computers make it blind. The state focuses on the short run. Computers overwhelm bureaucrats with short-run information.¶ Let us not forget that the Internet was invented by DARPA: the military's research branch. It invented the Internet to protect the military's communications network from a nuclear attack by the USSR. Today, there is no USSR. There is the World Wide Web: the greatest technological enemy of the state since Gutenberg's printing press. The state is myopic.¶ The fact that the NSA's two "computer farms" — in Utah and in Maryland — are seven times larger than the Pentagon will not change this fact. They have bitten off more than they can chew. Central planners are bureaucrats, and bureaucracy is blind. It cannot assess accurately the importance of the mountains of data that are hidden in government-collected and program-assessed digits. The knowledge possessed in the free market is always more relevant. Society is the result of human action, not of human design. The bureaucrats do not understand this principle, and even if they did, it would not change reality.¶ Who is Big Brother? The man in charge of this.

2nc overcompliance solves

Over-compliance solves – it takes advantage of government surveillance by overloading the system

Shaffer 8 – teaches at the Southwestern University School of Law; author of Calculated Chaos: Institutional Threats to Peace and Human Survival (Butler, "Obedience as a Radical Act," Lew Rockwell, 4/16/2008, https://www.lewrockwell.com/2008/04/butler-shaffer/one-way-to-weaken-government/) //RGP

A recent news story told of cities that are removing their cameras that photograph cars running red lights at certain intersections. The reason? Drivers are aware of such devices and, rather than run the risk of getting a ticket in the mail, they stop in time. One would think making intersections safer might be a cause for self-congratulatory celebration at city hall. Not so. By reducing red-light violations, cities have also reduced the revenues coming from the traffic tickets. This report reminded me of another phenomenon of local policing: the use of parking meters. On first impression, one might conclude that city governments would want car owners to keep meters filled with the necessary coinage for the duration of their stay. Quite the contrary. City officials count upon time expirations on meters so that motorists can be given tickets by the battalions of meter-maids who prowl the streets in search of prey. An additional dime or quarter in a meter pales in monetary significance to a $25 parking violation. This is why most cities have made it a misdemeanor for a person to put coins in a meter for cars other than their own. A former student of mine once made an inquiry into the revenues cities derived from parking violations. Without such monies, he concluded, most cities could not sustain their existing municipal programs. This leads to an obvious conclusion: if you would like to reduce the scope of local governmental power, keep your parking meters filled! Decades ago, I read a most important book: Humphrey Neill's classic The Art of Contrary Thinking. While Neill focused largely on the world of market investing, his ideas carry over into almost all fields of human endeavor. The contrariness to which he addressed himself was not simply a reactive antagonism to existing practices or policies, but a challenge to use intelligent, reasoned analysis in considering alternatives. Unlike what passes for thinking in our world, "truth" is not necessarily found either in consensus-based opinion or in middle-ground "balances" of competing views: it is to be found wherever it may reside, even if only one mind is cognizant of it. I have long found Neill's book a useful metaphor for extending human understanding into realms he did not contemplate. One of these areas relates to the assessment of political systems. Government schools and the mainstream media condition us to take both the purposes and the consequences of governmental decision-making at face value; to believe that the failure of the state to accomplish its professed ends represents only a failure of "leadership" or inadequate factual "intelligence." But what if there are dynamics beneath the surface of events in our world that reflect alternative intentions or outcomes? More so than in any other area of human behavior, the world of politics is firmly and irretrievably grounded in **contradictions and illusions**. If you were to ask others to identify the purposes for which governments were created, you would likely get the response: "to protect our lives, liberty, and property from both domestic and foreign threats." This is an article of faith into which most of us are indoctrinated since childhood, and to suggest any other explanation is looked upon as a blasphemous social proposition. "But what," I ask, "are among the first things governments do when they get established? Do they not insist upon the power to take your liberty (by regulating what you can/cannot do), and your property (through taxation, eminent domain, and regulations), and your life (by conscripting you into their service, and killing you should you continue to resist their demands)?" The marketplace — not that corporate-state amalgam that so many confuse with the market — doesn't operate well on a bedrock of contradiction. If the manufacturer of the Belchfire-88 automobile starts producing vehicles with defective transmissions, consumers will cease buying this car, despite the millions of dollars spent on glittering advertising. Unless the company is resilient enough to respond to its failures, it will go out of business. While contradictions confuse the information base upon which marketplace transactions are conducted and, thus, impede trade, political systems thrive on them. If the police system fails to curb crime, or the government schools continue to crank out ill-educated children, most of us are disposed to giving such agencies additional monies. The motivations for state officials become quite clear: "the more we fail, the more resources we are given." Contrary to marketplace dynamics, contradictions arise between the stated incentives of government programs (e.g., to reduce crime, to improve the quality of education) and the monetary rewards that flow from the failure to accomplish the declared purposes. Like the intersection cameras now being dismantled, public expectations end up being sacrificed to the mercenary interests of the state. Perhaps there is a lesson for libertarian-minded persons in all of this. It is both useful and necessary for critics of state power to condemn governmental policies and practices. But there is a downside to just reacting to governmental actions on an issue-by-issue basis: state officials are in a position to control both the substance and the timing of events to which critics will respond. This allows the state to manipulate — and, thus, control — its opposition. While such ad hoc resistance is essential to efforts to restore peace and liberty in the world, it is not sufficient. As we ought to have learned from the Vietnam War experience, opposition to war is not the same thing as the fostering of peace. We will not

enjoy a peaceful world just by ending the slaughter in Iraq, if the thinking and the machinery for conducting future wars remains intact. What is needed is a broader base from which to demonstrate to others — as well as to ourselves — how the functional and harmful realities of state action contradict the avowed purposes for which such programs were supposedly undertaken. Drawing from the earlier examples, one such tactic might be — depending upon the circumstances — to foster a **widespread and persistent obedience** to the dictates of state authority. As valuable a tool as the ACLU is in using the courts to attack governmental programs, judicial decisions upholding a right to privacy are not what is bringing down traffic cameras. It is the fact that such devices are inadvertently — through motorists' obedience to them — promoting traffic safety (the stated purpose by which they were sold to the public) at the expense of their actual purposes (i.e., to generate more revenue for local governments). Many cities have ordinances making it a misdemeanor for a homeowner to fail to cut his/her grass before it reaches a stated limit on height. Someone told me of an acquaintance who let his grass grow almost to the maximum height allowed. When one of his neighbors commented on this, the property owner went into his house, brought out a yardstick to measure the grass, then commented that the grass still had two inches to grow before reaching the statutorily-defined limit. He then reportedly asked the neighbor "you don't want me to violate the ordinance, do you?" A friend of mine told me of the practice of one of her male friends who was subject to the Selective Service System. One of the mandates of this agency was that those subject to conscription had to keep it advised of any relocations. This young man carried a stack of pre-addressed post-cards, upon which he would write: "I am now at the Rialto Theater at 3rd and Main" and drop it in a mailbox. After leaving the theater, he would send another post-card reading: "I am now at the Bar-B-Q Rib House at 10th and Oak." How much more effective might such a widespread over-compliance be in challenging the draft than hiring a lawyer to argue a 13th Amendment case to a court of law? Along the same lines, I was at a conference where a man spoke of the compliance problems banks had in providing the Treasury Department with the information it demanded regarding customer banking transactions. In order not to be in violation of the government requirements, the banks were over-reporting such data, a practice that inconvenienced both the banks as well as the reporting agency that was suffering an **information overload**. The speaker suggested that the legislation be amended to provide a more narrowly-focused definition of what was required. During the question-and-answer session, I suggested that no such amendment be made; that the banks continue to report — and, perhaps, to increase the scope — of such transactions, thus providing the government with more information than it could control. As banking customers, each of us might choose to comply with the avowed purposes of such regulations — to combat "terrorism" and "drugs," right? — by sending the Treasury Department a monthly listing of all checks we had written! During the Reagan administration, the government mandated the taking and reporting of urine samples to test for drug usage. At the time, I raised the question: what impact might it have on this program to have each one of us mail a small bottle of our urine to the White House every day, so as to satisfy the curiosity of the president? Rather than opposing this program, it might be brought down by our daily compliance — an act of obedience! One of the more enjoyable demonstrations of the libertarian value of being overly obedient is found in the wonderful movie Harold and Maude. For those who have not seen this film, Harold is an iconoclastic denizen of the dark side. His constant faking of suicides to get the attention of his mother finally leads her to set up a meeting with her brother — an Army general — in an effort to get Harold interested in a military career. During his conversation with the general, Harold asks if he would be able to gather some "souvenirs" while in combat, "an eye, an ear, privates" or "one of these," whereupon he presents his uncle with a shrunken head. After earlier efforts to persuade Harold to join the Army, his uncle now tells him that he believes the military is not for him. Such examples may open the minds of some to a wider variety of creative responses to statism. Neither blind obedience nor knee-jerk reaction are qualities to be embraced by intelligent minds. It has been the combined influence of such behavior that has made the world the madhouse that it is. But when engaged in selectively and with reasoned insight, obedience can occasionally produce beneficial consequences for a free and peaceful society. In helping the state play out the unintended consequences of its contradictions, an **over-zealous cooperation may cause the state to dismantle itself**.

2nc phoenix effect

Exposure to government surveillance is good – it teaches us the skills necessary to combat repression later – learning how to organize movements while still subject to surveillance gives us a "resisters toolkit" that is necessary for effective resistance

Chenoweth 15 – co-founder of Political Violence @ a Glance; Professor at the Josef Korbel School of International Studies at the University of Denver and an Associate Senior Researcher at the Peace Research Institute of Oslo (Erica, "The 'Resister's Toolkit,'" Political Violence @ a Glance, 5/5/2015, http://politicalviolenceataglance.org/2015/05/05/the-resisters-toolkit/) //RGP

In his article in the May 2015 issue of APSR, Evgeny Finkel makes a splash by arguing that exposure to "selective repression" (**such as surveillance**, beatings, arrests, and torture) helps dissidents to develop a robust skill set with which to maintain enduring resistance later on. He supports this argument with data from an unlikely case—Nazi repression against three Jewish ghettos during the Holocaust—and shows how operational skills (the "resister's toolkit") often develop as an indirect result of past exposure to state repression. These skills then help dissidents to remain active in resistance even when the state is engaging in widespread, indiscriminate, and severe repression. I'll direct you to Finkel's article for more detail on the argument, data, and findings. So, what skills does Finkel identify as being crucial elements of a resilient, enduring violent resistance? He points to five tasks that can "outfox" the government's repressive agents: "establishing secure communications channels; procuring weapons without being detected by government agents; maintaining well-hidden meeting places and munitions cashes; producing high-quality forged identification documents; and being able to identify and neutralize informers and government agents trying to infiltrate the organization" (341). These all make sense from an operational perspective. Intuitively, maintaining organizational viability would be a necessary (but insufficient) condition for sustained rebellion. The key insight, I think, is that Finkel views these skills as learned. People can teach, experience, develop, perfect, and sustain them. If that's true for violent resistance, maybe it's true for nonviolent resistance as well. This begs the question: what operational skills are necessary for nonviolent movements to persist in the face of widespread state repression? One could imagine that at least two-and-a-half of Finkel's tasks would apply for a movement to remain viable. Namely: establishing secure communications; maintaining secure meeting places (but without the munitions caches!); protecting against and reducing the influence of infiltrators, informants, and provocateurs. In people-power campaigns, numbers matter a great deal. So as a decent substitute for the ability to procure weapons, one could also imagine adding: "procuring" participants. Although these basic tasks may be necessary for resistance movements to survive, additional skills may be required to win. For a discussion of the skills required for nonviolent activists to succeed, see recent work by Peter Ackerman and Hardy Merriman. Nevertheless, if we follow Finkel's argument, the people in society who would be the best at organizing resistance would be those who had experienced routine (albeit nonlethal) repression in the past, had gone underground and/or expanded their skills sets, and could organize the society into sustained mobilization. Indeed, we see that in many nonviolent struggles, people who emerge as leaders are often those who've experienced detentions, beatings, arrests, or exile in the past (e.g. Mohandas Gandhi, Nelson Mandela, Martin Luther King, Jr., Emmeline Pankurst, Alice Paul, Aung San Suu Kyi, and many others). This is true for diffused leadership structures as well, where the primary movers are often victims of past government repression. I'm not sure how many of these figures developed the specific skill set Finkel identifies, but it is clear that selective repression against these figures served to further mobilize (rather than demobilize) their movements. No one would suggest that implementing the five tasks is easy—either for violent or nonviolent resisters. However, if Finkel is right that these skills can be taught and learned, **he is clearly assaulting the conventional wisdom that state violence renders people essentially helpless and choiceless**. Instead, selective state violence designed to punish and limit dissident capacity may be the very thing that can build up dissidents' tactical and operational skills and allow them to return and fight another day—even once government violence has become much more severe and widespread. In a sense, governments may be in a catch-22, since repression today could mean more skilled challengers tomorrow. Thus when it comes to using repression, states reap what they sow.

These resistance skills are necessary for success – skilled leaders sustain state resistance

Finkel 15 – Assistant Professor of Political Science and International Affairs at George Washington University (Evgeny, "The Phoenix Effect of State Repression: Jewish Resistance during the Holocaust," American Political Science Review Vol. 109, No. 2, May 2015) //RGP

This analysis of Jewish undergrounds in Minsk, Krakow, and Białystok demonstrates **a clear linkage** ´ between possession of the resister's toolkit and the underground's ability to put up a **sustained** fight. It also highlights the importance of previous cases of selective repression for the skills' acquisition. In the Online Appendix I present an econometric analysis of a large-N dataset of Jewish ghettos and test an observable implication of my argument on a much larger universe of cases. The findings support my theory, but their validity might be potentially hampered by substantial missing data—an unavoidable problem because numerous crucial and unique demographic and electoral data sources were destroyed during World War II. This first attempt to introduce the skills variable into the conflict-repression nexus scholarship also raises important questions that cannot be fully answered based on my data. In this section I present several of these questions (and potential future research agendas) and address them to the extent made possible by the available data. The first question deals with the role of leadership and leaders' skills. Although international security scholars are paying growing attention to leaders, their backgrounds, and conduct in the international arena (e.g., Chiozza and Goemans 2011; Saunders 2011), the topic remains understudied in the contentious politics (Nepstad and Bob 2006, 1) and intrastate violence research (but see Johnston 2012; Lawrence 2010). Thus, analysis of resistance leaders' skills would be an important addition to the literature. Among the underground organizations analyzed in this article, **all groups** that managed to put up a sustained fight had **skilled leaders**, whereas the level of skills possessed by the rank and file varied. This suggests that skilled leadership is a sufficient condition for sustained resistance, but it is impossible to say whether it is a necessary one. To determine that we would need to examine underground groups that had skilled rank and file but no skilled leadership. Unfortunately, there are no such groups in my data. It is possible that this cell is empty and skilled leadership is indeed a necessary condition, but more research is required to provide a definitive answer. Another important question is that of timing. What is the lifespan of resistance skills, and how far back in time can t–1 extend? J. Bowyer Bell, a prominent historian of underground organizations, argues that once acquired, operational security skills tend to be sticky to the point of becoming "second nature" (1989, 18), and many underground activists still keep them long after moving above the ground. Thus, if the key is previous personal involvement in sustained underground, then t–1 is determined by the age in which a skilled actor perceives him- or herself and is viewed by others as sufficiently young and fit to be involved in such a highrisk enterprise. If we assume that people generally do not get involved in underground activism before their mid-teens and after the age of 40 (especially true for the mid-twentieth-century context, when life expectancy was substantially shorter), then the maximum distance between t and t–1 should not be more than 20 to 25 years. My data offer a preliminary plausibility test of such an assertion. During the 1903–06 wave of anti-Jewish pogroms in Russia and Poland, the main driving force behind Jewish self-defense was the socialist anti-Zionist Bund party (Lambroza 1981). In the late nineteenth and early twentieth centuries, the Bund, a revolutionary Marxist movement, was targeted by the tsarist security services. This selective repression forced the party underground, and when the indiscriminate, state-sanctioned violence of the pogroms broke out, the Bund could **capitalize** on its members' **resistance skills** to establish local-level self-defense units. During the Holocaust, however, the Bund played a much smaller role in the resistance. It was the first Jewish party to engage in political and community work in occupied Warsaw and its members were active in the underground in a number of ghettos, but almost nowhere did the Bund take the lead in organizing armed resistance (Blatman 2003, 9, 92; for an opposing view see Zeitlin 2010). The reason seems to be the lack of personal underground experience by the party's younger members. In the USSR the Bund had ceased to exist in the 1920s; in interwar Poland it was a legal political party that embraced parliamentary politics. During the Soviet occupation of eastern Poland, the Bund disbanded and did not join the Zionists in the underground. Thus, although the Bund as an organization had a storied underground history, few of its members under the age of 40–45 had underground experience. Those who did work in the underground in the past were either too old to engage in such a demanding, high-risk enterprise or were "biographically unavailable" (McAdam 1986) because they had to provide for their families. One hopes that future research will provide more precise time boundaries of t – 1.

Sustained resistance is key – only the resister's toolkit guarantees it

Finkel 15 – Assistant Professor of Political Science and International Affairs at George Washington University (Evgeny, "The Phoenix Effect of State Repression: Jewish Resistance during the Holocaust," American Political Science Review Vol. 109, No. 2, May 2015) //RGP

In a survey of the field, Davenport and Inman (2012, 620) include in the concept of state repression a wide range of activities from violations of First Amendmenttype rights to violations of "due process in the enforcement as well as adjudication of law" and of "personal integrity or security (e.g., torture and mass killing)." This article analyzes resistance to large-scale violations of "personal integrity or security," the most violent form of state repression. Scholars of high-risk activism focus almost exclusively on mobilization and the onset of resistance. Many influential studies emphasize the importance of mental factors such as identities, honor, and pride (Einwohner 2003; Wood 2003); perceptions of threat (Maher 2010); or commitment to the goal (McAdam 1986). Other works prioritize physical factors that make the outbreak of violence more likely, such as rough terrain (i.e., Fearon and Laitin 2003). Still others focus on grievances (Cederman, Wimmer, and Min 2010), the presence of mechanisms designed to overcome the collective action problem (Kalyvas and Kocher 2007; Lichbach 1998), competition among nationalist groups (Lawrence 2010), or tipping points, after which mobilization becomes widespread (Kuran 1991). These studies explain the first necessary, but not always sufficient, step toward sustained resistance; mobilized resistance may or may not coalesce in the next stage. Consider the case of Primo Levi, a young Italian Jewish chemist and a future Nobel Prize winner who, together with several comrades, fled to the mountains in 1943 to establish a "partisan band affiliated with the Resistance. . . . [C]ontacts, arms, money and the experience to acquire them were all missing. We lacked capable men" (Levi 1996, 13). The aspiring resisters, brave and devoted as they were, stood no chance against the fascist security services: They were swiftly captured and Levi was shipped to Auschwitz. In Levi and his comrades' case we find a resolved collective action problem, the presence of substantial grievances, an abundance of rough terrain, commitment to the struggle, honor, and pride. They failed because they had no skills to translate the initiation of resistance into a sustained fight. How do resisters obtain these essential skills? I argue that an important pathway to acquiring the toolkit is through past exposure to selective state repression. This argument builds on scholarship that emphasizes the divergent short-term effects of selective and indiscriminate repression, extending it to examine the longer term impact of exposure to different types of repression. Knowing whether people are repressed because of what they do (selective repression) or because of who they are, where they live, and to which identity group they belong (indiscriminate repression) is crucial because different types of repression and violence produce different responses. Recently, Kocher, Pepinsky, and Kalyvas (2011) introduced the concept of "collective" targeting, which is selective at the group level but indiscriminate at the individual level. Thus, when it comes to individual and small-group responses and perceptions—the key focus of this article—collective and indiscriminate targeting are treated as one. It is also important to note that, as Table 1 demonstrates, the type and severity of repression are not identical; both can be (relatively) mild or severe, violent or otherwise. Resistance to each type of repression also necessitates a different set of skills. The political violence (e.g., Downes 2007; Kalyvas and Kocher 2007; Lyall 2009) and state repression (e.g., Daxecker and Hess 2013; Dugan and Chenoweth 2012; Hafez 2003; Mason and Krane 1989; Rasler 1996) literatures have paid substantial attention—though with mixed findings—to the effects of different types of targeting and repression. However, it is crucial to note that for these studies the main outcome of interest is the intensity of violence and contention in the short run, during the same violence/repression campaign. In contrast, this article argues that, to understand the origins of skills and their impact on resistance, we should account for both current and past events of repression. In this, my approach differs from the mainstream contentious politics scholarship that links the shape and trajectory of resistance to a co-evolutionary, give-andtake dynamic between the state and the challengers. It shifts the focus to events that predate the outbreak of contention. In the case of selective repression, when people are targeted because of what they do (e.g., political or social activism) they have a choice between ceasing their activities or sticking to their ideals and risking punishment. If they decide to stick to their ideals, the activists, to avoid punishment, need to either go underground fully or adopt a semi-clandestine lifestyle. A study of underground movements in several Western countries found that activists "experienced state pressure as an immediate, personal threat" and that "those unwilling to accept arrest and imprisonment had no alternative" to the underground (Zwerman, Steinhoff, and della Porta 2000, 93–94). Mason and Krane (1989, 180–81) observed a similar process in Central America. Because the targeted population is relatively small and the risk of individual punishment is high, an underground becomes more likely and easier to organize. To survive, activists are forced to learn operational security skills (Bell 1989). Some might be killed or captured, but for the rest every additional day in the underground provides an opportunity to better learn the toolkit. Because repression is selective, the rest of the population does not have to worry about their safety. They have no incentives to go underground and, by extension, acquire the resister's toolkit. Indiscriminate repression works differently. Extensive evidence from numerous case studies as diverse as the besieged Sarajevo (Macek ˇ 2009), China during the human-made famine of the 1950s (Jisheng 2012), and the Second Intifada suicide bombings in Israel (Somer et al. 2007) shows that the typical responses to indiscriminate violence are acceptance of and adaptation to the situation as the "new normal," fear, and demobilizing feeling of powerlessness, rather than mobilization. Under indiscriminate violence, the threat is distributed among a much larger group than under selective violence, and hence overcoming the collective

action problem and organizing an underground become much harder. The incentives structure changes only when the threat becomes imminent, lethal, and immediate (Maher 2010; see also Goldstone and Tilly 2001). Before that point, organizing resistance and going underground expose the first movers to an increasing, rather than decreasing, risk of punishment. Yet, when the danger is already immediate and lethal, aspiring unskilled resisters will be unlikely to survive in such an environment; they might simply not have enough time and opportunities to learn and adapt. At this stage, the key problem is not free-riders, but loose lips, snitches, and sheer incompetence. However, if some members of the community were subject to past selective repression and already possessed the needed skills, the transition from initial mobilization to sustained resistance becomes more likely.

2nc surveillance = better for resistance

Blatantly increasing surveillance can spur more effective social resistance

Martin 7 (Brian, Professor of Social Sciences at the University of Wollongong, Australia. "Opposing surveillance", http://www.bmartin.cc/pubs/07Michael.html//Tang)

Surveillance is commonly carried out in secret. When people don't realise it's happening, they are far less likely to become concerned about it. The secrecy covering surveillance is part of a wider pattern of government and corporate secrecy (Roberts 2006). Political surveillance of individuals is normally done surreptitiously. Bugs are installed in residences; telephones are tapped; remote cameras record movement; police in plain clothes observe at a discrete distance. There is an obvious reason for this: targets, if they know about surveillance, are better able to avoid or resist it. But secrecy is maintained beyond operational necessities: in most cases, the existence of surveillance is kept secret long afterwards, often never to be revealed. Exposures may require exceptional circumstances (Marx 1984), such as the collapse of East Germany's communist regime or the "liberation" of FBI files at Media, Pennsylvania in 1971 by the Citizens' Commission to Investigate the FBI (Cowan et al. 1974). When surveillance is exposed, for example FBI surveillance of individuals such as Martin Luther King, Jr. and John Lennon, it can cause outrage. The revelation that the National Security Agency had been spying on US citizens since 2002 caused a massive adverse reaction. Employers sometimes do not want to tell workers they are being monitored, when there is a possibility this may stimulate individual or collective resistance. (On other occasions employers are open about monitoring, when this serves to induce compliance.) Under the US Patriot Act, the FBI can obtain secret warrants to obtain records from libraries, Internet service providers and other organisations. The organisations subject to this intrusion cannot reveal it, under severe penalties. This draconian enforcement of secrecy serves to reduce personal and popular concern about surveillance, for example when the Patriot Act is used against non-terrorist groups such as antiwar protesters. In some cases, surveillance becomes routinised, so cover-up is less important. In many areas, camera monitoring is carried out openly: it is possible to observe oneself, on a screen, walking into a shop. On the other hand, some forms of surveillance are hidden so effectively that they are completely outside of most people's awareness, for example collection of web data, meshing of database files, police checks on car licence numbers and recording of bank transactions. The importance of low visibility in enabling surveillance to continue and expand is apparent through a thought experiment: imagine that you received, at the end of every month, a list of instances in which data had been collected about you, by whom and for what purpose. Imagine knowing whether you had been placed on a list to be denied a loan or a job. Exposing surveillance is crucial to challenging it. Exposure requires collection of information, putting it into a coherent, persuasive form, providing credible backing for the evidence, and communicating to a receptive audience. Sometimes a single person can do all of these steps, collecting information directly and publishing it on the web. Normally, though, a chain of participants is involved, for example an insider who leaks documents, a researcher who prepares an analysis, a journalist who writes a story and an editor or producer who publishes it. Campaigners help in exposure, as with Privacy International's Big Brother Awards for organisations with bad records in threatening privacy.

Surveillance relies on multiple methods to repress resistance

Martin 7 (Brian, Professor of Social Sciences at the University of Wollongong, Australia. "Opposing surveillance", http://www.bmartin.cc/pubs/07Michael.html//Tang)

Over the years, many people have opposed surveillance, seeing it as an invasion of privacy or a tool of social control. Dedicated campaigners and concerned citizens have opposed bugging of phones, identity cards, security cameras, database linking and many other types of surveillance. They have lobbied and campaigned against abuses and for legal or procedural restrictions. Others have developed ways of getting around surveillance. In parallel with resistance, there have been many excellent critiques of surveillance, exposing its harmful impacts and its role in authoritarian control (e.g., Dandeker 1990; Gandy 1993; Garfinkel 2000; Holtzman 2006; Lyon 1994, 2003; Marx 1988; Murray 1993; Rosen 2000). However, comparatively little is written about tactics and strategy against surveillance. Indeed, social scientists have little to say about tactics and strategy in any field (Jasper 2006: xii-xiii). My aim here is to present a framework for understanding tactics used in struggles over surveillance. Actions that are seen to be unfair or to violate social norms can generate outrage among observers (Moore 1978). Nonviolence researcher Gene Sharp (1973: 657-703) found that violent attacks on peaceful protesters – something that many people see as unjust – could be counterproductive for the attackers, generating greater support for the protesters among the protesters' supporters, third parties and even the attacking group. Because of this potential for attacks to be counterproductive, attackers, by design or intuition, may take steps to reduce possible outrage. By examining a wide range of issues – censorship, unfair dismissal, violent attacks on peaceful protesters, torture and aggressive war – a predictable pattern in tactics can be discerned: perpetrators regularly use five sorts of methods to minimise adverse reactions to their actions (Martin 2007). 1. Cover-up: the action is hidden or disguised. 2. Devaluation: the target of the action is denigrated. 3. Reinterpretation: plausible explanations are given for the action. 4. Official channels: experts, formal investigations or courts are used to give an appearance of justice. 5. Intimidation and bribery: targets and their allies are threatened or attacked, or given incentives to cooperate. This is called the backfire model: when these methods are insufficient to dampen public outrage, the action can backfire on the perpetrator. However, backfire is rare: in most cases, the methods work sufficiently well to minimise outrage. Consider an example different from surveillance: police use force in arresting someone. This has the potential to cause public outrage if the force used is seen as unnecessary, excessive or vindictive. Police in these circumstances regularly use one or more of the five methods. If possible, they undertake the arrest out of the public eye. They refer to the person arrested as a criminal or by derogatory terms. If challenged, they claim arrestees were resisting and that using force was necessary and carried out according to protocol. They refer those with grievances to official complaints procedures, which almost always rule in favour of the police. And they may threaten the arrestee with criminal charges should they make a complaint (Ogletree et al. 1995). On 3 March 1991, Los Angeles police arrested a man named Rodney King, in the course of which King was hit by two 50,000-volt tasers and beaten with metal batons more than 50 times. This arrest would have gone unnoticed except that George Holliday, who lived nearby, recorded the beating on his new videocamera. When footage was shown on television, it caused a massive public and political reaction against the Los Angeles police. Holliday's videotape cut through the normal cover-up and allowed viewers to judge the events for themselves, overriding the police's interpretation of the events and the media's normal police-sympathetic framing (Lawrence 2000). Nevertheless, in the ensuing saga the police and their supporters used every one of the five methods of inhibiting outrage – though, unusually, in this case their efforts were unsuccessful in preventing a huge backlash against the police (Martin 2005). Tactics for and against surveillance can be analysed using the same framework. The foundation for public outrage is a sense of unfairness. This is certainly present at least some of the time: people may see surveillance as an invasion of privacy (as with hidden video cameras), as a tool of repression (as in monitoring dissenters) or a tool of exploitation (as in monitoring of workers). The very word "surveillance" is a tool in opposing it, because the word has such negative connotations. A sense of unfairness is not inherent in the act of observing someone or collecting and analysing data about them. People's sense of unfairness is the subject of a continual struggle, with privacy campaigners trying to increase concern and purveyors of surveillance techniques trying to reduce it. Methods to

inhibit or amplify outrage are used within the prevailing set of attitudes and in turn affect those attitudes. Given that some people see surveillance as inappropriate, unfair, dangerous or damaging, there is a potential for resistance and hence it is predictable that one or more of the five methods of inhibiting outrage will be deployed. In the remainder of this paper, I look at each of the five methods of inhibiting outrage and ways to challenge these methods. The five-method classification used here is a convenient framework for examining tactics for and against surveillance. To use this framework does not require actors to be consciously engaging in a struggle, as many are simply reacting to the circumstances in which they find themselves. For those who are concerned about surveillance, though, it is useful to think in terms of tactics and strategies.

at: legal solutions solve

Politics and legal solutions can't change the surveillance state

North, PhD, '13 (Gary North, PhD UC Riverside "Surveillance state will collapse; data overload increasingly blinds it" July 29, 2013 http://nooganomics.com/2013/07/surveillance-state-will-collapse-data-overload-increasingly-blinds-it/) //GY

On the next day, July 24, the House of Representatives voted down an amendment to cut the NSA's budget — the official one, not the real one, which is secret. It was Nancy Pelosi who made the difference. She carried the NSA's water. The failure of Congress to make a token cut in the National Security Agency's official budget on July 24 was a green light for the NSA to spy on all Americans, forever.¶ Congress knows that the voters do not care enough to mobilize against the Patriot Act, which is the heart of the surveillance state. They also know that most House members are immune from the voters. Gerrymandering works. They also know that they, personally, are not immune from the NSA's monitoring of their telephone calls, emails, and other communications. They can count the votes. They know who is on top. The surveillance state is on top.¶ **The surveillance state is now unstoppable politically.** Legally, there is no possibility that it will be rolled back. It is now the non-law of the land. Wyden thinks the voters may roll it back. They won't. It is unstoppable politically.

PRISM MNDI

Topicality - Curtail

Curtail = Decrease

1nc

"Curtail" means to prohibit

Friman and Andreas '99 (H. Richard Friman - associate professor of political science at Marquette University. Peter Andreas - academy scholar at the Weatherhead Center for International Affairs, Harvard University. *The Illicit Global Economy and State Power*. Google Books p. 76)

The efforts of governments to **curtail** illicit financial flows today bear more similarity to the initiatives of the 1920s that those at Bretton Woods. To begin with, international efforts to **prohibit** capital flight have been almost nonexistent.

Violation –702 doesn't prohibit domestic surveillance – allows loopholes

"TFA" language in 702 allows NSA to bypass restrictions against domestic surveillance

Donohue '15 --From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

The component statutory interpretations, particularly **TFA and the assumptions that mark the foreignness determination, undermine the protections created for U.S. persons** in Sections 703 and 704 of the statute. **They make it possible for the NSA to obtain significant amounts of American citizens' communications**. Until the FAA, the surveillance of U.S. persons outside domestic bounds took place under the weaker standards of Executive Order 12,333. **Part of the purpose of the FAA was thus to increase the protections afforded to U.S. persons travelling abroad**. 214 **The way in which Section 702 is being used, however, allows the NSA to bypass Section 703 by making assumptions about legal status and location and potentially subjecting U.S. persons to surveillance without meeting the requirements of Section 703**. **The amount of information at stake is not insubstantial**. For years, the volume of intercepts under Section 702 has been one of the principal concerns of legislators familiar with the program. Senators have consistently expressed unease about the intelligence community's claim that **it is impossible to quantify how many Americans' communications have been implicated in the operation of Section 702**.215 What has gradually become clear is **that the program significantly more expansive than initially understood**.21

Vote neg – destroys limits - aff justifies bi-directional plan texts, which undermines core neg ground like terrorism and politics DA and CP's that compete on not decreasing domestic surveillance

Proves no solvency – TFA language creates letter of the law loophole

Topicality - Domestic

Domestic Surveillance = Data TFA US persons for Coercive Purposes

1nc

Domestic surveillance means that it must target US persons – not just be collected within the US

McCarthy, 6 – former assistant U.S. attorney for the Southern District of New York. (Andrew, "It's Not "Domestic Spying"; It's Foreign Intelligence Collection" National Review, 5/15, Read more at: http://www.nationalreview.com/corner/122556/its-not-domestic-spying-its-foreign-intelligence-collection-andrew-c-mccarthy

Eggen also continues the mainstream media's propagandistic use of the term "domestic surveillance [or 'spying'] program." In actuality, the electronic surveillance that the NSA is doing — i.e., eavesdropping on content of conversations — is not "domestic." A call is not considered "domestic" just because one party to it happens to be inside the U.S., just as an investigation is not "domestic" just because some of the subjects of interest happen to reside inside our country. Mohammed Atta was an agent of a foreign power, al Qaeda. Surveilling him — had we done it — would not have been "domestic spying." The calls NSA eavesdrops on are "international," not "domestic." If that were not plain enough on its face, the Supreme Court made it explicit in the Keith case (1972). There, even though it held that judicial warrants were required for wiretapping purely domestic terror organizations, the Court excluded investigations of threats posed by foreign organizations and their agents operating **both within and without** the U.S. That is, the Court understood what most Americans understand but what the media, civil libertarians and many members of Congress refuse to acknowledge: if we are investigating the activities of agents of foreign powers inside the United States, that is not DOMESTIC surveillance. It is FOREIGN counter-intelligence.

That, in part, is why the statute regulating wiretaps on foreign powers operating within the U.S. — the one the media has suddenly decided it loves after bad-mouthing it for years as a rubber-stamp — is called the FOREIGN Intelligence Surveillance Act (FISA). The United States has never needed court permission to conduct wiretapping outside U.S. territory; the wiretapping it does inside U.S. territory for national security purposes is FOREIGN INTELLIGENCE COLLECTION, not "domestic surveillance."

Surveillance is monitoring with preventive intent

Lemos, 10 - Associate Professor at Faculty of Communication at Federal University of Bahia, Brazil (Andre, ""Locative Media and Surveillance at the Boundaries of Informational Territories",

http://www.irma-international.org/viewtitle/48348/

Although they often appear to be synonymous, it is important to distinguish between informational control, monitoring and surveillance so that the problem can be better understood. We consider control to be the supervision of activities, or actions normally associated with government and authority over people, actions and processes. Monitoring can be considered a form of observation to gather information with a view to making projections or constructing scenarios and historical records, i.e., the action of following up and evaluating data. Surveillance, however, can be defined as an act **intended to avoid something**, as an observation whose **purposes are preventive** or as behavior that is attentive, cautious or careful. It is interesting to note that in English and French the two words "vigilant" and "surveillance", each of which is spelt the same way and has the same meaning in both languages, are applied to someone who is particularly watchful and to acts associated with legal action or action by the police intended to provide protection against crime, respectively. We shall define surveillance as actions that imply control and

monitoring in accordance with Gow, for whom surveillance "implies something quite specific as the intentional observation of someone's actions or the intentional gathering of personal information in order to observe actions taken in the past or future" (Gow. 2005. p. 8).

According to this definition, surveillance actions presuppose monitoring and control, but not all forms of control and/or monitoring can be called surveillance. It could be said that all forms of surveillance require two elements: **intent with a view to avoiding/causing something** and identification of individuals or groups by name. It seems to me to be difficult to say that there is surveillance if there is no identification of the person under observation (anonymous) and no preventive intent (avoiding something). To my mind it is an exaggeration to say, for example, that the system run by my cell phone operator that controls and monitors my calls is keeping me under surveillance. Here there is identification but no intent. However, it can certainly be used for that purpose. The Federal Police can request wiretaps and disclosure of telephone records to monitor my telephone calls. The same can be said about the control and monitoring of users by public transport operators. This is part of the administrative routine of the companies involved. Once again, however, the system can be used for surveillance activities (a suspect can be kept under surveillance by the companies' and/or police safety systems). Note the example further below of the recently implemented "Navigo "card in France. It seems to me that the social networks, collaborative maps, mobile devices, wireless networks and countless different databases that make up the information society do indeed control and monitor and offer a real possibility of surveillance.

Violation – PPD28 limits foreign information gathering, not surveillance for coercive purposes on domestic people.

Voting issue – for limits and ground. They explode the topic –

(1) All information gathering is topical under their interpretation and the negative loses security based disads and critiques

(2) Expanding 'domestic' to cover immigration and foreign counter-intelligence – which are both big enough to be separate topics

AND, Extra-Topicality is illegit – adding PPD 28 is necessary for their solvency, which means they have unique advantage from the non-topical part of the plan. Reject the entire aff as not topical - don't allow severance.

PPD-28 Regulates Foreign Surveillance

T- PPD 28 regulates foreign intel

Litt and Joel 14 (Robert Litt, he second General Counsel of the Office of the Director of National Intelligence, and Alexander W. Joel, the first Civil Liberties Protection Officer for the U.S. Office of the Director of National Intelligence, "Interim Progress Report on Implementing PPD-28", October 17, 2014, http://www.dni.gov/index.php/newsroom/reports-and-publications/204-reports-publications-2014/1126-interim-progress-report-on-implementing-ppd-28) // AW

PPD-28 reinforces current practices, establishes new principles, and strengthens oversight, to ensure that in conducting signals intelligence activities, the United States takes into account not only the security needs of our nation and our allies, but also the privacy of people around the world.¶ The Intelligence Community already conducts signals intelligence activities in a carefully controlled manner, pursuant to the law and subject to layers of oversight, focusing on important foreign intelligence and national security priorities. But as the President recognized, "[o]ur efforts will only be effective if ordinary citizens in other countries have confidence that the United States respects their privacy too."¶ To that end,

the Intelligence Community has been working hard to implement PPD-28 within the framework of existing processes, resources, and capabilities, while ensuring that mission needs continue to be met.

A2: We meet - American Companies are US Persons

American companies irrelevant to 702 authority – communication content determines domestic persons, not holder of the data – this means NSA's interpretation of the plan would still allow for domestic surveillance according to LETTER OF THE LAW

Section 702 of the FISA Amendments Act of 2008 (http://www.gpo.gov/fdsys/pkg/BILLS-110hr6304pcs/html/BILLS-110hr6304pcs.htm)//LP

Requirement to adopt.--The Attorney General, in consultation with the Director of National Intelligence, shall adopt targeting procedures that are reasonably designed to-- ``(A) ensure that any acquisition authorized under subsection (a) is limited to targeting persons reasonably believed **to be located outside the United States**; and ``(B) prevent the intentional acquisition of any communication as to which the **sender and all intended recipients** are known at the time of the acquisition **to be located in the United States.**

Especially true because, per the American companies, individuals own data, not companies

Verizon '**14 (**"Amicus Brief: U.S. Search Warrants Do Not Apply to Data Stored Overseas," 12/15/14, http://publicpolicy.verizon.com/blog/entry/us-search-warrants-do-not-apply-to-data-stored-overseas)//LP

Today, Verizon filed an amicus brief in support of Microsoft's appeal to reverse a federal court's decision that allowed the U.S. government to use a warrant to compel Microsoft to produce a customer's email stored overseas. We were joined on our brief by Cisco, Hewlett-Packard, eBay, salesforce.com and Infor. The case does not involve Verizon or any Verizon customers' data. Indeed, Verizon has not received any warrants from the U.S. government for customer data stored in our enterprise data centers outside the United States and we do not expect to receive such demands. Still, we have submitted this brief in order to turn back an unlawful overreach by the U.S. government. The law does not allow the U.S. government to use a search warrant to obtain customer data stored overseas. The U.S. Supreme Court has reiterated many times that U.S. statutes are presumed not to have extraterritorial application unless Congress "clearly expressed" its "affirmative intention" to the contrary.Congress has not clearly expressed its intention in any U.S. statutes that domestic warrants should apply to data stored in other countries. And there is good reason for that. For starters,the data at issue (the contents of private emails) belongs to a customer, not to the provider. Moreover, if U.S. law were to require a U.S. business to turn over customer data stored overseas it would conflict with the laws of many other countries that protect the privacy of such data and limit disclosure outside the country in which the data is stored. Furthermore, permitting the U.S. government to use a warrant to obtain data stored overseas would just encourage foreign governments to claim that they can obtain data stored in the U.S., which would threaten the privacy of Americans.

Domestic = In US Territory

1nc

"domestic" in the context of surveillance means collection of data in US territory

Thompson, '13 -- Legislative Attorney (Richard M. Thompson II is writing for the congressional research service, 4/3/13, http://www.pennyhill.com/jmsfileseller/docs/R42701.pdf) LP

In a series of cases that provide the closest analogy to UAVs, the Supreme Court addressed the use of manned aircraft to conduct domestic surveillance over residential and industrial areas. In each, the Court held that the fly-over at issue was not a search prohibited by the Fourth Amendment, as the areas surveilled were open to public view.

Domestic is only Domestic networks

Savage and McConnell 15 (John E. Savage, An Wang Professor of Computer Science Box 1910, Computer Science Department Brown University Brown University, Bruce W. McConnell Bruce McConnell is responsible for leading EWI's communications and networking with public and private sectors around the world, Senior Vice President, January 20,2015 http://www.ewi.info/idea/exploring-multi-stakeholder-internet-governance accessed June 28, 15)PA

It is domestic when the data transits only domestic networks. It can become an international issue when it crosses territorial boundaries, for example, when data is encrypted.

Violation – American companies store data internationally – this is the data that their internal links assume and it means that aff restricts foreign surveillance

Voting issue – for limits. They explode the topic –

Expanding 'domestic' to cover territory outside the US justifies surveillance of US bases, embassies, and international drones. Makes neg research burden impossible.

AND, Extra-Topicality is illegit – they may restrict some domestic servers, but they must also limit international servers to solve the aff. Reject the entire aff - don't allow severance.

Data stored on non-US servers

Data is stored outside US territory by domestic companies

Lorenzo **Franceschi-Bicchierai** 6/12/**14** http://mashable.com/2014/06/12/microsoft-u-s-government-data-foreign-servers/ "Microsoft Fights U.S. Government Over Rights to Data on Foreign Servers" Lorenzo Franceschi-Bicchierai is a reporter at Mashable's New York headquarters, where he covers cybersecurity, tech policy, privacy and surveillance, hackers, drones, and, more in general, the intersection of technology and civil liberties. Before Mashable, Lorenzo was an intern at Wired.com, where he wrote for Danger Room, and Threat Level. A recent graduate of Columbia's Graduate School of Journalism Lorenzo is also a Law graduate at University of Barcelona.

Microsoft is challenging a data request from the U.S. government in an unprecedented case that could have sweeping ramifications for online privacy around the world. In December 2013, the U.S. government obtained a search warrant requesting information about an email user for an investigation apparently involving drugs and money laundering. But Microsoft is refusing to cooperate because the data in question is stored in Ireland, and the company argues the U.S. can't force it to hand over data stored outside American soil. The case is a perfect example of how new technologies like cloud computing clash with pre-Internet laws. These are the answers to the most basic questions about the case. What is the government requesting? The government is looking for data associated with an Outlook.com email account, including the content of all emails and the identifying information of the account, according to the search warrant sent to Microsoft. The actual email address is redacted in court documents, and the details of the case are still unclear. What did Microsoft say to the request? Microsoft responded providing some information related to the account, but declined to turn over the content of the user's emails because that data is stored in a Microsoft server in Ireland. The company then asked the judge to throw out the request, arguing that the U.S. government doesn't have the authority to request data overseas with a search warrant. But a judge in New York ruled in April that Microsoft was compelled to turn over the data regardless of where it's stored. Microsoft disagrees and is still challenging the data request. What are Microsoft's arguments? In a court filing made public on Monday, Microsoft argued that a search warrant doesn't apply overseas. Since it doesn't give authority to "break down the doors of Microsoft's Dublin facility," it shouldn't give the government authority to access data within that facility, Microsoft argued. Moreover, the company argued, the warrant is too broad and vague, as it requests all content in the user's account. "It is, in a sense, the broadest possible warrant that one literally can imagine in the 21st century," Brad Smith, Microsoft's general counsel, said at a conference in New York last week. Lastly, Microsoft says that the government should use another, legal way to access this kind of data: a so-called mutual legal assistance treaty, or MLAT. Thanks

to this legal agreement with Ireland — as well as many other countries — U.S. authorities can access data in that country but, in turn, have to comply with local laws. Law enforcement authorities routinely use this kind of assistance to obtain evidence held in another country. Whart are the government's arguments? The U.S. government argues that companies can't refuse to comply legal requests "simply by storing the data abroad," as Preet Bharara, United States attorney for the Southern District of New York, said in a court filing. The danger, Bharara continued, is that criminals could skirt investigations by lying about their locations and thus forcing Microsoft to store data outside the U.S., and far from American law enforcement's reach. The judge in the case, James Francis, agreed with the government, arguing that the search warrant issued in this case applies to data in Ireland because it's more of an hybrid between a warrant and a subpoena. What this means: the request would be legal since subpoenas have reach outside the U.S. But legal experts don't agree with this interpretation. The relevant law in the case, the oft-maligned 1986 Electronic Communications Privacy Act (ECPA), clearly requires warrants when accessing content information, and subpoenas have different requirements. "It's a bad interpretation of the statute," Christopher Sprigman, a law professor at New York University,told Mashable.

Non-US data is stored on US servers

Dean **Wilson** January 23, 20**14** http://www.techradar.com/us/news/internet/microsoft-to-store-foreign-data-on-non-us-servers-amid-nsa-controversy-1218010 Irish journalist and author

Microsoft will begin allowing non-US customers to store their personal data on servers located outside the US, following leaks of extensive government snooping by the National Security Agency (NSA). The move will give consumers and business customers the option to shift their information to local data centres, such as those based in Ireland, which will take them outside the NSA's jurisdiction. "People should have the ability to know whether their data are being subjected to the laws and access of governments in some other country and should have the ability to make an informed choice of where their data resides," Brad Smith, general counsel at Microsoft, told the Financial Times. Surveillance shake-up Revelations over the past year about the NSA's widespread internet and phone surveillance have strained relationships between the US and its allies. Some countries that were the victims of spying, such as Brazil, are now bringing in new laws to prevent citizen data from being stored outside their own country. Many rival companies are opposed to the idea of letting customers choose where data is stored, which will likely be cost prohibitive, but Microsoft's decision will possibly cause some to change their minds. The move was welcomed by privacy advocates.

Ex Post CP

1nc

Text: The United States federal government should require ex post review by the Foreign Intelligence Surveillance Court of NSA surveillance targeting criteria, establish a public advocate at the FISC, and establish a cabinet-level privacy agency.

The CP restore domestic and international confidence in US surveillance without restricting the scope of NSA activities – instead it conducts post-surveillance minimization

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, April, lexis)

While I have concluded that U.S. surveillance policy does not violate the ICCPR, further reforms could highlight this point and silence persistent doubts here and abroad. These reforms could also remove any barriers to cooperation between the United States and foreign states, such as those in Europe, which are subject to the European Convention on Human Rights. This section identifies reforms that would add a public advocate to FISC proceedings, enhance FISC review of the criteria used for overseas surveillance, establish a U.S. privacy agency that would handle complaints from individuals here and overseas, and require greater minimization of non-U.S. person communications. These reforms would signal U.S. support of evolving global norms of digital privacy.

Although President Obama's speech in January 2014 proposed a panel of independent lawyers who could participate in important FISC cases, n161 further institutionalization of this role would be useful. A public advocate would scrutinize and, when necessary, challenge the NSA's targeting criteria on a regular basis. n162 Challenges would be brought in the FISC, after the NSA's implementation of criteria. The NSA would be able to adapt the criteria on an exigent basis, **subject to ex post review** by the FISC at the public advocate's behest. A public advocate and enhanced FISC review would serve three valuable functions: (1) ensure that the FISC received the best arguments on both sides; (2) serve as a valuable ex ante check on the government, encouraging the government to adopt those criteria that could withstand subsequent scrutiny; and (3) **promote domestic and global confidence in the legitimacy of processes governing NSA surveillance**.A U.S. cabinet level privacy agency would also **bolster the legitimacy of surveillance**. The agency could provide more regular recourse to subjects of surveillance, as the ECHR requires. That change would ease the barriers to continued U.S.-Europe cooperation on counterterrorism. A national agency would also work hand in hand with privacy officers in executive departments. It would increase the leverage of those officials, who could advocate vigorously in internal debates, knowing that their views would also have a champion in a free-standing executive department independent [*2166] of the national security bureaucracy. There are downsides to this proposal, of course. A new agency would add expense, and create some redundancy in government functions. Moreover, current models that provide recourse, such as the approach currently taken by the Department of Homeland Security, n163 have been criticized as unduly burdensome. n164 However, preserving cooperation with Europe and enhancing the overall legitimacy of U.S. surveillance provides a compelling justification.

Each of these instrumentalities - a public advocate at the FISC and a new privacy agency - could also work to strengthen minimization requirements for foreign communications. The NSA says that it disposes of all irrelevant communications within five years. There may be ways to shorten this time and require even more rigorous controls on sharing of information that lacks a clear link to terrorism or other foreign intelligence matters. More exacting minimization would also promote U.S.-European information sharing and **enhance global legitimacy**.

Net benefit is terrorism – the plan restricts the collection of 702 surveillance data to individualized and specific threat categories. That prevents the programmatic surveillance necessary for pattern analysis that can identify future terrorist threats

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

Programmatic surveillance initiatives like these differ in simple yet fundamental ways from the traditional forms of monitoring with which many people are familiar--i.e., individualized or particularized surveillance. Individualized surveillance takes place when authorities have some reason to think that a specific, known person is breaking the law. Investigators will then obtain a court order authorizing them to collect information about the target, with the goal of assembling evidence that can be used to establish guilt in subsequent criminal proceedings. Individualized surveillance is common in the world of law enforcement, as under Title III of the Omnibus Crime Control and Safe Streets Act of 1968. n23 It is also used in national security investigations. FISA allows authorities to obtain a court order to engage in wiretapping if they demonstrate, among other things, probable cause to believe that the target is "a foreign power or an agent of a foreign power." n24

By contrast, programmatic surveillance has very different objectives and is conducted in a very different manner. It usually involves the government collecting bulk data and then examining it to identify previously unknown terrorists, spies, and other national security threats. A good example of the practice is link analysis, in [*528] which authorities compile large amounts of information, use it to map the social networks of known terrorists--has anyone else used the same credit card as Mohamed Atta?--and thus identify associates with whom they may be conspiring. n25 (It is also possible, at least in theory, to subject these large databases to pattern analysis, in which automated systems search for patterns of behavior that are thought to be indicative of terrorist activity, but it's not clear that the NSA is doing so here.) Suspects who have been so identified can then be subjected to further forms of monitoring to determine their intentions and capabilities, such as wiretaps under FISA or other authorities. In a sense, programmatic surveillance is the mirror image of individualized surveillance. With individualized monitoring, authorities begin by identifying a suspect and go on to collect information; with programmatic monitoring, authorities begin by collecting information and go on to identify a suspect.

Programmatic surveillance is a potentially **powerful counterterrorism tool**. The Ra'ed al-Banna incident is a useful illustration of how the technique, when coupled with old-fashioned police work, can identify possible threats who otherwise might escape detection. Another example comes from a 2002 Markle Foundation study, which found that authorities could have identified the ties among all 19 of the 9/11 hijackers if they had assembled a large database of airline reservation information and subjected it to link analysis. n26 In particular, two of the terrorists--Nawaf al-Hamzi and Khalid al-Mihdhar--were on a government watchlist after attending a January 2000 al-Qaeda summit in Malaysia. So they could have been flagged when they bought their tickets. Querying the database to see if any other passengers had used the pair's mailing addresses would have led investigators to three more hijackers, including Mohamed Atta, the plot's operational leader. Six others could have been found by searching for passengers who used the same frequent-flyer and telephone numbers as these suspects. And so on. Again, the Markle study concerns airline reservation data, not the communications data that are the NSA's focus. But it is still a useful illustration of the technique's potential.

The government claims that programmatic surveillance has been responsible for concrete and actual counterterrorism benefits, not just hypothetical ones. Officials report that PRISM has helped detect and [*529] disrupt about 50 terrorist plots worldwide, including ten in the United States. n27 Those numbers include Najibullah Zazi, who attempted to bomb New York City's subway system in 2009, and Khalid Ouazzani, who plotted to blow up the New York Stock Exchange. n28 Authorities further report that PRISM played an important role in tracking down David Headley, an American who aided the 2008 terrorist atrocities in Bombay, and later planned to attack the offices of a Danish newspaper that printed cartoons of Mohamed. n29 The government also claims at least one success from the telephony metadata program, though it has been coy about the specifics: "The NSA, using the business record FISA, tipped [the FBI] off that [an] individual had indirect contacts with a known terrorist overseas. . . . We were able to reopen this investigation, identify additional individuals through a legal process and

were able to disrupt this terrorist activity." n30 Quite apart from foiling attacks, the government also argues that the NSA programs can **conserve scarce investigative resources** by helping officials quickly spot or rule out any foreign involvement in a domestic plot, as after the 2013 Boston Marathon bombing. n31 These claims have to be taken with a few grains of salt. Some observers believe that the government could have discovered the plots using standard investigative techniques, and without resorting to extraordinary methods like programmatic surveillance. n32 The metadata program has elicited special skepticism: The President's Review Group on Intelligence and Communications Technologies bluntly concluded that "the information contributed to terrorist investigations by the use of section 215 telephony meta-data was not essential to preventing attacks and could readily have been obtained [*530] in a timely manner using conventional section 215 orders." n33 The Privacy and Civil Liberties Oversight Board reached the same conclusion. n34 (Judicial opinion is split on the program's value. One judge has expressed "serious doubts" about its utility, n35 while another has concluded that its effectiveness "cannot be seriously disputed.") n36 Furthermore, we should always be cautious when evaluating the merits of classified intelligence initiatives on the basis of selective and piecemeal revelations, as officials might tailor the information they release in a bid to shape public opinion. n37 But even if specific claimed successes remain contested, programmatic surveillance in general can still be a useful counterterrorism technique. As these examples imply, effective programmatic surveillance often requires huge troves of information--e.g., large databases of airline reservations, compilations of metadata concerning telephonic and internet communications, and so on. This is why it typically will not be feasible to limit bulk collection to particular, known individuals who are already suspected of being terrorists or spies. Some officials have defended the NSA programs by pointing out that, "[i]f you're looking for the needle in a haystack, you have to have the haystack." n38 That metaphor doesn't strike me as terribly helpful; rummaging around in a pile of hay is, after all, a paradigmatic image of futility. But, the idea can be expressed in a more compelling way. Programmatic surveillance cannot be done in a particularized manner. The whole point of the technique is to identify unknown threats to the national security; by definition, it cannot be restricted to threats that have already been identified. We can't limit programmatic [*531] surveillance to the next Mohamed Atta when we have no idea who the next Mohamed Atta is--and when the goal of the exercise is indeed to identify the next Mohamed Atta.

Solvency – Legitmacy

Incorporating oversight in the surveillance process boosts U.S. cred and legitimacy and also gives a voice to U.S. citizens

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan Alexander, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", 8/12/14, http://moritzlaw.osu.edu/students/groups/is/files/2014/08/12-Sales.pdf, pg. 16-17 , accessed: 6/23/15, JR)

In addition to oversight by outsiders, a programmatic surveillance regime also should feature a system of internal checks within the executive branch, to review collection before it occurs, after the fact, or both. As for the ex ante checks, internal watchdogs should be charged with scrutinizing proposed bulk collection to verify that it complies with the applicable constitutional and statutory rules, and also to ensure that appropriate protections are in place for privacy and civil liberties. The Justice Department's Office of Intelligence is a well known example. The unit, which presents the government's surveillance applications to the FISA court, subjects these requests to exacting scrutiny with the goal of increasing the likelihood of surviving judicial review.65 Indeed, the office has a strong incentive to ensure that the applications it presents are airtight, so as to preserve its credibility with the FISA court.66 Ex post checks include such commonplace mechanisms as agency-level inspectors general, who can audit bulk collection programs, assess their legality, and make policy recommendations to improve their operation, as well as entities like the Privacy and Civil Liberties Oversight Board, which perform similar functions across the executive branch as a whole. Another important ex post check is to offer meaningful whistleblower protections to officials who know about programs that violate constitutional or statutory requirements. Allowing officials to bring their concerns to ombudsmen within the executive branch (and then eventually to Congress) can help root out lawlessness and also relieve the felt necessity of leaking information about highly classified programs to the media.

Cabinet-level privacy agency key to gut unnecessary data collection

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan Alexander, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", 8/12/14, http://moritzlaw.osu.edu/students/groups/is/files/2014/08/12-Sales.pdf, pg. 17, accessed: 6/23/15, JR)

These and other internal checks can achieve all three of the benefits promised by traditional judicial and legislative oversight—executive branch watchdogs can veto surveillance they conclude would be unlawful, the mere possibility of such vetoes can chill overreach, and increasing the costs of monitoring can redirect scarce resources toward truly important surveillance. External and internal checks thus operate together as a system; the two types of restraints are rough substitutes for one another. If outside players like Congress and the courts are subjecting the executive's programmatic surveillance activities to especially rigorous scrutiny, the need for comparably robust safeguards within the executive branch tends to diminish. Conversely, if the executive's discretion is constrained internally through strict approval processes, audit requirements, and so on, the legislature and judiciary may choose not to hold the executive to the exacting standards they otherwise would. In short, certain situations may have less need to use traditional interbranch separation of powers and checks and balances to protect privacy and civil liberties because the executive branch is subject to an "internal separation of powers"[67] that can accomplish much the same thing.

The CP solves miscalculation- it allows for a broader scope of expert data analysis

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan Alexander, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", 8/12/14, http://moritzlaw.osu.edu/students/groups/is/files/2014/08/12-Sales.pdf, pg. 9 , accessed: 6/23/15, JR)

Programmatic surveillance thus can help remedy some of the difficulties that arise when monitoring covert adversaries like international terrorists. FISA and other particularized surveillance tools are useful when authorities want to monitor targets whose identities are already known. But they are less useful when authorities are trying to identify unknown targets. The problem arises because, in order to obtain a wiretap order from the FISA court, the government usually must demonstrate probable cause to believe that the target is a foreign power or agent of a foreign power.[39] This is a fairly straightforward task when the target's identity is already known—e.g., a diplomat at the Soviet embassy in Washington, DC. But the task is considerably more difficult when the government's reason for surveillance is to detect targets who are presently unknown—e.g., alQaeda members who operate in the shadows. How can you convince the FISA court that Smith is an agent of a foreign power when you know nothing about Smith—his name, nationality, date of birth, location, or even whether he is a single person or several dozen? The government typically won't know those things unless it has collected some information about Smith—such as by surveilling him. And there's the rub. Programmatic monitoring helps avoid the crippling Catch-22 that can arise under particularized surveillance regimes like FISA: officials can't surveil unless they show that the target is a spy or terrorist, but sometimes they can't show that an unknown target is a spy or terrorist unless they have surveilled him.

A public advocate solves the perception link and spurs global compliance—President Obama's willingness to be transparent on surveillance is key

Margulies, 14 - Professor of Law, Roger Williams University School of Law (Peter, "The NSA in Global Perspective: Surveillance, Human Rights, and International Counterterrorism" II. THE LEGAL MERITS OF NSA SURVEILLANCE ABROAD UNDER THE ICCPR, pgs. 16-17, 1/23/14, http://fordhamlawreview.org/assets/pdfs/Vol_82/Margulies_April.pdf, accessed: 6/23/15, JR)

Having determined that the ICCPR applies as a threshold matter, we next ask whether NSA surveillance abroad is "arbitrary" or "unlawful" under Article 17. I assume in what follows that most surveillance conducted on non-U.S. persons outside the United States is lawful under the Fourth Amendment of the U.S. Constitution and U.S. statutes. Therefore, this section focuses on whether NSA surveillance is "arbitrary." I conclude that NSA surveillance is not arbitrary under Article 17, because it targets terrorists, national security threats,

and espionage in a tailored fashion. In reaching this conclusion, I rely on the principle of complementarity, which seeks to harmonize a body of international law with other international law doctrine and with the prerogatives of states. To integrate all of the relevant international law doctrines, I read Article 17 in tandem with the law of armed conflict and U.N. Security Council resolutions on counterterrorism. To reconcile Article 17 with these norms and with sovereign prerogatives, I advance a model of procedural pluralism that gives states flexibility in creating protections if they honor core principles such as notice, oversight, and minimization but does not mandate the same itemized menu of safeguards required in European Union (ECHR) jurisprudence. In fact, as I note, ECHR jurisprudence permits exceptions to procedural safeguards, including exceptions designed to preserve the effectiveness of national security surveillance, that are not radically different from U.S. practice. I note, however, that certain reforms of NSA surveillance, such as a public advocate, would further strengthen compliance, affirming that NSA programs are consistent with the ICCPR. President Obama's initiatives, including a clearer articulation of the bases for U.S. surveillance abroad, buttress this case.

CP allows for domestic and foreign legitimacy - reforms and minimization of surveillance in CP solve

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, http://fordhamlawreview.org/assets/pdfs/Vol_82/Margulies_April.pdf)//MR

While I have concluded that U.S. surveillance policy does not violate the ICCPR, further reforms could highlight this point and silence persistent doubts here and abroad. These reforms could also remove any barriers to cooperation between the United States and foreign states, such as those in Europe, which are subject to the European Convention on Human Rights. This section identifies reforms that would add a public advocate to FISC proceedings, enhance FISC review of the criteria used for overseas surveillance, establish a U.S. privacy agency that would handle complaints from individuals here and overseas, and require greater minimization of non-U.S. person communications. These reforms would signal U.S. support of evolving global norms of digital privacy. Although President Obama's speech in January 2014 proposed a panel of independent lawyers who could participate in important FISC cases,161 further institutionalization of this role would be useful. A public advocate would scrutinize and, when necessary, challenge the NSA's targeting criteria on a regular basis.162 Challenges would be brought in the FISC, after the NSA's implementation of criteria. The NSA would be able to adapt the criteria on an exigent basis, subject to ex post review by the FISC at the public advocate's behest. **A public advocate and enhanced FISC review would serve three valuable functions**: (1) ensure that the FISC received the best arguments on both sides; (2) serve as a valuable ex ante check on the government, encouraging the government to adopt those criteria that could withstand subsequent scrutiny; and (3) promote domestic and global confidence in the legitimacy of processes governing NSA surveillance. A U.S. cabinet level privacy agency would also bolster the legitimacy of surveillance. The agency could provide more regular recourse to subjects of surveillance, as the ECHR requires. **That change would ease the barriers to continued U.S.-Europe cooperation on counterterrorism.** A national agency would also work hand in hand with privacy officers in executive departments. It would increase the leverage of those officials, who could advocate vigorously in internal debates, knowing that their views would also have a champion in a free-standing executive department independent of the national security bureaucracy. There are downsides to this proposal, of course. A new agency would add expense, and create some redundancy in government functions. Moreover, current models that provide recourse, such as the approach currently taken by the Department of Homeland Security,163 have been criticized as unduly burdensome.164 However, preserving cooperation with Europe and enhancing the overall legitimacy of U.S. surveillance provides a compelling justification. Each of these instrumentalities—a public advocate at the FISC and a new privacy agency—could also work to strengthen minimization requirements for foreign communications. The NSA says that it disposes of all irrelevant communications within five years. There may be ways to shorten this time and require even more rigorous controls on sharing of

information that lacks a clear link to terrorism or other foreign intelligence matters. More exacting minimization would also **promote U.S.-European information sharing and enhance global legitimacy.**

Net Benefit - Links

Programmatic techniques avoids restrictions that stagnate surveillance of terrorism

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", http://moritzlaw.osu.edu/students/groups/is/files/2014/

08/12-Sales.pdf)//MR

Programmatic surveillance thus can help remedy some of the difficulties that arise when monitoring covert adversaries like international terrorists. FISA and other particularized surveillance tools are useful when authorities want to monitor targets whose identities are already known. But they are less useful when authorities are trying to identify unknown targets. The problem arises because, in order to obtain a wiretap order from the FISA court, the government usually must demonstrate probable cause to believe that the target is a foreign power or agent of a foreign power.39 This is a fairly straightforward task when the target's identity is already known—e.g., a diplomat at the Soviet embassy in Washington, DC. But the task is considerably more difficult when the government's reason for surveillance is to detect targets who are presently unknown—e.g., al- Qaeda members who operate in the shadows. How can you convince the FISA court that Smith is an agent of a foreign power when you know nothing about Smith—his name, nationality, date of birth, location, or even whether he is a single person or several dozen? The government typically won't know those things unless it has collected some information about Smith—such as by surveilling him. And there's the rub. Programmatic monitoring helps avoid the crippling Catch-22 that can arise under particularized surveillance regimes like FISA: officials can't surveil unless they show that the target is a spy or terrorist, but sometimes they can't show that an unknown target is a spy or terrorist unless they have surveilled him.

Net benefit - Impacts True

Using programmatic surveillance is successful – it undermined 50 terrorist plots

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", http://moritzlaw.osu.edu/students/groups/is/files/2014/08/12-Sales.pdf)//MR

Programmatic surveillance initiatives like these differ in simple yet fundamental ways from the traditional forms of monitoring with which many people are familiar—i.e., individualized or particularized surveillance. Individualized surveillance takes place when authorities have some reason to think that a specific, known person is breaking the law. Investigators will then obtain a court order authorizing them to collect information about the target, with the goal of assembling evidence that can be used to establish guilt in subsequent criminal proceedings. Individualized surveillance is common in the world of law enforcement, as under Title III of the Omnibus Crime Control and Safe Streets Act of 1968.23 It is also used in national security investigations. FISA allows authorities to obtain a court order to engage in wiretapping if they demonstrate, among other things, probable cause to believe that the target is "a foreign power or an agent of a foreign power."24 By contrast, programmatic surveillance has very different objectives and is conducted in a very different manner. It usually involves the government collecting bulk data and then examining it to identify previously unknown terrorists, spies, and other national security threats. A good example of the practice is link analysis, in which authorities compile large amounts of information, use it to map the social networks of known terrorists—has anyone else used the same credit card as Mohamed Atta?—and thus identify associates with whom they may be conspiring.25 (It is also possible, at least in theory, to subject these large databases to pattern analysis, in which automated systems search for patterns of behavior that are thought to be indicative of terrorist activity, but it's not clear that the NSA is doing so here.) Suspects who have been so identified can then be subjected to further forms of monitoring to determine their intentions and capabilities, such as wiretaps under FISA or other authorities. In a sense, programmatic surveillance is the mirror image of individualized surveillance. With individualized monitoring,

authorities begin by identifying a suspect and go on to collect information; with programmatic monitoring, authorities begin by collecting information and go on to identify a suspect. Programmatic surveillance is a potentially powerful counterterrorism tool. The Ra'ed al-Banna incident is a useful illustration of how the technique, when coupled with old-fashioned police work, can identify possible threats who otherwise might escape detection. Another example comes from a 2002 Markle Foundation study, which found that authorities could have identified the ties among all 19 of the 9/11 hijackers if they had assembled a large database of airline reservation information and subjected it to link analysis.26 In particular, two of the terrorists—Nawaf al-Hamzi and Khalid al-Mihdhar—were on a government watchlist after attending a January 2000 al-Qaeda summit in Malaysia. So they could have been flagged when they bought their tickets. Querying the database to see if any other passengers had used the pair's mailing addresses would have led investigators to three more hijackers, including Mohamed Atta, the plot's operational leader. Six others could have been found by searching for passengers who used the same frequent-flyer and telephone numbers as these suspects. And so on. Again, the Markle study concerns airline reservation data, not the communications data that are the NSA's focus. But it is still a useful illustration of the technique's potential. The government claims that programmatic surveillance has been responsible for concrete and actual counterterrorism benefits, not just hypothetical ones. Officials report that PRISM has helped detect and disrupt about 50 terrorist plots worldwide, including ten in the United States.27 Those numbers include Najibullah Zazi, who attempted to bomb New York City's subway system in 2009, and Khalid Ouazzani, who plotted to blow up the New York Stock Exchange.28 Authorities further report that PRISM played an important role in tracking down David Headley, an American who aided the 2008 terrorist atrocities in Bombay, and later planned to attack the offices of a Danish newspaper that printed cartoons of Mohamed.29 The government also claims at least one success from the telephony metadata program, though it has been coy about the specifics: "The NSA, using the business record FISA, tipped [the FBI] off that [an] individual had indirect contacts with a known terrorist overseas. . . . We were able to reopen this investigation, identify additional individuals through a legal process and were able to disrupt this terrorist activity."30 Quite apart from foiling attacks, the government also argues that the NSA programs can conserve scarce investigative resources by helping officials quickly spot or rule out any foreign involvement in a domestic plot, as after the 2013 Boston Marathon bombing.31 These claims have to be taken with a few grains of salt. Some observers believe that the government could have discovered the plots using standard investigative techniques, and without resorting to extraordinary methods like programmatic surveillance.32 The metadata program has elicited special skepticism: The President's Review Group on Intelligence and Communications Technologies bluntly concluded that "the information contributed to terrorist investigations by the use of section 215 telephony meta-data was not essential to preventing attacks and could readily have been obtained in a timely manner using conventional section 215 orders."33 The Privacy and Civil Liberties Oversight Board reached the same conclusion.34 (Judicial opinion is split on the program's value. One judge has expressed "serious doubts" about its utility,35 while another has concluded that its effectiveness "cannot be seriously disputed.")36 Furthermore, we should always be cautious when evaluating the merits of classified intelligence initiatives on the basis of selective and piecemeal revelations, as officials might tailor the information they release in a bid to shape public opinion.37 But even if specific claimed successes remain contested, programmatic surveillance in general can still be a useful counterterrorism technique.

Minimization regulations ensure the NSA data collection and transfer is only collected with the instances outlined in 702

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy", http://moritzlaw.osu.edu/students/groups/is/files/2014/08/12-Sales.pdf)//MR

While the NSA programs feature several important safeguards to help protect privacy and civil liberties, there is room for improvement. Policymakers should consider altering the minimization rules to better prevent mission creep, adding an adversarial element to certain aspects of the FISA court's proceedings, and enacting new legislation to place the telephony metadata program on a more stable statutory footing. First, the minimization rules that govern the section 702 program allow intelligence officials to share information with federal law enforcement if it contains "evidence [of] a crime."96 The government ecently has clarified that "nonpublicly available signals intelligence that the United States collects in bulk" may only be used to counter certain enumerated national security threats, as well as "[t]ransnational criminal threats."97 Even with that restriction, however, the rules seem too permissive. On their face, the minimization rules permit the fruits of PRISM surveillance to be used in investigations of even minor federal offenses, such as mail fraud and theft, so long as they have some "[t]ransnational" aspect. The problem is that the relative costs and benefits of surveillance depend on the magnitude of the offense under investigation. Just because we're willing to countenance the use of extraordinary methods to prevent terrorism, it doesn't mean the same techniques should be used to combat tax delinquency. Policymakers should tighten the list of crimes for which sharing is allowed. Of course, intelligence officials certainly should be able to tell their law enforcement counterparts when they come across evidence of terrorism, espionage, and other national security threats—the need for cops and spies to share more counterterrorism information is one of the enduring lessons of 9/11.98 And other serious crimes like those involving risk of death or serious bodily injury, or child exploitation, should be on the list as well. At the same time, we should not overestimate the NSA's enthusiasm for sharing the intelligence it gathers. Regardless of what the minimization rules permit, the NSA will have strong incentives to resist sharing information with or otherwise helping its bureaucratic rivals.99 Indeed, the New York Times recently reported widespread frustration among law enforcement officials over the NSA's reluctance to assist their investigations of routine offenses like "money laundering, counterfeiting and even copyright infringement"; their requests are usually denied "because the links to terrorism or foreign intelligence" are considered too "tenuous."100 (Note that the story addresses

NSA resources in general, not telephony metadata and PRISM data in particular.) In short, institutional self-interest and legal restrictions on sharing can be rough substitutes. And while self- interest will often lead the NSA to refuse access to sensitive intelligence in garden-variety criminal cases, these naturally occurring bureaucratic incentives should be supplemented with strong minimization rules that prevent inappropriate mission creep.

A2: Perm do both

Perm links to the net benefit -- stopping bulk collection of data abolishes pattern analysis, making it impossible for the U.S. to detect terrorists – that's Sales in the 1nc

A2: Perm do CP

Perm is severance – severance illegit – makes the aff a moving target destroying CP and DA ground

a) Public advocate requirement is outside PPD authority

Lawfare 2014 (Benjamin Wittes; chief of Lawfare, Senior Fellow in Governance Studies at the Brookings Institution, member of the Hoover Institution's Task Force on National Security and Law, "The President's Speech and PPD-28: A Guide for the Perplexed", 1/20/2014, http://www.lawfareblog.com/presidents-speech-and-ppd-28-guide-perplexed)//MR

Obama's speech announces reforms and changes **beyond** those outlined in the PPD. The president announces more routine declassification review of FISC opinions---which is both good and unsurprisingly. He also announces, in a carefully-worded part of the speech, that he is "calling on Congress to authorize the establishment of a panel of advocates from outside government to provide an independent voice in significant cases before the Foreign Intelligence Surveillance Court." The wording here is important. **Obama stops short of endorsing the Public Advocate idea**, which has constitutional difficulties and to whose strong form the Judicial Conference has objected. By describing these lawyers as "outside government," he seems to be leaning more towards an amicus model of adding adversarial process to FISC proceedings. But he leaves this point a bit vague, intentionally I think. And basically kicks the matter to Congress.

b) CP doesn't include 702 authority to limit domestic surveillance

c) CP doesn't apply PPD use restrictions

Here is a list of the use restrictions for reference:

White House 14 (Office of the Press Secretary, "Presidential Policy Directive -- Signals Intelligence Activities," 1/17/14, https://www.whitehouse.gov/the-press-office/2014/01/17/presidential-policy-directive-signals-intelligence-activities)

The limitations contained in this section do not apply to signals intelligence data that is temporarily acquired to facilitate targeted collection. References to signals intelligence collected in "bulk" mean the authorized collection of large quantities of signals intelligence data which, due to technical or operational considerations, is acquired without the use of discriminants (e.g., specific identifiers, selection terms, etc.). only for the purposes of detecting and countering: (1) espionage and other threats and activities directed by foreign powers or their intelligence services against the United States and its interests; (2) threats to the United States and its interests from terrorism; (3) threats to the United States and its interests from the development, possession, proliferation, or use of weapons of mass destruction; (4) cybersecurity threats; (5) threats to U.S. or allied Armed Forces or other U.S or allied personnel; and (6) transnational criminal threats, including illicit finance and sanctions evasion related to the other purposes named in this section. In no event may signals intelligence collected in bulk be used for the purpose of suppressing or burdening criticism or dissent; disadvantaging persons based on their ethnicity, race, gender, sexual orientation, or religion; affording a competitive advantage to U.S. companies and U.S. business sectors commercially; or achieving any purpose other than those identified in this section.

Case Debate

Solvency

General

No solvency - Can't get data from overseas servers – major companies have information on servers abroad

No solvency- 702 still allows for overreach- vague implementation

LoConte '10. (FISA Amendments Act 2008: Protecting Americans by Monitoring International Communications - Is It Reasonable; LoConte, Jessica. 2010 Pace Int'l L. Rev. Online Companion 6 (2010) Vol I:6. Pg 6. http://heinonline.org/HOL/Page?men_tab=srchresults&handle=hein.journals/piliewco2010&id=7&size=2&collection=journals&terms=702&termtype=phrase&set_as_cursor=)//LP

The procedures used are consistent with the Fourth Amendment of the Constitution of the United States.20 If the FISC finds that the above requirements are met, then it will issue a warrant.21 Note that in order to obtain a warrant from the FISA court, it is not necessary for the Attorney General or the DNI to specify who the target of surveillance will be. In fact, the statute specifically states that any "certification made under this subsection [section 702] is not required to identify the specific facilities, places, premises or property at which an acquisition ... will be directed or conducted."22 Nor does the statute state that the government must have a reasonable belief that the targets of surveillance have a connection to criminal or terrorist activities. Although section 702 requires the government to adopt minimization procedures, the FISC is not provided with any details regarding the specific minimization procedures to be implemented, which limits the court's review of the ways in which intelligence agencies will use the intercepted intelligence data in the future. Another provision that causes concern is section 702(g)(1)(B) of the FAA, which provides a temporary exception to the warrant requirement: surveillance may begin under the authority of the Attorney General and DNI without court authorization if "time does not permit the submission of a certification."

Circumvention

No solvency – multiple reasons --

a) "TFA" language in 702 allows NSA to bypass restrictions against domestic surveillance

Donohue '15 --From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

The component statutory interpretations, particularly **TFA and the assumptions that mark the foreignness determination, undermine the protections created for U.S. persons** in Sections 703 and 704 of the statute. **They make it possible for the NSA to obtain significant amounts of American citizens' communications**. Until the FAA, the surveillance of U.S. persons outside domestic bounds took place under the weaker standards of Executive Order 12,333. **Part of the purpose of the FAA was thus to increase the protections afforded to U.S. persons travelling abroad**. 214 **The way in which Section 702 is being used, however, allows the NSA to bypass Section 703 by making assumptions about legal status and location and potentially subjecting U.S. persons to surveillance without**

meeting the requirements of Section 703. **The amount of information at stake is not insubstantial**. For years, the volume of intercepts under Section 702 has been one of the principal concerns of legislators familiar with the program. Senators have consistently expressed unease about the intelligence community's claim that **it is impossible to quantify how many Americans' communications have been implicated in the operation of Section 702**.215 What has gradually become clear is **that the program significantly more expansive than initially understood**.21

b) Foreign Program goal requirement -- NSA can collect data about any U.S. citizen as long as the program has a foreign goal

Donohue '2015. From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

Speier, a California Democrat, continued: "**The bottom line is, this FISA bill permits the collection of Americans' emails and phone calls if they are communicating with someone outside of the U.S**."235 Representative Rush Holt (D-NJ), a member of HPSCI, opposed the bill on similar grounds: "It permits massive warrantless surveillance in the absence of any standard for defining how communications of innocent Americans will be protected; a fishing expedition approach to intelligence collection that we know will not make Americans more safe."236 Representative Dennis Kucinich (D-OH) opposed the legislation for the same reason: "**There's no requirement for the government to seek a warrant for any intercepted communication that includes a U.S. citizen, as long as the program in general is directed towards foreign targets.**"237 Kucinich added

c) Server location – foreign routing or servers allow NSA surveillance

Donohue '2015. From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

What is clear is that the inclusion of "about" communications significantly expands the volume of Internet intercepts under Section 702. By 2011, NSA was acquiring approximately 26.5 million Internet transactions per year as part of its upstream collection.179 Three points related to the volume and intrusiveness of the resulting surveillance deserve notice. **First, to obtain "about" communications, because of how the Internet is constructed, the NSA must monitor large amounts of data**.180 That is, if the NSA may collect not just e-mail to or from the target's e-mail account (badguy@ISP.com), but, in addition, other communications happening to mention badguy@ISP.com that pass through the collection point, then the NSA is monitoring a significant amount of traffic.181 And the agency is not just considering envelope information (for example, messages in which the selector is sending, receiving, or copied on the communication) but the actual content of messages.**182 Second, wholly domestic conversations may become swept up in the surveillance simply by nature of how the Internet is constructed.** Everything one does online involves packets of information. Every Web site, every e-mail, every transfer of documents takes the information involved and divides it up into small bundles. Limited in size, these packets contain information about the sender's IP address, the intended receiver's IP address, something that indicates how many packets the communication has been divvied up into, and what number in the chain is represented by the packet in question.183 not, include the other packets of information contained in the message. If a roadblock or problem arises in the network, the packets can then be re-routed, to reach their final destination. Domestic messages may thus be routed through international servers, if that is the most efficient route to the final destination. What this means is that even if the NSA applies an IP filter to eliminate communications that appear to be within the United States, it may nevertheless monitor domestic conversations by nature of them being routed through foreign servers. **In this manner, a student in Chicago may send an e-mail to a student in Boston that gets routed through a server in Canada. Through no intent or design of the individual in Chicago, the message becomes international and thus subject to NSA surveillance.** Third, further collection of domestic conversations takes place through the NSA's intercept of what are called multicommunication transactions, or MCTs. It is important to distinguish here between a transaction and a communication. Some transactions have only

single communications associated with them. These are referred to as SCTs. Other transactions contain multiple communications. If even one of the communications in an MCT falls within the NSA's surveillance, all of the communications bundled into the MCT are collected. The consequence is of significant import. FISC estimated in 2011 that somewhere **between 300,000 and 400,000 MCTs were being collected annually on the basis of "about" communication**—where the "active user" was not the target. So **hundreds of thousands of communications were being collected that did not include the target as either the sender or the recipient of the communication**.184

d) Lack of specific targeting requirements allows NSA broad parameters in determining domestic surveillance – allows for general data gathering

Donohue '2015. From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

The FAA is largely silent about what burden must be borne by the government to establish whether the target is a U.S. person. Instead, **Section 702 directs the Attorney General to adopt targeting procedures** reasonably designed (a) to ensure acquisition is limited to persons reasonably believed to be outside U.S.; and (b) to prevent the acquisition of domestic communications.186 In other words, the statute only requires that the NSA not know (a) that the target is in the U.S.; or (b) that it is intercepting entirely domestic communications. **There is nothing in the targeting requirements requiring intelligence agencies to take certain steps to ascertain whether the target is a U.S. person** or what must be done to ascertain the target's location. Sections 703 and 704, which are designed to deal with U.S. persons, say nothing in turn about what is required to demonstrate whether a target either is or is not a U.S. person.187 Instead, these provisions address situations where the applicant has probable databases or other surveillance systems that could be consulted to determine whether the target is a U.S. person or a non-U.S. person, **the document uses the word "may"—the present tense articulation of a mere possibili**ty. As an auxiliary verb, it adds a functional meaning to the resultant clause—specifically, in the case of "may," to intone possibility in a manner that equally incorporates the possibility of "may not." **The NSA thus may consult its databases to determine whether a target is a U.S. person. It also may decide not to. At no point does the document itself suggest what the NSA "must" do.**192

Ext. Circumvention - TFA

The NSA is exploiting the to, about, for policy—they have used this to collect domestic data.

Donohue '2015. From the Georgetown university of law.(Laura K., "Section 702 and the Collection of International Telephone and Internet Content," Georgetown Law. n/a date. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=2364&context=facpub)//TS

The most concerning aspect of the NSA's targeting practices under the FAA is the inclusion of TFA. Together with generous assumptions with regard to foreignness and the vague requirements embedded in the foreign intelligence determination, **TFA has allowed the NSA to collect data beyond what might otherwise be considered incidental**. **Congress may not have anticipated this possibility in 2008. But by 2012 the information had been made available to any Members inclined to read it. The legislature, however, did not take steps to end programmatic collection.** Nor did FISC play a strong role with regard to the legality of knowingly collecting entirely domestic conversations. The court's decision encouraged willful blindness: as long as the NSA did not develop sophisticated technologies, it could collect more information and fit within the statutory bounds. Critique of these developments could be read as simply a complaint that the law went the other way. After all, three branches of government appear to have given the NSA their blessing: Congress through renewal of the FAA, the FISA Court of Review via its approval of certification, targeting, and minimization procedures, and the AG and DNI in their oversight capacities. But the burden

borne by the government in the realm of national security is one that requires the public authorities to be consistent with practice. **It is concerning that what is being done in practice looks very different than what the law says on its face.**

Their own author concedes that statute is not adequate

Eoyang and Bishai, '15 – Eoyang is Director of Third Way's National Security Program, Chief of Staff to Representative Anna Eshoo (D-CA), and Defense Policy Advisor to Senator Kennedy/Bishai is National Security Fellow at Third Way and previously served as the press director at the Embassy of Iraq and a news producer at Al Jazeera English (Mieke and Chrissy, "Restoring Trust between U.S. Companies and Their Government on Surveillance Issues," *Third Way*, 3/19/15, http://www.thirdway.org/report/restoring-trust-between-us-companies-and-their-government-on-surveillance-issues)//CT

Of course, FAA Exclusivity wouldn't solve every problem. It would not prevent foreign governments from collecting information themselves and then providing it to U.S. intelligence agencies, as U.S. law cannot bind a foreign government. And some may argue that FAA provides inadequate civil liberties protections for Americans. This proposal says nothing about the adequacy of that statute in this respect. What it says is that for data held by an American company about a target that is not a U.S. person, the checks within FAA are stronger than those solely under E.O. 12333.

A2: Multi-Stakeholder Model Good/Data Localization Bad

US-centric model rejected now – Russia and China want data localization – plan doesn't restrict surveillance of foreign intelligence which is what their internal links assume is primary concern for other great powers

Multistakeholder model will fail – Western control

Marks 14 (JOSEPH MARKS Joseph Marks covers cybersecurity for POLITICO Pro. He previously covered government technology issues for Nextgov, part of Atlantic Media, and covered local and state politics and higher education for the Grand Forks (N.D.) Herald and the Albert Lea (Minn.) Tribune. He interned for Congressional Quarterly's Homeland Security section and The Associated Press's Jerusalem Bureau. THE WEST DOMINATES INTERNET GOVERNANCE, BUT THAT CAN CHANGE — Some developing nations have a legitimate beef with the "multi-stakeholder" model of Internet governance that the U.S. champions, the State Department's ambassador to the Internet acknowledged yesterday. The current slate of stakeholders just isn't diverse enough, Daniel Sepulveda said. In theory, the multi-stakeholder model means major decisions about how the Internet is organized are made by technical specialists at ICANN and other consensus-based non-profits rather than by national governments or multi-national organizations such as the United Nations. In practice, however, those non-profits are inordinately filled with Western government representatives, Western companies and Western civil society members, Sepulveda said on the sidelines of yesterday's Internet Governance Forum meeting at The George Washington University.

China already rejecting US-centric control of internet – wants "internet sovereignty"

Mozur and Jie 14(Jun 23, 2014 Paul Mozur writes about technology from The Wall Street Journal's Beijing bureau and Yang Jie computer scientist whose research interests include multimodal human-computer interaction (modeling and learning), computer vision, and pattern http://blogs.wsj.com/chinarealtime/2014/06/23/chinas-lays-out-argument-for-internet-sovereignty-convinced/ "China Argues for 'Internet Sovereignty.' Is It a Good Idea? " accessed 06/28/15)PA

As the Internet becomes more and more crucial to the day-to-day operations of government and multi-national companies, it's no surprise its geopolitical import is growing to rival that of other

industries like energy that dominate foreign policy. In a full-page spread on the Monday, the Communist Party's mouthpiece newspaper laid out China's position on how the Internet and its supporting infrastructure should be dealt with across the globe. The page featured interviews with five Chinese experts, including the so-called "father" of China's Great Firewall Fan Binxing. The upshot: They believe each country should have ultimate power to determine what Internet traffic flows in and out of its territory. It's a concept China has termed "Internet sovereignty," and though the opinions of each expert in the article varied, the core message is that each nation should have the right to govern the Internet as it sees fit. The addendum is that the U.S. has too long exerted too much control over the Internet, and the revelations of former National Security Agency contractor Edward Snowden exposes U.S. hypocrisy in calling for a more open Internet while simultaneously monitoring foreign governments, companies and individuals. The U.S. government recently said it plans to give up control over the body that manages Internet names and addresses, in a move designed to assuage concerns following Mr. Snowden's leaks and also to encourage international cooperation over management of the Web. Still, a number of U.S. hardware and Internet companies continue to control huge swathes of the globe's Internet traffic. "'Internet sovereignty' is an idea that is in line with the rules of international law," the People's Daily said. "From a practical point of view, each country should have the right to implement its own Internet policies and regulations according to its needs. Other countries have no right to interfere with this." On the flip side, some have argued that a smaller role for the U.S. could result in the Balkanization of the Internet – making the Chinese Internet, for example, even more cut off from the rest of the web than it already is. Outrage over U.S. cyberspying is set to continue, but the more salient question at this point is whether the world would be better off with a less U.S.-centric Internet, even if that means the risk of an Internet in which more countries take steps to censor and block content.

Internet sovereignty solves better than multi-stakeholder

Lewis 13 (James A. Lewis is the Director and Senior Fellow of the Technology and Public Policy Program at the Center for Strategic and International Studies in Washington, D.C. OCTOBER 2013 https://www.cigionline.org/sites/default/files/no4.pdf "Internet Governance: Inevitable Transitions" accessed 06/28/15)PA

The extension of Westphalian sovereignty into cyberspace has been incremental and gradual: a problem appears, the current multi-stakeholder approach fails to address it, and governments seek other solutions using their national authorities. There will be no rush to a global treaty, where the UN suddenly takes control of the Internet. Instead, nations will take steps to establish rules and penalties for behaviour on the Internet that are consistent with their national laws; over time this will aggregate into a new sovereign framework. Governments are unlikely to be involved in the day-to-day operations of the Internet, but they will put new rules in place for its operation. The process will leave proponents of the current governance structure confused and complaining as they are increasingly hemmed in by a range of national controls. This extension of sovereignty is not the balkanization of the Internet — a pejorative term coined by defenders of the status quo. The definition of borders in cyberspace is no more a balkanization than the existence of borders in the physical world; only those who still believe in the one-world global commons could interpret this as such. There will still be a global network where the primary motives Internet Governance: Inevitable Transitions for design and architecture are commercial and the primary differences among nations will be over the treatment of content and expression. This extension is shaped by the larger debate over sovereign authority versus universal human rights, but it was naive to think that technology would trump politics and that nations would meekly surrender control to some US construct reflecting US values.

Data localization inevitable

Root cause- Countries have seized this opportunity to compete with American markets, not b/c snowden.

Hill' 14. International affairs consultant, Worked on National security Staff in the White House as cybersecurity coordinator. (Jonah Force Hill, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS," 5-1-2014. Pg. 8-9, The Hague Institute for Global Justice. http://dx.doi.org/10.2139/ssrn.2430275)//TS

Powerful business interests undoubtedly see data localization as an effective and convenient strategy for gaining a competitive advantage in domestic IT markets long dominated by U.S. tech firms. To localization proponents of this stripe, the **NSA programs serve as a powerful and politically expedient excuse to pursue policies protective of domestic businesses**. As an illustration, **data localization in Germany presents clear economic benefits for a most powerful industry advocate for localization**, Deutsche Telekom (DT). Whether by way of its "email made in Germany" system or the Schengen area routing arrangement, DT looks poised to gain from efforts to reduce the prominence of American tech firms in Europe. It is no wonder that the company has been spearheading many of the localization proposals in that country. As telecommunications law expert Susan Crawford has noted, DT has been seeking to expand its cloud computing services for years, but has found its efforts to appeal to German consumers stifled by competition from Google and other American firms. 79 T-Systems International GmbH, DT's 29,000-employee distribution arm for information-technology solutions, has been steadily losing money as a result.80 Moreover, Crawford suggests that DT would not be content with gaining a greater share of the German market; she points out that through a Schengen routing scheme, "Deutsche Telekom undoubtedly thinks that it will be able to collect fees from network operators in other countries that want their customers' data to reach Deutsche Telekom's customers."81 **Similarly, companies and their allies in government in Brazil and India look to profit from data localization proposals**. Indeed, **the governments of both nations have for years sought to cultivate their own domestic information technology sectors**, at times by protecting homegrown industries with import tariffs and preferential taxation. Brazilian President Rousseff has on numerous occasions stated that her government intends to make Brazil a regional technology and innovation leader; in recent years the government has proposed measures to increase domestic Internet bandwidth production, expand international Internet connectivity, encourage domestic content production, and promote the use of domestically produced network equipment.82 India, more controversially, has at times required foreign corporations to enter into joint ventures to sell ecommerce products, and has compelled foreign companies to transfer proprietary technology to domestic firms after a predetermined amount of time.83 **Brazil and India are, of course, not alone** in this respect. **Indonesian firms are constructing domestic cloud service facilities** with the help of government grants, 84 while Korea is offering similar support to its own firms. **85 For the governments and corporations of these nations, long frustrated by their inability to develop a domestic IT industry that can compete on an even playing field with the U.S. technology giants, data localization is one means to confront, and perhaps overcome, the American Internet hegemony.**

Data Localization is inevitable -- European companies benefit from it.

Hill' 14. International affairs consultant, Worked on National security Staff in the White House as cybersecurity coordinator. (Jonah Force Hill, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS," 5-1-2014. Pg. 8-9, The Hague Institute for Global Justice. http://dx.doi.org/10.2139/ssrn.2430275)//TS

The problem for U.S. tech companies is **that there are actually a wide variety of forces and interest groups driving the data localization movement, and many of these** forces and **groups have objectives beyond the professed goals of data protection and counter-NSA surveillance**. One can easily discern in foreign governments' interest in data localization a combination of anti-American populism, a desire for greater ease of foreign (and domestic) surveillance, and a sense among policymakers and business that **the Snowden backlash presents an opportunity to cultivate domestic cloud and other tech services industries**, industries that have long been outcompeted by American tech companies in their home markets—old-fashioned protectionism tailored for the digital age. A quick look at four select localization studies25 reveals this complex mix of purposes, and helps to explain why **U.S. technology firms** – as well as those organizations and individuals abroad who also recognize the problems data

localization laws would introduce – **are having** such **a difficult time arguing their case, despite the logic working in their favor and against the policies they are contesting**.

Data localization pushed to protect domestic businesses – not because NSA

Hill' 14. International affairs consultant, Worked on National security Staff in the White House as cybersecurity coordinator. (Jonah Force Hill, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS," 5-1-2014. Pg. 8-9, The Hague Institute for Global Justice. http://dx.doi.org/10.2139/ssrn.2430275)//TS

Upon first glance, the preceding case studies present a consistent narrative: **for the nations now considering localization for data, the Snowden revelations exposed an NSA that had overstepped the boundaries** of acceptable surveillance, violated citizen privacy, and **catalyzed public and government opinion in favor of forceful action in response**. **For policymakers, data localization offers a seemingly simple and effective solution. Under closer examination, however**, a more complicated picture emerges. **The localization movement is** in fact **a complex and multilayered phenomenon**, **with the objective not only—or even primarily—of protecting privacy**. Depending on the country in which it is being advanced, **localization also serves to protect domestic businesses from foreign competition, to support domestic intelligence and law enforcement ambitions, to suppress dissent and to stir up populist enthusiasms for narrow political ends**. Direct evidence of these other objectives for which privacy seems to be a pretext is by its nature difficult to uncover: rarely to policy-makers admit to seeking protectionist goals, to spying on their populations, to suppressing dissent or to exploiting populist emotions. Yet, by viewing the localization movement in the context of other state and corporate interests and activities, it is possible to uncover these other, less exalted ends.

Countries already passed data localization laws – Snowden revelations only furthered pre-existing movements

Gross 15 (Grant Gross, "Two years after Snowden leaks, US tech firms still feel the backlash," Channel World, 6-10-15. http://www.channelworld.in/news/two-years-after-snowden-leaks,-us-tech-firms-still-feel-the-backlash#sthash.lhuYY7rA.dpuf)//TS

In addition to the upcoming Russian regulation, France and Germany are creating their own dedicated national networks, and other countries, including China, Australia and India, have passed data localization laws, the ITIF report said. Asked during the conference about ITIF's new estimates, Erich Andersen, deputy general counsel at Microsoft, questioned them. **Even before Snowden's leaks, many countries had begun to press for new laws dealing with data security and privacy, and the leaks "galvanized" the debate, he said**. Panel moderator Robert Boorstin, senior vice president at Albright Stonebridge Group, suggested that it's difficult for governments to pass laws that keep up with the constantly changing technology industry. But Andrea Glorioso, counselor for the digital economy for the European Union's delegation to the U.S., defended the EU's efforts to protect privacy and pass other consumer-protection regulations. Some tech companies argue against regulation, saying they want "frictionless innovation," he said. "When you're in a car, friction is a very good thing, because it's what allows you to brake," Glorioso said. "A world without friction is a world in which you just go ahead, and you cannot stop, even when you want to."

Credibility/Soft Power

General

FAA solves perception - Any evidence about U.S. legitimacy before June '15 is irrelevant the U.S. already restoring its legitimacy

Legitimacy K

The Vietnam War proves that adopting the false mindset of credibility leads to bad decision making, resulting in useless conflicts with harmful consequences.

Fettweis '07. Assistant professor of national security affairs in the National Security Decision Making Department at the U.S. Naval War College. (Christopher J. " Credibility and the War on Terror," winter, vol.122, no. 4. Blackwell Publishing Ltd.)//TS

The credibility imperative had become firmly embedded in the psyche of the U.S. foreign policy establishment by the time some of the crucial decisions regarding the war in Vietnam needed to be made. **Without the imperative, the war would not have been fought**. **More than any other single factor, a fear of the message that a communist victory would send to the neighboring** (and not-so-neighboring) **states compelled the United States to try to prop up the corrupt**, unpopular, Roman Catholic South Vietnamese **rulers**. In a 1965 memo released with the Pentagon Papers, **Secretary of Defense** John **McNaughton described the reasons that the United States was in Vietnam as 70 percent ''to avoid a humiliating U.S. defeat** (**to our reputation** as guarantor),'' 20 percent to prevent communism from overtaking South Vietnam, and only 10 percent to help the people of South Vietnam. 23 The damage that a failure in Vietnam could do to the reputation of the United States was potentially catastrophic. President Lyndon Johnson warned his cabinet that ''if we run out on Southeast Asia, there will be trouble ahead in every part of the globe—not just in Asia, but in the Middle East and in Europe, in Africa and Latin America. I am convinced that our retreat from this challenge will open the path to World War III.'' 24 Kissinger agreed, warning that if South Vietnam were allowed to fall, it would represent a ''fundamental threat, over a period of time, to the security of the United States.'' 25 **Only when framed inside the prism of the credibility imperative did victory in Vietnam become a vital national interest**. Skepticism grew steadily as the war dragged on, and as **the credibility imperative drove policymakers to believe that withdrawal from what seemed to be an unwinnable war would lead to national catastrophe**. Intellectuals in the anti -war movement led the way, expressing moral outrage that a war would be fought primarily for the messages it would send to our enemies and allies. 26 **Academic skepticism about the importance of credibility grew** alongside questions about the tangible interests at stake, **especially after it became clear that the costs in blood and treasure were not proportional to any potential benefits** that could conceivably be gained from the survival of an anti-communist South Vietnam. To prominent realists such as Hans Morgenthau and Kenneth Waltz, intervention in isolated, resource-poor Vietnam was irrational, ''moralistic,'' and mistaken. Only ''if developments in Vietnam might indeed tilt the world's balance in America's disfavor,'' argued Waltz, would the war be worthwhile.27They did not, of course, since from a purely material perspective, **Vietnam was next to irrelevant to U.S. national security**. The cost of a loss t o U .S. credibility, however, appeared incalculable. The war in Vietnam marked the beginning of the current debate over the importance of credibility, and the point of divergence between scholars and practitioners. Despite dire warnings from many of its leaders, **the United States** not only **withdrew its forces** from Southeast Asia but also cut back on its aid and watched North Vietnamese troops overrun Saigon in 19 75.Since this ''cut-an d-run'' and subsequent loss of an ally were undoubtedly unmitigated disasters for the credibility of the United States, **presumably a string of foreign policy setbacks should have followed.** If international actions are truly interdependent, as policymakers believe, then the 1970s would probably have seen evidence of allies beginning to question U.S. commitments, dominoes falling where the reputation of the United States maintained the status quo, an d increased levels of Soviet activity in the third world. The conventional wisdom suggests that the humiliating rooftop helicopter evacuation of the U.S. embassy in Saigon should have heralded a dark period for U.S. foreign policy. **However, no such string of catastrophes took place. Perhaps most obviously, there is**

no evidence that any allies of the United States were significantly demoralized, or that any questioned the wisdom of their allegiance. If anything, many of Washington's closest allies seemed relieved when the war ended, since many of them had doubted its importance in the first place and had feared that it distracted the United States from other, more pressingissues.28Certainly no state, not even any ''client'' states in the third world, changed its geopolitical orientation as a result of Vietnam. **The damage to U.S. credibility also did not lead to the long-predicted spread of communism throughout the region**, as even Kissinger today grudgingly acknowledges. **On the contrary, in the ten years that followed the fall of Saigon, the non-communist nations of Southeast Asia enjoyed a period of unprecedented prosperity**.30The only dominoes that fell were two countries that were even less relevant than Vietnam to the global balance of power—Cambodia and Laos, both of which were hardly major losses for the West, especially given the tragedies that followed. Nationalism proved to be a bulwark against the spread of communism that could not be overcome by any loss of confidence in U.S. commitments.

US Credibility doesn't affect other countries reactions - Cold War and Vietnam prove

Fettweis '07. Assistant professor of national security affairs in the National Security Decision Making Department at the U.S. Naval War College. (Christopher J. "Credibility and the War on Terror," winter, vol.122, no. 4. Blackwell Publishing Ltd.)//TS

There is actually scant evidence that other states ever learn the right lessons. **Cold War history contains little reason to believe that the credibility of the superpowers had very much effect on their ability to influence others.** Over the last decade, a series of major scholarly studies have cast further doubt upon the fundamental assumption of interdependence across foreign policy actions. Employing methods borrowed from social psychology rather than the economics-based models commonly employed by deterrence theorists, Jonathan Mercer argued that threats are far more independent than is commonly believed and, therefore, that **reputations are not likely to be formed on the basis of individual actions**.39While policymakers may feel that their decisions send messages about their basic dispositions to others, most of the evidence from social psychology suggests otherwise. **Groups** tend to **interpret the actions of their rivals as situational**, dependent upon the constraints of place and time. Therefore, **they are not likely to form lasting impressions of irresolution from single, independent events**. Mercer argued that the interdependence assumption had been accepted on faith, and rarely put to a coherent test; when it was, it almost inevitably failed.40Mercer's larger conclusions were that **states cannot control their reputations or level of credibility**, and that target adversaries and **allies will ultimately form their own perceptions**. Sending messages for their consideration in future crises, therefore, is all but futile. These arguments echoed some of the broader critiques of the credibility imperative that had emerged in response to the war in Vietnam, both by realists like Morgenthau and Waltz and by so-called area specialists, who took issue with the interdependence beliefs of the generalists. As Jervis observed, a common axis of disagreement in American foreign policy has been between those who focus on the specific situation and the particular nations involved (often State Department officials or area experts), and those who take a global geopolitical perspective (often in the White House or outside foreign policy generalists). The former usually believe that states in a region are strongly driven by domestic concerns and local rivalries; the latter are pre-disposed to think that these states look to the major powers for their cues and have little control over their own fates.4

Other Countries base their perceptions on national interests – basing US decisions the myth of legitimacy causes ineffective policy responses

Fettweis '07. Assistant professor of national security affairs in the National Security Decision Making Department at the U.S. Naval War College. (Christopher J. " Credibility and the War on Terror," winter, vol.122, no. 4. Blackwell Publishing Ltd.)//TS

Press argues that **national capabilities and interests—not past behavior—provide the foundation for the formation of perceptions**. However**, the credibility imperative has a powerful intuitive logic behind it**, based upon lifetimes of interpersonal experience. There are therefore significant impediments infront of those who would challenge the wisdom of the policymaker's obsession with reputation. **This divergence in conventional wisdom between policy and scholarship would not be a major issue for twenty-first-century international politics if policies that are primarily based upon the need to appear credible were not often counterproductive, costly, and dangerous. The imperative has clear effects**

upon policy, and is employed in debates in predictable, measurable, and uniformly unhelpful ways.

Warming

No impact and its not anthropogenic

Lupo 08 (NAPSA, Anthony R. assistant¶ professor of atmospheric science at¶ the University of Missouri at¶ Columbia and served as an expert¶ reviewer for the UN's Intergovernmental¶ Panel on Climate Change, "Global Warming Is Natural, Not Man-Made," 2008, http://www.napsnet.com/pdf_archive/34/50144.pdf) //AW

One of the fundamental tenets of our justice system is one is innocent until proven guilty. While that doesn't apply to scientific discovery, in the global warming debate the prevailing attitude is that human¶ induced global warming is already¶ a fact of life and it is¶ up to doubters to¶ prove otherwise.¶ To complete the¶ analogy, I'll add that¶ to date, there is no¶ credible evidence to¶ demonstrate that the climatological¶ changes we've seen since the¶ mid-1800's are outside the bounds¶ of natural variability inherent in¶ the earth's climate system.¶ Thus, any impartial jury¶ should not come back with a¶ "guilty" verdict convicting humanity¶ of forcing recent climatological¶ changes.¶ Even the most ardent supporters¶ of global warming will not¶ argue this point. Instead, they¶ argue that humans are only partially¶ responsible for the observed¶ climate change. If one takes a¶ hard look at the science involved,¶ their assertions appear to be¶ groundless.¶ First, carbon dioxide is not a¶ pollutant as many claim. Carbon¶ dioxide is good for plant life and is¶ a natural constituent of the¶ atmosphere. During Earth's long¶ history there has been more and¶ less carbon dioxide in the atmosphere¶ than we see today.¶ Second, they claim that climate¶ is stable and slow to change, and¶ we are accelerating climate¶ change beyond natural variability.¶ That is also not true.¶ Climate change is generally a¶ regional phenomenon and not a¶ global one. Regionally, climate has¶ been shown to change rapidly in¶ the past and will continue to do so¶ in the future. Life on earth will¶ adapt as it has always done. Life¶ on earth has been shown to thrive¶ when planetary temperatures are¶ warmer as opposed to colder.¶ Third, they point to recent¶ model projections that have¶ shown that the earth will warm¶ as much as 11 degrees Fahrenheit¶ over the next century.¶ One should be careful when¶ looking at model projections. After¶ all, these models are crude representations¶ of the real atmosphere¶ and are lacking many fundamental¶ processes and interactions¶ that are inherent in the real¶ atmosphere. The 11 degrees scenario¶ that is thrown around the¶ media as if it were the mainstream¶ prediction is an extreme¶ scenario.¶ Most models predict anywhere¶ from a 2 to 6 degree increase over¶ the next century, but even these¶ are problematic given the myriad¶ of problems associated with using¶ models and interpreting their¶ output.¶ No one advocates destruction¶ of the environment, and indeed¶ we have an obligation to take care¶ of our environment for future generations.¶ At the same time, we¶ need to make sound decisions¶ based on scientific facts.¶ My research leads me to¶ believe that we will not be able to¶ state conclusively that global¶ warming is or is not occurring for¶ another 30 to 70 years. We simply¶ don't understand the climate system¶ well enough nor have the¶ data to demonstrate that humanity¶ is having a substantial impact¶ on climate change.¶

Cyberterror

Congressional oversight prevents NSA backdoors already - no link to cyber terrorism.

Mazmanian June 6, **2015**. (Adam, "CJS funding bill would limit high-tech surveillance," 6-6-15. The Business of federal technology. http://fcw.com/articles/2015/06/04/cjs-funding-bill.aspx) // TS

The House passed a $51.4 billion Commerce, Justice and Science funding **bill** for fiscal 2016 on June 3 **that would pare back the government's authority to conduct surveillance on communications.** Taken together, they constitute something of a follow-on to the USA Freedom Act, just signed into law, which put new rules on the bulk collection and searching of telephone metadata by spy agencies. **The bill, passed** 242-183, includes: ***An amendment** by Ted Poe (R-Texas) **that would prohibit funding for government to require technology companies**

to build in support for tapping encrypted communications. The provision would put the brakes on efforts by FBI Director James Comey to guarantee that law enforcement agencies have access to encrypted communications. The amendment was adopted by voice vote. * An amendment by Darrell Issa (R-Calif.) that would bar funding of efforts by federal law enforcement to use "stingray" devices, which simulate the activity of cell towers to capture location **and** identifying information from mobile phones, to collect data in bulk without a court order. The amendment was adopted by voice vote. * An amendment by Jared Polis (D-Colo.) that would ban the Drug Enforcement Administration from collecting phone records in bulk. The amendment was adopted by voice vote. * **An amendment** by Thomas Massie (R-Ky.) **that would bar the N**ational **I**nstitute of **S**tandards and **T**echnology **from coordinating on encryption or computer security standards with the CIA and the National Security Agency**, except for the purposes of improving information security. **The** Massie **amendment was a response to revelations from** former NSA contractor Edward **Snowden** and other sources **about collaboration between NIST and the intelligence community to insert flaws into highly complex encryption standards** – revelations that led NIST to ultimately disavow the standards. The amendment was adopted 383-43. "Don't you want the best security available that the minds in this country can create ... to safeguard your health records, maybe to safeguard your gun records, maybe to safeguard your bank accounts and your credit cards? We are more safe when we have better security and better encryption, so it makes no sense for [NIST] to work with the NSA to weaken our encryption software," Massie said. **Supply chain, census, other IT measures** The bill would renew federal policy requiring supply-chain vetting for the acquisition of high-impact and moderate-impact IT systems, including an assessment from the FBI or other appropriate agency to evaluate cyber risks posed by any system whose manufacture is touched by firms controlled or subsidized by the Chinese government, or other sources identified by the U.S. as posing a cybersecurity threat. The House bill would extend the language of the measure to encompass the renewal as well as the acquisition of systems. Appropriators are worried about the looming 2020 census. The bill includes $848 million in funding for the count, but there are some strings attached related to IT delivery. The bill would mandate that half the IT funding for the 2020 census be withheld pending the Census Bureau's delivery of a spending plan for the large-scale Census Enterprise Data Collection and Processing project, which would put all the census data gathering, analytics and dissemination technology under a single system for the first time. The bill would deliver drastic cuts to the National Strategy for Trusted Identities in Cyberspace, a Commerce Department program designed to fund pilot projects to create new methods of online authentication that go beyond simple usernames and passwords. Under the bill, funding of new grants would cease, and second-year awards under 2015 grants would be canceled, with the allowed funding being used to wind up the program. The White House issued a veto threat before the bill went up for a vote. On the IT side, the Obama administration is particularly concerned about census IT funding, the NIST appropriation, Internet governance transition work being performed by the National Telecommunications and Information Administration at Commerce, funding for Commerce's digital service team, and budget requests by NASA and the National Science Foundation to comply with the Digital Accountability and Transparency Act.

Big tech companies have installed encryptions—the NSA cannot access backdoors anymore.

Kharpal '2015. Citing Glen Greenwald who received a Pulitzer award for his work on the Snowden revelations. (Arjun, "iPhone encryption 'petrified' NSA: Greenwald," CNBC, 3-18-2015. http://www.cnbc.com/id/102515972)//TS

Stronger encryption in Apple's iPhones and on websites like Facebook has "petrified" the U.S. government because it has made it harder to spy on communications, Glenn Greenwald, the writer who first reported on Edward Snowden's stolen files, told CNBC. Former National Security Agency (NSA) contractor Edward Snowden caused major shockwaves around the world in 2013 when he unveiled the surveillance body's wide ranging spying practices, which included regularly attempting to snoop of data held by major technology companies. Apple, Google, Facebook and Yahoo are some of the major companies that have been in the spotlight after Snowden's revelations. Information from the Snowden documents released earlier this month detailed how the CIA had been trying for a decade to crack the security in Apple's products. And last year, **Yahoo revealed that it was threatened with a $250,000 per day fine if it didn't hand over data to the NSA. The tech giants have been taking major steps to make sure their communications are safe from spying**, a move Greenwald – who won a Pulitzer Prize for his reporting on the topic – said was motivated by the fear of losing customers rather than care for data privacy. "I don't… (Think) they suddenly care about privacy," Greenwald said. "If…you're a Facebook executive or an Apple executive, you're extremely worried that the next generation of users…are going to be vulnerable to the pitch from Brazilian, and Korean and German social media companies where they advertise and say don't use Facebook and Google because they'll give your data to the NSA." Snowden is due to address CeBIT later today. Glenn Greenwald, the man who helped Snowden publish the documents, said that **Silicon Valley companies have bolstered the encryption on their products, thereby making it harder for governments to eavesdrop.** "**They** (Apple) **are now starting to put serious encryption technologies** in their new iPhones **in their new releases** and this has really petrified governments around the world," Greenwald told CNBC in an interview at tech fair CeBIT in Germany.

NSA surveillance is key to preventing cyber terrorism.

Weise '2015. (Elizabath, "Experts: NSA efforts part of the battle in cyber-proxy war," USA Today, 6-7-2015. http://www.usatoday.com/story/tech/2015/06/04/nsa-warantless-surveillance-cybersecurity-china/28493013/)//TS

SAN FRANCISCO — **The U**nited **S**tates **is engaged in a** proxy war with its enemies, a **war where cyberspace is the battlefield, cyber experts say**. **Because of that, the National Security Agency's expansion of warrantless surveillance of Americans' international Internet traffic is necessary**, said Tom Kellermann, chief cybersecurity officer with Trend Micro, a Texas-based computer security company. "Let's be fair. The National Security Agency's role is to protect national security. **This is not about violating Americans' privacy, this is about spy hunting**," Kellermann said. The revelation Thursday of NSA's broad program to scoop up Americans' Internet activities coincided with the government's disclosure that Chinese hackers had breached the computer system of the Office of Personnel Management, potentially compromising the data of 4 million current and former federal workers. "**The cyber civilization of the United States is being undermined, not just by criminal hackers but also by nation-states that have literally burrowed into our companies, our cities and our networks**," Kellerman said. **The type of proactive surveillance the NSA was conducting is crucial**, according to Jasper Graham, vice president for cybertechnology and analytics with Darktrace, a Washington, D.C.-based cyber-security firm. "**Sometimes hunting is the only way you can catch people. Otherwise you're always in response mode, waiting for something to strike you**," said Graham, who worked as a technical director at NSA for 15 years. Black-and-white distinction between criminal hackers and the intelligence wings of other countries can be difficult to make. It's common in some nations for hackers to be allowed to operate with impunity as long as they don't hack anything within their own country, experts say. They're also expected to share information they come across that might be useful to their nation, and to be "patriotic" and aid the state when called upon, Kellerman said. Intrusions often have multiple targets and happen on multiple levels. Graham offered a hypothetical example: If a government wanted information about specific types of employees at the Defense Department, it could hire or encourage a hacking group to attack a financial institution or health care system in the Washington, D. C., area. That would get them personal information about hundreds of thousands of individuals, some of whom may work at the Defense Department. "They're hiding one attack in the noise of another, and everybody writes it off as cyber-crime," Graham said. That's where looking at hacking activity broadly can pay off, Graham said. "You don't know until you work your way up the food chain if they're working independently or they're a small hacking group working with a government." For Herbert Lin, a Stanford University cyber-policy expert, whether the NSA program was an effective strategy for detecting and stopping hacking by foreign governments is the wrong question. "The question is really if the NSA program was helpful enough that it is worth the expense and the cost," Lin said. "Personally I wish we didn't have to do it, but I think it's an understandable response" given the current threat environment, he said. Other experts have their doubts about whether the NSA program is helpful. "One need only open up a newspaper" to see that it's not working, said Amit Yoran, CEO of the computer security company RSA. The needs of the intelligence and law enforcement communities are often at odds with what businesses want and need, he said. "Intelligence wants to monitor, to learn about the threat and how they work. Law enforcement wants to collect information so they can prosecute," Yoran said. Victims of hacks want to rush in and clean up their system. "So there's a very powerful divide," he said. In the end, he said, "if **you were serious about protecting the United States from these external cyber threats, then absolutely this is the sort of thing you'd consider doing**." While Yoran doesn't think the potential ethical issues represent "a serious compromise," he knows that others might come to different conclusions if they don't trust the U.S. government to do what's right. "If you fundamentally don't trust, you fundamentally don't trust. I can't prove a negative," he said. For privacy advocate Marc Rotenberg, with the Electronic Privacy Information Center in Washington D.C., trust and oversight form the crux of the matter. "**The cost of government secrecy will always be the lack of public trust**," he said. "In the absence of meaningful oversight, the NSA will push its surveillance authority beyond what the law allows."

Cyber warfare is a self-fulfilling prophecy

Valeriano and Manus '15 -- Brandon Valeriano has a Ph.D. from Vanderbilt University in Political Science and Ryan C. Maness has a Ph.D. in Political Science from the University of Illinois in Chicago. (Brandon and Ryan C., "Cyber War versus Cyber Realities: Cyber Conflict in the International System" 5/26/15. Oxford University Press, Pg.20-21) //AHS

We now live in a digital era in whitch the speed, interconnectedness, and level of computer interaction between states and individuals is growing at an exponential rate. Choucri (2012: 13) suggests that "cyberspace has created new conditions for which there are no clear precedents." As with most new things, this new reality brings fear since the infrastructure we depend on is thought to be fragile and too complex. We depend so much on digital communications that it stands to reason that we are also vulnerable to threats that originate from this realm. As Bowden's quote makes clear, the fragility of what we most depend on is a source

of vulnerability for some. Rid (2013: vii) even suggests that we are addicted to the Internet, and this is a source of concern as our habit is therefore fragile. The fragility, addiction, and dependency we have on the Internet signals weakness for some. Weaknesses offer are exploited by those who seek to gain, especially in a situation of historical enmity. Yet, these ideas are assumptions; there is a perception of fragility and of dependency that might not match the reality of the situation. If the perceived weakness and fragility become the dominant frame, there is a potential for the fear invoked to translate to the securitization notion of forthcoming conflict, exploiting this weakness. We argue throughout that the opposite might be true, that the Internet and cyber interactions are more stable than most believe and therefore this domain can be a source of cooperation. Cyberspace will become the domain of conflict only if we let the fear process take hold and dominate the discourse; the perception of fear then becomes a self-fulfilling prophecy. The CNBC network in the United States produced a documentary on cyber warfare that documents the typical securitized discourse in this arena. Their introductory statement is a typical example of the hyperbolic statements associated with cyber conflict. "In the United States, we are Internet dependent. Our financial system, power grids, telecommunications, water supplies, flight controls and military communications are all online – making them vulnerable to countless cyber incidents by cyber criminals. The goal could be a 10-minute blackout, a breach of national security, a stock trading glitch or the theft of millions of dollars worth of intellectual property." In short, everything from our money to our water is vulnerable to infiltration. The question is to what extent these extreme warning and fears are warranted. How vulnerable is any given country to cyber malice, and what evidence do we have for cyber conflict in the last decade? Should this fear be the basis for reorganization in military structures and doctrine?

Empirical outliers have been overhyped in cyber security discourse

Valeriano and Manus '15 -- Brandon Valeriano has a Ph.D. from Vanderbilt University in Political Science and Ryan C. Maness has a Ph.D. in Political Science from the University of Illinois in Chicago. (Brandon and Ryan C., "Cyber War versus Cyber Realities: Cyber Conflict in the International System" 5/26/15. Oxford University Press. Pg.137) //AHS

Throughout this volume we have made the case that cyber conflicts thus far are over-hyped and that states practice a large degree of restraint in using them. We find that the rate of conflict is not indicative of a revolution in military affairs, but rather is a continuation of espionage and nuisances otherwise common in international affairs. The next question is, if we take a closer look at the process, content, and meaning of what might be known as the prominent cyber conflicts, then what more do we learn? Do our quantitative conclusions hold up in the context of what might be called the outliers, or the black swans of the cyber security discourse? We need to support our data investigations with the story of cyber conflicts in order to reinforce the points asserted in previous chapters. Here we demonstrate that even the most popular and well-known cyber incidents are not changing the shape of the battlefield; they are a new technology, like any other that we have seen in the past. Throughout history, militaries and governments have adapted to and utilized new technologies in the battlefield as well as for diplomacy, but rarely have the changed the shape of international affairs. It seems that cyber conflict falls into this category in that the technology alone by no means changes the shape of relationships. We go even further with our weekly events-based data investigation to suggest that, by and large, the response to cyber incidents, when the do happen, does not indicate that governments are disturbed or severely troubled by the incidents (see Chapter 5). Some tactics provoke reactions, but mainly cyber actions have been assimilated as a normal process of international life, a claim widely divergent from the tone of the general cyber security debate.

Cyber-attacks are just hype – "digital Pearl Harbor" or "cyber 9/11" have yet to materialize despite decades of warning

Gartzke and Lindsay 6/22/15 (Eric Gartzke is an associate professor at UC San Diego in the in the Department of Political Science and Jon Lindsay is an assistant adjunct professor at UC San Diego and an Oxford Martin Associate with the Oxford Global Cyber Security Capacity Center. (Eric and Jon R., "Weaving Tangled Webs: Offense, Defense, and Deception in Cyberspace,"6-22-2015.

Taylor and Francis group. Pg323-324. Security Studies Vol 24, Issue 2.
http://www.tandfonline.com/doi/pdf/10.1080/09636412.2015.1038188)//AHS

Where Are All the Attacks? If geographic, technological, or organizational conditions make conquest feasible at low cost or risk in comparison with the effort of defending the same objectives, then aggressors should be more tempted to launch an attack, the security dilemma and negative spirals should be more intense, and greater uncertainty and secrecy should lead to more miscalculation and war.21 According to a prominent body of international relations theory, high levels of offense dominance, in general, should be tied to a heightened risk of war.22 The deficiencies of traditional protective strategies as summarized above should thus make cyber war the sum of all fears, as many have predicted. Indeed, the US Department of Defense gets attacked ten million times a day; a US university receives a hundred thousand Chinese attacks per day; and one firm measures three thousand distributed denial of service (DDoS) attacks per day worldwide.23 In reality, however, most of these so-called attacks are just routine probes by automated networks of compromised computers (botnets) run by profit-seeking criminals or spy bureaucracies—a far cry from terrorism or military assault. The most alarming scenarios of a "digital Pearl Harbor" or "cyber 9/11" have yet to materialize despite decades of warning. The Stuxnet worm caused limited and temporary disruption of Iran's nuclear program in the late 2000s, the only known historical case of infrastructure damage via deliberate cyber attack, but this operation seems to reveal more about the strategic limitations of cyber war than its potency.24 The cyber revolution should presumably provide rivals with potent new tools of influence, yet actual cyber disputes from 2001 to 2011 remain restrained and regionalized, not disruptive and global.25 Computer espionage and nuisance cybercrime thrive, to be sure, but they are neither as prevalent nor as costly as they might be, leading skeptics to describe US losses as "a rounding error" in a fifteen trillion dollar economy.26 It is possible in principle that the same tools used for computer-network exploitation may one day be leveraged for more destructive strikes. Yet even if the nontrivial operational challenges of cyber war can be overcome, proponents of the cyber-revolution thesis have yet to articulate convincing strategic motives for why a state or non-state actor might actually use cyber capabilities effectively.27 A considerable shortage of evidence in the study of cyber conflict is thus a source both of concern and relief.

Low risk of cyberterrorism - interconnectedness now proves – Aff not necessary to solve – our ev postdates

Lindsay 15 (Jon R. Lindsay holds a PhD in political science from the Massachusetts Institute of Technology and an MS in computer science and BS in symbolic systems from Stanford University. He is an officer in the U.S. naval reserve with seventeen years of experience including assignments in Asia, Europe, Latin America, and the Middle East., Tai Ming Cheung director of the University of California Institute on Global Conflict and Cooperation, is a long-time analyst of Chinese and East Asian defense and national security affairs with particular expertise on the political economy of science, technology, and innovation and their impact on national security matters. Dr. Cheung was based in Asia from the mid-1980s to 2002 covering political, economic and strategic developments in greater China., Derek S. Reveron is a professor of national security affairs and the EMC Informationist Chair at the U.S. Naval War College. He specializes in strategy development, non-state security challenges, and U.S. defense policy. China and Cybersecurity, 4/1/15, Google Books, pg343)PA

Yet government remedies also can introduce problems. Unity of commands in an American principle of warfare, but actual coordination of different organizations and agencies has proven to be extremely difficult, not least because cybersecurity is more about economic incentives than warfare. China's fragmented authoritarian system has fared little better and potentially worse in cyber policy integration, as discussed in the introduction. Furthermore, innovation in the commercial information technology sector moves far more rapidly than the pace of policymaking in any state. The opportunities for making mischief online emerge faster than government regulators can adjust on desirability of doing so. The profusion of cyber threats might appear to support technologist interpretations of cyber space as an autonomous domain with its own deterministic logic. The interpretation overlooks a broad international consensus that the continuing buildout of the Internet economy is a good thing for commerce and development, consistent with liberalist expectations. Cyberspace is a man-made construct, after all, and connection to it is voluntary. Disconnection remains unattractive

as long as the benefits of being online continue to be so great and the risks comparatively minor. Liberalist expect the repeated interaction and deep interference of cyberspace to act as a restraint on more severe forms of cyber harms: states stand to gain much from much from their Internet interdependence and much to lose from conflict. The fact that the Internet exists at all, a fabric of international interconnection, means that liberalist views should be taken seriously. However, there are limits to this implicit liberal consensus, and explicit normative framework for international cyberspace may be beyond them.

Bilateral Talks

Pakistan/Proliferation Scenario

No Indo-Pak war - deterrence prevents

Ganguly 2008, Professor of Political at Indiana University, (Sumit "Nuclear Stability in South Asia," International Security, Volume 33, Number 2, 11/21/8, Muse AS)

As the outcomes of the 1999 and 2001–02 crises show, nuclear deterrence is robust in South Asia. Both crises were contained at levels considerably short of full-scale war. That said, as Paul Kapur has argued, Pakistan's acquisition of a nuclear weapons capability may well have emboldened its leadership, secure in the belief that India had no good options to respond. India, in turn, has been grappling with an effort to forge a new military doctrine and strategy to enable it to respond to Pakistani needling while containing the possibilities of conflict escalation, especially to the nuclear level.78 Whether Indian military planners [End Page 65] can fashion such a calibrated strategy to cope with Pakistani probes remains an open question. This article's analysis of the 1999 and 2001–02 crises does suggest, however, that nuclear deterrence in South Asia is far from parlous, contrary to what the critics have suggested. Three specific forms of evidence can be adduced to argue the case for the strength of nuclear deterrence. First, there is a serious problem of conflation in the arguments of both Hoyt and Kapur. Undeniably, Pakistan's willingness to provoke India has increased commensurate with its steady acquisition of a nuclear arsenal. This period from the late 1980s to the late 1990s, however, also coincided with two parallel developments that equipped Pakistan with the motives, opportunities, and means to meddle in India's internal affairs—particularly in Jammu and Kashmir. The most important change that occurred was the end of the conflict with the Soviet Union, which freed up military resources for use in a new jihad in Kashmir. This jihad, in turn, was made possible by the emergence of an indigenous uprising within the state as a result of Indian political malfeasance.79 Once the jihadis were organized, trained, armed, and unleashed, it is far from clear whether Pakistan could control the behavior and actions of every resulting jihadist organization.80 Consequently, although the number of attacks on India did multiply during the 1990s, it is difficult to establish a firm causal connection between the growth of Pakistani boldness and its gradual acquisition of a full-fledged nuclear weapons capability. Second, India did respond with considerable force once its military planners realized the full scope and extent of the intrusions across the Line of Control. Despite the vigor of this response, India did exhibit restraint. For example, Indian pilots were under strict instructions not to cross the Line of Control in pursuit of their bombing objectives.81 They adhered to these guidelines even though they left them more vulnerable to Pakistani ground fire.82 The Indian military exercised such restraint to avoid provoking Pakistani fears of a wider attack into Pakistan-controlled Kashmir and then into Pakistan itself. Indian restraint was also evident at another level. During the last war in [End Page 66] Kashmir in 1965, within a week of its onset, the Indian Army horizontally escalated with an attack into Pakistani Punjab. In fact, in the Punjab, Indian forces successfully breached the international border and reached the outskirts of the regional capital, Lahore. The Indian military resorted to this strategy under conditions that were not especially propitious for the country. Prime Minister Jawaharlal Nehru, India's first prime minister, had died in late 1964. His successor, Lal Bahadur Shastri, was a relatively unknown politician of uncertain stature and standing, and the Indian military was still recovering from the trauma of the 1962 border war with the People's Republic of China.83 Finally, because of its role in the Cold War, the Pakistani military was armed with more sophisticated, U.S.-supplied weaponry, including the F-86 Sabre and the F-104 Starfighter aircraft. India, on the other hand, had few supersonic aircraft in its inventory, barring a small number of Soviet-supplied MiG-21s and the indigenously built HF-24.84 Furthermore, the Indian military remained concerned that China might open a second front along the Himalayan border. Such concerns were not entirely chimerical, because a Sino-Pakistani entente was under way. Despite these limitations, the Indian political leadership responded to Pakistani aggression with vigor and granted the Indian military the necessary authority to expand the scope of the war. In marked contrast to the politico-military context of 1965, in 1999 India had a self-confident (if belligerent) political leadership and a substantially more powerful military apparatus. Moreover, the country had overcome most of its Nehruvian inhibitions about the use of force to resolve disputes.85 Furthermore, unlike in 1965, India had at least two reserve strike corps in the Punjab in a state of military readiness and poised to attack across the border if given the political nod.86 Despite these significant differences and advantages, the Indian political leadership chose to scrupulously limit the scope of the conflict to the Kargil region. As K. Subrahmanyam, a prominent Indian defense analyst and political commentator, wrote in 1993: [End Page 67] The awareness on both sides of a nuclear capability that can enable either

country to assemble nuclear weapons at short notice induces mutual caution. This caution is already evident on the part of India. In 1965, when Pakistan carried out its "Operation Gibraltar" and sent in infiltrators, India sent its army across the cease-fire line to destroy the assembly points of the infiltrators. That escalated into a full-scale war. In 1990, when Pakistan once again carried out a massive infiltration of terrorists trained in Pakistan, India tried to deal with the problem on Indian territory and did not send its army into Pakistan-occupied Kashmir.87 Subrahmanyam's argument takes on additional significance in light of the overt acquisition of nuclear weapons by both India and Pakistan.

Tactical proliferation solves conflict

Pillalamarri, 3/24/15 - an assistant editor at the National Interest (Akhilesh, "Confirmed: Pakistan is Building 'Battlefield Nukes' to Deter India," *The Buzz* 3/24/15, http://nationalinterest.org/blog/the-buzz/confirmed-pakistan-building-battlefield-nukes-deter-india-12474 //JD

As the world remains focused on preventing a nuclear arms race in the Middle East, South Asia's dangerous nuclear rivalry—between India and Pakistan—grows ever more deadly. General Khalid Kidwai, a top advisor to the Pakistani government, said this week that Pakistan needed short-range tactical nuclear weapons, also known as "battlefield nukes" to deter nuclear archrival India. Kidwai said that "having tactical weapons would make war less likely," at a conference on nuclear security organized by the Carnegie Endowment for International Peace in Washington. Kidwai administered Pakistan's nuclear and missile weapons program for fifteen years. Pakistan's tactical weapon development includes the Nasr Missile, which has a range of around 37 miles (60 kilometers) and reflects concerns in Pakistan that "India's larger military could still wage a conventional war against the country, thinking Pakistan would not risk retaliation with a bigger nuclear weapon."Pakistan especially fears and aims to neutralize India's "Cold Start" doctrine, a type of blitzkrieg that aims to advance fast enough into Pakistan to seize key installations before a retaliatory nuclear strike

US-China Scenario

China won't accept US-centric stakeholder model – based in human rights agenda

Lindsay 15 (Jon R. Lindsay holds a PhD in political science from the Massachusetts Institute of Technology and an MS in computer science and BS in symbolic systems from Stanford University. He is an officer in the U.S. naval reserve with seventeen years of experience including assignments in Asia, Europe, Latin America, and the Middle East., Tai Ming Cheung director of the University of California Institute on Global Conflict and Cooperation, is a long-time analyst of Chinese and East Asian defense and national security affairs with particular expertise on the political economy of science, technology, and innovation and their impact on national security matters. Dr. Cheung was based in Asia from the mid-1980s to 2002 covering political, economic and strategic developments in greater China., Derek S. Reveron is a professor of national security affairs and the EMC Informationist Chair at the U.S. Naval War College. He specializes in strategy development, non-state security challenges, and U.S. defense policy. China and Cybersecurity, 4/1/15, Google Books, pg343)PA

The perceived severity of the threats above has generated numerous calls for improved international cooperation on cybersecurity. Jason Healey, for example, sees a "flurry of organized and unorganized violence" in the cyber domain but anticipates new norms and regimes will keep cyberspace "generally as stable as the air, land, space, and maritime domains", containing localized conflict from disrupting the international system. It is notable that the Chinese authors in this volume appear more optimistic about the potential for the international cooperation than many of the Western authors. Li Yuxiao and Xu Lu write that "a China-U.S. cybersecurity communication mechanism is important to improve mutual trust and enhance research and defense capabilities" and recommend working toward "a set of common rules for the network society in order to promote the process of global informatization." Senior Colonel Ye similarly writes that "we have to reject the logic that there must be fierce hostilities between the traditional, established superpowers and rising powers," and instead recognize that "mutual respect, mutual understanding and cooperation between nations should be the foundation of Asia-Pacific and world security, including cybersecurity. International cooperation on cybersecurity is desirable, but there are certain obstacles. Any notion of a cyber arms control treaty or the establishment of cyber norms must be reconciled with actual cyber

activities and government interests in promoting or tolerating them. Sarah McKune points out the cyber exploitation of ethnic minorities and Internet censorship by the Chinese state stand in stark contrast to cosmopolitan visions of an open Internet with string normative protection for human rights. The US Department of State "Internet freedom" agenda "works to advance Internet freedom as an aspect of universal rights of freedom of expression and the free flow of information. As part of the initiative, the US government and activists from non-governmental organizations develop and deploy technologies that dissidents can use to subvert controls on Internet content. This essentially means hacking the "Great Firewall." China perceives this to be provocative interference in its domestic affairs and an attack on its information security architecture. China, together with Russia, would prefer to shift governance of the Internet to the United Nations with the stronger norms of Internet Sovereignty and noninterference; Europe and the United States prefer to maintain the current "multistakeholder" arrangement while strengthening norms of openness and human rights. While there may be agreement that international norms are desirable, there is **sharp disagreement** on the content of those norms. The Obama administration's decision to transfer the internet Assigned Named Authority (IANA) function from the Department of Commerce of the international community may be a sign of China's and Russia's effective diplomacy or at least a sign that the United States recognizes the damage done to its international reputation. The challenge of international policy coordination is exacerbated by intra-states disorganization and disconnects between public and private actors. As Fred Cate writes, "The threats are too broad, the actors too numerous, to knowledge levels too unequal, the risks too easy to avoid internalizing, the free-rider problem too prevalent, and the stakes too great to believe that markets alone will be adequate to create the right incentives or out-comes."

China doesn't want US-centric internet governance -- US constitutional imperatives

Submarainan 8-5-**13** B.Sc. in Applied Sciences, 1980, Madras University, India; P.G. Honors Dip. in Management, 1984, XLRI, India; M.B.A., 1990 and Ph.D., 1992, Rutgers University) is a ISP Fellow at the Yale Law School, and the Gabriel Ferrucci Professor of Computer Information Systems at the School of Business, Quinnipiac University, Connecticut. . He published The book Computer Security, Privacy and Politics: Current Issues, Challenges and Solutions Ed. Subramanian, was published in 2008 by IRM Press. Internet Governence: A Developing Country's perspective http://scholarworks.lib.csusb.edu/cgi/viewcontent.cgi?article=1223&context=ciima AS)

However, the Multistakeholder forums, policies and procedures have not assuaged some of the fears and concerns of other countries that still fear control of the Internet by the U.S. government. Over the years, there have been numerous calls for separating ICANN from its connection to the U.S. Department of Commerce. In addition, as more and more nations join the Internet, these calls have only increased. Some governments such as China and Russia fear that the U.S. constitutional imperative to protect free expression at all costs could impinge on their own sovereignty and security. Civil society has increasingly asked for equal status in policy decision making, as in many forums they do not yet have those rights. In the discussion that follows, I turn the focus of Internet governance to India, considered by many analysts to be a rapidly developing economy.

Lack of trust between China and the US means no cooperation

Lindsay 15 (01 April 2015 Jon R. Lindsay holds a PhD in political science from the Massachusetts Institute of Technology and an MS in computer science and BS in symbolic systems from Stanford University. He is an officer in the U.S. naval reserve with seventeen years of experience including assignments in Asia, Europe, Latin America, and the Middle East., Tai Ming Cheung director of the University of California Institute on Global Conflict and Cooperation, is a long-time analyst of Chinese and East Asian defense and national security affairs with particular expertise on the political economy of science, technology, and innovation and their impact on national security matters. Dr. Cheung was based in Asia from the mid-1980s to 2002 covering political, economic and strategic developments in greater China., Derek S. Reveron is a professor of national security affairs and the EMC Informationist Chair at the

U.S. Naval War College. He specializes in strategy development, non-state security challenges, and U.S. defense policy. China and Cybersecurity (Google Books) pg343)PA

American espionage against China, to include Chinese information technology companies, is unlikely to abate just because of public indignation in Chinese media or diplomatic protest without more serious consequences. Likewise, the cybersercurity firm Mandiant notes that "recent observations of China-based APT activity indicate that the PRC has no intention of abandoning its cyber campaigns, despite the Obama administration's specific warning that China's continued cyber espionage 'was going to be [a] very difficult problem in the economic relationship' between the two countries". This situation highlights a major obstacle to the establishment of international norms. It is hard to establish an agreement over activities that the parties do not admit conducting. It is hard to enforce compliance with an agreement when the proscribed activity is intentionally designed to be undetectable. Many governments have the technical means and expertise to conduct covert operations online and have thus far shown little restraint in doing so both the incentives espionage and the inability of liberal norms and institutions to contain it.

No SCS escalation – interdependence solves

Hong '13 senior research fellow at the East Asian Institute (EAI), National University of Singapore. Before joining EAI, he was professor at the Research School of South East Asian Studies, Xiamen University, China, teaching International Political Economy, Big Power Relations, and ASEAN Economy. (Zhao, "THE SOUTH CHINA SEA DISPUTE AND CHINAASEAN RELATIONS" 6/12/13, http://dx.doi.org/10.1080/03068374.2012.760785 AS)

However, at this stage there is no reason to regard military confrontation as likely or inevitable. Economically, China and ASEAN countries have become increasingly interdependent, as China is currently the second largest trade partner of ASEAN, and ASEAN is the third largest trade partner of China. In the light of increasing economic ties and mutual desire for regional peace and stability, China and ASEAN-related countries are likely to make every effort to stabilise their bilateral relations. President Aquino stated during his state visit to China in August 2011 that China-Philippines relations will not be affected by the dispute over the South China Sea, reiterating the need "to deal with the disputes through peaceful dialogue, and to continue to maintain regional peace, security and stability, creating a favorable environment for economic growth".43 And it is important to note that some procedural progress was made in 2011. In November 2011, China made a goodwill gesture of providing US$ 475 million to establish the China-ASEAN Maritime Cooperation Fund, and there are several working groups now in place. Indeed, the expansion of economic ties and the growth of common interests have laid the foundation for partial settlement or management of the territorial disputes.

Activism

General

Data localization won't prevent coalition building- people will find a way to communicate

Coldewey 11. ("People, Not Things, Are The Tools Of Revolution" Feb 11, 2011 by Devin Coldewey- a Seattle-based writer and photographer. He has written for TechCrunch since 2007 and is currently a contributor at NBC News. http://techcrunch.com/2011/02/11/tools-of-revolution/)//LP

Warmest congratulations to the Egyptian people, whose truly grassroots revolution has reminded the world what political action is supposed to look like. Although the work is far from done, and reconstituting a government by the people and for the people is perhaps the more difficult phase, it is right that they, and the world, should take a moment to reflect on a job well done. Some are using that moment to praise the social media tools used by some of the protesters, and the role the internet played in fueling the revolution. While it's plain that these

things were part of the process, I think the mindset of the online world creates a risk of overstating their importance, and elevating something useful, even powerful, to the status of essential. The people of Egypt made use of what means they had available, just as every oppressed people has in history. Twitter and Facebook are indeed useful tools, but they are not tools of revolution — at least, no more than Paul Revere's horse was. People are the tools of revolution, whether their dissent is spread by whisper, by letter, by Facebook, or by some means we haven't yet imagined. What we, and the Egyptians, should justly be proud of, is not just those qualities which set Egypt's revolution apart from the last hundred, but those which are fundamental to all of them. Malcom Gladwell has become the whipping boy of the internet for having suggested however long ago it was that the social web is something that breeds weak connections and requires only a minimum of participation. He was right then, and he's right now; he wrote a short post the other day defying the gloating masses (sensibly, but haughtily), and concluded with something commentators of the Egyptian revolution should take to heart: "People with a grievance will always find ways to communicate with each other. How they choose to do it is less interesting, in the end, than why they were driven to do it in the first place." It's one thing to give credit where credit is due and admire the rapidity and resilience of internet-based communication. The new uses to which the younger generation is putting the internet are very interesting and point to shifts in the way people are choosing to share information. It's another thing to ascribe to these things powers they don't have, powers that rest in the people who use them. It sounds like quibbling, but it's an important distinction. Facebook greased the gears, but it isn't the gears, and never will be. The revolution has been brewing for decades, and these same protesters have been in the streets countless times, after organizing by phone, by word of mouth, or simply as a shared reaction to some fresh enormity.

Democratic Peace Theory Wrong

Democratic peace theory false- competing interests

Larison 12. (DANIEL LARISON- published in the New York Times Book Review, Dallas Morning News, Orthodox Life, Front Porch Republic, The American Scene, and Culture11, and is a columnist for The Week. He holds a PhD in history from the University of Chicago. April 17, 2012. "Democratic Peace Theory Is False" http://www.theamericanconservative.com/larison/democratic-peace-theory-is-false/)//LP

Fabio Rojas invokes democratic peace theory in his comment on Rachel Maddow's new book, Drift: The Unmooring of American Military Power (via Wilkinson): "The idea is simple – for whatever reason, democracies almost never fight each other. Of course, democracies go to war against non-democracies. But for some reason, democracies just don't fight each other. What's the policy implication of all this? First, the sorts of rules that Maddow proposes are useless. People will just ignore the rules when they want to when they want war. Second, you have to reduce the population of non-democracies. Thus, if the Federal government wants to protect the United States by preventing war, the best, and cheapest, way to do it is to provide support and assistance for indigenous movements for democracy and tolerance. Once people have a genuine democracy at work, they just don't want to fight with each other. They just don't." Rojas' claim depends entirely on the meaning of "genuine democracy." Even though there are numerous examples of wars between states with universal male suffrage and elected governments (including that little dust-up known as WWI), the states in question probably don't qualify as "genuine" democracies and so can't be used as counter-examples. Regardless, democratic peace theory draws broad conclusions from a short period in modern history with very few cases before the 20th century. The core of democratic peace theory as I understand it is that democratic governments are more accountable to their populations, and because the people will bear the costs of the war they are going to be less willing to support a war policy. This supposedly keeps democratic states from waging wars against one another because of the built-in electoral and institutional checks on government power. One small problem with this is that it is rubbish. Democracies in antiquity fought against one another. Political equality and voting do not abolish conflicts of interest between competing states. Democratic peace theory doesn't account for the effects of nationalist and imperialist ideologies on the way democratic nations think about war. Democratic nations that have professional armies to do the fighting for them are often enthusiastic about overseas wars. The Conservative-Unionist government that waged the South African War (against two states with elected governments, I might add) enjoyed great popular support and won a huge majority in the "Khaki" election that followed. As long as it goes well and doesn't have too many costs, war can be quite popular, and even if the war is costly it may still

be popular if it is fought for nationalist reasons that appeal to a majority of the public. If the public is whipped into thinking that there is an intolerable foreign threat or if they believe that their country can gain something at relatively low cost by going to war, the type of government they have really is irrelevant. Unless a democratic public believes that a military conflict will go badly for their military, they may be ready to welcome the outbreak of a war that they expect to win. Setting aside the flaws and failures of U.S.-led democracy promotion for a moment, the idea that reducing the number of non-democracies makes war less likely is just fantasy. Clashing interests between states aren't going away, and the more democratic states there are in the world the more likely it is that two or more of them will eventually fight one another.

Middle East

Plan can't solve – outside influence not needed and alt causes to effective transitions

KHOURI 2011 ("THE LONG REVOLT" BY RAMI G. KHOURI. Wilson Quarterly, SUMMER 2011. http://wilsonquarterly.com/quarterly/summer-2011-a-changing-middle-east/the-long-revolt/)//LP

Even as they are experiencing these momentous changes, Arab countries must deal with four enormous and simultaneous challenges: maintaining security, rekindling economic growth, creating legitimate and participatory governance systems, and preventing mass discontent sparked by unfulfilled expectations from pushing countries back toward autocratic rule. The liberated Arab lands that are able to slowly establish more democratic political governance systems will each take on a different tone and color as they create their own formulas from the possibilities before them: tribal values, pan-Arab sentiment, narrow nationalism, corporate globalism, Islamist influences, **and roles for the military.** Arab democracies will look very different from Western ones, and the world should have the patience and composure to let the people of this region find their own sustainable balances between religiosity and secularism, state-centered and pan-Arab nationalism, and traditional and modern forms of governance.

US democracy promotion in the Middle East cause terrorism and instability- no popular support

Harsanyi 15 (David Harsanyi- a Senior Editor at The Federalist FEBRUARY 19, 2015 "Obama Is Wrong. Democracy Is The Last Thing The Middle East Needs Right Now" http://thefederalist.com/2015/02/19/obama-is-wrong-democracy-is-the-last-thing-the-middle-east-needs-right-now/)//LP

President Barack Obama gave a speech at White House's "Countering Violent Extremism" summit yesterday crammed with predictable feel-good ideas for combating the imaginary root causes of Islamic extremism. And in the midst of arguing that radicalism was principally driven by anger over colonialism, illiteracy, and unemployment, Obama proposed an idea that we should have been abandoned trillions of dollars and many years ago: more democracy. Here's how the president laid it out in the Los Angeles Times: Efforts to counter violent extremism will only succeed if citizens can address legitimate grievances through the democratic process and express themselves through strong civil societies. First of all, does Obama really believe that extremists have "legitimate grievances?" Are the disaffected youth recruited from the slums of Paris (but, curiously, not from the slums of Rio or Beijing) concerned that France doesn't offer a strong enough civil society? Are the radicals beheading Christians in North Africa ticked off over a lack of women's rights in Yemen? Are extremists who target Jews and free-speech enthusiasts in Copenhagen worried about the health of democratic institutions in Europe? No, it's the grievances themselves that are the root of the problem. In most Arab countries, the authoritarian leadership is in some ways more liberal than the majority of the citizenry. As bad as these regimes are – and we coddle and enable many of them – almost every time the democratic process has been tried in the Islamic world, it's produced more extremism

and factional violence. So which nation does the president propose would benefit most from more democracy? Pakistan? Iraq? Saudi Arabia? Jordan? How would Christians and Alawites fare in a democratic Syria, do you think? Perhaps as well as minorities do in a democratic Libya, a place Obama argued Americans had to intervene militarily or the "democratic impulses that are dawning across the region would be eclipsed by the darkest form of dictatorship." Turns out that democratic impulses can also lead to darkness. There is no Gadhafi regime, but there is anarchy, a fertile recruiting ground for terrorists and a country where Copts can be executed without too many hassles and American consulates can be sacked without any repercussion. All of it enabled, in part, by the president's unauthorized war (and Congress' implicit approval of that war) that was meant to help facilitate democracy. At the same time, the administration punishes the Egyptian government for putting an end to the extremism empowered by democratic impulses. It is Egypt's al-Sisi – no great friend of liberty, granted – who's spoken out most forcefully about the future of Islam. Yet the administration has withheld aid from that government until it can "certify that Egypt is taking steps toward democracy." As if insuring a larger role for the Muslim Brotherhood was in the U.S.'s – or the world's – best interests. To put our confused priorities in perspective, the United States condemned the Egyptians for bombing ISIS targets in Libya over the summer, complaining that "outside interference in Libya exacerbates current divisions and undermines Libya's democratic transition." (Incredulous italics mine) Egypt is not only dealing with ISIS in democratic Libya, it is dealing with terrorism originating from democratic Gaza, where Palestinians were offered autonomy and a chance to build a strong civil society, but put Hamas in charge instead. In the West Bank, where the moderates of the PLO run the show, Mahmoud Abbas can't even hold elections because the will of the people is too extreme for Fatah. In Turkey and in Pakistan, the military is counterbalance to the democratic impulses that would allow theocrats to become members of NATO or nuclear powers. Democracy can't work now. Three reasons why: 1. In a open political environment, extremists will always be willing to resort to violence to grab power. 2. Institutions tasked with protecting society from that extremism will no longer be "democratic" once they react. 3. The populace doesn't have any real desire for a secular democracy, anyway. According to Pew Research Center polling, given a choice between a leader with a strong hand or a democratic system of government, most Muslims choose democracy. For us, democracy is shorthand for all the things we like about liberalism, but overwhelming percentages of Muslims believe that Islamic law should be the official law of their own nations, which, as we've seen, does not "coexist" with our notions of self-determination. With apologies to the president, this knotty situation does not exist because Americans aren't sensitive enough. But I'm sympathetic to Michael Gerson's contention that presidents don't have the freedom to be honest, constrained by sensitivities and realities of the world. He writes: Most of those urging Obama to assert that Islam is somehow especially flawed among the great faiths have never been closer to power than a fuse box. There is no possible circumstance in which a president could say such a thing. It would cause a global firestorm, immediately alienating Muslim allies and proxies whom we depend on to help fight the Islamic State and other enemies. The problem is that the president goes far beyond niceties. For starters, I'm not sure anyone has ever implored him to say Islam is inherently flawed or doomed. But shouldn't we non-politicians be more sympathetic to M.G. Oprea's argument that, among other things, referring to Islamist terrorists merely as "violent extremists" constitutes a dangerous attempt to hide from reality? The administration claims it doesn't want to confer ISIS –a group that Graeme Wood says derives its philosophy "from coherent and even learned interpretations of Islam" – the credibility of being called "Islamic." This fantasy forces the administration to concoct offensive rationalizations and preposterous moral equivalencies that drives disjointed, ineffective policies. Much like our Middle East "democracy" fantasy ends up bolstering the power and reach of the very same extremists we claim to want to stop.

Democratic internet promotion is destabilizing- it's a values-promoting agenda

Mead 4/9 (WALTER RUSSELL MEAD - Henry A. Kissinger Senior Fellow for U.S. Foreign Policy at the Council on Foreign Relations. The American Interest, Volume 10, Number 5. April 9, 2015 "The Paradox of American Democracy Promotion" http://www.the-american-interest.com/2015/04/09/the-paradox-of-american-democracy-promotion/)//LP

America is and always has been by nature a revolutionary force in world affairs. This is not primarily or only because our moral values compel us to become the avatars of a global transformation. It is rather because the way American society works is profoundly destabilizing to the rest of the world. When Al Gore "invented the internet" he did as much to destabilize the Middle East as George W. Bush did when he invaded Iraq. More seriously—and with apologies to the former Vice President—the internet started out as a DARPA project to facilitate the secure sharing of classified information. No one in DARPA, the Defense Department, or anywhere else in America was thinking about how

to flatten hierarchies or challenge the social status quo everywhere in the world once the technology went commercial. The concern was about how to communicate effectively, how a company could use a corporate website to its competitive advantage, and so on. But the internet turned out to be a profoundly revolutionary force in politics around the world, and it poses huge problems to cultures and governments with foundations different from our own. Technology is not and has never been socially or politically neutral; it embodies and usually transmits the attitudes, economic endowments, moral priorities, and even the aesthetics of the societies that create it. It is very hard to simply adopt the machine and not the less tangible biases that go with it.In the same way, Hollywood movies have helped to create a situation in which many young people, for instance, no longer think they should marry whomever their parents tell them to marry. There are all kinds of ways in which the American presence in the world has been and remains culturally subversive. In the 19th century we were seen on the Continent as a dangerous nation. The United States wasn't sending armies out into the world to overthrow other regimes, but the mere existence of a successful, stable, large, powerful, and economically effective democratic society was a terrible example from the perspective of Europe's rulers and religious traditionalists, who argued that their hierarchical positions were necessary to the effective governance of society as a whole. The United States was a living, thriving reproach to the political legitimacy of autocracies abroad. Inevitably, therefore, the friends of stability and authority around the world tended increasingly to be as anti-American as they were formerly anti-British, and for similar reasons. The British, of course, did send military forces out into the world, but their real disruptive power derived from the revolutionary impact of a wider and eventually more market-based global trading system that rewarded efficiency and creativity and punished institutionalized privilege and all related arguments from authority. Forces that wanted to see social change in their countries tended to be pro-American. We still see this pattern today. The United States is revolutionary by being as well as by acting.The United States is revolutionary by being as well as by acting. Any foreign policy that doesn't take this into account will run into trouble. Consider Google and other major Silicon Valley companies, whose business models depend on a relatively open internet, with freedom of association and freedom of communication. In important ways the boundaries of Chinese, Iranian, or Russian power are the boundaries that limit where their business model can reach. For commercial reasons alone, much of American business is pushing the U.S. government toward the promotion of a liberal model for internet governance and of freedom of communication in ways that are parallel or equivalent to a values-promoting foreign policy. The government of a country with global trading interests like the United States must prioritize questions like contract law in foreign relations; the contracts that American companies have entered into abroad must be enforceable in transparent and honest courts of law. All kinds of people who do not think of themselves as democratic reformers in the history of American foreign policy have been consistently pushing all kinds of reform agendas around the globe that are self-interested in motivation but expansively liberal in consequence. There is every reason to believe that this kind of commercially based liberal policy will endure, and, with the information revolution shifting the world's economic center of gravity away from the production and exchange of physical commodities toward the production and exchange of design and ideas, the importance of liberal values to American commerce is likely to grow.

Democratic movements are suppressed- Sectarianism

Miranda 4/23 (Alba Benito Miranda- Intern at the Elcano Royal Institute. International Relations and Translation & Interpreting (Comillas Pontifical University). 23/04/2015 "Sectarianism in Bahrain and the New Middle East Cold War" http://www.blog.rielcano.org/en/sectarianism-in-bahrain-and-the-new-middle-east-cold-war/)//LP

The current Middle East seems to be on the verge of collapse and the revival of the Sunni-Shia divide appears to be the main culprit. The Arab Spring uprisings have altered the existing balance of power and accentuated the sectarian differences in the region. In this context, some states have lost no time in exploiting religious differences to their advantage, and in using sectarianism as a political weapon to pursue political and geostrategic goals. Both Iran and Saudi Arabia have taken the lead in this power politics game, turning the Gulf region into the battlefield of what has been referred to as the "new Middle East cold war." Similarly to regional hegemons in the Cold War, and in the Arab Cold War of the 1950s and 1960s, Saudi Arabia and Iran have not engaged in direct confrontation with each other, but have used neighbouring countries as battlefields to settle their rivalries. Given the multicultural, sectarian and transnational identities in the Gulf, the exploitation of the Sunni-Shia divide has become a key tool in the foreign policies of some states. The repression of the 2011 uprising in Manama's Pearl Roundabout is particularly illustrative, since it involved the use of a sectarian discourse by the governments of both the Al-Khalifa and the Al-Saud. Although democratic and cross-sectarian in nature, Bahrain's Arab Spring was immediately depicted as sectarian and portrayed as part of an Iranian plot to overthrow the Al-Khalifa regime and threaten the balance of power in the Gulf. It was perceived both as an external and internal threat to the Gulf Cooperation Council (GCC) states due to the risk of contagion and spillover. Shia-led calls for reforms challenged not only the sovereignty of the autocratic leaders, but also Sunni hegemony in the region, since they empowered both Iran and the Shia communities in the

Gulf. Saudi Arabia was the most affected state, given its animosity towards Iran and the outbreak of Shia unrests in its oil-rich Eastern Province. In order to suppress Bahrain's February 2011 uprising, Saudi Arabia led the military intervention of the Joint Peninsula Shield Force within a month of the outburst of the protests. It was the first time that the GCC intervened militarily in one of its member states to suppress an internal revolt, as its founding treaty only considers intervention in the case of a foreign threat. Sectarianism made possible the externalization of the threat posed by the Pearl Roundabout uprising, as it was used by the GCC states as a weapon for self-defence. By picturing the revolts as sectarian, Manama and Riyadh delegitimized and silenced Bahraini's political demands, hence safeguarding the sovereignty of their regimes. And by accusing Iran of participating in the revolts, they triggered a quick response and a joint pre-emptive action by the GCC, thus protecting Saudi and Sunni hegemony in the Arabian Peninsula. Both Saudi Arabia and Iran have taken advantage of this sectarian discourse to preserve their power in the region. Given the strong ties between Manama and Riyadh, Saudi Arabia has promoted the use of sectarianism in Bahrain (a close ally) in order to protect its own internal political and economic stability (especially in the Eastern Province) and its hegemony in the Arabian Peninsula. Iran has also benefitted from this portrait of the Bahraini uprising. Even though there is no evidence of direct Iranian meddling in the unrest, Iran has made no efforts to deny these claims. In fact, it has strongly criticized Saudi military intervention and has provided media coverage favourable to the protestors. It has done so motivated by the possibility of increasing Shia leverage in the region. In this cold war context, sectarianism has become a powerful political weapon used not only in Bahrain but also in Syria, Iraq and Yemen. Since rivalries between Saudi Arabia and Iran are played out within the political arena of multicultural neighbouring countries, the exploitation of the Sunni-Shia divide has emerged as much more than a soft power foreign policy tool. However, sectarianism has proven to be a double-edged sword and its overuse is giving rise to important security concerns, as identity is easier to exacerbate than to control. Given the existing transnational identities in the Gulf and the role of sectarian sensitivities in the region, Saudi Arabia and Iran should be more careful when using sectarianism as a means to justify their pursuit of realpolitik interests, since the over-empowerment of identity may end up blurring state boundaries and changing the perception of security threats in the Middle East.

Can't solve democratic transition- requires experienced leadership

Joffe 6/1 (Prof George Joffe - a Research Fellow at the Centre and Visiting Professor of Geography at Kings College, London University. He specialises in the Middle East and North Africa and is currently engaged in a project studying connections between migrant communities and trans/national violence in Europe. He is also a lecturer on the Centre's M.Phil. in International Relations. 01 June 2015. "Resentment, anger and violence" https://www.middleeastmonitor.com/articles/guest-writers/18957-resentment-anger-and-violence)//LP

There are, perhaps, two other lessons to be drawn from the Algerian experience and the events of 2011. Firstly, democratic transition is a difficult and lengthy process and that cultural authenticity and moral authority are not, in themselves, guarantors of success. Thus, an-Nahda in Tunisia was able, eventually, to operate effectively within a nascent democratic environment because its leadership had spent two decades in exile observing how democratic systems, despite their imperfections, actually worked. It understood the compromises that formal empowerment by an electorate still required, both in its own understanding of the political process and in its relations with coalition partners and even its political opposition. Those were lessons that the Muslim Brotherhood in Egypt either ignored or of which it was unaware, and it was this that stimulated the Tamarrud movement which the Egyptian army command adroitly exploited to remove it from power.

China

China's human rights improving already – China's National Human Rights Action Plan

PRC 15 (June 08, 2015 "Progress in China's Human Rights in 2014" http://en.people.cn/n/2015/0608/c90785-8903658.html)//LP

The basic rights of the Chinese people became better protected, and China's constitutional principle of "respecting and safeguarding human rights" was implemented in a better way. In 2014, China made steady progress in comprehensively completing the building of a moderately prosperous society. By the end of the year, among all the 29 countable or measurable indicators for economic and social development set forth in the 12th Five-Year Plan (2011-2015), 12 had been over-fulfilled, three had been nearly fulfilled and 11 had made smooth progress, accounting for 90 percent of the total. The mid-stage assessment of China's National Human Rights Action Plan (2012-2015) was carried out in December 2014, and the result showed that most of the targets set in the plan had

been reached, and a larger part of the quantitative indices had been half or even more achieved. In the same year China's efforts for law-based governance reached a new take-off stage. The Fourth Plenary Session of the 18th Central Committee of the CPC approved the Resolution of the CPC Central Committee on Certain Major Issues Concerning Comprehensively Advancing the Law-Based Governance of China, drawing up a clear blueprint for building a socialist law-based country with Chinese characteristics. The fundamental purposes of the blueprint are to protect civic rights, to defend human dignity and to put basic human rights into practice.

PRC improving -- women's rights proves

Li 2000. ("Women 's Movement and Change of Women ' s Status in China" Journal of International Women's Studies: Vol. 1 Issue 1. January 2000. Yuhui Li. http://vc.bridgew.edu/cgi/viewcontent.cgi?article=1626&context=jiws)

This study examines history of women's movement and gender stratification in urban areas in contemporary China. Undeniably, there have been many changes in the PRC that have significantly reduced the gender inequality in China compared with the past in the thousands of years of Chinese history. Many of the changes were institutionalized from the top and were fairly effective. The central government has been directly involved in designing many policies and implementing them to protect women. Women's labor force participation was for some time brought to almost the saturated level. There has been significant increase in the level of general public's awareness over the issue of gender inequality. Gender gap has become smaller in the areas of educational achievement, labor force participation and occupational distribution.

Women's Movements

Internet activism won't succeed on a large scale- opposition and internal fights

Carmon 15 (IRIN CARMON - a national reporter at MSNBC, covering gender and politics. FEBRUARY 17, 2015 "What Women Need" http://prospect.org/article/what-women-need)//LP

Something on the surface, if not in the structures of things, has shifted in recent years. Until a few years ago, even sympathetic celebrities and politicians cringed at anything feminist or even tangentially insistent on women's rights. Perhaps things needed to get worse—with right-wingers talking about "legitimate rape" and everything suggested by it—before they could get better, particularly for the female voters courted by the parties. The Internet also allowed a critical mass of feminists to come out of hiding and speak on their own terms, among them Girls creator Lena Dunham, whom Swift credited as her feminist mentor. These are mostly symbolic victories, though they matter, too, and feminists have been starved for them. Whether the groundswell can be channeled into something more sustainable and profound is another question. Not only is the opposition fierce, there are also deep fractures among those who call themselves feminists. "Divisions across age, race, class and ideology have complicated efforts to establish common priorities," writes Deborah L. Rhode in What Women Want.

Can't solve- free internet is still misogynistic

Vagianos 14 (Alanna Vagianos- an Associate Editor for HuffPost Women. She graduated from Elon University in North Carolina. 10/03/2014 "This Is What It's Like To Be A Woman Online" http://www.huffingtonpost.com/2014/09/19/what-its-like-to-be-a-woman-online-buzzfeed_n_5849052.html)//LP

Being a woman on the Internet is no easy feat. Anyone who's ventured onto the World Wide Web has likely witnessed -- or been on the receiving end of -- comments thrown at a woman simply because, well, she's female. In a video titled "What It's Like To Be A Woman Online," Buzzfeed interviewed nine women who are visible and active on social media about their experiences on the Internet. The comments they've received run the range from horrifying and offensive to downright weird. Whether left in the comments section of an article or fired off as direct tweets, the responses the women featured in the video received online all share a general theme of misogyny. From outrageous comments on appearance such as "Ugly Jewish whore" and "For your age, you're looking great," to mansplaining, rarely can a

woman publish a few words on the Internet without receiving unsolicited, irrelevant commentary from the world's biggest peanut gallery. Hearing women read idiotic commentary aloud brings some humor to a rather depressing reality, but the abuse women receive online everyday cuts much deeper than the few tweets and comments highlighted in the three-minute clip. Women routinely receive death threats, rape threats and even bomb threats when they have a public presence online. And the fact that we have come to view this behavior as somewhat "inevitable" is terrifying. No woman should ever have to live by the rule: "Block if [the commenter] get scary, ignore if it's just annoying."

No widespread empowerment even with free internet- lack of infrastructure, illiteracy

UN 20**05** (Women2000 and Beyond. "Gender equality and empowerment of women through ICT" September 2005. UN Division for the Advancement of Women, Department of Economic and Social Affairs. http://www.un.org/womenwatch/daw/public/w2000-09.05-ict-e.pdf)//LP

"The so-called digital divide is actually several gaps in one. There is a technological divide—great gaps in infrastructure. There is a content divide. A lot of web-based information is simply not relevant to the real needs of people. And nearly 70 per cent of the world's websites are in English, at times crowding out local voices and views. There is a gender divide, with women and girls enjoying less access to information technology than men and boys. This can be true of rich and poor countries alike". United Nations Secretary-General, Kofi Annan Statement to the World Summit on the Information Society, Geneva, 10 December 2003. While the potential of ICT for stimulating economic growth, socioeconomic development and effective governance is well recognized, the benefits of ICT have been unevenly distributed within and between countries. The term "digital divide" refers to the differences in resources and capabilities to access and effectively utilize ICT for development that exist within and between countries, regions, sectors and socio-economic groups. The digital divide is often characterized by low levels of access to technologies. Poverty, illiteracy, lack of computer literacy and language barriers are among the factors impeding access to ICT infrastructure, especially in developing countries. Internet usage figures collected by the International Telecommunications Union (ITU) in 2003 illustrate this gap in access. For instance, in 2003, the United States reported 5,558 Internet users per 10,000 persons, compared with 690 users per 10,000 persons in Asia and 156 users per 10,000 persons in Africa.

No definitive case studies ICT's benefits on Womens' movements

Bonder 02. (Gloria Bonder- an Argentine researcher and gender activist. Founded the Center for Women's Studies (CEM) and coordinated the International Working Group on Women and ICT field of the United Nations. UN meeting on "Information and communication technologies and their impact on and use as an instrument for the advancement and empowerment of women." 11 to 14 November 2002. "From access to appropriation: Women and ICT policies in Latin American and the Caribbean." http://www.mujeresenred.net/zonaTIC/IMG/pdf/GBonder.pdf)//LP

Access to information, to knowledge and the interaction between cultures and social groups have never been so within the reach of humanity, nor as valued as in the last decades. The continuous innovation and global spreading of Information and Communication Technologies (ICTs) appear like a fundamental resource in order to reach these goals and inaugurate a change of era known as Information Society or Knowledge Society. However, in its current phase of development, we must clearly differentiate the potentialities (informative, educational, cultural, political, economic, etc.) offered by these technologies, from their manifestations and actual impact on the various contexts and social groups. This type of analysis is still at a beginning stage in the LAC Region. Therefore, the understanding of the role currently played by these technologies in our societies is usually based on impressions, "good wishes" and, in the best of cases, on some partial studies.

Economy

Econ Decline Won't Cause War

Econ Decline Doesn't Cause War

Ferguson '6 "Niall Ferguson, a Laurence A. Tisch Professor of History at Harvard University and a Senior Fellow at the Hoover Institution at Stanford University. 'The Next War of the World, 2006', " https://www.foreignaffairs.com/articles/middle-east/2006-09-01/next-war-world

Nor can economic crises explain the bloodshed. What may be the most familiar causal chain in modern historiography links the Great Depression to the rise of fascism and the outbreak of World War II. But that simple story leaves too much out. Nazi Germany started the war in Europe only after its economy had recovered. Not all the countries affected by the Great Depression were taken over by fascist regimes, nor did all such regimes start wars of aggression. In fact, no general relationship between economics and conflict is discernible for the century as a whole. Some wars came after periods of growth, others were the causes rather than the consequences of economic catastrophe, and some severe economic crises were not followed by wars.Many trace responsibility for the butchery to extreme ideologies. The Marxist historian Eric Hobsbawm calls the years between 1914 and 1991 "an era of religious wars" but argues that "the most militant and bloodthirsty religions were secular ideologies." At the other end of the political spectrum, the conservative historian Paul Johnson blames the violence on "the rise of moral relativism, the decline of personal responsibility [and] the repudiation of Judeo-Christian values." But the rise of new ideologies or the decline of old values cannot be regarded as causes of violence in their own right. Extreme belief systems, such as anti-Semitism, have existed for most of modern history, but only at certain times and in certain places have they been widely embraced and translated into violence.And as tempting as it is to blame tyrants such as Hitler, Stalin, and Mao for the century's bloodletting, to do so is to repeat the error on which Leo Tolstoy heaped so much scorn in War and Peace. Megalomaniacs may order men to invade Russia, but why do the men obey? Some historians have attempted to answer the novelist's question by indicting the modern nation-state. The nation-state does indeed possess unprecedented capabilities for mobilizing masses of people, but those means could just as easily be harnessed, and have been, to peaceful ends.Others seek the cause of conflict in the internal political arrangements of states. It has become fashionable among political scientists to posit a causal link between democracy and peace, extrapolating from the observation that democracies tend not to go to war with one another. The corollary, of course, is that dictatorships generally are more bellicose. By that logic, the rise of democracy during the twentieth century should have made the world more peaceful. Democratization may well have reduced the incidence of war between states. But waves of democratization in the 1920s, 1960s, and 1980s seem to have multiplied the number of civil wars. Some of those (such as the conflicts in Afghanistan, Burundi, China, Korea, Mexico, Mozambique, Nigeria, Russia, Rwanda, and Vietnam) were among the deadliest conflicts of the century. Horrendous numbers of fatalities were also caused by genocidal or "politicidal" campaigns waged against civilian populations, such as those carried out by the Young Turks against the Armenians and the Greeks during World War I, the Soviet government from the 1920s until the 1950s, and the Nazis between 1933 and 1945 -- to say nothing of those perpetrated by the communist tyrannies of Mao in China and Pol Pot in Cambodia. Indeed, such civil strife has been the most common form of conflict during the past 50 years. Of the 24 armed conflicts recorded as "ongoing" by the University of Maryland's Ted Robert Gurr and George Mason University's Monty Marshall in early 2005, nearly all were civil wars.

AFF Answers

FYI's About Aff

FYI- 702 procedures (read to understand 702 restriction)

Donohue 15 (Harvard Journal of Law and Public Policy 38.1 (Winter 2015): 117-265. Laura K, Professor of Law A.B., Dartmouth; M.A., University of Ulster, Northern Ireland; Ph.D., Cambridge University; J.D., Stanford, http://search.proquest.com.proxy.lib.umich.edu/pqrl/docview/1658465073/341393F9D9AC4223PQ/2?accountid=14667) // AW

FISA Section 702 empowers the Attorney General (AG) and the Director of National Intelligence (DNI) jointly to authorize, for up to one year, "the targeting of persons reasonably believed to be located outside the United States to acquire foreign intelligence information."64 Five limitations apply. Acquisition may not intentionally (a) target a person known to be located in the United States;65 (b) target an individual reasonably believed to be located outside the United States, if the actual purpose is to target an individual reasonably believed to be located in domestic bounds;66 (c) target a U.S. person reasonably believed to be outside domestic bounds;67 or (d) obtain wholly domestic communications.68 In addition, (e), all acquisition must be conducted consistent with the Fourth Amendment.69¶ Procedurally, five steps must be followed for acquisition to commence. First, the AG and DNI must adopt targeting and minimization procedures consistent with the statutory requirements.70 Second, the two officials must provide FISC with a written certification and any supporting affidavits, attesting that there are procedures in place reasonably designed to ensure that the acquisition is limited to targeting individuals outside of the United States and to prevent the intentional acquisition of domestic communications, and that the minimization procedures meet the requirements of the statute.71 They must guarantee that guidelines have been adopted to ensure compliance with the statutory limitations.72 They also must attest that "a significant purpose of the acquisition is to obtain foreign intelligence information."73 Third, the targeting and minimization procedures must be provided to the Congressional intelligence committees, as well as the Committees on the Judiciary of the Senate and the House of Representatives.74¶ FISC is limited in the role it can play with regard to reviewing the certification, as well as the targeting and minimization procedures. As long as the certification elements are present, the targeting procedures are reasonably designed to ensure that acquisition targets persons are reasonably believed to be outside the United States and do not knowingly intercept domestic communications, the minimization procedures are statutorily consistent, and the procedures are consistent with the Fourth Amendment, "the Court shall enter an order approving the certification and the use, or continued use ..." of an acquisition.75¶ The FAA created numerous reporting requirements. At least twice a year, the Attorney General and DNI must assess compliance with the targeting and minimization procedures and submit the assessments to FISC, House Permanent Select Committee on Intelligence (HPSCI) and the Senate Select Committee on Intelligence (SSCI), and the House and Senate Committees on the Judiciary.76 The inspectors general of DOJ and the IC agency using Section 702 authorities are authorized to review compliance with the targeting and minimization procedures, and required to review (a) the number of intelligence reports containing U.S. persons' identities disseminated to other agencies; and (b) the number of targets later determined to be located in the United States.77 The IG reports are provided to the AG, the DNI, and the same Congressional committees receiving the AG and DNI targeting and minimization reports.78 In addition, the head of each IC agency obtaining information under Section 702 must annually review the programs to ascertain whether foreign information has been, or will be, obtained from the acquisition.79 The annual review must also consider the number of intelligence reports disseminated to other agencies containing references to U.S. persons, the number of targets later ascertained to be located within the United States, and a description of any procedures approved by the DNI relevant to the acquisition, the adequacy of the minimization procedures.80 This review must then be provided to FISC, the Attorney General, the DNI, the Congressional intelligence committees, and the Committees on the Judiciary of the House of Representatives and the Senate.81 Finally, every six months, the Attorney General must inform the intelligence and judiciary committees of any certifications submitted consistent with Section 702, the reasons for exercising the authority, any directives issued in conjunction with the acquisition, a description of the judicial review during the reporting period of the certifications as well as targeting and minimization procedures (including copies of orders or pleadings submitted in connection with such reviews that contain a significant legal interpretation of the law), any actions taken to challenge or enforce a directive issued, any compliance reviews, and a description of any incidents of noncompliance.

FYI- IC Procedures

Office of the Press Secretary (The White House, "Presidential Policy Directive -- Signals Intelligence Activities," January 17, 2014, https://www.whitehouse.gov/the-press-office/2014/01/17/presidential-policy-directive-signals-intelligence-activities) // AW

The IC has long recognized that effective oversight is necessary to ensure that we are protecting our national security in a manner consistent with our interests and values. Accordingly, the policies and procedures of IC elements, and departments and agencies containing IC elements, shall include appropriate measures to facilitate oversight over the implementation of safeguards protecting

personal information, to include periodic auditing against the standards required by this section.¶ The policies and procedures shall also recognize and facilitate the performance of oversight by the Inspectors General of IC elements, and departments and agencies containing IC elements, and other relevant oversight entities, as appropriate and consistent with their responsibilities. When a significant compliance issue occurs involving personal information of any person, regardless of nationality, collected as a result of signals intelligence activities, the issue shall, in addition to any existing reporting requirements, be reported promptly to the DNI, who shall determine what, if any, corrective actions are necessary. If the issue involves a non-United States person, the DNI, in consultation with the Secretary of State and the head of the notifying department or agency, shall determine whether steps should be taken to notify the relevant foreign government, consistent with the protection of sources and methods and of U.S. personnel.

Topicality

Domestic

Domestic refers to only internal affairs of a country

Wild 06 (SUSAN ELLIS WILD has been a practicing attorney since 1982, when she graduated with honors from George Washington University Law School. Webster's New World Law Dictionary p. 128 accessed 06/24/15)PA

Domestic adj. pertaining to the internal affairs of products of a country; relation to matters of the family.

Domestic is of your country

Merriam-webster (http://www.merriam-webster.com/dictionary/domestic)PA

domestic : of, relating to, or made in your own country : relating to or involving someone's home or family : relating to the work (such as cooking and cleaning) that is done in a person's home

Domestic relates to a home

BLACK, M. A. 1991 (HENRY CAMPBELL was the founder of Black's Law Dictionary, the definitive legal dictionary first published in 1891. He was also the editor of The Constitutional Review from 1917. BLACK'S LAW DICTIONARY 6th edition p.484 accessed 06/24/15) PA

Domestic, adj. Pertaining, belonging, or relating to a home, a domicile, or to the place of birth, origin, cre- ation, or transaction

Curtail

Empirically, "curtail" means a decrease in surveillance measures

United States v. United States District Court (No. 70-153) **1972** https://www.law.cornell.edu/supremecourt/text/407/297 LP

In that month Attorney General Tom Clark advised President Truman of the necessity of using wiretaps "in cases vitally affecting the domestic security." In May 1940 President Roosevelt had authorized Attorney General Jackson to utilize wiretapping in matters "involving the defense of the nation," but it is questionable whether this language was meant to apply to solely domestic subversion. The nature and extent of wiretapping apparently varied under different administrations and Attorneys General, but, except for the sharp **curtailment** under Attorney General Ramsey Clark in the latter years of the Johnson administration, electronic surveillance has been used both against organized crime and in domestic security cases at least since the 1946 memorandum from Clark to Truman.

Contextually, "curtail" means a decrease in surveillance

Healy 03 -- senior editor at the Cato Institute **(**Gene, "Beware of Total Information Awareness," 1/20/03, http://truthseek.info/pdf/bewareoftotalinformationawareness190820061008.pdf LP

The Army's domestic surveillance activities were substantially curtailed after the end of World War I. But throughout the 20th Century, in periods of domestic unrest and foreign conflict, army surveillance ratcheted up again, most notably in the 1960s.

Curtail is to limit

Merriam-webster (http://www.merriam-webster.com/dictionary/curtail)PA

Curtail : to reduce or limit (something)

Curtail is to cut short

Dictionary.com (http://dictionary.reference.com/browse/curtail)PA

verb (used with object) to cut short; cut off a part of; abridge; reduce; diminish.

Curtail is to cut off

BLACK, M. A. 1991 (HENRY CAMPBELL was the founder of Black's Law Dictionary, the definitive legal dictionary first published in 1891. He was also the editor of The Constitutional Review from 1917. BLACK'S LAW DICTIONARY 6th edition p.383 accessed 06/24/15) PA

Curtail. To cut off the end or any part of; hence to shorten, abridge, diminish, lessen, or reduce; and term has no such meaning as abolish. State v. Edwards, 207 La. 506, 21 So.2d 624, 625.

Empirically, "curtail" means to regulate

Friman and **Andreas '99** (H. Richard Friman - associate professor of political science at Marquette University. Peter Andreas - academy scholar at the Weatherhead Center for International Affairs, Harvard University. The Illicit Global Economy and State Power. Google Books p. 76)

Indeed, the link between decisions to liberalize capital controls and regulatory initiatives to curtail illicit transactions in the new liberal environment has often been very close. In the European Community, for example, initiatives to curtail tax evasion and money laundering began to be pursued at the very same time that member countries had agreed to abolish capital controls.

702 doesn't authorize domestic surveillance

Clapper and Holder '12. (James Clapper and Eric Holder, DNI and AG. 2/8/2012. A letter too Speaker Boehner and Leaders Reid, Pelosi, and McConnell. http://www.justice.gov/sites/default/files/ola/legacy/2012/11/08/02-08-12-fisa-reauthorization.pdf)//LP

One provision. section 702, authorizes surveillance directed at non-U.S. persons located overseas who are of foreign intelligence importance. At the same time, it provides a comprehensive regime of oversight by all three branches of Government to protect the privacy and civil liberties of U.S . persons. Under section 702, the Attorney General and the Director of National Intelligence may authorize annually, with the approval of the Foreign Intelligence Surveillance Court (FISC), intelligence collection targeting categories of non-U.S. persons abroad, without the need for a court order for each individual target. Within this framework, no acquisition may intentionally target a U.S. person. here or abroad. or any other person known to be in the United States. The law requires special procedures designed to ensure that all such acquisitions target only non-U.S. persons outside the United States_ and to protect the privacy of U.S. persons whose nonpublic information may be incidentally acquired. The Department of Justice and the Office of the Director of National Intelligence conduct extensive oversight reviews of

section 702 activities at least once every sixty days, and Title VII requires us to report to the Congress on implementation and compliance twice a year.

A2: Legitimacy K

Reputation matters – its embedded in crisis analysis

Yarhi-Milo '2010. Assistant professor of politics and Internet affairs. (Keren, "Revisiting Reputation: How Past Actions Matter in International Politics," August. Princeton. http://www.polisci.upenn.edu/~weisiger/reputation.pdf)//TS

Does reputation for resolve matter? Our findings provide strong evidence that it does. **While studies by reputation critics are correct to argue that realist variables like power and interests play an important role in states' behavior during crises, past actions do have significant consequences. Countries that have backed down are substantially more likely to face subsequent challenges.** We argue that the **discrepancy between our results and those** advanced **by reputation critics may stem from their focus on crisis decision-making, where information gleaned from past action will already have been incorporated into broader estimates of interests and** hence **is less likely to be referenced directly**, as well as from their failure to recognize that reputation acts through estimates of an opponent's interests. At the same time, our results do not provide unequivocal support in favor of the strong version of reputation associated with Thomas Schelling. Rather, we observe that the effects of past actions remain, but are weaker, when the subsequent interaction less closely resembles the dispute in which the country in question earned its reputation. Thus, we find that past actions have a less substantive effect on the probability of a new dispute when the inferences are drawn by observers who were not involved in the previous dispute. Further, we find that lessons from territorial disputes are much more strongly associated with subsequent territorial challenges than are lessons from non-territorial disputes. At the same time, however, we find that reputation for resolve is not leader-specific, indicating that leader turnover in a country with a bad reputation should not significantly lower the 29 probability that such a country will be challenged again. Important questions about reputation remain. We find that reputation for resolve exists and is fairly general, but that leaves unanswered questions about the generality of reputation for other traits like honesty and reliability. Separately, while we find little change in reputation after leadership turnover, further research would be needed to definitively establish the degree to which reputations affix to leaders or to states. It is not implausible that both the generality of reputation and the degree to which inferences are drawn about specific leaders or about states in general would vary by regime type or over time. **Our results confirm what leaders already intuitively suspect: reputation for resolve is worth having in international politics**. While we certainly do not mean to imply that backing down is always the wrong thing to do, leaders who contemplate doing so should be aware of the associated costs.

Legitimacy is real – evaluations of credibility are factored into self-interests

Yarhi-Milo '2010. Assistant professor of politics and Internet affairs. (Keren, "Revisiting Reputation: How Past Actions Matter in International Politics," August. Princeton. http://www.polisci.upenn.edu/~weisiger/reputation.pdf)//TS

The **explanations and evidence that reputation critics provide have serious limitations**.6 Press argues that power and interest are more important than reputation for resolve. Yet **past actions matter in formal models of reputation by affecting** uninformed **players' estimates of opponents' interests** (Alt, Calvert, and Humes 1988, Nalebuff 1991**). A country that backs down in a crisis is deemed to have a relatively low valuation for the political issue at stake** or a relatively high subjective cost of fighting. To the extent that lessons about an actor's resolve from one crisis carry over to another, then, they do so in the form of statements about that actor's interests. Once this lesson is learned, however, there is no guarantee that leaders will refer back to the prior incident that led them to conclude that their opponent was resolved, instead merely observing that it has high interests in the political stake. In short, **juxtaposing reputation to a realist power and interests story is inappropriate if estimates of interests depend in part on past actions**. Press (2005, 21) briefly acknowledges this possibility, observing that a

situation in which "**a decision maker uses an adversary's history of keeping commitments to assess** the adversary's interests or military power, and hence **credibility**," would be evidence that reputations matter. In practice, however, his empirical work focuses on whether or not leaders justify predictions about adversary behavior based on actions in past crises, while paying much less attention to the indirect route identified here in which **past actions affect beliefs about interests**, which in turn affect predictions about future behavior. Game theoretic models of reputation formation indicate, however, that **this indirect path in fact should be the primary route by which past actions should influence current behavior, and hence by which reputations should operate.**

Legitimacy's created through reviewing past actions – deterrence proves countries that information to determine reactions

Yarhi-Milo '2010. Assistant professor of politics and Internet affairs. (Keren, "Revisiting Reputation: How Past Actions Matter in International Politics," August. Princeton. http://www.polisci.upenn.edu/~weisiger/reputation.pdf)//TS

Moreover, there is the problem, noted most prominently by Fearon (1994, 2002), that within crises leaders are likely to focus primarily on new information, such as that gleaned from crisis negotiations or military mobilization, rather than the information that was available prior to the crisis. **Past actions are** by definition **observable prior to a specific crisis**. As such, **we should expect their influence on opponents' perceptions to be most readily visible prior to the crisis as well**.7 **In the context of a significant crisis, leaders certainly debate the level of an opponent's resolve** (i.e. interests), taking into account all the available information. By the time that they do so, however, **information gleaned from past actions – reputation** – **will have been folded into the general assessment of interests,** alongside other pertinent sources of information such as what has been learned from the opponent's crisis behavior in the current crisis. **Thus, while** it would not be inconsistent with **our** argument for **leaders** to **reference past action** in the context of an ongoing crisis, **it would not be surprising if such references did not appear**. **The place to look for the effect of past actions on future expectations is at the level of general deterrence.**

Good reputation reduces conflict risks --- loss of reputation reduces negotiating power

Yarhi-Milo '2010. Assistant professor of politics and Internet affairs. (Keren, "Revisiting Reputation: How Past Actions Matter in International Politics," August. Princeton. http://www.polisci.upenn.edu/~weisiger/reputation.pdf)//TS

What then are the implications of these arguments for international politics? The clearest prediction concerns general deterrence: **countries that have earned a bad reputation will be more likely to be challenged, while those who have earned a good reputation will be less likely to face challenges.** More precisely, a **bad reputation leads observers to believe that they can convince the country in question to make more significant political concessions than they otherwise would have been willing to make.** This inference has two effects: countries that would have initiated a crisis anyway now ask for more than they otherwise would have, and countries that would not have initiated a dispute now believe that it is worthwhile to do so. **A similar relationship applies in reverse for countries with a good reputation**, **who are less attractive targets**, **meaning that some who would have started a dispute anyway demand less from them**, **while others who would have made a demand now opt not to do so**. While statistically testing predictions about the size of demands (especially relative to an unobservable counterfactual in which the target had behaved differently in the past) is not possible, predictions about the frequency of challenges are more straightforward to examine.

Case answers

Internet freedom answers

AT: NSA overreach

Obama policy statement minimizes data abuse risks and is binding US policy

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, April, lexis)

Edward Snowden's disclosures have thus far centered on two NSA programs. One is domestic - the so-called metadata program, operated pursuant to section 215 of the USA PATRIOT Act, n13 and entailing the bulk collection of call record information, including phone numbers and times of calls. n14 The other is foreign - the PRISM program, operated pursuant to section 702 of the Foreign Intelligence Surveillance Act (FISA). n15 Under section 702, the government may conduct surveillance targeting the contents of communications of non-U.S. persons reasonably believed to be located abroad when the surveillance will result in acquiring foreign intelligence information. n16 The FISC must approve any government request for surveillance under section 702, although these requests can [*2141] describe broad types of communications without identifying particular individuals. n17

Under section 702, "foreign intelligence information" that the government may acquire includes a number of grounds related to national security, such as information relating to an "actual or potential attack" or "other grave hostile acts of a foreign power or an agent of a foreign power." n18 It also includes information relating to possible sabotage n19 and clandestine foreign "intelligence activities." n20 Another prong of the definition appears to sweep more broadly, including information relating to "the conduct of the foreign affairs of the United States." n21 Despite the greater breadth of this provision, President Obama informed a domestic and global audience that U.S. intelligence agencies seek a narrow range of information centering on the national security and foreign intelligence concerns described above. n22 While the U.S. intelligence agencies acquire a substantial amount of data that does not fit under these rubrics, the president's speech confirmed that U.S. analysts do not rummage through such data randomly or for invidious purposes. n23 A scatter-shot approach of this kind would be unethical, illegal, and ineffective. Instead, NSA officials query communications using specific "identifiers" such as phone numbers and email addresses that officials reasonably believe are used by non-U.S.

persons abroad to communicate foreign intelligence information. n24 The government must also have in place minimization procedures to limit the acquisition, retention, and dissemination of nonpublic information about U.S. persons. n25 The NSA deletes all irrelevant content, including content from non-U.S. persons, after five years. n26

In acknowledging the "legitimate privacy interests" of both U.S. and non-U.S. persons, President Obama affirmed the U.S. commitment to core principles in January 2014. n27 First, he narrowed the operating definition of [*2142] foreign intelligence information, limiting it to "information relating to the capabilities, intentions, or activities of foreign governments or elements thereof, foreign organizations, foreign persons, or international terrorists." n28 In addition, he asserted that the NSA would engage in bulk collection of communications for purposes of "detecting and countering" terrorism, espionage, nuclear proliferation, threats to U.S. forces, and financial crimes, including evasion of duly enacted sanctions. n29 Addressing anticipated concerns that these limits still left the NSA with too much discretion, President Obama declared what the United States would not do. First, it would not collect communications content "for the purpose of suppressing or burdening criticism or dissent, or for disadvantaging persons based on their ethnicity, race, gender, sexual orientation, or religion." n30 Second, it would disseminate and store information regarding any person based on criteria in section 2.3 of Executive Order 12,333 n31: cases involving "foreign intelligence or counterintelligence," public safety, or ascertainment of a potential intelligence source's credibility. n32

Of course, President Obama's speech did not quell the complaints of NSA critics. One could argue that even the description the president provided has legal flaws under domestic and/or international law. One can also argue that the president's policy directive, statutory provisions, and case law cannot wholly eliminate the possibility of systemic or individual abuse of NSA authority. That said, there are compelling reasons for treating the president's speech and directive as an **authoritative and binding** statement of U.S. policy. The most compelling reason may be the simplest: no American president has ever been so forthright on the subject of intelligence collection, and few heads of state around the globe have ventured down the path that President Obama chose. n33 That alone counsels treating President Obama's guidance as more than "cheap talk."

Existing oversight checks NSA overreach

Cordero, 14 - Carrie F. Cordero is the Director of National Security Studies at Georgetown University Law Center ("Fear vs. Facts: Exploring the Rules the NSA Operates Under" 6/13, http://www.cato-unbound.org/2014/06/13/carrie-f-cordero/fear-vs-facts-exploring-rules-nsa-operates-under

There is no doubt the Snowden disclosures have launched a debate that raises significant issues regarding the extent of U.S. government national security surveillance authorities and activities. And Julian Sanchez's essay Snowden: Year One raises a number of these issues, including whether the surveillance is too broad, with too few limits and too little oversight. But an overarching theme of Sanchez's essay is fear – and fear of what might be overshadows what actually is, or is even likely. Indeed, he suggests that by just "tweaking a few lines of code" the

NSA's significant capabilities could be misdirected from targeting valid counterterrorism suspects to Americans involved in the Tea Party or Occupy movements.

So really, what would it take to turn NSA's capabilities inward, to the dark corner of monitoring political activity and dissent? It turns out, quite a lot. So much, in fact, that after a considered review of the checks and balances in place, it may turn out to be not worth fearing much at all.

First, a little history. Prior to 1978, NSA conducted surveillance activities for foreign intelligence purposes under Executive authority alone. In 1978, Congress passed the Foreign Intelligence Surveillance Act (FISA), which distinguished between surveillance that occurred here at home and that which occurred overseas. FISA requires that when electronic surveillance is conducted inside the United States, the government seek an order from the Foreign Intelligence Surveillance Court (FISC or the Court) based on probable cause. So, if the government wants to conduct surveillance targeting a foreign agent or foreign power here in the United States, it must obtain FISC approval to do so. By law, the Court may not issue an order targeting an American based solely on activities protected by the First Amendment to the Constitution. The Attorney General is required to report on the full range of activities that take place under FISA to four congressional committees: both the intelligence and judiciary committees in Congress. The law requires that the committees be "fully informed" twice each year.

There have been a number of amendments to FISA over the years. In 1994, the statute was amended to require that physical searches for national security purposes conducted inside the United States also happen by an order from the FISC. The USA-PATRIOT Act of 2001 amended several provisions of FISA, one of which enabled better sharing of information between terrorism and criminal investigators. And in 2008, FISA was amended to provide a statutory framework for certain approvals by the Attorney General, Director of National Intelligence, and FISC regarding the targeting of non-U.S. persons reasonably believed to be outside the United States for foreign intelligence purposes, when the cooperation of a U.S. communications service provider is needed.

So how do we know that this system of approvals is followed? Is the oversight over NSA's activities meaningful, or "decorative," as Sanchez suggests?

It is worth exploring. Here is how oversight of the Section 702 surveillance works, as one example, since it has been the subject of a significant part of the debate of the past year. Section 702 was added to FISA by the FISA Amendments Act of 2008. It authorizes the NSA to acquire the communications, for foreign intelligence purposes, of non-U.S. persons reasonably believed to be outside the United States. These are persons with no Constitutional protections, and yet, because the acquisition requires the assistance of a U.S. electronic communications provider, there is an extensive approval and oversight process. There is a statutory framework. Specifically, the Attorney General and Director of National Intelligence jointly approve certifications. According to declassified documents, the certifications are topical, meaning, the way the statute is being implemented, the certifications are not so specific that they identify individual targets; but they are not so broad that they cover any and everything that might be foreign intelligence information. The certifications are filed with the FISC, along with targeting and minimization procedures. Targeting procedures are the rules by which NSA selects valid foreign intelligence targets for collection. Minimization procedures are rules by which NSA handles information concerning U.S. persons. The FISC has to approve these procedures. If it does not approve them, the government has to fix them. The Court reviews these procedures and processes annually. The Court can request a hearing with government witnesses (like senior intelligence officials, even the

NSA Director, if the judge wanted or needed to hear from him personally) or additional information in order to aid in its decisionmaking process. Information about the 702 certifications is reported to the Congressional intelligence committees.

Once the certifications are in effect, attorneys from the Department of Justice's (DOJ) National Security Division and attorneys and civil liberties officials from the Office of the Director of National Intelligence (ODNI) review the NSA's targeting decisions and compliance with the rules. They conduct reviews at least every 90 days. During that 90-day period, oversight personnel are in contact with NSA operational and compliance personnel. Compliance incidents can be discovered in one of at least two ways: the NSA can self-report them, which it does; or the DOJ and ODNI oversight personnel may discover them on their own. Sometimes the NSA does not report a compliance incident in the required timeframe. Then the time lag in reporting may become an additional compliance incident. The DOJ and ODNI compliance teams write up semi-annual reports describing the results of their reviews. The reports are approved by the Attorney General and Director of National Intelligence and provided to the FISC and to Congress. According to the one report that has been declassified so far, in August 2013, for a six-month period in 2012, the rate of error for the NSA's compliance under Section 702 collection was .49% - less than half of one percent. If we subtract the compliance incidents that were actually delays in reporting, then the noncompliance rate falls to between .15-.25% - **less than one quarter of one percent**. Hardly an agency run amok.

--xt – squo solves

Squo Congressional oversight prevents abuse and oversight reform is better than scaling back

Cordero, 14 - Carrie F. Cordero is the Director of National Security Studies at Georgetown University Law Center ("Fear vs. Facts: Exploring the Rules the NSA Operates Under" 6/13, http://www.cato-unbound.org/2014/06/13/carrie-f-cordero/fear-vs-facts-exploring-rules-nsa-operates-under

Generally, however, Congressional committees charged with oversight of the Intelligence Community do their job. The Intelligence Committees of Congress have professional staff, often with deep experience in national security matters. The Committees conduct substantive hearings, although, due to the sensitive and operational nature of the topics discussed, often in classified session. Congressional staff also receive briefings. During the debate surrounding the passage of the FISA Amendments Act of 2008, many members of Congress and their staffs visited the NSA and received dozens of briefings regarding its details and subsequent implementation.

Decorative? Returning to the question implicitly posed by Sanchez's argument: what would it take to turn this system inside out? Most likely, it would take either a conspiracy of the highest order, or the complete incompetence of everyone involved in the process – from operators to leadership inside the Intelligence Community, from lawyers to senior officials at the Justice Department, from legal advisors to judges of the FISC, from staff to members of Congress.

Here's what happens in the real world: people make mistakes; technological implementation goes awry; bureaucracy gets in the way of getting down to the bottom line. The adequacy and rigor of

Congressional oversight waxes and wanes based, at times, on the quality of the leadership of the various committees at any time. Government employees also sometimes do the wrong thing, such as the twelve cases in ten years that the NSA has explained to Congress, and then they are held accountable. Oversight and compliance systems sometimes fail, too, such as the delay in recognizing the problems in the technical implementation of the phone metadata program that was subsequently brought to the Court's attention. These are all valid reasons to work on improving auditing, compliance, oversight and accountability mechanisms. They are not valid reasons for adopting reforms that would dramatically scale back important national security capabilities that keep the nation safe.

The NSA already implemented technical reforms to PRISM that prevent overreach

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

The second program--known as PRISM or section 702--uses court orders issued under section 702 of FISA n18 to collect the content of certain international communications. In particular, the NSA targets specific non-Americans who are reasonably believed to be located outside the country, and also engages in bulk collection of some foreign-to-foreign communications that happen to be passing through telecommunications infrastructure in the United States. n19 The FISA [*527] court does not approve individual surveillance applications each time the NSA wishes to intercept these communications; instead, it issues once-a-year blanket authorizations. n20 As detailed below, in 2011 the FISA court struck down the program on constitutional and statutory grounds after the government disclosed that it was inadvertently intercepting a significant number of communications involving Americans; n21 the court later upheld the program when the NSA devised a technical solution that prevented such over-collection. n22

Zero incentive exists to expand PRISM – practicality prevents abuse

Lempert, 13 - Richard O. Lempert is a Visiting Fellow in Governance Studies at the Brookings Foundation and the University of Michigan's Eric Stein Distinguished University Professor of Law and Sociology emeritus ("PRISM and Boundless Informant: Is NSA Surveillance a Threat?" 6/13, http://www.brookings.edu/blogs/up-front/posts/2013/06/13-prism-boundless-informant-nsa-surveillance-lempert

The protection most of us enjoy under PRISM may be more practical than legal. The amount of data that can be collected limits the reach of the program. Not only is capturing too much information from innocent Americans a waste of resources, but also suspicious communications can be lost in a forest of irrelevant data. The NSA thus has powerful reasons to limit impermissible observations, at least where there is no good reason to suspect Americans of terrorist involvements. Still we lack two bits of information important in assessing this program. One is the fate of information pertaining to Americans who should not have been observed in the first place. If this information is purged from all databases except perhaps when the person is

dangerous, erroneous capture is less of a concern than it otherwise would be. Second, we don't know how monitoring targets are determined or the number of targets selected. To the extent that individuals, organizations and sites are targeted based on target-specific concerns about the threats they pose, the net cast is likely to be narrow, and even if the reasons for targeting do not rise to the level of legally cognizable probable cause, they tend in this direction. But if targets are selected based on the impersonal outputs of other data mining efforts like the telephone records that feed Boundless Informant, all bets are off. Depending on the algorithms used and the degree to which they have been empirically validated, the net could be wide or narrow, and the likelihood that a target would be involved in terrorism or that citizens would be swept into the net may be great or small. Congress in overseeing PRISM should demand this information if it is not already provided.

It is easy to be cynical about government and the respect that agencies show for the laws under which they operate. Cynicism is fed by occasional scandals and by the more frequent pseudo-scandals which make it appear that within the Beltway things are out of control. Having spent four years as a Division Director at the National Science Foundation and three years as Chief Scientist in the Human Factors/ Behavioral Science Division of DHS's Science and Technology Directorate, I am not cynical. Time and again I have seen government employees seek to follow the law even when it seems silly and interferes with their mission. When I joined DHS I was most surprised by the fierceness of efforts to comply with the U.S. Privacy Act. At times interpretations of what the Act protected were so broad as to border on the ridiculous, and costs were real: research projects with national security implications were delayed, redesigned or even precluded because privacy officers, sometimes with little basis in the statute, felt there was a risk that personally identifiable information (PII) would be impermissibly collected. The absence of any reason to fear revelation or misuse made no difference. The strict scrutiny applied to research that might involve PII is, to be sure, relaxed in front line operational settings like PRISM and legal restrictions may differ, but my experience in two agencies as well as conversations with people in the intelligence community (IC) lead me to believe that it is a mistake to regard as a sham the legal restrictions on PRISM or other IC data mining and surveillance activities.

Through its PRISM and Boundless Informant efforts, NSA is working to protect the nation, apparently with some success. The 99.9% of us who pose no threat of terrorism and do not inadvertently consort with possible terrorists should not worry that the government will track our phone or internet exchanges or that our privacy will be otherwise infringed.

Economy answers

AT: Cloud computing

NSA surveillance doesn't undermine cloud computing

Henderson, 4/9/15 (Nicole, "Impact of NSA Surveillance on US Cloud Providers Not as Bad as We Thought: Forrester" 4/9, http://www.thewhir.com/web-hosting-news/impact-nsa-surveillance-us-cloud-providers-not-bad-thought-forrester

It's been two years since Edward Snowden leaked details of the NSA's PRISM surveillance program, and although analysts predicted an exodus from US-based cloud and hosting services in response to the revelations, it hasn't exactly worked out that way, a new report finds.

Forrester released a new report last week that suggests concerns around international customers severing ties with US-based hosting and cloud companies "were overblown."

"Lost revenue from spending on cloud services and platforms comes to just over $500 million between 2014 and 2016. While significant, these impacts are far less than speculated, as more companies reported taking control of security and encryption instead of walking away from US providers," Forrester's principal analyst serving security and risk professionals Edward Ferrara said in a blog post.

Snowden recently told a crowd of cloud and hosting providers that use of encryption is growing, and encrypted traffic has doubled since 2013.

In 2013, Forrester predicted that US cloud providers cloud lose up to $180 billion in business by 2016 due to concerns around the scope of NSA's PRISM program.

According to NextGov, Forrester finds that 26 percent of enterprises based in Asia Pacific, Canada, Europe and Latin America have stopped or reduced their spending with US-based firms for Internet-based services. Thirty-four percent said these concerns were related to fears of US surveillance, while others said they want to support businesses in their own country, or data sovereignty rules prevent them from storing data abroad.

Forrester surveyed more than 3,000 businesses between June and July 2014.

More than half of respondents said that they did not trust US-based outsourcers to handle sensitive information, with only 8 percent reporting to trust their company's intellectual property with a US-based outsourced company.

Ninety-percent of decision-makers have taken steps to encrypt their data, according to the report.

No significant impact on cloud computing

Weise, 4/7/15 (Elizabeth, "PRISM revelations didn't hit U.S. cloud computing as hard as expected" 4/7, http://americasmarkets.usatoday.com/2015/04/07/prism-revelations-didnt-hit-u-s-cloud-computing-as-hard-as-expected/

When Edward Snowden revealed the extent of the U.S. National Security Agency's PRISM spying program, there were concerns that American cloud, hosting and outsourcing businesses would lose customers running to non-U.S.-based companies safe from NSA's prying eyes.

"The assertion was that this would be a death blow to U.S. firms trying to operating in Europe and Asia," said Forrester Research analyst Ed Ferrara.

But two recent reports from Forrester find it was less catastrophic than expected.

That's good news for companies like Box (BOX), DropBox and others that make their money by selling U.S.-based data storage.

Forrester had originally predicted U.S. companies could lose as much as $180 billion in sales.

Instead, just 29% of technology decision-makers in Asia, Canada, Europe and Latin America halted or reduced spending with U.S.-based firms offering Internet-based services due to the PRISM scandal, Forrester's Business Technographics Global Infrastructure Survey for 2014 found

"It's a relatively small amount of data," Ferrara said.

That's because most of the companies didn't need to move all their data, much of which was stored in-house. Instead, only 33% of the data held by that 29% of companies was at a third-party data center or in a cloud system.

Forrester believes the overall loss to U.S. cloud providers for 2015 will be about $15 billion and in 2016, $12 billion, a far cry from projections that were ten times that a year ago.

Forrester also found that companies are looking at other ways to protect the integrity of their data, not just from the NSA but also from surveillance by other nations.

Chief among them was encryption. Eighty-four percent of the companies said they're using various encryption methods to protect sensitive material.

The survey's definition of cloud providers is broad, and includes both platform as a service, infrastructure as a service and software as a service companies, said Ferrara.

Solvency answers

Solvency 1nc

Modeling is empirically false

Edgar, 4/13/15 - visiting fellow at the Institute and adjunct professor of law at the Georgetown University Law Center (Timothy, "The Good News About Spying"

https://www.foreignaffairs.com/articles/united-states/2015-04-13/good-news-about-spying

Despite high hopes for a fresh start on civil liberties, during his first term in office, Obama ratified and even expanded the surveillance programs that began under former President George

W. Bush. After NSA contractor Edward Snowden began revealing the agency's spying programs to The Guardian in 2013, however, Obama responded with a clear change of direction. Without great fanfare, his administration has made changes that open up the practices of the United States intelligence community and protect privacy in the United States and beyond. The last year and a half has been the **most significant period of reform** for national security surveillance since Senator Frank Church led the charge against domestic spying in the late 1970s.

In 2013, at Obama's direction, the Office of the Director of National Intelligence (ODNI) established a website for the intelligence community, IC on the Record, where previously secret documents are posted for all to see. These are not decades-old files about Cold War spying, but recent slides used at recent NSA training sessions, accounts of illegal wiretapping after the 9/11 attacks, and what had been highly classified opinions issued by the Foreign Intelligence Surveillance Court about ongoing surveillance programs.

Although many assume that all public knowledge of NSA spying programs came from Snowden's leaks, many of the revelations in fact came from IC on the Record, including mistakes that led to the unconstitutional collection of U.S. citizens' emails. Documents released though this portal total more than 4,500 pages—surpassing even the 3,710 pages collected and leaked by Snowden. The Obama administration has instituted other mechanisms, such as an annual surveillance transparency report, that will continue to provide fodder for journalists, privacy activists, and researchers.

The transparency reforms may seem trivial to some. From the perspective of an intelligence community steeped in the need to protect sources and methods, however, they are deeply unsettling. At a Brown University forum, ODNI Civil Liberties Protection Officer Alexander Joel said, "The intelligence community is not designed and built for transparency. Our culture is around finding our adversaries' secrets and keeping our own secrets secret." Accordingly, until only a few years ago, the intelligence community resisted making even the most basic information public. The number of FISA court opinions released to the public between 1978 and 2013 can be counted on one hand.

Beyond more transparency, Obama has also changed the rules for surveillance of foreigners. Until last year, privacy rules applied only to "U.S. persons." But in January 2014, Obama issued Presidential Policy Directive 28 (PPD-28), ordering intelligence agencies to write detailed rules assuring that privacy protections would apply regardless of nationality. These rules, which came out in January 2015, mark the first set of guidelines for intelligence agencies ordered by a U.S. president—or **any world leader**—that explicitly protect foreign citizens' personal information in the course of intelligence operations. Under the directive, the NSA can keep personal information in its databases for no more than five years. It must delete personal information from the intelligence reports it provides its customers unless that person's identity is necessary to understand foreign intelligence—a basic rule once reserved only for Americans.

The new rules also include restrictions on bulk collection of signals intelligence worldwide—the practice critics call "mass surveillance." The NSA's bulk collection programs may no longer be used for uncovering all types of diplomatic secrets, but will now be limited to six specific categories of serious national security threats. Finally, agencies are no longer allowed simply to "collect it all." Under PPD-28, the NSA and other agencies may collect signals intelligence only after weighing the benefits against the risks to privacy or civil liberties, and they must now consider the privacy of everyone, not just U.S. citizens. This is the first time any U.S. government

official will be able to cite a written presidential directive to object to an intelligence program on the basis that the intelligence it produces is not worth the costs to privacy of innocent foreign citizens.

THOSE IN GLASS HOUSES

Obama's reforms make great strides toward transparency and protecting civil liberties, but they have been **neither celebrated nor matched abroad**. When Chancellor Angela Merkel of Germany found out she had been the target of American eavesdropping, her reaction was swift. "This is not done," she said, as if scolding a naughty child. Many Germans cheered. They and other Europeans believe that their laws protect privacy better than U.S. laws. But that is only partly true: Although Europe has stronger regulations limiting what private companies (such as Google and Facebook) can do with personal data, citizens are granted comparatively little protection against surveillance by government agencies. European human rights law requires no court approval for intelligence surveillance of domestic targets, as U.S. law has since 1978. Similarly, European governments do not observe limits on electronic surveillance of non-citizens outside of their own territories, as the United States now does under Obama's presidential policy directive.

By blaming only the NSA for mass surveillance, the public and foreign leaders let other intelligence services off the hook. No wonder that some human rights organizations, including Privacy International and Big Brother Watch UK, have filed legal challenges against mass surveillance by the NSA's British counterpart, the Government Communications Headquarters (GCHQ). But foreign leaders have taken few steps to limit government surveillance, and none have done **anything remotely comparable** to what Obama did in last year's directive.

Circumvention inevitable

Redmond, 14 – J.D. Candidate, 2015, Fordham University School of Law (Valerie, "I Spy with My Not So Little Eye: A Comparison of Surveillance Law in the United States and New Zealand" FORDHAM INTERNATIONAL LAW JOURNAL [Vol. 37:733

In the United States, the current state of surveillance law is a product of FISA, its amendments, and its strictures. An evaluation of US surveillance law proves that inherent loopholes undercut FISA's protections, which allows the US Government to circumvent privacy protections.182 The main problems are the **insufficient definition of surveillance**, the ability to spy on agents of foreign powers, the lack of protection against third party surveillance, and the ability to collect incidental information.183

First, a significant loophole arises in the interpretation of the term "surveillance."184 In order for information collection to be regulated by FISA, it must fall under FISA's definition of surveillance.185 This definition does not apply to certain **National Security Letters**, which are secret authorizations for the Federal Bureau of Investigation ("FBI") to obtain records from telephone companies, credit agencies, and other organizations if they merely certify that the information is relevant to an international terrorism investigation.186 National Security Letters are regularly used to circumvent FISA's warrant procedures.187

Additionally, FISA's definition of surveillance is antiquated because it distinguishes between data acquired inside of the United States and outside of the United States.188 This distinction allows the NSA to process surveillance that is received from other countries irrespective of whether the target is a US citizen.189 Therefore, the NSA is unrestrained when a communication is not physically intercepted within the United States.190

Second, an issue arises when US citizens are construed to be agents of foreign powers under FISA because a warrant can be issued to engage in surveillance against them.191 According to FISA's procedures, the only way to spy on a US citizen is when they can be considered to be an agent of a foreign power, or engaged in information gathering, aiding, or abetting a foreign power.192 However, this limitation does not result in total privacy protection because it only requires probable cause that a person is an agent of a foreign power, not that a crime is being committed.193 The effect of this ability is that the US Government can conduct surveillance on a US citizen with no ties to terrorism such as a suburban mother telling her friend that her son "bombed" a school play.194

Furthermore, FISA is limited to protecting against surveillance by the US Government; it does not create a reasonable expectation of privacy for individuals from surveillance by a third party.195 This rule is exploited by the United States' participation in Echelon.196 Because US law generally does not regulate information sharing, the United States essentially violates the privacy rights of US citizens by accepting information from foreign intelligence agencies about potential threats involving US citizens.197 Thus, the lack of privacy rights when US citizens are spied on by agencies outside of the United States creates a loophole for spying on US citizens without the government restrictions created by existing law.198

Lastly, US law allows for the collection of incidental information.199 It is predicted that Echelon collects nearly all communications, many of which can be considered incidental.200 Therefore, the fact that FISA allows for the collection of incidental information suggests that privacy rights can be violated by its involvement in Echelon.201

The domestic-only limit wrecks solvency

Kehl, 14 – Policy Analyst at New America's Open Technology Institute (Danielle, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity" July, https://www.newamerica.org/oti/surveillance-costs-the-nsas-impact-on-the-economy-internet-freedom-cybersecurity/

The U.S. government has already taken some limited steps to mitigate this damage and begin the slow, difficult process of rebuilding trust in the United States as a responsible steward of the Internet. But the reform efforts to date have been relatively narrow, focusing primarily on the surveillance programs' impact on the rights of **U.S. citizens**. Based on our findings, we recommend that the U.S. government take the following steps to address the broader concern that the NSA's programs are impacting our economy, our foreign relations, and our cybersecurity:

1. Strengthen privacy protections for both Americans **and non-Americans**, within the United States **and extraterritorially**.

2. Provide for increased transparency around government surveillance, both from the government and companies.

3. Recommit to the Internet Freedom agenda in a way that directly addresses issues raised by NSA surveillance, including moving toward **international human-rights based standards on surveillance**.

4. Begin the process of restoring trust in cryptography standards through the National Institute of Standards and Technology.

5. Ensure that the U.S. government does not undermine cybersecurity by inserting surveillance backdoors into hardware or software products.

6. Help to eliminate security vulnerabilities in software, rather than stockpile them.

7. Develop clear policies about whether, when, and under what legal standards it is permissible for the government to secretly install malware on a computer or in a network.

8. Separate the offensive and defensive functions of the NSA in order to minimize conflicts of interest.

It's a linear case turn – it expands perceptions of foreign abuse

Chandler and Le, 15 - * Director, California International Law Center, Professor of Law and Martin Luther King, Jr. Hall Research Scholar, University of California, Davis; A.B., Harvard College; J.D., Yale Law School AND **Free Speech and Technology Fellow, California International Law Center; A.B., Yale College; J.D., University of California, Davis School of Law (Anupam and Uyen, "DATA NATIONALISM" 64 Emory L.J. 677, lexis)

First, the United States, like many countries, **concentrates much of its surveillance efforts abroad.** Indeed, the Foreign Intelligence Surveillance Act is focused on gathering information overseas, limiting data gathering largely only when it implicates U.S. persons. n174 The recent NSA surveillance disclosures have revealed extensive foreign operations. n175 Indeed, **constraints on domestic operations** may well have **spurred the NSA to expand operations abroad**. As the Washington Post reports, "Intercepting communications overseas has clear advantages for the NSA, with looser restrictions and less oversight." n176 Deterred by a 2011 ruling by the Foreign Intelligence Surveillance Court barring certain broad **domestic surveillance** of Internet and telephone traffic, n177 the NSA may have increasingly turned its attention overseas.

Allied info sharing makes circumvention inevitable

Donohue, 15 - Professor of Law, Georgetown University Law Center (Laura, "SECTION 702 AND THE COLLECTION OF INTERNATIONAL TELEPHONE AND INTERNET CONTENT" 38 Harv. J.L. & Pub. Pol'y 117, Winter, lexis)

With GCHQ in mind, it is worth noting an additional exception to both FISA and Executive Order 12,333: to the extent that it is not the United States engaged in the collection of information, but, rather, one of our allies, **rules that otherwise limit the U.S. intelligence community may not apply.** From the language of the order, it appears that the United States may receive or benefit from other countries' collection of information on U.S. citizens, where it does not actively participate in the collection or specifically request other countries to carry out the collection at its behest. n142 In turn, the United States can provide information about foreign citizens to their governments that their intelligence agencies, under their domestic laws, might otherwise be unable to collect. To the extent that the programs underway are extended to the closely allied "Five Eyes" (Australia, Canada, the United Kingdom, the United States, and New Zealand), structural demarcations **offer a way around the legal restrictions** otherwise enacted to protect citizen rights in each region.

Government acquisition of third party data inevitable – surveillance is only one of many tools

Turner, 15 - Brad Turner is a graduate of Duke Law School and a practicing attorney in Ohio. ("When Big Data Meets Big Brother: Why Courts Should Apply United States v. Jones to Protect People's Data" 16 N.C. J.L. & Tech. 377, January, lexis)

The government can obtain second-hand data from private parties in a variety of ways. First, the government can simply ask for it. According to Google, nearly 1% of requests for its user data from law enforcement are emergency requests. n185 A bill that has been proposed in Congress, called the Cyber Intelligence Sharing and Protection Act ("CISPA"), might dramatically increase this percentage. CISPA would make it legal for the government to ask companies for data about their customers and then protect those companies from lawsuits related to the handing over of that data, "notwithstanding any other provision of law." n186

Second, the government can demand the data with a subpoena. A subpoena need not be reviewed or pre-approved by a court to be valid and enforceable. n187 Google says that 68% of its data requests from the government are in the form of a subpoena. n188 Subpoenas can request any information or documents that are at all relevant to an investigation. Relevance is defined very broadly and includes any information or documents that "might have the potential to lead to relevant information." n189 So long as a subpoena meets this very lenient standard, a court will deem the subpoena valid to the extent that the subpoena's demands are not overbroad or unduly burdensome. n190

Third, the government can demand the information with a court order, which, by definition, does require prior approval by a [*411] court. n191 Google says that 22% of its requests for data by the government are from warrants, and another 6% are from court orders. n192 The NSA collects much of its data by using secret FISA court orders, collecting huge sums of data from U.S. telephone companies, including AT&T, Verizon, and Sprint, and Internet service-providers like Facebook, Apple, Google, Microsoft, Yahoo, and AOL. n193 Statutes regulate these data-collection efforts. n194

Fourth, the government can purchase the information. Big Data is valuable and companies are willing to sell. n195 For the right price, [*412] government can access the same rich data-troves held by private organizations. For example, the federal government recently started buying access

to a private database maintained by the credit bureau Equifax, called "The Work Numbers." n196 The database contains 54 million active salary and employment records and more than 175 million historical records from approximately 2,500 U.S. employers. n197 Equifax also sells this same data to credit card issuers, property managers, and auto lenders. n198

Finally, the government can intercept the data using wiretaps, bugs, and Trojan horses among many other available tools. The NSA collects much of its data by tapping directly into telecommunications cables, both domestically and abroad. n199 These cables are owned by private-sector telecommunications companies, not the U.S. Government. n200 According to top-secret records provided by Edward Snowden, every day the NSA "Acquisitions Directorate" collects millions of records from Yahoo and Google this way. n201 Apparently, "from undisclosed interception points, the NSA ... copies entire data flows across fiber-optic cables that carry information among the data centers of the Silicon Valley giants." n202 In just one month, the NSA had collected nearly 200 million new records, which included metadata and the content of text, audio, and video. n203 In a classic case of the pot calling the kettle black, a representative from Google blasted these activities, [*413] saying, "We are outraged at the lengths to which the government seems to have gone to intercept data from our private fiber networks ... ." n204 A spokesperson for Yahoo remained more reserved, saying, "We have strict controls in place to protect the security of our data centers, and we have not given access to our data centers to the NSA or to any other government agency." n205 Google has since encrypted its dataflows between its data centers in an effort to secure its customers' data from the NSA's prying eyes. n206

Section 702 limit doesn't resolve perception problems – the fundamental issue is fear of PRISM

Granick, 13 – civil liberties director for the Center for Internet and Society at Stanford Law School (Jennifer, "REFORMING FISA: A CRITICAL LOOK AT THE WYDEN/UDALL PROPOSAL AND FOREIGN SURVEILLANCE" 9/30, http://cyberlaw.stanford.edu/publications/reforming-fisa-critical-look-wydenudall-proposal-and-foreign-surveillance

Rather than focus on section 215, I want to focus in this post on the bill's proposed reforms to section 702 of the FISA Amendments Act, or FAA. This is the provision underlying the PRISM program—and its use to obtain the content of phone calls and Internet messages, which Glenn Greenwald revealed based on Edward Snowden's documentation. There's been less discussion of the problems with section 702 than of those with section 215, even as we've learned some worrisome things about the way the NSA uses this legal authority. The new bill would address some, but by no means all, of these problems. In my opinion, it needs to be broader.

I. Bacgkround

First, some legal and technological background is in order. Traditional FISA required the government to show probable cause that the target of the underlying foreign intelligence surveillance was an agent of a foreign power and would use the facilities at which the government planned to direct surveillance before conducting electronic surveillance. This probable cause requirement had the practical effect of limiting surveillance to communications to or from individuals who are reasonably believed to be working for another government or a terrorist group.

In addition to the expansions created in 2001 by the USA PATRIOT Act (including section 215), section 702 of the FAA created a new source of authority for conducting warrantless electronic surveillance. If the Attorney General and the Director of National Intelligence certify that the purpose of the monitoring is to collect foreign intelligence information about any non-American individual or entity not known to be in the United States, the Foreign Intelligence Surveillance Court (FISC) can require companies to provide access to Americans' international communications. The court does not approve the target or the facilities to be monitored, nor does it assess whether the government is doing enough to minimize the intrusion, correct for collection mistakes, and protect privacy. Once the court approves the certification, the government can issue top-secret directives to Internet companies like Google and Facebook to turn over calls, e-mails, video and voice chats, photos, voice-over IP calls (like Skype), and social networking information.

Enter, PRISM. PRISM surveillance is technologically complicated, involving both the aforementioned directives demanding that companies turn over the contents of user Internet messages, as well as upstream surveillance conducted directly on the fiber optic cables carrying telecommunications and Internet traffic. Pulling the right stuff off the cables as it travels is a technological challenge. Reports suggest that one way the NSA has accomplished this surveillance is via the XKeyScore tool, which appears to copy and temporarily store almost everything that flows over the network, filter that traffic based on various selection criteria, and store the subset in different databases for longer periods of time. No one has yet identified the legal authority under which the NSA justifies XKeyScore. It cannot be the FAA because that law does not authorize copying everything, even for a short period of time.

Leaving that question aside for now, I want to highlight several pernicious results of the FISA Amendments Act or FAA.

Americans' communications with targets overseas are subject to warrantless interception. Once those communications are collected, current rules allow the NSA to search the trove for U.S. person identifiers, which Wyden has referred to as the "back door searches loophole".

The non-U.S. targets include regular people, not just those who are agents of foreign powers. While analysts provide their foreign intelligence purpose when selecting the target, the rationale is just one short sentence.

By untethering surveillance from facilities that the target uses, the FAA greatly increased the opportunity for the NSA to collect information about rather than just to or from the target. As an example, if I monitor a network for "Jennifer Granick" and Jennifer Granick uses that network, I'll get her communications, and maybe some messages about her. If I can monitor any facility for "Jennifer Granick", I'm going to pull only messages about, but not to or from her.

II. The Wyden/Udall Proposal

Enter the new bill. The fact sheet says the Intelligence Oversight and Surveillance Reform Act would reform section 702 to:

Close the "back door searches" loophole;

Prohibit the government from collecting communications that are "about the target", in non-terrorism contexts;

Strengthen the prohibition against "reverse targeting," or targeting a foreigner in order to warrantlessly acquire the communications of an American who is known to be communicating with that foreigner; and

Place stronger statutory limits on the use of unlawfully collected information.

These are critical reforms. I would like to see the bill further include a higher standard of care with regards to ensuring that people inside the U.S. are not targeted. As Professor Christopher Sprigman and I argued in the New York Times, PRISM is designed to produce at least 51 percent confidence in a target's "foreignness" — as John Oliver of "The Daily Show" put it, "a coin flip plus 1 percent." In other words, 49 percent of the time the NSA may be acquiring information it is not allowed to have, even under the terrifyingly broad auspices of the FAA.

More fundamentally, though, the Wyden/Udall bill does not fully address a fundamental problem with the FAA, which is that it authorizes surveillance of average citizens of other countries for reasons that are not necessarily related to the security of the United States. Senator Udall acknowledged in the press conference announcing the bill (at 30:17) that the NSA's unfettered spying has had and will continue to have an adverse economic effect on U.S.-based businesses, and that this is one of the motivations behind the bill.

Prohibiting "about the target" collection is one giant step forward. That would mean that non-targets outside the U.S. could not be subject to surveillance under this law just because they talk about a target, unless their conversation is related to terrorism. Depending on the details of the targeting and minimization procedures, if my British friend in London and I email about our dismay over the Kenya attacks, that would be fair game, but our conversation about the policies of Brazilian President Dilma Roussef would be off limits.

However, targets still need not be agents of foreign powers so long as a significant purpose of the collection is foreign intelligence. Foreign intelligence is broad, and includes any information that "relates to" the conduct of U.S. foreign affairs. For example, DNI James Clapper affirmed that the U.S. collects information about economic and financial matters to "provide the United States and our allies early warning of international financial crises which could negatively impact the global economy … or to provide insight into other countries' economic policy or behavior which could affect global markets."

Monitoring economic and financial matters is in the United States' national interest. However, routine eavesdropping upon common foreigners to discover information about these matters is a bad idea. First, foreigners have privacy rights, too. Freedom from arbitrary interference with one's privacy is part of the Universal Declaration of Human Rights.

Next, this monitoring is detrimental to U.S. companies and to the United States' long-term interests in promoting democratic ideals. As Sprigman and I argue, although it may be legal, unfettered U.S. spying on foreigners will cause serious collateral damage to America's technology companies, to our Internet-fueled economy, and to human rights and democracy the world over. Since our Atlantic article on June 28th, and the disclosure that the NSA targeted both Petrobras and President Dilma Roussef, Brazil has announced that it will look into requiring Internet companies to store its citizens' data locally, and take other steps that threaten to balkanize the global Internet. When Brazil takes these steps, it gives comfort and cover to authoritarian countries who will do the same, so that they can better censor, spy on, and control Internet access within their own borders.

--xt – domestic only limit

The domestic-only limit prevents solvency

Kehl, 14 – Policy Analyst at New America's Open Technology Institute (Danielle, "Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity" July, https://www.newamerica.org/oti/surveillance-costs-the-nsas-impact-on-the-economy-internet-freedom-cybersecurity/

It appears that little consideration was given over the past decade to the potential economic repercussions if the NSA's secret programs were revealed.38 This failure was acutely demonstrated by the Obama Administration's initial focus on reassuring the public that its programs primarily affect non-Americans, even though non-Americans are also heavy users of American companies' products. Facebook CEO Mark Zuckerberg put a fine point on the issue, saying that the government "blew it" in its response to the scandal. He noted sarcastically: "The government response was, 'Oh don't worry, we're not spying on any Americans.' Oh, wonderful: that's really helpful to companies [like Facebook] trying to serve people around the world, and that's really going to inspire confidence in American internet companies."39 As Zuckerberg's comments reflect, certain parts of the American technology industry are particularly vulnerable to international backlash since growth is **heavily dependent on foreign markets**. For example, the U.S. cloud computing industry has grown from an estimated $46 billion in 2008 to $150 billion in 2014, with nearly 50 percent of worldwide cloud-computing revenues coming from the U.S.40 R Street Institute's January 2014 policy study concluded that in the next few years, new products and services that rely on cloud computing will become increasingly pervasive. "Cloud computing is also the root of development for the emerging generation of Web-based applications—home security, outpatient care, mobile payment, distance learning, efficient energy use and driverless cars," writes R Street's Steven Titch in the study. "And it is a research area where the United States is an undisputed leader."41 This trajectory may be dramatically altered, however, as a consequence of the NSA's surveillance programs.

The NSA doesn't comply with foreignness designation requirements

Gellman, 14 – staff writer for the Washington Post; won 3 Pullitzer Prizes (Barton, Washington Post, "In NSA-intercepted data, those not targeted far outnumber the foreigners who are" 7/5, http://www.washingtonpost.com/world/national-security/in-nsa-intercepted-data-those-not-targeted-far-outnumber-the-foreigners-who-are/2014/07/05/8139adf8-045a-11e4-8572-4b1b969b6322_story.html

When NSA and allied analysts really want to target an account, their concern for U.S. privacy diminishes. The rationales they use to judge foreignness sometimes stretch legal rules or well-known technical facts to the breaking point.

In their classified internal communications, colleagues and supervisors often remind the analysts that PRISM and Upstream collection have a "lower threshold for foreignness 'standard of proof' " than a traditional surveillance warrant from a FISA judge, requiring only a "reasonable belief" and not probable cause.

One analyst rests her claim that a target is foreign on the fact that his e-mails are written in a foreign language, a quality shared by tens of millions of Americans. Others are allowed to presume that anyone on the chat "buddy list" of a known foreign national is also foreign.

In many other cases, analysts seek and obtain approval to treat an account as "foreign" if someone connects to it from a computer address that seems to be overseas. "The best foreignness explanations have the selector being accessed via a foreign IP address," an NSA supervisor instructs an allied analyst in Australia.

Apart from the fact that tens of millions of Americans live and travel overseas, additional millions use simple tools called proxies to redirect their data traffic around the world, for business or pleasure. World Cup fans this month have been using a browser extension called Hola to watch live-streamed games that are unavailable from their own countries. The same trick is routinely used by Americans who want to watch BBC video. The NSA also relies routinely on locations embedded in Yahoo tracking cookies, which are widely regarded by online advertisers as unreliable.

--XT – section 702 fails

FAA isn't a real check – aff author concedes

Eoyang and Bishai, 15 - *Mieke Eoyang is the Director of the National Security Program at Third Way, a center-left think tank. She previously served as Defense Policy Advisor to Senator Edward M. Kennedy, and a subcommittee staff director on the House Permanent Select Committee on Intelligence, as well as as Chief of Staff to Rep. Anna Eshoo (D-Palo Alto); **Chrissy Bishai is a Fellow at Third Way ("Restoring Trust between U.S. Companies and Their Government on Surveillance Issues" 3/19, http://www.thirdway.org/report/restoring-trust-between-us-companies-and-their-government-on-surveillance-issues

Of course, FAA Exclusivity wouldn't solve every problem. It would not prevent foreign governments from collecting information themselves and then providing it to U.S. intelligence agencies, as U.S. law cannot bind a foreign government. And some may argue that FAA provides inadequate civil liberties protections for Americans. This proposal says nothing about the adequacy of that statute in this respect. What it says is that for data held by an American company about a target that is not a U.S. person, the checks within FAA are stronger than those solely under E.O. 12333.

AT: FISC oversight

FISC oversight approved NSA targeting because the NSA lacks the technical capability to distinguish between domestic and foreign targets

Donohue, 15 - Professor of Law, Georgetown University Law Center (Laura, "SECTION 702 AND THE COLLECTION OF INTERNATIONAL TELEPHONE AND INTERNET CONTENT" 38 Harv. J.L. & Pub. Pol'y 117, Winter, lexis)

6. FISC Oversight of Targeting Procedures

FISC first became aware of the implications of the NSA's interpretation of TFA in 2011. n283 The court was surprised by the government's admission that it would have to intercept significantly more content to scan it for relevant information. In its first Section 702 docket, the government had indicated that the acquisition of telephonic communications:

would be limited to "to/from" communications--i.e., communications to or from a tasked facility. The government explained, however, that the Internet communications acquired would include both to/from communications and "about" communications--i.e., communications containing a reference to the name of the tasked account . . . . Based upon the government's descriptions of the proposed collection, the Court understood that the acquisition of Internet communications under Section 702 would be limited to discrete "to/from" communications between or among individual account users and to "about" communications falling within [redacted] specific categories that had been first described to the Court in prior proceedings. n284

In reviewing and granting the application for an order, the court had not taken into account the NSA's acquisition of Internet [*191] transactions, which "materially and fundamentally alter[ed] the statutory and constitutional analysis." n285

FISC was troubled by the government's revelations--making it the third time in less than three years in which the NSA had disclosed a "substantial misrepresentation" on "the scope of a major collection program." n286 One of three possibilities held: the court was particularly slow, the government had been lying, or the government had made a mistake. Regardless, "[t]he government's submissions make clear not only that NSA has been acquiring Internet transactions since before the Court's approval of the first Section 702 certification in 2008, but also that NSA seeks to continue the collection of Internet transactions." n287

FISC noted that it is a crime to "engage[] in electronic surveillance under color of law except as authorized" by statute or . . . to "disclose[] or use[] information obtained under color of law by electronic surveillance, knowing or having reason to know that the information was obtained through electronic surveillance not authorized" by statute. n288 Yet, to the extent that MCTs contained communications that the NSA was not supposed to collect (in other words, wholly domestic communications), this appeared to be precisely what had occurred with regard to the NSA's upstream collection. n289

In its October 2011 memorandum opinion, the court confronted two areas: first, targeting procedures as applied to the acquisition of communications other than Internet transactions -- that is, "discrete communications between or among the users of telephone and Internet communications facilities that are to or from a facility tasked for collection." n290 As in the past, the court found the targeting procedures with regard to non-Internet transactions to be sufficient. Second, the court considered de novo the sufficiency of the government's targeting procedures in

relation to Internet transactions [*192] transactions. n291 Despite the acknowledgement by the government that it knowingly collected tens of thousands of messages of a purely domestic nature, FISC found the procedures consistent with the statutory language that prohibited the intentional acquisition of domestic communications. n292

The court's analysis of the targeting procedures focused on upstream collection. n293 At the time of acquisition, the collection devices lacked the ability to distinguish "between transactions containing only a single discrete communication to, from, or about a tasked selector and transactions containing multiple discrete communications, not all of which may be to, from, or about a tasked selector." n294 The court continued: "As a practical matter, this means that NSA's upstream collection devices acquire any Internet transaction transiting the device if the transaction contains a targeted selector anywhere within it." n295 Because of the enormous volume of communications intercepted, it was impossible to know either how many wholly domestic communications were thus acquired or the number of non-target or U.S. persons' communications thereby intercepted. n296 The number of purely domestic communications alone was in the tens of thousands. n297

Despite this finding, FISC determined that the targeting procedures were consistent with the statutory requirements that they be "reasonably designed" to (1) "ensure that any acquisition authorized under [the certifications] is limited to targeting persons reasonably believed to be located outside the United States" and (2) "prevent the intentional acquisition of any communication as to which the sender and all intended recipients are known at the time of the acquisition to be located in the United States." n298

To reach this conclusion, the court read the statute as applying, in any particular instance, to communications of individuals "known at the time of acquisition to be located in the United [*193] States." n299 As the equipment did not have the ability to distinguish between purely domestic communications and international communications, the NSA could not technically know, at the time of collection, where the communicants were located. From this, the court was "inexorably led to the conclusion that the targeting procedures are 'reasonably designed' to prevent the intentional acquisition of any communication as to which the sender and all intended recipients are known at the time of the acquisition to be located in the United States." n300 This was true despite the fact that the NSA was fully aware that it was collecting, in the process, tens of thousands of domestic communications. n301 As far as the targeting procedures were concerned, at least with regard to MCTs, the NSA had circumvented "the spirit" but not the letter of the law. n302

The court's reading led to an extraordinary result. The statute bans the knowing interception of entirely domestic conversations. The NSA said that it knowingly intercepts entirely domestic conversations. Yet the court found its actions consistent with the statute.

A few points here deserve notice. First, it is not immediately clear why the NSA is unable to determine location at the moment of intercept and yet can ascertain the same at a later point. Second, in focusing on the technical capabilities of any discrete intercept, the court encouraged a form of willful blindness--that is, an effort to avoid criminal or civil liability for an illegal act by intentionally placing oneself into a position to be unaware of facts that would otherwise create liability. n303 In light of the court's interpretation, [*194] the NSA has a diminished interest in determining at the point of intercept whether intercepted communications are domestic in nature.

Its ability to collect more information would be hampered. So there is a perverse incentive structure in place, even though Congress intended the provision to protect individual privacy.

The Executive Branch kept Congress fully informed about FISC's concerns with regard to MCTs and the collection of domestic conversations. Senator Dianne Feinstein later noted that the Intelligence and Judiciary Committees had received more than 500 pages of information four days after Judge Bates' opinion, relating to the operation of Section 702. n304 Following receipt of the information (which addressed domestic communications and the knowing interception of U.S. persons' information), the Senate Intelligence Committee held a closed hearing at which the matter was discussed. n305 In December 2011, the committees received more than 100 more pages of related materials, which became the focus of another closed hearing on February 9, 2012. n306

7. Law as Written Versus Law as Applied

In terms of statutory interpretation and the knowing collection of wholly domestic conversations, Congress and FISC knew what was happening and allowed PRISM and upstream collection to continue. The situation thus could be read as one in which all three branches of the government agreed: Congress passed the FAA, the intelligence community interpreted and applied it, and the judiciary extended its blessing.

Nevertheless, in light of the highly classified nature of the programs, and their direct impact on individual rights, there is something troubling about having the only public portion of the authorities--the law--suggest one thing, when in reality the statute is being understood and applied in the opposite manner. In this case, for example, the statute's plain language suggests that a particularized judicial order is required to intercept U.S. persons' international communications and that the NSA may not knowingly intercept wholly domestic conversations. Yet FISC sanctioned the scanning and potential collection of significant portions of U.S. [*195] persons' international communications, absent any particularized order, and it allowed the NSA to knowingly collect tens of thousands of wholly domestic conversations. Although national security is a matter of the highest importance, given the secrecy involved in the enterprise, one would expect a higher level of due diligence from those entrusted with oversight.

The targeting provisions also raise questions about the role in which Congress is placing FISC. In the FAA, Congress for the first time inserted a role for the court into the process of obtaining foreign intelligence outside the United States, but it also severely circumscribed FISC's authority. The court in some ways thus appears to be acting in the capacity of an oversight body, generally ensuring that procedures are in place and asking the NSA to police itself. Beyond the immediate question about the appropriate role for the court, as discussed above. n307

Ex post CP

1nc – ex post CP

Text:

The United States federal government should:

--require ex post review by the Foreign Intelligence Surveillance Court of NSA surveillance targeting criteria

--establish a public advocate at the FISC

--establish a cabinet-level privacy agency

The CP restore domestic and international confidence in US surveillance without restricting the scope of NSA activities – instead it conducts post-surveillance minimization

Margulies, 14 - Professor of Law, Roger Williams University School of Law ("CITIZENSHIP, IMMIGRATION, AND NATIONAL SECURITY AFTER 9/11: THE NSA IN GLOBAL PERSPECTIVE: SURVEILLANCE, HUMAN RIGHTS, AND INTERNATIONAL COUNTERTERRORISM" 82 Fordham L. Rev. 2137, April, lexis)

While I have concluded that U.S. surveillance policy does not violate the ICCPR, further reforms could highlight this point and silence persistent doubts here and abroad. These reforms could also remove any barriers to cooperation between the United States and foreign states, such as those in Europe, which are subject to the European Convention on Human Rights. This section identifies reforms that would add a public advocate to FISC proceedings, enhance FISC review of the criteria used for overseas surveillance, establish a U.S. privacy agency that would handle complaints from individuals here and overseas, and require greater minimization of non-U.S. person communications. These reforms would signal U.S. support of evolving global norms of digital privacy.

Although President Obama's speech in January 2014 proposed a panel of independent lawyers who could participate in important FISC cases, n161 further institutionalization of this role would be useful. A public advocate would scrutinize and, when necessary, challenge the NSA's targeting criteria on a regular basis. n162 Challenges would be brought in the FISC, after the NSA's implementation of criteria. The NSA would be able to adapt the criteria on an exigent basis, **subject to ex post review** by the FISC at the public advocate's behest. A public advocate and enhanced FISC review would serve three valuable functions: (1) ensure that the FISC received the best arguments on both sides; (2) serve as a valuable ex ante check on the government, encouraging the government to adopt those criteria that could withstand subsequent scrutiny; and (3) **promote domestic and global confidence in the legitimacy of processes governing NSA surveillance**.

A U.S. cabinet level privacy agency would also **bolster the legitimacy of surveillance**. The agency could provide more regular recourse to subjects of surveillance, as the ECHR requires. That change would ease the barriers to continued U.S.-Europe cooperation on counterterrorism. A national agency would also work hand in hand with privacy officers in executive departments. It would increase the leverage of those officials, who could advocate vigorously in internal debates, knowing that their views would also have a champion in a free-standing executive department independent [*2166] of the national security bureaucracy. There are downsides to this proposal, of course. A new agency would add expense, and create some redundancy in government functions. Moreover, current models that provide recourse, such as the approach currently taken by the Department of Homeland Security, n163 have been criticized as unduly burdensome. n164 However, preserving cooperation with Europe and enhancing the overall legitimacy of U.S. surveillance provides a compelling justification.

Each of these instrumentalities - a public advocate at the FISC and a new privacy agency - could also work to strengthen minimization requirements for foreign communications. The NSA says that it disposes of all irrelevant communications within five years. There may be ways to shorten this time and require even more rigorous controls on sharing of information that lacks a clear link to terrorism or other foreign intelligence matters. More exacting minimization would also promote U.S.-European information sharing and **enhance global legitimacy**.

The net benefit is terrorism – the plan restricts the collection of 702 surveillance data to individualized and specific threat categories. That prevents the programmatic surveillance necessary for pattern analysis that can identify future terrorist threats

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

Programmatic surveillance initiatives like these differ in simple yet fundamental ways from the traditional forms of monitoring with which many people are familiar--i.e., individualized or particularized surveillance. Individualized surveillance takes place when authorities have some reason to think that a specific, known person is breaking the law. Investigators will then obtain a court order authorizing them to collect information about the target, with the goal of assembling evidence that can be used to establish guilt in subsequent criminal proceedings. Individualized surveillance is common in the world of law enforcement, as under Title III of the Omnibus Crime Control and Safe Streets Act of 1968. n23 It is also used in national security investigations. FISA allows authorities to obtain a court order to engage in wiretapping if they demonstrate, among other things, probable cause to believe that the target is "a foreign power or an agent of a foreign power." n24

By contrast, programmatic surveillance has very different objectives and is conducted in a very different manner. It usually involves the government collecting bulk data and then examining it to identify previously unknown terrorists, spies, and other national security threats. A good example of the practice is link analysis, in [*528] which authorities compile large amounts of information, use it to map the social networks of known terrorists--has anyone else used the same credit card as Mohamed Atta?--and thus identify associates with whom they may be conspiring.

n25 (It is also possible, at least in theory, to subject these large databases to pattern analysis, in which automated systems search for patterns of behavior that are thought to be indicative of terrorist activity, but it's not clear that the NSA is doing so here.) Suspects who have been so identified can then be subjected to further forms of monitoring to determine their intentions and capabilities, such as wiretaps under FISA or other authorities. In a sense, programmatic surveillance is the mirror image of individualized surveillance. With individualized monitoring, authorities begin by identifying a suspect and go on to collect information; with programmatic monitoring, authorities begin by collecting information and go on to identify a suspect.

Programmatic surveillance is a potentially **powerful counterterrorism tool**. The Ra'ed al-Banna incident is a useful illustration of how the technique, when coupled with old-fashioned police work, can identify possible threats who otherwise might escape detection. Another example comes from a 2002 Markle Foundation study, which found that authorities could have identified the ties among all 19 of the 9/11 hijackers if they had assembled a large database of airline reservation information and subjected it to link analysis. n26 In particular, two of the terrorists--Nawaf al-Hamzi and Khalid al-Mihdhar--were on a government watchlist after attending a January 2000 al-Qaeda summit in Malaysia. So they could have been flagged when they bought their tickets. Querying the database to see if any other passengers had used the pair's mailing addresses would have led investigators to three more hijackers, including Mohamed Atta, the plot's operational leader. Six others could have been found by searching for passengers who used the same frequent-flyer and telephone numbers as these suspects. And so on. Again, the Markle study concerns airline reservation data, not the communications data that are the NSA's focus. But it is still a useful illustration of the technique's potential.

The government claims that programmatic surveillance has been responsible for concrete and actual counterterrorism benefits, not just hypothetical ones. Officials report that PRISM has helped detect and [*529] disrupt about 50 terrorist plots worldwide, including ten in the United States. n27 Those numbers include Najibullah Zazi, who attempted to bomb New York City's subway system in 2009, and Khalid Ouazzani, who plotted to blow up the New York Stock Exchange. n28 Authorities further report that PRISM played an important role in tracking down David Headley, an American who aided the 2008 terrorist atrocities in Bombay, and later planned to attack the offices of a Danish newspaper that printed cartoons of Mohamed. n29 The government also claims at least one success from the telephony metadata program, though it has been coy about the specifics: "The NSA, using the business record FISA, tipped [the FBI] off that [an] individual had indirect contacts with a known terrorist overseas. . . . We were able to reopen this investigation, identify additional individuals through a legal process and were able to disrupt this terrorist activity." n30 Quite apart from foiling attacks, the government also argues that the NSA programs can **conserve scarce investigative resources** by helping officials quickly spot or rule out any foreign involvement in a domestic plot, as after the 2013 Boston Marathon bombing. n31

These claims have to be taken with a few grains of salt. Some observers believe that the government could have discovered the plots using standard investigative techniques, and without resorting to extraordinary methods like programmatic surveillance. n32 The metadata program has elicited special skepticism: The President's Review Group on Intelligence and Communications Technologies bluntly concluded that "the information contributed to terrorist investigations by the use of section 215 telephony meta-data was not essential to preventing attacks and could readily have been obtained [*530] in a timely manner using conventional

section 215 orders." n33 The Privacy and Civil Liberties Oversight Board reached the same conclusion. n34 (Judicial opinion is split on the program's value. One judge has expressed "serious doubts" about its utility, n35 while another has concluded that its effectiveness "cannot be seriously disputed.") n36 Furthermore, we should always be cautious when evaluating the merits of classified intelligence initiatives on the basis of selective and piecemeal revelations, as officials might tailor the information they release in a bid to shape public opinion. n37 But even if specific claimed successes remain contested, programmatic surveillance in general can still be a useful counterterrorism technique.

As these examples imply, effective programmatic surveillance often requires huge troves of information--e.g., large databases of airline reservations, compilations of metadata concerning telephonic and internet communications, and so on. This is why it typically will not be feasible to limit bulk collection to particular, known individuals who are already suspected of being terrorists or spies. Some officials have defended the NSA programs by pointing out that, "[i]f you're looking for the needle in a haystack, you have to have the haystack." n38 That metaphor doesn't strike me as terribly helpful; rummaging around in a pile of hay is, after all, a paradigmatic image of futility. But, the idea can be expressed in a more compelling way. Programmatic surveillance cannot be done in a particularized manner. The whole point of the technique is to identify unknown threats to the national security; by definition, it cannot be restricted to threats that have already been identified. We can't limit programmatic [*531] surveillance to the next Mohamed Atta when we have no idea who the next Mohamed Atta is--and when the goal of the exercise is indeed to identify the next Mohamed Atta.

2nc – ex post solves

The CP's ex post review process deters executive abuse and restores legitimacy to US surveillance

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

As for the structural considerations, one of the most important is what might be called an anti-unilateralism principle. A system of programmatic surveillance should not be put into effect on the say-so of the executive branch, but rather should be a collaborative effort that involves Congress (in the form of authorizing legislation) or the judiciary (in the form of FISA court review of the initiatives). n42 An example of the former is FISA itself, which Congress enacted in 1978. At the time, the NSA was engaged in bulk collection, without judicial approval, of certain international communications into and out of the United States--namely, by tapping into offshore telecommunications cables and by eavesdropping on satellite based radio signals. FISA's [*533] famously convoluted definition of "electronic surveillance" n43 preserved these preexisting practices even as Congress was imposing a new requirement of judicial approval for other kinds of monitoring. n44 An example of the latter concerns the warrantless Terrorist Surveillance Program, under which the NSA was intercepting, outside the FISA framework, certain communications between suspected al-Qaeda figures overseas and people located in the United States. After that program's existence was revealed in late 2005, the executive branch persuaded

the FISA court to issue orders allowing it to proceed subject to various limits. n45 (That accommodation eventually proved unworkable, and the executive then worked with Congress to put the program on a more solid legislative footing through the temporary Protect America Act of 2007 n46 and the permanent FISA Amendments Act of 2008.) n47

Anti-unilateralism is important for several reasons. To take the most obvious, Congress and the courts can help prevent executive overreach. n48 The risk of abuse is lessened if the executive branch must enlist its partners before commencing a new surveillance initiative. Congress might decline to permit bulk collection in circumstances where it concludes that ordinary, individualized monitoring would suffice, or it might **authorize programmatic surveillance** subject to various privacy protections. In addition, inviting many voices to the decision-making table increases the probability of sound outcomes. More participants with diverse perspectives can also help mitigate the groupthink tendencies to which the executive branch is sometimes [*534] subject. n49 If we're going to engage in programmatic surveillance, it should be the result of give and take among all three branches of the federal government, or at least between its two political branches, not the result of executive edict.

A second principle follows from the first: Programmatic surveillance should, wherever possible, have explicit statutory authorization. Congress does not "hide elephants in mouseholes," n50 the saying goes, and we should not presume that Congress meant to conceal its approval of a potentially controversial programmatic surveillance system in the penumbrae and interstices of obscure federal statutes. Instead, Congress normally should use express and specific legislation when it wants to okay bulk data collection. Clear laws will help remove any doubt about the authorized scope of the approved surveillance, thereby **promoting legal certainty**. Express congressional backing also helps give the monitoring an **air of legitimacy**. And, a requirement that programmatic surveillance usually should be approved by clear legislation helps promote accountability by minimizing the risk of congressional shirking. n51 If the political winds shift, and a legislatively approved program becomes unpopular, Congress will not be able to hide behind an ambiguous statutory grant of power and deflect responsibility to the President.

Ex post oversight is key to effective programmatic surveillance – the CP allows the government to collect all available data – it just puts ex post restrictions on the data analysis stage that deters executive data abuses

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

As for the operational considerations, among the most important is the need for external checks on programmatic surveillance. In particular, bulk data collection should have to undergo some form of judicial review, such as by the FISA court, in which the government demonstrates that it meets the applicable constitutional and statutory standards. Ideally, the judiciary would give its approval before collection begins. But this will not always be possible, in which case timely post-collection judicial review will have to suffice. (FISA has a comparable mechanism for temporary warrantless surveillance in emergency situations.) n60 Programmatic surveillance also should be subject to robust congressional oversight. This could take a variety of forms, including informal

consultations with members of Congress when designing the surveillance regime (including, at a minimum, congressional leadership and members of the applicable committees), [*537] as well as regular briefings to appropriate personnel on the operation of the system and periodic oversight hearings.

Of course, judicial review in the context of bulk collection won't necessarily look the same as it does in the familiar setting of individualized monitoring of specific targets. If investigators want to examine the telephony metadata associated with a particular terrorism suspect, they can apply to the FISA court for a pen register or trap and trace order upon a showing that the information sought is relevant to an ongoing national security investigation. n61 But, as explained above, that kind of particularized showing often won't be possible where authorities are dealing with unknown threats, and where the very purpose of the surveillance is to identify those threats. In these situations, reviewing courts may find it necessary to allow the government to collect large amounts of data without individualized suspicion. This doesn't mean that privacy safeguards must be abandoned and the executive given free rein. Instead, courts could be tasked with scrutinizing the initiative's overall structure and operation to determine its compatibility with constitutional and statutory requirements. And courts further could require authorities to demonstrate some level of individualized suspicion before accessing the data that has been collected. Protections for privacy and civil liberties thus can migrate from the collection phase of the intelligence cycle to earlier and later stages, such as the systems design and analysis stages. n62

In more general terms, because programmatic surveillance involves the collection of large troves of data, it likely means some dilution of the familiar ex ante restrictions that protect privacy by constraining the government from acquiring information in the first place. It therefore becomes critically important to devise **meaningful ex post safeguards** that can achieve similar forms of privacy protection. In short, restrictions on the government's ability to access and use data that it has gathered must substitute for restrictions on the government's ability to gather that data at all; what I have elsewhere called **use limits must stand in for collection limits**. n63

This sort of oversight by the courts and Congress provides an obvious, first-order level of protection for privacy and civil liberties--an external veto serves as a direct check on possible executive [*538] misconduct. Judicial and legislative checks also offer an important second-order form of protection. The **mere possibility** of an outsider's veto can have a chilling effect on executive misconduct, discouraging officials from questionable activities that would have to undergo, and might not survive, external review. n64 Moreover, external checks can channel the executive's scarce resources into truly important surveillance and away from relatively unimportant monitoring. This is so because oversight increases the administrative costs of collecting bulk data--e.g., preparing a surveillance application, persuading the judiciary to approve it, briefing the courts and Congress about how the program has been implemented, and so on. These increased costs encourage the executive to prioritize collection that is expected to yield truly valuable intelligence and, conversely, to forego collection that is expected to produce information of lesser value.

Ex ante requirements amount to a rubber stamp

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

The FISC approves virtually every application for an order with which it is presented. According to Electronic Privacy Information Center (EPIC) statistics, the court denied only five applications from its inception through 2006.40 In that time, it has approved thousands of others, including a new high of 2176 in 2006.41 Of course, "[i]t is possible to draw divergent conclusions from this data. One could infer that the extensive FISA safeguards have forced the Executive to self-censor its requests. One could also argue, however, that the **courts act merely as a 'rubber stamp'** whenever the Executive invokes national security."42 Upon analyzing FISA's structure and track record, the nature of electronic surveillance in service of national security, and more general separation of powers and national security lessons, it seems that something more like the latter is the ultimate result of FISA.

Limitations inherent in the project of judicial pre-approval of national security surveillance render the system unable to perform the function for which it was created; each of the problems described below mutually reinforces the others, leading to **systemic ineffectiveness**. In the absence of the notice requirements that attach in domestic surveillance, 43 and in light of the ex parte nature of FISC proceedings, no opportunity for meaningful review may ever present itself.44 "The potential for abuse is substantial, since all applications remain sealed and unavailable to the public, and since targets are never notified that they have been under surveillance."45

The lack of adversariality, reliance on executive representations and national security framing mean it's a rubber stamp

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

1. Non-adversariality. — One of the most striking elements of the FISA system is the total absence of adversariality. Because the collection of intelligence in this context requires by its very nature that the surveilled party not receive notice in advance, the ex ante approval system is almost by definition also ex parte. This puts the FISC in an "anomalous position,"46 in the words of the current Attorney General, similar to that of a court reviewing FISA materials for admission in a criminal case. In such situations, "[t]he judge is forced not only to act as an arm of the prosecution in weighing the prosecution's arguments about whether disclosure would or would not compromise national security, but also to act as a defense lawyer in determining whether the information is useful to the defendant."47 Similarly, in reviewing a FISA application, the FISC must attempt the difficult, if not impossible, task of simultaneously occupying the roles of advocate and neutral arbiter — all without the authority or ability to investigate facts or the time to conduct legal research.48 The judge lacks a skeptical advocate to vet the government's legal arguments, which is of crucial significance when the government is always able to claim the weight of national security expertise for its position. It is questionable whether courts can play this role effectively, and, more importantly, whether they should.49

2. Reliance on Executive Representations. — One frequently overlooked element of the FISA system is its almost complete reliance upon the Executive's representations and willingness to

abide by the statutory terms.50 This would be all the more true if Congress lowers the degree of factual specificity necessary for issuance of a FISC order, a change that is included in both the Senate and House bills.51 Even under the current standard, however, the FISC cannot inquire behind the representations made by the applicant; so long as the applicant presents a "statement of facts showing that there are reasonable grounds"52 for the order to issue, "the judge shall enter an ex parte order as requested."53

There is a strong connection between the difficulties of relying on executive branch representations and the ex parte nature of the FISC inquiry: the FISC lacks the presence of an adversarial voice drawing into focus any concerns with an application. In this sense, the two problems are mutually reinforcing. Indeed, the FISC on one occasion detailed "misstatements and omissions of material facts" that the government confessed "in some 75 FISA applications,"54 problems that did not come to light at the time the orders were issued. In this context it is also worth noting that the Executive has never actually accepted that it is bound by FISA, citing inherent presidential authority over national security under Article II of the Constitution.55 The current administration acted in part on this basis in operating the TSP.56 Lacking the ability to initiate an inquiry beyond what the Executive brings to its attention, the FISC's oversight of the process is substantially controlled by the very entity it is designed to oversee.

3. Institutional Limitations of the Judiciary. — Even if the above problems could be overcome, institutional factors that are inherent in the national security arena will always function to limit the ability of the judiciary to serve as an effective check. First, the surveillance that FISA deals with necessarily involves secrecy, inherently requires policy judgments, and takes place in the context of the increased powers of the Executive in the national security arena. As a result, policymakers are rightly fearful of giving too much review power to courts and face inevitable pressure to scale back the amount of decisionmaking authority left to the judiciary.

Second, the courts are, and have always been, extremely passive in exercising jurisdiction over cases touching upon national security, both because of the reasons just noted (political judgment and executive power) and because of resultant concerns for institutional legitimacy and judicial restraint.57 Courts tend to be highly deferential because of "concern for the efficiency and expertise of the nation's foreign intelligence process and the deleterious effects that might result from judicial interference."58 Judges are most certainly aware of the limits of their own policy expertise. This effect is greatly enhanced when judges must weigh the national security necessity ex ante, rather than being asked to review it after the fact.

Indeed, it is interesting to note that the scope of review exercised by the FISC has steadily narrowed over time. To be sure, it was narrow to begin with,59 but both legislative action and limiting constructions applied by the courts themselves have narrowed the FISC's authority even further. For example, when Congress amended FISA to require only that national security be a "significant purpose," rather than the "primary purpose," of the surveillance for which authorization is sought,60 the FISCR read the statutory shift quite broadly. It held that when surveillance of a foreign agent is undertaken for purposes of both national security and law enforcement, the government need only "entertain[] a realistic option of dealing with the agent other than through criminal prosecution" in order to satisfy the test.61 The court reasoned that the new provisions "eliminated any justification for the FISA court to balance the relative weight the government places on criminal prosecution as compared to other counterintelligence responses."62 Yet this seems a far less robust limit than the plain language or legislative history indicated: importantly, the legislature considered and rejected requiring only "a" rather than "a significant"

purpose.63 Given a hint of statutory ambiguity, then, the court effectively read the requirement of "significant purpose" out of the statute, resulting in a regime of even less exacting scrutiny. Ultimately, "[t]hrough a combination of government tactics, the mandate of the FISA court, and federal court interpretations of the FISA law, the FISA safeguards which were intended to balance individual rights against the government's claims of national security have been essentially eviscerated."64

As a result, "[c]harging a panel of federal judges with insufficient background information on specific cases, and little intelligence experience, with approving foreign intelligence surveillance applications has resulted in an essentially rubber stamp process where applications are practically never denied."65 Primary reliance on judicial oversight will virtually always tend toward deference, both in exercising jurisdiction and in determining individual cases.

Ex ante review undermines effective restrictions on domestic surveillance and shuts down an engaged citizenry

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

Ex ante judicial review is not only of limited effectiveness, but it is also affirmatively harmful in several respects. Ex ante judicial approval imparts a broader imprimatur of validity than is warranted given the limited effectiveness of the review. Further, it clouds accountability and can be a cumbersome and intrusive process harmful to national security interests. In fact, "the creation of FISA courts may actually have resulted in fewer restrictions on the domestic surveillance activities of intelligence agencies"69 because "[t]he secrecy that attends FISC proceedings, and the limitations imposed on judicial review of FISA surveillance, may insulate unconstitutional surveillance from any effective sanction."70

1. The Judicial Imprimatur. — The issuance of an order by the FISC confers a stamp of approval from the widely respected Article III courts. A FISC order makes a strong statement that a neutral arbiter has looked closely at the situation and found the surveillance warranted. Yet, as the set of limitations just discussed indicates, the protective force of a FISC order may not align with the actual vigor of the inquiry.

This disparity may give rise to several problems. First, changed circumstances following the issuance of the order may undermine the validity of the surveillance. Minimization procedures are largely unhelpful in solving this problem: "[T]he Act provides for the same kind of incoherent and largely unenforceable 'minimization' requirements that plague criminal wiretap statutes."71 Much more importantly, the judicial order may mask and indeed later provide cover for improper governmental motives and improper intrusions on liberty.72 In these situations, ex ante review may **sanitize the improper surveillance**. The presence of the judicial order may function to dissuade legislative or executive oversight entities from inquiry. Worse, judicial orders offer the potential for the government to hide behind the nominally objective, even if only minimally rigorous, scrutiny that they represent.

Surveillance conducted for political reasons, for example, might escape detection, condemnation, and consequences — political, if not legal — if that surveillance is given judicial protection.73 Indeed, this sanitization could occur on an even broader level: ex ante judicial approval interferes with the healthy public skepticism that attends political actors and that may help keep the citizenry engaged in considering the difficult tradeoffs between liberty and security necessary in this context. This is not to say that the judiciary should decline to play a constitutionally permissible role; rather, the point is that system designers concerned with protecting civil liberties should keep in mind the drawbacks of ex ante approval. In total, the capacity of ex ante approval to enable some of the most dangerous sorts of abuses far outweighs its middling ability to provide a useful check.

Ex ante review undermines political accountability – key to checking abuses and fostering public engagement

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

2. Clouded Accountability. — Although several of FISA's provisions recognize the need for clear lines of accountability, the statute's broad structure fails to account for this crucial element. A simple comparison is useful: The Attorney General would be far more politically exposed if he or she signed off on an improper emergency order, which permits an exception to the ex ante approval requirement, rather than a regular FISA order approved by the FISC. In fact, the emergency authorization procedures under 50 U.S.C. § 1805(f) recognize the need for accountability by requiring notice if the application is turned down after the Attorney General has authorized it on an emergency basis.74 Similarly, the personal review provisions of § 1804(e) establish clear lines of authority for approval. But the presence of a judicial order authorizing surveillance permits a culpable official to escape the political consequences of his or her improprieties by using the court's approval as evidence of reasonableness, claiming reasonable reliance, or **foisting blame upon the court.**

Exposing the Attorney General — and through him or her the President — to the political consequences of these decisions is crucial for two reasons: First, it minimizes the possibility of politically motivated surveillance that would pass minimal judicial review, because such invasions of privacy would be seen as wholly illegitimate.75 Second, it would both enable and force the American public to confront the fact that, ultimately, it is responsible for determining the proper balance between liberty and security. The public will be much more comfortable with allowing invasions of fellow citizens' privacy when judges authorize them. In the end, "if a government is intent on engaging in interrogation to protect national security there is little the judges can do about it anyway."76 Forcing citizens to think hard about their values is of particular importance in the context of a vague "war on terror" devoid of identifiable boundaries.

Ex post review creates the best overall balance between liberty and national security
Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

C. The Role of the Courts

While the limitations and dangers associated with ex ante judicial approval of national security surveillance counsel in favor of developing a new core means of protecting civil liberties in this arena, they in no way mandate a complete elimination of the judicial role. To the contrary, an appropriately modified role for the judiciary is of fundamental importance to address some of the limitations of the system of political checks. Ultimately, a return of the judiciary to its pre-FISA role of ex post reasonableness review would permit the federal courts to complement the proposed broader oversight system and to meet Fourth Amendment requirements by restoring judicial focus to individual constitutional rights and relaxing national security pressures on the courts.101

1. Fourth Amendment Strictures. — It is worth noting initially that FISA has always contemplated situations in which full-on ex ante judicial oversight is not necessary to permit domestic electronic surveillance. At present, FISA conceives of three situations in which a court order is not necessary. These are all situations in which the balance in favor of the government is most compelling because the risk to privacy interests is low, the need for dispatch is great, or a drastic change of circumstances takes place. First, 50 U.S.C. § 1802 gives the Attorney General power, upon written certification under oath, to authorize up to one year of electronic surveillance directed at communications "exclusively between or among foreign powers" or "technical intelligence . . . from property or premises under the open and exclusive control of a foreign power" so long as "there is no substantial likelihood that the surveillance will acquire the contents of any communication to which a United States person is a party" and minimization procedures are complied with. Second, under § 1805(f), the Attorney General may authorize emergency surveillance without court interference for seventy-two hours if he or she determines that a standard FISA order could not be acquired in time and that there is a sufficient "factual basis for issuance of an order." Finally, for fifteen days following a declaration of war, § 1811 permits non-court-ordered, Attorney General–authorized surveillance.

Foreign intelligence surveillance occupies a unique spot in the Court's Fourth Amendment jurisprudence.102 In Katz v. United States,103 the Court issued perhaps its sternest statement on the obligation of obtaining a warrant prior to exercising a search,104 while also extending Fourth Amendment protection to include electronic surveillance. 105 Importantly, however, the Court expressly reserved the issue of electronic surveillance in the national security context.106 In United States v. U.S. District Court107 (the Keith case), the Court again focused on the need for "prior judicial scrutiny" in rejecting the government's claim for an exception to the warrant requirement in the domestic national security context.108 Yet once again, the Court made a crucial reservation: "[T]his case involves only the domestic aspects of national security. We have not addressed, and express no opinion as to, the issues which may be involved with respect to activities of foreign powers or their agents."109 It is thus an open constitutional question whether foreign intelligence surveillance falls within an exception to the Fourth Amendment's warrant requirement.

While full argumentation for the proposition that the Fourth Amendment embodies such an exception is beyond the scope of this Note,110 the case law is clear that the true "touchstone of the Fourth Amendment is reasonableness,"111 such that the Fourth Amendment only "[s]ometimes . . . require[s] warrants."112 Especially in light of the increasing number of exceptions to the warrant requirement,113 it seems likely that an exception is appropriate in the context of foreign intelligence surveillance for purposes of national security, not only in terms of meeting a more formalist reading of the Fourth Amendment, but even more forcefully meeting a functionalist reading, under which the improved protections of civil liberties could render the decreased reliance on ex ante judicial review preferable under the Fourth Amendment.

2. Policy Benefits. — A proponent of a national security exception notes that "[t]he repeal of FISA . . . would simply effectuate the nation's return to its previous tradition."114 Yet the obvious retort is that the very abuses detailed in the Church Committee report were a major product of that tradition. Still, the old tradition did have some benefits that can be obtained by coupling the ex post reasonableness role of reviewing courts with the political checks described above. For one, rather than shielding meaningful inquiry, as ex ante review can, ex post review may produce "a renewed focus on Fourth Amendment principles"115 by both the judicial and political branches. Indeed, the more developed factual setting available in ex post review would help with the effort to define reasonableness.

Further, it could be argued that since only a small number of people are likely to be affected by surveillance, and especially given that those affected are likely to be disfavored or underrepresented groups such as members of minority religions or immigrants, the political process cannot be trusted to perform oversight. Yet ex post judicial review would remain a powerful check if the government seeks to use FISA-gathered information in other legal settings, such as criminal trials, habeas corpus proceedings, or motions for prospective relief. Ex post reasonableness review thus provides an important backstop to the oversight process.

IV. CONCLUSION

The current FISA system is illogical. Its purported benefits are at best questionable, and it features serious drawbacks in terms of the efficient functioning of national security surveillance and the numerous ways it undermines protections of liberty. While the Senate bill falls short of instituting the sort of robust political checks buttressed by ex post judicial review necessary to provide adequate protections, it offers an important paradigm shift in the way that FISA is conceived. This reconceptualization should be embraced and bettered by incorporating some of the terms of the House bill, rather than rejected as insufficiently protective of the role of the judiciary. Those concerned with protecting civil liberties should view an end to reliance on ex ante judicial review as a chance to develop real political checks that can vigorously protect both national security and liberty interests.

AT: FISC oversight weak

The public advocate part of the CP and the strengthening of PCLOB to make it a cabinet level agency remedies existing weaknesses of the FISC

Setty, 15 - Professor of Law and Associate Dean for Faculty Development & Intellectual Life, Western New England University School of Law (Sudha, "Surveillance, Secrecy, and the Search for Meaningful Accountability" 51 Stan. J Int'l L. 69, Winter, lexis)

One promising move with regard to oversight and transparency has been the establishment and staffing of the Privacy and Civil Liberties Oversight Board (PCLOB). n186 This board, tasked with assessing many aspects of the government's national security apparatus both for efficacy and for potentially unnecessary incursions into civil liberties, has a broad mandate and, compared with many national security decision makers, significant independence from the executive branch. n187 Retrospectively, the PCLOB has, among other things, issued the highly critical report of the NSA Metadata Program in January 2014 that led to further public pressure on the Obama administration to curtail this program; it is promising that the PCLOB's prospective agenda includes further analysis of various surveillance programs. n188 However, the PCLOB's potential influence in protecting civil rights may be limited by its position: The PCLOB is an advisory body that analyzes existing and proposed programs and possibly recommends changes, but it cannot mandate that those changes be implemented. The ability to have a high level of access to information surrounding counterterrorism surveillance programs and to recommend changes in such programs is important and should be lauded, but over-reliance on the PCLOB's non-binding advice to the intelligence community to somehow solve the accountability and transparency gap with regard to these programs would be a mistake.

For example, on prospective matters, it is likely that intelligence agencies would consult the PCLOB only if the agency itself considers the issue being faced new or novel, as the NSA metadata program was labeled prior to its inception. In such cases, decision makers within an agency generally ask whether the contemplated program is useful or necessary, technologically feasible, and legal. If all three questions are answered affirmatively, the program can be implemented. Now that the PCLOB is fully operational, it seems likely that if a contemplated program is considered new or novel, an intelligence agency would consult the PCLOB at some stage of this process for its guidance on implementing the program. This nonpartisan external input may improve self-policing within the [*102] intelligence community and help intelligence agencies avoid implementing controversial programs or, even if implemented, set better parameters around new programs. n189

If the PCLOB is able to exert some degree of soft power in influencing national security decision-making, then the judiciary represents hard power that could be used to force the protection of civil liberties where it might not otherwise occur. The FISC should be reformed to **include a public advocate** lobbying on behalf of privacy concerns, making the process genuinely adversarial and strengthening the FISC against charges that it merely rubber stamps applications from the intelligence community. n190 Article III courts need to follow the lead of Judge Leon in Klayman in conceptualizing privacy as broad and defensible, even in a world where electronics-based communication is dominant and relatively easy for the government to collect. If the judicial defense of privacy were combined with the possibility of liability for violations of that privacy, it is likely that this would incentivize increased self-policing among the members of the intelligence community. The creation of an active PCLOB and a more adversarial process before the FISC will not provide a perfect solution to the dilemmas posed by the government's legitimate need for

secrecy and the protection of the public against potential abuse. Yet because these changes are institutional and structural, they are well-placed to improve the dynamic between the intelligence community, oversight mechanisms, and the public.

Conclusion

Genuine accountability should not depend on the chance that an unauthorized and illegal leak will occur. In the comparative example of the United Kingdom, engagement with a European Union energized with a commitment to increase privacy protections, along with domestic parliamentary oversight, provide two potential avenues for increased constraint on surveillance. In India, the parliament and the courts historically enabled, not constrained, the intelligence community. Whether that stance will continue as the government's technological capabilities increase is yet to be seen.

Domestically, it could be argued that the types of reform recommended here to improve actual accountability and transparency over programs like the NSA Metadata Program are overkill: They involve multiple branches of government, the PCLOB, and the public. However, much of the accountability apparatus that has been in place was dormant until the Snowden disclosures, and would have remained passive without those disclosures. A multi-faceted, long-term, structural approach [*103] to improving transparency and accountability - one that involves at a minimum the courts and the PCLOB, but hopefully Congress, the executive branch, and the public as well - improves the likelihood of sustained and meaningful accountability as new surveillance capabilities are developed and implemented.

2nc terrorism link wall – FAA restrictions

FISA's authority alone is insufficient to prevent terrorism – the government needs the widest possible net, including domestic surveillance

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 94-96

According to the administration, these are just interceptions of communications to and from the United States in which one of the parties is suspected of terrorist connections, though the suspicion does not rise to the probable-cause level that would be required for obtaining a warrant. There may be more to the program, however. Most likely the next terrorist attack on the United States will, like the last one, be mounted from within the country but be orchestrated by leaders safely ensconced somewhere abroad. If a phone number in the United States is discovered to have been called by a known or suspected terrorist abroad, or if the number is found in the possession of a suspected terrorist or in a terrorist hideout, it would be prudent to intercept all calls, domestic

as well as international, to or from that U.S. phone number and scrutinize them for suspicious content. But the mere fact that a suspected or even known terrorist has had a phone conversation with someone in the United States or has someone's U.S. phone number in his possession doesn't create probable cause to believe that the other person is also a terrorist; probably most phone conversations of terrorists are with people who are not themselves terrorists. The government can't get a FISA warrant just to find out whether someone is a terrorist; it has to already have a reason to believe he's one. Nor can it conduct surveillance of terrorist suspects who are not believed to have any foreign connections, because such surveillance would not yield *foreign* intelligence information.

FISA has yet another gap. A terrorist who wants to send a message can type it in his laptop and place it, unsent, in an e-mail account, which the intended recipient of the message can access by knowing the account name. The message itself is not communicated. Rather, it's as if the recipient had visited the sender and searched his laptop. The government, if it intercepted the e-mail from the intended recipient to the account of the "sender," could not get a FISA warrant to intercept (by e-mailing the same account) the "communication" consisting of the message residing in the sender's computer, because that message had never left the computer.

These examples suggest that **surveillance outside the narrow bounds of FISA might significantly enhance national security**. At a minimum, such surveillance might cause our foreign terrorist enemies to abandon or greatly curtail their use of telephone, e-mail, and other means of communicating electronically with people in the United States who may be members of terrorist sleeper cells. Civil libertarians believe that this is bound to be the effect of electronic surveillance, and argue that therefore such surveillance is futile. There is no "therefore." If the effect of electronic surveillance is to close down the enemy's electronic communications, that is a boon to us because it is far more difficult for terrorist leaders to orchestrate an attack on the United States by sending messages into the country by means of couriers. But what is far more likely is that some terrorists will continue communicating electronically, either through carelessness— the Madrid and London bombers were prolific users of electronic communications, and think of all the drug gangsters who are nailed by wiretaps—or in the mistaken belief that by using code words or electronic encryption they can thwart the NSA. (If they can, the program is a flop and will be abandoned.) There are careless people in every organization. If al-Qaeda is the exception, civil libertarians clearly are underestimating the terrorist menace! In all our previous wars, beginning with the Civil War, when telegraphic communications were intercepted, our enemies have known that we might intercept their communications, yet they have gone on communicating and we have gone on intercepting. As for surveillance of purely domestic communications, it would either isolate members of terrorist cells (which might, as I said, have no foreign links at all) from each other or yield potentially valuable information about the cells.

FISA's limitations are borrowed from law enforcement. When a crime is committed, the authorities usually have a lot of information right off the bat—time, place, victims, maybe suspects—and this permits a focused investigation that has a high probability of eventuating in an arrest. Not so with national security intelligence, where the investigator has no time, place, or victim and may have scant idea of the enemy's identity and location; **hence the need for the wider, finer-meshed investigative net**. It is no surprise that there have been leaks from inside the FBI expressing skepticism about the NSA program. This skepticism reflects the Bureau's emphasis on criminal investigations, which are narrowly focused and usually fruitful, whereas

intelligence is a search for the needle in the haystack. FBI agents don't like being asked to chase down clues gleaned from the NSA's interceptions; 999 out of 1,000 turn out to lead nowhere. They don't realize that often the most that counterterrorist intelligence can hope to achieve is to impose costs on enemies of the nation (as by catching and "turning" some, or forcing them to use less efficient means of communication) in the hope of disrupting their plans. It is mistaken to think electronic surveillance a failure if it doesn't intercept a message giving the time and place of the next attack.

Bureaucratization of ex ante review undermines counter-terrorism investigations

Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

3. The Demands of National Security. — Finally, while the focus of this Note is on the protection of civil liberties, the current system may also do a poor job of promoting security. From an institutional competence perspective, it seems questionable that judges should occupy a gatekeeping role. Indeed, all the reasons discussed above that judges have invoked in reducing their own authority over such issues apply with equal force here.77

The inefficiencies of the current system are even more problematic. Given the permissiveness of the statutory standards and the FISA courts, inefficiency is the primary motivating force behind attempts to reduce judicial oversight. As DOJ has noted, "[n]umerous Congressional and Executive Branch reviews of the FISA process have recommended that the FISA process be made more efficient."78 Others are more forthright, describing the FISC order procedures as "hopelessly slow and bureaucratic."79 On the whole, "if we are seeking a model of judicial review that advances security, there is little reason to think that the FISA Court, at least as currently set up, advances that goal."80

FISA can't identify unknown terrorists – advance surveillance is necessary to generate enough information

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

Programmatic surveillance thus can help remedy some of the difficulties that arise when monitoring covert adversaries like international terrorists. FISA and other particularized surveillance tools are useful when authorities want to monitor targets whose identities are already known. But they are less useful when authorities are trying to identify unknown targets. The problem arises because, in order to obtain a wiretap order from the FISA court, the government usually must demonstrate probable cause to believe that the target is a foreign power or agent of a foreign power. n39 This is a fairly straightforward task when the target's identity is already known--e.g., a diplomat at the Soviet embassy in Washington, DC. But the task is considerably

more difficult when the government's reason for surveillance is to detect targets who are presently unknown--e.g., al-Qaeda members who operate in the shadows. How can you convince the FISA court that Smith is an agent of a foreign power when you know nothing about Smith--his name, nationality, date of birth, location, or even whether he is a single person or several dozen? The government typically won't know those things unless it has collected some information about Smith--such as by surveilling him. And there's the rub. Programmatic monitoring helps avoid the crippling Catch-22 that can arise under particularized surveillance regimes like FISA: officials can't surveil unless they show that the target is a spy or terrorist, but sometimes they can't show that an unknown target is a spy or terrorist unless they have surveilled him.

Ex post restrictions can protect information being used against people for anything other than preventing terrorism

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 98-101)

Concerns with privacy could be alleviated, moreover, by adopting a rule forbidding the intelligence services to turn over any intercepted communications to the Justice Department for prosecution for any offense other than a violation of a criminal law intended for the protection of national security. Then people would not worry that unguarded statements in private conversations would get them into trouble. Such a rule would be a modification, urged in a parallel setting by Orin Kerr, of the "plain view" doctrine of search and seizure. That doctrine, another of the exceptions to the requirement of a warrant to search or seize, allows the seizure of evidence that the police discover in plain view in the course of an unrelated lawful search—even though the discovery is accidental and a warrant could not have been obtained to search for the evidence discovered. But what if an intelligence officer, reading the transcript of a phone conversation that had been intercepted and then referred to him because the search engine had flagged it as a communication possibly possessing intelligence value, discovers that one of the parties to the communication seems to be planning a murder, though a murder having nothing to do with any terrorist plot? Must the officer ignore the discovery and refrain from notifying the authorities? Though the obvious answer is no, my answer is yes.

There is much wild talk in private conversations. Suppose the communication that has been intercepted and read for valid national security reasons contains the statement "I'll kill the son of a bitch." The probability will be very high that the statement is hyperbole, that there is no serious intent to kill anyone. But suppose intelligence officers have been told that if a communication they read contains evidence of crime, they should turn it over to the FBI. The officer in my hypothetical case does that, and the Bureau, since the matter has been referred to it by a government agency, takes the threat seriously and investigates (or turns the matter over to local police for investigation, if no federal crime is suspected). As word of such investigations got around, people would learn that careless talk in seemingly private conversations can buy them a visit from the FBI or the police. At this point the risk that national security surveillance would significantly deter candor in conversation would skyrocket. It is more important that the public tolerate extensive national security surveillance of communications than that an occasional run-of-the-mill crime go unpunished because intelligence officers were not permitted to share

evidence of such a crime with law enforcement authorities. But if the evidence is of a crime related to national security, then sharing it with law enforcement authorities is appropriate and should be (and is) required. Other exceptions may be needed. Suppose that what is overheard is a conversation that identifies one of the parties as a serial killer. Serial killing is not terrorism, but it is such a serious crime that clues to it picked up in national security surveillance should be communicated to law enforcement authorities.

If such a rule (with its exceptions) were in place, I believe that the government could, in the present emergency, intercept *all* electronic communications inside or outside the United States, of citizens as well as of foreigners, without being deemed to violate the Fourth Amendment, provided that computers were used to winnow the gathered data, blocking human inspection of intercepted communications that contained no clues to terrorist activity. We know that citizens (and permanent residents) can be terrorists operating against their country, even without any foreign links. The United States has had its share of U.S. citizen terrorists, such as the Unabomber and Timothy McVeigh and presumably whoever launched the anthrax attack on the East Coast in October 2001. The terrorist bombings of the London subway system in July 2005 were carried out by British citizens. And U.S. persons who are not terrorists or even terrorist sympathizers might have information of intelligence value—information they might be quite willing to share with the government if only they knew they had it. The information that enables an impending terrorist attack to be detected may be scattered in tiny bits that must be collected, combined, and sifted before their significance is apparent. Many of the bits may reside in the e-mails or phone conversations of innocent people, such as unwitting neighbors of terrorists, who may without knowing it have valuable counterterrorist information—one consequence of the jigsaw puzzle character of national security intelligence.

A further question, however, is whether the Fourth Amendment should be deemed to require warrants for such surveillance. The Keith case that I mentioned earlier held that warrants are required for conducting purely domestic surveillance even when the purpose is to protect national security, though the Court suggested that perhaps the probable-cause requirement could be attenuated. It would have to be. If the goal of surveillance is not to generate evidence of criminal activity but to detect terrorist threats, including those too incipient to be prosecutable as threats, and even threats of which the persons under surveillance may be unaware because the significance of the clues they possess eludes them, then to insist that the investigators establish probable cause to believe criminal activity is afoot will be to ask too much. The amendment's requirement of particularity of description of what is to be searched or seized would also have to be relaxed for surveillance warrants adequate to national security to be feasible, because intelligence officers will often not have a good idea of what they are looking for.

Requiring a particular demonstration of threat wrecks terrorism investigations

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 138-141)

Civil libertarians argue that the government ought to be required to demonstrate that it has a reasonable basis for believing that the person to whom the records pertain is involved in terrorist

activity. But as should be clear by now, **that would be too restrictive a requirement**. To impose it would be either to misunderstand the needs of intelligence or to underestimate the value of intelligence in the struggle against terrorism (or perhaps to underestimate the terrorist threat). Information about an individual who is not part of a terrorist ring may nevertheless be highly germane to an investigation of the ring or, what may be as important, to an investigation aimed at discovering the existence of such rings. The information might concern an imam who, though not himself involved in terrorism, was preaching holy war. It might concern family members of a terrorist, who might have information about his whereabouts. It might consist of sales invoices for materials that could be used to create weapons of mass destruction, or of books and articles that expressed admiration for suicide bombers.

The impact of section 215 on civil liberties is quite limited— only a few dozen section 215 demands have been served on libraries. Most records custodians will, as I said, voluntarily hand over nonprivileged records to the government when told the records may contain information relevant to national security. A custodian's refusal to disclose the records might generate enough suspicion to enable the government to obtain a subpoena even under a much narrower version of section 215.

One understands, though, why civil libertarians have labeled section 215 the "libraries provision" despite its being used so rarely against libraries. To discover what people have been reading, as distinct from discovering their financial or health status, is to gain insight into what they are thinking—and what they are planning. This is why the government might want to obtain a record of a person's library borrowings (not to mention his bookstore purchases, records of which also fall within the scope of section 215). And when the quest for knowledge of what a person is thinking is driven by concern with terrorism, which is almost always politically motivated, success in the quest is likely to include the acquisition of a comprehensive picture of the subject's political beliefs. Knowing that the government is seeking to compile such pictures, people of unorthodox views may hesitate to buy or borrow books that express such views. This is the same issue that is raised by the government's conducting surveillance of mosques. Whether such surveillance presents Fourth Amendment problems depends on the method used to conduct it; surveillance as such, as we saw in Chapter 4, does not violate the First Amendment despite its undoubted effect on the exercise of free speech.

The Miller line of decisions, in holding that a voluntary disclosure of information manifests a willingness to waive or forfeit any right of privacy, seems unrealistic about the meaning not only of "voluntary" but also of "privacy" itself. Informational privacy does not mean refusing to share information with everyone. Obviously a telephone conversation is not private in that sense, nor a letter, nor a conversation between spouses or friends. Every conversation is at least twosided. The fact that I disclose symptoms of illness to my doctor does not make my health a public fact, especially if he promises (or the rules of the medical profession require him) not to disclose my medical history to anyone without my permission.

One must not confuse solitude with secrecy; they are distinct forms of privacy. Solitude fosters individualistic attitudes; conversely, the constant presence of other people or the sense of being under constant surveillance enforces conformity. But one also needs freedom to communicate in private. The planning of organized activity obviously is impossible without communication; less obviously, productive independent thinking almost always requires bouncing ideas off other people. And few of us are sufficiently independent-minded to persist in an unorthodox idea if we don't discover that others share it.

If "liberty" in the Fifth Amendment's due process clause can connote sexual freedom, and "due process" can be understood to require that any restriction on liberty be no greater than is necessary, why can't there be a due process right to control information about oneself that is not already public knowledge, unless one is trying to use that control for unlawful ends or the government has a pressing need for the information? Maybe there can be—provided, however, that the "pressing need" qualification is taken seriously. Constitutional rights, as we have seen throughout this book, are not absolutes whose scope is fixed without regard to competing interests. How much information about oneself one should be permitted to withhold from the government depends critically on how valuable the information is to the government. In an era of global terrorism and proliferation of weapons of mass destruction, the government has a compelling need to gather, pool, sift, and search vast quantities of information, much of it personal.

Restrictions on collection of data aid terrorism – protections against misuse of data solve better

Posner, 6 - judge on the United States Court of Appeals for the Seventh Circuit in Chicago and a Senior Lecturer at the University of Chicago Law School (Richard, Not a Suicide Pact: The Constitution in Time of National Emergency, p. 143-144)

Privacy is the **terrorist's best friend**, and the terrorist's privacy has been enhanced by the same technological developments that have both made data mining feasible and elicited vast quantities of personal information from innocents: anonymity combined with the secure encryption of digitized data makes the Internet a powerful tool of conspiracy. The government has a compelling need to exploit digitization in defense of national security. But if this is permitted, intelligence officers are going to be scrutinizing a mass of personal information about U.S. citizens. And we know that people don't like even complete strangers poring over the details of their private lives. But the fewer of these strangers who have access to those details and the more professional their interest in them, the less the affront to privacy. One reason people don't much mind having their bodies examined by doctors is that they know that doctors' interest in bodies is professional rather than prurient; we can hope that the same is true of intelligence professionals.

The primary danger of such data mining is leaks by intelligence personnel to persons inside or outside the government who might use the leaked data for improper purposes. Information collected by a national security data-mining program would have to be sharable within the national security community, which would include in appropriate cases foreign intelligence services, but not beyond. Severe sanctions and other security measures (encryption, restricted access, etc.) could and should be imposed in order to prevent—realistically, to minimize—the leakage of such information outside the community. My suggestion in the last chapter that the principle of the Pentagon Papers case be relaxed to permit measures to prevent the media from publishing properly classified information would reinforce protection of the privacy of information obtained by national security data mining.

I have said both that people value their informational privacy and that they surrender it at the drop of a hat. The paradox is resolved by noting that as long as people don't expect that the details of their health, love life, or finances will be used to harm them in their interactions with other

people, they are content to reveal those details to strangers when they derive benefits from the revelation. As long as intelligence personnel can be trusted to use their knowledge of such details only for the defense of the nation, the public will be compensated for the costs of diminished privacy in increased security from terrorist attacks.

Distinguishing between domestic and foreign targets is frequently impossible
Harvard Law Review, 8 – no author cited, "SHIFTING THE FISA PARADIGM: PROTECTING CIVIL LIBERTIES BY ELIMINATING EX ANTE JUDICIAL APPROVAL" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/shifting_the_FISA_paradigm.pdf

4. The Nature of Terrorism. — Institutional limitations are especially pressing given the vagaries of "terrorism."66 Substantial gray areas exist in distinguishing domestic from foreign and criminal from intelligence interests. Courts, fearful of treading too heavily in the national security arena, will be loath to tell the government that someone it has determined to be connected to terrorism is in fact being targeted unfairly for his or her religion or national origin.

Indeed, recent statutory developments have greatly clouded the already difficult task of making such distinctions. For example, the legislative move from "primary" to "significant" purpose discussed above, and the related tearing down of the "wall" that prevented information sharing between intelligence and law enforcement entities,67 means that a court must accuse the government of not reasonably suspecting a target's involvement with terrorism if it is to deny an application. Similarly, the standard for pen/trap orders68 was lowered from a showing that the device was used to communicate with an agent of a foreign power under the old 50 U.S.C. § 1842(c)(3) to a much lower showing of "relevant to an ongoing investigation" under the new 50 U.S.C. § 1842(c)(2). Whereas before the FISC may at least have been able to point to the relatively objective question of whether an individual was in fact an agent of a foreign power, the current loose standard would force the court to tell the government that the desired target bore no relevance to a terrorism investigation.

AT: Perm do both

The perm links to terrorism – the existing FAA structure is carefully balanced to allow ex post review. Increasing the ex ante nature of the FAA could wreck terrorism investigations
Blum, 9 (Stephanie, "WHAT REALLY IS AT STAKE WITH THE FISA AMENDMENTS ACT OF 2008 AND IDEAS FOR FUTURE SURVEILLANCE REFORM" 18 B.U. Pub. Int. L.J. 269, Spring, lexis)

In sum, under traditional FISA, certain kinds of international communications have always been completely outside of FISA review. Under the FAA, there is now FISC reviews of targeting and minimization procedures as well as the ex post oversight mechanisms. Additionally, it is not even clear that a warrant would be required to gather foreign intelligence within the country. While per Keith, a warrant is required if the threat is solely domestic, it is unsettled whether a warrant is required when there is a connection to a foreign power. Significantly, in August 2008, the FISCR upheld the constitutionality of the PAA (that had expired) explicitly finding that there was a foreign intelligence exception to the Fourth Amendment warrant requirement. n241 Although the petitioners (telecommunication companies who did not want to comply with an order under the PAA) argued that the PAA would result in incidental communications of innocent Americans being retained due to warrantless surveillance of people reasonably believed to be overseas, the FISCR rejected that argument. It stated, "The petitioner's concern of incidental collections is overblown. It is settled beyond peradventure that incidental collections occurring as a result of constitutionally permissible acquisitions do not render those acquisitions unlawful." n242

The FISCR's holding that the PAA was constitutional means that it would likely find the FAA - which has more judicial review and reporting requirements than the PAA - to be similarly lawful. Hence, it seems a legal stretch to maintain that the government needs a warrant when it targets foreign nationals overseas who may incidentally communicate with U.S. persons in the United States. While the FAA, as applied to U.S. persons, must still be reasonable under the Fourth Amendment, given the FISC-monitored minimization procedures and ex post oversight mechanisms, it seems that the FAA has struck a [*306] **nuanced compromise** between the need to expeditiously gather foreign intelligence, and the protection of civil liberties.

Furthermore, compared to traditional FISA, the FAA relies more heavily on ex post oversight mechanisms than on ex ante warrants based on individualized suspicion - and this may be a benefit. Several scholars have questioned the effectiveness of FISA's ex ante warrants issued by a secret court based on only one-sided information provided by the government. n243 Critics of FISA argue that because the FISC approves virtually all requests for warrants, it merely serves as a rubber stamp and does not provide any genuine judicial review. The FISC has, indeed, approved almost all warrant requests - as of 2006, the FISC had approved all but five out of over 17,000 requests. n244 According to a Note written by the Harvard Law Review, ex ante judicial review to conduct foreign surveillance may be **counterproductive** and unworkable:

The [FISC] judge lacks a skeptical advocate to vet the government's legal arguments, which is of crucial significance when the government is always able to claim the weight of national security expertise for its position. It is questionable whether courts can play this role effectively, and, more importantly, whether they should. n245

Because the FISC has no way to evaluate the facts presented by the government, it has to assume that the government-provided facts are correct. Problematically, the FISC identified evidence of governmental misstatements and omissions of material facts in seventy-five FISA applications. n246 This evidence did not come to light until after the FISC issued the warrants. n247

Judges are also extremely deferential to claims of national security, especially when they "must weigh the national security necessity ex ante, rather than being asked to review it after the fact." n248 The Harvard Note argues that "ex ante judicial review is not only of limited effectiveness, but it is also **affirmatively harmful**" in that it "imparts a broader imprimatur of validity than is warranted given the limited effectiveness of judicial review." n249 Hence, as the Note observes,

ex ante judicial review may **impede security** without providing any real privacy interest protection. n250 Therefore, the Note argues that "Congress is better situated constitutionally and better equipped institutionally to make the sort of value judgments and political determinations that are necessary [*307] to fulfill FISA's purposes." n251 The Note concludes that "those concerned with protecting civil liberties should view an end to reliance on ex ante judicial review as a chance to develop real political checks that can vigorously protect both national security and liberty interests." n252

The permutation increases the burden on the government and inhibits investigations

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

At the same time, all of the ex ante restrictions will necessarily be poor proxies for an ex post review of reasonableness. Instead of substituting for ex post review of reasonableness, ex ante restrictions supplement those restrictions. Ex ante limitations force the government to follow two sources of law: the reasonableness of executing the warrant imposed by reviewing courts ex post, and the restrictions imposed by the magistrate judge ex ante. If the ex ante restrictions happen to be modest, or are drafted in a way that ensures that they are always less than or equal to the restrictions of reasonableness ex post, then such restrictions will merely replicate the ex post reasonableness determinations. But every time an ex ante restriction goes beyond ex post reasonableness, the restrictions will end up prohibiting the government from doing that which is constitutionally reasonable. The limitations will be unreasonable limitations caused by judicial error.

Ex ante restrictions are highly error prone

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

Ex ante restrictions tend to introduce constitutional errors in this environment. To be sure, such restrictions stem from the best of intentions: they reflect a good-faith effort to identify what will be constitutionally reasonable.201 However, ex ante predictions of reasonableness will be more error prone than ex post assessments for two major reasons. First, ex ante restrictions require courts to "slosh [their] way through the factbound morass of reasonableness" 202 without actual facts. Second, ex ante restrictions are imposed in ex parte hearings without legal briefing or a hearing. Both reasons suggest that ex ante restrictions often will inaccurately gauge the reasonableness of how warrants are executed. The major difficulty with ex ante restrictions is that the reasonableness of executing a warrant is highly factbound, and judges trying to impose ex ante restrictions generally will not know the facts needed to make an accurate judgment of

reasonableness. Granted, magistrate judges might have a ballpark sense of the facts, from which they might derive a sense of what practices are ideal. For example, they might think that it is unreasonable to seize all of a suspect's home computers if on-site review is possible. Alternatively, they might think it is unreasonable to conduct a search for image files if the warrant only seeks data not likely to be stored as an image. They might think it is unreasonable to keep a suspect's computer for a very long period of time without searching it. All of these senses will be based on a rough concept of how the competing interests of law enforcement and privacy play out in typical computer searches and seizures.

At the same time, these ballpark senses of reasonableness can never improve past very rough approximation. A magistrate judge cannot get a sense of the exigencies that will unfold at each stage of the search process. The reasonableness of searching on-site will not be known until the agents arrive and determine how many computers are present, what operating systems they use, and how much memory they store. The needed time window before the government searches the seized computer depends on how much the government can prioritize that case over other cases, given existing forensic expertise and resources, as well as which agency happens to be working that case.203 The reasonableness of different search protocols depends on the operating systems, an analyst's expertise in forensics, which forensics programs the government has in its possession, what kind of evidence the government is searching for, and whether the suspect has taken any steps to hide it.204 Finally, the reasonableness of retaining seized computers that have already been searched depends on whether the government might need the original computer as evidence or whether it ends up containing contraband that should not be returned and is subject to civil forfeiture. 205

The magistrate presented with an application for a warrant simply cannot know these things. Judges are smart people, but they do not have crystal balls that let them predict the number and type of computers a suspect may have, the law enforcement priority of that particular case, the forensic expertise and toolkit of the examiner who will work on that case, whether the suspect has tried to hide evidence, and if so, how well, and what evidence or contraband the seized computers may contain. Magistrate judges can make ballpark guesses about these questions based on vague senses of what happens in typical cases. But even assuming they take the time to learn about the latest in law enforcement resources and the computer forensics process—enough to know about typical cases—they cannot do more than come up with general rules that they think are useful for those typical cases.

The errors of ex ante restrictions are particularly likely to occur because warrant applications are ex parte. The investigators go to the judge with an affidavit and a proposed warrant.206 The judge reads over the materials submitted. The judge can modify the warrant, but his primary decision is whether to sign or reject it. The entire process takes a matter of minutes from start to finish. No hearing occurs. There is no testimony beyond the affidavit in most cases, and the affidavit usually contains only standard language about computer searches.207 A prosecutor may be present, but need not be. Obviously, no representative of the suspect is present to offer witnesses or argument.

In that setting, judges are particularly poorly equipped to assess reasonableness. The most they can develop is a standard set of ex ante restrictions that they use in all computer warrants, perhaps one shared with other magistrate judges in their district. More careful scrutiny is both impractical and unlikely. The ability of a magistrate judge to assess reasonableness in that setting is a far cry from her ability to rule on reasonableness in an ex post hearing, in which agents and experts can

take the stand and counsel for the defendant can cross-examine the agent, offer his own witnesses, submit written briefs, and present oral argument.

Ex post review significantly decreases the risk of judicial errors

Kerr, 10 - Professor, George Washington University Law School (Orin, "EX ANTE REGULATION OF COMPUTER SEARCH AND SEIZURE" Virginia Law Review, October, SSRN)

The proper answer is "no." Ex ante restrictions are unworkable and unwise for two core reasons. First, the combination of error-prone ex ante judicial review and more accurate ex post judicial review will result in systematic constitutional error. Instead of requiring reasonableness, ex ante review will result in reasonable steps being prohibited by judicial error. The likelihood of error will be a function of constitutional uncertainty. The more unclear the relevant legal rules, the more uncertain will be the restrictions needed to ensure reasonableness. However, as the law of reasonableness becomes clear, ex ante restrictions also become useless: the police will follow the rules because they know they will be imposed ex post, without a need for ex ante restrictions. From this perspective, the perceived need for ex ante restrictions is merely a response to present legal uncertainty.

Of course, it is better to prohibit unreasonable searches ex ante than invalidate them ex post while the law remains uncertain. Perhaps this carves out a role for ex ante restrictions, just as a placeholder until the law becomes settled? Again, the answer is "no." The difficulty is that ex ante restrictions impair the ability of appellate courts and the Supreme Court to develop the law of unreasonable searches and seizures in the usual case-by-case fashion. Assuming ex ante restrictions are not null and void, they transform Fourth Amendment litigation away from an inquiry into reasonableness and towards an inquiry into compliance with the magistrate's commands. Search and seizure law cannot develop in this environment. For that reason, ex ante restrictions cannot be temporary measures used until the law becomes settled. Ironically, those measures will actually prevent the law from being settled.

AT: Perm do the CP

The plan relies on FISA authorization to limit surveillance – that's by definition ex ante. The CP establishes robust FISC review of surveillance after it has occurred – that's ex post

Morgan, 8 - Law Clerk to the Honorable Samuel H. Mays, Jr., United States District Court for the Western District of Tennessee. J.D., 2007, New York University School of Law (Alexander, "A BROADENED VIEW OF PRIVACY AS A CHECK AGAINST GOVERNMENT ACCESS TO E-MAIL IN THE UNITED STATES AND THE UNITED KINGDOM" 40 N.Y.U. J. Int'l L. & Pol. 803, Spring, lexis)

In this Note, I use "oversight" to refer to any form of review, be it internal or external, judicial or nonjudicial, that accompanies e-mail surveillance either before (ex ante) or after (ex post) its use. The American regime includes both ex ante and ex post oversight of e-mail surveillance. Ex ante oversight includes departmental protocols, as well as the judicial authorization requirements under the ECPA and **FISA**. Departmental protocols that require senior agency officials to approve applications to courts provide an administrative hurdle that informally limits the number of surveillance applications and ensures a good-faith basis for their submission. n61 Though these protocols provide initial limits on e-mail surveillance, the judiciary remains the most important, as judges provide an extrinsic check that agency officials cannot. Judges are less likely than prosecutors or executive agents to have a vested interest in an investigation's success and are therefore better suited to oversee compliance with surveillance requirements. n62

[*815] Courts are the only forum for ex post oversight in the United States. Where the government conducts surveillance in violation of statute, courts may impose penalties on the persons guilty of unauthorized surveillance and, in some cases, they may exclude the evidence from trial. n63 Suppression of evidence obtained in violation of the ECPA is available for wire or oral communications, but is inexplicably absent for e-mail. n64 Legal commentators denounce this distinction as "baseless" n65 and further argue that, without a statutory hook, criminal defendants have a lesser "incentive to raise challenges to the government's internet surveillance practices." n66

When government surveillance abridges constitutional rights, there are two avenues of redress. n67 At trial, criminal defendants may seek to suppress evidence obtained through unconstitutional means, as well as evidence derived therefrom (deemed "fruit of the poisonous tree"). n68 Victims of unconstitutional searches may also bring civil actions seeking damages for deprivation of rights under color of law. n69

Ex post oversight is qualitatively different from the plan – it allows all surveillance to occur, but establishes protections against the misuse of surveillance data. The plan severs because it has to curtail surveillance from the start

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

In addition to oversight by outsiders, a programmatic surveillance regime also should feature a system of internal checks within the executive branch, to review collection before it occurs, after the fact, or both. As for the ex ante checks, internal watchdogs should be charged with scrutinizing proposed bulk collection to verify that it complies with the applicable constitutional and statutory rules, and also to ensure that appropriate protections are in place for privacy and civil liberties. The Justice Department's Office of Intelligence is a well known example. The unit, which presents the government's surveillance applications to the FISA court, subjects these requests to exacting scrutiny with the goal of increasing the likelihood of surviving judicial review. n65 Indeed, the office has a strong incentive to ensure that the applications it presents are airtight, so as to preserve its credibility with the FISA court. n66 Ex post checks include such commonplace mechanisms as agency-level inspectors general, who can audit bulk collection

programs, assess their legality, and make policy recommendations to improve their operation, as well as entities like the Privacy and Civil Liberties Oversight Board, which perform similar functions across the executive branch as a whole. Another important ex post check is to offer meaningful whistleblower protections to officials who know about programs that violate constitutional or statutory requirements. Allowing officials to bring their concerns to ombudsmen within the executive branch (and then eventually to Congress) can help root out lawlessness and also relieve [*539] the felt necessity of leaking information about highly classified programs to the media.

The CP doesn't curtail surveillance – it curtails what authorities may DO with the data after it's collected – it's a form of harm minimization only

Sales, 14 - Associate Professor of Law, Syracuse University College of Law (Nathan, I/S: A Journal of Law and Policy for the Information Society, "Domesticating Programmatic Surveillance: Some Thoughts on the NSA Controversy" 10 ISJLP 523, Summer, lexis)

A third operational consideration is the need for strong minimization requirements. Virtually all surveillance raises the risk that officials will intercept innocuous data in the course of gathering evidence of illicit activity. Inevitably, some chaff will be swept up with the wheat. The risk is especially acute with programmatic surveillance, in which the government assembles large amounts of data in the search for clues about a small handful of terrorists, spies, and other national security threats. n71 Minimization is one way to deal with the problem. Minimization rules limit what the government may do with data that does not appear pertinent to a national security investigation--e.g., how long it may be retained, the conditions under which it will be stored, the rules for accessing it, the purposes for which it may be used, the entities with which it may be shared, and so on. Congress appropriately has required intelligence officials to adopt minimization procedures, both under FISA's longstanding particularized surveillance regime n72 and under the more recent authorities permitting bulk collection. n73 But the rules need not be identical. Because programmatic surveillance often involves the acquisition of a much larger trove of non-pertinent information, the minimization rules for bulk collection ideally would contain stricter limits on the use of inadvertently collected information for purposes unrelated to national security. In other words, the minimization procedures should reflect the anti-mission-creep principle described above.

PRISM SDI

On Case

US/EU Adv

US/EU Frontline

The U.S. government has acted decisively to mitigate EU concerns about PRISM and NSA surveillance.

Archick, 2014 [Kristin, Specialist in European Affairs, Congressional Research Service, U.S.-EU Cooperation Against Terrorism, December 1, 2014, https://www.fas.org/sgp/crs/row/RS22030.pdf]

U.S. officials have sought to reassure EU leaders and MEPs that U.S. surveillance activities operate within U.S. law and are subject to oversight by all three branches of the U.S. government. Some observers note that the United States has been striving to demonstrate that it takes EU concerns seriously and is open to improving transparency, in part to maintain European support for the SWIFT and the PNR accords. At the EU's request, a high-level U.S.-EU working group was established to discuss the reported NSA surveillance operations, especially the so-called PRISM program (in which the NSA allegedly collected data from leading U.S. Internet companies), and to assess the "proportionality" of such programs and their implications for the privacy rights of EU citizens.35 In November 2013, the European Commission (the EU's executive) issued a report on the findings of this working group, along with recommendations for addressing European concerns about U.S.-EU data flows and restoring transatlantic trust.36 U.S. and EU policy makers have been seeking possible ways to implement some of the Commission's proposals. In June 2014, U.S. Attorney General Holder announced that as part of efforts to conclude the DPPA, the Obama Administration would seek to work with Congress to enact legislation to provide EU citizens with the right to pursue redress in U.S. courts for certain data privacy violations—a key EU demand.

Shared interests between U.S. and Europe trump fallout from U.S. surveillance. Relations are resilient.

Raisher, '14 [Josh is a program coordinator for the Transatlantic Trends survey at the German Marshall Fund of the United States, "Ties that Bind?" U.S. News & World Report, 9-11-2014, http://www.usnews.com/opinion/blogs/world-report/2014/09/11/german-us-relationship-still-strong-despite-nsa-merkel-spying-rift]

Fortunately, this is happening at a time when shared interests continue to push the two countries towards closer cooperation, irrespective of how much their leaders – and publics – trust each other. Whatever difficulties exist in the transatlantic relationship, Obama and Merkel have presented a united front when addressing Russian actions in Ukraine. And there is evidence of this confluence of policy preferences in the general public as well: In the same Transatlantic Trends survey, American and German publics often agreed when asked

what tools they would prefer to use to address foreign policy concerns. Sixty percent of Germans said that U.S. leadership in world affairs was desirable, and 70 percent of Americans said the same of the EU. The relationship between the two countries is still fundamentally strong, and Germany still sees a prominent place for the U.S. in world affairs. But more and more, Germans may want that place to be farther outside of their own borders.

TTIP kills the multilateral trading system

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

Bretton-Woods multilateralism has provided the world with 30 years of economic growth following World War II. Its initial purpose was mainly political: building up an international system geared towards support, across the IMF membership, of New Deal models through trade liberalisation and monetary stability guaranteed by capital controls. Because of the Cold War and the persisting colonial and post-colonial system, it was the West and the North that primarily reaped Bretton-Woods benefits. America gradually abandoned its role of guardian of the Bretton-Woods mainly by decoupling dollar from gold and pushing to replace solidarity between countries through the IMF by entrusting financial markets, through deregulation and floating exchange rates, with the responsibility of preventing and correcting structural deficits and surplus, which actually did not work. However, market-driven globalisation has taken over and has succeeded in eventually bringing about a certain North-South convergence through the rise of Asia, driven by China's Renaissance. This change in the power balance between emerging and advanced economies must translate into a new type of governance. This governance model must build up on Bretton-Woods foundations, and must definitely retain its multilateral character, but with the rebalancing of voting rights and enough flexibility to allow for the diversity of development models in economies that are catching up. **TTIP goes in a different direction by substituting pressure with negotiation and by imposing a *'one-size fits all'* reference model. An EU-US deal would further weaken a multilateral trading system already undermined by a chaotic flurry of FTA deals and by the competitive liberalisation race triggered by the US. • The coalition of the two largest trading powers would entail a trade diversion effect for the rest of the WTO membership. • A regulatory coalition of the declining hegemons amounts to an attempt to twist the arm of emerging nations with regard to norms and standards.** • However, emerging nations have the right to develop their own norms and standards for their domestic markets which are expanding faster than in advanced countries. This is where the real trade-off between the West and China comes though: regulatory harmonisation for access to rising markets. • TTIP will either create the risk of a regulatory divide or will constitute a regulatory domination of the West over emerging countries, two scenarios which are incompatible with the spirit of multilateralism.

TTIP kills the NATO alliance – weakens U.S.-Europe relations.

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

TTIP would put Europe and America on a path which undermines the multilateral trading system at a time when the overall multilateral governance needs to be mended, rebalanced and reinforced so as to adjust it to the new multipolar structure of the world economy. By leaving China outside the scope of TPP and of TTIP, the US and Europe are running the risk of isolating this great emerging nation, with the subsequent prospect of pushing it towards an alternative strategy, i.e. forming a regional normative coalition with its neighbours so as to pursue its expansion by retaining the dynamism of its domestic and its regional markets for its companies. The EU and the US should be more careful about uniting against China. Their alliance will be perceived as two declining hegemonic powers attempting to dictate their rule to emerging powers. Instead of engaging in the construction of a new international economic order, TTIP is trying to prolong the ancient one. There is still time to stop the hazardous process of TTIP or rather to let it sink into the moving sands of popular contestation. An early harvest would serve as a face-saving device. A "plurilateralisation" of TTIP including China would however be the best possible outcome. It would represent a first step towards more balanced multilateral governance. The European Commission must reassess TTIP and propose to change tack before the whole process derails into frustration and acrimony with an unexpected paradox, a weakening of the strategic Atlantic Alliance.

TTIP's economic benefits are vastly exaggerated. It may even reduce economic output.

Bromund, Hederman, Riley and Coffey, '13 [Ted, PhD, is Senior Research Fellow in Anglo–American Relations in the Margaret Thatcher Center for Freedom; Rea, the Director of the Center for Data Analysis and the Lazof Family Fellow; Bryan, Jay Van Andel Senior Policy Analyst in Trade Policy in the Center for International Trade and Economics; Luke, the Margaret Thatcher Fellow in the Thatcher Center at The Heritage Foundation; "Transatlantic Trade and Investment Partnership (TTIP): Pitfalls and Promises," Issue Brief #4100, The Heritage Foundation, December 5, 2013, http://www.heritage.org/research/reports/2013/12/transatlantic-trade-and-investment-partnership-ttip-pitfalls-and-promises]

Existing models do not fully capture the dynamic and beneficial effects of freer trade. But precisely because the U.S. and EU economies are both large and already relatively open, the beneficial effects of freer trade, though real, would not be dramatic. One reason for caution about TTIP is the exaggerated hopes that many proponents place on it. U.S. Assistant Secretary of State for European Affairs Victoria Nuland asserts that "TTIP can be for our economic health what NATO has been to our shared security."[3] The Atlantic Council similarly asserts that TTIP "should increase military spending in Europe" and "would be a significant boost to the NATO alliance."[4] Both of these claims are doubtful at best. The reality is that, due in part to the policies of the EU itself, the EU's share of world output has declined and will continue to decline. According to the October 2013 edition of the International Monetary Fund's World Outlook Database, the EU share was 30.9 percent in 1980; by 2018, it will be 16.7 percent.[5] That is the fundamental fact that is driving world events and U.S. policy to turn away from Europe, and no conceivable TTIP would

alter this reality. Indeed, a bad agreement could actually make both the U.S. and the EU even less well off.

The overestimated benefits of TTIP are outweighed by its negative effects; low tariffs now, long time frame, miniscule benefits and uncertain job creation.

European Green Party Green Electoral Convention, **'14** ["Position Paper "TTIP – Too many untrustworthy promises and real risks," February 22, 2014, http://europeangreens.eu/brussels2014/content/position-paper-ttip]

A standard argument for "free trade" agreements is that they reduce tariffs, thereby expanding trade, allowing access to cheaper imports and that broad benefits to the economy clearly outweigh the downsides. But tariffs between the US and the EU are quite low already – 3 percent on average. Officials promoting TTIP are therefore focusing their positive economic predictions on the 'elimination, reduction, or prevention of unnecessary "behind the border" policies', so called non-tariff trade barriers. Optimistic studies have assumed that TTIP might result in a 0.5-1 percent increase in gross domestic product (GDP). Besides the fact that this way of thinking is the one that has lead Europe to the actual crisis, such estimates are unrealistically high, and fail to mention that the full range of benefits is only projected to be achieved by 2027. This means that the short-term benefits are unlikely to outweigh the negative effects – in terms of health, social protection, environment and privacy – of the agreement According to an analysis by Public Citizen´s Global Trade Watch (a consumer advocate group), benefits from TTIP would amount to about less than €40 per family, per year. And that does not take into account any additional costs from weakened safeguards regarding health, financial, environmental and other public interest regulations. Tom Jenkins from the European Trade Union Council (ETUC) has voiced his doubts regarding job increases promised through TTIP: „It is unclear, where these jobs should come from and which EU countries would in the end benefit."

TTIP undermines democratic freedoms through secret negotiations and special international tribunals.

European Green Party Green Electoral Convention, **'14** ["Position Paper "TTIP – Too many untrustworthy promises and real risks," February 22, 2014, http://europeangreens.eu/brussels2014/content/position-paper-ttip]

The lack of transparency that has characterised the TTIP negotiations is not only an ominous signal but an infringement on every citizen´s right to know what is being negotiated in their name. The negotiating mandate which the EU Council gave to the Commission is still classified as a secret document. Even members of the European Parliament, which plays an important role in Europe´s trade relations, because it can veto trade deals, as it did for Anti-Counterfeiting Trade Agreement (ACTA), are only allowed limited access to negotiating texts. The EU Commission does claim that it is being more transparent about TTIP than it was in earlier trade negotiations, but the members of an advisory body, which includes civil society representatives, do not have access to negotiating texts. Citizens, instead of transparency, get propaganda about an alleged benefit of €500 per family. We suspect that the organisation of a public consultation on investor protection provision for corporations are meant as a smokescreen designed to keep the issue off the agenda until after the European elections in late May. This secrecy undercuts democratic values. When neither citizens nor their representatives are allowed to be in the know about sensitive negotiations concerning regulatory issues that affect their daily lives in so many ways, this is not right. It is a collusion of bureaucratic power with special interest groups who get privileged access through some 600 lobbyists. Greens insist on full transparency, nothing less. The negotiation mandate and the negotiating texts of each round should be made public, so that a

transparent and public debate can be held at regular intervals. After all, norms and rules that have been democratically decided are at stake. Greens also strictly oppose the inclusion of investor-to-state dispute settlement (ISDS) mechanisms in TTIP. ISDS allows foreign investors to bypass domestic courts and to file their complaints directly with international arbitration tribunals, often composed of corporate lawyers. Why have such legal privileges for international investors when they could rely on well-developed judicial systems? This is about corporate power. If an arbitration tribunal concludes that democratically determined policies might narrow an investor's projected profits, it could oblige a government to pay billions in damages. This would disastrously limit the democratic freedom to legislate on environmental, health, financial and other matters.

Democracy prevents nuclear warfare, ecosystem collapse, and extinction.

Diamond 95. [Larry a professor, lecturer, adviser, and author on foreign policy, foreign aid, and democracy, "Promoting Democracy in the 1990s: Actors and instruments, issues and imperatives : a report to the Carnegie Commission on Preventing Deadly Conflict", December 1995, http://wwics.si.edu/subsites/ccpdc/pubs/di/di.htm]

This hardly exhausts the lists of threats to our security and well-being in the coming years and decades. In the former Yugoslavia nationalist aggression tears at the stability of Europe and could easily spread. The flow of illegal drugs intensifies through increasingly powerful international crime syndicates that have made common cause with authoritarian regimes and have utterly corrupted the institutions of tenuous, democratic ones. Nuclear, chemical, and biological weapons continue to proliferate. The very source of life on Earth, the global ecosystem, appears increasingly endangered. Most of these new and unconventional threats to security are associated with or aggravated by the weakness or absence of democracy, with its provisions for legality, accountability, popular sovereignty, and openness.

TTIP is a secret trade agreement hurting our health, food safety, public services, the environment and democracy

The Gaia Foundation 14 {The Gaia Foundation is a charity group dedicated to helping people around the world and preserving the world; "What is the TTIP? Why is it bad news? What can you do about it in the UK?"; 6-27-14; http://www.gaiafoundation.org/orsinittip; ME}

The Transatlantic Trade and Investment Partnership (TTIP) is a bilateral 'free trade' agreement currently under secret negotiation by the EU, USA and powerful industry lobbies. According to its supporters the TTIP will boost economic growth and create jobs, but in reality it represents a corporate assault on our health, food safety, public services and the ecosystems we rely upon as EU citizens. This is because the TTIP is designed to 'harmonise' regulations and standards (regarded as 'trade irritants' by industry) between the EU and US. Since the EU has much stronger trade regulations protecting public health, food safety, and the environment, this 'harmonisation' really means deregulation in the EU; reducing protections for the environment and public health, in favour of exploiting them for corporate profits. If it is successful the TTIP will also place transnational corporations above the law, giving them new powers that undermine democracy and the ability of governments to control them. The EU and US want to finalise TTIP by the end of 2014, so it is vital that we understand and resist this threat to our health, ecosystems and common heritage. Here are some insights at a glance, and a few suggestions for how you can take action to

stop the TTIP. The TTIP's regulatory harmonisations will ignite a 'race to the bottom' of environmental regulations in the EU, so that they come to resemble the USA's far weaker regulatory system. This watering down of protective regulation, and the likely abandonment of the precautionary principle, (the cornerstone of EU environmental legislation) will open up our ecosystems to unchecked exploitation from fracking, GM monocultures, mining and other threats. It will also open EU markets to ecologically damaging and toxic products, such as tar sands, fuelling further ecological devastation around the globe. To top it all the TTIP could lock the EU and the USA into intensified use of fossil fuels.

Eco collapse causes extinction.

Jayawardena 9 (Asitha, London South Bank University, "We Are a Threat to All Life on Earth", Indicator, 7-17, http://www.indicator.org.uk/?p=55)

Sloep and Van Dam-Mieras (1995) explain in detail why the natural environment is so important for life on Earth. It is from the environment that the living organisms of all species import the energy and raw material required for growth, development and reproduction. In almost all ecosystems plants, the most important primary producers, carry out photosynethesis, capturing sunlight and storing it as chemical energy. They absorb nutrients from their environment. When herbivores (i.e. plant-eating animals or organisms) eat these plants possessing chemical energy, matter and energy are transferred 'one-level up.' The same happens when predators (i.e. animals of a higher level) eat these herbivores or when predators of even higher levels eat these predators. Therefore, in ecosystems, food webs transfer energy and matter and various organisms play different roles in sustaining these transfers. Such transfers are possible due to the remarkable similarity in all organisms' composition and major metabolic pathways. In fact all organisms except plants can potentially use each other as energy and nutrient sources; plants, however, depend on sunlight for energy. Sloep and Van Dam-Mieras (1995) further reveal two key principles governing the biosphere with respect to the transfer of energy and matter in ecosystems. Firstly, the energy flow in ecosystems from photosynthetic plants (generally speaking, autotrophs) to non-photosynthetic organisms (generally speaking, heterotrophs) is essentially linear. In each step part of energy is lost to the ecosystem as non-usable heat, limiting the number of transformation steps and thereby the number of levels in a food web. Secondly, unlike the energy flow, the matter flow in ecosystems is cyclic. For photosynthesis plants need carbon dioxide as well as minerals and sunlight. For the regeneration of carbon dioxide plants, the primary producers, depend on heterotrophs, who exhale carbon dioxide when breathing. Like carbon, many other elements such as nitrogen and sulphur flow in cyclic manner in ecosystems. However, it is photosynthesis, and in the final analysis, solar energy that powers the mineral cycles. Ecosystems are under threat and so are we Although it seems that a continued energy supply from the sun together with the cyclical flow of matter can maintain the biosphere machinery running forever, we should not take things for granted, warn Sloep and Van Dam-Mieras (1995). And they explain why. Since the beginning of life on Earth some 3.5 billion years ago, organisms have evolved and continue to do so today in response to environmental changes. However, the overall picture of materials (re)cycling and linear energy transfer has always remained unchanged. We could therefore safely assume that this slowly evolving system will continue to exist for aeons to come if large scale infringements are not forced upon it, conclude Sloep and Van Dam-Mieras (1995). However, according to them, the present day infringements are large enough to upset the world's ecosystems and, worse still, human activity is mainly responsible for these infringements. The rapidity of the human-induced changes is particularly undesirable. For example, the development of modern technology has taken place in a very short period of time when compared with evolutionary time scales – within decades or centuries rather than thousands or millions of years. Their observations and concerns are shared by a number of other scholars. Roling (2009) warns that human activity is capable of making the collapse of web of life on which both humans and non-human life forms depend for their existence. For Laszlo (1989: 34), in Maiteny and Parker (2002), modern human is 'a serious threat to the future of humankind'. As Raven (2002) observes, many life-support systems are deteriorating rapidly and visibly. Elaborating on human-induced large scale infringements, Sloep and Van Dam-Mieras (1995) warn that they can significantly alter the current patterns of energy transfer and materials recycling, posing grave problems to the entire biosphere. And climate change is just one of them! Turning to a key source of this crisis, Sloep and Van Dam-Mieras (1995: 37) emphasise that, although we humans can mentally afford to step outside the biosphere, we are 'animals among animals, organisms among organisms.' Their perception on the place of humans in nature is resonated by several other scholars. For example, Maiteny (1999) stresses that we humans are part and parcel of the ecosphere. Hartmann (2001) observes that the modern stories (myths, beliefs and paradigms) that humans are not an integral part of nature but are separate from it are speeding our own demise. Funtowicz and Ravetz (2002), in Weaver and Jansen (2004: 7), criticise modern science's model of human-nature relationship based on conquest and control of nature, and highlight a more desirable alternative of 'respecting ecological limits, …. expecting surprises and adapting to these

Extension – Surveillance No Impact on Relations

NSA surveillance has not harmed trust and relations with Europe.

A. France proves no adverse impact.

Landauro and Schechner, 6-24-15 [Inti, writes about French industrial companies and general news from The Wall Street Journal's Paris bureau; Sam, covers technology across Europe, based out of the Wall Street Journal's Paris bureau. He has previously served as a French business correspondent, "France Seeks to Play Down Tensions With U.S. Following Spying Allegations," Wall Street Journal, 6-24-2015, http://www.wsj.com/articles/france-says-u-s-spying-on-its-presidents-unacceptable-1435136798]

During the call, Mr. Obama "reiterated that we have abided by the commitment we made to our French counterparts in late 2013 that we are not targeting and will not target the communications of the French president," the White House said. French government spokesman Stephane Le Foll said France didn't expect the WikiLeaks allegations to hurt relations between the allies. France's intelligence coordinator, Didier Le Bret, he said, plans to meet with NSA officials to ensure that the agency is honoring pledges that the Obama administration made in the wake of leaks from former NSA contractor Edward Snowden. "We need to keep a measured response given what is at stake," Mr. Le Foll said. WikiLeaks and two French publications published late Tuesday six documents describing purported U.S. surveillance of internal deliberations and conversations of Mr. Hollande, as well as former French presidents Nicolas Sarkozy and Jacques Chirac. "These are unacceptable facts that have already led to clarifications between the United States and France," Mr. Hollande's office said. "France will not tolerate any acts that compromise its security and the safeguarding of its interests." After his meeting with Ms. Hartley, Mr. Fabius said he had asked the U.S. ambassador to come back with assurances that similar surveillance of the French government will not occur again. "We understand that there may be interceptions where terrorists are concerned," he said. "But that has absolutely nothing to do with listening to allied and friendly leaders." After the documents were published, the White House said it wasn't currently spying on Mr. Hollande and wouldn't conduct such surveillance of him in the future. The statement didn't deny that spying had taken place in the past. "We do not conduct any foreign intelligence surveillance activities unless there is a specific and validated national-security purpose," said Ned Price, a spokesman for the White House National Security Council. "This applies to ordinary citizens and world leaders alike." Still, the latest leak detailing alleged U.S. spying on European allies is a reminder of the simmering trans-Atlantic tensions over surveillance. The disclosure of widespread spying has also put European governments on the defensive over their gathering of intelligence. France ranks among the most sophisticated countries when it comes to electronic surveillance. U.S. intelligence and law-enforcement officials have cited France as one of the countries with the capabilities to spy on the U.S., though Mr. Le Foll reiterated on Wednesday that France doesn't spy on allies. France also shares electronic intelligence with the NSA, taking advantage of the its access to submarine cables and communications networks in swaths of Africa where it was once a colonial power, one former French official said. In return, the U.S. shares information on other parts of the world, the official added.

B. Germany has dropped investigations into alleged U.S. surveillance of Angela Merkl. No actual evidence was unearthed.

Landauro and Schechner, 6-24-15 [Inti, writes about French industrial companies and general news from The Wall Street Journal's Paris bureau; Sam, covers technology across

Europe, based out of the Wall Street Journal's Paris bureau. He has previously served as a French business correspondent, "France Seeks to Play Down Tensions With U.S. Following Spying Allegations," Wall Street Journal, 6-24-2015, http://www.wsj.com/articles/france-says-u-s-spying-on-its-presidents-unacceptable-1435136798]

Since 2013, leaks from Mr. Snowden have detailed widespread surveillance efforts by the NSA, as well as specific allegations of U.S. spying on allies—including the tapping of the cellphone of German Chancellor Angela Merkel. The German general prosecutor's office said earlier this month it was dropping its investigation into the alleged eavesdropping on Ms. Merkel's cellphone because of a lack of evidence. Tuesday's publication comes just weeks after documents unearthed by a German parliamentary probe alleged that Germany's intelligence service helped the NSA spy on European governments, including France's. The allegations caused a political firestorm in Germany and were embarrassing for the German government, which has loudly protested U.S. surveillance practices.

Empirically, U.S.-German relations have thrived despite U.S. surveillance. Germany has dropped its investigation for lack of evidence.

BBC, 6-12-15 ["Snowden NSA: Germany drops Merkel phone-tapping probe," BBC News-Europe, 6-12-15, http://www.bbc.com/news/world-europe-33106044]

Germany has dropped an investigation into alleged tapping of Chancellor Angela Merkel's phone by the US National Security Agency (NSA). The office of federal prosecutor Harald Range said the NSA had failed to provide enough evidence to justify legal action. The allegations of NSA phone-tapping came out in the secrets leaked by US whistleblower Edward Snowden about large-scale US surveillance in 2013. German-US ties were severely strained. When the allegations were made the White House gave no outright denial, but said Mrs Merkel's phone was not being bugged currently and would not be in future. Mrs Merkel told the US government angrily that "spying between friends just isn't on". And the alleged spying shocked public opinion in Germany. On 4 June last year Mr Range said "sufficient factual evidence exists that unknown members of the US intelligence services spied on the mobile phone of Chancellor Angela Merkel". But in December he revealed that the investigation was not going well and he had not obtained enough evidence to succeed in court. A statement from Mr Range's office on Friday said "the accusation cannot be proven in a legally sound way under criminal law". It said "the vague statements by US officials about possible surveillance of the chancellor's mobile telecommunication by a US intelligence service - 'not any more' - are not enough to describe what happened". The prosecutor did not manage to obtain an original NSA document proving the alleged spying, and a transcript which purportedly re-created it from memory was deemed insufficient as evidence. The BBC's Jenny Hill in Berlin says Germans are very concerned about privacy because of their own history. Mass surveillance was a characteristic of the Nazi era and the communist East German state. But now President Obama and Chancellor Merkel have a fairly pragmatic, pleasant relationship, our correspondent says. A German parliamentary committee is also investigating NSA surveillance, but it has not managed to get much help from US officials either, Germany's Spiegel news website reports.

Extension – TTIP Kills Economy

TTIP trades off with domestic reforms that are key to the economy. Domestic growth must precede trade induced economic progress.

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

The most serious problem posed by TTIP will be the social cost for Europe of the large restructurings that would arise from the mergers, acquisitions, closures and privatisations brought about by the completion of a single transatlantic market. The economic law of a single price for goods and services in a unified market tends to make factor prices i.e. wages and profits converge. The communicating vessels process is very effective for the labour market. In the context of unemployment, labour prices will be pulled downwards and the unequal income structure prevailing in the US will weigh on the European wage structure. In such a context, productivity gains brought about by economies of scale will not translate into higher wages, but into lower ones. The transformative effect asserted by TTIP proponents might in the end just be an overall degradation of working conditions and of the Welfare State. Ignoring this high risk scenario against the current populist backcloth in Europe would be politically hazardous. In conclusion, the main rationale for TTIP might not withstand the decisive test of growth. The truth about growth and jobs in Europe – a large economy where the macroeconomic impact of external trade is limited – is that the solution does not lie under the lamppost of trade policy. The Eurozone has entered into a 'lost decade' for growth. The EU can be caught in the 'secular stagnation' recently highlighted by Lawrence Summers, whilst deflation becomes a short-term possibility for the Eurozone. Growth has come to a halt in Euthat rope for both supply-side and demand-side reasons. On the supply side, which is decisive for the long-term potential output, Europe is lagging behind on innovation, both technological and institutional. The relative cost of labour to capital is too high. Energy costs are relatively more expensive than in the US. On the demand side, which is at present the most critical element for attaining the potential output level, the debt overhang, both public and private, severely inhibits consumption demand. Moreover, as highlighted by the IMF, growing inequalities – the poor spend, the rich save – also exert a deflationary impact. Fiscal austerity, when procyclical as it currently is, aggravates the poor growth performance and further deteriorates the debt/GDP ratio. The way to resume growth is not through trade, which for Europe is a necessary but auxiliary growth engine. Today, only domestic policies can spark growth in the Eurozone: first, mutualisation and restructuring of debt through a transfer union with fiscal discipline would prove very effective; second, massive innovation investments hanging from R-D and education to transeuropean networks would boost both long-term competitiveness and short-term job creation; third, fighting inequalities through national social policies would be eased by EU tax harmonisation. The expansionary impact of domestic policy-driven Eurozone growth on transatlantic trade would by far exceed the growth impact of bilateral trade liberalisation. In the trade and growth nexus, causality undeniably goes both ways. Growth feeds trade as trade feeds growth, depending on the economic context and on the type of trade deal. TTIP is definitely not the right answer for resuming growth, either in Europe, or in the US. However, a growth policy would boost Atlantic trade.

TTIP doesn't generate real economic growth.

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE

FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

Growth is the main rationale put forward for justifying TTIP. A CEPR study financed by the Commission estimates that by the end of a 12 year transition, TTIP will have secured an EU GDP additional growth of 0.5% provided that the negotiation liberalisation objectives are fully met with regard to tariffs, NTBs and public procurement. 0.5% is a very low figure and ex-post analysis usually proves that such forecasts are very tentative and are usually overrated. In the case of TTIP, which is the first FTA the EU is negotiating with a somewhat larger and more advanced partner; three major risks cannot be ignored. (i) A modest growth figure Why is the figure so modest though? This is essentially for three reasons. Firstly, no one challenges the idea that trade liberalisation is conducive to long term growth if only through its transformative impact. Yet the more differences there are between partners, the higher the trade-led growth. This is the case in multilateral deals with broad sectorial and geographical coverage. It is less obvious when resource endowments and productivity levels are very similar between partners like between the US and the EU. Transformation benefits are then minimal but restructuring costs can be high. Secondly, the US and the EU have already completed a high level of integration in the goods sector through massive crossed investments, aimed at turning the regulatory obstacles around and providing 7 million jobs on each side of the pond. Harmonisation would mean partial job repatriation. In the services sector, which is less integrated, the expected benefits will be limited by imperfect competition (monopolies, oligopolies, market power) resting on economies of scale, network effects and branding. US firms often enjoy the advantages of being the prime movers, such as in information technology and digital industries and services. Moreover, it is unlikely that efficiency gains in sensitive sectors like health, education and public utilities, for which pressure for de facto privatisation schemes will grow, will be felt by the consumer. They will be monopolised by the shareholders of large firms. Restructuring will take place through privatisation and through mergers and acquisitions, and their eventual growth impact and distributional effects are not clear. In the case of "public goods by choice" (health, education, water), the political dimension cannot be ignored. In this case, market liberalisation can conflict with democracy and therefore come into severe conflict with public opinion. Thirdly, TTIP promoters completely ignore an assumption which trade theoreticians deem critical: trade allows for an increase in productivity as imports free up already employed resources so that they can be redirected into more efficient uses. The current high level of unemployment in Europe severely limits this crucial gain from trade liberalisation. In fact, trade liberalisation in the context of severe unemployment can very well generate no additional growth at all. Unemployment must first be brought down by domestic growth policy. (ii) A diverging growth The overall additional EU GDP growth of 0.5% guaranteed by TTIP would translate into further divergence within the Eurozone and would aggravate domestic inequalities within countries. Some countries such as Germany and its Nordic neighbours will benefit but other countries will lose out. However, unlike the US, neither the EU nor even the Eurozone, have any effective political mechanisms for redistributing gains and losses among Member States and among social groups2 . (iii) A clash between two social models Contrary to the proponents of the so-called trigger-down growth theory, trade does not amount to a win-win game and does not necessarily alleviate poverty. If trade proves a win win game in the long term, there are winners and losers in the short and medium term. Most trade economists dismiss or overlook these distributional issues and deem them irrelevant. They insist that growth matters more than fair redistribution. This is challenged by the school of inclusive growth which highlights the social and economic costs of excessive inequalities. Distributional effects of trade liberalisation are critical since nowadays they provide the main source of citizen mistrust vis-à-vis markets, governments and the EU. Moreover, the IMF has recently acknowledged the deflationary bias of growing inequalities.

Extension – TTIP Kills Democracy

TTIP will ruin democracy by enhancing corporate power.

The Gaia Foundation 14 {The Gaia Foundation is a charity group dedicated to helping people around the world and preserving the world; "What is the TTIP? Why is it bad news? What can you do about it in the UK?"; 6-27-14; http://www.gaiafoundation.org/orsinittip; ME}

The TTIP represents an unabashed corporate attack on democracy. This attack is implemented through something known as the Investor-State Dispute Settlement (ISDS), a mechanism that grants corporations the right to sue governments if they pass laws or enact policies that could reduce a corporation's present or future profits. ISDS will allow corporation's to sue such government's through secretive international trade courts. The money won by corporations in these secretive and undemocratic 'justice' proceedings will be taken directly from the taxpayers' pockets. ISDS and similar provisions have already been used to undermine authorities who chose to protect their people and Earth around the world to chilling effect. Even before legislation is passed they have prevented states from introducing socially or environmentally progressive measures for fear of being challenged through ISDS.

Extension – TTIP Is Net Worse

TTIP could cause job loss, lower income, risk public services, environment damage, and violate safety regulations, worsening income inequality.

O'Grady 14 {Frances O'Grady is the British Trades Union Congress General Secretary; "TTIP - A Bad Deal Could Be Worse Than No Deal at All"; 25/11/14; http://www.huffingtonpost.co.uk/frances-o-grady/ttip-uk-economy_b_6219536.html}

But I'm worried that a bad deal would be even worse. A bad deal could cost jobs, lower wages, and worse still it could put the NHS and other public services at risk. A bad deal might well be worse than no deal at all. Projections from some economists suggest that, even if TTIP creates growth, the benefits won't necessarily be shared fairly, and the proportion of growth going to wages could fall further - deepening a trend that has been going on for a generation. Using the more-realistic-than-most UNCTAD economic model, Tufts University researchers suggest workers' wages could fall by over £3,000 a year. Some of the tariff reductions proposed in TTIP could indeed be good news for British exporters, such as the chemicals and automotive industries - and even textiles, Scotch Whisky and farming. And there are some non-tariff barriers, such as regulatory requirements that achieve the same standards by different routes, which could also usefully be negotiated away. But I think the cart has been put before the horse. Instead of seeking an agreement with those limited but uncontentious objectives, politicians and business on both sides of the Atlantic have over-reached, seeking to sweep away all sorts of health and safety, environmental and consumer protections.

AT: TTIP Solves EU Soft Power

TTIP kills EU soft power.

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

TTIP will aggravate Europe's already ingrained difficulty to build up its own identity. From the very beginning, Europe has been a hybrid construction mixing federal and intergovernmental features. However, more importantly, it has developed a schizophrenic personality. It still cannot decide whether it wants to build up a true European political community with its own model, its own currency, and its own defence; or constitute a subset of a broader Atlantic Alliance, in which its economic affiliation to the US supplements the strategic NATO partnership. TTIP exacerbates these feelings of ambivalence and Atlanticist tropism which would interfere with Europe's drive towards political unity. This last objection to TTIP is the most decisive, but it is also extremely difficult to express in clear and convincing terms. For those who see Europe mainly through business lenses, the very idea that a Transatlantic Common Market would put the attempt to build up a sense of a common destiny among European citizens at risk is irrelevant or even ludicrous. Yet this is the crux of the argument against TTIP: one must choose between Europe and TTIP.

TTIP trades off with an effective EU foreign policy

Defraigne, '14 (Pierre, Executive Director, Madariaga-College of Europe Foundation, former Deputy Director-General in DG Trade, former Head of Cabinet for Pascal Lamy, European Commissioner for Trade (1999-2002), and former Director for North-South Relations and Head of Cabinet for Etienne Davignon, Vice-President of the European Commission (1977-1983), "THE FUTURE OF EU-US RELATIONS: POLITICAL AND ECONOMIC REFLECTIONS ON THE TTIP AGREEMENT," October, http://www.feps-europe.eu/assets/b0b70ad7-6aca-4ed0-9a4b-a89b4e490280/ttip-contributions-oct2014-pdefraignepdf.pdf, bgm)

TTIP is first and foremost a formidable distraction from EU priorities which, from a growth and jobs perspective, should focus on completing the unity of the Single Market, consolidating Eurozone governance and remedying its dangerous drift towards deflation. From a more political standpoint, the EU should tackle the construction of its own strategic capacity which conditions the possibility of an effective EU foreign policy aimed at promoting EU interests and values which differ from US ones. Europe must reassess the Atlantic relationship in the light of its own long term future which does not yet appear very clear to most Europeans, and does not even achieve consensus among governments. However, whatever the institutional forms the EU takes or the exact geographical territory it covers, Europe will have to come to terms with two challenges: the first is the choice of a common social and environmental model as the benchmark for all national ones so as to reconcile the unity of the EU's Single Market with the free circulation of people, production factors, goods and services and to share the governance consistency of the Eurozone. The second is a sufficient degree of strategic autonomy so as to take responsibility for defending the model, which reflects not only a way of life but deep and important values which make up the European civilisation. This construction calls for a sense of commonality of destiny, which would provide the EU with a shared transnational identity beyond national identities.

Cloud Computing Adv

Cloud Computing Frontline

Alternative causality: Declining U.S. educational standards devastate its competitiveness.

Grossman, Rivkin, Sharer and Porter, 2014 [Allen, Senior Fellow and Professor of Management Practice, Harvard Business School; Jan, Rauner Professor at Harvard Business School; Kevin, Senior Lecturer of Business Administration, Harvard Business School; Michael Porter, Bishop William Lawrence Professor at Harvard Business School; "K–12 EDUCATION AND THE ROLE OF BUSINESS," AN ECONOMY DOING HALF ITS JOB, September 2014, http://www.hbs.edu/competitiveness/Documents/an-economy-doing-half-its-job.pdf]

The challenge that America's education system poses to U.S. competitiveness has been obscured by a lack of long-run information on student performance that is comparable across countries. Last fall, however, the Organisation for Economic Co-operation and Development (OECD) released new data that make it possible to see the issue in a fresh light. For the first time, the OECD evaluated the workplace competencies of adults—in literacy, numeracy, and problem-solving skills—by age and country.4 The data allow us to examine adult competencies in successive age cohorts within a country and thereby get a sense of how well a country's education and training systems have performed over long periods. Figure 10 shows the OECD results for literacy, with a measure of proficiency on the vertical axis. The blue columns show that younger U.S. workers have better literacy skills than older workers. This reflects, presumably, an education system that is making progress in absolute terms. The challenge to America, however, is that the green columns, representing the international average, have progressed much faster than the blue columns. America has among the most literate 55- to 65-year-olds in the world, but the same is not true of younger cohorts. Figure 11 shows that America faces similar challenges in problem-solving and numeracy skills. What were once American advantages in human capital have turned into disadvantages. Relative performance matters in global competition, where American workers must out-produce and out-innovate the world's best. Some would argue (and we would agree) that Figures 10 and 11 reveal an ethical issue: our society is not fulfilling its promise to children to educate and prepare them. Others would argue (and again we would agree) that the figures point to a political problem: our democracy cannot work well when many citizens are denied the opportunities that strong educations afford. We would add that the figures highlight a fundamental business problem: companies operating in the U.S. cannot succeed without well-educated, highly skilled employees. Moreover, the living standards of most Americans will not rise if their workplace skills lag much of the world's. The situation captured in the OECD data—and reflected also in the mediocre performance on international tests—does not allow business leaders to sit on the sidelines.

Alternative Causality: Inadequate post educational job skills kill U.S. competitiveness.

Fuller, 2014 [Joseph, Senior Lecturer of Business Administration, Harvard Business School; "WORKFORCE SKILLS," AN ECONOMY DOING HALF ITS JOB, September 2014, http://www.hbs.edu/competitiveness/Documents/an-economy-doing-half-its-job.pdf]

The OECD data discussed on page 14—showing a growing U.S. disadvantage in adult competencies—point to weaknesses not only in America's K–12 education system but also in the way we develop skills after high school and on the job. Troubles in workforce skills have been evident in the United States for years. In annual surveys conducted by ManpowerGroup since 2006, the portion of U.S. employers reporting difficulty in filling positions reached as high as 52%, with "lack of technical skills" in applicants among the top causes.5 In the 2011 HBS survey on U.S. competitiveness, alumni involved in firm location choices reported that access to skilled labor was more often a reason to move a business activity out of the United States than it was a reason to keep an activity in America.6 In 2013–14 as in past years, alumni assessed workforce skills as a U.S. strength that is in decline. (See Figure 5 on page 10.) Skills shortages make it hard for firms operating in the United States to increase their productivity consistently, the major driver in sustaining their ability to compete and raising their capacity to pay workers. Thus, skills issues are at the heart of the aspect of U.S. competitiveness that worries us the most: the stagnation of living standards among most Americans. Historically, the prosperity of America's middle class rested on a foundation of world-class workplace skills. That has proven especially true for workers in so-called middle-skills jobs—roles that

require more education and training than a high school diploma but less than a four-year college degree. Middle-skills jobs are estimated to account for as much as 48% of all work in America.7 They have provided high and rising living standards for generations of American welders, machinists, health care workers, computer technicians, and others. Any path to greater U.S. competitiveness, and especially to higher living standards in America, will require reinvigorating the skill base of America's workforce, particularly for middle-skills occupations.

Alternative Causality: Crumbling transportation and logistics infrastructure crush U.S. competitiveness.

Kanter, 2014 [Rosabeth Moss, Ernest L. Arbuckle Professor of Business Administration, Harvard Business School, "TRANSPORTATION INFRASTRUCTURE," AN ECONOMY DOING HALF ITS JOB, September 2014, http://www.hbs.edu/competitiveness/Documents/an-economy-doing-half-its-job.pdf]

It is widely understood that America's companies depend heavily on the nation's transportation infrastructure— to bring inputs into their operations, to deliver goods to customers, and to move personnel where they are needed. Infrastructure affects the costs, quality, speed, service, and safety of business in America. Transportation infrastructure also shapes the living standards of all U.S. citizens, by influencing commuting times and the cost of living, for instance. Transportation infrastructure has an especially profound impact on less affluent citizens, who are more likely to rely on public transportation and to live in neighborhoods with few transport options. For them in particular, mobility is opportunity. Because it is so vital to America's businesses and citizens, transportation infrastructure has been a focal topic for the HBS project on U.S. competitiveness. In 2013–14, Professor Rosabeth Moss Kanter, the head of HBS's transportation infrastructure efforts and an expert on change leadership, added a set of infrastructure questions to the alumni survey. She also convened a national summit of 200 top leaders across sectors and industries to define an agenda for action, "America on the Move: Transportation and Infrastructure for the 21st Century." (For more information on the summit and agenda, see http://www.hbs.edu/competitiveness/ research/transportation-infrastructure/america-on-themove.html.) This section draws lessons from both the survey and the summit. A Strength, but in Decline The challenges to American transportation and logistics infrastructure are well publicized. The American Society of Civil Engineers recently gave the United States a D+ grade for the quality of its infrastructure. The federal Highway Trust Fund nearly became insolvent in 2014. Congresss recently extended funding until May 2015, but there is no plan for a longer-term funding solution. Such challenges have contributed to increasing concerns about what has historically been a U.S. strength. Respondents to the 2012 HBS survey on U.S. competitiveness rated logistics infrastructure as a competitive strength but were overwhelmingly pessimistic about its trajectory—significantly more so than a sample of the general population.17 On the 2013– 14 survey, a majority of respondents, 75%, reported that logistics infrastructure—railroads, highways, ports, and airports—was at least average compared to other advanced economies, with 52% rating it better or much better than average. However, the majority, 51%, also reported that this infrastructure is falling behind that of other advanced economies, with only 8% indicating optimism about its trajectory. Compared to past years, there is a slight upswing in optimism: in 2013–14, 10% fewer business leaders reported a belief that logistics infrastructure was declining than in 2012.

More Alt Causes

Alternative Causality: the U.S. tax code places domestic companies at a severe competitive disadvantage. This discourages critical investment.

Fricke, 2014 [Peter, contributor to the Daily Caller, former associate at the Charles G. Koch Institute, "US Tax Code Causes Businesses to Flee Overseas," Daily Caller, 7-28-14, http://dailycaller.com/2014/07/28/us-tax-code-causes-businesses-to-flee-overseas/]

While agreeing on the need for comprehensive business tax reform, many conservatives and other free-market advocates dispute Lew's assessment that inversion is just a cynical ploy to avoid paying U.S. taxes. Curtis Dubay, a research fellow at the Heritage Foundation, points out in a recent column for the Daily Signal that "any business, no matter where headquartered, pays the 35 percent U.S. corporate tax rate on income earned within our borders." The real motivation behind inversion, he says, is the "worldwide tax system", whereby U.S. businesses are taxed on their foreign earnings. The U.S. is the only industrialized country in the world with such a system, putting domestic companies at a disadvantage relative to foreign competitors who are "free to make investments that the U.S. worldwide tax system makes unprofitable for U.S. businesses." Jason Fichtner of the nonpartisan Mercatus Institute, a free-market think tank, believes anti-inversion legislation serves mainly to deflect attention from the real issue of U.S. competitiveness. "Legislative proposals that attempt to treat the symptoms of the corporate tax code's problems—rather than issues causing them—are doomed to fail," he told The Daily Caller News Foundation.

Alternative Causality: US fiscal policy poses the largest threat to competitiveness

Walker and Kaplan, '13 [David Walker served as United States Comptroller General from 1998 to 2008, and is Founder and CEO of the Comeback America Initiative. Robert Kaplan is a Professor Emeritus at Harvard Business School and co-developer of both activity-based costing and the Balanced Scorecard, Current Fiscal policy harms US competitiveness, 4/112013, http://fortune.com/2013/04/11/current-fiscal-policy-harms-u-s-competitiveness/ , MC]

We're focusing too much on the present, and too little on the future. Political dysfunction in D.C. has led to the American public being barraged by continuous media reports about the fiscal cliff, the debt ceiling, and the sequester. But the political skirmishes and impasses around these short-term events are distracting us from the real danger ahead: Our reckless fiscal trajectory that threatens America's competitiveness. For the nation to prosper, we must remain an attractive location for companies to pay competitive wages consistent with high and rising living standards. This requires targeted investments by the government, especially in physical and informational infrastructure, education and training, and scientific research. But the bad measurements used by the government are keeping the public in the dark about how needed investments for the future are being crowded out by the government's enormous debt and other obligations. The nation's reported debt has almost tripled — to over $16.6 trillion — just since 2000, and the interest on this debt must be paid every year into the future. This obligation, however, is not the real problem. The U.S. actually is in a much deeper financial hole, and one that is not evident on the federal balance sheet. The nation's off-balance sheet obligations include our country's promises for future Medicare and Social Security payments which, as of fiscal 2012, totaled nearly $50 trillion. These off-balance sheet obligations also include other promises, such as the unfunded pension and retiree health benefits for civilian and military personnel, and for various contingent commitments like guarantees for student loans, home mortgages and corporate pension benefits.

Excessive regulation and high taxes stifle innovation, job creation, killing competitiveness

SST '12 [The Committee on Science, Space, and Technology has jurisdiction over all energy research, development, and demonstration, and projects, "Excessive regulation and high taxes stifle innovation, job creation", 3/27/2012, https://science.house.gov/press-release/excessive-regulation-and-high-taxes-stifle-innovation-job-creation, MC]

In the first three years of the Obama Administration, the Federal Government imposed 106 new major regulations with annual costs of more than $46 billion. As of April 1, 2012, the United States will have the highest marginal corporate income tax in the industrialized world. Chairman Quayle warned that "This tax rate harms competitiveness by taking money away from companies that could

be better used to conduct research, develop new innovations and create jobs, and it encourages companies to look for more favorable business environments abroad." While the U.S. continues to have the largest economy in the world, recent trends suggest that other countries are catching up in terms of economic growth and competitiveness. A study by the Information Technology and Innovation Foundation, a non-partisan research and educational institute, ranks the U.S. sixth out of 40 countries in overall innovation-based competitiveness.

Solvency

Solvency Frontline

Empirically, the President will engage in illegal NSA surveillance, ignoring legal authority.

ACLU, 2015 [American Civil Liberties Union, "NSA SPYING ON AMERICANS IS ILLEGAL," Copyright 2015, https://www.aclu.org/nsa-spying-americans-illegal]

What if it emerged that the President of the United States was flagrantly violating the Constitution and a law passed by the Congress to protect Americans against abuses by a super-secret spy agency? What if, instead of apologizing, he said, in essence, "I have the power to do that, because I say I can." That frightening scenario is exactly what we are now witnessing in the case of the warrantless NSA spying ordered by President Bush that was reported December 16, 2005 by the New York Times. According to the Times, Bush signed a presidential order in 2002 allowing the National Security Agency to monitor without a warrant the international (and sometimes domestic) telephone calls and e-mail messages of hundreds or thousands of citizens and legal residents inside the United States. The program eventually came to include some purely internal controls - but no requirement that warrants be obtained from the Foreign Intelligence Surveillance Court as the 4th Amendment to the Constitution and the foreign intelligence surveillance laws require.

Absent international agreements, curtailing surveillance is impossible. So-called totalitarian nightmares and beyond will be inevitable.

Rothkopf, 5-12-15 [David, CEO and Editor of the Foreign Policy Group, "What Would Thomas Jefferson Do…With the CIA?" Foreign Policy, 5-12-15, https://foreignpolicy.com/2015/05/12/thomas-jefferson-u-s-intelligence-needs-an-overhaul/?utm_source=Sailthru&utm_medium=email&utm_term=Flashpoint]

By 2020, it is estimated, 50 billion devices will be connected to the Internet—most of them embedded microprocessors that will offer real-time insights into every aspect of life on the planet. Furthermore, effectively every human being, every organization, and every government on Earth will be connected in a man-made system for the first time in history. Each of those billions of microprocessors and each connection on the web will be a potential entry point for surveillance and spying. What's more, thanks to drones and nanodevices that can be hidden and embedded on targets by the millions, humans stand at the dawn of an era of potentially ubiquitous sensing. (This is not to speak of the gradual impact artificial intelligence will have on how people direct, conduct, and analyze what is gathered.) If the world does not set limits, **preferably by international treaty**, as to what is fair game in this system—in terms of both surveillance and cyberconflict—humanity runs the risk of entering a period that will make Big Brother dystopian

fantasies pale by comparison. Central to this process of setting limits will be having a public debate about the philosophical building blocks of the system: what is privacy, who owns the data each sensor produces, how should people divvy up the rights of individuals, corporations, and states. Furthermore, intelligence agencies will have to be reorganized to deal with these new realities, and so too will entire national security systems. Increasingly, the Internet will be the terrain on which most future battles will be fought, won, or lost; information warriors, many of them from the IC, will be the principal combatants.

Global efforts regulate information gathering will be necessary to render surveillance more transparent.

Rothkopf, 5-12-15 [David, CEO and Editor of the Foreign Policy Group, "What Would Thomas Jefferson Do…With the CIA?" Foreign Policy, 5-12-15, https://foreignpolicy.com/2015/05/12/thomas-jefferson-u-s-intelligence-needs-an-overhaul/?utm_source=Sailthru&utm_medium=email&utm_term=Flashpoint]

It will be essential that **the world** reconsider views on the classification of information. Vastly more information is publicly available than could likely ever be gathered covertly. Such open-source information is easier to verify, easier to share, of greater use to policymakers, and essential to the kind of public-private collaboration that will be required in the new security environment. Conversely, estimates from career intelligence consumers suggest the vast majority of what is available via classified channels is also available or discoverable via open sources. Not classifying it would save billions of dollars.

Ext – Circumvention

Legislative reform of illegal surveillance will always be circumvented. Only revolution which destroys the entire surveillance infrastructure can solve.

Whitehead, 5-16-15 [John, constitutional and human rights attorney, and founder of the Rutherford Institute," The NSA's Technotyranny: One Nation Under Surveillance," WashingtonsBlog, 5-16-15, http://www.washingtonsblog.com/2015/05/the-nsas-technotyranny-one-nation-under-surveillance.html]

In other words, it doesn't matter who occupies the White House: the secret government with its secret agencies, secret budgets and secret programs won't change. It will simply continue to operate in secret until some whistleblower comes along to momentarily pull back the curtain and we dutifully—and fleetingly—play the part of the outraged public, demanding accountability and rattling our cages, all the while bringing about little real reform. Thus, the lesson of the NSA and its vast network of domestic spy partners is simply this: once you allow the government to start breaking the law, no matter how seemingly justifiable the reason, you relinquish the contract between you and the government which establishes that the government works for and obeys you, the citizen—the employer—the master. Once the government starts operating outside the law, answerable to no one but itself, there's no way to rein it back in, short of revolution. And by revolution, I mean doing away with the entire structure, because the corruption and lawlessness have become that pervasive.

NSA surveillance reform is useless: The government simply ignores restrictive legislation and surveillance is too pervasive.

Whitehead, 5-16-15 [John, constitutional and human rights attorney, and founder of the Rutherford Institute," The NSA's Technotyranny: One Nation Under Surveillance," WashingtonsBlog, 5-16-15, http://www.washingtonsblog.com/2015/05/the-nsas-technotyranny-one-nation-under-surveillance.html]

The National Security Agency (NSA) has been a perfect red herring, distracting us from the government's broader, technology-driven campaign to render us helpless in the face of its prying eyes. In fact, long before the NSA became the agency we loved to hate, the Justice Department, the FBI, and the Drug Enforcement Administration were carrying out their own secret mass surveillance on an unsuspecting populace. Just about every branch of the government—from the Postal Service to the Treasury Department and every agency in between—now has its own surveillance sector, authorized to spy on the American people. Then there are the fusion and counterterrorism centers that gather all of the data from the smaller government spies—the police, public health officials, transportation, etc.—and make it accessible for all those in power. And of course that doesn't even begin to touch on the complicity of the corporate sector, which buys and sells us from cradle to grave, until we have no more data left to mine. The raging debate over the fate of the NSA's blatantly unconstitutional, illegal and ongoing domestic surveillance programs is just so much noise, what Shakespeare referred to as "sound and fury, signifying nothing." It means nothing: the legislation, the revelations, the task forces, and the filibusters. The government is not giving up, nor is it giving in. It has stopped listening to us. It has long since ceased to take orders from "we the people."

Illegal surveillance is inevitable. The rule of law cannot curtail it.

Whitehead, 5-16-15 [John, constitutional and human rights attorney, and founder of the Rutherford Institute," The NSA's Technotyranny: One Nation Under Surveillance," WashingtonsBlog, 5-16-15, http://www.washingtonsblog.com/2015/05/the-nsas-technotyranny-one-nation-under-surveillance.html]

What this brief history of the NSA makes clear is that you cannot reform the NSA. As long as the government is allowed to make a mockery of the law—be it the Constitution, the FISA Act or any other law intended to limit its reach and curtail its activities—and is permitted to operate behind closed doors, relaying on secret courts, secret budgets and secret interpretations of the laws of the land, there will be no reform. Presidents, politicians, and court rulings have come and gone over the course of the NSA's 60-year history, but none of them have done much to put an end to the NSA's "technotyranny." The beast has outgrown its chains. It will not be restrained.

Surveillance State Adv

Surveillance State Frontline

The surveillance state is too pervasive. All branches and agencies, plus corporations, exercise biopower over the people; NSA only reform will fail.

Whitehead, 5-16-15 [John, constitutional and human rights attorney, and founder of the Rutherford Institute," The NSA's Technotyranny: One Nation Under Surveillance,"

WashingtonsBlog, 5-16-15, http://www.washingtonsblog.com/2015/05/the-nsas-technotyranny-one-nation-under-surveillance.html]

The National Security Agency (NSA) has been a perfect red herring, distracting us from the government's broader, technology-driven campaign to render us helpless in the face of its prying eyes. In fact, long before the NSA became the agency we loved to hate, the Justice Department, the FBI, and the Drug Enforcement Administration were carrying out their own secret mass surveillance on an unsuspecting populace. Just about every branch of the government—from the Postal Service to the Treasury Department and every agency in between—now has its own surveillance sector, authorized to spy on the American people. Then there are the fusion and counterterrorism centers that gather all of the data from the smaller government spies—the police, public health officials, transportation, etc.—and make it accessible for all those in power. And of course that doesn't even begin to touch on the complicity of the corporate sector, which buys and sells us from cradle to grave, until we have no more data left to mine. The raging debate over the fate of the NSA's blatantly unconstitutional, illegal and ongoing domestic surveillance programs is just so much noise, what Shakespeare referred to as "sound and fury, signifying nothing." It means nothing: the legislation, the revelations, the task forces, and the filibusters. The government is not giving up, nor is it giving in. It has stopped listening to us. It has long since ceased to take orders from "we the people.

NSA surveillance isn't analogous to Foucault's Panopticon. At best, reactions to rather than applications of surveillance are comparable.

McGraw, '13 [Bryan, Associate Professor of Politics at Wheaton College, "How NSA Surveillance is NOT Like Foucault (but our reactions are)," Civitas Peregrina, June 11, 2013, https://civitasperegrina.wordpress.com/2013/06/11/how-nsa-surveillance-is-not-like-foucault-but-our-reactions-are/]

It's easy to see why we might then jump from the NSA's Prism program to Foucault. But here's what makes Foucault's argument interesting and not just some obtuse forerunner of the "X Files" (or any other conspiracy minded move/tv show). One of the panopticon's key features was that the tower where the guards resided was mirrored so that the prisoners could not tell if they were actually under observation at any particular moment. In fact, they need not be under observation at all for the tower to do its job. Foucault's view was that our liberal society was indeed one of deep disciplining, but it was not the case that there was a "them" that was doing the disciplining. Rather, we all are caught up and participate in our mutual disciplining. We are, to Foucault's mind, our own oppressors in that we impose a kind of "normalization" on one another. What the NSA=Foucault folks suppose is that Foucault had in mind a social order in which some small elite, armed with technologies and power, would herd the rest of us into docile compliance. Foucault's argument was actually much more worrisome: that all of us, armed with the ordinary technologies of communication and observation, would herd ourselves into docile submission. So the NSA program (whatever its merits and demerits) isn't Foucaldian. Rather, I would argue, it is our reactions – where commentators assume their expected positions, offer ritualized expressions of support or outrage, and punish (via dialogue) those who range outside the bounds of "proper" discourse – that reminds me of Foucault.

Alternative Causality: the modern Imperial Presidency is the root cause of Foucaldian biopower.

Smith, '13 [Reid, Freedom Works' staff writer and editor, "The Surveillance State in Your Head," The American Conservative, July 19, 2013, http://www.theamericanconservative.com/articles/the-surveillance-state-in-your-head/]

With the fall of the Soviet Union, there was hope that the imperial presidency would be scaled back by Congress, but such optimism proved hollow. In The Cult of the Presidency, Gene Healy notes that while partisan rhetoric today is as acerbic as it has been in decades, Republicans and Democrats alike accept the bottomless depth of executive responsibility and the president's unique grasp on power. We've normalized dependence on his guidance and our subordination. The modern president has greatly exceeded, in size and scope, the few enumerated powers initially bestowed upon him and in the process has become a great deal more powerful—and potentially more dangerous. His powers of surveillance and social compulsion are virtually unmatched in human history. From a Foucauldian perspective, one might argue our president (Bush or Obama, it hardly matters) has staked his claim as our watchman. We become increasingly aware that all we do takes place under surveillance, and our dull surprise at this revelation suggests our submission to the system—the inevitable outcome of our assent to political power.

Foucaldian critique of NSA surveillance is impossible under modern capitalism. Current power structures are self -reinforcing.

Bruno, '14 [Zachary, BA, Critical Theory, Occidental College, "The PRISM Program Panopticon: Foucault's Insights in the Era of Snowden," March 24, 2014, http://www.zachcbruno.com/academic/dd-preview/images/pdf/PrismProgramPanopticon.pdf]

With this, Foucault would propose that critiquing the NSA's illicit surveillance program would first require deconstructing the structures of power and discursive claims making which surround it. In this regard, Reeves (2003) argues that a self-reinforcing dynamics exists, as it pertains to the discourses and power structures sustaining such governmental tools. In this regard, the difficulty of critiquing them, in the sense which Foucault (1995) intends, is related to the manner in which this power is self-reinforcing. Indeed, to garner a better understanding of the difficulties of critique in such a context, one need only examine Foucault's work on sexuality, repression, and biopolitics-based social control to understand the operation of these mechanisms. With the above in mind, what becomes most apparent, from considering Foucault's portrayal of the diffusion of normalizing power in contemporary society, is that it is impossible to resist the potency of this power from within modern society itself. Given that the latter is permeated with multiple structures of repression, often invisible to the human eye, or already internalized to such a degree that we are no longer capable of even recognizing their existence; it becomes clear that we live in a social context in which resistance through critique, within society, is at least temporarily impossible. If a social revolution were to ever undo the structures of normalizing power which currently permeate our social interactions, it might become possible to rebuild a society without the concentrations of capital, and thus power, which prevail today. In the interim, however, resisting and informally critiquing within the confines of organized modern capitalist society is a futile endeavor because of the all-too-deep entrenchment of those entities which regulate us, and force us to adopt certain behaviors in spite of our desires. Thus, because the entirety of our society has been permeated by these powerful exogenous forces, there is no true potential for resistance within society. Instead, because we cannot necessarily understand or confront all of the elements of our oppression, it is clear that resistance to the forces identified by Foucault must take place outside of mainstream society. On this basis, critique of the everyday colloquial variety is impossible simply because it necessitates that we accept and take for granted the imposed structures of meaning which emerge from society's most significant power bases.

The American populace cannot engage in Foucaldian critique of NSA surveillance because of disciplinary structures like the War on Terror.

Bruno, '14 [Zachary, BA, Critical Theory, Occidental College, "The PRISM Program Panopticon: Foucault's Insights in the Era of Snowden," March 24, 2014, http://www.zachcbruno.com/academic/dd-preview/images/pdf/PrismProgramPanopticon.pdf]

Applied to the context of the NSA's surveillance Panopticon, the ultimate reality of the impossibility of critique is one wherein it is impossible for the American mass to understand the multiple structures of oppression inherent to the PRISM Program. Indeed, the apathy discussed by Zurchner (2014) is likely an embodiment of a context wherein the American population is blinded by the other disciplinary structures, like the purported threats of the War on Terror, which serve to maintain high levels of fear in American society. In this regard, the work of Lokaneeta (2010) suggests that these, associated with the notion of American governmentality, have preponderated in the post-9/11 context because of the visceral power of the discourse of threat which the Bush and Obama Administrations have spread.

Extension – Alt Causes to Panopticism

The Foucaldian Panopticon is inherent to a myriad of government agencies. Restricting NSA based surveillance is too narrowly based to succeed.

Buttar, '13 [Shahid, former executive director of the Bill of Rights Defense Committee, is a constitutional lawyer and grassroots organizer. Shahid directed a national program to combat racial and religious profiling, after serving for three years as associate director of the American Constitution Society for Law & Policy, "Beyond the Panopticon: The NSA Isn't Alone," Defending Dissent Foundation, 12-26-13, http://www.bordc.org/blog/beyond-panopticon-nsa-isn%E2%80%99t-alone]

The Panopticon is real. It siphons billions of dollars each year from a federal budget in crisis. And it is watching you and your children. Lost in the debate about NSA spying, however — and even most public resistance to it — have been the various other federal agencies also complicit in Fourth Amendment abuses. Even critics of domestic surveillance have largely failed to recognize how many government agencies spy on Americans. A presidential review panel recently recommended substantial changes to FBI powers, including ending the authority to issue National Security Letters. NSLs are secret data requests used to circumvent both First and Fourth Amendment protections, demanding information about third parties and gagging the recipients. The FBI's pattern of abusing undercover infiltration to disrupt First Amendment protected organizations, however, stretches back decades, threatens democracy even more deeply than NSLs, and continues unabated. Beyond the NSA and FBI, many other agencies are also involved in domestic surveillance. And all of them continue to evade public and congressional scrutiny.

Federal agencies other than NSA are complicit in maintaining the Panopticon.

A. Department of Homeland Security:

Buttar, '13 [Shahid, former executive director of the Bill of Rights Defense Committee, is a constitutional lawyer and grassroots organizer. Shahid directed a national program to combat racial and religious profiling, after serving for three years as associate director of the American Constitution Society for Law & Policy, "Beyond the Panopticon: The NSA Isn't Alone," Defending Dissent Foundation, 12-26-13, http://www.bordc.org/blog/beyond-panopticon-nsa-isn%E2%80%99t-alone]

The Department of Homeland Security (DHS) is a sprawling behemoth, with nearly a quarter million employees scattered across nearly two dozen component agencies. While purporting to protect the "homeland" (a term with loaded connotations worth noting, but setting aside for now) from various threats, DHS spies on Americans in several disturbing ways. Some of the most dystopian piggyback on programs presented to the public as supporting immigration enforcement.

Border security agencies, like Customs & Border Protection (CBP) and Immigration & Customs Enforcement (ICE), have facilitated a record number of deportations under the Obama administration, creating a domestic humanitarian crisis. Critics of the administration's immigration crackdown have vocally challenged its failures. According to the New York Times, "the department's continually shifting strategies against illegal immigration had two things in common. They were ineffective and cruel."

B. Postal Service:

Buttar, '13 [Shahid, former executive director of the Bill of Rights Defense Committee, is a constitutional lawyer and grassroots organizer. Shahid directed a national program to combat racial and religious profiling, after serving for three years as associate director of the American Constitution Society for Law & Policy, "Beyond the Panopticon: The NSA Isn't Alone," Defending Dissent Foundation, 12-26-13, http://www.bordc.org/blog/beyond-panopticon-nsa-isn%E2%80%99t-alone]

Nor are law enforcement agencies the only ones joining the intelligence agencies to spy on Americans. Even the US Postal Service is getting in on the surveillance racket. In July, the New York Times reported on the Mail Isolation Control and Tracking program, "in which Postal Service computers photograph the exterior of every piece of paper mail that is processed in the United States — about 160 billion pieces last year…." It concluded that "postal mail is subject to the same kind of scrutiny that the National Security Agency has given to telephone calls and e-mail." Like the NSA's ubiquitous electronic wiretapping, postal surveillance carries disturbing implications, particularly in terms of enabling the suppression of political dissent. Most astounding in the context of the controversy over NSA spying, however, is the sheer ignorance about the postal service's monitoring practices.

C. State and local law enforcement:

Buttar, '13 [Shahid, former executive director of the Bill of Rights Defense Committee, is a constitutional lawyer and grassroots organizer. Shahid directed a national program to combat racial and religious profiling, after serving for three years as associate director of the American Constitution Society for Law & Policy, "Beyond the Panopticon: The NSA Isn't Alone," Defending Dissent Foundation, 12-26-13, http://www.bordc.org/blog/beyond-panopticon-nsa-isn%E2%80%99t-alone]

DHS also erodes constitutional rights through its collaborations with local police. State and local law enforcement agencies around the country collaborate with a series of over 70 regional DHS-funded fusion centers pursuing ambiguous missions at unknown costs. DHS leaders have praised fusion centers, but critics — extending from the libertarian CATO Institute and immigrant rights groups to FBI veterans — have described them as wasteful, duplicative, constitutionally offensive, and ineffective from a public safety standpoint. Targeted surveillance, of the sort abused by the FBI, is also a problem across state & local departments. For years, peace activists, Ron Paul supporters, environmentalists, and Muslims have been targeted for government spying in dozens of states--not only by the FBI, but also by state and local police. Until being shut down by the Governor in 2010, Pennsylvania state officials not only spied on environmental activists, but also shared its intelligence reports with their corporate targets, including mining companies. DHS also facilitates the paramilitarization of local and state police agencies, which around the country have sought DHS grants to buy everything from sophisticated listening devices to surveillance cameras, automated drivers license plate scanners developed originally for military uses, aerial surveillance drones, and even armored tanks.

AT: Add-ons

AT: Internet Fragmentation Add-on

Internet fragmentation is irreversible. Countries have gone too far in establishing their own networks. In any case, no impact on Internet users.

Kaspersky, '13 [Eugene, chairman and CEO of Kaspersky Lab, "What will happen if countries carve up the internet?" the Guardian, 12-17-2013, http://www.theguardian.com/media-network/media-network-blog/2013/dec/17/internet-fragmentation-eugene-kaspersky]

Ordinary users will hardly perceive any change while these state-run parallel networks are being built, but there is another aspect of this global trend that will affect everyone directly. Some countries are already seriously considering making sure as much of their internet traffic as possible stays within their national borders. In some countries, for example Brazil, there's talk about forcing global giants such as Google and Facebook to locate their data centres locally to process local communications. If this trend gains worldwide momentum, it will be a disaster for global IT giants and pose a threat of full-blown Balkanisation of the internet. The process would probably foster the creation of local search engines, email systems, social networks and so on – an intimidating prospect for publicly listed companies. As a result, the whole notion of netizens, or global online citizens, and of the internet being a global village could lose all practical meaning. What could emerge is a patchwork of online nation states with different rules and regulations and hindered communications. Sadly, I don't think the trend can be reversed. It feels as inevitable as the change of the seasons. But while one can't help complaining about bad weather in December, it's worth remembering that a bit of snow is not the end of the world.

Alternative causality: Multiple factors generate internet fragmentation, not just surveillance: dominance of international bodies, cyber- crime and cyber war.

Patrick,'14 [Stewart, Senior Fellow and Director, Program on International Institutions and Global Governance, Council on Foreign Relations, "The Obama Administration Must Act Fast to Prevent the Internet's Fragmentation," The Internationalist, 2-26-2014, http://blogs.cfr.org/patrick/2014/02/26/the-obama-administration-must-act-fast-to-prevent-the-internets-fragmentation/]

Since the dawn of the digital age, the United States had consistently supported an open, decentralized, and secure cyber domain that remains largely in private hands. Even before the Snowden disclosures, that vision was under threat, thanks to disagreements among governments on three fundamental issues. First, some world leaders are questioning whether the ITU(International Telecommunications Union) ought to play a more active role in regulating cyberspace. To the degree that the Internet is "governed," the primary regulatory body remains ICANN (the Internet Corporation for Assigned Names and Numbers), an independent, nonprofit corporation based in Los Angeles. The outsized role of ICANN—and the widespread perception of U.S. (and broader Western) control over the Internet—has long been a sore point for authoritarian states, as well as many developing countries, which would prefer to move cyber governance to the intergovernmental ITU. A second threat to the open Internet has been a surge in cyber crime—and disagreement over how to hold sovereign jurisdictions accountable for criminality emanating from their territories. Estimates of the magnitude of cyber crime range from large to astronomical. In 2012, NSA director general Keith Alexander put the annual global cost at $1 trillion. Most cyber crime is undertaken by nonstate actors against private sector targets for motives of financial gain. But national authorities have also been involved in economic espionage, both directly and through proxies. The most infamous case involves a unit of China's People's Liberation Army, which allegedly has been at the forefront of Chinese hacking efforts to steal industrial secrets and technology from

leading U.S. companies. Third, the growing specter of cyberconflict—even cyber war—among nations threatens a secure and open Internet. Worldwide, dozens of governments are developing doctrines and capabilities to conduct "information operations." This includes, of course, the United States, which has established a robust Cyber Command within the Department of Defense. Meanwhile, there is no international consensus on what constitutes a "cyberattack," what responses to these incursions are permissible, and whether and how existing laws of war might be applied to cyberconflict.

U.S. surveillance isn't the real reason for fragmentation. It's an excuse for the real, localized motivations for national and regional networks.

Lillington, '14 [Karlin, journalist and columnist with the Irish Times focusing on technology, with a special interest in the political, social, business and cultural aspects of information and communication technologies, PhD from Trinity College; "Halting internet fragmentation tops agendas," Irish Times, 5-8-2014, http://www.irishtimes.com/business/technology/halting-internet-fragmentation-tops-agendas-1.1786657]

Most sessions at the two-day event had acknowledged that the revelations by Edward Snowden of mass covert surveillance by the NSA in the US, and GCHQ in England, had accelerated proposals to localise data – often referred to as a "Balkanisation" of data – in some countries. But human rights activists had warned that such proposals were not always what they seemed. For example, Joana Varon Ferraz, of Centro de Tecnologia e Sociedade da Fundação Getulio Vargas, Brazil, noted several times during the event that Brazil's motivations in agreeing to build new undersea broadband cables, and calling for data to be held only within its borders, were more about increasing its own access to its citizen's data, and opportunities for internal covert surveillance.

An non-fragmented Internet enhances cyberstalking, violence against women and actually restricts freedom.

Lillington, '14 [Karlin, journalist and columnist with the Irish Times focusing on technology, with a special interest in the political, social, business and cultural aspects of information and communication technologies, PhD from Trinity College; "Halting internet fragmentation tops agendas," Irish Times, 5-8-2014, http://www.irishtimes.com/business/technology/halting-internet-fragmentation-tops-agendas-1.1786657]

She (Jody Liddicoat, human rights specialist with the Association for Progressive Communications) also questioned whether a completely free and unfettered internet was desirable. The arrival of new technologies, such as Google Glass, highlighted this complication, she said, as its use could contribute to cyberstalking and the ongoing problem of violence against women. "One internet isn't one where all freedoms are unbounded. It's one where we begin to negotiate those freedoms," she said. "Unbounded freedom has the potential to inhibit the freedom of another."

AT: Cybersecurity Add on

There is no clear evidence of existential cyber security threat. Alarmist rhetoric constitutes an example of threat construction similar to the run-up to the Iraq War.

Brito & Watkins, '11 [Jerry, Senior Research Fellow, Mercatus Center at George Mason University; Tate, Research Associate, Mercatus Center at George Mason University, "Loving the Cyber Bomb? The Dangers of Threat Inflation in Cybersecurity Policy," Harvard National

Security Journal, April 26, 2011, http://mercatus.org/sites/default/files/publication/Loving-Cyber-Bomb-Brito-Watkins.pdf]

Over the past two years, there has been a steady drumbeat of alarmist rhetoric coming out of Washington about potential catastrophic cyber threats. For example, at a Senate Armed Services Committee hearing last year, Chairman Carl Levin said, "cyberweapons and cyberattacks potentially can be devastating, approaching weapons of mass destruction in their effects."2 Proposed responses include increased federal spending on cybersecurity and the regulation of private network security practices. Security risks to private and government networks from criminals and malicious state actors are no doubt real and pressing. However, the rhetoric of "cyber doom"3 employed by proponents of increased federal intervention in cybersecurity implies an almost existential threat that requires instant and immense action. Yet these proponents lack clear evidence of such doomsday threats that can be verified by the public. As a result, the United States may be witnessing a bout of threat inflation similar to that seen in the run-up to the Iraq War. Additionally, a cyber-industrial complex is emerging, much like the military-industrial complex of the Cold War. This complex may serve not only to supply cybersecurity solutions to the federal government, but to drum up demand for those solutions as well.

Using apocalyptic rhetoric to address cybersecurity ensures counterproductive policymaking. Further study is necessary before acting.

Brito & Watkins, '11 [Jerry, Senior Research Fellow, Mercatus Center at George Mason University; Tate, Research Associate, Mercatus Center at George Mason University, "Loving the Cyber Bomb? The Dangers of Threat Inflation in Cybersecurity Policy," Harvard National Security Journal, April 26, 2011, http://mercatus.org/sites/default/files/publication/Loving-Cyber-Bomb-Brito-Watkins.pdf]

Cybersecurity is an important policy issue, but the alarmist rhetoric coming out of Washington that focuses on worst-case scenarios is unhelpful and dangerous. Aspects of current cyber policy discourse parallel the run-up to the Iraq War and pose the same dangers. Pre-war threat inflation and conflation of threats led us into war on shaky evidence. By focusing on doomsday scenarios and conflating cyber threats, government officials threaten to legislate, regulate, or spend in the name of cybersecurity based largely on fear, misplaced rhetoric, conflated threats, and credulous reporting. The public should have access to classified evidence of cyber threats, and further examination of the risks posed by those threats, before sound policies can be proposed, let alone enacted.

Empirical, historical evidence proves cyber-doom scenarios are highly unlikely. Threatened systems are resilient.

Lawson, '11 [Sean, writes about science, technology, security, and military affairs. Topics of interest include cybersecurity policy, surveillance, drones, network-centric warfare, military use of social media, and the rhetoric of threat inflation. He is assistant professor in the Department of Communication at the University of Utah, "Cyberwar Hype Comes Under Increasing Scrutiny," Forbes, April 28, 2011, Ahttp://www.forbes.com/sites/seanlawson/2011/04/28/cyberwar-hype-comes-under-increasing-scrutiny/]|

My own report for the Mercatus Center, also released in January, largely echoed the findings of the OECD report. In it, I argued that current debates about cyberwar rely too much on hypothetical scenarios that imagine the worst, what I called "cyber-doom scenarios." I demonstrated that when subjected to evaluation based on empirical evidence from history and sociology, we can conclude that cyber-doom scenarios are unlikely. Fears of vulnerabilities based in new technologies are not new. The telegraph, telephone, radio, railroads, and other new technologies have led to similar fears in the past and those fears have yet to be realized. Instead, what history and sociology show us is that both technological systems and social systems are more resilient than we often assume. Cases such as strategic bombing, blackouts, natural disasters, and terrorist attacks have not typically led to total

or long-term collapse of social, economic, or technological systems. If these events have not led to the kinds of results that the prophets of cyber-doom predict, why would we expect that cyber-attacks would?

Cybersecurity hype increases the risk of a NATO-Russia war. It constitutes a self-fulfilling prophecy.

Lee & Rid, '14 [Robert, an active-duty USAF Cyber Warfare Operations Officer who has led multiple cyberspace operations programmes in the Air Force and US Intelligence Community; Thomas, professor in the Department of War Studies at King's College London, OMG CYBER! THIRTEEN REASONS WHY HYPE MAKES FOR BAD POLICY," RUSI Journal, October/November 2014, http://www.tandfonline.com/doi/pdf/10.1080/03071847.2014.969932]

Eleven: Hype Escalates Conflict. Government, military and industry leaders are consequently able to make wild claims without providing evidence. This has an escalatory effect. 'We're in a pre-9/11 moment, in some respects, with cyber,' said John Carlin, assistant attorney general for national security in the Justice Department in Aspen, Colorado in July. 25 He did not provide concrete details to back up his claim. Just weeks after Russia annexed Crimea in March 2014, NATO's Supreme Allied Commander Europe (SACEUR), USAF General Philip Breedlove, made comments about Russia's use of cyber in doing so. He told the New York Times that cyber-warfare had been used to isolate the Ukrainian military on the Crimean peninsula.26 A month later he revisited these claims, stating that cyber was a critical part of Russia's actions. To quote Breedlove:27 When they [Russia] took Crimea, cyber was part of a well-planned, total decapitation of Crimea from the command and control structure of Ukraine. Ukraine was absolutely disconnected from being able to do anything with their forces in that area. Cyber was one of three tools used, and used quite exquisitely. Consequently, the Atlantic Alliance is updating its cyber-defence policy – a point confirmed at the recent NATO summit in Wales. A very serious cyberattack, some in the Atlantic Alliance seem to suggest, should be treated like an invasion. 'For the first time we state explicitly that the cyber-realm is covered by Article5of the Washington Treaty, the collective defence clause', said Jamie Shea, NATO's deputy assistant secretary general for emerging security challenges, in June. 28 At first glance, this statement appears to be meant as a deterrent. However, deterrence does not seem to apply: to deter, a statement needs to be clear and backed by credible threat of punishment. So far, NATO is doing the reverse: 'We do not say in exactly which circumstances or what the threshold of the attack has to be to trigger a collective NATO response,' Shea said, 'and we do not say what that collective NATO response should be'.29 A vague but high bar for cyber-attacks also implicitly legitimises ongoing espionage attacks as acceptable and minor. Moreover, the vast majority of cyber-attacks also do not fall into NATO's remit in the first place: espionage and cyber-crime are problems for intelligence agencies and law enforcement, not for a military alliance. For militants and the Kremlin, the subtext is clear: cyber matters; better up your game. NATO – among others– is escalating a problem that someone else will have to solve.

Current efforts will provide effective safeguards against cyber- attacks. Security improvements are ongoing.

Keller, 3-3-15 [John, editor-in-chief of Military & Aerospace Electronics magazine, which provides extensive coverage and analysis of enabling electronic and optoelectronic technologies in military, space, and commercial aviation applications. A member of the Military & Aerospace Electronics staff since the magazine's founding in 1989, Mr. Keller took over as chief editor in 1995., "DARPA eyes cyber security program to safeguard private and proprietary computer information," Military & Aerospace Magazine, March 3, 2015, http://www.militaryaerospace.com/articles/2015/03/darpa-cyber-security.html]

U.S. military researchers will brief industry on 12 March 2015 on an upcoming new cyber security research program to develop ways of protecting the private and proprietary information of individuals and enterprises. Officials of the U.S. Defense Advanced Research Projects Agency (DARPA) in Arlington, Va., will detail the upcoming program from 10 a.m. to 3 p.m. on 12 Brandeis March 2015 at the Holiday Inn, 4610 North Fairfax Drive, in Arlington, Va. The Brandeis proposers day is to familiarize participants with DARPA's interest in privacy science; identify potential proposers; and provide an opportunity for potential proposers to ask questions about the upcoming Brandeis program. Privacy is critical to a free society, DARPA researchers say. As Louis Brandeis said in 1890, the right to privacy is a consequence of understanding that harm comes in more ways than just the physical. He was reacting to the ability of the new "instantaneous camera"

to record personal information in new ways. Since then, the ability of technology to collect and share information has grown beyond all expectation. DARPA researchers are reaching out to industry for ways to continue the benefits of information sharing, while safeguarding the private information of individuals and businesses.

Related: DARPA picks six companies to define enabling technologies for U.S. cyber warfare strategy

The White House has made cyber security a priority and has launched initiatives to enable the safe and effective sharing of information to increase the nation's ability to protect itself and to thwart any adversary's ability to shut down our networks, steal trade secrets, or invade the privacy of Americans, researchers say.

Off Case

Executive Self Restraint CP

1NC CP Shell

TEXT: The President should issue and implement an executive order repealing all domestic online surveillance authority under Executive Order 12333, preventing enforcement of domestic online surveillance authority under the Patriot Act and the FISA Act Amendments of 2008 and prohibiting any requirement for manufacturers of electronic devices or software to provide bypasses for encryption.

Counterplan is net beneficial because using the executive avoids the link to politics.

Executive Self Restraint functions to substantially curtail national security and specifically surveillance operations. Empirics prove.

Sales, '12 [Nathan, Assistant Professor of Law, George Mason University, "SELF RESTRAINT AND NATIONAL SECURITY," JOURNAL OF NATIONAL SECURITY LAW & POLICY [Vol. 6:227], George Mason University Law and Economics Research Paper Series, August 8, 2012, http://jnslp.com/wp-content/uploads/2012/08/08__Sales_Master_6-28-12-NS.pdf]

If the only thing we knew about national security was what we learned from Hollywood, we'd come away with the impression that the Pentagon and CIA were populated entirely by rogue agents who routinely, if not gleefully, flout the legal restrictions that govern them. Think of Jack Bauer goading a captured terrorist into talking by staging a mock execution of his young son, or General Jack Ripper enthusiastically ordering a nuclear strike on the Soviet Union. That crude caricature is almost the exact opposite of reality. Military and intelligence officials tend to be scrupulously careful when deciding how to deploy the immense powers at their fingertips. The government frequently adopts constraints on its ability to carry out certain national security operations, restrictions that go much farther than what is required by the governing principles of domestic or international law. Recent history offers plenty of examples. Counterterrorism interrogators aren't getting as close as possible to the legal line drawn by the Convention Against Torture, the federal torture statute, and the Detainee Treatment Act; they've been restricted to the relatively benign techniques authorized in the Army Field Manual. In the 1980s and 1990s, officials were reluctant to order targeted killings that they believed were perfectly consistent with domestic and international prohibitions on assassination; they either rejected them outright (in the case of Osama bin Laden) or modified them to camouflage their true purpose (in the case of Mohammar Qadaffi). Military officers aren't itching to order attacks that are even arguably permissible under the laws of war; they're foregoing lawful strikes that members of the JAG corps regard as problematic for moral, economic, and other non-legal reasons. **Justice Department lawyers didn't aggressively promote information sharing under** the **Foreign Intelligence Surveillance Act; they built a wall that segregated cops from spies and set themselves up as** the department's information sharing **gatekeepers.**

New Executive Orders curtailing surveillance are easy to pass and implement as well as legally binding. Time frame is immediate.

Electronic Frontier Foundation, 7-9-15 [EFF-The Electronic Frontier Foundation is the leading nonprofit organization defending civil liberties in the digital world. EFF champions user privacy, free expression, and innovation through impact litigation, policy analysis, grassroots activism, and technology development. "Tell Obama: Stop Mass Surveillance Under Executive Order 12333," 7-9-15, https://act.eff.org/action/tell-obama-stop-mass-surveillance-under-executive-order-12333]

Executive orders are legally binding orders given by the President of the United States which direct how government agencies should operate. Executive Order 12333 covers "most of what the NSA does" and is "the primary authority under which the country's intelligence agencies conduct the majority of their operations."1 So while the U.S. Congress is considering bills to curtail mass telephone surveillance, the NSA's primary surveillance authority will be left unchallenged. It's time to change that. Last July, former State Department chief John Napier Tye came forward with a damning account of Executive Order 12333, which he published in The Washington Post2. Thanks to his account and the reports of others who have spoken out candidly against surveillance under E.O. 12333, we know: Executive Order 12333 is used to collect the content of your communications– including Internet communications like emails and text messages. Executive Order 12333's has no protections for non-U.S. persons, a fact that has been used to justify some of the NSA's most extreme violations of privacy, including the recording of an entire country's telephone conversations.3 Executive Order 12333 is used to collect information on U.S. persons who are not suspected of a crime. As Tye wrote, "It does not require that the affected U.S. persons be suspected of wrongdoing and places no limits on the volume of communications by U.S. persons that may be collected and retained." No US court has seriously considered the legality and constitutionality of surveillance conducted under Executive Order 12333. This executive order was signed by President Ronald Reagan in 1981, many years before the Internet was widely adopted as a tool for mass communication. A stroke of the U.S. President's pen over thirty years ago created the conditions that led to our global surveillance system. The present President could fix it just as easily. Join us in calling on President Obama to fix Executive Order 12333 and end the mass surveillance of people worldwide.

1NC Net Benefit Shell: Presidential Power Good

The President acting alone preserves executive power – prevents Congress from stepping in.

Wall Street Journal 2013

[Wall Street Journal, 9/5/2013. "Obama's Curbs on Executive Power Draw Fire," http://online.wsj.com/article/SB10001424127887323893004579057463262293446.html]

A senior administration official said that while the new drone-strike policy does rein in executive authority, the NSA and Syria proposals weren't a reduction of power but an effort to increase transparency and build public confidence. Still, the president, who was criticized for seizing too much power through recess appointments and other steps that some said circumvented Congress, now is being criticized by veterans of past Republican administrations for weakening the presidency. John Yoo, The president's moves on national-security issues reflect a mix of political pragmatism as well as personal principles, and exactly how much power Mr. Obama actually has given up is the subject of debate. He has walked a fine line on Syria, for example, saying he wasn't required to seek sign-off from lawmakers for a military strike but asking for their approval anyway. a Justice Department official in the George W. Bush administration, said Mr. Obama had unnecessarily limited his own authority. He noted that it is rare to see a president restrict his powers. Mr. Obama "has been trying to reduce the discretion of the president when it comes to national security and foreign affairs," said Mr. Yoo, now a law professor at the University of California at Berkeley. "These proposals that President Obama is making really run counter to why we have a president and a constitution." Others, though, said the president had given up a modicum of authority in an effort to protect presidential power and guard against congressional action. The question of the extent of executive power has been long debated in Washington. President Lyndon Johnson was accused of using a narrow congressional resolution to vastly and illegally expand the Vietnam War, for example, and President Richard Nixon was accused of creating an "imperial presidency" before his resignation. More recently, Mr. Obama's predecessor, Mr.

Bush, was accused by Democrats of having inappropriately expanded executive powers in combating terrorism. Jack Quinn, who served as White House counsel for President Bill Clinton, said Mr. Obama's recent moves amount to threading a needle to reach agreements and avoid larger setbacks for executive power. "Sometimes, it's important to show tolerance for others in order to preserve the power that you have," he said. "I don't think anyone can say that he is a shrinking violet when it comes to his use of power as president." A.B. Culvahouse, White House counsel under Ronald Reagan, agreed that the president imposing constraints on executive authority is the preferable course if it helps dissuade Congress from stepping in to impose the same or more onerous limitations. Lawmakers retain the power of the purse, he noted, and also could codify restrictions in statute.

A strong unchecked executive is necessary to prevent and win inevitable conflicts, including wars with China, North Korea, Iran and the War on Terrorism.

McCarthy, '06

[Andrew, Director Center for law and counterterrorism at the Foundation for Defense of Democracies, March 2006, "The Powers of War and Peace by John Yoo," Commentary, https://www.commentarymagazine.com/articles/the-powers-of-war-and-peace-by-john-yoo/]

Yoo's thesis in this book is strongest as an argument grounded in text—the text, that is, of our founding law. Precisely because the Constitution reposes such power in the executive, he argues, it is adaptable to the demands of crisis (though one must add that broad presidential power is necessarily also open to great abuse and even disastrous miscalculation). It is also flexible enough to allow for international cooperation in the name of the national interest without a wholesale commitment to dreamy multilateral constructs (though this, too, can make for trouble in an age of globalization in which dependable allies are essential). But is Yoo's reading, especially concerning the power of war, truly consistent with the framers' original understanding? As the constitutional scholar Cass Sunstein has observed in reviewing Yoo's book, George Washington himself construed Congress's power to declare war as meaning that "no offensive expedition of importance can be undertaken until after they [Congress] have deliberated on the subject, and authorized such a measure." Other giants of the founding—Adams, Jefferson, Hamilton, Madison, Chief Justice John Marshall—voiced similar sentiments. Even granting that the framers expressly resisted congressional war-making, and promoted a vibrant executive, one need not interpret "declare" as narrowly and legalistically as Yoo suggests. In short, the tension reflected in the debates at the constitutional convention persists. But one must also be alert to reality. In a world beset by the constant threat of sudden destructive force, a robust and firmly grounded view of presidential power is imperative. Potential perils come today not just from growing national powers like China but from rogue states in Iran and North Korea as well as from increasingly diffuse terror cells that have demonstrated their capacity to continue striking globally even when, as now, they are under siege. If public safety is to be something other than an illusion, securing it will demand the power to attack quickly and, in appropriate circumstances, preemptively; the price of awaiting consensus from 535 members of Congress may be too prohibitive. For showing how that power derives from the very system the framers bequeathed us, John Yoo deserves our deep thanks.

2NC: Executive Self Restraint CP Extensions

Executive Self Restraint eliminates the need for external checks and oversight. Empirically, the incentives for restraint are powerful.

Sales, '12 [Nathan, Assistant Professor of Law, George Mason University, "SELF RESTRAINT AND NATIONAL SECURITY," JOURNAL OF NATIONAL SECURITY LAW & POLICY [Vol. 6:227], George Mason University Law and Economics Research Paper Series,

August 8, 2012, http://jnslp.com/wp-content/uploads/2012/08/08__Sales_Master_6-28-12-NS.pdf]

Much of the case law and scholarship concerning national security rests on the assumption that the executive branch is institutionally prone to overreach – that, left to its own devices, it will inch ever closer to the line that separates illegal from legal, and sometimes enthusiastically leap across it. The obvious conclusion is that external, principally judicial, checks are needed to keep the Executive in line.2 In many cases the Executive does indeed push the envelope. But not always.3 The government often has powerful incentives to stay its own hand – to forbear from military and intelligence operations that it believes are perfectly legal. Officials may conclude that a proposed mission – a decapitation strike on al Qaeda's leadership, say, or the use of mildly coercive interrogation techniques on a captured terrorist – is entirely permissible under domestic and international law. Yet they nevertheless might rule it out. In other words, the government sometimes adopts self-restraints that limit its ability to conduct operations it regards as legally justified; it "fight[s] with one hand behind its back," to borrow Aharon Barak's memorable phrase.4

There are powerful motives for executive self- restraint: cost/benefit analysis and bureaucratic empire building.

Sales, '12 [Nathan, Assistant Professor of Law, George Mason University, "SELF RESTRAINT AND NATIONAL SECURITY," JOURNAL OF NATIONAL SECURITY LAW & POLICY [Vol. 6:227], George Mason University Law and Economics Research Paper Series, August 8, 2012, http://jnslp.com/wp-content/uploads/2012/08/08__Sales_Master_6-28-12-NS.pdf]

The question then becomes why officials adopt these restraints even when they believe them to be legally unnecessary. Public choice theory suggests two possible explanations. First, self-restraint might result from systematic asymmetries in military and intelligence officials' expected value calculations. The expected costs of a given national security operation often dwarf the expected benefits; officials have more to lose from being aggressive than they have to gain. In particular, operations –even concededly lawful ones – can inspire adversaries to launch demoralizing propaganda campaigns accusing the United States of war crimes, can sap the willingness of allies to assist this country, and can even result in criminal prosecutions or private lawsuits against the responsible officials. In addition, the resulting costs can be internalized onto the responsible officials more easily than the resulting benefits. While all national security players experience a degree of cost benefit asymmetry, some experience more than others. In particular, the senior policymakers who approve operations, and the lawyers who review them, seem even more cautious than the operators who actually carry them out. This may be because policymakers and lawyers discount some of the benefits that operators expect to gain (e.g., certain forms of psychic income), and also account for certain costs that operators overlook (e.g., ramifications for the country's broader strategic priorities). Policymakers and lawyers therefore will veto proposed missions when they calculate – as they often will – that their costs exceed their benefits. Second, self-restraint might result from bureaucratic "empire building,"5 as lawyers and other officials seek to magnify their clout by rejecting operations planned by their inter- and intra-agency competitors. Military and intelligence figures seek to maximize, among other values, the influence they hold over senior policymakers as well as autonomy to pursue the priorities they deem important. One way for an official to do that is to interfere with a rival's plans. A bureaucratic player typically gains no power by serving as a competitor's yes man. Often, it gains by saying no, because its obstruction forces the rival to be responsive to its concerns. Reviewers in the government's national security apparatus therefore will veto operations planned by other entities when doing so will enhance their welfare.

Cost benefit differences and bureaucratic empire building enhance executive self-restraint.

Sales, '12 [Nathan, Assistant Professor of Law, George Mason University, "SELF RESTRAINT AND NATIONAL SECURITY," JOURNAL OF NATIONAL SECURITY LAW & POLICY [Vol. 6:227], George Mason University Law and Economics Research Paper Series, August 8, 2012, http://jnslp.com/wp-content/uploads/2012/08/08__Sales_Master_6-28-12-NS.pdf]

Public choice theory can help answer that question. As developed in this article, there are at least two explanations that can account for the government's tendency to tie its own hands in national security operations: cost-benefit asymmetry and empire building. Officials in military and intelligence agencies tend to be cautious for a straightforward reason. It is in their interest to be cautious. The expected costs of national security operations are often greater than the expected benefits. The best case scenario for a cop, spy, or soldier is that he gets a pat on the back; the worst is that he goes to jail. That gap naturally predisposes officials to play it safe, and senior government policymakers (and therefore their lawyers) are likely to be especially cautious. It shouldn't come as much of a surprise, then, when attorneys in the intelligence community or the Pentagon veto an operation – even a concededly lawful operation – that has the potential to inspire demoralizing propaganda campaigns by adversaries, expose officials to criminal prosecutions, or worse. The lawyers are doing what all lawyers do – trying to keep their clients out of trouble. You may be convinced that it's legal to bomb a particular convoy or share a particular intelligence report with your buddy at the FBI. But there's no guarantee that Belgian war crimes prosecutors or the FISA Court will see things the same way. Why take the chance?

Persuasive examples of executive self- restraint in national security and specifically surveillance abound.

Sales, '12 [Nathan, Assistant Professor of Law, George Mason University, "SELF RESTRAINT AND NATIONAL SECURITY," JOURNAL OF NATIONAL SECURITY LAW & POLICY [Vol. 6:227], George Mason University Law and Economics Research Paper Series, August 8, 2012, http://jnslp.com/wp-content/uploads/2012/08/08__Sales_Master_6-28-12-NS.pdf]

One example of self-restraint is Executive Order 13,491, which limits counterterrorism interrogations, including those conducted by the CIA, to the techniques listed in the Army Field Manual. The AFM prohibits or severely restricts a number of fairly mild interrogation methods such as low-grade threats, the "good cop, bad cop" routine, and other staples of garden-variety law enforcement investigations. A second example, sketched above, is the White House's onetime reluctance to use targeted killings against Osama bin Laden, despite its belief that doing so would be consistent with domestic and international laws against assassination. Third, lawyers in the Judge Advocate General corps sometimes reject military strikes that would be permissible under the law of war, but that they regard as problematic for moral, economic, social, or political reasons. A fourth example is the Justice Department's erection of a "wall" that restricted information sharing between intelligence officials and criminal investigators, despite the fact that the applicable statute (the Foreign Intelligence Surveillance Act of 1978) contained no such limits, and despite the fact that the governing DOJ guidelines established mechanisms for swapping such data.

Politics Links

PRISM Politics Links

Bipartisan support for PRISM is overwhelming. Congress definitively supports the status quo.

Green, '13 [Lloyd, former attorney in the Justice Department, "Prism and the NSA: Something Congress Can Agree On," The Daily Beast, June 6, 2013, http://www.thedailybeast.com/articles/2013/06/16/prism-and-the-nsa-something-congress-can-agree-on.html]

Finally, our polarized political leaders have found their bipartisan spirit. Lloyd Green on why members of Congress from both sides of the aisle like government data mining. The center lives. Bipartisanship is not dead, as Democratic and Republican congressional leaders rally around the National Security Agency's big data grab. With the exception of op-ed writers, the American Civil Liberties Union, and the Pauls—Rand and Ron—Washington's establishment is standing together with the administration. In this scrum, party is secondary, at least on Capitol Hill. In a show of unity virtually unseen since 9/11, the congressional leadership has come out unanimously in support of the status quo, while deflecting allegations that The Guardian's news story was actually news. According to Senate Majority Leader Harry Reid, senators who complain about being left in the dark have only themselves to blame, and all other Americans should sit down and shut up.

Fear of being blamed for terrorist attacks ensures continued Congressional support for PRISM surveillance.

Green, '13 [Lloyd, former attorney in the Justice Department, "Prism and the NSA: Something Congress Can Agree On," The Daily Beast, June 6, 2013, http://www.thedailybeast.com/articles/2013/06/16/prism-and-the-nsa-something-congress-can-agree-on.html]

But can you really blame Congress for its reluctance to challenge the president or the very legal rubric that Congress itself enacted? As Peggy Noonan put it, "The thing political figures fear most is a terror event that will ruin their careers. The biggest thing they fear is that a bomb goes off and it can be traced to something they did or didn't do, an action they did or didn't support."

The American public supports PRISM as critical to fight terrorism after 9-11.

Green, '13 [Lloyd, former attorney in the Justice Department, "Prism and the NSA: Something Congress Can Agree On," The Daily Beast, June 6, 2013, http://www.thedailybeast.com/articles/2013/06/16/prism-and-the-nsa-something-congress-can-agree-on.html]

Meanwhile, Americans are not demanding that the administration stop doing whatever it is doing. Public opinion is ambivalent, not adamant, with conflicting polls delivering contrary messages. According to a joint Washington Post–Pew Research Center poll, 56 percent find the NSA's telephone tracking program to be acceptable, while two in five disagree. Still, a later Gallup poll showed a majority of the public opposed to telephone and Internet tracking, with less than two fifths supportive. In other words, don't expect much to change, insofar as 9/11 has changed everything where the threat of terror is concerned. Sen. Al Franken, by way of Harvard and SNL, tells us that Prism and the NSA are "not about spying on the American people." Channeling his inner Stuart Smalley, Franken adds, "There are certain things that are appropriate for me to know that is not appropriate for the bad guys to know."

There is bipartisan House support for continuing the current PRISM program.

Harris, '13 [Bryant, reporter with Inter Press Service News. He has worked in Muscat, Oman and was a U.S. Peace Corps Volunteer in Morocco. He graduated from UW-Madison in 2011 with a BA in Middle East Studies, "Amash Amendment: House PRISM Vote Shows GOP Hypocrisy in Action," News.Mic, July 25, 2013, http://mic.com/articles/56539/amash-amendment-house-prism-vote-shows-gop-hypocrisy-in-action]

On Wednesday the House voted on an amendment to an appropriations bill that would have defunded the NSA's PRISM program and ended its ability under the PATRIOT Act to collect phone records and metadata from individuals not under investigation. "Small government" Republicans teamed up with "liberal" Democrats to narrowly defeat Rep. Justin Amash's (R-Mich.) amendment, 217-205. One hundred thirty-four Republicans voted "no" on the Amash amendment, as opposed to 83 Democrats. Although many of the Republican representatives who opposed the amendment constantly rail against the excesses of big government and actively oppose the Affordable Care Act on the grounds that it gives the federal government too much power, they have no problem giving President Barack Obama control and unlimited access to our phone records and metadata.

There is bipartisan Senate support for continuing the PRISM program.

Fischer-Zernin, '13 [Maxime, Studying Political Science at Duke University (T. '15). His interests lie primarily in American national security and foreign policy. He is currently an Editor-at-Large for the Duke Political Review, and is a contributor for PolicyMic.com., "PRISM Scandal: Same Republicans Who Blamed Obama For Benghazi, IRS, AP, Are Silent On PRISM — Why?" News.Mic, June 7, 2013, http://mic.com/articles/47129/prism-scandal-same-republicans-who-blamed-obama-for-benghazi-irs-ap-are-silent-on-prism-why]

The NSA programs of acquiring broad amounts of telephone and Internet data have drawn support from both Republicans and Democrats, including the leading members of both parties on the Senate Intelligence Committee, Dianne Feinstein and Saxby Chambliss. While some in the GOP, such as Sen. Rand Paul (R-Ky.) are standing by their principles, others such as Sen. Chambliss (R-Ga.) and Lindsey Graham (R-SC) appear to trust Obama only when it suits their agenda. In a statement, Chambliss says that these "lawful intelligence activities must continue, with the careful oversight of the executive …" This is surprising coming from the same man who believes that President Obama was misleading the American people: "What Susan Rice said was exactly what President Obama told her to say … They were about ready to throw her under the bus." He later added, "I do think that there were some politics involved in the message that the White House wanted to send." Talking about the IRS and Benghazi scandals, Sen. Lindsey Graham commented, "The Obama administration is not a victim of anything other than their excess abuse of power," calling Obama's actions "every bit as damaging as Watergate." However, Graham does not seem to have an issue with the same administration that was "spinning the American people" and "stonewalling the Congress" while acquiring masses of telephone and Internet data on American and foreign citizens. Defending the NSA, Graham told Fox & Friends that "I'm glad the NSA is trying to find out what the terrorists are up to overseas and in our country." While neither Chambliss's nor Graham's mistrust of Obama is necessarily problematic, it is difficult to "square the circle" as to why the White House cannot be trusted to run the IRS or secure diplomatic compounds, but can be trusted with voluminous quantities of personal data. On the libertarian right, congressmen have been far more consistent in their views. Sen. Rand Paul condemned the NSA surveillance as "an astounding assault on the Constitution," adding, "After revelations that the Internal Revenue Service targeted political dissidents and the Department of Justice seized reporters' phone records, it would appear that this administration has now sunk to a new low." Sen. Graham has even gone as far as to attack Rand Paul for criticizing the White House: "I see the threat to the average American, radical Islam coming to our backyard trying to destroy our way of life. He sees the threat (from) the government that's trying to stop the attack. I'm more threatened by the radical Islamists than I am the government agencies who are trying to protect us." While Republicans continue to push the Benghazi and IRS scandals, the choice of many to defend Obama's use of the NSA suggests that Republicans may actually care about the policy enough not to exploit the issue and use it as part of the giant scandal narrative, which would seem to be the smart political play.

Terrorism DA

Terror Links

PRISM is Essential to U.S. Security in War Against Terrorism –DA Links!

Carafano '13 (James, Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow, "PRISM is Essential to U.S. Security in War Against Terrorism", August 6th, 2013, http://www.heritage.org/research/commentary/2013/8/prism-is-essential-to-us-security-in-war-against-terrorism)

Our intelligence professionals must be able to find out who the terrorists are talking to, what they are saying, and what they're planning," said the president. "The lives of countless Americans depend on our ability to monitor these communications." He added that he would cancel his planned trip to Africa unless assured Congress would support the counterterrorism surveillance program. The president was not Barack Obama. It was George W. Bush, in 2008, pressing Congress to extend and update reforms to the Foreign Intelligence Surveillance Act (FISA). He was speaking directly to the American public, in an address broadcast live from the Oval Office. How times have changed. Back then, the President of the United States willingly led the fight for the programs he thought necessary to keep the nation safe. Now, our president sends underlings to make the case. In distancing himself from the debate over PRISM (the foreign intelligence surveillance program made famous by the world-travelling leaker Edward Snowden), President Obama followed the precedent he established in May at the National Defense University. There, he spoke disdainfully of drone strikes, the authorization to use military force against terrorists, and the detention facilities at Guantanamo Bay. All three are essential components of his counterterrorism strategy. In distancing himself from his own strategy, Obama hoped to leave the impression that he is somehow above it all. He has dealt with the Snowden case the same way. When asked while traveling in Africa if he would take a role in going after the leaker, the president replied "I shouldn't have to." The White House's above-it-all attitude sends seriously mixed messages to the American people, who are trying to figure if the government's surveillance programs are legal and appropriate. Congress has not been much better. The authority for PRISM is in FISA Section 702. Congress debated these authorities in 2007 and again when the program was reauthorized in 2008. Senate Majority Leader Harry Reid, D-Nev., surely remembers the controversy. He wrote President Bush: "There is no crisis that should lead you to cancel your trip to Africa. But whether or not you cancel your trip, Democrats stand ready to negotiate a final bill, and we remain willing to extend existing law for as short a time or as long a time as is needed to complete work on such a bill." Evidently, Reid must have felt the authorities granted under Section 702 received a full and sufficient hearing. Most current members of Congress were seated under the dome during the 2008 debates. They had every opportunity not just to read the law, but to be briefed on the program by intelligence officials before voting on the bill. For them to act shocked at the scope of the program today rings about as hollow as Obama's expressed disdain for the operations he oversees. The reality is that Congress and the administration share responsibility for these programs. If they want to change or modify them, who's stopping them? If changes are made, however, they should to be made for the right reason. Leaders must never compromise our security for political expediency. At least 60 Islamist-inspired terrorist plots have been aimed at the U.S. since the 9/11 attacks. The overwhelming majority have been thwarted thanks to timely, operational intelligence about the threats. Congress should not go back to a pre-/11 set of rules just to appeal to populist sentiment. Congress and the White House have an obligation to protect our liberties and to safeguard our security -- in equal measure. Meeting that mission is more important than winning popularity polls.

PRISM helped stop terrorism in US and 20-plus countries.

Mattise '13 (Nathan, New Orleans-based Staff Editor at Ars Technica, "PRISM helped stop terrorism in US and 20-plus countries", June 16th 2013, http://arstechnica.com/tech-policy/2013/06/prism-helped-stop-terrorism-in-us-and-20-plus-countries-nsa-document-argues/)

US intelligence officials sent Congress a new declassified document on Saturday, which the Senate Intelligence Committee then made public. Outlets such as CNN and the Associated Press received the document and revealed a number of interesting statistics related to the government's use of the NSA's controversial PRISM program. However, this document has not yet been published on the Senate Intelligence Committee's website (and does not seem to be easily obtained through basic Internet search). The new document is part of an intelligence official's effort to "show Americans the value of the program," according to the AP. The report's primary supporting stat? Intelligence officials said that information gleaned from these NSA initiatives helped prevent terrorist plots in the US and more than 20 other countries. Additionally, the release stated that phone metadata was searched for less than 300 times within the secretive database last year. The document also added details to the public's growing picture of the PRISM program. CNN reported that the NSA must delete these records after five years. The AP wrote that the NSA programs are reviewed every 90 days by a secret court authorized by the Foreign Intelligence Surveillance Act (FISA), and that the metadata records (which includes a call's time and length) can only be inspected for "suspected connections to terrorism." Despite all the public attention, the Obama Administration continues to insist that no privacy violations took place. According to White House Chief of Staff Denis McDonough (speaking Sunday on Face The Nation), the president plans to further clarify this "in the days ahead." On Friday, TechDirt also published a set of two documents described as "talking points about scooping up business records (i.e., all data on all phone calls) and on the Internet program known as PRISM." One of the talking points' main arguments is that Section 702 of the Foreign Intelligence Surveillance Act authorizes actions similar to those described above. This is despite the fact that no member of the public has ever been able to see the FISA court's ruling of the government's interpretation.

PRISM stopped 50 terrorist attacks, including assaults on the New York Stock Exchange and New York City subways.

Gerstein '13

(Josh, White House reporter for POLITICO, specializing in legal and national security issues, "PRISM stopped NYSE attack", June 18th 2013, http://www.politico.com/story/2013/06/nsa-leak-keith-alexander-92971.html**)**

Recently leaked communication surveillance programs **have** helped thwart more than 50 "potential terrorist events" **around the world since the Sept. 11 attacks, National Security Agency Director Keith Alexander said Tuesday. Alexander said at least 10 of the attacks were set to take place in the United States, suggesting that most of the terrorism disrupted by the program had been set to occur abroad. The** NSA **also** disclosed **that** counterterrorism **officials** targeted fewer than 300 phone numbers **or other "identifiers**" last year in the **massive** call-tracking database **secretly** assembled by the U.S. government. **Alexander said the programs were subject to "extraordinary oversight." "This isn't some rogue operation that a group of guys up at NSA are running," the spy agency's chief added. The data on use of the call-tracking data came in a fact sheet released to reporters in connection with a public House Intelligence Committee hearing exploring the recently leaked telephone data mining program and another surveillance effort focused on Web traffic generated by foreigners. (POLITICO Junkies: NSA leaks cause flood of political problems) Alexander said** 90 percent of the potential terrorist incidents were disrupted by **the Web traffic program known as** PRISM**. He was less clear about how many incidents the call-tracking effort had helped to avert.** Deputy FBI Director Sean Joyce said the **Web traffic** program had contributed to arrests averting a plot to bomb the New York Stock Exchange that resulted in criminal charges in 2008**. Joyce also indicated that the** PRISM **program** was essential to disrupting a plot to bomb the New York City subways in 2009**. "Without the [Section] 702 tool, we would not have identified Najibullah Zazi," Joyce said. However, President Barack Obama acknowledged in an interview aired Monday that it is impossible to know whether the subway plot might have been foiled by other methods. "We might have caught him some other way. We might have disrupted it because a New York cop saw he was suspicious. Maybe he turned out to be incompetent and the bomb didn't go off. But at the margins we are increasing our chances of preventing a catastrophe like that through these programs," Obama told Charlie Rose on PBS. At the hearing, Alexander detailed the scope and safeguards of the programs, while Deputy Attorney General James Cole laid out the legal basis for the surveillance. "This is not a program that's off the books, that's been hidden away," Cole said of the call-tracking program, which was classified "top secret" prior to recent leaks. He noted that the Patriot Act provision found to authorize it has been twice reauthorized by Congress. "All of us in the national security [community] are constantly trying to balance**

protecting public safety with protecting people's civil liberties," Cole said. NSA Deputy Director Chris Inglis said a very limited number of individuals are authorized to access the call-tracking database.

Terror DA Turns the Case – EU Relations

Fallout from a terrorist attack would damage US-European relations far more than U.S. surveillance. The disad turns the case.

Raisher, '14 [Josh is a program coordinator for the Transatlantic Trends survey at the German Marshall Fund of the United States, "Ties that Bind?" U.S. News & World Report, 9-11-2014, http://www.usnews.com/opinion/blogs/world-report/2014/09/11/german-us-relationship-still-strong-despite-nsa-merkel-spying-rift]

So even if policymakers significantly rein in the NSA program itself, along with other espionage activities targeting Germany, something new would inevitably replace them – and potentially something far less appealing to America's allies. The potential domestic fallout of a successful terror attack is sufficiently monumental that it makes political sense for leaders to disregard the fraying of America's relationship with an ally if it reduces the risk of such an event; and if the president wants to curtail intelligence-gathering programs, his room for error is dangerously narrow.

Policing DDI

*** Off-Case ***

Baudrillard Visibility K

Visibility K - 1NC

(I only retagged the first card – you probably should retag the rest, but you don't need to.)

The affirmative's critique relies on the structural notion of difference and otherness, turning the Other into a symbol by calling upon it and subjectifying its existence. This logic necessitates the violence of transparency – turning the other into a subject justifies the racism that they try to prevent

Grace 2000—Senior Lecturer in Feminist Studies @ University of Canterbury at Christchurch (Victoria, 2000, Routledge, "Baudrillard's Challenge: A Feminist Reading," http://sociology.sunimc.net/htmledit/uploadfile/system/20100724/20100724151252877.pdf, rmf)

Baudrillard develops his most sustained discussion of the erasure of 'Otherness' and the proliferation of 'difference' in The Transparency of Evil (TE). His critique distinguishes 'difference' from a form of otherness that is radical, in which there is no scale of values upon which otherness can be registered. Baudrillard is emphatic that not only is otherness not the same as difference, but **difference is what destroys otherness**. Differences are indeed differentiated along a single scale of values. In an interview with Le Journal des Psychologues he says that difference is diversification, 'it is the spectre of modality', making it distinct from alterity in a way he describes there as 'absolute' (Gane 1993: 173). The 'hell of the same' (the void in the second quotation cited at the beginning of this section) is deflected by the hyperreal 'melodrama of difference' (both being chapter titles in TE). Simulation of a spectacular, everproliferating display of 'difference' is entirely consistent with the logic of sign value. Baudrillard claims that **otherness can now be considered to be subject to the law of the market, and** in fact, as a rare item, **is highly valued**. **The 'Other' is** no longer to be conquered, exterminated, hated, excluded, or seduced but rather **now to be understood, liberated, recognised, valued, 'coddled', resurrected as 'different'** This distinction between a form of 'otherness' that is indeed structurally irreducible, neither comparable nor opposable, and a form of 'difference' that is precisely predicated on establishing criteria against which difference is ascertained,3 is central to the critique offered here of feminist insistence on 'irreducible difference'. For this feminist proclamation to be meaningful we need some kind of structural critique of the social, political, economic, and semiotic structuring of difference and otherness. Baudrillard's analysis shifts the ground considerably. It makes additional questions pertinent; for example, what is at stake contemporarily in insisting on the importance of 'irreducible difference'? His work suggests that this kind of question has to be addressed through a critique of the political economy of the sign. At least. With reference to Baudrillard's 'melodrama of difference', the word 'melodrama' has the sense of 'decidedly overdone'. A dictionary definition is: 'sensational dramatic piece with crude appeals to emotions and usually happy ending'. The 'usually happy ending' is rather ironic given its humanist appeal, and the 'happy ending' of cultural hybridity would see the end of the apparent anachronism of racism, a form of discrimination Baudrillard analyses as precisely

prescribed by 'difference' (I will elaborate on this below). Baudrillard uses the term 'melodrama' in conjunction with 'psychodrama' and 'sociodrama' to critique contemporary discourses and practices of 'otherness', both of which conjure the centrality of simulation to the scene of 'cultural difference', and metaphorically depict the simulated and dramatised absence of the other, with its 'melodramatic' undertones of crude emotionality. Baudrillard's argument that racism is an artefact of the institution of difference is integrally related to the structure of differentiation and the axiological and semiological form of its logic. To differentiate in the hyperreal mode of simulation is to discriminate: to establish differences that, generated from the model, are nothing more than more of the same. **Racism**, Baudrillard argues, **does not exist 'so long as the other remains Other'** (TE: 129). When the Other is foreign, strange, 'other', for example, within the order of the symbolic in Baudrillard's critical terms, **there is no scale of equivalence or difference against which discrimination can be performed.** Encounter and transformation are fully open and reversible, in all forms (including the agonistic encounter of violence and death). Racism becomes possible when 'the other becomes merely different' as then the other becomes 'dangerously similar'. This is the moment, according to Baudrillard, when 'the inclination to keep the other at a distance comes into being' (TE: 129). The intolerable introjection of difference in the case of the construction of 'the subject' as 'different', or traversed by a multiplicity of 'differences', means **the other must be exorcised: the differences of the other must be made materially manifest.** The inevitability of a fluctuation, oscillation, vacillation of differences in a differential system means the 'happy ending' will always be illusory. 'Difference' (of others) is fetishised as the icon that keeps 'the subject' different.

The visibility of the affirmative recreates virulence through the hyper-signification of the 1ac. The medium has become the message. The 1ac's politics of transparency internalizes control through the panendoptikon, where individuals become transparent to themselves. Reality only exists through hyper-expression and over-representation; the modern "subject" no longer exists, rather an empty screen projecting a fake sociality.

Baudrillard 2 ~ "The violence of the image", http://www.egs.edu/faculty/jean-baudrillard/articles/the-violence-of-the-image/

This is the typical violence of information, of media, of images, of the spectacular. Connected to **a total visibility**, a total **elimination of secrecy.** Be it of a psychological or mental, or of a neurological, biolo-gical or genetic order - soon we shall discover the gene of revolt, the center of violence in the brain, perhaps even the gene of resistance against genetic manipulation - biological brainwashing, brainstorming, brainlifting, with nothing left but recycled, whitewashed lobotomized people as in Clockwork Orange. At this point we should not speak of violence anymore, but rather of virulence. Inasmuch that it does not work frontally, mechanically, but by contiguity, by contamination, along chain reactions, breaking our secret immunities. And operating not just by a negative effect like the classical violence, but on the contrary by an excess of the positive, just as a cancerous cell proliferates by metastasis, by restless reproduction and an excess of vitality.

That is the point in the controversy about the **violence on the screens** and the **impact of images** on people's mind. The fact is that **the medium itself has a neutralizing power**, counterbalancing the direct effect of the violence on the imagination. I would say : the violence of the third type annihilates the violence of the first and second type - but at the price of a more virulent intrusion in the deep cells of our mental world. The same as for anti-biotics : they eradicate the agents of disease by reducing the general level of vitality.

When the medium becomes the message (MACLUHAN), then **violence as a medium becomes its own message**, a messenger of itself. So the violence of the message cannot be compared with the violence of the medium as such, with the **violence-emanating** from the **confusion between medium**

and message. It is the same with viruses the virus also is information, but of a very special kind - it is medium, and message, agent and action at the same time. That the very origine of its "virulence", of its uncontrollable proliferation. In fact, in all actual biological, social or mental processes,**virulence has substituated violence**. The **traditional violence of alienation**, power and oppression **has been superated** by something more violent than violence itself : **the virality**, the virulence. And while it was an historical or individual subject of violence, **there is no subject**, no personal agent of virulence (of contamination, of chain reaction), and then no possibility to confront it efficiently. The classical violence was still haunted by the specter of the Evil, it was still visible. Virulence only transappears, it is **of the order of transparency** and its logic is that of the transparency of the Evil.

The image (and more generally the s re of information) is **violent** because what happens there is the **murder of the Real**, the vanishing point of Reality. **Everything must be seen, must be visible**, and the **image is the site par excellence of this visibility**. But at the same time it is the site of its disappearance. And that something in it has disappeared, has returned to nowhere, makes the very fascination of the image.

Particularly in the case of all professional of **press-images which testify of the real events**. **In making reality**, even the most violent, **emerge to the visible**, it makes the **real substance disappear. I**t is like the Myth of Eurydice : when Orpheus turns around to look at her, she vanishes and returns to hell. That is why, the more exponential the marketing of images is growing the more fantastically grows the **indifference towards the real world**. Finally, the real **world becomes a useless function**, a collection of **phantom shapes** and **ghost events**. We are not far from the silhouettes on the walls of the cave of Plato.

A wonderful model of this **forced visibility** is Big Brother and all similar programs, reality shows, docusoaps etc. Just there; where everything is given to be seen **there is nothing left to be seen**. It is the mirror of platitude, of banality, of the zero degree of everyday life. There is the place of **a fake sociality**, a virtual sociality where the Other is desperately out of reach - this very fact illuminating perhaps the fundamental truth that the human being is not a social being. Move over in all these scenarii the televisual public is mobilized as spectator and judged as become itself Big Brother. The power of **control** and transvisuality **has shifted** to the **silent majorities** themselves.

We are far beyond the panoptikon, where **there was still a source of power and visibility** it was so to say a panexoptikon - things were made visible to an external eye, whereas here they are made **transparent** to themselves - a **panendoptikon** - thus erasing the traces of control and making the operator himself transparent. **The power of control is internalized**, and **people** are no more Lt victims of the image : **they transform themselves into images** - they only exist as screens, ;or in a superficial dimension.

All that is visualized there, in the operation Big Brother, is pure virtual reality, a synthetic image of the banality, producted : as in a computer. The equivalent of a ready-made - a given transcrition of everyday life - which is itself already **recycled by all current patterns.**

Is there any sexual voyeurism ? Not at all. Almost no sexual scenery. But people dont want that, what they secretly want to see is the **spectacle of the banality**,which is from now our real pornography, own true obscenity - that of the nullity,of insignificance and platitude (i.e. the extreme reverse of the "There of the Cruelty"). But maybe in that scene lies a certain form of cruelty, at least of a virtual one. At the time when media and television are more and more unable to give an image of the events of the world, then they discover the everyday life, the existential banality as the most criminal event, as the most violent (in)actua-lity, as the very place of the Perfect Crime. And that it is, really. And people are fascinated, terrified and fascinated by this indifference of the Nothing-to-see, of the Nothing-to-say, by the indifference of their own life, as of the zero degree of living. The banality and the consumption of banality have now become an olympic discipline of our time - the last form of the experiences of the limits.

In fact, this deals with the naive impulsion to be nothing, and to comfort oneself in this nothingness - sanctioned by the right to be nothing and to be considered and respected as such. Something like a struggle for Nothing and for Virtual death - the perfect opposite to the basic anthropological postulat of the struggle for life. At least it seems that we are all about to change our basic humanistic goals.

There are two ways of disappearing, of being nothing, (in the Integral Reality, everything must logically want to disappear - automatic abreaction to the overdose of reality). Either to be hidden,and to insist on the right not-to-be-seen (the actual defense of private life).Or one shifts to a delirious exhibitionism of his own platitude and insignificance - ultimate protection against the servitude of being,and of being himself. Hence the

absolute obligation to be seen,to make oneself visible at any price. Everyone deals on both levels at the same time. Then **we are in the double bind** - not **to be seen,and to be continously visible**. No ethics,no legislation can solve this dilemma,and the whole current polemic about the right to information,all this polemic is useless. **Maximal information, maximal visibility** are now part of the human rights (and of human duties all the same) and the destiny of the image is trapped between the unconditional right to see and that, unconditional as well, not to be seen.

This means that **people are deciferable at every moment**. **Overexposed to** the light of **information**, and addicted to their own image. Driven to express themselves at any time - self-expression as the ultimate form of confession, as Faucauld said. To become an image, one has to give a visual object of his whole everyday life, of his possibilities, of his feelings and desires. He-has to keep no secrets and to interact permanently. Just here is the deepest violence, a violence done to the deepest core, to the hard core of the individual. And at the same-time to the **language**, because **it also loses its symbolic originality - being nothing more than the operator of visibility**.. It loses its ironic dimersion, its conceptual distance, its autonomous dimension - where language is more important than what it signifies. **The image too is more important than what it sneaks of**. That we forget usually, again and again and that is a source of the violence done to the image.

Today everything takes the look of the image - then all pretend that the real has disappeared under the pression and the profusion of images.. What is totally neglected is that **the image also disappears under the blow and the impact of reality**. The image is usually spoiled of its own existence as image, deyoted to a **shameful complicity with the real.** The violence exercised by the image is largely balanced by the violence done to the image - its exploitation as a pure vector of documen-tation, of testimony, of message (including the message of misery and violence), its allegeance to morale, **to pedagogy, to politics, to publicity**. Then the magic of the image, both as fatal and as vital illusion, is fading away. The Byzantine Iconoclasts wanted to destroy images in order to abolish meaning and the representation of God. Today we are still iconoclasts, but in an opposite way : **we kill the images by an overdose of meaning**.

Borgès'fable on " The People of the Mirror :he gives the hypothesis that **behind each figure of resemblance and representation there is a vanquished enemy**, a defeated singularity, a dead object. And the Iconoclasts clearly understood how icons were the best way of letting God disappear. (but perhaps God himself had chosen to disappear behind the images ? Nobody knows). Anyway,today is no more the matter of God : **We disappear behind our images**. No chance anymore that our images are stolen from us, that we must give up our secrets - because we no longer have any. That is at the same time the sign of our ultimate morality and of our total obscenity.

There is a deep misunderstanding of the process of meaning. Most **images** and photographs today **reflect the misery and the violence of human condition**. But all this affects us less and less, just because **it is over signified**. In order for the meaning, for the message to affect us, **the image has to exist on its own**, to **impose its original language**. In order for the real to be transferred to our imagination, or our imagination transferred to the real, it must be a counter-transference upon the image, and this countertransference has to be resoluted, worked through (in terms of psychoanalysis). Today we see misery and violence becoming a leitmotiv of publicity just by the way of images. Toscani for example is reintegrating sex and Aids, war and death into fashion. And why not ? Jubilating ad-images are no less obscene than the pessimistic ones) But at one condition to show the violence of publicity itself, the violence of fashion, the violence of the medium. What actually publishers are not able even to try to do. However, **fashion** and high society are themselves a kind of **spectacle of death**. The world's misery is quite **so visible**, quite so transparent in the line and the face of any top-model as on the skeletal body of an african boy. The same cruelty is to be perceived everywhere, if one only knows how to look at it.

The 1AC is nothing more than the production and assimilation of otherness. This creates a violent form of identification whereby the other becomes an object of manipulation, another commodity in the economy of symbolic exchange.

Baudrillard 02

/Jean, Screened Out, 51 – 56/

With modernity, we enter the age of the production of the Other. **The aim is no longer to kill the Other, devour it, seduce it, vie with it, love it or hate it, but, in the first instance, to produce it** The Other is no longer an object of passion, but an object of production. Perhaps, in its radical otherness or its irreducible singularity, the Other has become dangerous or unbearable, and its seductive power has to be exorcized? Or perhaps, quite simply, otherness and the dual relation progressively disappear with the rise of individual values and the destruction of symbolic ones? The fact remains that otherness does come to be in short supply and, ifwe are not to live otherness as destiny, the other has to be produced imperatively as difference. This goes for the world as much as for the body, sex and social relations. It is to escape the world as destiny, the body as destiny, sex (and the opposite sex) as destiny, that the production of the other as difference will be invented. For example, sexual differ- ence: each sex with its anatomical and psychological characteristics, with its own desire and all the irresolvable consequences that ensue, including the ideology ofsex and the Utopia of a difference based both in right and in nature. None of this has any meaning in seduction, where it is a question not of desire but of a game with desire, and where it is a question not of the equality of the sexes or the alienation ofthe one by the other, since game-playing involves a perfect reciprocity ofpart- ners (not difference and alienation, but otherness and complicity). Seduction is as far from hysteria as can be. Neither of the sexes projects its sexuality on to the other; the distances are given; otherness is intact - it is the very condition of that higher illusion that is play with desire.

However, with the coming of the nineteenth century and Romanticism, a mas- culine hysteria comes into play and with it a change in the sexual paradigm, which we must once again situate within the more general, universal framework of the change in the paradigm of otherness.

In this hysterical phase, it was, so to speak, the femininity of man which pro- jected itself on to woman and shaped her as an ideal figure in his image. In Romantic love, the aim was not, now to conquer the woman, to seduce her, but to create her from the inside, to invent her, in some cases as achieved Utopian vision, as idealized woman, in others as jemme jatale, as star - another hysterical, supernat- ural metaphor. The Romantic Eros can be credited with having invented this ideal of harmony, of loving fusion, this ideal of an almost incestuous form of twin beings — the woman as projective resurrection ofthe same, who assumes her super- natural form only as ideal of the same, an artefact doomed henceforth to Vamour ox, in other words, to a pathos ofthe ideal resemblance ofbeings and sexes - a pathetic confusion which substitutes for the dual otherness of seduction. The whole mechanics ofthe erotic changes meaning, for the erotic attraction which previously arose out of otherness, out of the strangeness of the Other, now finds its stimulus in sameness - in similarity and resemblance. Auto-eroticism, incest? No. Rather a hypostasis of the Same. Of the same eyeing up the other, investing itself in the other, alienating itselfin the other - but the other is only ever the ephemeral form ofa difference which brings me closer to me. This indeed is why, with Romantic love and all its current spin-offs, sexuality becomes connected with death: it is because it becomes connected with incest and its destiny - even in banalized form (for we are no longer speaking ofmythic, tragic incest here; with modern eroticism we are dealing with a secondary incestuous form - of the protection of the same in the image of the other - which amounts to a confusion and corruption of all images).

We have here then, in the end, the invention of a femininity which renders woman superfluous. **The invention of a difference which is merely a roundabout copulation with its double. And which, at bottom, renders any encounter with otherness impossible** (it would be interesting to know whether there was not any hysterical quid pro quo from the feminine in the construction of a virile, phallic mythology; feminism being one such example of the hystericization of the mas- culine in woman, of the hysterical projection of her masculinity in the exact image ofthe hysterical projection by man ofhis femininity into a mythical image of woman).

However, there still remains a dissymmetry in this enforced assignment to dif- ference.

This is why I have contended, paradoxically, that man is more different from woman than woman is from man. I mean that, within the framework ofsexual dif- ference, man is merely different, whereas in woman there remains something ofthe radical otherness which precedes the debased status ofdifference.

In short, in this process of extrapolation of the Same into the production of the Other, of hysterical invention of the sexual other as twin sister or brother (if the twin theme is so prominent today, that is because it reflects this mode oflibidinal cloning), the sexes become progressively assimilated to each other. This develops from difference to lesser difference through to the point of role-reversal and the vir- tual non-differentiation of the sexes. And it ends up making sexuality a useless function. In cloning, for example, pointlessly sexed beings are going to be repro- duced, since sexuality is no longer needed for their reproduction.

If the real woman seems to disappear in this hysterical invention ofthe feminine (though she has other means ofresisting this), in this invention ofsexual difference, in which the masculine occupies the privileged pole from the outset, and in which all the feminist struggles will merely reassert that insoluble privilege or difference, we must recognize too that masculine desire also becomes entirely problematical since it is able only to project itselfinto another in its image and, in this way, render itselfpurely speculative. So all the nonsense about the phallus and male sexual priv- ilege, etc. needs revising. There is a kind of transcendent justice which means that, in this process ofsexual differentiation which culminates inexorably in non- differentiation, the two sexes each lose as much of their singularity and their otherness. This is the era ofthe Transsexual,

in which all the conflicts connected with this sexual difference carry on long after any real sexuality, any real alterity of the sexes, has disappeared.

Each individual repeats on his or her own body this (successful?) takeover ofthe feminine by masculine projection hysteria. The body is identified and appropriated as a self-projection, and no longer as otherness and destiny. In the facial features, in sex, in sickness and death, identity is constantly being altered. You can do nothing about that. It is destiny. But this is precisely what has to be warded off at all costs in the identification of the body, the individual appropriation of the body, of your desire, your appearance, your image: plastic surgery on all fronts. **For if the body is no longer a site of otherness, of a dual relation, if it is a site of identification, then you have urgently to reconcile yourselfwith it, to repair it, perfect it, turn it into an ideal object**. Everyone treats his/her body as man treats woman in the projective identification we have described: he invests it as a fetish in a desperate attempt at self-identification. **The body becomes an object of autistic worship, of an almost incestuous manipulation**. And it is the body's resemblance to its model which becomes a source oferoticism and unconsummated self-seduction, insofar as it vir- tually excludes the Other and is the best means of excluding any seduction from elsewhere.

Many other things relate also to this production of the Other - a hysterical, spec- ulative production. Racism is one example, in its development throughout the modern era and its current recrudescence. Logically, it ought to have declined with progress and the spread ofEnlightenment. But the more we learn how unfounded the genetic theory of race is, the more racism intensifies. This is because we are dealing with an artificial construction of the Other, on the basis of an erosion of the singularity of cultures (of their otherness one to another) and entry into the fetish- istic system of difference. So long as there is otherness, alienness and a (possibly violent) dual relation, there is no racism properly so called. That is to say, roughly, up to the eighteenth century, as anthropological accounts attest. Once this 'natural' relation is lost, we enter upon an exponential relation with an artificial Other. And there is nothing in our culture with which we can stamp out racism, since the entire movement of that culture is towards a fanatical differential construction of the Other, and a perpetual extrapolation ofthe Same through the Other. Autistic cul- ture posing as altruism.

We talk of alienation. But the worst alienation is not being dispossessed by the other, but being dispossessed of the other: **it is having to produce the other in the absence of the other, and so continually to be thrown back on oneself and one's own image**. If, today, we are condemned to our image (to cultivate our bodies, our 'looks', our identities, our desires), this is not because ofalienation, but because ofthe end ofalienation and the virtual disappearance ofthe other, which is a much worse fate. In fact, the definition ofalienation is to take oneselfas one's focus, as one's object of care, desire, suffering and communication. This definitive short-circuiting of the

other ushers in the era of transparency. Plastic surgery becomes universal. And the surgery performed on the face and the body is merely the symptom ofa more rad- ical surgery: that performed on otherness and destiny.

What is the solution? There is no solution to this erotic trend within an entire culture; to this fascination, this whirl of denial of otherness, of all that is alien and negative; to this foreclosing of evil and this reconciliation around the Same and its multiple figures: incest, autism, twinship, cloning. All we can do is remind ourselves that seduction lies in non-reconciliation with the other, in preserving the alien status of the Other. **One must not be reconciled with oneself or with one's body. One must not be reconciled with the other, one must not be reconciled with nature, one must not be reconciled with the feminine** (that goes for women

The system demands that we maximize production of meaning – in response, we refuse the affirmative's injection of meaning and their call upon the other, we refuse signification, and we refuse meaning.

Baudrillard 2K ~http://www.egs.edu/faculty/jean-baudrillard/articles/simulacra-and-simulations-viii-the-implosion-of-meaning-in-the-media/

What is essential today is to evaluate this double challenge – the challenge of the masses to meaning and their silence (**which is not at all a passive resistance**) - the challenge to meaning

that comes from the media and its fascination. All the marginal, alternative efforts to revive meaning are secondary in relation to that challenge.

Evidently, there is a paradox in this inextricable conjunction of the masses and the media: do the media neutralize meaning and produce unformed [informe] or informed [informée] masses, or is it the masses who victoriously resist the media by directing or absorbing all the messages that the media produce without responding to them? Sometime ago, in "Requiem for the Media," I analyzed and condemned the media as the institution of an irreversible model of communication without a response. But today? This absence of a response can no longer be understood at all as a strategy of power, but as a counterstrategy of the masses themselves when they encounter power. What then? Are the mass media on the side of power in the manipulation of the masses, or are they on the side of the masses in the liquidation of meaning, in the violence perpetrated on meaning, and in fascination? Is it the media that induce fascination in the masses, or is it the masses who direct the media into the spectacle? Mogadishu-Stammheim: the media make themselves into the vehicle of the moral condemnation of terrorism and of the exploitation of fear for political ends, but simultaneously, in the most complete ambiguity, they propagate the brutal charm of the terrorist act, they are themselves terrorists, insofar as they themselves march to the tune of seduction (cf. Umberto Eco on this eternal moral dilemma: how can one not speak of terrorism, how can one find a good use of the media - there is none). The media carry meaning and countermeaning, they manipulate in all directions at once, **nothing can control this process**, they are the vehicle for the simulation internal to the system and the simulation that destroys the system, according to an absolutely Mobian and circular logic - and it is exactly like this. **There is no alternative** to this, no logical resolution. Only a logical exacerbation and a catastrophic resolution.

With one caution. We are face to face with this system in a double situation and insoluble double bind - exactly like children faced with the demands of the adult world. Children are simultaneously required to constitute themselves as autonomous subjects, responsible, free and conscious, and to constitute themselves as submissive, inert, obedient, conforming objects. The child resists on all levels, and **to a contradictory demand** he **responds with a double strategy**. To the demand of being an object, he opposes all the practices of disobedience, of revolt, of emancipation; in short, **a total claim to subjecthood**. To the demand of being a subject he opposes, just as obstinately and efficaciously, **an object's resistance**, that is to say, exactly the opposite: **childishness, hyperconformism, total dependence, passivity, idiocy.** Neither strategy has more objective value than the other. The subject-resistance is today unilaterally **valorized** and viewed as positive - just as in the political sphere **only** the practices of **freedom, emancipation, expression, and** the constitution of **a political subject** are seen as valuable and subversive. But this is to ignore the equal, and without a doubt superior, **impact of all the object practices**, **of the renunciation of the subject position and of meaning** - precisely the practices of the masses - that we bury under the derisory terms of **alienation and passivity**. The liberating practices respond to one of the aspects of the system, to the constant ultimatum we are given to constitute ourselves as pure objects, but they do not respond at all to the other demand, **that of constituting ourselves as subjects**, of liberating ourselves, expressing ourselves at whatever cost, of voting, producing, deciding, speaking, participating, playing the game - a form of blackmail and ultimatum just as serious as the other, even more serious today. To a system whose argument is oppression and repression, the strategic resistance is the liberating claim of subjecthood. But this strategy is more reflective of the earlier phase of the system, and even if we are still confronted with it, it is no longer the strategic terrain: **the current argument of the system is to maximize**

speech, the maximum production of meaning. Thus the strategic resistance is that of the **refusal of meaning** and of the spoken word - or of the hyperconformist simulation of the very mechanisms of the system, which is a form of refusal and of non-reception. It is the strategy of the masses: it is equivalent to returning to the system its own logic by doubling it, to **reflecting meaning**, like a mirror, **without absorbing it**. This strategy (if one can still speak of strategy) prevails today, because it was ushered in by that phase of the system which prevails.

To choose the wrong strategy is a serious matter. All the movements that only play on **liberation**, **emancipation**, on the **resurrection of a subject** of history, of the group, of the word based on "consciousness raising," indeed a "**raising of the unconscious**" of subjects and of the masses, do not see that they are going in the direction of the system, **whose imperative today is precisely the overproduction and regeneration of meaning and of speech.**

T

(maybe some of the FW args and cards apply here, but you should probably just run FW, T was just an extra thing I did)

1NC

A is the Interpretation

Curtail is to reduce or limit

Cambridge 15 (Definition of curtail from the Cambridge Academic Content Dictionary © Cambridge University Press) http://dictionary.cambridge.org/us/dictionary/american-english/curtail

> Curtail verb [T] us /kərˈteɪl/
> › to reduce or limit something, or to stop something before it is finished: He had to curtail his speech when time ran out.

B Is the Violation

The aff engages in counter gazing, they define the "white gaze" as a form of surveillance employed by the federal government to reduce bodies to their surface stereotypes, that's 1AC Yancy 13.

By this logic, the "intellectual counter gazing" of the affirmative is a mechanism that instead surveils systems of whiteness.

By applying an additional "gaze" unto systems of whiteness, the affirmative increases surveillance rather than curtail it.

C. The Affirmative Interpretation Is Bad For Debate

Limits are necessary for negative preparation and clash, and their interpretation makes the topic too big. Permitting reduction by effect is unlimiting. All sorts of things affect surveillance. For example, the economy affects government spending and budgeting for surveillance, and just about everything affects the economy.

D. T IS A VOTER

The opportunity to prepare promotes better debating

FW (better than T)

1NC

Our interpretation is that an affirmative should defend curtailing federal government surveillance as the endpoint of their advocacy. This does not mandate roleplaying, immediate fiat or any particular means of impact calculus.

Surveillance can only be understood in relation to the agent doing the surveying – understanding federal government surveillance as unique is key or the topic becomes abstract and unlimited

Cetina 14
(DANIEL K. CETINA, BALANCING SECURITY AND PRIVACY IN 21ST CENTURYAMERICA: A FRAMEWORK FOR FISA COURT REFORM, 47 J. Marshall L. Rev. 1453 2013-2014, Hein)

Any legitimate attempt to discuss and critique United States surveillance tactics necessarily demands defining exactly what surveillance is and what it entails. Although discourse surrounding governments' intelligence and law enforcement techniques transcends any specific epoch or state,11 modern communication technologies "have revolutionized our daily lives [and] have also created minutely detailed recordings of those lives," 12 thereby making governmental surveillance simple, potentially ubiquitous, and susceptible to abuse.13 Of course, recent surveillance programs were implemented for the noble purpose of conducting the War on Terrorism; 14 but the danger is that pursuing this purpose unchecked can undermine the central principles that both provide the Republic's foundation and differentiate it from the very enemies it combats. 15¶ While the prospect of governmental surveillance seems to implicitly suggest a quasi-Orwellian dystopia,16 fantastical science fiction mythologies, 17 abstruse philosophical concepts, 18 or documented repressive regimes,19 the reality is both less foreboding and more nuanced. Although American society, ostensibly, is looking increasingly akin to such fiction, theory, and

totalitarianism, surveillance as applied is not so disturbing. Surveillance involves and encompasses many topics and practices, both abstract and practical,20 but it primarily involves power relationships. 2 1 Specifically, surveillance is "the focused, systematic and routine attention to personal details for purposes of influence, management, protection or direction."22 Surveillance can target a modern society's numerous communications networks, 28 which exist to send and receive information. 24 The communications include both envelope information and content information, distinct categories that draw varying degrees of interest from the surveillance authority. 25¶ But surveillance is not strictly the province of the federal government. 26 Indeed, state and local governments have their own surveillance practices, as do private corporations, which routinely use surveillance data to determine purchasing trends and calibrate advertising, especially through such social media sites as Facebook.28 Surveillance, therefore, transcends the boundary between the private sector and the public sector. 29¶ The focus here, however, is on federal governmental surveillance. It is therefore critical to understand from where the federal government derives its authority to monitor and analyze communications networks.

The Aff undermines the ability to have a limited and stable number of Affirmatives to prepare against. The link magnitude is high. Their affirmative prevents arguments about core topic areas like the NSA and the political ramifications of the plan.

This is a reason to vote negative.

Our first standard is competition – every affirmative argument needs to be filtered through the question of "how does this function in a competitive venue of debate where there must be a win or a loss assigned to each team. All their evidence will assume non-competitive academic environment rather than one where a forced choice will inevitably take place with every ballot.

Second is substantive side bias

Not defending the clear actor and mechanism of the resolution produces a substantive side bias.

They have the ability to recontextualize link arguments, shift focus to different proscriptive claims of the 1AC while using traditional competition standards like perms to make non-absolutist disagreements irrelevant.

This undermines research. The Aff is incentivized to pick a body of literature with very little negative literature and a prolif of aff advocacies based on single articles or created phrases. There is no incentive to produce detailed strategies because academic

disagreements in the literature are minute and easily wished away by perms or Aff changes.

And we have an external impact – Sufficient research-based preparation and debates focused on detailed points of disagreement are key to political effectiveness. This means they can never effectively assemble a movement and decks their solvency

(Gary, Feb 19, A Great Debate, http://opinionator.blogs.nytimes.com/2013/02/19/a-great-debate/?emc=eta1)

This is the year of what should be a decisive debate on our country's spending and debt. But our political "debates" seldom deserve the name. For the most part representatives of the rival parties exchange one-liners: "The rich can afford to pay more" is met by "Tax increases kill jobs." Slightly more sophisticated discussions may cite historical precedents: "There were higher tax rates during the post-war boom" versus "Reagan's tax cuts increased revenues."¶ Such volleys still don't even amount to arguments: they don't put forward generally accepted premises that support a conclusion. Full-scale speeches by politicians are seldom much more than collections of such slogans and factoids, hung on a string of platitudes. Despite the name, candidates' pre-election debates are exercises in looking authoritative, imposing their talking points on the questions, avoiding gaffes, and embarrassing their opponents with "zingers" (the historic paradigm: "There you go again.").¶ There is a high level of political discussion in the editorials and op-eds of national newspapers and magazines as well as on a number of blogs, with positions often carefully formulated and supported with argument and evidence. But even here we seldom see a direct and sustained confrontation of rival positions through the dialectic of assertion, critique, response and counter-critique. Such exchanges occur frequently in our law courts (for example, oral arguments before the Supreme Court) and in discussions of scientific papers. But they are not a significant part of our deliberations about public policy. As a result, partisans typically remain safe in their ideological worlds, convincing themselves that they hold to obvious truths, while their opponents must be either knaves or fools — with no need to think through the strengths of their rivals' positions or the weaknesses of their own.¶ Is there any way to make genuine debates — sustained back-and-forth exchanges, meeting high intellectual standards but still widely accessible — part of our political culture? (I leave to historians the question of whether there are historical precedents— like the Webster-Hayne or Lincoln-Douglas debates.) Can we put our politicians in a situation where they cannot ignore challenges, where they must genuinely engage with one another in responsible discussion and not just repeat talking points?¶ A first condition is that the debates be focused on specific points of major disagreement. Not, "How can we improve our economy?" but "Will tax cuts for the wealthy or stimulus spending on infrastructure do more to improve our economy?" This will prevent vague statements of principle that don't address the real issues at stake.¶ Another issue is the medium of the debate. Written discussions, in print or online could be easily arranged, but personal encounters are more vivid and will better engage public attention. They should not, however, be merely extemporaneous events, where too much will depend on quick-thinking and an engaging manner. We want remarks to be carefully prepared and open to considered responses.

Next is Mechanism Education

The Aff's failure to identify an agent and mechanism makes cost-benefits analysis impossible, meaning debates take place in an academic vacuum where tradeoffs are irrelevant. It makes link comparisons vacuous and means that detailed PICs about substance are all but impossible.

And this turns the Aff – debates over mechanisms for change are crucial to solve material violence on a large scale. This means they wont be able to create a government and their 1ac will have no solvency because they will just break down the system and not be able to create a new one. This turns case.

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Motivating client activism under dynamic social conditions requires the development and constant assessment and reassessment of a political perspective that measures that resistance and its possibilities. That task in turn requires the development of specific activist goals within the context of such analyses, and perhaps broader, national and international strategy--what some call the political "next step." This is particularly true today, when the economic crisis plaguing capitalism, the "war on terror" and climate change undeniably have world-wide dimensions. Instances of failure, too, need to be part of that analysis, because they teach us much about why otherwise promising activist efforts do not become sustained mass movements of the sort to which we all aspire.¶ Thus, the theoretical need is two-fold: to construct a broader organizing perspective from a political standpoint, and to consider activism writ large. Without reading the pulse of prevailing social conditions, it is easy to miscalculate what that next step ought to be. We will not build a mass movement though sheer perseverance--a linear, idealist conception of change at odds with dynamic social conditions. By the same token, we may underestimate the potential of such mass activism if we focus simply on the local dimensions of our work.¶ The dialectic between a dynamic social context and political consciousness and action requires a constant organizational and political calibration and modulation often missing from theoretical scholarship. Without such a working perspective, we are apt to be either ultra-left or overly conservative. As Jim Pope put it recently in the context of new forms of labor organizing: "If we limit our vision of the future to include only approaches that work within the prevailing legal regime and balance of forces, then we are likely to be irrelevant when and if the opportunity for a paradigm shift arises." n449 The cyclical nature of labor organizing, he argues, mirrors politics generally:¶ American political life as a whole has likewise alternated between periods characterized by public action, idealism, and reform on the [*189] one hand, and periods of private interest, materialism, and retrenchment on the other. A prolonged private period spawns orgies of corruption and extremes of wealth and poverty that, sooner or later, ignite passionate movements for reform. n450¶ C. 'Activism': Towards a Broader, Deeper, Systematic Framework¶ In progressive lawyering theory, grassroots activism is frequently equated with "community organizing" and "movement" or "mobilization" politics. n451 Indeed, these methods have come to predominate activist lawyering in much the same way as "public interest law" has come for many to encompass all forms of progressive practice. "Activism" is, of course, broader still. Even on its own terms, the history of community organizing and social movements in the United States includes two vitally important traditions frequently given short shrift in this realm: industrial union organizing and alternative political party-building. n452 In this section, my aim is not to catalogue the myriad ways in which lawyers and clients can and do become active (methodically or institutionally)--which, given human creativity and progress, in any event may be impossible to do--but rather to problematize three assumptions: first, the tendency to define grassroots activity narrowly; second, the notion that certain groups--for example "the poor" or the "subordinated"--are the definitive agents of social change; and finally, the conviction that mass mobilization or movement-building, by itself, is key to social transformation.¶ 1. Grassroots Activism¶ There are countless ways in which people become socially or politically active. Yet even the more expansive and sophisticated considerations of activism in progressive lawyering theory tend to unnecessarily circumscribe activism. For example, Cummings and Eagly argue that we need to "unpack" the term "organizing." n453 Contrasting two strategies of the welfare rights movement in the 1960s, these authors distinguish between "mobilization as short-term community action and organizing as an effort to build long-term institutional power." n454 In the same breath, however, they define organizing "as shorthand for a range of community-based practices," n455 even though at least some activism, for example union organizing or, say, [*190] fasting, might not be best characterized as "community-based."¶ What is required is a larger framework that takes into account the sum total of activist initiatives. Lucie White argues that we need to "map out the internal microdynamics of progressive grassroots initiatives ... observe the multiple impacts of different kinds of initiatives on wide spheres of social and political life ... and devise typologies, or models, or theories that map out a range of opportunities for collaboration." n456 This map would be inadequate--and therefore inaccurate--if we include certain activist initiatives and not others. But that is precisely what the progressive lawyering literature has done by failing to regularly consider, for example, union organizing or alternative political party-building.¶ 2. Agents of Social Change: Identity, Class and Political Ideology As with our definition of activism, here, too, the problem is a lack of clarity, breadth or scope, which leads to misorientation. Have we defined, with theoretical precision, the social-change agents to whom we are orienting--e.g., the "people," the "poor," the "subordinated," "low-income communities" or "communities of color?" And if so, are these groupings, so defined, the primary agents of social change? By attempting to harmonize three interrelated (yet divergent) approaches to client activism--organizing on the bases of geography and identity, class and the workplace, and political ideology--modern community organizing simultaneously blurs and balkanizes the social-change agents to whom we need to orient. What, after all, is "community?" In geographic terms, local efforts alone cannot address social problems with global dimensions. n457 As Pope observed of workers' centers: "the tension between the local and particularistic focus of community unionism and the global scope of trendsetting corporations like Wal-Mart makes it highly unlikely that community unionism will displace industrial unionism as 'the' next paradigm of worker organization." n458 On the other hand, members of cross-class, identity-based "communities" may not necessarily share the same interests. In the "Asian American community," Ancheta explains: using the word "community" in its singular form is often a misnomer, because Asian Pacific Americans comprise many communities, each with its own history, culture and language: Filipino, Chinese, Japanese, Korean, Vietnamese, Thai, Cambodian, Lao, Lao-Mien, [*191] Hmong, Indian, Indonesian, Malaysian, Samoan, Tongan, Guamanian, Native Hawaiian, and more. The legal problems facing individuals from different communities defy simple categorization. The problems of a fourth-generation Japanese American victim of job discrimination, a monolingual refugee from Laos seeking shelter from domestic violence, an elderly immigrant from the Philippines trying to
