Counterplans

Word-PIC

[if the plan text says ‘uav’ or ‘UAS’ replace it with drones]

The aff sanitizes language and justifies atrocity - the term ‘UAV/UAS’ is an attempt to whitewash the horrible history and practices of Drones.

Stanley 13 – Senior Policy Analyst @ the ACLU (Jay, May 20th 2013, https://www.aclu.org/blog/drones-vs-uavs-whats-behind-name, "Drones" vs "UAVs" -- What's Behind A Name?) NAR

Representatives of the drone industry and other drone boosters often make a point of saying they don’t like to use the word “drones.” When my colleague Catherine Crump and I were writing our drones report in 2011, we talked over what terminology we should use, and decided that since our job was to communicate, we should use the term that people would most clearly and directly understand. That word is “drones." Drone proponents would prefer that everyone use the term “UAV,” for Unmanned Aerial Vehicle, or “UAS,” for Unmanned Aerial System (“system” in order to encompass the entirety of the vehicle that flies, the ground-based controller, and the communications connection that connects the two). **These acronyms are technical, bland, and bureaucratic**. That’s probably their principal advantage from the point of view of those who want to separate them from the **ugly, bloody, and controversial uses** to which they’ve been put by the CIA and U.S. military overseas. I suppose there is a case to be made that domestic drones are a different thing from overseas combat drones. Certainly, there’s a wide gulf separating a $17 million Reaper drone armed with Hellfire missiles and a hand-launched hobbyist craft buzzing around somebody’s back yard. But drone proponents themselves would be the first to say that drones are a tool—one that can be used for many different purposes. They can be used for fun, photography, science, surveillance, and yes, raining death upon people with the touch of a button from across the world. Even the overseas military uses of drones vary, including not just targeted killing but also surveillance and logistics. Putting aside well-founded fears that even domestically we may someday see the deployment of weaponized drones, in the end, the difference between overseas and domestic drones is a difference in how the same tool is used. Regardless of whether you’ve got a Predator, a Reaper, a police craft, or a $150 backyard hobby rotorcraft, that tool is what it is. What it is is a drone. I can’t touch on this subject without quoting from George Orwell’s famous essay “Politics and the English Language,” in which Orwell argued that bland and needlessly complicated language was a political act—a symptom of attempts to cover up things. “Such phraseology is needed if one wants to name things without calling up mental pictures of them,” he wrote. Defending the English language against such obfuscatory usages, he argued, requires writers to: Use “the fewest and shortest words that will cover one's meaning.” “Let the meaning choose the word, and not the other way around.” “Never us a long word where a short one will do.” “Never use a foreign phrase, a scientific word, or a jargon word if you can think of an everyday English equivalent.” All of which back up our decision to stick with the word “drones.” In light of the overseas uses of drone technology, it’s worth noting Orwell’s conclusion: Political language—and with variations this is true of all political parties, from Conservatives to Anarchists—**is designed to make lies sound truthful and murder respectable.** If the word “drones” has horrible connotations, it’s because the technology has in fact been associated with horrible things. Many Americans may not pay attention, but when U.S. drones bring dismembering explosions down upon wedding parties, women, children, and other innocent civilians, they generate all the warm feelings and associations in those countries that the Boston Marathon bombing brought here. In any event, if we change the word we use for drones and they continue to be used for such purposes, then the new word will just gain the same associations as the old. Linguists call that the “euphemism treadmill”—the process by which euphemisms lose their value as euphemisms and take on all the negative coloring of the original word. For example, the words “moron,” “imbecile,” and “idiot” were once neutral terms referring to specific levels of mental disability. They were replaced with the euphemism “mentally retarded”—but in time that has also come to be seen as offensive. The good news for drone boosters is that the very fluidity of the meaning of words that makes a euphemism treadmill possible also means there is plenty of opportunity for the word “drone” to gain more positive connotations over time. If the technology does, in fact, bring benefits to our lives, and not just continue as a surveillance and killing tool, then the word will start to take on the warm and fuzzy tones its proponents would like. Mainly we at the ACLU use “drones” because that is the clearest way to communicate. At the same time, if the word continues to carry a reminder that this is an extremely powerful technology capable of being used for very dark purposes, then that’s not necessarily a bad thing.

*Cyber Security – Cyber Treaty

1NC Shell

Text: The United States federal government should propose a treaty through the United Nations on cyber-war that prohibits first use of cyber weapons and use against civilian infrastructure, applies the law of state responsibility to non-state actors conducting cyber-attacks, create an obligation of treaty members to investigate who committed cyber-attacks against a victim state, with enforcement coming from an International Cyber Forensics and Compliance Staff and issue a document making its current cyber war doctrine transparent, encourage discussion on cyberwar and the Law of Armed Conflict, and offer to restrain its cyber capabilities in exchange for ratification of the treaty, and implement the results of treaty negotiations.

We'll clarify

Treaty solves miscalculated cyber war

Schneier '12

Bruce, is the Chief Technology Officer of Co3 Systems, a fellow at Harvard's Berkman Center, and a board member of EFF, "Cyberwar Treaties," https://www.schneier.com/blog/archives/2012/06/cyberwar_treati.html

We're in the early years of a cyberwar arms race. It's expensive, it's destabilizing, and it threatens the very fabric of the Internet we use every day. Cyberwar treaties, as imperfect as they might be, are the only way **to contain the threat.**

If you read the press and listen to government leaders, we're already in the middle of a cyberwar. By any normal definition of the word "war," this is ridiculous. But the definition of cyberwar has been expanded to include government-sponsored espionage, potential terrorist attacks in cyberspace, large-scale criminal fraud, and even hacker kids attacking government networks and critical infrastructure. This definition is being pushed both by the military and by government contractors, who are gaining power and making money on cyberwar fear.

The danger is that military problems beg for military solutions. We're starting to see a power grab in cyberspace by the world's militaries: large-scale monitoring of networks, military control of Internet standards, even military takeover of cyberspace. Last year's debate over an "Internet kill switch" is an example of this; it's the sort of measure that might be deployed in wartime but makes no sense in peacetime. At the same time, countries are engaging in offensive actions in cyberspace, with tools like Stuxnet and Flame.

Arms races stem from ignorance and fear: ignorance of the other side's capabilities, and fear that their capabilities are greater than yours. Once cyberweapons exist, there will be an impetus to use them. Both Stuxnet and Flame damaged networks other than their intended targets. Any military-inserted back doors in Internet systems make us more vulnerable to criminals and hackers. And it is only a matter of time before something big happens, perhaps by the **rash actions of a low-level military officer**, perhaps by **a non-state actor**, perhaps by **accident**. And if the target nation retaliates, we could find ourselves in a real cyberwar.

The cyberwar arms race **is destabilizing.**

International cooperation and treaties are the only way to reverse this. Banning cyberweapons entirely is a good goal, but almost certainly unachievable. More likely are treaties that stipulate a no-first-use policy, outlaw unaimed or broadly targeted weapons, and mandate weapons that self-destruct at the end of hostilities. Treaties that restrict tactics and limit stockpiles could be a next step. We could prohibit cyberattacks against civilian infrastructure; international banking, for example, could be declared off-limits.

Yes, enforcement will be difficult. Remember how easy it was to hide a chemical weapons facility? Hiding a cyberweapons facility will be even easier. But we've learned a lot from our Cold War experience in negotiating nuclear, chemical, and biological treaties. The **very act** of negotiating limits the arms race and **paves the way to peace**. And even if they're breached, the world is safer because the treaties exist.

Block

Unilateral avoidance of shared legal obligations undermines the entire architecture of international law

Koplow 13—David, is Professor of Law and Director of the Center for Applied Legal Studies at Georgetown University Law Center. He was Special Counsel for Arms Control to the General Counsel, U.S. Department of Defense, Washington, DC, from 2009 to 2011."Indisputable Violations: What Happens When the United States Unambiguously Breaches a Treaty?," The Fletcher Forum of World Affairs 37(1): http://www.fletcherforum.org/wp-content/uploads/2013/02/Koplow_37-1.pdf

So what? Why does it matter that the United States violates treaties, and occasionally does so without a shred of legal cover? Perhaps that is the realpolitik privilege of the global hegemon: to be able to sustain hypocrisy asserting that its unique international responsibilities and its "exceptional" position in the world enable the United States explicitly to welch on its debts, fudge on its obligations, and adopt a "do as we say, not as we do" approach with other countries.

However, **there is a cost when the world's strongest state behaves this way**. One potential danger is that other countries may mimic this disregard for legal commitments and justify their own cavalier attitudes toward international law by citing U.S. precedents. Reciprocity and mutuality are fundamental tenets of international practice; it is foolhardy to suppose that other parties will indefinitely continue with treaty compliance if they feel that the United States is taking advantage of them by unilateral avoidance of shared legal obligations.

So far, there has not been significant erosion of the treaties discussed in the three examples. The United States and Russia will fall years short of compliance with the CWC destruction obligations, but other parties, with the notable exception of Iran, have reacted with aplomb, comfortable with the two giants' unequivocal commitment to eventual compliance. Likewise, the VCCR is not unraveling, even if other states lament the asymmetry in consular access to detained foreigners. And while many states pay their UN dues late and build up substantial arrearages, that recalcitrance seems to stem more from penury than from a deliberate choice to follow the U.S. lead.

But that persistent flouting undermines the treaties—and by extension, it jeopardizes the entire fabric of international law. Chronic noncompliance—especially ostentatious unexcused, unjustified noncompliance—also sullies the nations **reputation** and degrades U.S. diplomats' ability to drive other states to better conform with their obligations under the full array of treaties and other international law commitments from **trade** to **human rights** to **the Law of the Sea**. The **United States** depends upon the international legal structure more than anyone else: Americans have the biggest interest in promoting a stable, robust, reliable system for international exchange. It is shortsighted and self-defeating to publicly and unblushingly undercut the system that offers the United States so many benefits. It is especially damaging when, following an indisputable violation, the United States acknowledges its default, participates in an international dispute resolution procedure, and apologizes—but then continues to violate the treaty. The CWC implementation bodies, the International Court of Justice, and even the UN General Assembly and Security Council are unable to effectively do much to sanction or penalize the mighty United States, but it is still terrible for U.S. interests to disregard those mechanisms.

*Democracy – Campaign Finance Reform

1NC Shell

Text: The United States federal government should pass the Fair Elections Act.

Campaign Finance Reform solves the democracy internal link

Mandle 15 – Executive Director of Democracy Matters and Associate Professor of Sociology and Anthropology at Colgate University

(Joan Mandle, "Why we Need Reform", Democracy Matters, http://www.democracymatters.org/what-you-need-to-know-about-money-in-politics-2/overview/why-we-need-reform/)

I. The lifeblood of our democracy is under threat Democracy is above all a process of citizen participation, with government accountable to the people. But it is precisely that necessary participation and accountability that have been weakened and eroded by big contributors who dominate the private financing of campaigns Voter turnout for elections is far lower than in most other democracies. A turnout rate of only around 50% is typical, even for high-profile races. Cynicism about politics and government is rampant as people see: a) the influence of big contributors on laws and policy and b) the corruption scandals involving campaign contributions. The cost of running for office continues to escalate. Few citizens can afford the huge cost of running for office at any level of government. Uncontested and non-competitive elections have increased in frequency, with a re-election rate of incumbents that tops 90% in both federal and state races. Incumbents regularly out-spend challengers by margins of 4 to 1. In 2010, the Supreme Court reversed a 100 year-old ban on corporate and union expenditures on political speech, unleashing unlimited spending from these sources. The "Citizen's United" decision has worsened the dominance of corporate influence in our democracy. In 2014, the Court's McCutcheon decision raised the limit of individual contributions to national party and federal candidate committees from a little over $200,000 to over $3 million (essentially no limit at all on what one person can contribute). The Supreme Court has declared war on campaign finance reform and exponentially raised the power of individuals and corporations to control our elections, laws and democracy. The number of bright young people who want to spend their lives in politics or government service has declined as the price of participation has risen. Fewer than 1% of Americans contribute the vast majority of private money going to fund campaigns. Too many politicians are forced to spend up to 20 hours a week raising money rather than solving our country's pressing problems. National polling has consistently shown that large majorities of the American people distrust the government because they believe that wealthy special interests have more influence in Washington and in state capitols than do voters. Polls also showed that over 2/3 of voters say we need changes to the way elections are financed. II. What can we do? In response there has emerged a pro-democracy movement, committed to deepening the democratic process in the United States. Fundamental to this movement is the struggle to change the way election campaigns are financed, especially by ensuring public financing for serious candidates. Fundamentally a democracy can only be as strong as its elections — elections in which many ideas are heard and where citizens actively engage by running for office, participating in debate, and voting. Private money in elections undermines a truly democratic political process. Changing the way elections are financed is the first and most important step in resolving this shameful situation. If private money continues to dominate American politics, the desires of the affluent will control legislation and the rest of us will be ignored. If we change campaign finance laws, we will help create the real democracy most of us want — one in which laws and policy reflect the will of the majority of the American people. Democracy Matters' motto is CHANGE ELECTIONS. CHANGE AMERICA. III. What is wrong with the present system? Politicians, who depend on huge sums of money to run their campaigns, respond more to the concerns of wealthy donors and special interests than they do to the concerns of voters Affordable health care policy has been held hostage to big contributors who fight reform. Protecting the environment is a low priority for legislators who take big campaign contributions from oil and energy companies. Providing more affordable college loans and grants is fought by banks and college-loan companies. Our foreign policy is too often influenced by the economic interests of big donors rather than by welfare of our country. Huge contributions by banks and the financial industry have ensured that real regulation of Wall Street has been blocked, while our economy has suffered. The safety of our food supply takes second place to the interests of companies that contribute millions to politicians every year. Funding for research and for higher education lags as college tuitions rise and legislators vote for tax breaks for big campaign contributors. Lobbyists representing wealthy contributors gain privileged access to elected officials, while ordinary citizens have to stand in line or rely on sending emails. Precious tax dollars are wasted in the form of pay-backs to wealthy special interests who have filled campaign coffers. You name the issue, and it has a link back to political decisions made by elected officials who are indebted for campaign contributions to a small group of wealthy special interests. Everyone knows there is something wrong – that the system is broken – but they think there is nothing we can do. For specific information on federal campaign contributions (who gives how much to whom as well as reports and commentary on outrageous money and politics happenings) go to the Center for Responsive Politics (www.opensecrets.org); for state-level information go to www.followthemoney.org. IV. Is there a solution? It is obvious that to sustain a democracy and solve the many problems we face as a country, we need to reform the way private money dominates our elections Citizens throughout the country have been organizing together since the early 1990's to correct these problems by instituting systems of public financing of elections, often called Voter-Owned Clean Elections (CE) or Fair Elections. The system is voluntary, and only candidates who show support from their districts can qualify. These reforms have proven to be both constitutional (the courts have ruled it does not harm free speech) and costs only a reasonable amount. Reforms of campaign contribution laws for state-level races have passed in Connecticut (2005); Maine (1996); Arizona (1998) for state elections; and in the cities of Albuquerque, NM (2005) and Portland, OR (2005) for municipal elections. In addition, New Mexico passed CE for the state races for its Public Regulation Commission; New Jersey for two state Assembly districts; and North Carolina and New Mexico for Appellate and Supreme Court judges. In Congress, the Fair Elections Act has been introduced to give Congressional candidates a way to run competitive races without depending on big corporate-based and wealthy donors. The proposed bill would create a hybrid public-financing system, with small donations as well as a public grants going to qualified candidates for the House and Senate. On-going fights for reform to make government accountable to citizens at both the state and federal level are getting traction and building all the time.

Block

The rich have a monopoly on politics- it destroys democratic ideals

Brennan Center for Justice 4/12/11

(The Fair Elections Now Act: A Comprehensive Response to Citizens United April 12, 2011, Brennan Center for Justice at New York Law School, http://www.brennancenter.org/analysis/fair-elections-now-act-comprehensive-response-citizens-united)

The Brennan Center for Justice thanks the Subcommittee on the Constitution, Civil Rights and Human Rights for the opportunity to offer testimony in support of the Fair Elections Now Act, S. 750. Providing public financing for federal elections is a necessary, effective, and constitutional response to last year's game-changing Supreme Court decision in Citizens United v. FEC. The Fair Elections Now Act fights corruption and the appearance of corruption by reducing elected officials' dependence on large donors. It encourages constituent-focused campaigns, and increases the power and participation of small donors in elections. Ultimately, public financing restores voters to their central role in our democracy. With Citizens United, the age-old problem of big money in politics has reached a historic inflection point. In that case, the Court overturned decades of law restricting corporate campaign spending. In doing so, the Court re-ordered the priorities in our democracy—amplifying special interests while displacing the voices of the voters. The 2010 midterm elections gave us a preview of what we can expect in 2012, and beyond. In the first post-Citizens United election, tens of millions of dollars from corporate treasuries were spent to influence the electoral process, leaving voters and grassroots groups consigned to the political margins. Many big spenders—including corporate interests—were able to shield their identities through gaping loopholes in federal disclosure law. In fact, 35 percent of all independent spending was done in the dark. Indeed, a detailed study on political spending in the 2010 elections by New York City Public Advocate Bill de Blasio illustrates the pernicious impact of Citizens United on accountability and transparency in American politics. De Blasio's report focused on the races where Citizens United had the most pronounced impact—namely, elections to the U.S. Senate. After examining the ten most expensive Senate races, De Blasio discovered that: "Anonymous or uncapped entities" (that is, organizations taking advantage of the lifting of restrictions on political spending by Citizens United) spent over $85 million on U.S. Senate races—of which $65.4 million was spent on the top ten races alone. Over 30% of outside spending in these Senate races was funded by anonymous donations. These funds included single donations totaling millions of dollars. In other words, in the last federal election cycle, more spending than ever was made by outside organizations that are wholly unaccountable to voters—indeed, such organizations routinely fail to publicly disclose the names of the corporations and wealthy individuals who are bankrolling their campaigns. This influx of secret money poses major risks of corruption, since such independent spending has been used as a quid pro quo for favorable political treatment for large spenders, as explained below.

Super PACs destroy the democratic system

Bowie '12. Blair Bowie. Adam Lioz. The Huffington Post. Updated: 04/09/2012 5:12 am EDT. http://www.huffingtonpost.com/blair-bowie/how-super-pacs-are-auctio_b_1262962.html

By now there's been no shortage of reporting on the tremendous influence Super PACs have had on the Republican presidential primary. From Sheldon Adelson single-handedly extending Newt Gingrich's campaign to pro-Romney Super PAC Restore our Future running more than 12,000 TV ads in Florida, their super-sized footprint has been felt across the country. In a new report, called Auctioning Democracy: The Rise of Super PACs and the 2012 Elections, we take a comprehensive look at Super PAC fundraising -- from their advent in the wake of 2010's Citizens United Supreme Court decision through 2011 Federal Election Commission year-end filings. Our findings confirm that Super PACs represent much of what is wrong with American democracy rolled neatly into one package: they provide a convenient avenue for

for-profit businesses and wealthy donors to dominate the political process with a flood of sometimes secret cash. Business Money Contrary to the Supreme Court's flawed Citizens United ruling, for-profit businesses should not be permitted to spend treasury funds to influence elections. This spending is usually self-interested, and undermines political equality by allowing those who have achieved success in the economic sphere to translate this success directly into the political sphere. Yet, Super PACs have provided a convenient avenue through which more than 550 for-profit businesses have contributed more than $30 million, accounting for 18% of total itemized Super PAC fundraising since their inception. Secret Money Despite lofty talk of disclosure and transparency in the Citizens United opinion, Super PACs have provided an avenue for secret money to influence elections. Our analysis of FEC data shows that 6.4% of the itemized funds ra ised by Super PACs since 2010 was "secret money" not traceable to its original source, from 501(c)(4) nonprofits or other Super PACs that themselves raised secret money. As the chart below shows, secret money spiked just before the 2010 election, and we expect to see an unprecedented surge flowing to Super PACs as we approach November. Wealthy Contributors Our research confirms what has also been widely reported -- that the vast majority of Super PAC fundraising comes from a tiny number of wealthy individuals and institutions. Of all itemized contributions from individuals to Super PACs, 93% came in contributions of at least $10,000. Only 726 individuals, or 23 out of every 10 million people in the U.S., made a contribution this large to a Super PAC. More than half of itemized Super PAC money came from just 37 people giving at least $500,000. Our big-money system, fueled by Super PACs, is bad for democracy because it gives wealthy individuals and institutions unfair influence over who wins elections; and because, despite the Supreme Court's out-of-touch reasoning, winning candidates are likely to feel more accountable to big donors who helped elect them than the constituents they are supposed to represent. **This violates the spirit of the "one-person, one-vote" principle and a basic premise of political equality: the size of one's wallet should not determine the strength of one's voice in our democracy.** It might not systemically skew politics or policy outcomes if these well-heeled donors were like the rest of us -- if on average they had the same life experiences, opinions about issues, and political views as average-earning citizens. But, unsurprisingly this is not the case. We've long known that large donors are more likely to be wealthy, white, male, and conservative on economics. A recent Russell Sage Foundation report confirms this. The authors found meaningful distinctions between the wealthy respondents they surveyed and the general public on economic issues such as the relative importance of deficits and unemployment. Fighting Back So, we've determined that Super PACs are like kryptonite for our democracy. What can we do to fight back against this menace? Our report names concrete policy solutions to help stanch the flow of unlimited money into democracy. To name a few, Congress and the States can add a layer of accountability to corporate electoral spending by requiring publicly traded corporations to get shareholder sign-off on political spending, as is the norm in European countries where businesses are allowed to spend in elections. The Securities and Exchange Commission can require businesses to disclose their political spending, removing the opportunity to cloak spending through non-profits. And, Congress can enact proactive tools that encourage more small donor participation in campaign financing, like vouchers or tax credits. But, ultimately, the people must act together through Congress and the state legislatures to amend our Constitution to make perfectly clear that **the First Amendment is not -- and never was -- intended as a tool for use by wealthy donors and large corporations to dominate the political process.**

Text: The United States federal government should develop offshore wind farms.

Offshore wind key to advanced manufacturing clusters

N'dolo 10 – associate principal @ Camoin Associates

(Michael and Bruce Bailey, "Offshore development can yield economic benefits," North American Wind Power, Fall 2010)//BB

Economic opportunities

Wind power is a job-creation **engine**. According to the American Wind Energy Association, the wind industry supported over 85,000 jobs in 2009 alone. Most of these jobs were in manufacturing, an area of the U.S. labor force that has been declining rapidly for years. The wind energy industry represents a **significant opportunity** for **turning this decline around**.¶ Although wind power industry clusters exist in North America, there are many specifics to offshore wind that differentiate it from its onshore cousin. Requirements such as installation vessels, unique turbine components, specialized research focus, and professional and technical experience are not yet present in the North American workforce skill set. All of these unique requirements represent an economic opportunity for job creation, ranging from research, design and manufacturing to operations and maintenance.¶ Vessels. Highly specialized installation vessels must be built, operated, repaired and docked during the off-season. The newest generation of such vessels under development in Europe can cost hundreds of millions of dollars to construct and can require a **small army of workers** in ports with sufficient ship-building capacity. In addition, other smaller vessels are necessary for ongoing maintenance and repair operations.¶ The Jones Act requires that all goods transported by water between U.S. ports are carried in U.S.-flagged ships that are constructed in the U.S., owned by U.S. citizens and crewed by¶ permanent residents of the U.S. Although some developers have been successful in requesting an exception, allowing them to use foreign vessels, the Jones Act creates a significant barrier for off-shore developers. Investing and developing a domestic vessel industry to serve the offshore market would significantly increase the attractiveness of a region to offshore developers and investors, in addition to creating jobs to support the new industry.¶ Components. Offshore components tend to he larger and bulkier. Certain components are either unique to (foundations) or modified for (hermetically sealed nacelles, seaworthy substations, nacelle-mounted or substation-mounted helicopter pads for maintenance, and corrosion-resistant materials) offshore use. One of the largest portions of the installed cost of a typical offshore wind farm is directly attributable to the manufacturing and pro-assembly of turbine and foundation components. In regions where a high level of wind component manufacturing currently exists, there is significant opportunity tor creating offshore wind component manufacturing clusters.¶ Installation. Turbines and foundations must be assembled in a staging area, loaded onto a vessel and installed. There are limitations on the ability of any one state or province to service both coasts, but it is reasonable to assume, for example, that an installation cluster in the Mid-Atlantic region of the¶ U.S. could provide installation capacity for a number of projects on the East Coast.

Manufacturing key to econ

Franklin J. Vargo, 10/01/**03**, National Association of Manufacturers, FNS, l/n

I would like to begin my statement with a review of why manufacturing is vital to the U.S. economy. Since manufacturing only represents about 16 percent of the nation's output, who cares? Isn't the United States a post-manufacturing services economy? Who needs manufacturing? The answer in brief is that the United States economy would collapse without manufacturing, as would our national security and our role in the world. That is because manufacturing is really the foundation of our economy, both in terms of innovation and production and in terms of supporting the rest of the economy. For example, many individuals point out that only about 3 percent of the U.S. workforce is on the farm, but they manage to feed the nation and export to the rest of the world. But how did this agricultural productivity come to be? It is because of the tractors and combines and satellite systems and fertilizers and advanced seeds, etc. that came from the genius and productivity of the manufacturing sector. Similarly, in services -- can you envision an airline without airplanes? Fast food outlets without griddles and freezers? Insurance companies or banks without computers? Certainly not. The manufacturing

industry is truly the innovation industry, without which the rest of the economy could not prosper. Manufacturing performs over 60 percent of the nation's research and development. Additionally, it also underlies the technological ability of the United States to maintain its national security and its global leadership. Manufacturing makes a disproportionately large contribution to productivity, more than twice the rate of the overall economy, and pays wages that are about 20 percent higher than in other sectors. But its most fundamental importance lies in the fact that a healthy manufacturing sector truly underlies the entire U.S. standard of living -because it is the principal way by which the United States pays its way in the world. Manufacturing accounts for over 80 percent of all U.S. exports of goods. America's farmers will export somewhat over $50 billion this year, but America's manufacturers export almost that much event month! Even when services are included, manufacturing accounts for two-thirds of all U.S. exports of goods and services. If the U.S. manufacturing sector were to become seriously impaired, what combination of farm products together with architectural, travel, insurance, engineering and other services could make up for the missing two-thirds of our exports represented by manufactures? The answer is "none." What would happen instead is the dollar would collapse, falling precipitously -- not to the reasonable level of 1997, but far below it -and with this collapse would come high U.S. inflation, a wrenching economic downturn and a collapse in the U.S. standard of living and the U.S. leadership role in the world. That, most basically, is why the United States cannot become a "nation of shopkeepers."

Block

OSW promotes fast growth - energy

N'dolo 10 – associate principal @ Camoin Associates

(Michael and Bruce Bailey, "Offshore development can yield economic benefits," North American Wind Power, Fall 2010)//BB

Avoided costs

There are many other ways that offshore development can positively impact local economics, all of which focus on avoided costs. Often misunderstood or ignored, avoided costs are those that, if not addressed, could result in money or **opportunity leaving** an area.¶ For example, is the avoided costs of transmission system upgrades. Many metropolitan areas along the Eastern Seaboard suffer from capacity issues in transmission infrastructure that require tens of billions of dollars to remedy. The extent to which such costs can be delayed, reduced or avoided altogether is an economic benefit to the host community and should be considered as an offset to the perceived higher per-kilowatt power costs of offshore wind.¶ There are additional avoided costs that may be more sig-nificant. Many states and some metropolitan areas have either mandates or policy goals requiring the sourcing of renewable energy by a certain date. If such power cannot be produced locally, providers will be required to source renewable power from elsewhere. This is, in effect, taking local ratepayer dollars and sending them outside of the local economy, a situation analogous to consumer dollars flowing out of the U.S. to pur-chase electronics from low-cost manufacturing countries.¶ These outflows of dollars are tied to **massive job losses**. For the exporting state or province, the ability to recapture these dollars represents new money added to the local economy and additional economic activity. The final avoided cost worth noting is that offshore, while expensive relative to fossil fuels, is less expensive than some other sources of renewable energy such as solar or tidal. The differential costs between offshore¶ wind and other forms of renewable energy can be considered avoided costs that are not passed on to ratepayers.

The aff solves trade and independently without the counterplan trade is ineffective

Scott et al. '13 (Robert E. Scott – Director of Trade and Manufacturing Policy Research, Rob Scott joined the Economic Policy Institute in 1996. His areas of research include international economics, trade and manufacturing policies and their impacts on working people in the United States and other countries, the economic impacts of foreign investment, and the macroeconomic effects of trade and capital flows. He has published widely in academic journals and the popular press. Helene Jorgensen. Doug Hall – Director of the Economic Analysis and Research Network (EARN), Doug Hall became Director of EPI's Economic Analysis and Research Network (EARN) in July 2009, after being an active member of EARN for ten years. Hall previously served as director of operations and research for the Connecticut EARN partner, Connecticut Voices for Children, where he played a leading role in work related to family economic security and state tax and budget issues. He is the author or co-author of dozens of reports, including several reports on state-level economic trends, and eight State of Working Connecticut reports. "Reducing U.S. trade deficits will generate a manufacturing-based recovery for the United States and Ohio" 2/7/13, http://www.epi.org/publication/bp351-trade-deficit-currency-manipulation/)//JHH

Manufacturing has played a **leading role** in the nation's economic recovery, adding 504,000 jobs between February 2010, when manufacturing employment fell to its lowest point, and October 2012. These 504,000 jobs constituted 11.1 percent of the 4.5 million jobs created in that period. However, this relatively recent manufacturing boom comes on the heels of more than a decade of sharp declines in manufacturing employment. Between March 1998 and October 2012, the United States lost 5.7 million manufacturing jobs, nearly a third (32 percent) of manufacturing employment; most of these job losses were due to the growing U.S. trade deficit. Taken together, these trends highlight the manufacturing sector's importance to the U.S. economy and recovery, as well as the role of trade deficits in eliminating U.S. manufacturing jobs.¶ This paper argues that reviving U.S. manufacturing requires eliminating a jobs-destroying U.S. trade deficit in goods by ending currency manipulation and **investing in a series of coordinated manufacturing policies**. It also estimates the economic benefits of ending currency manipulation on trade, jobs, and public budgets in the United States and in Ohio, one of the nation's preeminent manufacturing states.¶ Global currency manipulation1 is one of the most important causes of growing U.S. trade deficits, and of unemployment and slow economic growth in the United States and Europe. Currency manipulation distorts international trade flows by artificially lowering the cost of U.S. imports and raising the cost of U.S. exports. This leads to goods trade deficits that displace U.S. jobs, particularly in the manufacturing sector. The U.S. goods trade deficit could be reduced by between about $190 billion and $400 billion over the course of three years (modeled in this paper as having started in 2011)2 by eliminating global currency manipulation. Without any increase in federal spending or taxation, the United States would reap enormous benefits. As this paper explains, over three years a reduction in the U.S. goods trade deficit of this magnitude would:¶ Create between 2.2 million and 4.7 million U.S. jobs (equal to between 1.4 percent and 3.0 percent of total nonfarm employment)¶ Reduce the national unemployment rate by between 1.0 and 2.1 percentage points¶ Create about 620,000 to 1.3 million manufacturing jobs (27.5 percent of all jobs created by eliminating currency manipulation)¶ Increase U.S. GDP by between $225.0 billion and $473.7 billion (an increase of between 1.4 percent and 3.1 percent)3¶ Shrink the federal budget deficit by between $78.8 billion and $165.8 billion (reductions that would continue as long as the trade balance remained stable), as growth in output expands tax receipts and reduces safety net payments¶ Because Ohio's strong manufacturing sector would experience above-average gains through the increased demand for traded manufactured goods, reducing the U.S. goods trade deficit by between about $190 billion and $400 billion via the elimination of global currency manipulation would have enormous benefits for the state. This paper explains that over three years it would:¶ Create 94,900 to 199,700 jobs (equal to between 1.6 percent and 3.4 percent of total Ohio employment)¶ Reduce Ohio's unemployment rate by between 1.3 and 2.7 percentage points¶ Create 36,100 to 75,900 Ohio manufacturing jobs (equal to 38.0 percent of all Ohio jobs created through ending currency manipulation)¶ Increase Ohio GDP by between $8.3 billion and $17.4 billion (an increase of between 1.9 percent and 3.9 percent)¶ Improve the fiscal position of Ohio state and local governments altogether by between $1.7 billion and $3.7 billion (improvements that would continue as long as the trade balance remained stable), as output growth leads to increased tax revenues and spending reductions¶ But currency manipulation is only one of many demand-side constraints on manufacturing job growth; other countries' dumping practices, insufficient U.S. investment in infrastructure, and other factors have also been barriers to the recovery of U.S. manufacturing. Supply-side constraints also play a role: The United States and its domestic manufacturers are competing in an environment where many other countries, including Germany, Japan, China, and Korea, operate comprehensive manufacturing and labor force development programs to support their traded goods industries; the United States does not.¶ Thus, ending currency manipulation would still leave the United States with a goods trade deficit, which stood at $738.4 billion in 2011. Under the model utilized in this paper, it would be between $360.9 billion and $564.3 billion (equal to between 2.3 percent and 3.6 percent of U.S. GDP) after three years. Fully eliminating the goods trade deficit requires implementing policies that will help restore demand for U.S. goods and boost supply-side supports. As detailed in this paper, such policies include:¶ **Greatly expanding investments in manufacturing R&D and technology diffusion programs**¶ **Providing public financial support to small and medium-sized manufacturers**¶ Developing school-to-work job training systems for non-college-educated workers, including apprenticeship programs modeled on Danish and German models¶ Developing new trade policies that support fair, balanced, and sustainable trade¶ **Planning and implementing manufacturing and traded industry strategies**, including establishing an institution akin to Japan's Ministry of Economy, Trade, and Industry4¶ **Making massive investments in infrastructure**, for example by meeting the United States' $2.2 trillion worth of infrastructure needs over the next five years¶ **Greatly expanding public and private investments in green and renewable energy technologies**¶ Such steps could lead to the **complete elimination of the U.S. goods trade deficit**, which would allow U.S. manufacturing to recover most or all of the market share and employment lost since the late 1990s.

*EU Relations – OSW

Expanding offshore wind commercialization is crucial to US-EU cooperation

Quinn ’14 (Máire GEOGHEGAN-QUINN European Commissioner for Research, Innovation and Science Opening speech at the World Ocean Council World Ocean Council New York, 29 September 2014

As Europeans and North Americans, when we think of the Atlantic, our first reflection may be that the ocean is something that separates us by its sheer vastness and by the harshness of its marine environment. But the Atlantic Ocean also unites us. It's a physical link. And from Ireland, to Newfoundland, to Florida, we face similar challenges and similar opportunities. So, for me, as the European Commissioner responsible for Research, Innovation and Science, **the Atlantic** also **presents a vast potential for collaboration**. Collaboration aimed at tackling the challenges and making the most of the opportunities. A little over one year ago, the US, the EU and Canada signed the Galway Statement on Atlantic Ocean Cooperation. Today we have a perfect forum in which to present this cooperation to industry and to identify ways to collaborate and better address the Atlantic together - our shared heritage, our shared resource and our joint responsibility. **The challenges we face are global in dimension, whether climate change, the rise in sea levels or the sustainable exploitation of marine resources. These challenges are so great, and so important, that international cooperation is not an optional extra – it's essential**. We need the best researchers and the best innovators, in academia and in companies, working together with policymakers on both sides of the Atlantic. But I don't want to talk only about the challenges. I also want to talk about the opportunities. The Blue Economy is expected to experience major growth in the coming decades. Blue biotechnology has an expected yearly growth rate of 5 to 10%. Deep-sea mineral extraction could provide up to 10% of the world's total minerals. **Marine renewable energy** is expected to grow to **40 Gigawatts of offshore wind capacity by 2020. The Blue Economy will only realise its full potential** across all its different **sectors if it is built on a solid base of** research and **innovation**. And we rely on research and innovation to help ensure that growth does not come at the expense of the marine environment. It took us a couple of centuries to fully appreciate the cost to the environment of the industrial revolution. We know better now, and can't afford to make similar mistakes in our oceans. Sustainability must be ensured and the seas and oceans must be de-polluted so that future generations can continue to enjoy the benefits. Knowledge and innovation are the keys to reducing pressure on resources and ensuring that our oceans remain healthy for future generations. Europe and its Atlantic partners already have a strong technology and innovation base in many new and emerging marine sectors. However, these technologies often **face bottlenecks** that prevent them from making it **‘from lab to market’**. **Investments are therefore needed to support the deployment and demonstration of innovations** such as multi-use offshore platforms, integrated multi-trophic aquaculture and large-scale integrated bio-refineries.

Block

Offshore wind is crucial to US-EU economic and trade ties

Stori ’14 (January 27, 2014 | by Val Stori, OWAP Project Director Trade Missions Critical in Building an Offshore Wind Industry

Perhaps one of the most cost-effective measures US developers can take to reduce project risk and installation costs is partnership with experienced developers. Reducing risks and construction time can have a significant impact on overall project costs. In Europe, growing professionalism in the industry—mainly market entry by large construction companies and major utilities, has led to faster installation times and improved methods. These major players have developed and improved techniques and equipment specific to offshore wind development, which has led to speedier installations and thus, reduced costs. In fact, leading utility and major offshore wind developer DONG Energy predicts that a cost reduction of 10-20% by 2017 is realistic; companies like these are focused on streamlining, improving efficiencies, and incentivizing OEMs and suppliers to reduce costs. **Through partnerships, a US developer can gain valuable experience and tap the wealth of knowledge that European developers have already amassed. To spur the development of offshore wind in the US and to gain public acceptance through more acceptable power prices, the US must take advantage not only of European know-how, but also of the European supply chain.** State renewable energy agencies and local economic development councils who already are heavily invested in offshore wind-related infrastructure and who are looking to position themselves as **leading US offshore wind players, are engaging with key European developers and political leaders through international trade missions. In 2013, two CESA members travelled to Germany and Denmark along with a contingent from economic development councils and port authorities as part of international trade missions.** Both contingents returned to the US cognizant of the major challenges that lie ahead in building a domestic industry, yet aware of the tremendous opportunities for growth. After touring some of the world’s largest wind farms, visiting offshore wind-dedicated ports, and speaking with turbine OEMs, the US representatives returned home to champion for offshore wind. In the words of New Bedford Mayor Jon Mitchell, who travelled to Europe with the Massachusetts Clean Energy Center, “it is hard to avoid the adage that seeing is believing.” But what other than awe at the industry’s huge potential is to be gleaned from these international missions? **Beyond the fact finding and knowledge sharing lies an integral component of these trade missions—the opportunity to build relationships and establish joint ventures.** Dedicated matchmaking sessions and networking opportunities are critical to kick-starting efficient development off US shores. **The opportunity to partner—whether a US contractor partners to operate in Europe and brings the experience back or a US project partners with an experienced European contractor—enables us to benefit from Europe’s learning curve**. We do not have to reinvent the wheel every step of the way. In fact, to do so would likely be cost prohibitive at this point in the game. The US currently does not have the volume or the guaranteed market to develop a robust supply chain or to justify investment in domestic ventures that would support the nascent-at-best industry. Even in Germany, where nearly 400MW of offshore wind were installed in 2013, factories sit idle when demand is low despite investment of an estimated $1.3 billion for specialized ports and factories. Even though economic development and job creation are key goals for the states interested in building an offshore wind industry, until a sufficient pipeline of projects is established along the US Atlantic coast, the first few projects will be supplied by European manufacturers. **European developers and manufacturers are eager to work on this side of the Atlantic.** Recently, the Maryland Energy Administration was invited to attend the annual European Wind Energy Association’s conference at the request of European turbine manufacturers who recognize that Maryland may be the first state to deploy a large-scale project in the US. And in late December, Cape Wind contracted with Siemens to supply the project with Siemens’ 3.6MW turbines and an electrical services platform. The platform, in fact, has been contracted out by Siemens to Cianbro Corp.—a Massachusetts-based company, that will construct the offshore substation at its manufacturing facility in Brewer, Maine. While it may be too early for European developers to establish significant facilities in the US at this stage, **they are looking for project partners and prime locations to invest**—especially if states set offshore wind targets. **It could be a win-win situation. Local content is lacking and would be a substantial hurdle causing major bottlenecks if US offshore developers chose to go “local only.” Overseas cooperation with local industry will be key in getting the US offshore wind industry up and running, while providing a large opportunity for the established European players to get involved in US developments**.

Expanding economic and trade ties are the only way to sustain the relationship

Brattberg '13 (By Erik Brattberg. Published 8 November 2013. Erik Brattberg is Analyst at The Swedish Institute of International Affairs, and currently Visiting Fellow at the Atlantic Council of the United States and a Non-Resident Fellow at the Paul H. Nitze School of Advanced International Studies (SAIS) at Johns Hopkins University in Washington DC.

If so, this could be the start of a recreated and re-invented transatlantic relationship. The development of a more strategic EU-US relationship could also help allay fears regarding the US 'abandonment' of Europe. While US strategic thinking is changing – and fast (the so-called 'Asian pivot' is only the beginning) – a more strategic transatlantic relationship would still serve a critical function for Washington, and not just on the security side of things. The drawdown of the military mission in Afghanistan means that the US will have less need for Europe in coming years. Focusing more on global economic and trade issues could constitute a new strategic imperative for closer EU-US ties.

Energy is the litmus test- current cooperation is insufficient AND without energy alignment other cooperation will be undercut

Koryani, 11—Hungarian diplomat, former Undersecretary of State, foreign policy and energy expert. He is also the Deputy Director of the Dinu Patriciu Eurasia Center of the Atlantic Council of the United State (David [Editor], Tranatlantic Energy Futures, 2011, http://transatlantic.sais-jhu.edu/publications/books/Transatlantic_Energy_Futures/Transatlantic_Energy_Futures.pdf)

Critical factors of divergence cannot be discounted either, as **they have an almost equally strong pull**. **Differing climate change perceptions and the lack of U.S. commitment and action is extremely dangerous, as it alienates Europeans,** both policymakers and the wider public alike**. These differences, if not solved, could drive a wedge for decades between the partners, undermine trust, create a value gap and hinder cooperation not only in** climate change and **energy issues but in all other aspects as well. There is in fact a chance that U.S. and European energy markets could largely decouple** in coming years, **due** in **part to differences regarding the need to tackle climate change**, and in part to diverging geopolitical and domestic trends. **The U.S. has edged closer to self sufficiency with respect to fossil fuels**, with the extensive development of its vast unconventional gas resources and increasing reliance on Canadian oil sands. **This could lead to a more isolationist stance in U.S. policy**. Meanwhile unconventional gas faces mixed reactions in Europe; the EU, for example, plans to shun oil shales and tar sands in its impending Fuel Quality Directive. Friction in transatlantic perceptions on energy security and divergences over preferred courses of action are real dangers that must be addressed head on. Towards a Transatlantic Energy Alliance The systemic transformation of the world of energy, triggered by climate change and powered by new technologies, will likely cause the reorganization of our societies. The benefits and pitfalls of transatlantic cooperation are beyond doubt. Renewing the transatlantic community's leadership is essential to lead the world to a sustainable, low carbon future. Transatlantic cooperation can contribute to provide secure and affordable energy to people in the EU and the U.S., foster economic prosperity and create jobs. **Current cooperation on a wide range of subjects is encouraging but inadequate**. What we need is a new impetus, genuine political will, adequate resources and enhanced cooperation to advance a transatlantic green economy. Joint efforts in addressing climate change, **innovation and investment into clean**

energy technologies, risk sharing and cost reduction, joint RD&D and harmonized energy diplomacy **must be the cornerstones of a Transatlantic Energy Alliance**. A Transatlantic Energy Alliance is desirable and feasible, but not self-evident. **Climate change and energy cooperation will be the litmus test of converging or diverging European and American norms, values and interests in the 21st century**. We have to bridge our differences and we have to do that quickly in order to remain in the driving seat. To amend Robert Kagan's famous line, Americans may be from Mars and Europeans from Venus, but we shall all soon need to move to some other planet if we do not adjust course. Transatlantic Energy Futures endeavors to give you a taste of the intricate and multifaceted energy challenges facing our communities. It aims to do so with a strong conviction in the enduring prominence and necessity of the transatlantic partnership.

Aligning US energy towards renewables is crucial to the US-EU alliance and solving global conflicts

Koranyi '12 (David Koranyi is the deputy director of the Atlantic Council's Dinu Patriciu Eurasia Center and the editor of the book Transatlantic Energy Futures - Strategic Perspectives on Energy Security, Climate Change and New Technologies in Europe and the United States, September 4, 2012, "An Emerging Transatlantic Rift on Energy?")

American and European energy markets are on a diverging path. The US has edged closer to self-sufficiency with respect to fossil fuels, due mostly to the extensive development of its unconventional resources. From 60 percent in 2005, net petroleum imports were down to 45 percent of the US supply last year. By 2020, this rate could be further reduced close to zero, excluding Canada and Mexico. Shale gas made the United States the number one natural gas producer in the world, overtaking Russia, and revitalized manufacturing and the chemical industry. Meanwhile, climate-conscious Europe's already high energy import dependence continues to grow. Use of renewable resources **mandated** by the European Union are **spreading dynamically**, but will take time to mature. Indigenous unconventional gas faces mixed reactions in some member states. In the wake of the Fukushima accident, nuclear energy is on decline in most countries. Ironically, coal use has increased lately in Germany, due to the nuclear power plant closures and flaws in the EU's cap-and-trade system. Romney has proposed a plan that would widen the transatlantic gap further. He proposes to accelerate the development of America's considerable on- and offshore oil and natural resources by opening up federal lands and wildlife refuges, relaxing legislation, extending tax breaks, and approving Keystone XL that would carry shale oil from Canada; to rehabilitate coal by reverting the Environmental Protection Agency's prohibitive clean air standards introduced by the current administration; and to revitalize nuclear power by streamlining the permitting procedures. The underlying tenet of the plan is a complete disregard for the threat of climate change, a term the document does not use. Romney renounces the "myth of green jobs creation" and promotes new jobs in the oil, gas, and coal sectors instead. The plan also stipulates that renewables can compete with other resources on a "level playing field," and implies the cessation of government support for renewable energy projects. The plan, not to mention its implementation, will cause outrage in Europe. To most European policymakers, and the general public alike, shale oil and coal are anathemas, and the "drill baby drill" mentality is considered environmentally reckless. Brussels and other European capitals already resent that President Obama has not spent enough political capital on global climate change negotiations. Europeans worry that a Romney Administration would derail the timeframe agreed to in Cancun last December. Moreover, Europeans believe that a pursuit of US energy independence could prove both elusive and counter-productive. Even if complete self-sufficiency is achieved, oil prices are determined on the global oil market. The United States **might miss breakthroughs** in technologies and **business opportunities** that are offered by the **global scramble for renewables**. While global challenges to stable energy markets prevail, an illusion of energy independence might prompt a more isolationist stance in US foreign policy and a reduced commitment to strategic interests like Europe's energy security. **A transatlantic friction is looming. Would the United States and Europe ultimately be able to reconcile their visions? The transatlantic partners share strategic interests and face common threats and challenges closely linked to energy issues, such as** the proliferation of nuclear weapons, **a resurgent Russia, an unstable Middle East, or China's insatiable appetite for resources** and its repercussions around the globe. **The United States and Europe are uniquely positioned to develop technology, leverage financing, and share experiences in** legislative and **regulatory developments. In times of austerity,** identifying synergies and pooling resources is paramount. There is also plenty to build upon. Owed largely to the increased use of cheap natural gas in electricity generation, to the detriment of coal and measures like enhanced vehicle fuel economy standards, last week the US Energy Information Administration reported that energy-related CO2 emissions in the first three months of the year were the lowest since 1992 (though still much higher per capita than in Europe). While Congress and the US government are paralyzed, more than thirty US states adopted renewable energy portfolio standards similar to the EU's 20 percent target by 2020. Regional emission trading schemes are on the rise in the absence of a federal one. Texas is becoming a renewable energy technology hotspot and wind and solar powerhouse. Many in Europe are willing to learn from the US how to unlock their own shale gas potential that can serve as a bridge fuel to the EU's preferred zero-carbon future as gas emits much less CO2. Conversely, the US is looking to exploit four decades of European experience in energy efficiency improvements and demand reduction. Though politically and financially tricky, both EU member states and the United States should revisit nuclear energy as an essential component in providing affordable and sustainable energy. The list goes on. **The benefits of transatlantic cooperation are beyond doubt**. The consequences of a falling out

between the United States and the EU after the elections are far-reaching. A continued dialogue launched in the framework of the US-EU Energy Council in 2009 would be a way to avoid that. Joint efforts to address climate change, innovation, and investment in clean energy technologies, risk sharing, and cost reduction; joint research and development and harmonized energy diplomacy should be the cornerstones. A value gap that will undermine trust within the alliance is in nobody's interest.

*Grid Collapse – Mexican Renewables

1NC Shell

Plan: The United States federal government should increase investment to develop cross-border grid, transmission, and distribution infrastructure in Mexico.

Bilateral Coop solves power grid

Terry 12 (Alison, Master's candidate at the University of Denver's Josef Korbel School of International Studies, "Policy and Practice in North American Energy Security," International Affairs Review, XX(3), Spring, http://www.iar-gwu.org/sites/default/files/articlepdfs/North%20American%20Energy%20Security.pdf)

Threats to energy security can take the form of **natural** disasters, cyber attacks, or **regional disputes** involving exporting countries. Each of these situations has the potential to **disrupt supply flows** and impair the functioning of critical infrastructure. Hurricane Katrina served as an integrated shock because it simultaneously interrupted flows of oil, natural gas, and electricity throughout North America.2 Canada and Mexico assisted the US Federal Emergency Management Agency with disaster response. This event demonstrates that **cooperative continental defense strategies** can help to ensure energy security. The idea of energy interdependence is particularly relevant to North America because the United States, Canada, and Mexico import and export energy from one another. Rather than operating the North American energy markets individually for each country, the United States, Canada, and Mexico should develop regional markets that can **overlap easily across the international borders**.3 For example, Canada is currently the largest supplier of energy to the United States.4 In 2010, 25.1 percent of net US oil imports came from Canada and 8.5 percent came from Mexico.5 The United States provides 65.9 percent of Mexico's net natural gas imports.6 Although the three countries cannot completely satisfy their energy needs in a North American triad, the relationship of energy sharing could act as a **stabilizing force** for the continent in the face of tenuous import-export relationships in the international energy trade.

Block

Grid interconnectivity is key – enhances grid security and generates additional investment into renewables

Ibarra-Yunez 12 (Dr. Alejandro, Professor of Economics and Public Policy – Instituto Tecnologico de Estudios Superiores de Monterrey (Mexico), "Economic and Regulatory Challenges and Opportunities for US-Mexico Electricity Trade and Cooperation," Policy Research Project Report 174, May, http://repositories.lib.utexas.edu/bitstream/handle/2152/17560/prp_174-econ_reg_challenges_US_Mex_electricity-2012.pdf?sequence=5)

Growth in energy demand and **generating capacity** is outpacing growth in the transmission and distribution system—a situation that poses real challenges on both sides of the United States-Mexico border. The six Mexican states and four US states that comprise the border region face similar energy issues and constraints to each country as a whole. Decreasing reserve margins and peak demand trends suggest the need to **add generating and transmission capacity** in both countries—a concern that can potentially be mitigated by increases in electricity trade and power sharing. Electricity **grid interconnection** can reduce domestic supply concerns and **enhance overall grid reliability** in addition to yielding environmental benefits through the promotion of renewable source generation. No entity has conducted a study of the entire US-Mexico border region as a single geographic region on the topic of energy use. As a result, this chapter seeks to compile relevant data from various studies to provide a holistic view of the main trends and indicators of importance in the border region. Additionally, it analyzes recent developments in the consumption and demand for electricity in the United States-Mexico border region and its impacts for a North American integration scenario—specifically, within the border states of California, New Mexico, Arizona, Texas, Baja California, Sonora, Chihuahua, Coahuila, Nuevo Leon, and Tamaulipas. This analysis finds that an optimized, integrated grid would increase overall grid reliability and induce capital investment in generation and transmission capacity.

Text: The United States federal government should develop offshore wind farms.

Offshore wind key to advanced manufacturing clusters

N'dolo 10 – associate principal @ Camoin Associates

(Michael and Bruce Bailey, "Offshore development can yield economic benefits," North American Wind Power, Fall 2010)//BB

Economic opportunities

Wind power is a job-creation **engine**. According to the American Wind Energy Association, the wind industry supported over 85,000 jobs in 2009 alone. Most of these jobs were in manufacturing, an area of the U.S. labor force that has been declining rapidly for years. The wind energy industry represents a **significant opportunity** for **turning this decline around**.¶ Although wind power industry clusters exist in North America, there are many specifics to offshore wind that differentiate it from its onshore cousin. Requirements such as installation vessels, unique turbine components, specialized research focus, and professional and technical experience are not yet present in the North American workforce skill set. All of these unique requirements represent an economic opportunity for job creation, ranging from research, design and manufacturing to operations and maintenance.¶ Vessels. Highly specialized installation vessels must be built, operated, repaired and docked during the off-season. The newest generation of such vessels under development in Europe can cost hundreds of millions of dollars to construct and can require a **small army of workers** in ports with sufficient ship-building capacity. In addition, other smaller vessels are necessary for ongoing maintenance and repair operations.¶ The Jones Act requires that all goods transported by water between U.S. ports are carried in U.S.-flagged ships that are constructed in the U.S., owned by U.S. citizens and crewed by¶ permanent residents of the U.S. Although some developers have been successful in requesting an exception, allowing them to use foreign vessels, the Jones Act creates a significant barrier for off-shore developers. Investing and developing a domestic vessel industry to serve the offshore market would significantly increase the attractiveness of a region to offshore developers and investors, in addition to creating jobs to support the new industry.¶ Components. Offshore components tend to he larger and bulkier. Certain components are either unique to (foundations) or modified for (hermetically sealed nacelles, seaworthy substations, nacelle-mounted or substation-mounted helicopter pads for maintenance, and corrosion-resistant materials) offshore use. One of the largest portions of the installed cost of a typical offshore wind farm is directly attributable to the manufacturing and pro-assembly of turbine and foundation components. In regions where a high level of wind component manufacturing currently exists, there is significant opportunity tor creating offshore wind component manufacturing clusters.¶ Installation. Turbines and foundations must be assembled in a staging area, loaded onto a vessel and installed. There are limitations on the ability of any one state or province to service both coasts, but it is reasonable to assume, for example, that an installation cluster in the Mid-Atlantic region of the¶ U.S. could provide installation capacity for a number of projects on the East Coast.

Strong domestic manufacturing key to maintain hegemony and stave off China

Welsh 14, Editor, writer and social media consultant. He was the Managing Editor of FireDogLake and theAgonist. His work has also appeared at Huffington Post, Alternet, and Truthout

Ian Welsh, "How China Can End American Hegemony" 2014 MARCH 25 http://www.ianwelsh.net/how-china-can-end-american-hegemony/

I concentrate on manufacturing because it and resource extraction are the two things which really matter. All the software in the world, all the "financial services" don't matter if you can't make, mine, or grow what you need. If you were China, and you wanted to destroy US hegemony, how would you do it? The simple answer is "control the means of production". Right now many US companies manufacture in China: Apple may be

located in California, but its manufacturing base is largely in China. As time goes by, those who make goods, learn how to design them. As companies more and more offshore and outsource their design, this becomes more and more true. Companies like Apple can build their goods in China because of patent law: the Chinese may know how to make them, but it's illegal to do so. The logical path for China would be to wait till they have the actual production facilities for every key sector, then break the patents and let the factories (which are already Chinese owned subcontractors, as a rule) make the goods themselves. If you do this in one fell-swoop, because the facilities no longer exist in the US or Europe to make the goods, the US and, indeed, Western governments are faced with two choices: go into an economic tailspin, or buy from China either way. The conventional reply to this is "but the Chinese need Western consumers!" Do they? Will they forever? Or can they take their huge population and turn that into a consumer base? Can they turn various developing countries into consumers of their goods? Africa, in particular, has been looking more and more to China, because China offers development: building roads and factories and ports and airports, which the West no longer does, at least not without insisting on crippling IMF conditions. China doesn't do that, it doesn't care how other countries run their internal affairs: if they want to subsidize food, that's fine by China. Russia, of course, will increasingly turn to China as the West isolates it. Much of Latin America is already looking towards China, and find Chinese influence far less problematic than American influence, since the Chinese don't actively try to overthrow their governments. Will this happen? Perhaps, perhaps not. But, increasingly, it is a route open to the Chinese. They control the actual means of production: the West has very kindly engaged in massive technology and capital transfer to China, moving expertise and the actual production. One might argue that cooperation is better for China. But will it always be? Thanks to massive mismanagement of the economy, the environment and both renewable and non-renewable resources, we are increasingly moving into a period of scarcity. In a negative sum game, cutting America, which consumes far more than its per capita share of resources off at the knees may be exactly what China needs to do to ensure its own prosperity and survival.

Block

OSW promotes fast growth

N'dolo 10 – associate principal @ Camoin Associates

(Michael and Bruce Bailey, "Offshore development can yield economic benefits," North American Wind Power, Fall 2010)//BB

Avoided costs

There are many other ways that offshore development can positively impact local economics, all of which focus on avoided costs. Often misunderstood or ignored, avoided costs are those that, if not addressed, could result in money or **opportunity leaving** an area.¶ For example, is the avoided costs of transmission system upgrades. Many metropolitan areas along the Eastern Seaboard suffer from capacity issues in transmission infrastructure that require tens of billions of dollars to remedy. The extent to which such costs can be delayed, reduced or avoided altogether is an economic benefit to the host community and should be considered as an offset to the perceived higher per-kilowatt power costs of offshore wind.¶ There are additional avoided costs that may be more sig-nificant. Many states and some metropolitan areas have either mandates or policy goals requiring the sourcing of renewable energy by a certain date. If such power cannot be produced locally, providers will be required to source renewable power from elsewhere. This is, in effect, taking local ratepayer dollars and sending them outside of the local economy, a situation analogous to consumer dollars flowing out of the U.S. to pur-chase electronics from low-cost manufacturing countries.¶ These outflows of dollars are tied to **massive job losses**. For the exporting state or province, the ability to recapture these dollars represents new money added to the local economy and additional economic activity. The final avoided cost worth noting is that offshore, while expensive relative to fossil fuels, is less expensive than some other sources of renewable energy such as solar or tidal. The differential costs between offshore¶ wind and other forms of renewable energy can be considered avoided costs that are not passed on to ratepayers.

Fast growth key to hard power but independently solves great power confrontation

Khalilzad 11 – PhD, Former Professor of Political Science @ Columbia, Former ambassador to Iraq and Afghanistan

(Zalmay Khalilzad was the United States ambassador to Afghanistan, Iraq, and the United Nations during the presidency of George W. Bush and the director of policy planning at the Defense Department from 1990 to 1992. "The Economy and National Security" Feb 8 http://www.nationalreview.com/articles/259024/economy-and-national-security-zalmay-khalilzad)//BB

Today, economic and fiscal trends pose the most severe long-term threat to the United States' position as global leader. While the United States suffers from fiscal imbalances and low economic growth, the economies of rival powers are developing rapidly. The continuation of these two trends could lead to a shift from **American primacy** toward a multi-polar global system, leading in turn to increased geopolitical rivalry and even war among the **great powers.** The current recession is the result of a deep financial crisis, not a mere fluctuation in the business cycle. Recovery is likely to be protracted. The crisis was preceded by the buildup over two decades of enormous amounts of debt throughout the U.S. economy — ultimately totaling almost 350 percent of GDP — and the development of credit-fueled asset bubbles, particularly in the housing sector. When the bubbles burst, huge amounts of wealth were destroyed, and unemployment rose to over 10 percent. The decline of tax revenues and massive countercyclical spending put the U.S. government on an unsustainable fiscal path. Publicly held national debt rose from 38 to over 60 percent of GDP in three years. **Without faster economic growth** and actions to reduce deficits, publicly held national debt is projected to reach dangerous proportions. If interest rates were to rise significantly, annual interest payments — which already are larger than the defense budget — would crowd out other spending or require substantial tax increases that would undercut economic growth. Even worse, if unanticipated events trigger what economists call a "sudden stop" in credit markets for U.S. debt, the United States would be unable to

roll over its outstanding obligations, precipitating a sovereign-debt crisis that would almost certainly compel a radical retrenchment of the United States internationally. Such scenarios would reshape the international order. It was the economic devastation of Britain and France during World War II, as well as the rise of other powers, that led both countries to **relinquish their empires**. In the late 1960s, British leaders concluded that they lacked the economic capacity to maintain a presence "east of Suez." Soviet economic weakness, which crystallized under Gorbachev, contributed to their decisions to withdraw from Afghanistan, abandon Communist regimes in Eastern Europe, and allow the Soviet Union to fragment. If the U.S. debt problem goes critical, the United States would be compelled to retrench, reducing its military spending and shedding international commitments. We face this domestic challenge while other major powers are experiencing rapid economic growth. Even though countries such as China, India, and Brazil have profound political, social, demographic, and economic problems, their economies are growing faster than ours, and this could alter the global distribution of power. These trends could in the long term produce a multi-polar world. If U.S. policymakers fail to act and other powers continue to grow, it is not a question of whether but when a new international order will emerge. The closing of the gap between the United States and its rivals could intensify geopolitical competition among major powers, increase incentives for local powers to play major powers against one another, and undercut our will to preclude or respond to international crises because of the higher risk of escalation. The stakes are high. In modern history, the longest period of peace among the great powers has been the **era of U.S. leadership**. By contrast, multi-polar systems have been unstable, with their competitive dynamics resulting in frequent crises and major wars among the great powers. Failures of multi-polar international systems produced both world wars. American retrenchment could have **devastating consequences**. Without an American security blanket, regional powers could rearm in an attempt to balance against emerging threats. Under this scenario, there would be a heightened possibility of arms races, miscalculation, or other crises spiraling into all-out conflict. Alternatively, in seeking to accommodate the stronger powers, weaker powers may shift their geopolitical posture away from the United States. Either way, hostile states would be emboldened to make aggressive moves in their regions

*Internet Freedom – Online Gambling

1NC Shell

The United States federal government should legalize online gambling in the United States.

Prohibition destroys internet freedom – legalization solves

Gardner 10, staff writer at Casino Gambling Watch, April Gardner, Gambling Regulations Will Help Obama's World Internet Freedom Mandate, http://www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html

President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel.

Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, **Obama spoke about how the Internet should remain free from government interference everywhere** in the world. The **freedom** to surf the Internet **would allow people** all **across the globe to research issues and learn from** the wide array of news that is currently found on **the Internet. "We** will **support a free and open Internet, so individuals have the information to make up their own minds," said Obama.** "And **it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." That statement may have been much better received had the US not had their own blocks on Internet freedom. The Internet gambling industry currently is operating as a black market** in the US **due to the** 2006 **U**nlawful **I**nternet **G**ambling **E**nforcement **A**ct. **The law is** a form of **Internet censorship** that Representative Barney Frank and other lawmakers have been trying to repeal. **In the quest for Internet freedom, the US proclaims themselves as leaders, however, the country must be careful** with their plea. **If the US can place** Internet **bans on certain industries**, then **little could be done to stop other countries from banning different industries or websites** because of their beliefs. For instance, in countries where religion is unified, **there could be bans on any material that the country finds outside the rules of their particular religion.** In other countries, bans could be placed on industries that are run largely by foreign operators. President **Obama took a strong first step today by promoting Internet freedom. The next step will be making sure the US leads by example**, and **one area to start would be by lifting the ban on Internet gambling. The president** has **laid down the gauntlet**, and **now it is time for him to follow his own lead.**

Block

Gambling is the key precedent for Chinese internet liberalization. Erixon et al 2009

Fredrik, Director of the European Centre for International Political Economy, Protectionism Online: Internet Censorship and International Trade Law, ECIPE Working Paper • No. 12/2009 http://www.ecipe.org/media/publication_pdfs/protectionism-online-internet-censorship-and-international-trade-law.pdf

A case brought before the WTO over censorship would be very likely to give rise to a debate about sovereignty and the ever-expanding scope of trade-related issues under the WTO. However, such a case would mark an important borderline against disproportionate and arbitrary censorship when a partial blockage would be sufficient to achieve the aims of the censors. It would also be economically significant. Censorship is the most important non-tariff barrier to the provision of online services, and a case might clarify the circumstances in w:hich different forms of censorship arc WTO consistent. Such clarification would reduce legal uncertainty for online businesses. Not all WTO rulings, however, result in actual compliance — as mentioned, the member found to be employing WTO-inconsistent measures might decide to continue to use them and accept the consequent retaliation. Even before the ruling in Online Gambling, the US Trade Representative implied that the offending Federal law could not be changed, and that the only way to correct the "drafting error" was to withdraw from its commitments on "other recreational services",** which it is free to do with three months notice under GATS Article XXI. In following this course, how-ever, the US was required to compensate countries injured by its withdrawal from the commit- ment, i.e. to make a deal that not only satisfied Antigua and Barbuda, but all countries who make a claim of having interests against the US in the dispute settlement. In Online Gambling, Australia, Costa Rica, India, Macau, Canada, Japan and the EU joined in with costly demands for compensa- tion . A defendant in a case over censorship who was found to have behaved inconsistently with its WTO obligations, but refused to lift the censorship or correct its form, would therefore have to cither accept authorised retaliation against it or withdrawal from the relevant obligation through compensation. THE WAY AHEAD WEAKNESS OF UNILATERAL ACTION The issue of online censorship can be approached through various different routes under inter- national trade law. Each route has its own limitations, opportunities and political consequences. A regulation, like the once-proposed US Global Online Freedom Act, would discourage invest- ment and market access. Proposals for such types of legislation have been greeted with scepti- cism, whether the proposal is to be put into effect by the EU, the US, or both together. This route has the disadvantage that it damages the companies seeking to export its services by prohibiting businesses from making certain types of investment abroad, and further penalising those w:ho are already limited in their trade through subjection to a censorship regime. Simply put, it taxes the competitiveness of the actors own companies commercially or limits the room for manoeuvre. Furthermore, past experiences from other embargoes show that they are seldom effective to- wards economies that represent significant commercial market potentials. There is also a question of equal treatment between various sectors of industry, in this case the manufacturers versus services. The routers and servers that make up the Great Firewall/Golden Shield of China were provided by IT firms in EU and US—with the consent of their governments, and in some case, these manufacturers even provide training to the personnel in the ministries that administer the censorship. The question of liability, with potential effects (or lack thereof) makes it a dangerous route. POSSIBLE ACTION THROUGH THE WTO The WTO provides principles of proportionality and can impose sanctions on breaches by its members of their WTO obligations; although it has difficulty in ensuring that members found to have acted inconsistently with the WTO restore WTO consistency rather than treating the sanctions as the price of maintaining the inconsistent policy. It is also true that a WTO member found to have violated its WTO obligations could withdraw from the obligation (as the US did after Online Gambling). These are not cheap options, however. Maintaining a policy that has been found to be WTO in- consistent or withdrawing from a commitment is likely to be expensive in terms of losses of trade or direct compensation, and may also be costly in terms of reductions in terms of capital inflows, investment and know-how and losses of service trade. Creating a great fuss in order to maintain censorship, moreover, might be embarrassing, both in terms of attention drawn to the censor- ship and of the air of desperation that would attach to policy shifts for the purpose of maintaining censorship. The WTO route is weak given it is unlikely to be able to abolish

censorship as such. It may, however, have the potential to discipline the clumsier manifestations of censorship: outright blockages by a government that is capable of enforcing selective filtering for example, **and will persuade governments to use more selective and less trade-disruptive means**. Another drawback of the WTO route is that an online industry wishing to use WTO dispute-settlement cannot do so on its own account, but must convince its government to take action. Also, some countries that might be targets of such action are not members of the WTO (for example, Russia, Iran and North Korea). As final note, although the dispute settlement mechanism of neither the WTO nor other trade instruments could be used to eliminate Internet censorship, they might limit the use of its more commercially damaging forms. For businesses, trade with countries ruled by authoritarian re- gimes, or with countries where the concept of the rule of law: is still under development, will always be difficult —if not outright dangerous. Contesting arbitrary and disproportionate blocks on access to such markets will incrementally help to reduce legal uncertainty and therefore contribute in the long run to a regulatory environment where the risks and costs of market par- ticipation are foreseeable.

The plan reverses this.

First, brain drain-Legalizing online gambling revitalizes the high tech sector and attracts skilled workers

Titch, policy analyst at Reason Foundation, 2012 ("Internet Gambling: Keys to a Successful Regulatory Climate" http://reason.org/files/internet_gambling_regulation.pdf)

Another point in favor of online gambling is that it **plays to U.S. technology skill strengths**. While it is true that online casinos do not offer the same types of jobs as brick-and-mortar operations, they do call for 21 st century **knowledge-industry skills** in software-writing and engineering, devel- opment and use of **encryption and security protocols**, and real-time database management. If online gambling were to emerge as analysts currently envision, **it will call on expertise** in four major **information technology areas** where the U.S. leads. • Geographical location verification: To determine that users of an intrastate gambling site are indeed connecting from inside the state. Mobility applications will be especially challenging to engineer. • Age verification: To verify that users meet the minimum age requirement to gamble legally online. • Security: To ensure the validity of player accounts, deposits and withdrawals, protect player funds, protect player privacy, protect the integrity of the games against hacks, cheats or, in the case of poker, collusion or use of computerized playing programs (known colloquially as "poker bots") Database management: Critical for the maintenance and updating of self-exclusion lists, as well as for management of promotions (and to curtail promotions abuse). Internet gambling, especially if it requires every operator to have an in-state presence, will **cre-ate demand for these types of high-paying IT jobs, and help stem the exodus of college graduates skilled in technology sector areas**, to other states. This aim works in tandem with other state efforts to cultivate a **business climate that welcomes tech industry entrepreneurs** and start-ups, and the increase in jobs and tax base these enterprises bring.

Second, competition-legalized gambling would be a major boost to competition in the market-key to innovation and cost reduction

Basham, 2012 (Patrick, founding director of the Democracy Institute, Cato Institute adjunct scholar, served as the founding director of the Social Affairs Center at the Fraser Institute, Canada's leading free market think tank, studied political science at the University of Houston and Cambridge University, "A Safe Bet: Online Gambling's Good for U.S." http://www.cato.org/publications/commentary/safe-bet-online-gamblings-good-us)

Online gambling can be regulated effectively and without excessive cost, to standards that will provide strong protections for consumers and vulnerable players. The principal benefit of regulation to online players is the personal and legal security of funds, whereas currently players in unregulated environments have no legal recourse over matters such as suspected cheating and frozen assets. **A**nother **major benefit** of allowing online gambling is that **competition will be introduced** into a highly regulated marketplace dominated by licensed providers who monopolize the gaming market. Increased competition results in a more efficient allocation of resources, as gambling providers attempt to maintain and attract new customers. The Internet has revealed the potential of technology not only to dramatically increase existing gambling opportunities

but also to introduce new ones. As such, the Internet offers potential consumers **convenient and inexpensive access** to their favorite gambling sites, introducing competition into an industry once dominated by highly restrictive licensing practices. This form of gambling also **encourages private sector businesses to develop network capacity and commerce. Not only will this increased competition result in a wider range of gambling activities, it will reduce cost to consumers.** With legal online gambling, competition among operators would increase to such an extent that they will be **forced by the marketplace**, rather than by governments, to offer a reduced house advantage. Banning online gambling in the domestic American market simply results in the establishment of Internet gaming sites overseas. As other jurisdictions identify the demand for online gambling, they have supplied this service to consumers.

This would spill over to overall improvements in bandwidth

Whittaker, 2007 Jerry, "Impact of Internet Gambling" http://www.gamblingwiz.com/online-gambling/1320-Impact-of-internet-gambling.htm

There are a number of impacts of Internet gambling. Some are good while some are bad. One good thing that can happen is that the Internet Gambling can encourage the private sector to develop a **efficient network capacity and commerce**. When it comes to play internet Gambling it becomes the need of the Internet to offer efficient flash graphics and very sophisticated user interfaces. **This can result in a broader bandwidth and better software for all the types of internet applications.** A very perfect example of this is the real world Casino. The real world casino has therefore resulted in building the most new form of appealing environments.

Plan makes Obama's push for internet freedom credible – key to reversing internet restriction worldwide

Gardner, 10 (Staff Editor & Reporter-Casino Gambling Web, 9/23, Gambling Regulations Will Help Obama's World Internet Freedom Mandate, http://www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html)

Gambling Regulations Will Help Obama's World Internet Freedom Mandate President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet, so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." **That statement may have been much better received had the US not had their own blocks on Internet freedom**. **The Internet gambling industry** currently **is operating as a black market in the US** due to the 2006 Unlawful Internet Gambling Enforcement Act. The law is a form of Internet censorship that Representative Barney Frank and other lawmakers have been trying to repeal. In the quest for Internet freedom, **the US proclaims themselves as leaders, however, the country must be careful with their plea**. **If the US can place Internet bans on certain industries, then little could be done to stop other countries from banning different industries** or websites because of their beliefs. For instance, in countries where religion is unified, there could be bans on any material that the country finds outside the rules of their particular religion. In other countries, bans could be placed on industries that are run largely by foreign operators. President Obama took a strong first step today by **promoting Internet freedom. The next step will be making sure the US leads by example**, **and one area to start would be** by **lifting the ban on Internet gambling**. The president has laid down the gauntlet, and now it is time for him to follow his own lead.

Only legalizing gambling solves – prohibitions justify broad regulation of the internet that collapse openness

Telford 10/20/14 Erik, senior vice president at the Franklin Center for Government & Public Integrity, The Hill, October 20, 2014, "Ending the cycle of casino cronyism", http://thehill.com/blogs/congress-blog/politics/221124-ending-the-cycle-of-casino-cronyism

When powerful gaming interest are spearheading the fight to ban online gambling, it should give you pause. Their main policy objective is focused on federal legislation to ban online gambling outright – **stifling their competition** before it ever reaches the market. It is a glimpse of crony capitalism in its most naked form, and represents a very **troubling assault on Internet freedom**, giving government a foot in the door for a broader regulatory regime and usurping our federalist system. The 2011, the Department of Justice's position interpretation on Internet gambling **threw the issue to state legislatures--where it should be**. Almost immediately, Nevada, Delaware, and New Jersey passed legalizing legislation. The Restoration of America's Wire Act, sponsored by Sen. Lindsey Graham (R-S.C.) and Rep. Jason Chaffetz (R-Utah) would prohibit interstate sports betting using wire services, effectively **killing online gambling across the states where it's legal**. While their pretense is to advance a moral good, this policy would **undermine the free market**, **encourage crime**, **and erodes the** constitutional **concept of states' rights**. Proponents of the regulation have brought in political heavyweights to undermine legalized online gambling, including former Arkansas Sen. Blanche Lincoln (D), who represents the Coalition to Stop Internet Gambling, claiming that legalizing online gambling would promote fraud, addiction, and money laundering. "I think it's going to be very difficult to work something out," Lincoln said, "I think it's important to put a time-out on this and to stop and think about what it's going to mean to us as a nation in our economy, to our children and to our society." However, these problems already exist with black market gambling mostly run from overseas with profits funding shady and potentially dangerous operations outside the jurisdiction of state regulation and consumer protections. Alan Feldman, an executive vice president of MGM notes that online gambling "is here, and it's been here for a very long time." Legalizing online gambling would likely see more of a shift from illegal to legal play instead of funneling customers away from traditional casinos and their trappings. Free market advocates agree that consumers would enjoy more security were this pursuit made legal. "In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior." wrote officials of the Institute For Policy Innovation to several congressmen. They then shared wider concern that "Perhaps even more concerning is the fact that this bill allows the federal government to take a **heavy hand in regulating the Internet**, **opening the door for increased Internet regulation in the future**." Just like Prohibition in the 1920's, banning this vice would actually incentivize criminal behavior. Those fearful of fraud, child participation, and profits diverted to gangs or terrorists should push for legalization in every state to make the industry as transparent as possible. Legalizing this long-established, multibillion dollar business gets the profits out of the shadows, expands market opportunities, and puts revenue into the coffers of both legitimate business and state governments that will benefit.

Now is key – the splinternet is coming

Simon 14 (Joel, November, executive director of the Committee to Protect Journalists, "The New Censorship: Inside the Global Battle for Media Freedom", google books)

The threat to the global Internet is not imminent, but it is growing and multifaceted. While the possibility of Chsina and other Internet-restricting countries handing Internet governance to the United Nations is still remote, its effect would be "catastrophic," says MacKinnon, who believes UN governance would represent the end of the Internet as a shared global resource. The fact that more and more people around the world are accessing the Web through mo- bile devices rather than broadband already **gives governments more direct control,** since wireless networks are more easily monitored and censored. A more **immediate concern** is that China's international advocacy is helping advance its argument that the restrictions governments impose on the domestic Internet are legitimate in an international context. **Experts are expressing increased alarm about the possible emergence of a "Splinternet,"** with divergent national systems that arc not fully connected. "Around the world countries are increasingly restricting the Internet and seeking to bring it under state control," notes Dan Gillmor, an author and Internet expert.36 **China's ability to construct a**

domestic Internet with its own norms has global security implications that go beyond its leadership of the antilibertarian movement and its example to authoritarian regimes. This is because as China becomes more adept at managing informa- tion domestically, it also disrupts the flow of information across bor- ders. China's economic and political health, of course, is central to the world economy, yet the government suppresses information on everything from major political developments to mundane economic data. In August 2012, the New York Times reported that as exports had slowed and domestic demand slackened, many industries were accumulating a massive backlog of unsold inventory. Yet the Chinese government sought to obscure the extent of the problem by, for ex- ample, halting the release of data about new car registration.37 Basic information about a variety of issues with a global impact— **from environmental degradation to food safety**—is censored on- line. The government routinely withholds data about air quality in Beijing and actively suppresses information—including on micro- blogs—about popular demonstrations against pollution, like the 2011 mass demonstrations against a chemical plant in Dalian. Food safety issues—from tainted milk, to exploding watermelons treated with growth hormones, to waste oil resold to restaurants for cooking—are routinely censored or covered up.38 Even more alarmingly is that **there is some evidence that Chinese government censorship is undermin- ing the integrity of the global Internet**, according to the blogger and technologist Isaac Mao. Internet users from Chile to California who carry out searches in Chinese can be routed through servers inside China—and thus caught in the country's censorship web. "People liv- ing in New York City who try to study Chinese would hit the wall when websites include some 'sensitive words,'" Mao explained.3'' Even as the overheated Chinese economy begins to cool, China continues to provide a powerful alternative vision of the role of in- formation and media. It's a vision that has an obvious resonance in many parts of the world. While Ai Weiwei's dream may yet come true, there is also a nightmare scenario in which governments around the world continue both to strengthen their ability to manage and con- trol the Internet and to build the international support to do so. The result could be that information would be managed and manipulated not only for citizens of repressive regimes but at least hypothetically for Internet users everywhere. This is obviously a grave threat to the current system of global news and information upon which people around the world depend.

Legalizing online gambling key to internet freedom – it's a Trojan horse for widespread regulation
Telford 10/20/14

Erik Telford is senior vice president at the Franklin Center for Government & Public Integrity, The Hill, October 20, 2014, "Ending the cycle of casino cronyism", http://thehill.com/blogs/congress-blog/politics/221124-ending-the-cycle-of-casino-cronyism

When powerful gaming interest are spearheading **the fight to ban online gambling**, it should give you pause. Their main policy objective **is** focused on federal legislation to ban online gambling outright – **stifling** their **competition** before it ever reaches the market. **It** is a glimpse of crony capitalism in its most naked form, and **represents a very troubling assault on Internet freedom**, **giving government a foot in the door for a broader regulatory regime** and usurping our federalist system.

The 2011, the Department of Justice's position interpretation on Internet gambling threw the issue to state legislatures--where it should be. Almost immediately, Nevada, Delaware, and New Jersey passed legalizing legislation.

The Restoration of America's Wire Act, sponsored by Sen. Lindsey Graham (R-S.C.) and Rep. Jason Chaffetz (R-Utah) would prohibit interstate sports betting using wire services, effectively killing online gambling across the states where it's legal. While their pretense is to advance a moral good, this policy

would undermine the free market, encourage crime, and erodes the constitutional concept of states' rights.

Proponents of the regulation have brought in political heavyweights to undermine legalized online gambling, including former Arkansas Sen. Blanche Lincoln (D), who represents the Coalition to Stop Internet Gambling, claiming that legalizing online gambling would promote fraud, addiction, and money laundering.

"I think it's going to be very difficult to work something out," Lincoln said, "I think it's important to put a time-out on this and to stop and think about what it's going to mean to us as a nation in our economy, to our children and to our society."

However, these **problems already exist with black market gambling** mostly **run from overseas with profits** funding shady and potentially dangerous operations outside the jurisdiction of state regulation and consumer protections.

Alan Feldman, an executive vice president of MGM notes that online gambling "is here, and **it's been here for a very long time.**" **Legalizing online gambling would** likely **see more** of **a shift from illegal to legal play** instead of funneling customers away from traditional casinos and their trappings.

Free market advocates agree that consumers would enjoy more security were this pursuit made legal. "In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior." wrote officials of the Institute For Policy Innovation to several congressmen. They then shared wider concern that "Perhaps **even more concerning is the fact** that this bill **allows the federal government to take a heavy hand in regulating the Internet, opening the door for increased Internet regulation in the future."**

Just like Prohibition in the 1920's, **banning this vice** would **actually incentivize criminal behavior.** Those fearful of fraud, child participation, and profits diverted to gangs or terrorists **should push for legalization in every state to make the industry as transparent as possible.** Legalizing this long-established, multibillion dollar business gets the profits out of the shadows, expands market opportunities, and puts revenue into the coffers of both legitimate business and state governments that will benefit.

Plan solves—reverse causal and signal key
Gardner, 10

(Staff Editor & Reporter-Casino Gambling Web, 9/23, Gambling Regulations Will Help Obama's World Internet Freedom Mandate, http://www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html)

Gambling Regulations Will Help Obama's World Internet Freedom Mandate President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians

their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet, so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." **That statement may have been much better received had the US not had their own blocks on** Internet freedom. No alt causes
Gelb, 10

(Prof-Business & Economic-UH, “Getting Digital Statecraft Right,” Foreign Affairs, 7/28, http://www.foreignaffairs.com/articles/66502/betsy-gelb-and-emmanuel-yujuico/getting-digital-statecraft-right)

All these cases share the same fallacy -- that U.S.-directed methods can spur development in other nations. But U.S. policies seeking to extend freedom through technology can be successful -- if the United States refrains from acting in ways that seem less than sincere, and **if it adopts a gradual, rather than transformative, approach. U.S. protests against censorship would seem more convincing if it were not for its own policies restricting Internet freedom.** Consider, for example, the United States' questionable **prohibition of cross-border trade in Internet gambling**. In 2004, the World Trade Organization ruled in favor of Antigua and Barbuda against the United States when the United States banned online gambling services emanating from the twin-island nation. The United States appealed the case and lost, but in the meantime, Antigua's online gambling industry was virtually destroyed. The United States still has not yet satisfactorily resolved this ruling and should do so by conforming to it.

Fragmentation destroys cloud computing
McDowell, 12

(5/31, FCC Chair, Comm'r. McDowell's Congressional Testimony, http://www.fcc.gov/document/commr-mcdowells-congressional-testimony-5-31-2012)

It is a pleasure and an honor to testify beside my friend, Ambassador Phil Verveer. First, please allow me to dispense quickly and emphatically any doubts about the bipartisan resolve of the United States' to resist efforts to expand the International Telecommunication Union's ("ITU") authority over Internet matters. Some ITU officials have dismissed our concern over this issue as mere "election year politics." Nothing could be further from the truth as evidenced by Ambassador Verveer's testimony today as well as recent statements from the White House, Executive Branch agencies, Democratic and Republican Members of Congress and my friend and colleague, FCC Chairman Julius Genachowski. We are unified on the substantive arguments and have always been so. Second, it is important to define the challenge before us. The threats are real and not imagined, although they admittedly sound like works of fiction at times. For many years now, scores of countries led by China, Russia, Iran, Saudi Arabia, and many others, have pushed for, as then-Russian Prime Minister Vladimir Putin said almost a year ago, "international control of the Internet" through the ITU.1 I have tried to find a more concise way to express this issue, but I can't seem to improve upon now-President Putin's crystallization of the effort that has been afoot for quite some time. More importantly, I think we should take President Putin very seriously. 1 Vladimir Putin, Prime Minister of the Russian Federation, Working Day, GOV'T OF THE RUSSIAN FED'N, http://premier.gov.ru/eng/events/news/15601/ (June 15, 2011) (last visited May 14, 2012). Six months separate us from the renegotiation of the 1988 treaty that led to insulating the Internet from economic and technical regulation. What proponents of Internet freedom do or don't do between now and then will determine the fate of the Net, affect global economic growth and determine whether political liberty can proliferate. During the treaty negotiations, the most lethal threat to Internet freedom may not come from a full frontal assault, but through insidious and seemingly innocuous expansions of intergovernmental powers. This subterranean effort is already under way. While influential ITU Member States have put forth proposals calling for overt legal expansions of United Nations' or ITU authority over the Net, ITU officials have publicly declared that the ITU does not intend to regulate Internet governance while also saying that any regulations should be of the "light-touch" variety.2 But which is it? It is not possible to insulate the Internet from new rules while also establishing a new "light touch" regulatory regime. Either a new legal paradigm will emerge in December or it won't. The choice is binary. Additionally, as a threshold matter, it is curious that ITU officials have been opining on the outcome of the treaty negotiation. The ITU's Member States determine the fate of any new rules, not ITU leadership and staff. I remain hopeful that the diplomatic process will not be subverted in this regard. As a matter of process and substance, patient and persistent incrementalism is the Net's most dangerous enemy and it is the hallmark of many countries that are pushing the proregulation agenda. Specifically, some ITU officials and Member States have been discussing an alleged worldwide phone numbering "crisis." It seems that the world may be running out of phone numbers, over which the ITU does have some jurisdiction. 2 Speech by ITU Secretary-General Touré, The Challenges of Extending the Benefits of Mobile (May 1, 2012),http://www.itu.int/net/pressoffice/press_releases/index.aspx?lang=en (last visited May 29, 2012). 2 Today, many phone numbers are used for voice over Internet protocol services such as Skype or Google Voice. To function properly, the software supporting these services translate traditional phone numbers into IP addresses. The Russian Federation has proposed that the ITU be given jurisdiction over IP addresses to remedy the phone number shortage.3 What is left unsaid, however, is that potential ITU jurisdiction over IP addresses would enable it to regulate Internet services and devices with abandon. IP addresses are a fundamental and essential component to the inner workings of the Net. Taking their administration away from the bottomup, non-governmental, multi-stakeholder model and placing it into the hands of international bureaucrats would be a grave mistake. Other efforts to expand the ITU's reach into the Internet are seemingly small but are tectonic in scope. Take for example the Arab States' submission from February that would change the rules' definition of "telecommunications" to include "processing" or computer functions.4 This change would essentially swallow the Internet's functions with only a tiny edit to existing rules.5 When ITU leadership claims that no Member States have proposed absorbing Internet governance into the ITU or other intergovernmental entities, the Arab States' submission demonstrates that nothing could be further from the truth. An infinite number of avenues exist to 3 Further Directions for Revision of the ITRs, Russian Federation, CWG-WCIT12 Contribution 40, at 3 (2011), http://www.itu.int/md/T09-CWG.WCIT12-C-0040/en (last visited May 29, 2012) ("To oblige ITU to allocate/distribute some part of IPv6 addresses (as same way/principle as for telephone numbering, simultaneously existing of many operators/numbers distributors inside unified numbers space for both fixed and mobile phone services) and determination of necessary requirements."). 4 Proposed Revisions, Arab States, CWG-WCIT12 Contribution 67, at 3 (2012), http://www.itu.int/md/T09CWG.WCIT12-C-0067/en (last visited May 29, 2012). 5 And Iran argues that the current definition already includes the Internet. Contribution from Iran, The Islamic Republic of Iran, CWG-WCIT12 Contribution 48, Attachment 2 (2011), http://www.itu.int/md/T09-CWG.WCIT12C-0048/en (last visited May 29, 2012). 3 accomplish the same goal and it is camouflaged subterfuge that proponents of Internet freedom should watch for most vigilantly. Other examples come from China. China would like to see the creation of a system whereby Internet users are registered using their IP addresses. In fact, last year, China teamed up with Russia, Tajikistan and Uzbekistan to propose to the UN General Assembly that it create an "International Code of Conduct for Information Security" to mandate "international norms and rules standardizing the behavior of countries concerning information and cyberspace."6 Does anyone here today believe that these countries' proposals would encourage the continued proliferation of an open and freedom-enhancing Internet? Or would such constructs make it easier for authoritarian regimes to identify and silence political dissidents? These proposals may not technically be part of the WCIT negotiations, but they give a sense of where some of the

ITU's Member States would like to go. Still other proposals that have been made personally to me by foreign government officials include the creation of an international universal service fund of sorts whereby foreign – usually state-owned – telecom companies would use international mandates to charge certain Web destinations on a "per-click" basis to fund the build-out of broadband infrastructure across the globe. Google, iTunes, Facebook and Netflix are mentioned most often as prime sources of funding. In short, the U.S. and like-minded proponents of Internet freedom and prosperity across the globe should resist efforts to expand the powers of intergovernmental bodies over the Internet 6 Letter dated 12 September 2011 from the Permanent Representatives of China, the Russian Federation, Tajikistan, and Uzbekistan to the United Nations addressed to the Secretary-General, Item 93 of the provisional agenda - Developments in the field of information and telecommunications in the context of international security, 66th Session of the United Nations General Assembly, Annex (Sep. 14, 2011), http://www.cs.brown.edu/courses/csci1800/sources/2012_UN_Russia_and_China_Code_o_Conduct.pdf (last visited May 29, 2012). even in the smallest of ways. As my supplemental statement and analysis explains in more detail below, **such a scenario would be devastating to global economic activity, but it would hurt the developing world the most.** Thank you for the opportunity to appear before you today and I look forward to your questions. Thank you, Chairman Walden and Ranking Member Eshoo, for holding this hearing. Its topic is among the most important public policy issues affecting global commerce and political freedom: namely, whether the International Telecommunication Union (ITU), or any other intergovernmental body, should be allowed to expand its jurisdiction into the operational and economic affairs of the Internet. As we head toward the treaty negotiations at the World Conference on International Telecommunications (WCIT) in Dubai in December, I urge governments around the world to avoid the temptation to tamper with the Internet. Since its privatization in the early 1990s, the Internet has flourished across the world under the current deregulatory framework. In fact, the long-standing international consensus has been to keep governments from regulating core functions of the Internet's ecosystem. Yet, some nations, such as China, Russia, India, Iran and Saudi Arabia, have been pushing to reverse this course by giving the ITU or the United Nations itself, regulatory jurisdiction over Internet governance. The ITU is a treaty-based organization under the auspices of the United Nations.1 Don't take my word for it, however. As Russian Prime Minister Vladimir Putin said almost one year ago, the goal of this well-organized and energetic effort is to establish "international control over the Internet using the monitoring and supervisory capabilities of the [ITU]."2 Motivations of some ITU Member states vary. Some of the arguments in support of such actions may stem from frustrations with the operations of Internet Corporation for Assigned Names and Numbers (ICANN). Any concerns regarding ICANN, however, should not be used as a pretext to end the multi-stakeholder model that has served all nations – especially the developing world – so well. Any reforms to ICANN should take place through the bottom-up multi-stakeholder process and should not arise through the WCIT's examination of the International Telecommunication Regulations (ITR)s. Constructive reform of the ITRs may be needed. If so, the scope of any review should be limited to traditional telecommunications services and not expanded to include information services or any form of Internet services. Modification of the current multistakeholder Internet governance model may be necessary as well, but we should all work together to ensure no intergovernmental regulatory overlays are placed into this sphere. Not only would nations surrender some of their national sovereignty in such a pursuit, but they would suffocate their own economies as well, while politically paralyzing engineering and business decisions within a global regulatory body. 1 History, IThttp://www.itu.int/en/about/Pages/history.aspx">U, http://www.itu.int/en/about/Pages/history.aspx (last visited May 14, 2012). 2 Vladimir Putin, Prime Minister of the Russian Federation, Working Day, GOV'T OF THE RUSSIAN FED'N, http://premier.gov.ru/eng/events/news/15601/ (June 15, 2011) (last visited May 14, 2012). Every day headlines tell us about industrialized and developing nations alike that are awash in debt, facing flat growth curves, or worse, shrinking GDPs. Not only must governments, including our own, tighten their fiscal belts, but they must also spur economic expansion. **An unfettered Internet offers the brightest ray of hope for growth during this dark time of economic uncertainty, not more regulation.** Indeed, we are at a crossroads for the Internet's future. One path holds great promise, while the other path is fraught with peril. The promise, of course, lies with keeping what works, namely maintaining a freedom-enhancing and open Internet while insulating it from legacy regulations. The peril lies with changes that would ultimately sweep up Internet services into decades-old ITU paradigms. If successful, these efforts would merely imprison the future in the regulatory dungeon of the past. **The future of global growth and political freedom lies with an unfettered Internet.** Shortly after the Internet was privatized in 1995, a mere 16 million people were online worldwide.3 As of early 2012, approximately 2.3 billion people were using the Net.4 Internet connectivity quickly evolved from being a novelty in industrialized countries to becoming an essential tool for commerce – and sometimes even basic survival – in all nations, but especially in the developing world. Such explosive growth was helped, not hindered, by a deregulatory construct. Developing nations stand to gain the most from the rapid pace of deployment and adoption of Internet technologies brought forth by an Internet free from intergovernmental regulation. By way of illustration, a McKinsey report released in January examined the Net's effect on the developing world, or "aspiring countries."5 In 30 specific aspiring

countries studied, including Malaysia, Mexico, Morocco, Nigeria, Turkey and Vietnam,6 Internet penetration has grown 25 percent per year for the past five years, compared to only five percent per year in developed nations.7 Obviously, broadband penetration is lower in aspiring countries than in the developed world, but that is quickly changing thanks to mobile Internet access technologies. Mobile subscriptions in developing countries have risen from 53 percent of the global market in 2005 to 73 percent in 2010.8 In fact, Cisco estimates that the number of mobile-connected devices will exceed the world's population sometime this year.9 Increasingly, Internet users in these countries use only mobile devices for their Internet access.10 This trend has resulted in developing countries growing their global share of Internet users from 33 percent in 2005, to 52 percent in 2010, with a projected 61 percent share by 2015.11 The 30 aspiring countries discussed earlier are home to one billion Internet users, half of all global Internet users. The effect that rapidly growing Internet connectivity is having on aspiring countries' economies is tremendous. The Net is an economic growth accelerator. It contributed an average 1.9 percent of GDP growth in aspiring countries for an estimated total of $366 billion in 2010.13 In some developing economies, Internet connectivity has contributed up to 13 percent of GDP growth over the past five years.14 In six aspiring countries alone, 1.9 million jobs were associated with the Internet.15 And in other countries, the Internet creates 2.6 new jobs for each job it disrupts.16 I expect that we would all agree that these positive trends must continue. The best path forward is the one that has served the global economy so well, that of a multi-stakeholder governed Internet. One potential outcome that could develop if pro-regulation nations are successful in granting the ITU authority over Internet governance would be a partitioned Internet. In particular, fault lines could be drawn between countries that will choose to continue to live under the current successful model and those Member States who decide to opt out to place themselves under an intergovernmental regulatory regime. A balkanized Internet would not promote global free trade or increase living standards. At a minimum, it would create extreme uncertainty and raise costs for all users across the globe by rendering an engineering, operational and financial morass. For instance, Harvard and the Massachusetts Institute of Technology (MIT) recently announced placing many of their courses online for free – for anyone to use. The uncertainty and economic and engineering chaos associated with a newly politicized intergovernmental legal regime would inevitably drive up costs as cross border traffic and **cloud computing become more complicated and vulnerable to regulatory arbitrage**. Such costs are always passed on to the end user consumers and may very well negate the ability of content and application providers such as Harvard and MIT to offer first-rate educational content for free. **Nations that value freedom and prosperity should draw a line in the sand against new regulations while welcoming reform that could include a non-regulatory role for the ITU.** Venturing into the uncertainty of a new regulatory quagmire will only undermine developing nations the most.

Plan: The United States federal government should enhance oil spill prevention, control, and response through development of Arctic specific standards for the oil and gas industry in the Arctic Outer Continental Shelf.

Plan solves mutlilat

Ebinger et al. '14 (Charles Ebinger is a senior fellow and director of the Energy Security Initiative at Brookings. He has more than 35 years of experience specializ- ing in international and domestic energy markets (oil, gas, coal, and nuclear) and the geopolitics of energy, and has served as an energy policy advisor to over 50 governments. He has served as an ad- junct professor in energy economics at the Johns Hopkins School of Advanced International Stud- ies and Georgetown University's Walsh School of Foreign Service. Alisa Schackmann is the senior research assistant in the Energy Security Initiative at Brookings. With a background covering international ener- gy policy and climate change negotiations from abroad, her research focuses on the impact of U.S. policies on global energy markets and security. She has a Master's degree from the Lyndon B. Johnson School of Public Affairs at the University of Texas at Austin and a B.A. from the University of Southern California. John P. Banks is a nonresident senior fellow at the Energy Security Initiative at Brookings. He has worked with governments, companies and regulators for over 25 years in establishing and strengthening policies, institutions, and regulato- ry frameworks to promote sustainable energy sec- tors. Mr. Banks also serves as an adjunct professor at the School of Advanced International Studies at Johns Hopkins University. He has worked in over 20 countries. "Offshore Oil and Gas Governance in the Artic: A Leadership Role for the U.S." Published in the March 2014 Policy Brief 14-01 (Energy Security Initiative) for the Brookings Institute. Page xiii)//JHH

The U.S. government must "decide if it is an Arctic nation or not and what our vital interests in the re- gion are."4 Based on our analysis and conclusions, we believe that it is in the U.S. national interest to lead in strengthening the Arctic offshore oil and gas governance regime. The **cornerstone of U.S. leadership** should be enhancing oil spill preven- tion, control and response through the develop- ment of Arctic-specific standards and resource sharing arrangements to ensure adequate stan- dards, procedures, financial resources, equipment, and infrastructure are in place and available.¶ This policy approach supports important ob- jectives of the U.S. **N**ational **A**rctic **S**trategy to strengthen **international cooperation** and "pro- mote Arctic oil pollution preparedness, preven- tion and response." It also addresses U.S. ob- ligations to meet the Arctic Council's Kiruna Declaration to develop effective ways to imple- ment the Arctic Oil Pollution Agreement—namely, to "encourage future national, bi-national, and multinational contingency plans, training and exercises, and to develop effective response mea- sures."5 Moreover, it supports recommendations from the Deepwater Horizon Commission, the Offshore Energy Safety Advisory Commission, and the Department of Interior to develop Arc- tic-specific regulations. In short, we believe that our recommendations provide an opportunity for the U.S. to increase domestic awareness of the strategic importance of the region and improve governance of Arctic offshore oil and gas activi- ties, while meeting stated objectives and commit- ments of U.S. policy in the region.¶ Our specific recommendations are as follows:¶ 1. Establish oil spill prevention, control, and response as the overarching theme for U.S. chairmanship of the Arctic Council in 2015-2017.¶ 2. Create the diplomatic post of "Arctic Am- bassador."¶ 3. Establish a Regional Bureau for Polar Af- fairs in the U.S. Department of State.¶ 4. Accelerate the ongoing development of¶ Alaska-specific offshore oil and gas stan- dards and discuss their applicability in bilateral and multilateral forums for the broader Arctic region.¶ 5. Strengthen bilateral regulatory arrange- ments for the Chukchi Sea with Russia, and the Beaufort Sea with Canada. ¶ 6. Support the industry-led establishment of an Arctic-specific resource sharing organization for oil spill response and safety.¶ 7. Support and prioritize the strengthening of the Arctic Council through enhanced thematic coordination of offshore oil and gas issues.¶ 8. Support the establishment of a circumpo- lar Arctic Regulators Association for Oil and Gas. Climate change is contributing to unprecedented changes in the Arctic. As the ice melts further and hydrocarbon exploration and development move into more ice-infested waters, new regulatory ap- proaches will be needed, including the adoption of Arctic-specific standards and the implementation of systems, infrastructure, and resource sharing arrangements to strengthen oil spill prevention, containment, and response. Despite much debate over how this is best accomplished, there is broad consensus that the prospect of much of the Arc- tic opening up for commercial development on a scale scarcely recognized a few decades ago poses major challenges. Environmental challenges on the local, regional, and international levels and associated risks, especially to indigenous com- munities, must be managed through strengthen- ing the existing offshore governance regime.¶ This policy brief is designed to inform the legis- lative and executive branches of the U.S. govern- ment of the current state of offshore oil and gas governance in the Arctic, the need to strengthen this governance, possible avenues for doing so, and the leadership opportunities available in its chairmanship of the Arctic Council. The brief is intended to highlight that the responsibilities and challenges the U.S. will assume in this role can- not be met with current policies. Rather, **proper leadership** will require a sustained commitment of financial and institutional resources to move forward efforts to improve the prevention, con- tainment, and response to accidents in the Arctic.¶ Congress has the responsibility to understand the importance of establishing strong offshore gover- nance in this region as a national security priority. Even if offshore oil and gas activities in the region take decades to come online at commercial scale, tourism, fishing, and transportation will continue to drive economic development in the Arctic. Hydrocarbon activity is sure to follow this path once paved. When it does, it is critical that proper oil spill prevention, response, and management regimes are in place to avoid environmental dev- astation. In preparing for its chairmanship of the Arctic Council, the U.S. government must not only recognize the opportunity it has to spear- head these efforts but also to embrace them, pushing forward on initiatives such as those rec- ommended in this policy brief.

No multilateral norms now- US leadership solves-

Borgerson 10 SCOTT G. BORGERSON is International Affairs Fellow at the Council on Foreign Relations and a former Lieutenant Commander in the U.S. Coast Guard, April 2008, "Arctic Meltdown: The Economic and Security Implications of Global Warming", http://www.jstor.org/stable/pdfplus/20032581.pdf?acceptTC=true

Washington cannot afford to stand idly by. The Arctic region is not currently governed by any comprehensive multilateral norms and regulations because it was never expected to become a navigable water¬way or a site for large-scale commercial development. Decisions made by Arctic powers in the coming years will therefore profoundly shape the future of the region for **decades. Without U.S. leadership** to help develop **diplomatic solutions** to competing claims and potential conflicts, the region could **erupt in an armed mad dash** for its resources.

Offshore drilling key to US Arctic leadership

Cohen and Altman 11 Ariel Cohen, Ph.D. is a Senior Research Fellow for Russian and Eurasian Studies and International Energy Policy at the Heritage Foundation, Anton Altman is a research volunteer at The Heritage Foundation, August 16, 2011, "Russia's Arctic Claims: Neither LOST nor Forgotten", http://blog.heritage.org/2011/08/16/russias-arctic-claims-neither-lost-nor-forgotten/

Moscow has an unquestionable head start on the rest of the world, and it is not shy about investing in its ambitions. At least six new icebreakers and Sabetta, a new year-round port on the arctic shores—costing $33 billion—are on the agenda, but Prime Minister Putin has said the Kremlin is "open for a dialogue with our foreign partners and with all our neighbors in the Arctic region, but of course we will defend our own geopolitical interests firmly and consistently." Or as they said in Soviet times, "What is mine is mine, and what is yours is negotiable."¶ The Arctic is of **vital geopolitical importance** not just to Russia, but to the entire world. It has enormous quantities of hydrocarbon energy and other natural resources, and as the Arctic is no longer completely icebound, in summertime it may become an important transportation route **vital to U.S. national security**.¶ Despite this, at present the U.S. has made virtually no effort to strengthen its position in the frozen final frontier. The chief concern is America's lack of icebreakers—even Canada and Finland have more than the United States. Icebreakers are vital to exploring the Arctic and enforcing one's sovereignty there. As of 2010, Russia had 29 icebreakers in total and was building more. The United States had two (including one that is obsolete), with no plans to expand. The Heritage Foundation has exposed this problem extensively:¶ The United States has significant geopolitical and geo-economic interests in the High North, but the **lack of policy attention** and insufficient funding have placed the U.S. on track to abdicate its national interests in this **critical region.**¶ The **U**nited **S**tates must **strengthen its position in the Arctic** and make its interests clear to friend and foe alike. Washington should reach out to the Arctic Council members to block Russia's expansion plans at the U.N. Meanwhile, the U.S. should fund and build its icebreaking squadron and deploy it in Alaska.¶ Russia's Arctic aspirations are a serious geopolitical challenge for U.S. and allied interests. America's **security and economic prosperity** in the 21st century will depend on U.S. ability **to access polar waters and the Arctic Ocean bed**.

*Tech Competitiveness – H-1B

Text: The United States federal government should exempt certain highly skilled workers from employment-based visa limits, reform the per-country quota system for immigrant visas, and recapture unused immigrant visas to ease the burden on oversubscribed categories.

H-1B solves tech competitiveness- costs millions of dollars

Partnership for a New American Economy 14 http://www.mikebloomberg.com/news/new-report-shows-h-1b-visa-denials-slowed-u-s-tech-sector-growth-depressed-wage-and-job-growth-for-u-s-born-workers-following-great-recession/ New Report Shows H-1B Visa Denials Slowed U.S. Tech Sector Growth, Depressed Wage and Job Growth for U.S.-Born Workers Following Great Recession June 04, 2014

2007 and 2008 H-1B Visa Denials in Cities Across the U.S. Cost U.S.-Born Workers Hundreds of Thousands of Jobs and Nearly $3 Billion in Missed Wages View the report from Partnership for a New American Economy here. The Partnership for a New American Economy today released a new report showing how existing H-1B visa lottery caps disproportionately hurt American-born tech workers by slowing job and wage growth in more than 200 metropolitan areas across the United States. H-1B visa denials in 2007 and 2008 caused these areas to miss out on creating as many as 231,224 tech jobs for American-born workers in the years that followed and cost U.S.-born, college-educated workers in computer-related fields as much as $3 billion in aggregate annual earnings. "This report shows that the existing cap on H-1B visas is directly undermining our technology industry's ability to grow and create new jobs for U.S.-born workers," said John Feinblatt, Chairman of the Partnership for a New American Economy. "Our current system jeopardizes the fastest growing sector of our economy and if Congress does not act, other countries will win the race for global talent. It's time for Washington to work with – not against – the industries that make our economy strong." Key Findings The high number of H-1B visa applications that were eliminated in the 2007-2008 visa lotteries represented a major lost opportunity for U.S.-born workers and the American economy overall. The failure of 178,000 H-1B visa applications in computer related fields to make it through the 2007 and 2008 H-1B visa lotteries caused U.S metropolitan areas to miss out on creating as many as 231,224 often highly-sought after tech jobs for U.S.-born workers in the two years that followed. The total number of U.S.-born workers with computer-related jobs would have exceeded 2 million by 2010 with that additional employment. The U.S. tech industry would have grown substantially faster in the years immediately after the recession if not for the large number of visas that didn't make it through the 2007 and 2008 H-1B visa lotteries. The number of jobs for U.S.-born workers in computer-related industries would have grown at least 55 percent faster between 2005-2006 and 2009-2010, if not for the applications eliminated in the recent H-1B visa lotteries. Computer firms could have added as many as three times more jobs for U.S.-born workers than they actually did during that period without all the unsuccessful H-1B visa applications. U.S.-born workers without bachelor's degrees were disproportionately hurt by the H-1B visa lotteries in 2007-2008. Because less-educated tech workers often play valuable roles supporting the work of high-skilled engineers, programmers, and others, they were particularly impacted by recent H-1B trends. By 2009-2010, U.S. metropolitan areas lacked as many as 188,582 computer-related jobs for U.S.-born workers without a college degree as a direct result of the large number of applications that were eliminated in the 2007 and 2008 H-1B visa lotteries. The number of positions missing from the economy for U.S.-born,

college-educated tech workers, in contrast, was between 24,280 and 42,642. The H-1B visa lotteries in 2007 and 2008—and the denials resulting from them—greatly slowed wage growth for workers in computer-related industries. In 2009, the 1.1 million U.S.-born, college-educated workers in computer-related fields missed out on as much as $3 billion in aggregate annual earnings as a direct result of the large number of applications that were unsuccessful in the H-1B visa lotteries in the 2007-2008 period. From 2005-2006 to 2009-2010, wages for college-educated, U.S.-born workers with computer-related jobs grew by 1.7 percent. Without the earlier visa lotteries, their wages could have grown by as much as 4.9 percent during that period. For some cities, the H-1B visa lotteries in 2007 and 2008 had a particularly large impact. In New York City and Northeast New Jersey, the large number of H-1B visas that didn't make it through the lottery for workers in computer-related fields caused the local economy to miss out on creating as many as 28,005 jobs for native-born workers in those industries by 2009-2010. The Washington, DC metropolitan area, including parts of Virginia and Maryland, lost the opportunity to create as many as 30,222 computer-related jobs for U.S.-born workers during that period; Chicago and Dallas Fort Worth passed up the opportunity to create as many as 27,329 such positions together. This report was prepared for the Partnership for a New American Economy by Giovanni Peri, University of California, Davis and the National Bureau of Economic Research; Kevin Shih, University of California, Davis; and Chad Sparber, Colgate University. See the full report, Closing Economic Windows: How H-1B Visa Denials Cost U.S.-Born Tech Workers Jobs and Wages During the Great Recession. About the Partnership for a New American Economy The Partnership for a New American Economy brings together more than 500 Republican, Democratic and Independent mayors and business leaders who support immigration reforms that will help create jobs for Americans today. The Partnership's members include mayors of more than 35 million people nationwide and business leaders of companies that generate more than $1.5 trillion and employ more than 4 million people across all sectors of the economy, from Agriculture to Aerospace, Hospitality to High Tech and Media to Manufacturing. Partnership members understand that immigration is essential to maintaining the productive, diverse and flexible workforce that America needs to ensure prosperity over the coming generations. Resolves competitiveness- leads to innovation

Hart 9 David Hart, director of the center for science and technology policy at George mason university, Zoltan Acs, director of the center for entrepreneurship and public policy at George Mason University, and Spencer Tracy, head of the national policy research council, 7-2009, "High-tech Immigrant Entrepreneurship in the United States," Small Business Administration

A vigorous high-technology sector is vital to sustain U.S. prosperity in the 21st century. The new products, services, and business models that the high-tech sector generates differentiate this nation's output from that of the rest of the world and enable capital accumulation, wage gains, and productivity growth. A high level of entrepreneurship, by which we mean the founding of new businesses, makes the high-tech sector vigorous. High-tech entrepreneurs, by which we mean the founders of new high-tech businesses, take risks that managers of existing high-tech businesses choose not to take and recognize opportunities that they fail to spot. High-tech entrepreneurship requires a rare combination of inclinations, capabilities, and resources. Half of new businesses fail within five years (Shane 2008), so founders must be optimistic, but also capable of weathering severe challenges. Because the opportunities in high-tech sectors blend together technological and market factors, individual entrepreneurs and founding teams in these sectors typically combine technical expertise rooted in formal education with market savvy that flows from extensive business experience. They must also be able to tap quickly and effectively into networks of customers, suppliers, expertise, finance, and talent as business opportunities ripen. Foreign-born individuals play an important role in U.S. high-tech entrepreneurship. By virtue of having left their native land, they may have entrepreneurial inclinations. Their 7 large presence in American higher education and the U.S. labor force, especially science and engineering disciplines and occupations, equips them with valuable knowledge that bears on high-tech innovation. Their outsider status may allow them, in some cases, to recognize "out-of-the box" opportunities that native-born individuals with similar knowledge and skills do not perceive..

*Tech Leadership – OSW

1NC Shell

Text: The United States federal government should develop offshore wind farms.

Offshore wind solves US tech leadership

Klarevas 9 –Louis Klarevas, Professor for Center for Global Affairs @ New York University, 12/15, "Securing American Primacy While Tackling Climate Change: Toward a National Strategy of Greengemony," http://www.huffingtonpost.com/louis-klarevas/securing-american-primacy_b_393223.html

As national leaders from around the world are gathering in Copenhagen, Denmark, to attend the United Nations Climate Change Conference, the time is ripe to re-assess America's current energy policies - but within the larger framework of how a new approach on the environment will stave off global warming and shore up American primacy. By not addressing climate change more aggressively and creatively, the United States is squandering an opportunity to secure its **global primacy** for the next few generations to come. To do this, though, the U.S. must rely on innovation to help the world escape the coming environmental meltdown. Developing the key technologies that will **save the planet from global warming** will allow the U.S. to **outmaneuver potential great power rivals** seeking to replace it as the international system's hegemon. But the greening of American strategy must occur soon. The U.S., however, seems to be stuck in time, unable to move beyond oil-centric geo-politics in any meaningful way. Often, the gridlock is portrayed as a partisan difference, with Republicans resisting action and Democrats pleading for action. This, though, is an unfair characterization as there are numerous proactive Republicans and quite a few reticent Democrats. The real divide is instead one between realists and liberals. Students of realpolitik, which still heavily guides American foreign policy, largely discount environmental issues as they are not seen as advancing national interests in a way that generates relative power advantages vis-à-vis the other major powers in the system: Russia, China, Japan, India, and the European Union. ¶ Liberals, on the other hand, have recognized that global warming might very well become the **greatest challenge ever faced by (hu)mankind**. As such, their thinking often eschews narrowly defined national interests for the greater global good. This, though, ruffles elected officials whose sworn obligation is, above all, to protect and promote American national interests. What both sides need to understand is that by becoming a lean, mean, green fighting machine, the U.S. can actually bring together liberals and realists to advance a collective interest which benefits every nation, while at the same time, securing America's global primacy well into the future. To do so, the U.S. must re-invent itself as not just your traditional hegemon, but as history's first ever green hegemon. Hegemons are countries that dominate the international system - bailing out other countries in times of global crisis, establishing and maintaining the most important international institutions, and covering the costs that result from free-riding and cheating global obligations. Since 1945, that role has been the purview of the United States. Immediately after World War II, Europe and Asia laid in ruin, the global economy required resuscitation, the countries of the free world needed security guarantees, and the entire system longed for a multilateral forum where global concerns could be addressed. The U.S., emerging the least scathed by the systemic crisis of fascism's rise, stepped up to the challenge and established the postwar (and current) liberal order. But don't let the world "liberal" fool you. While many nations benefited from America's new-found hegemony, the U.S. was driven largely by "realist" selfish national interests. The liberal order first and foremost benefited the U.S. With the U.S. becoming bogged down in places like Afghanistan and Iraq, running a record national debt, and failing to shore up the dollar, the future of American hegemony now seems to be facing a serious contest: potential rivals - acting like sharks smelling blood in the water - wish to challenge the U.S. on a variety of fronts. This has led numerous commentators to forecast the U.S.'s imminent fall from grace. Not all hope is lost however. With the impending systemic crisis of global warming on the horizon, the U.S. again finds itself in a position to address a transnational problem in a way that will benefit both the international community collectively and the U.S. selfishly. The current problem is two-fold. First, the competition for oil is fueling animosities between the major powers. The geopolitics of oil has already emboldened Russia in its 'near abroad' and China in far-off places like Africa and Latin America. As oil is a limited natural resource, a **nasty zero-sum contest could be looming** on the horizon for the U.S. and its major power rivals - a contest which threatens American primacy and **global stability**. Second, converting fossil fuels like oil to run national economies is producing irreversible harm in the form of carbon dioxide emissions. So long as the global economy remains oil-dependent, greenhouse gases will continue to rise. Experts are predicting as much as a 60% increase in carbon dioxide emissions in the next twenty-five years. That likely means more devastating water shortages, droughts, forest fires, floods, and storms. In other words, if global competition for access to energy resources does not **undermine international security**, **global warming will**. And in either

case, oil will be a culprit for the instability. Oil arguably has been the most precious energy resource of the last half-century. But "black gold" is so 20th century. The key resource for this century will be green gold - clean, environmentally-friendly energy like wind, solar, and hydrogen power. Climate change leaves no alternative. And the sooner we realize this, the better off we will be. What Washington must do in order to avoid the traps of petropolitics is to convert the U.S. into the world's first-ever green hegemon. For starters, the federal government must drastically increase investment in energy and environmental research and development (E&E R&D). This will require a serious sacrifice, committing upwards of $40 billion annually to E&E R&D - a far cry from the few billion dollars currently being spent. By promoting a new national project, the U.S. could develop new technologies that will assure it does not drown in a pool of oil. Some solutions are already well known, such as raising fuel standards for automobiles; improving public transportation networks; and expanding nuclear and wind power sources. Others, however, have not progressed much beyond the drawing board: batteries that can store massive amounts of solar (and possibly even wind) power; efficient and cost-effective photovoltaic cells, crop-fuels, and hydrogen-based fuels; and even fusion. Such innovations will not only provide alternatives to oil, they will also give the U.S. an edge in the global competition for hegemony. If the U.S. is able to produce technologies that allow modern, globalized societies to escape the oil trap, those nations will eventually have no choice but to adopt such technologies. And this will give the U.S. a **tremendous economic boom**, while simultaneously providing it with means of leverage that can be employed to **keep potential foes in check**. The bottom-line is that the U.S. needs to become green energy dominant as opposed to black energy independent.

Block

Counterplan solves US tech leadership

Caperton et al, 11 – Policy Analyst with the Energy Opportunity group at the Center for American Progress. Kate Gordon: Vice President of Energy Policy, Center for American Progress. Bracken Hendricks: Senior Fellow, Center for American Progress. Daniel J. Weiss: Senior Fellow and Director of Climate Strategy, CenTer for American Progress. (Richard, Kate Gordon, Bracken Hendricks, and Daniel Weiss, "Helping America Win the Clean Energy Race," Center for American Progress, 2/7/2011, http://cdn.americanprogress.org/wp-content/uploads/issues/2011/02/pdf/ces_brief.pdf) //RGP

But these successes cannot continue without a strong signal that the U.S. government is fully committed to building a domestic market for clean energy technologies. Many new business plans were written with the expectation that Congress would pass comprehensive climate and energy legislation that would put a price on carbon pollution that levels the playing field for clean technologies to compete with coal and oil. This effort included a "renewable electricity standard" proposed by Sen. Jeff Bingaman (D-NM), which passed the Senate Energy Committee with bipartisan support. The RES would have required utilities to generate at least 15 percent of their electricity by wind, solar, and other renewable sources. Unfortunately Senate Republican leaders blocked any energy legislation in 2010, just as the Recovery and Reinvestment Act funds began to run their course. The result: Cleantech companies now find themselves in a tight financial position, facing slackening market demand and a tightening supply of private-sector investment capital. This is no way to build a modern industry. Already we have seen cutting-edge solar power manufacturing companies begin to close their doors, either permanently or to move to other countries with strong and dedicated clean energy markets. Evergreen Solar Inc., for example, recently announced plans to close its Massachusetts plant to put more funds into solar panel manufacturing in China. The company followed on the heels of SpectraWatt Inc. in New York and Solyndra Inc. in California closing some of their facilities. As General Electric Co.'s chairman and chief executive, Jeff Immelt, said at last year's ARPA-E summit, those countries with strong demand for renewable energy products will naturally pull these companies into their borders because "innovation and supply chain strength gets developed where the demand is the greatest." Similarly, wind manufacturers in Iowa, once a state leader in this industry, are laying off workers as new orders fail to materialize. Leading global financier Deutsche Bank decided to move billions of investment dollars out of the U.S. clean energy market, and into China and Europe as soon as it was clear there would be no comprehensive climate and energy legislation coming out of the 111th Congress. China and our other economic competitors in Asia, Europe, and emerging markets are not waiting for America to regroup. The home team can win the clean energy race These stories share a common theme: investment dollars leaving the United States to be deployed among our global competitors who have fully embraced the economic and environmental imperative to enter a new era of cleaner, more sustainable and domestic energy. China is the most striking example. In 2009, even as the United States was installing more wind turbines, China driven by stable long-term demand for its products, became the world's largest manufacturer of wind power systems. It was already the world's largest solar manufacturer and developer of efficient nuclear and coal technologies. But China isn't alone. Not by a long shot. Germany is not far behind in linking strong clean energy policies to market growth and manufacturing leadership, as the leading global manufacturer of solar inverters—a key part of solar power systems—and has made huge strides in energy storage solutions that will further accelerate the widespread adoption of renewable power. Denmark, Japan, and the United Kingdom are also global clean energy leaders with

thriving domestic markets. All these countries have comprehensive programs in place to spur robust and stable demand for low-carbon energy, which then creates a market for businesses to manufacture and install the technologies to meet that demand. Last June, China announced its plan to meet a renewable energy standard of 20 percent by 2020, matching the European Union's target. Germany has set a target of 60 percent by 2050. The country already gets 16 percent of all its power from renewables, well on its way to meeting this ambitious goal, and some think it may reach 100 percent by 2050. Denmark has gone a step further, actually announcing its intention to become 100 percent independent of fossil fuels by 2050, something that at least one of its islands has already achieved. This occurred in a country that in 1970 was almost completely dependent on foreign fossil fuels. These countries prove that strong clean energy standards build growing economies. But even more than that, strong clean energy standards are now imperative if we are to compete on the same playing field as China and Europe. America over the course of the 20th century took command of the Industrial Revolution and the communications revolution, and then led the world into the Information Age. It is time for us to lead the clean-tech revolution, too. Today, others are beating us to the punch, not because we lack the technology and innovation to lead this new revolution, but because we are not providing the market signals needed for our private-sector entrepreneurs need to invest over the long haul. This clean energy investment gap is rapidly becoming the greatest threat to America's technology leadership.

Text: The United States federal government should develop offshore wind farms.

Counterplan generates four times America's electricity consumption – modelled globally

Thaler 12 - Professor of Energy Policy, Law & Ethics

(Jeff, "FIDDLING AS THE WORLD BURNS: HOW CLIMATE CHANGE URGENTLY REQUIRES A PARADIGM SHIFT IN THE PERMITTING OF RENEWABLE ENERGY PROJECTS," 42 Environmental Law Journal 1101)//BB

Unfortunately, as the economic and health costs from fossil fuel emissions have grown so too has the byzantine labyrinth of laws and regulations to be navigated before a renewable energy project can be approved, let alone financed and developed. 6 The root cause goes back to the 19 70s when some of our fundamental environmental laws were enacted, before we were aware of climate change threats, to slow down the review of proposed projects by requiring more studies of potential project impacts before approval.7 But in our increasingly carbon-based 21st century, we need a paradigm shift. While achieving important goals, those **federal laws** and regulations, and similar ones at the state and local levels, have become so unduly burdensome, slow, and expensive that they will **chill investment** in, and kill any significant growth of, renewable carbon-free energy sources and projects, thereby imposing huge economic, environmental and social costs upon both our country and the world8 unless they are substantially changed. Indeed, by 2050 the U.S. must reduce its greenhouse gas emissions by 80% to even stabilize atmospheric levels of carbon, and can do so by increasing generated electricity from renewable sources from the current thirteen percent up to eighty percent9-- but only if there are targeted new policy efforts to accelerate, fifty times faster than since 1990, implementation of clean, renewable energy sources.10 Thus, Part II focuses on one promising technology to demonstrate the flaws in its current licensing permitting regimes, and makes concrete recommendations for reform.11 Wind power generation from onshore installations is proven, generates no GHGs and consumes no water,12 is increasingly **cost-competitive** with most fossil fuel sources, and can be **employed** relatively **quickly** in many parts of the United States and world. Offshore wind power is a relatively newer technology, especially deep-water floating projects, and presently less cost-competitive than onshore wind. However, because wind speeds are on average about ninety percent **stronger** and **more consistent** over water than over land, with higher power densities and lower shear and turbulence,13 America's offshore resources can provide more than our current electricity use.14 Moreover, these resources are near many major cities that are home to much of the population and electricity demand thereby "reducing the need for new high-voltage transmission from the Midwest and Great Plains to serve coastal lands..."15 Therefore, in light Part II's spotlight on literally dozens of different federal (yet alone state and local) statutes and their hundreds of regulations standing between an offshore wind project applicant and construction, Part III makes concrete statutory and regulatory recommendations to much more **quickly enable the full potential of offshore wind** energy to become a reality before it is too late. Greenhouse gases (GHGs) trap heat in the atmosphere; the primary GHG emitted by human activities is carbon dioxide (CO_2), which in 2012 represented 84 percent of all human-sourced U.S. GHG emissions.16 "The combustion of fossil fuels to generate electricity is the largest single source of CO2 emissions in the nation, accounting for about 40% of total U.S. CO2 emissions and 33% of total U.S. greenhouse gas emissions in 2009."17 The significant increased concentrations of GHGs into our atmosphere since the 1750 Industrial Revolution began greater use of fossil fuel sources have caused our world to warm and climate to change.18 Climate change may be the single greatest threat to human society and wildlife, as well as to the ecosystems upon which each depends for **survival**.19 In 1992, the U.S. signed and ratified the United Nations Framework Convention on Climate Change (UNFCC), whose stated objective was: "[s]tabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. Such a level should be achieved within a time-frame sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner."20 In 2007, the Intergovernmental Panel on Climate Change (IPCC) concluded that it is "very likely," at least ninety percent certain, that humans are responsible for most of the "unequivocal" increases in globally averaged temperatures of the previous fifty years. 21 Yet in the twenty years since the UNFCCC, it also is **unequivocal** that GHG levels have not stabilized but **continue to grow**, ecosystems and food production have not been able to adapt, and our heavy reliance on fossil-fueled energy continues "dangerous anthropogenic interference with the climate system."22 Equally unequivocal is that 2011 global temperatures were "the tenth highest on record and [were] higher than any previous year with a La Nina event, which [normally] has a relative cooling influence"; "the warmest 13 years of average global temperatures [also] have all occurred in the 15 years since 1997."23 Global emissions of carbon dioxide also jumped 5.9% in 2010 by the largest amount on record -- 500 million extra tons of carbon was pumped into the air, "the largest absolute jump in any year since the Industrial Revolution [began in 1750], and the largest percentage increase since 2003."24 In order to even have a fifty-fifty chance that the average global temperature will not rise more than 2° C25 beyond the temperature of 1750,26 our cumulative emissions of CO2 after 1750 must not exceed one trillion tons; but by mid-July 2012 we had already emitted over 559 billion tons and rising, and at current rates will emit the trillionth ton in July 2043.27 The consequence is that "the current generation are uniquely placed in human history: the choices we make now—in the next 10-20 years—will alter the destiny of our species (let alone every other species) unalterably, and forever."28 Unfortunately, by the end of 2011 the more than 10,000 government and U.N. officials from all over the world attending the Durban climate change conference29 agreed that there is a "significant gap between the aggregate effect of Parties' mitigation pledges in terms of global annual emissions of greenhouse gases by 2020 and aggregate emission pathways consistent with having a likely chance of holding the

increase in global average temperature below 2 °C or 1.5 °C above pre-industrial levels."30 What are some of the growing economic, public health, and environmental costs to our country proximately31 caused by our daily burning of fossil fuels? The National Research Council (NRC) analyzed the "hidden" costs of energy production and use not reflected in market prices of coal, oil, other energy sources, or the electricity and gasoline produced from them. For the year 2005 alone, the NRC estimated $120 billion of damages to the U.S. from fossil fuel energy, reflecting primarily health damages from air pollution associated with electricity generation and motor vehicle transportation. Of that total, $62 billion was due to coal-fired electricity generation; $56 billion from ground transportation (oil-petroleum); and over $2.1 billion from electricity from and heating with natural gas. The $120 billion figure did not include damages from climate change, harm to ecosystems and infrastructure, insurance costs, effects of some air pollutants, and risks to national security, which the NRC examined but did not specifically monetize. 32 The NRC did, however, suggest that under some scenarios climate damages from energy use could equal $120 billion.33 Thus, adding natural resource damages from harm to ecosystems, infrastructure damages, insurance costs, air pollutant costs, and fossil-fueled national security costs to $240 billion, our burning of fossil fuels appears to be costing Americans about $300 billion each year—a "hidden" number likely to be larger in the future. What does the future hold for a carbon-stressed world? Most scientific analyses presently predict that by 2050 the Earth may warm by 2 to 2.5° C due to the rising level of greenhouse gases in the atmosphere; at the high-end of projections, the 2050 warming could exceed 4.5° C.34 But those increases are not consistent globally; rather, "[i]n all possible [predicted] outcomes, the warming over land would be roughly twice the global average, and the warming in the Arctic greater still."35 For example, the NRC expects that each degree Celsius increase will produce in the U.S. double to quadruple the area burned by wildfires in the western U.S.; a 5-15 percent reduction in crop yields; more destructive power from hurricanes; greater risk of very hot summers; and more changes in precipitation frequency and amounts.36 Globally, a summary of studies predicts that a 1°C global average temperature rise will reduce Arctic sea ice by an annual average of fifteen percent and by twenty-five percent in Septembers 37; at 2°C Europe suffers greater heat waves, the Greenland Ice Sheet significantly melts, and many land and marine species are driven to extinction; at 3°C the Amazon suffers severe drought and resultant firestorms that will release significantly more carbon into the atmosphere38; at 4°C hundreds of billions of tons of carbon in permafrost melt, releasing methane in immense quantities, while the Arctic Ocean ice cap disappears and Europe suffers greater droughts.39 To presently assess what a 5°C rise will mean, we must look back into geological time, 55 million years ago, when the Earth abruptly experienced dramatic global warming due to the release of methane hydrates--a substance presently found on subsea continental shelves. Fossils demonstrate that crocodiles were in the Canadian high Arctic, breadfruit trees were growing on the coast of Greenland, and the Arctic Ocean saw water temperatures of 20 °C within 200km of the North Pole itself.40 And a 6°C average rise takes us even further back, to the end of the Permian period, 251 million years ago, when up to 95% of species relatively abruptly became extinct.41 This may sound extreme, but the International Energy Administration warned this year that the 6°C mark is in reach by 2050 at current rates of fossil fuel usage.42 However, even given the severity of these forecasts, many still question the extent that our climate is changing,43 and thus reject moving away from our largely fossil-fueled electricity, transportation and heating sources. Therefore, in this next subsection I provide the latest scientific data documenting specific climate impacts to multiple parts of U.S. and global daily lives, and the costly consequences that establish the urgency for undertaking the major regulatory reforms I recommend in Part III of this Article. B. Specific Climate Threats and Consequences 1. When Weather Extremes Increase A 2011 IPCC Special Report predicted that it is virtually certain [99-100% probability] that increases in the frequency of warm daily temperature extremes and decreases in cold extremes will occur throughout the 21st century on a global scale. It is very likely [90% to 100% probability] that heat waves will increase in length, frequency, and/or intensity over most land areas.... It is very likely that average sea level rise will contribute to upward trends in extreme sea levels and extreme coastal high water levels. 44 Similarly, a House of Representatives Committee report (ACESA Report) found that "[t]here is a broad scientific consensus that the United States is vulnerable to weather hazards that will be exacerbated by climate change."45 It also found that the "cost of damages from weather disasters has increased markedly from the 1980s, rising to more than $100 billion in 2007. In addition to a rise in total cost, the frequency of weather disasters costing more than one billion dollars has increased."46 In 2011, the U.S. faced the most billion-dollar climate disasters ever, with fourteen distinct disasters alone costing at least $53 billion to our economy.47 In the first six months of 2012 in the U.S., there were more than 40,000 hot temperature records, horrendous wildfires, major droughts, oppressive heat waves, major flooding, and a powerful derecho wind storm.48 The IPCC Fourth Assessment Report identified impacts from growing weather hazards upon public health to include: more frequent and more intense heat waves; more people suffering **death**, **disease** and injury from **floods**, storms, fires, and **droughts**; increased cardio-respiratory morbidity and mortality associated with ground-level ozone pollution; changes in the range of some infectious disease carriers **spreading**, for example, **malaria** and the **West Nile** virus; and increased malnutrition and consequent disorders.49 As noted above, $120 billion per year of the NRC's Hidden Energy report's damage assessment were based on health damages,50 including an additional 10,000-20,000 deaths per year.51 And by 2050, cumulative heat-related deaths from unabated climate change are predicted to be an additional 33,000 in the forty largest U.S. cities, with more than 150,000 additional deaths by 2100.52 Weather extremes also **threaten our national security**, whose policy is premised on stability. In 2007 the CNA Corporation's report National Security and the Threat of Climate Change described climate change as a "**threat multiplier for instability**" and warned that p]rojected climate change poses a serious threat to America's national security. The predicted effects of climate change over the coming decades include extreme weather events, drought, flooding, sea level rise, retreating glaciers, habitat shifts, and the increased spread of life-threatening diseases. These conditions have the potential to disrupt our way of life and to force changes in the way we keep ourselves safe and secure.53 The following year, in the first-ever U.S. government analysis of climate change security threats, the National Intelligence Council issued an assessment warning, in part, that climate change could **threaten U.S. security** by leading to political instability, mass movements of **refugees**, **terrorism,** and **conflicts over** water and other **resources**.54 2. When Frozen Water Melts In 2007 the IPCC predicted that sea levels would rise by 8 to 24 inches above current levels by 2100; since then, however, numerous scientists and studies have suggested that the 2007 prediction is already out-of-date and that sea levels will likely rise up to 1.4 meters (55 inches) given upwardly trending CO2 emissions.55 The 2009 ACESA Report found that rising sea levels are already causing inundation of low-lying lands, corrosion of wetlands and beaches, exacerbation of storm surges and flooding, and increases in the salinity of coastal estuaries and aquifers.... Further, about one billion people live in areas within 75 feet elevation of today's sea level, including many US cities on the East Coast and Gulf of Mexico, almost all of Bangladesh, and areas occupied by more than 250 million people in China.56 This year NASA's Chief Scientist testified to Congress that two-thirds of sea level rise from the last three decades is derived from the Greenland and Antarctic ice sheets and the melting Arctic region, then warned: [t]he West Antarctic ice sheet (WAIS), an area about the size of the states of Texas and Oklahoma combined....contains the equivalent of 3.3 m of sea level, and all that ice rests on a soft-bed that lies below sea level. In this configuration, as warm seawater melts the floating ice shelves, causing them to retreat and the glaciers that feed them to speed up, there is no mechanism to stop the retreat and associated discharge, if warming continues. Thus the WAIS exhibits great potential for substantial and relatively rapid contributions to sea level rise. ... In Greenland, the situation is not as dramatic, since the bed that underlies most of the ice is not below sea level, and the potential for unabated retreat is limited to a few outlet glaciers. In Greenland, however, summer air temperatures are warmer and closer to ice's melting point, and we have observed widespread accumulation of meltwater in melt ponds on the ice sheet surface..57 In the West Antarctic ice sheet region, glacier retreat appears to be widespread, as the air has "warmed by nearly 6°F since 1950."58 As for Greenland's Ice Sheet, it also is at greater risk than the IPCC had thought. Recent studies with more complete modeling suggest that the warming threshold leading to an essentially ice-free state is not the previous estimate of an additional 3.1°C, but only 1.6°C. Thus, the 2°C target may be insufficient to prevent loss of much of the Ice Sheet and resultant significant sea level rise.59 The ACESA Report also identified the Arctic as "one of the hotspots of global warming"60 because "[o]ver the past 50 years average temperatures in the Arctic have increased as much as 7 °F, five times the global average."61 Moreover, in "2007, a record 386,000 square miles of Arctic sea ice melted away, an area larger than Texas and Arizona combined and as big a decline in one year as had occurred over the previous decade".62 "Arctic sea ice is melting faster than climate models [had] predict[ed], and is about thirty years ahead" of the 2007 IPCC predictions, thus heading toward the Arctic Ocean being ice-free in the late summer beginning sometime between 2020 and 2037.63 How is the Arctic's plight linked to non-Arctic impacts? "The Arctic region arguably has the greatest concentration of potential tipping elements in the Earth system, including Arctic sea ice, the Greenland ice sheet, North Atlantic deep-water formation regions, boreal forests, permafrost and marine methane hydrates."64 Additionally: Warming of the Arctic region is proceeding at three times the global average....Loss of Arctic sea ice has been tentatively linked to extreme cold winters in Europe... Near complete loss of the summer sea ice, as forecast for the middle of this century, if not before, will probably have knock-on effects for the northern mid-latitudes, shifting jet streams and storm tracks.65 Since 1980, sea levels have been rising three to four times faster than the global average between Cape Hatteras, N.C. and Boston.66 "[P]ast and future global warming more than doubles the estimated odds of 'century' or worse floods occurring within the next 18 years" for most coastal U.S. locations.67 Although land-based glacier melts are not major contributors to sea level rise, they do impact peoples' food and water supplies. Virtually all of the world's glaciers, which store seventy-five percent of the world's freshwater, are receding in direct response to global warming, aggravating already severe water scarcity--both in the United States and abroad.68 While over fifteen percent of the world population currently relies on melt water from glaciers and snow cover for drinking water and irrigation for agriculture, the IPCC projects a sixty percent volume loss in glaciers in various regions and widespread reductions in snow cover throughout the twenty-first century.69 Likewise, snowpack has been decreasing, and it is expected that snow cover duration will significantly decrease in eastern and western North America and Scandinavia by 2020, and globally by 2080.70 Climate change thus increases **food insecurity** by reducing yields of grains, such as corn and wheat, from increased water scarcity and intensification of severe hot conditions, thereby causing corn price volatility to sharply increase.71 Globally, the number of people living in "severely stressed" river basins will increase "by one to two billion people in the 2050s"...About two-thirds of the global land area is expected to experience increased water stress".72 3. When Liquid Water Warms Over the past century, oceans, which cover seventy percent of the Earth's surface, are warming. Global sea-surface temperature has increased about 1.3°F, while the heat has also penetrated almost two miles into the deep ocean.73 This increased warming is contributing to the destruction of seagrass meadows, causing an annual release back into the environment of 299 million tons of carbon.74 Elevated atmospheric carbon dioxide concentrations also are leading to higher absorption of CO2 into the upper ocean, making the surface waters more acidic (lower Ph).75 "[O]cean chemistry currently is changing at least 100 times more rapidly than it has changed during the 650,000 years preceding our [fossil-fueled] industrial era."76 The acidification has serious implications for the calcification rates of organisms and plants living at all levels within the global ocean. **Coral reefs**, the habitat for about a

quarter of (over a million) of marine species, are collapsing, endangering more than a third of all coral species77; indeed, temperature thresholds for the majority of coral reefs worldwide are expected to be exceeded, causing mass bleaching and complete coral mortality.78 "[T]he productivity of plankton, krill, and marine snails, which compose the base of the ocean food chain, [also] declines as the ocean acidifies,"79 adversely impacting populations of everything from whales to salmon80 who also are being harmed by the oceans' warming up. 81 **Extinctions from climate change** also are expected to be significant and widespread. The IPCC Fourth Assessment found that "approximately 20-30% of plant and animal species assessed so far are likely to be at increased risk of extinction if increases in global average temperature exceed 1.5-2.5°C82—a range likely to be exceeded in the coming decades. "[R]ecent studies have linked global warming to declines in such [] species as [] blue crabs, penguins, gray whales, salmon, walruses, and ringed seals[; b]ird extinction rates are predicted to be as high as 38 percent in Europe and 72 percent in northeastern Australia, if global warming exceeds 2°C above pre-industrial levels."83 Between now and 2050, Conservation International estimates one species will face extinction every twenty minutes; the current extinction rate is one thousand times faster than the average during Earth's history, 84 in part because the climate is changing more than 100 times faster than the rate at which many species can adapt.85 4. When Land Dries Out The warming trends toward the Earth's poles and higher latitudes are threatening people not just from melting ice and sea level rise, but also from the predicted thawing of permafrost of thirty to fifty percent by 2050, and as much or more of it by 2100.86 "The term permafrost refers to soil or rock that has been below 0°C (32°F) and frozen for at least two years."87 Permafrost underlies about twenty-five percent of the land area in the northern hemisphere, and is "estimated to hold 30 percent or more of all carbon stored in soils worldwide" —which equates to four times more than all the carbon humans have emitted in modern times.88 Given the increasing average air temperatures in Eastern Siberia, Alaska and northwestern Canada, thawing of the Northern permafrost would release massive amounts of carbon dioxide (doubling current atmospheric levels) and methane89 into the atmosphere. Indeed, there are about 1.7 trillion tons of carbon in northern soils (roughly twice the amount in the atmosphere), about eighty-eight percent of it in thawing permafrost.90 Permafrost thus may become an annual source of carbon equal to fifteen to thirty-five percent of today's annual human emissions.91 But like seagrass meadows and unlike power plant emissions, we cannot trap or prevent permafrost carbon emissions at the source. Similarly, forests, which "cover about 30 percent of the Earth's land surface and hold almost half of the world's terrestrial carbon…act both as a source of carbon emissions to the atmosphere when cut, burned, or otherwise degraded and as a sink when they grow…"92 A combination of droughts, fires, and spreading pests, though, are causing economic and environmental havoc:. "In 2003, [] forest fires in Europe, the United States, Australia, and Canada accounted for more global [carbon] emissions than any other source…"93 There have been significant increases in both the number of major wildfires and the area of forests burned in the U.S. and Canada.94 Fires fed by hot, dry weather have killed enormous stretches forest in Siberia and in the Amazon, "which recently suffered two 'once a century' droughts just five years apart".95 Climate change also is exacerbating the geographic spread and intensity of insect infestations. For example, in British Columbia "the mountain pine beetle extended its range north and has destroyed an area of soft-wood forest three times the size of Maryland, killing 411 million cubic feet of trees—double the annual take by all the loggers in Canada. Alaska has also lost up to three million acres of old growth forest to the pine beetle."96 Over the past fifteen years the spruce bark beetle extended its range into Alaska, where it has killed about 40 million trees, "more than any other insect in North America's recorded history".97 The drying and burning forests, and other increasingly dry landscapes, also are causing "flora and fauna"[to move] to higher latitudes or to higher altitudes in the mountains". 98 The human and environmental costs from failing to promptly reduce dependence on carbon-dioxide emitting sources for electricity, heating and transportation are dire and indisputable. Rather than being the leader among major countries in per capita GHG emissions, our country **urgently needs to lead the world** in cutting eighty percent our emissions by 2050, and using our renewable energy resources and technological advances **to help other** major emitting **countries do the same**. However, significantly increasing our use of carbon-free renewable sources to protect current and future generations of all species—human and non-human—**requires concrete changes in how our legal system regulates and permits renewable energy sources**. One of those sources with the potential for **significant energy production** and comparable elimination of fossil fueled greenhouse gases near major American and global population sources **is offshore wind**. II. THE OFFSHORE WIND POWER PERMITTING AND LEASING OBSTACLE COURSE A. Overview of Technology and Attributes As noted in the Introduction, offshore wind energy projects have the potential to generate large quantities of pollutant-free electricity near many of the world's major population centers, and thus to help reduce the ongoing and projected economic, health, and environmental damages from climate change.99 Wind speeds over water are stronger and more consistent than over land, and "have a gross potential generating capacity four times greater than the nation's present electric capacity."100 The net capacity factor101 for offshore turbines is greater than standard land-based turbines, and their blade-tip speeds are higher than their land-based counterparts.102 Offshore wind turbine substructure designs mainly fall into three depth categories: shallow (30 m or less), transitional (>30 m to 60 m), and deep water (>60 m).103 All of the grid-scale offshore wind farms in Europe have monopole foundations embedded into the seabed in water depths ranging from 5m to 30m; the proposed American projects such as Cape Wind in Massachusetts and Block Island in Rhode Island would likewise be shallow-water installations.

Offshore wind solves warming

Biello 12 – Associate editor @ Scientific American

(David, "The Sky Is the Limit for Wind Power," http://www.scientificamerican.com/article.cfm?id=no-limit-for-wind-power)//BB

Wind turbines on land and offshore could readily provide more than four times the power that the world as a whole currently uses. Throw in kites or robot aircraft generating electricity from sky-high winds and the world could physically extract roughly 100 times more power than presently employed—and the climatic consequences remain minimal.¶ Two new computer-model analyses suggest there are **few limits** to the wind's potential. Although "there are physical limits to the amount of power that can be harvested from winds, these limits are **well above** total global energy demand," explains climate-modeler Kate Marvel of Lawrence Livermore National Laboratory, who led the analysis published September 9 in **Nature Climate Change.** (Scientific American is part of Nature Publishing Group.) Current global demand is roughly 18 terawatts. (A terawatt is one trillion watts.)

Solves multiple warming causes

Rosenberg 8 – Professor of Law, Associate Dean for Academic Affairs, and Director, American Legal Systems (LLM) Graduate Program, William and Mary Law School

(Ronald, "Article: Making Renewable Energy a Reality--Finding Ways to Site Wind Power Facilities," 32 Wm. & Mary Envtl. L. & Pol'y Rev. 635)//BB

3.Total Elimination of Air Pollutants and Greenhouse Gas Emissions

Probably the strongest advantage of wind power is the absence of air pollution and greenhouse gas emissions. Thermoelectric fossil-fuel-fired plants generate the largest percentage of American electricity. 121 They are also the largest single CO_2 contributor, even exceeding contributions from all forms of transportation. 122 Wind power, by definition, does [661] not burn any fuel so it does not emit any air pollutants or greenhouse gases. This lack of air emissions is a permanent feature of a wind power facility. Conventional fossil fuel combustion also results in sulfur dioxide, nitrogen oxides, carbon monoxide, particulate matter, hydrocarbons, mercury and other emissions which are considered to be air pollutants of concern to the public's health and safety and regulated under clean air laws. 123 Additionally, the absence of carbon dioxide resulting from wind power contributes to the reduction of global warming gases. With the increased emphasis on the elimination of greenhouse gases, 124 the substitution of fossil-fuel- generated electricity with non-combustion-produced electricity will reduce the rate of growth of greenhouse gas emissions from America's electrical energy sector. As American climate change policy begins to embrace more rigorous greenhouse gas reduction goals, wind power could be viewed as a viable energy alternative to electricity generated from coal and natural gas.

OSW solves warming

Schroeder 10 - J.D. from University of California, Berkeley, School of Law

(Erica, 2010. And Masters in Environmental Management from Yale School of Forestry and Environmental Studies, "Turning Offshore Wind On", California Law Review)//BB

Many of the most compelling benefits of offshore wind are similar to those of onshore wind, though offshore wind has its own unique set of benefits. To start, wind power generation can help meet the growing energy demand in the United States. The U.S. Energy Information Administration predicts that the demand for electricity in the United States will grow to 5.8 billion MWh in 2030, a 39 percent increase from 2005.58 The more that wind power can help to meet this demand, the more diversified the United States' energy portfolio will be, and the less susceptible the nation will be to dependency on foreign fuel sources and to price fluctuations in traditional fuels.59 In addition, wind power benefits the United States by creating a substantial number of jobs for building and operating the domestic wind energy facilities.60 In an April 2009 speech at the Trinity Structural Towers Manufacturing Plant in Iowa, President Obama predicted that if the United States —fully pursues our potential for wind energy on land and offshore,‖ wind power could create 250,000 jobs by 2030.61 Once a wind project is built, it involves only **minimal environmental impacts** compared to traditional electricity generation. Wind power emits negligible amounts of traditional air pollutants, such as sulfur dioxide and particulate matter, as well as carbon dioxide and other greenhouse gases.62 Lower emissions of traditional air pollutants means fewer air quality-related illnesses locally and regionally.63 Lower **g**reen**h**ouse **g**as emissions will help to **combat climate change**, effects of which will be felt **locally** and **around the world**.64 According to the International Panel on Climate Change (IPCC), the effects of climate change will include melting snow, ice, and permafrost; significant effects on terrestrial, marine, and freshwater plant and animal species; forced changes to agricultural and forestry management; and adverse human health impacts, including increased heat-related mortality and infectious diseases.65 The U.S. Energy Information Administration estimates that the United States emits 6 billion metric tons of greenhouse gases annually, and it expects emissions to increase to 7.9 billion metric tons by 2030, with 40 percent of emissions coming from the electric power sector.66 Thus, if the United States can get more of its electricity from wind power, it will contribute less to climate change, and help to mitigate its negative impacts. Furthermore, wind power does not involve any of the additional environmental costs associated with nuclear power or fuel extraction for traditional electricity generation, such as coal mining and natural gas extraction.67 Wind power generation also does not require the water necessary to cool traditional coal, gas, and nuclear generation units.68Moreover, offshore wind power has certain attributes that give it added benefits compared to onshore wind. Wind tends to be stronger and more consistent offshore—both benefits when it comes to wind power generation.69 This is largely due to reduced wind shear and roughness on the open ocean.70 Wind shear and roughness refer to effects of the landscape surrounding turbines on the quality of wind and thus the amount of electricity produced.71 While long grass, trees, and buildings will slow wind down significantly, water is generally very smooth and has much less of an effect on wind speeds.72 In addition, because offshore wind projects face fewer barriers—both natural and manmade—to their expansion, offshore developers can take advantage of economies of scale and build larger wind farms that generate more electricity.73Importantly, offshore wind also could overcome the problems that onshore wind faces regarding the distance between wind power generation and electricity demand. That is, although the United States has considerable onshore wind resources in certain areas, mostly in the middle of the country, they are frequently distant from areas with high electricity demand, mostly on the coasts, resulting in transmission problems.74 By contrast, offshore resources are near coastal electricity demand centers.75 In fact, twenty-eight of the contiguous forty-eight states have coastal boundaries, and these same states use **78 percent** of the United States' electricity.76 Thus, offshore wind power generation can effectively serve major U.S. demand centers and avoid many of the transmission costs faced by remote onshore generation.77 If shallow water offshore potential (less than about 100 feet in depth) is met on the nation's coasts, twenty-six of the twenty-eight coastal states would have sufficient wind resources to meet at least 20 percent of their electricity needs, and many states would have enough to meet their **total electricity demand**.78

Economy/Competitiveness

1NC CP

CP Text: The United States Federal Government should limit marginal tax rate dependent tax preferences to 15%

CP solves the economy

Lim 13 Diane Lim is Chief Economists @ the Pew Charitable Trusts, "Proposal 7: Limiting Individual Income Tax Expenditures", February 2013, http://www.hamiltonproject.org/files/downloads_and_links/THP_15WaysFedBudget_Prop7_rev.pdf//OF

Our economy currently faces the dual challenges of persistent demand-side weakness in the short term, and inadequate public and private saving to grow the supply side of the economy over the longer term. Reducing the deficit by raising revenues through base-broadening strategies would be an effective fiscal policy plan to respond to both conditions. If we can raise revenue by broadening and leveling the tax base without having to raise marginal rates**, there unambiguously would be a net positive effect on supply-side economic growth,** from increased public saving (due to lower deficits), an improved allocation of resources (due to a more neutral tax treatment across sectors of the economy), and maintenance of incentives for private saving and labor supply (due to lower or constant marginal tax rates). By raising revenue primarily from higher-income households, there would be less potential damage to the near-term, demand-constrained economy, since high-income households are not as cash-constrained to begin with and hence are less likely to reduce consumption when their incomes fall. In fact, anticipation of near-term reductions in tax expenditures could stimulate those presently subsidized activities, because taxpayers would be encouraged to engage in those activities before effective tax rates on them are scheduled to rise. Reducing these individual tax expenditures primarily at the top also would help reverse the decades-long trend of rising income inequality and the more recent trend (since 2001) of tax policy exacerbating that inequality. By reducing overall tax expenditures, policymakers can minimize the extent to which they would have to increase marginal income tax rates to achieve a given level of deficit reduction. But if a base-broadening effort alone fails to raise adequate revenues to meet these fiscal targets, marginal tax rate increases may be necessary to make up the difference, and are justified provided that the economic benefits of the additional deficit reduction outweigh the economic costs resulting from the increased distortions on private incentives. Experience and research, in fact, suggests that the effects of marginal tax rates on private saving are small relative to the effects of aggregate revenue-level changes on public and national saving (Greenstone, Looney, and Samuels 2012, fact 9). A Policy Approach That Is Politically Feasible, Administratively Easy, and Design Flexible There may be economic arguments for reducing or eliminating some income tax expenditures more than others, but acrossthe-board approaches are probably more feasible than reducing particular tax expenditures, because lobbying pressures may be less prevalent when no one particular interest or industry is being singled out. On the other hand, across-the-board approaches certainly will not be easy unless there is significant public support for "mutual sacrifice" solutions. Many across-the-board approaches to trimming tax expenditures are easy to specify and implement and can be calibrated to different revenue goals and marginal tax rate specifications. Rate-increasing and base-broadening approaches can be viewed as both policy substitutes and complements in order to scale and fine-tune the combined tax policy changes to their various economic purposes and fiscal goals. The Proposal There are several different ways to reduce income tax expenditures across the board, which can be sorted into two categories: those that reduce the tax subsidies by affecting the size of the subsidies at the margin (a price-incentive effect), and those that reduce the subsidies primarily by capping or limiting the total value of the subsidies (an income effect). The following are three policy options that reduce the price subsidy effects of tax expenditures, thereby affecting the price incentive effects: 1. **Limit marginal-tax-rate-dependent tax preferences to one of the lower-bracket rates.** President Obama has proposed a limit of itemized deductions to the 28 percent rate in each of his past budgets; in 2012 he expanded the proposal to include some other tax expenditures such as the exclusion of employer-provided health benefits and the preferential tax rate on dividends. The Congressional Budget Office (CBO) estimated that this expanded version would raise $523 billion over ten years (CBO 2012). (The prior versions of the 28-percent limitation, which were limited to itemized deductions, were estimated to raise almost $300 billion over ten years.) The CBO has also described a proposal to further limit the rate on itemized deductions (but not other tax preferences) to 15 percent. **The CBO estimates this proposal would raise $1.2 trillion over ten years** (see CBO 2011, revenue option 7, pp. 151–152).1

2NC Solvency

The CP controls the largest internal link into economic growth and competitiveness

Baily and Slaughter 8 Martin N. Baily served as chairman of the Council of Economic Advisers during the second Clinton administration, from 1999 to 2001, and as one of three members of the council from 1994 to 1996. He was a Senior Fellow at the Peterson Institute for International Economics from 2001 until 2007. Matthew J. Slaughter is Associate Dean of the MBA Program and Professor of International Economics at the Tuck School of Business at Dartmouth. He is also currently a Research Associate at the National Bureau of Economic Research; a Senior Fellow at the Council on Foreign Relations; an academic advisor to the McKinsey Global Institute; and a member of the academic advisory board of the International Tax Policy Forum. "Strengthening U.S. Competitiveness in the Global Economy", December 2008, http://www.pegcc.org/wordpress/wp-content/uploads/pec_wp_strengthening_120908a.pdf//OF

What is the competitiveness cost to America from the two fiscal problems we have identified? Start with our constrained national discussion of fiscal policy. A government tax on any business or consumer activity tends to curtail it; accordingly, it is widely agreed that sound tax regimes are those with broad and transparent bases, where the breadth allows low rates (for some given target revenue) and the transparency fosters certainty for long-term decision-making by businesses and households. Largely because of the problems of our current national fiscal discussion, we are far from a sound regime. The President's Advisory Panel on Federal Tax Reform opened its bipartisan report with the following characterization. We have lost sight of the fact that the fundamental purpose of our tax system is to raise revenues to fund government … **The current tax system distorts the economic decisions of families and businesses, leading to an inefficient allocation of resources and hindering economic growth** … The **tax system is both unstable and unpredictable.** Frequent changes in the tax code, which often add to or undo previous policies, as well as the enactment of temporary provisions, result in uncertainty for businesses and families. This volatility is harmful to the economy and creates additional compliance costs.28 **The fiscal problem of looming unsustainable deficits threatens America's competitiveness by threatening long-run economic growth.** Large and growing fiscal deficits would draw on America's available pool of savings generated by American households, American companies, and (thanks to globalization) foreigners through the trade deficit. American companies also rely on these same savings to fund their productivity-enhancing capital investments in property, plant, equipment, R&D, and worker training. So larger budget deficits, if not perfectly offset by more savings, will tend to raise real interest rates (the price of savings) and thus reduce the capital investment of U.S. companies. This will mean slower growth in worker productivity and earnings. The exact timing of when rising fiscal deficits would curtail U.S. economic performance would depend a lot on how much foreign investors would be willing to continue supplying their savings to buy this expanding government debt. **If foreign-investor demand were to shift abruptly away from this debt, the resulting sharp depreciation of the U.S. dollar and spike in U.S. interest rates could bring sudden, severe drops in capital investment** (and overall recession as well)—along with higher price inflation and its related problems. How big might these economic impacts be? Very big. CBO calculations of its alternative fiscal scenario predict that expanding federal debt would reduce the total U.S. capital stock in 2040 by 25% compared with what it would be that year if the fiscal deficit did not rise from its 2007 level. By 2050 that reduction would grow to over 40%.

AT: Politics

The counterplan is bipartisan – corporate tax reform has unanimous support

HLSF 2013 Harvard Law School Forum, based off an article written by Lucas Goodman and Robert Pozen, lectures for the Harvard Business School, 1/10/2013, "Corporate Tax Reform", http://corpgov.law.harvard.edu/2013/01/10/corporate-tax-reform/

Amid the current debate over tax policy in Washington, **there is a bipartisan consensus on one issue: the corporate tax rate,** which is currently 35 percent, should be reduced to roughly 25 percent. At the same time, budgetary pressures preclude any significant increase in the deficit to accomplish corporate tax reform.¶ In light of these competing demands, most corporate tax reformers advocate broadening the corporate tax base to pay for any rate reduction. Unfortunately, few politicians have put forth base-broadening measures that would generate revenue sufficient to significantly lower the corporate tax rate on a revenue-neutral basis.¶ In fact, revenue-neutral corporate income tax reform is likely to be very difficult, because corporate tax expenditures represent a relatively small portion of total corporate tax revenues. A preliminary analysis by the Joint Committee on Taxation suggested that the elimination of all corporate tax expenditures—except for the deferral of tax on foreign source profits, a provision whose repeal would be politically and economically infeasible—would allow for the corporate tax rate to be reduced to only 28 percent.¶ Therefore, if policymakers want to reduce the corporate tax rate on a revenue-neutral basis, they will likely have to adopt other types of reforms to broaden the corporate tax base. Ideally, those reforms should offer the potential for significant revenue gains and reduce economic distortions.

Cyber Security

NEG

1NC

The United States Federal government should pass the National Cybersecurity Protection Advancement Act.

NCPAA solves for mistrust between the government and the private sector-avoids link to the terror DA

Anthony **Kimery, 15**, Editor-in-Chief @ Homeland Security today, "Bipartisan Cybersecurity Bill Overwhelmingly Passes House; Now its Up to Senate,"http://www.hstoday.us/single-article/bipartisan-cybersecurity-bill-overwhelmingly-passes-house-now-its-up-to-senate/4cc686c955fce8083b25be7da7fded7d.html

The main provisions of NCPA as reported by the Committee on Homeland Security will: •Authorizes a non-Federal entity (e.g. company) to, for a cybersecurity purpose voluntarily share information with DHS or another non-federal entity about cyber threats (cyber threat indicators) and measures to defend their networks against such cyber threats (defensive measures); (2) monitor their own networks for cyber threats; and (3) operate measures to defend their networks against cyber threats. •Requires both the non-federal entity and DHS to take "reasonable efforts to remove information that can be used to identify specific persons and is reasonably believed at the time of sharing to be unrelated to a cybersecurity risk or incident." •Confers liability protection against lawsuits to any non-federal entity that shares cyber threat indicators or defensive measures or conducts authorized monitoring on their networks when acting in accordance with the requirements of the Act, so long as the non-Federal entity did not engage in "willful misconduct." Additionally, it specifically immunizes non-federal entities for failing to act on information provided. •Establishes substantial oversight and reporting requirements for the DHS Chief Privacy Officer, DHS Chief Civil Rights and Civil Liberties Officer, DHS Inspector General and the Privacy and Civil Liberties Oversight Board. "American companies will have the tools they need to better protect their digital networks with this legislation," said House Committee on Homeland Security Chairman Michael McCaul (R-Texas) and Cybersecurity, Infrastructure Protection and Security Technologies Subcommittee Chairman John Ratcliffe (R-Texas) in a joint statement. The two lawmakers said, "We live in an ever-evolving threat environment where cyber attacks are personally affecting Americans, as well as our businesses and the government's ability to defend the United States. Removing the legal barriers for the voluntary sharing of cyber threats will help keep malicious nation states and cyber criminals out of our vital digital networks. This bipartisan, pro-privacy, pro-security bill has been three years and hundreds of stakeholder meetings in the making. I look forward to moving this landmark bill over to the Senate and getting it to the President's desk as quickly as possible." "I came to Washington to solve problems and make our country a safer place for all Americans. The National Cybersecurity Protection Advancement Act is a much needed bill that accomplishes both," Ratcliffe added, emphasizing that, "By passing this legislation, we are proactively protecting the national security of our country and the personal privacy of our citizens – both of which, under the status quo, remain vulnerable to malicious attacks from cyber adversaries ... Ultimately, it will arm those who protect our networks with valuable cyber threat indicators that they can use to fortify defenses against future cyber intrusions while protecting the personal information of Americans." "Today, the House joined with the President and stakeholders from across our critical infrastructure sectors to make our nation – and our cyberspace – more secure," said Rep. Bennie G. Thompson (D-Miss), ranking member pf the House Committee on Homeland Security.

AT: Can't solve Cybersecurity

NCPAA can solve cyberthreats and build trust between the public and private sphere.

Grant **Gross**, Apr 13, 20**15**, Washington, D.C., correspondent for IDG News Service, "New cyberthreat information sharing bill may be more friendly to privacy," http://www.pcworld.com/article/2909432/new-cyberthreat-information-sharing-bill-may-be-more-friendly-to-privacy.html

A new bill designed to encourage businesses and government agencies to share information about cyberthreats with each other may go farther toward protecting the privacy of Internet users than other recent legislation in the U.S. Congress. The National Cybersecurity Protection Advancement NCPA Act, introduced Monday in the House of Representatives by two Texas Republicans, appears to do a "much better job" at protecting privacy than two bills that have passed through the House and Senate Intelligence Committees, said Robyn Greene, policy counsel at the New America Foundation's Open Technology Institute. The bill differs from the House Intelligence Committee's Protecting Cyber Networks Act [PCNA] and the Senate Intelligence Committee's Cybersecurity Information Sharing Act [CISA] in that it doesn't allow government agencies to share cyberthreat information they've received from private companies with law enforcement for purposes unrelated to cybersecurity, Greene said by email. The new House bill "doesn't verge on cybersurveillance by letting law enforcement use information that it would receive in investigations and prosecutions that have nothing to do with cybersecurity," She added. "The government would only be allowed to use the information for cybersecurity purposes." Still, the NCPA raises some concerns, Greene said. It would allow companies to share some "unnecessary" personal information with government agencies, and it authorizes companies to deploy defensive measures that could harm "innocent" network users who aren't cyberattackers, she said. Privacy advocates have opposed several cyberthreat information sharing bills in recent years over fears that those bills would allow companies to share nearly unlimited information about their users with government agencies. Some of the bills allow agencies such as the Department of Homeland Security to pass that information on to law enforcement agencies such as the FBI for criminal investigations unrelated to cyberthreats. The NCPA was introduced by Representative Michael McCaul, chairman of the House Homeland Security Committee, and Representative John Ratcliffe, chairman of the committee's cybersecurity subcommittee. Congress must take action to defend U.S. networks, they said in a joint statement. "Cybercriminals, hacktivists and nation states will never stop targeting Americans' private information and American companies' and government networks to damage, disturb and steal intellectual property and U.S. Government secrets," they said. Like other cyberthreat information sharing bills, it would shield companies that share information with the government from user lawsuits. Companies sharing information are required to take "reasonable efforts" to avoid disclosing personal information. The bill's lawsuit protections don't apply when a company has engaged in "willful misconduct' while sharing information, according to the bill text.

NCPAA bolsters cybersecurity

Barbara Vergetis **Lundin, 15**, the Editor of FierceMarkets' Energy Group, encompassing FierceEnergy and FierceSmartGrid. Barb has spent the better part of two decades covering the energy industry - first as Editor of Trade Press Publishing's Energy Decisions magazine, then as Web Editor and Analyst for Financial Times Energy's Energy Insight, and most recently as a contributor to various print and online energy industry publications, "Cybersecurity act to encourage threat information sharing with government," http://www.smartgridnews.com/story/cybersecurity-act-encourage-threat-information-sharing-government/2015-04-14

Specifically, the NCPA Act bolsters cybersecurity by: Providing liability protections to companies for the voluntary sharing of cyber threat indicators and defensive measures with the Department of Homeland Security's (DHS) National Cybersecurity and Communications Integration Center (NCCIC) or with other private entities. • Granting liability protections for private companies to conduct network awareness of their own information systems. • Allowing companies to operate defensive measures and conduct network awareness on information systems they own or operate. • Preserving existing public-private partnerships to ensure ongoing collaboration on cybersecurity.

AT: Companies Hate Surveillance

Companies like NCPAA- helps boost income and maintain consumer trust

Dylan Sachs, 7/25, contributor to Business 2 Community, "Minimizing Online Cyber Threats — Beyond the Headline Attacks," http://www.business2community.com/tech-gadgets/minimizing-online-cyber-threats-beyond-the-headline-attacks-01280607#kPfepmbpBIloPsmy.99

Whether or not a business is willing to share its information with the government to potentially help curb large data breaches, these smaller threats will remain a serious threat. If left unchecked, something as simple as a phishing e-mail could have long-lasting ramifications for the brand and its business. That is why implementing a wider, more encompassing security strategy that might include a holistic monitoring approach, could potentially help businesses. By taking the information they already have access to and then identifying risks across multiple online domains, businesses will be able to safeguard companies and citizens alike. And in the end, companies will be able to ensure a better business model with proactive threat monitoring, a more solid brand reputation and a safer consumer community.

AT: Destroys Privacy Rights

NCPAA boosts consumer privacy with multiple safeguards.

Barbara Vergetis **Lundin, 15**, the Editor of FierceMarkets' Energy Group, encompassing FierceEnergy and FierceSmartGrid. Barb has spent the better part of two decades covering the energy industry - first as Editor of Trade Press Publishing's Energy Decisions magazine, then as Web Editor and Analyst for Financial Times Energy's Energy Insight, and most recently as a contributor to various print and online energy industry publications, "Cybersecurity act to encourage threat information sharing with government," http://www.smartgridnews.com/story/cybersecurity-act-encourage-threat-information-sharing-government/2015-04-14

The NCPA Act protects consumer privacy by: • Designating the NCCIC as the lead civilian 'portal' for voluntary cyber threat information sharing. • Enhancing DHS's Privacy Office to ensure the NCCIC complies with all civilian laws that protect Americans' privacy and civil liberties. • Requiring private companies to 'scrub' and remove personal information unrelated to the cybersecurity risk before sharing with the NCCIC or other private entities. • Instructing the NCCIC to conduct a second 'scrub' and destroy any personal information that is unrelated to the cybersecurity risk before further sharing with other government entities or private entities. • Ensuring that cyber threat information is used solely to prevent and respond to cyberattacks and enhance the nation's cyber defenses. It cannot be used for any law enforcement or surveillance purposes.

NCPAA limits scope of info to ensure privacy rights are being upheld

Robyn Greene, 15, policy counsel for the Open Technology Institute at New America Foundation specializing in issues concerning surveillance and cybersecurity, "Flawed, The Homeland Security Committee's Cybersecurity Bill Protects Privacy Better Than Other Information Sharing Bills," https://www.newamerica.org/oti/though-flawed-the-homeland-security-committees-cybersecurity-bill-protects-privacy-better-than-other-information-sharing-bills/

Under the NCPAA, companies would be authorized to share so-called "cyber threat indicators" with the government. Compared to the PCNA, the NCPAA would do a better job of protecting personal information from being shared with the government by more narrowly defining the term "cyber threat indicators" and thereby more narrowly limiting the scope of information to be disclosed. Once the government receives information under the NCPAA, it would be permitted to use it only for cybersecurity purposes. Unlike under PCNA, law enforcement agencies could not use the information to investigate crimes that have nothing to do with cybersecurity. This limitation is critically important to ensuring that this cybersecurity bill doesn't become a backdoor for general-purpose cyber-surveillance. The NCPAA is also an upgrade over the PCNA because it effectively cements civilian control over domestic cybersecurity. It does not include a requirement that DHS automatically disseminate all of the information it receives to the National Security Agency (NSA). The PCNA fails to protect privacy on all of these counts, and this week, OTI joined a coalition of 55 civil society groups, security experts, and academics in a letter voicing our strong opposition. First, its definition for cyber threat indicator is broader than the definition in the NCPAA, so companies would be able to share more personal information with the government. Even worse, the PCNA would authorize the government to use any of the information it receives to prevent, investigate, and prosecute a vast array of crimes the have nothing to do with cybersecurity. Those crimes range the gamut from terrorism to carjacking and arson to garden-variety violent crimes. These excessive use authorizations not only seriously threaten Americans' privacy, they also make the PCNA as much a cyber-surveillance bill as it is a cybersecurity bill. Finally, the PCNA would undermine civilian control of cybersecurity information sharing because it would require the government to automatically disseminate to the NSA every indicator companies share with it. This would vastly increase the NSA's access to Americans' personal information.

AT: Unpopular Among Privacy Advocates

Privacy protections of the bill would make it popular among privacy rights groups

Cory Bennett, 15, cybersecurity journalist for the Hill, "House panel releases bill on cyber threat data-sharing," http://thehill.com/policy/cybersecurity/236497-house-homeland-security-panel-releases-major-cyber-bill

Committee Chairman Michael McCaul (R-Texas) had said earlier this week that the measure, named the National Cybersecurity Protection Advancement Act, was on the brink of release. Cybersecurity information sharing has been a top legislative priority this year for lawmakers, industry groups and government officials. The public and private sectors must share more cyber threat data, they argue, if either wants to stop the glut of cyberattacks that have hammered major companies and government agencies. McCaul's bill did not contain any major surprises. It names the DHS as the "primary interface" in the public-private cyber threat data exchange. It does leave the door open for companies to share with other agencies such as the Treasury Department or National Security Agency, although would not explicitly authorize that sharing. The measure also allows for sharing among agencies within the government. The privacy language has been strengthened throughout from previous iterations of a similar bill, according to Alex Manning, staff director of the House Homeland Security subcommittee on cybersecurity last Congress. "The text made a more concerted effort to appease some of the privacy advocates," said Manning, currently senior government relations director with Arent Fox. There's a greater focus on the role the DHS privacy office will play, with specific guidelines for how it should monitor and file oversight reports on the data sharing program, Manning explained. The bill also bolstered the language requiring companies to strip personal information from their data before sharing it with the government. The DHS is already required to do a scrub of sensitive information in the cyber data it receives. If DHS officials notice a certain company is repeatedly failing to redact personal information, McCaul's bill would allow the department to terminate the company's ability to share with the agency. The alterations will likely appeal to numerous privacy groups. The ACLU already supported a version of the bill last year.

NCPAA key to safeguard privacy and maintain private sector relationships

Ratcliffe, 15, Subcommittee Chairman, "Committee Moves Bill to Improve Cybersecurity, Protect Americans' Privacy: Bill Includes Liability and Privacy Protections for Voluntary Info-Sharing on Cyber Threats," https://homeland.house.gov/press-release/committee-moves-bill-improve-cybersecurity-protect-americans-privacy

Subcommittee Chairman Ratcliffe said: "I'm grateful that this legislation was unanimously passed by the Homeland Security Committee. Securing Americans' privacy and the integrity of their personal information is precisely why Congress must act. The National Cybersecurity Protection Advancement (NCPA) Act will enhance the capabilities and relationships that the private sector has worked so hard to develop, while establishing procedures to safeguard personal privacy. If the private sector does not have access to timely cyber threat indicators – the tools, tactics, and techniques of other attempted intrusions – we are putting our homeland in grave danger. The time is now for legislation like the NCPA Act that protects personal information from cyber intrusions, prevents widespread disruption to vital sectors of our economy, and safeguards our homeland from ongoing cyber threats."

NCPAA has multiple protections to privacy-laundry list

David **Inserra** and Riley **Walters, 15**, Policy Analyst, Homeland Security and Cybersecurity, Research Assistant, "House Cyber Information Sharing Bills: Right Approach but Require Fixes,"

http://www.heritage.org/research/reports/2015/04/house-cyber-information-sharing-bills-right-approach-but-require-fixes

When it comes to cyber information sharing, the types of information that are being shared include the coding of a virus, the route an attacker used, or a hole in security. However, there may be some personal information attached that is not relevant to dealing with cyber threats, indicators, defensive measures, or risks. While security professionals have no interest in this information, there is a trade-off between removing all unnecessary information and sharing information in a timely manner.[5] Both bills require that "reasonable" measures be taken to remove any personal information that is unrelated to a cyber risk or incident before sharing with the federal government or other non-federal entities.[6] The PCNA also provides non-federal entities the ability to take reasonable efforts to "implement a technical capability configured to remove any [personal] information." This technical capability is a possible nod toward the Structured Threat Information eXpression (STIX) standardized language and mechanisms for sharing information that enable sharers to limit what proprietary or private information is shared without slowing information sharing.[7] The PCNA and the NCPAA also establish a series of other privacy guidelines and reports. The PCNA charges the Attorney General, the Privacy and Civil Liberties Oversight Board (PCLOB), the Director of National Intelligence (DNI), and inspectors general (IGs) with this responsibility while the NCPAA charges the Department of Homeland Security (DHS) Under Secretary for Cybersecurity and Infrastructure Protection, the DHS Chief Privacy Officer, IGs, and the PCLOB.[8] While some reports on privacy are certainly important and necessary, both bills seem to create too many reporting requirements and should be streamlined to ensure that duplicative tasks are not being asked of multiple privacy and oversight organizations. Both bills also include provisions that properly punish government workers who wrongfully use information, limit the use and retention of information containing personal data, and notify private-sector sharers when they are sharing information improperly.

Plan guarantees protection of privacy

Daniel **Farris**, Lindsay **Kessler, 15**, co-chairs Polsinelli's Data Center & Infrastructure and Data Privacy & Security teams, "House Passes the National Cybersecurity Protection Advancement Act,"

http://www.jdsupra.com/legalnews/house-passes-the-national-cybersecurity-69958/

The NCPAA grants companies protection against liability for sharing data with the Department of Homeland Security ("DHS") by amending the Homeland Security Act of 2002 to encourage voluntary information sharing about cyber threats, with liability protections, between and among the private sector and Federal government. Without these liability protections, companies sharing data pursuant to the PCNA could expose themselves to class actions or increased regulatory enforcement actions. Responding to privacy concerns, the NCPPA also includes numerous provisions to ensure the protection of the privacy of American citizens and ensure that shared cyber threat information is solely used for cybersecurity purposes. Specifically, the NCPAA allows the DHS's national cybersecurity and communications integration center ("NCCIC") to include tribal governments, information sharing and analysis centers, and private entities among its non-federal representatives. The Act also expands the NCCIC's functions to include global cybersecurity with international partners; requires federal and non-federal entities to take reasonable efforts to remove and safeguard information that can be used to identify specific persons and that is unrelated to cybersecurity risks or incidents prior to sharing; prohibits federal entities from using shared indicators or defense measures to engage in surveillance or other collection activities for the purpose of tracking an individual's personally

identifiable information and bars the usage of such information for regulatory purposes; establishes a private cause of action for a person to bring against the federal government if a federal agency intentionally or willfully violates restrictions on the use and protection of voluntarily shared indicators or defense measures; and exempts from antitrust laws non-federal entities that, for cybersecurity purposes, share certain indicators, measures or assistance in accordance with the NCPAA.

AT: Pass later

Need to solve cyber security now- risk is larger everyday

Erin **Kelly,15**, Reporter for USA Today, covering privacy issues, cybersecurity, “House passes bipartisan cybersecurity information-sharing bill,”
http://www.usatoday.com/story/news/politics/2015/04/22/cybersecurity-information-sharing-bill-house-vote/26188355/

It was the first action in the new Congress in response to recent high-profile cyber attacks that have included Sony Pictures, Home Depot, JPMorgan Chase, Target, Anthem health insurance, the State Department and the White House. Lawmakers voted 307-116 to approve the Protecting Cyber Networks Act, which was passed last month by the House Permanent Select Committee on Intelligence. "The increasing pace and scope of cyber attacks cannot be ignored," said Rep. Devin Nunes, R-Calif., chairman of the intelligence committee. "This bill will strengthen our digital defenses so that American consumers and businesses will not be put at the mercy of malevolent cyber thieves." Although the Obama administration has not endorsed any specific bill, President Obama has called on Congress to pass strong cybersecurity information-sharing legislation, and lawmakers have been moving quickly to do that. "Every day we delay, more privacy is stolen, more jobs are lost, and more economic harm is done," said California Rep. Adam Schiff, the senior Democrat on the intelligence panel. "Let's stop sitting by and watching all of this happen. Let's do something."

AT: Links to politics

CP is bipartisan

McCalley 4/14 Sean McCalley (quoting members of Congress) is a reporter for Federal News Radio, "Bipartisan cybersecurity bill expands information sharing network", 4/14/15, http://federalnewsradio.com/congress/2015/04/bipartisan-cybersecurity-bill-expands-information-sharing-network//OF

To do that, the NCPA Act would offer liability protections for private sector businesses from lawsuits in the event they share personal information about customers. The bill also outlines privacy protocols to protect the rights of citizens who interact with those companies. Rep. Michael McCaul (R-Texas), the committee chairman, introduced the bill yesterday. The NCPA Act would protect companies that report data to the National Cybersecurity and Communications Integration Center (NCCIC) at the Homeland Security Department. It extends protections for information sharing with other private organizations, too. In exchange for liability protections, businesses and federal agencies must follow specific parameters in the bill to protect the privacy of the data. Both Republicans and Democrats on the committee expressed strong support for the bill, which Rep, Bennie Thompson (D-Miss.), the ranking member, called the product of "months of bipartisan stakeholder outreach and collaboration, [and] the bill has strong privacy and civil liberties protections." The markup included a range of amendments that McCaul characterized as "largely bipartisan," with many passing without controversy. Those led to some changes that added more responsibilities for some federal agencies and expanded the network responsible for collaborating on the data supplied by the private sector.

cp – solvency advocates

Act solves- creates educational opportunities to encourage women, minorities, and low incomed communities to pursue a higher level STEM education

Christina Wallace and Nathalie Molina Nino, 15, Christina Wallace is the Founding Director of BridgeUp: STEM at the American Museum of Natural History. Nathalie Molina Nino is the co-Founder of Entrepreneurs@Athena at Barnard College and the Chief Revenue Officer of PowerToFly, "How to Get More Girls Involved in STEM," http://time.com/3835310/girls-stem-school/

Creating STEM programming that engages girls earlier in their elementary and secondary-school education will help shift the classroom dynamic away from one that is majority boys and thus more welcoming to girls. Supporting interdisciplinary STEM projects—such as using computer programming in a science class to process or visualize a data set—will give students a better understanding of how these subjects are used in real life. Fostering career exploration activities will give some transparency to and highlight role models in careers that have high opportunity but are often less familiar to students. U.S. Senator Kirsten Gillibrand's STEM Gateways Act would provide federal grants for programs in elementary school, middle school, and high school that would help create educational opportunities in STEM fields for girls, minorities, and children from all economic backgrounds. The STEM Gateways Act includes after-school opportunities, and supports career exploration and workforce training for high school students. Right now, just a fifth of the federal dollars that are spent on STEM training goes toward funding training below an undergraduate degree. Yet, according to the 2013 Brookings report, "The Hidden STEM Economy," as many as half of all STEM jobs are available without a four-year college degree. By supporting STEM career exploration and training during high school, students can make informed decisions about their next steps. The Gillibrand bill isn't a panacea—it doesn't address the "leakiness" of the pipeline into STEM, where women and minorities drop out due to harassment or an unwelcoming environment—but it addresses the beginning of the pipeline and encourages more girls, minorities, and under-resourced youth to start down the path of choosing STEM careers. It is an investment in a future where more girls like Jordyn are given opportunities that could change their lives. The girls and young women of America deserve this. And so does our future workforce.

STEM Gateways Act improves US economic development- minorities and women are key to STEM future

Madeline **Hren, 15**, PR/Communications Intern at HQ Raleigh, "Rep. Kennedy and Latino STEM Alliance push for equal access to job training education ," http://dailyfreepress.com/2015/02/27/congressman-kennedy-and-latino-stem-alliance-push-for-equal-access-to-job-training-education/

Marta Montleon, superintendent of Diman Regional Vocational Technical High School in Fall River, was also present at the roundtable and argued that although the push for more STEM education is relatively new, the need to address this issue has been imperative for a long time. "So much of what we need for economic and job development, and just to move our country forward, is related to students and young people having a good foundation in STEM," Montleon said. "If the population predictions are correct, many of our states are going to be minority-majority populations, and if we don't do a better job of encouraging those populations into our high-demand careers, we will not have enough young people who are qualified and educated and trained for those careers going forward." The

STEM Gateways Act, which Kennedy reintroduced this month, would provide federal funding through the U.S. Department of Education to help schools implement STEM curricula in the classroom, with a special focus on reaching underrepresented groups in the field, the release stated. The Act would also implement partnerships between elementary schools and community colleges, non-profits and other organizations for after-school learning, tutoring and mentoring, and summer programs, the release stated. Several residents said the lack of female presence in STEM fields can be attributed to societal norms, but it's not necessarily a well-known problem. Jude Deeney, 56, of Brighton, said pressures from society have prevented minority groups from becoming involved in the STEM fields. "There seems to have been a trend where women are discouraged from entering into those fields, so any sort of push to increase their participation would be great," Deeney said.

STEM Gateways Act increases US STEM competitiveness- increases domestic opportunities for minorities and women

Triangle Coalition for STEM education, 13, "STEM Gateways Act Introduced to Promote STEM among Underserved Groups," http://www.trianglecoalition.org/stem-gateways-act-introduced-to-promote-stem-among-underserved-groups,

On Tuesday, Senator Kristen Gillibrand (D-NY) and Congressman Joe Kennedy (D-MA) introduced a new STEM education bill to promote and encourage opportunities specifically for underrepresented groups. The STEM Gateways Act (S. 1796, H.R. 3690), co-sponsored by Congressman Mike Honda (D-CA), would provide competitive grants through the Department of Education for elementary and secondary schools and community partners to implement rigorous STEM education programs serving women, minorities and economically disadvantaged students. Funds could be used to support both formal and informal STEM learning and other education activities including teacher professional development, career preparation, mentoring, and internships. Programs would have to support one or more of the following goals: Encourage interest in the STEM fields at the elementary school or secondary school levels. Motivate engagement in STEM fields by providing relevant hands-on learning opportunities at the elementary school and secondary school levels. Support classroom success in STEM disciplines at the elementary school or secondary school levels. Support workforce training and career preparation in STEM fields at the secondary school level. Improve access to career and continuing education opportunities in STEM fields at the secondary school level "New York is home to the greatest colleges and universities, and the world's most innovative minds," said Sen. Gillibrand. "But if we're going to compete and win in the global economy, we must prepare our students with the education they need for the jobs of the future. That starts with getting more talented young women, minorities, and students in high-need communities into the STEM pipeline. We are relying on our children today to be the innovators of tomorrow. It's our job to make sure they are prepared."

cp – women = gr8

There are plenty of STEM women – it's just a question inclusion

Reyes 12 – founder of the Frida Kahlo Institute for Women at the Borderlands (Maria-Elena, "Increasing Diversity in STEM by Attracting Community College Women of Color," 2012, https://www.engr.psu.edu/AWE/ARPAbstracts/CommunityCollege/ARP_WomenofColorCommunityCollege_Literature%20Overview.pdf)

Rationale for Diversifying the STEM Talent Pool

Nelson and Brammer (2007) argue that the United States needs to shift away from the old patterns of importing international students and recruit U.S. students into STEM. While international scientists and engineers might address the critical need to replace retiring U.S. STEM professionals, Nelson and Brammer say that international students will "not fulfill the need for scientists and engineers who will transfer U.S. values, culture, and interests while developing solutions critical to national, international and global crises" (p. 3).

Women, who make up 51% of the U.S. population (U.S. Census Bureau, 2010) and are attending higher education institutions in record numbers, present a ready group of recruits from which to increase the number of U.S.-born engineers and scientists. A focus on recruiting and training women of color also **would diversify the U.S. STEM pool.** The motivation to transfer U.S. values, culture, and interests into solutions is embedded in the expressed desires of women and other underrepresented individuals to work on projects that are environmentally and socially conscious and benefit their own communities (Aronson, Reyes, & Goldberg, 2003; Seymour & Hewitt, 1997), and many individuals in underrepresented groups leave STEM because they believe that the fields have no social relevance (Bonous-Hammarth, 2000; Carter & Hurtado, 2007).

Women = gr8 for STEM

Adkins 12 – senior vice president of IBM's Systems & Technology Group, a National Academy of Engineering inductee, and serves on the national board of the Smithsonian Institution (July 2012, Rodney C., "America Desperately Needs More STEM Students. Here's How to Get Them," http://www.forbes.com/sites/forbesleadershipforum/2012/07/09/america-desperately-needs-more-stem-students-heres-how-to-get-them/)

Second, we need to improve the composition of the STEM education pipeline to include more women and underrepresented minorities. Although women fill close to half of all jobs in the U.S., they hold less than 25% of STEM-related jobs. At the same time, 43% of school-age children today are of African American, Latino, or Native American descent. Yet of all the engineering bachelor's degrees in the U.S., less than 15% are awarded to underrepresented minorities. We need to reconcile these opposing trends so that the composition of our STEM education pipeline reflects America's shifting demographics.

On the national level, Congress and the administration have shown an interest in the issue, pursing legislation and enacting programs to help expand the number of underrepresented minority students studying STEM in college. National nonprofit organizations, like the National Action Council for Minorities in Engineering, also play an important role, by supplying Congress with research and policy analysis, in addition to providing scholarships directly to students.

As we look to the future, improving the size and the composition of the STEM education pipeline will strengthen our country's global competitiveness and unleash new innovations that will propel society forward. Yes, STEM-related education can be challenging at times, but it can also be inspiring. Let's encourage the next generation to study STEM by

teaching them that the technology that surrounds their daily lives is not just for their consumption, it is for them to create and build upon. It will be their innovations that eradicate disease, improve the environment, and power a brighter future.

Women are necessary in STEM

Del Giudice 14 - a national-award-winning journalist and Pulitzer Prize nominee (November 2014, Marguerite, “Why It's Crucial to Get More Women Into Science,” 11/08/14, http://news.nationalgeographic.com/news/2014/11/141107-gender-studies-women-scientific-research-feminist/)

The Power of Collaboration

Including gender in research could attract more women to science as well, Schiebinger says, because careers and avenues of research suddenly can become relevant to women.

She says that as more women get involved in the sciences—or any field historically dominated by men—the general knowledge in that field tends to expand.

"There are lots of places where you can show the direct link between increase in number of women and outcome in knowledge," she says. "History, primatology, biology, medicine."

It's an idea that dovetails with a major shift that has taken place in how scientific inquiry is being carried out by research teams.

Involving more qualified women, as well as additional "social identities"—gay people, African Americans and Latinos, those with physical disabilities, and others—can enrich the creativity and insight of research projects and increase the chances for true innovation, says Scott Page, a professor at the University of Michigan who studies diversity in complex systems.

In this sense, the corporate world is evolving more quickly than the science world.

According to the Atlantic Monthly magazine's cover story in May, "Half a dozen global studies, conducted by the likes of Goldman Sachs and Columbia University, have found that companies employing women in large numbers outperform their competitors on every measure of profitability."

"You need them at leadership positions," he says, "directing the field."

cp – nb

STEM has become a predominately male environment, relegating women to the outskirts

Settles 14 - associate professor in the department of psychology at Michigan State University, a core faculty affiliate of MSU's Center for Multicultural Psychology Research and MSU's Center for Gender in Global Context, d PhD in personality from the University of Michigan (October 2014, Isis H., "Women in STEM: Challenges and determinants of success and well-being," http://www.apa.org/science/about/psa/2014/10/women-stem.aspx)

The STEM Environment

Numerical underrepresentation and negative stereotypes contribute to negative environments for women in STEM. Negative gender-based experiences, such as sexual harassment, are more likely to occur in male-dominated settings like the sciences (e.g., Antecol & Cobb-Clark, 2001; Willness, Steel, & Lee, 2007) and men are far more likely to direct sex-based mistreatment toward women in male-dominated careers (e.g., science) as a means of penalizing them for violating gender-role norms and stereotypes (Dovidio, Major, & Crocker, 2000). Further, Kanter's (1977) classic theory of proportional representation suggests that women who are a numerical minority in an organizational settings ("tokens") will experience additional stressors. Specifically, women may experience greater performance pressure because they are highly visible as tokens and are expected to represent "women" as a group. Women may also experience social isolation because they are seen as outsiders by men in the organization. Finally, perceptions of individual women are filtered through stereotypes about their gender. For example, compared to men, women are stereotyped as less intelligent and less competent in mathematics and science (Lane, Goh, & Driver-Linn, 2012; Shih, Pittinsky, & Ambady, 1999). Moreover, the cultural stereotype of the scientist as objective, rational, and single-minded is consistent with prescribed norms for men, but counter to stereotypes and prescribed norms for women (Barbercheck, 2001; Diekman & Steinberg, 2013; Fiske, Cuddy, Glick & Xu, 2002). Together, these factors contribute to a "chilly" climate for women in STEM, with multiple challenges that contribute to their low numbers at every level.

Structural and Interpersonal Challenges

cp – answers

There are already enough women in STEM

Rosser and Taylor 9 - a scholar who has focused on attracting and retaining women in science, professor who specializes in international relations, political economy, and comparative politics (Sue and Mark Zachary, "Why Are We Still Worried about Women in Science?" May-June 2009, http://www.aaup.org/article/why-are-we-still-worried-about-women-science)

Hidden Trends

Over the past three decades, the overall percentage of women receiving degrees in science, technology, engineering, and mathematics—known collectively as the STEM disciplines—**has increased dramatically**. This growth tends to mask at least three other aspects of the demographics of the science and technology workforce.

To start, it masks a decrease over recent decades in white U.S. men, the traditional group from which this country has drawn its STEM workforce. In the United States, women now earn more bachelor's and master's degrees than men (see table 1). The National Science Foundation (NSF) reported in 2007 in Women, Minorities, and Persons with Disabilities in Science in Engineering that in 2004, women earned 57.6 percent of the bachelor's degrees in all fields and 59.1 percent of all master's degrees. Beginning in 2000, women also earned more of the bachelor's degrees in science and engineering, although they earned only 43.6 percent of the master's degrees in those fields. In 2004, women earned 60 percent of the PhDs in fields other than science and engineering, but only 44 percent of the PhDs in science and engineering received by U.S. citizens and permanent residents.

Border Security CP

1NC Border Security CP

The United States federal government should immediately and fully implement the SAFE Port Act of 2006.

Full implementation of the SAFE Port Act of 2006 delayed till 2016 – better mandates and reinforcement needed now

Homeland Security News Wire 14 – [Homeland Security News Wire, "100% scanning of U.S.-bound cargo containers delayed until 2016", Homeland Security News Wire, 8/1, http://www.homelandsecuritynewswire.com/dr20140801-100-scanning-of-u-s-bound-cargo-containers-delayed-until-2016]

DHS has delayed until 2016 the implementation of key sections of the SAFE Port Act of 2006, which requires that 100 percent of U.S.-bound ocean containers be scanned at the foreign port of origin. U.S. importers welcome the news of the delay, but they urge Congress to eliminate the scanning requirement altogether. "We fully support your waiver," wrote industry groups, including those representing freight forwarders and customs brokers, in their recent letter to DHS chief Jeh Johnson. "However, instead of going through this exercise every two years, we urge you and the Administration to recommend to the Congress that the statutory 100% container scanning requirement be repealed," they wrote.¶ The mandate fails to make clear how DHS defines the word "scanned." Does the department simply want an image of a container before it ships, or must authorities analyze the image and then decide if further inspection is needed? What are the standards for a qualified scan, and who would pay for purchasing, operating, and maintaining the scanning equipment? How will DHS coordinate the scans with foreign port officials? How would the United States react if a foreign government later insisted that containers arriving from the United Sates be scanned before shipping?¶ "We can't just do this as a U.S.-only solution. It has to work for the rest of the world, and our trading partners have pointed this out," said Jonathan Gold, vice president of supply chain and customs policy with the National Retail Federation. For one thing, "the technology just is not there," said Gold. Forbes reports that DHS expects to conclude a review of the scanning technology by the end of 2014; but even with the technology present, the original legislation mandating the scans failed to identify who would cover the cost of the program.

2NC Solves – Economy

US needs to strengthen Port Security and infrastructure– billions of dollars are lost annually

Walters 15 – [Riley Walters, Research Assistant at Douglas and Sarah Allison Center for Foreign and National Security Policy, "The U.S. Needs to Secure Maritime Ports by Securing Network Ports", The Heritage Foundation, 2/23, http://www.heritage.org/research/reports/2015/02/the-us-needs-to-secure-maritime-ports-by-securing-network-ports]

Maritime connectedness continues to be a key asset for U.S. economic and strategic interests. Threats to port and vessel network systems have long been overshadowed by concerns about kinetic attacks and supply-chain security. All maritime stakeholders remain at risk of cyber intrusion as cyber attackers seek any and all means of accessing maritime networks. Therefore, key measures need to be in place to evolve symbiotically as new threats emerge.¶ The U.S. Department of Homeland Security (DHS) and maritime stakeholders need to stay ahead of these risks in order to keep trade flow maximized, while avoiding the creation of regulations that may slow trade and hinder business.¶ Risks for Port Cybersecurity¶ For all U.S. industries, cybersecurity costs are growing.[1] Cyber attacks on port systems can have a variety of negative effects. The economic losses from port delays or closure can vary in severity. One port's failure negatively affects all connecting regional ports. In 2002, the 11-day closure of 29 ports on the West Coast cost an estimated $11 billion. Northeast ports lost an estimated $50 billion—$1 billion in cargo delays alone—because of Hurricane Sandy in 2012.[2] As labor disputes that began in October 2014 continue in West Coast ports, trade partners in Asia are feeling the effects of undelivered goods.[3]¶ With port and vessel network systems implementing new technology, stakeholders are moving away from traditional stand-alone systems, and maritime industrial control systems (ICS) are becoming more integrated. While new systems help to streamline production and increase the flow of trade, the number of vulnerabilities in network systems is also increasing. Cyber threat actors continue to find new ways of accessing network systems, through traditional land-line connections, new or pre-existing Wi-Fi ports, and USB-introduced threats, such as installing malware (Stuxnet) or extracting information (Edward Snowden). Vulnerabilities in smaller systems can be exploited to gain access to larger networks—a time-consuming type of attack for the everyday hacktivist, but a credible investment for drug smugglers and nation-state sympathizers.¶ In September 2014, the Senate Committee on Armed Services reported that Chinese hackers were behind the successful advanced persistent threat (APT) attacks on contractors in U.S. Transportation Command (TRANSCOM), dating as far back as 2008.[4] The military relies on these commercial vessels for strategic and humanitarian contingencies, transporting 95 percent of U.S. Forces' dry cargo annually.[5] According to the report, Chinese military compromised "multiple systems" on a commercial ship contracted by TRANSCOM for logistics routes. Between June 2012 and May 2013, the FBI reported two shipping companies and eight technical service providers of TRANSCOM were victims of cyber intrusion.

2NC – Solves Cyberterror

Cooperation between Congress, DHS, and the Obama Administration is key to prevent further cyber and physical attacks on US Ports

Establishing a concrete policy is key to prevent port threats

Caponi and Belmont 14 – [Steven L. Caponi and Kate B. Belmont, Partner at Blank Rome LLP and J.D. Fordham University School of Law, "Maritime Cybersecurity: A Growing, Unanswered Threat", The Maritime Executive, 10/24, http://www.maritime-executive.com/article/Maritime-Cybersecurity-A-Growing-Unanswered-Threat-2014-10-24]

Government and Industry Response¶ ¶ Numerous governmental agencies in both the EU and U.S. are starting to respond to the cyber threats facing the maritime industry. They have not yet, however, promulgated concrete guiding plans and policies. Instead, the governmental agencies have assumed the role of loudly sounding a clarion call to action and taken a supporting role for industry participants.¶ ¶ Responsibility to actively defend against the risks of a cyber attack and be in a position to effectively respond to an incident rests squarely on the shoulders of individual ship owners, shipping companies, port operators, and others involved in the maritime industry. The failure to assume this responsibility will undoubtedly lead to serious and potentially devastating consequences, including government fines, direct losses, third-party liability, lost customers, and reputational damage that cannot be repaired.¶ ¶ Mitigating the Threat¶ ¶ Companies looking to learn more about the steps they can take to meet the evolving cyber threat head-on should consult with cybersecurity professionals and available literature. Widely available resources include the National Institute of Standards and Technology, which issues the Framework for Improving Critical Infrastructure Cybersecurity and the National Infrastructure Protection Plan ("NIPP"), developed pursuant to the Homeland Security Act of 2002 and Homeland Security Presidential Directive 7 ("HSPD-7"). These documents, along with numerous others, can assist companies in developing a risk management framework to address cyber threats and use proven risk management principles to prioritize protection activities within and across sectors.

CP = Popular

SAFE Port Act is popular in both House and Senate – overwhelming vote for bill Halcoussis and Lowenberg 14 – [Dennis Halcoussis and Anton D. Lowenberg, Department of Economics of California State University and Professor of Department of Economics of California State University, "ALL IN: AN EMPIRICAL ANALYSIS OF LEGISLATIVE VOTING ON INTERNET GAMBLING RESTRICTIONS IN THE UNITED STATES", Wiley Online Library, 3/13, http://onlinelibrary.wiley.com/doi/10.1111/coep.12054/full]

Our roll call voting data are for the Internet Gambling Prohibition and Enforcement Act, H.R. 4411, which passed in the House of Representatives by a vote of 317 to 93 on July 11, 2006. (H.R. 4411 was not voted on by the Senate and never became law.) The UIGEA, as we have seen, was added to an unrelated piece of legislation, the SAFE Port Act, in a Conference Report which was passed by the House on September 29, 2006, by a vote of 409 to 2, and unanimously by the Senate on September 30, 2006. The overwhelming support for the UIGEA in the House likely reflected legislator preferences for the SAFE Port Act to which it was attached and which dealt with issues related to national security. A better gauge of legislator preferences regarding internet gambling is the voting record on H.R. 4411, which was concerned exclusively with this issue. Moreover, the roll call vote on H.R. 4411 contained a much larger number of "nays," thereby providing sufficient variation in the sample to facilitate econometric testing.¶ The content of the UIGEA is very similar to that of H.R. 4411, so that we can infer that the voting record on H.R. 4411 closely mirrored that which would have occurred if the UIGEA had been voted on by itself. In large measure, the UIGEA replicates the language of H.R. 4411, with one notable exception. H.R. 4411 included a provision introduced in an earlier bill sponsored by Rep. Goodlatte, namely, H.R. 4777. The latter bill sought to significantly expand the scope of the Wire Act by amending the definition of "the business of betting and wagering" to make it clear that the Act was not limited to sports gambling but also extended to online casinos and poker rooms (Casinoadvisor.com, accessed February 5, 2011; Doyle 2006, 3). This amendment to the Wire Act was rolled into H.R. 4411, but when the UIGEA was added to the SAFE Port Act, the amendment was dropped (Doyle 2006, 3). Other provisions of H.R. 4411 that were dropped from the UIGEA included an increase in the maximum prison term for violation of the Wire Act from 2 to 5 years and an authorization of $40 million in appropriations spread over 4 years for enforcement of the Wire Act (Doyle 2006, 5).14

Cyber Security CP

1NC Cyber Security CP

The President should propose and the Senate should ratify an international agreement that includes provisions to strengthen cyber warfare regulations and create protected zones for critical cyber infrastructure of civilian interest.

A cyber treaty is key to improving cybersecurity.

Giuseppe G. **Zorzino** 12/20/**14** (security consultant with more than 33 years of experience in the IT industry "Cyber-war or cyber-peace?" Security Affairssecurityaffairs.co/wordpress/31294/cyber-warfare-2/cyber-war-cyber-peace.html)

When dealing with conventional conflicts, the management procedures have been regulated by international treaties over time. The very cyber-war, i.e. the extension of the "armed" confrontation in the fifth domain, should follow the same rules. The doctrines of military officers from many countries qualify it as just like a conventional conflict, but reality is different. There is disagreement on the term "cyber-attack". When can we speak of an "attack to the nation", and what is the limit of the destructive consequences beyond which we can speak of "offensive attack"? Is it necessary that there is loss of life or can't simply be triggered by material damage to the infrastructures? And also in this second case, which is the limit, the extent over which the trigger is configured as "attack"? How is it possible to attribute liability in an incontrovertible manner, to a nation? Like a legal litigation, would it be necessary to have a third-party authority for forensic attribution to accountable actors, now in the cyberspace? When we talk about attack among states, in the "cyber" world the responsibility cannot be mandatorily attributed to military units of a party. Acts of "cyber" hostility can be caused by people not organized in recognized military units. The lack of shared interpretation about the meaning of "cyber-war" and its rules, should not prevent the achievement of international agreements on how to conduct "cybernetic" war. In the opinion of some experts[5], a treaty should include obligations of effective cooperation in the investigation subsequent to cyber-crimes. The lack of cooperation would indicate guilt or complicity by the nation. Other analysts[6] prefer to extend the principles of the Geneva and The Hague Conventions to cyber-confrontations because they consider them also applicable/appropriate to this domain of confrontation. Signing humanitarian agreements for the creation of protected zones for the critical infrastructure of civilian interest, however, would not prevent the possibility of their involvement. The not framed cyber-warriors could be induced to not adhere to these protected enclaves of cyberspace. Particularly "the patriots who group together as cyber-armies"[7] might be tempted to do that. The result of this unregulated use of increasingly sophisticated technologies can still overturn social norms of coexistence or legitimate confrontation. It is therefore necessary to first resolve the ambiguities in the interpretation of Countries' behaviour in cyberspace and create legal instruments for the recognition and attribution of responsibility to Nations. Therefore, it is necessary first of all to resolve ambiguities in the interpretation of the behavior of states in cyberspace and created legal instruments for the recognition and allocation of national responsibilities. Finally, international cooperation[8] has to be shared and reinforced in tackling cyber-crimes that have an alibi for the inevitable buck-passing. Such agreements should regulate the conduct of military confrontation in this domain, establish some rules of deterrence (by denial) based on the response structures to cyber-attacks, strengthen regulations on cyber warfare because they enable the effective tracking threats. The politics should give a crucial impulse to agreements between states. The need for a cyber-treaty to prevent future cyber-wars is turning out to be increasingly urgent. Its achievement would undoubtedly have a positive impact on all countries, reducing the heavy costs caused by cyber-crime[9].

2NC – Solvency

International treaties are key to cybersecurity – past treaties prove.

C. Raja **Mohan** 11/21/**14** (Distinguished Fellow at ORF, leading the Strategic Studies Initiative of the Foundation, foreign affairs columnist and prof, member of INdia's National Security Advisory Board "Towards An International Treaty on Cyber Security: A Bilateral Dialogue Between India and The US" CYFY cyfy.org/towards-an-international-treaty-on-cyber-security-a-bilateral-dialogue-between-india-and-the-us/)

As worldwide concerns on cyber security grow, preventing war and regulating conflict in the cyber domain through a treaty have come to the top of the international agenda. The last few years have seen a growing body of effort to bring the cyber domain under international law. It is based on two sets of convictions. The first is the historical experience. Every new domain that has emerged over the last few centuries of the modern age-maritime, air or space-has been brought under international regulation despite the unique complexities that each presented. All these domains were inevitably securitised; yet, a set of rules and norms have been negotiated for each by the international community. The second is the assessment that no single country can address on its own all the security challenges the cyber domain presents. Therefore, a measure of international cooperation in the cyber realm, many believe, is a necessity. As international negotiations on a cyber security treaty advance incrementally, there is need for a sustained and purposeful engagement between India and America. This paper explores some of the challenges of constructing such a dialogue. The UN Group of Governmental Experts (GGE) established by the Secretary General has provided a valuable forum for discussion on cyber security issues in the last few years among major powers. In a report submitted in August 2013, the GGE presented a number of propositions agreed upon by consensus among its members. The GGE asserted that the traditional principles of international law are applicable to the cyber domain, thereby concluding an important debate. Given the difficulties of delimiting state boundaries and affixing state responsibilities in the cyber domain, many had argued that traditional international law was not of much value in regulating cyberspace. Technological diffusion and the capacity of individuals and non-state actors to inflict considerable damage have also been viewed as limiting the possibility of inter-state agreements. In cyberspace, the GGE held, states should comply with the prohibition on the use of force, respect territorial sovereignty and the principle of settling disputes by peaceful means in much the same way as in the physical world. The right, specified in Article 51 of the UN Charter, to self-defence, including the use of force, would apply if a cyber attack reached the level of an 'armed attack'. The report, however, refrained from spelling out when this could be the case. The report offered a set of recommendations on the principles of responsible behaviour in cyberspace, proposed a slew of confidence building measures such as exchange of information on national cyber policies, sharing of knowledge on best practices, promotion of regional consultations and expansion of cooperation in law enforcement and international assistance for capacity building. While the recommendations of the report are a step forward, translating them into treaty language will not be easy. The devil, as they say, is always in the detail. Yet, the idea of a formal treaty to regulate cyber warfare draws mixed responses in both Washington and Delhi. For an entirely different set of reasons, some of which are rooted in their strategic culture, India and the US are both ambivalent towards cyber security treaties. For America, the question is about sustaining its extraordinary lead in cyber technologies and its freedom of operation in the cyber domain. Many in the US see cyber regulation as they do arms control: they believe both will end up constraining America while allowing its rivals and others catch up. Opponents of cyber arms control also point out that while the US is compelled by its laws to abide by international agreements, other countries may not be so fastidious. This approach of the right is contested by the multilateralists in the American establishment who believe the US should take the lead in regulating cyberspace because American technological primacy is likely to be short-lived in the cyber domain. They also argue that the US is far more vulnerable than its adversaries, given the centrality of cyberspace in the advanced US economy. This also makes the US more

susceptible to asymmetric warfare. Therefore cyber arms control is a useful way of limiting potential threats and serves American interests over the long term. The latter arguments prevailed with President Barack Obama, who has moved beyond the previous administration's opposition to multilateralism in cyberspace. Since then, the US has been more open to engagement with other powers in various UN and other forums. This does not mean there is a domestic consensus in America on the best approach to cyber security. The divide between unilateral and multilateral approaches within the US is deep.

A cyber treaty will solve all cybersecurity problems.

Soafer et al Jun 14, 20**10** (Abraham D. Sofaer Hoover Institution David Clark Massachusetts Institute of Technology Whitfield Diffie Internet Corporation for Assigned Names and Numbers "Cyber Security and International Agreements" Brown EDU cs.brown.edu/courses/csci1800/sources/lec17/Sofaer.pdf)

The current, largely unilateral and defensive measures relied upon to provide cyber security in the U.S. (and elsewhere) are widely viewed as insufficient to ensure an adequate level of safety. 27 It may be possible, as CSIS and others have recommended, to provide adequate protection for certain, critical national security activities by isolating them from the Internet and other outside interventions. For most, current functions, however, some aspects of the principal security deficiencies identified can only be remedied or reduced through increased and more effective international cooperation. The first recommendation for a multilateral treaty to deal with cybersecurity was published by Stanford University's Center for International Security and Cooperation in 2000. That draft proposed creating an international agency with regulatory authority similar to that of established specialized agencies in other areas of transnational activity, but with heavy reliance on private expertise. It expressly excluded state action from its scope. 28 The U.S. has opposed such an approach, but support for multilateral understandings and activities has increased. 29 General Assembly ("GA") resolutions commencing in 1998 (GA Res. 53/70) have been adopted annually, noting various aspects of the cyber security problem including crime, terrorism, critical infrastructure protection, spam, attacks on cyber infrastructure, and the need for capacity building. 30 In addition, conferences supported by the UN, individual governments, regional organizations, and others have been held on several occasions at various places in the world, resulting in calls for increased international cooperation to deal with threats to cyber security. 31 On January 6, 2006, the GA adopted Resolution 60/45, calling among other things for the appointment by the Secretary General of "a group of governmental experts, to be established in 2009 on the basis of equitable geographical distribution," to continue to study "existing and potential threats in the sphere of information security and possible cooperative measures to address them," and "to submit a report on the results of this study to the General Assembly at its sixty-fifth session." The Group of Governmental Experts representing 15 states, including China, India, Russia, and the U.S., met four times and on July 10, 2010 issued a report summarizing the threats currently faced by Information and Communication Technologies ("ICTs"), and recommending the following "further steps for the development of confidence-building and other measures to reduce the risk of misperception resulting from ICT disruptions"

AFF – No Solvency

The need for an international treaty is not actually needed.

Elise **Viebeck 4/28**/15 (national enterprise reporter "A cybersecurity treaty? Not so fast, says State cyber czar" The Hill thehill.com/policy/cybersecurity/240276-a-cybersecurity-treaty-not-so-fast-says-state-cyber-czar)

Calls for an international treaty on cybersecurity are premature given the evolving nature of online threats, the State Department's cyber envoy said Monday. Christopher Painter, the department's coordinator for cyber issues since 2011, acknowledged growing desire in some quarters for an international agreement on what constitutes normal behavior for nation states online. ADVERTISEMENT Persistent cyberattacks against U.S. government agencies, infrastructure and private-sector firms have produced concern that not enough is being done to deter bad actors such as Russia and China. But a treaty is not the answer, at least not now, Painter said. "You often hear people say we need a treaty in cyberspace [and] I've said often I don't know what a treaty is in cyberspace," Painter said at a cybersecurity conference held at Georgetown University, according to FCW. "I don't know who signs that treaty, I don't know who the parties of that treaty are." The problem of cyber deterrence is taking up more and more time in congressional discussions of hacking threats. Some lawmakers have argued that the Defense Department's current strategy is not working, and National Security Agency Director Adm. Mike Rogers appeared to agree in one recent hearing. The Pentagon last week released a new cybersecurity strategy that includes an unprecedented emphasis on offensive cyber weapons. "I think it will be useful to us for the world to know that, first of all, we're going to protect ourselves, we're going to defend ourselves," Pentagon chief Ashton Carter told reporters. Painter, for his part, said he is working on "smaller measures to cultivate trust … including exchanging points-of-contact and discussing cyber doctrine" with his counterparts around the world, FCW reported. He is also promoting a set of peacetime principles for cyberspace, including no attacks on infrastructure. "Let's not try to rush into a treaty that would take years and we're not really even sure what that's about," he said.

Democracy CP

1NC Democracy CP

The United States federal government should increase voter participation in primaries, ensure a fair process for drawing Congressional districts and increase the transparency of political contributions of money

This solves low voter participation, and low bipartisan trust and cooperation, both of which undermine democracy.

Snowe and Glickman 14 (Olympia Snowe, Dan Glickman; Snowe is a former Senator (R-Maine); Dan Glickman is a former Representative (D-Kansas), former Secretary of Agriculture, Senior Fellow at the Bipartisan Policy Center, and co-chair of the BPC's Democracy Project. "Ten Ways to Strengthen American Democracy," Politico, June 24, 2014, http://www.politico.com/magazine/story/2014/06/10-ways-to-strengthen-american-democracy-108203.html#.Vbrgs_lViko)

The current level of dysfunction in Washington is like nothing we could have imagined when we began our journeys in public service. Yet we are convinced, based on our decades of experience encompassing the legislative and executive branches, that the status quo of today need not constitute the new normal of tomorrow.¶ As such, on Tuesday, as part of the Bipartisan Policy Center's Commission on Political Reform, we released more than 60 concrete and achievable recommendations that will improve the federal government's ability to function regardless of the deep ideological divides that exist both among lawmakers and the American public, while addressing some of the root causes of the polarization.¶ What are some politically realistic reforms that could significantly improve the way we govern? Here are 10 key ideas to fix the electoral process, return Congress to legislating and enhance public service.¶ **1. Increase voter participation in primaries**:¶ Only 20 percent of eligible voters vote in congressional primaries. The commission recommends that states and political parties aim for 30 percent by 2020 and 35 percent by 2026. Rather than a yearlong process that confuses voters, we recommend a single June congressional primary date, more open primaries and eliminating congressional caucuses and conventions.¶ **2. Balance access and integrity in our elections**:¶ We recommend that states use the data revolution to (1) identify eligible, unregistered voters and offer them the opportunity to register and (2) greatly improve the accuracy of voter rolls.¶ **3. Ensure a fair process for drawing congressional districts**:¶ To reduce distrust between the two parties, we urge the adoption of redistricting commissions with the bipartisan support of state legislatures and the electorate, to avoid the kind of single-party gerrymandering that has contributed to political polarization.¶ **4. Tackle money in politics**:¶ All political contributions, including those made to outside and independent groups, should be disclosed. Congress should also pass legislation requiring detailed disclosure of spending by congressional leadership PACs and mandate that those funds be used solely for political activities, not personal use.¶ **5. Reform the filibuster and Senate debate**:¶ Eliminate the ability to filibuster the motion to proceed; in other words, don't allow filibusters on whether to move to debate a bill. And, at the same time, guarantee a minimum number of 10 amendments, split between the majority and minority, on each bill debated.¶ **6. Empower congressional committees**:¶ Legislation should go through the full committee and amendment processes to avoid power in Congress being too centralized. By strengthening the role of congressional committees, we will create fertile soil for consensus building across the aisle.¶ **7. Spend more time legislating in Washington — and with one another**:¶ The House and Senate should schedule synchronized, five-day workweeks in Washington, with three weeks in

session followed by one-week recesses. The president and congressional leadership should hold regular monthly meetings, and the president should attend biannual joint caucuses.¶ **8. Adopt a biennial budget cycle**:¶ To avoid the annual clash over the budget and ensure better oversight and long-term thinking, Congress should adopt a two-year cycle for budget and appropriations. The current annual budgeting process is badly broken — as crisis after crisis has shown over the past few years.¶ **9. Create an expectation to serve**:¶ We encourage a year of service for Americans ages 18 to 28, and recommend greatly improving the opportunities to serve in programs like AmeriCorps and the Peace Corps, to run for political office or to serve in appointed office. This would fulfill Americans' enthusiasm to give back.¶ **10. Improve the presidential appointments process**:¶ The onerous appointments process discourages many of the most qualified applicants. We recommend cutting back on unnecessary restrictions to serve, streamlining the financial disclosure process, reducing the number of positions requiring Senate confirmation and encouraging the private sector to allow employees to take a temporary position in government.¶ There is no magic wand for making government work again. Yet indisputably, there are many measures that we can, and must, undertake. Divided government need not, and must not, mean dysfunctional government. After all, Americans are a can-do people, and we deserve to be governed that way.

2NC Solvency

Elections with integrity are key to democracy

Annan 13 (Kofi Atta Annan; Ghanaian diplomat; served as the 77th Secretary-General of the UN from January 1997 to December 2006. "Deepening democracy: why elections with integrity matter", The Elders, March 4, 2013, http://theelders.org/article/deepening-democracy-why-elections-integrity-matter)

Why elections with integrity matter:¶ Elections with integrity are the foundation of democracy. In a true democracy, our elected leaders are simply the temporary custodians of political power; the power ultimately rests with the people. We elect leaders to act on our behalf so that we can go about our lives, caring for our families, teaching at our schools, staffing our hospitals and running our businesses. At election time, the power returns to the people – and they in turn empower the elected.¶ Elections also provide people in each society with the opportunity to resolve political conflict peacefully. When citizens go to the polls and cast their votes – whether in Kenya, the United States or Indonesia – they aspire not only to elect their leaders, but to choose a direction for their nation.¶ The Commission defines an election with integrity as one that is "based on the democratic principles of universal suffrage and political equality as reflected in international standards and agreements, and is professional, impartial and transparent in its preparation and administration throughout the electoral cycle." At its core, the ideal of electoral integrity means that all voters should have an equal opportunity to participate in public debate and cast their ballots, all votes are counted equally, and all candidates seeking election do so on a level playing field.¶ Elections as a catalyst for change:¶ As well as conferring legitimacy and public trust on elected officials, and security for the losers, elections are also a powerful catalyst for good governance, security and development.¶ My home country of Ghana experienced a cycle of military coups following independence in 1957, before settling into a series of democratic elections and transfers of power. The new legitimacy of its political institutions enabled both responsive governance and private-sector driven development. Indeed, following the implementation of sound policies including smart agricultural reforms, Ghana is the only country in Africa to have met both the poverty and hunger components of the first Millennium Development Goal.¶ When elections are flawed they corrode public trust, and in severe cases can endanger democracy and even lead to conflict. I saw how harmful flawed elections can be following the disputed presidential elections in Kenya in December 2007. The post-election violence caused tremendous damage and loss, resulting in the deaths of 1,300 people and the displacement of over 600,000. As the country holds its General Election today, I fervently hope that all Kenyans will commit themselves to helping to ensure that the polls are free, fair and credible.

Elections are key to rights-- freedom to participate in the government, freedom of expression, empowerment, fighting corruption, and ending wars

Annan et al. 12 (Kofi Atta Annan; Ghanaian diplomat; served as the 77th Secretary-General of the UN from January 1997 to December 2006. THE REPORT OF THE GLOBAL COMMISSION ON ELECTIONS, DEMOCRACY AND SECURITY", Global Commission on Elections, Democracy, and Security, September 2012, http://www.ycsg.yale.edu/assets/downloads/deepening_democracy.pdf)

Elections with integrity are important to values that we hold dear—human rights and democratic principles. Elections give life to rights enshrined in the Universal Declaration of Human Rights and the International Covenant on Civil and Political Rights, including freedom of opinion and expression,

freedom of peaceful assembly and association, the right to take part in the government of one's country through freely elected representatives, the right of equal access to public service in one's country, and the recognition that the authority of government derives from the will of the people, expressed in 'genuine periodic elections which shall be by universal and equal suffrage and shall be held by secret ballot.'

But in addition to promoting democratic values and human rights, elections with integrity can also yield other tangible benefits for citizens. Evidence from around the world suggests that elections with integrity matter for empowering women, fighting corruption, delivering services to the poor, improving governance, and ending civil wars. To be clear, elections with integrity cannot by themselves develop economies, create good governance, or make peace, but recent research does suggest that improved elections can be a catalytic step towards realizing democracy's transformative potential.

When conducted with integrity, electoral processes are at the heart of democracy's ability to resolve conflict peacefully. The ability of a society to resolve conflicts without violence requires debate, information, interaction among citizens, and meaningful participation in their own governance, all of which have the potential to change people's minds and allow governments to take authoritative decisions. Elections with integrity can deepen democracy and enhance public deliberation and reasoning about salient issues and how to address them.

2NC Campaign Finance Reform

Campaign finance reform will gain bipartisan support-- despite political differences, parties will agree that democratic participation in the government is necessary

Schwarz 7/9/2015 (Jon Schwarz, writer for First Look, "You're Not Meeting the Candidates Now, They're All Going Out to Meet Sheldon Adelson", First Look, July 9, 2015, https://firstlook.org/theintercept/2015/07/09/rep-john-sarbanes-plan-de-suck-u-s-government-part-ii/ Note: The writer who published this article is Jon Schwarz, but this card is from his interview of Rep. John Sarbanes.)

Are all 150 of your bill's co-sponsors Democrats?¶ [Sarbanes:] The huge lion's share of that is Democrats, but we think we can begin to build support from the other end of the political spectrum. We have one Republican co-sponsor, Walter Jones of North Carolina, who's very passionate about this issue.¶ We're finding that the sentiment of feeling left out, of your voice not being heard, you can find that on either end of the political spectrum. In fact, if you look at the Tea Party movement on the right, and Occupy Wall Street on the left, they both come from the same place: a feeling on the part of the average person that there's some powerful elite in Washington and New York that is running the country, and that everybody else is getting left behind. I think there's real potential to create a political coalition that cuts across the political spectrum — where you could have people saying, well, you and I don't agree on just about anything when it comes to substantive policy, but we can agree that as a matter of democratic process that our voices should be heard.

Though transparency is good, it's just a referee and doesn't increase participation by voters-- public funding is key to real campaign finance reform

Schwarz 7/9/2015 (Jon Schwarz, writer for First Look, "You're Not Meeting the Candidates Now, They're All Going Out to Meet Sheldon Adelson", First Look, July 9, 2015, https://firstlook.org/theintercept/2015/07/09/rep-john-sarbanes-plan-de-suck-u-s-government-part-ii/ Note: The writer who published this article is Jon Schwarz, but this card is from his interview of Rep. John Sarbanes.)

[Interviewer:]Given the recent Supreme Court decisions, it seems like it's a much more plausible way forward to add money from regular people to the system rather than limiting the amount from other places.¶ [Sarbanes:]I will mention that a good thing about our approach is that we're not trying to put any limits on anybody's speech, we're actually giving speech to people who feel right now that they don't have it. That way we don't get tangled up with our proposal in this whole First Amendment debate, or in the jurisprudence of the Supreme Court, which has led to a call for a constitutional amendment.¶ [With this] you don't need 38 states and two-thirds of the House and Senate, like you do for a constitutional amendment. You need 218 votes in the House and 51 in the Senate and a presidential signature. I'm not saying that's necessarily easy to get. But it's a lot more practical ambition, I think, than getting a constitutional amendment.¶ And this is really important: if you do transparency and disclosure — which I support — all that's doing is just putting a referee on the field to blow the whistle when the big money players go over the line. Yeah, there's a ref down there, but you're still watching, you're not on the field yourself, you're not a player.¶ So we wanted to design something that

said to the people up in the bleachers: “Hey, guess what — we’re going to play a new kind of game where you actually get to come onto the field.”¶You’re not meeting the candidates now, they’re all going out to meet [casino magnate and major donor to right-wing causes] Sheldon Adelson on the field. They’re not going to listen to you. But with this you’re on the field.¶To me that’s so much more exciting and inspirational as a response to the situation we find ourselves in.

CP = Popular

Support for reform is growing in Congress and the public

DeSaulnier, McNerney, Sarbanes, and Huffman 3/31/2015 (Rep. Mark Desaulnier is from California's 11th Congressional District, Rep. Jerry McNerney is from California's 9th Congressional District, Rep. John Sarbanes is from Maryland's 3rd Congressional District, Rep. Jared Huffman is from California's 2nd Congressional District. "Taking Back Democracy", Huffington Post, March 31, 2015, http://www.huffingtonpost.com/mark-desaulnier/government-by-the-people-act_b_6973214.html)

Five years after the Supreme Court's landmark Citizens United ruling, big-money campaign donors and wealthy special interests have amassed unprecedented political power -- and their corrosive influence on our government is growing.¶ Every election brings new examples of special interests drowning out the voices of ordinary citizens. The 2014 election was no exception: With nearly $4 billion spent, it was the most expensive midterm election in American history. Shadowy Super PACs and dark money groups spent more money than ever before, relying on a handful of mega donors to fill their coffers.¶ As a result, in only the first few months of the new, Republican-controlled Congress, we've seen a litany of bills that do favors for the wealthy and well-connected, but a dearth of legislation that would truly help hard-working families.¶ No wonder why voters are cynical about the state of American democracy. What goes on in Washington confirms their worst suspicions: that special interests are calling the shots and blocking progress on important issues, like making the economy work for everyday Americans, creating good jobs, protecting consumers and safeguarding the environment.¶ Despite this grim reality, there is reason for hope. Most people still run for public office for the right reason: a sincere desire to help others and to make a positive difference in their communities. And there are many dedicated, principled leaders in Congress who are frustrated by the outsized role of money in politics and who long to restore Congress' credibility with the public. Moreover, grassroots support is growing among everyday Americans who want to take back our democracy.¶ The key to tapping into all of these sentiments is to ensure that the voices of ordinary citizens are not drowned out by the undue influence of corporations and mega-donors. However, Supreme Court decisions striking down campaign spending limits have made this difficult.

CP = Bipartisan

There is bicameral support for an XO that required transparency

This card is from the website of a Senator for Rhode Island--

http://www.whitehouse.senate.gov/news/release/bicameral-call-for-greater-transparency-in-political-spending

Washington, D.C. – In separate letters sent by House and Senate lawmakers today, Congresswoman Anna G. Eshoo (D-Calif.) and Senator Sheldon Whitehouse (D-R.I.) led over 100 House Members and 26 Senators, respectively, in calling on the president to issue an Executive Order requiring companies that do business with the federal government to fully disclose their political contributions.¶ "Taxpayers have a right to know where their money is spent and you have the power to ensure that the American people can obtain this information," the House lawmakers wrote in a June 22, 2015 letter to President Obama. "With public funds come public responsibilities, and any company receiving federal tax dollars should be required by Executive Order to fully disclose their political spending in a timely and accessible manner."¶ Senators echoed the same sentiment, saying, "Political spending by government contractors is a problem you can address without congressional authorization. You would be on solid legal ground if you were to issue an executive order requiring disclosure of political spending by entities that have been awarded government contracts and their senior leadership… An executive order will not solve our campaign finance problems but it will at least be a step in the right direction, and will show your Administration's commitment to transparency and fairness."¶ Nearly half a billion dollars in undisclosed money has been spent in the last two election cycles. Under current law, the president can take immediate action to increase disclosure by requiring companies that receive federal contracts to fully disclose their political expenditures. Among the top 15 recipients of federal contracting dollars, a recent analysis by Public Citizen found that only 47 percent fully disclose their contributions to non-disclosing 501(c)(4) organizations.¶ In an April letter to White House counsel, Whitehouse was joined by Sens. Bernie Sanders (I-VT), Tom Udall (D-NM), Al Franken (D-MN), and Elizabeth Warren (D-MA) in urging the administration to take similar action. Senators joining today's letter include Judiciary Committee Ranking Member Patrick Leahy (D-VT) and members of Democratic leadership such as Sens. Dick Durbin (D-IL), Chuck Schumer (D-NY), Patty Murray (D-WA), and Amy Klobuchar (D-MN).¶ This is the fourth time Eshoo has led her colleagues in calling on the president to issue an Executive Order. She first wrote to him on the issue in 2011.

Democracy Solves Terrorism

The spread of democracy by the USFG is key to stopping terrorism.

Shadi **Hamid and** Steven **Brooke**, 2/1/**10** (Hamid is deputy director of the Brookings Doha Center and a fellow at the Saban Center for Middle East Policy, Brooke is a Ph.D. student in the Department of Government at the University of Texas, Hoover Institution at Stanford University "Promoting Democracy to Stop Terror, Revisited" www.hoover.org/research/promoting-democracy-stop-terror-revisited) Wadhwani

A new strategy A multitude of factors — economic, political, cultural, and religious — contribute to Islamic radicalism and terror. However, one important factor, and one that appears to have a strong empirical basis, is the Middle East's democracy deficit. Any long-term strategy to combat terrorism should therefore include a vigorous, sustained effort to support democracy and democrats in a region long debilitated by autocracy. Obviously, this is an enormous challenge and should not be taken lightly. However, abandoning such a critical task would mean more of the same — a Middle East that continues to fester as a source of political instability and religious extremism. And, in today's world, such instability, and the violence that so often results, cannot be contained; it will spill over and harm America and its allies. A new democracy promotion strategy in the Middle East should include a variety of measures, including making aid to autocratic regimes conditional on political and human rights reforms; elevating democracy as a crucial part of all high-level bilateral discussions with Arab leaders; coming to terms with the inclusion of nonviolent Islamist parties in the political process; using membership in international organizations as leverage; increasing the budget for programs like the Middle East Partnership Initiative and the Millennium Challenge Account; deepening cooperation with the European Union to spread responsibility; and sponsoring initiatives that bring together Islamist and secular groups to forge inclusive pro-democracy platforms. The pace of democratization should take into account local contexts yet must maintain a consistent focus on expanding the rights of citizens, supporting the development of viable opposition parties, and moving toward free and fair elections. Before moving in such a direction, the idea of Middle East democracy must be rehabilitated in the eyes of policymakers and the public alike. But before moving in such a direction, the idea of Middle East democracy must be rehabilitated in the eyes of policymakers and the public alike. Absent a bipartisan political commitment, any new effort will falter. We realize that elevating democracy promotion will mean breaking with the last several decades of U.S. policy, which has relied upon close relationships with Arab regimes at the expense of Arab publics. But our long-term national security, as well as our broader interests in the region, demand such a reorientation. The first step, however, is to reestablish a consensus here at home on both the utility and value of democracy promotion. Once that happens, the discussion of how to actually do it can be conducted with greater clarity. If, on the other hand, we choose to continue along the current path — paying lip service to the importance of democracy abroad but doing increasingly less to actually support it — a great opportunity will be lost. Turning away from the Arabs and Muslims who overwhelmingly support greater freedom and democracy will rob us of perhaps our strongest weapon in the broader struggle of ideas. For decades, the people of the region have been denied the ability to chart their own course, ask their own questions, and form their own governments. Lack of democratic outlets has pushed people towards extreme methods of opposition and made the resort to terrorist acts more likely. Recognizing this is a crucial step toward a sustained effort to promote Middle East democracy and represents our best chance at a durable and effective counterterrorism policy that protects our vital interests while remaining true to our ideals.

AT: CT K2 Demo Promo

Democracy promotion should be delinked from counterterrorism policy-- it's counterproductive and decreases credibility

Stoddard 2010 (Steve Stoddard, "RETHINKING THE RELATIONSHIP BETWEEN DEMOCRACY AND TERRORISM", International Affairs Review, Spring/Summer 2010, http://www.iar-gwu.org/sites/default/files/articlepdfs/Democracy%20and%20Terrorism.pdf)

First, counterterrorism policy documents and public rhetoric must decrease the prominence of democracy promotion to its traditional, peripheral role. Second, the United States should recast its technical support and foreign aid as "good governance" programs that will encourage states to be more responsive to their populations. Third, instead of attempting to destabilize authoritarian regimes, the United States should focus on stabilizing the failed or failing states that pose an even greater risk of terrorism. Fourth, the United States needs to address its massive credibility problem in the Middle East. Fifth, the United States must pursue energy independence and other policies to reduce the overall strategic importance of the Middle East region. ¶ 1. REMOVE DEMOCRACY PROMOTION FROM COUNTERTERRORISM POLICY AND RHETORIC: ¶ De-linking democracy promotion and counterterrorism policy is not an entirely new suggestion. The Washington Institute for Near East Policy's Presidential Task Force on Confronting the Ideology of Radical Extremism included it as part of their overall strategy for counter-radicalization. The task force argues that the prominence of democracy promotion in policy and rhetoric "has the unintended implication of hurting the ability of both U.S. government and nongovernmental organizations to play an effective role on the ground in supporting democracy and reform efforts, as it raises suspicion that the real purpose of the efforts is regime change."92 Accordingly, the National Security Strategy of the United States, the National Strategy for Combating Terrorism, and other official documents should be revised so that democracy promotion no longer forms a pillar of U.S. counterterrorism policy. The goal of spreading democracy need not be abandoned entirely—and it may still have some role in national security policy—but it needs to be treated as a completely separate matter from counterterrorism.¶ The accompanying public rhetoric must also be toned down substantially. As a recent report by the Center for Strategic and International Studies notes, "flourishing U.S. rhetoric such as Bush's Second Inaugural Address might at times be inspirational, but can also provoke charges of hypocrisy and a loss of credibility if it is too lofty and concomitant actions are not easy to see."93 Many experts interviewed for that study believe U.S. policy should be better conceived of as "democracy support" rather than "democracy promotion;" a wise distinction that is worth adopting in public diplomacy under the Obama administration.94

AT: Military Action Key

Military intervention to promote democracy almost always fails-- don't change the regime in the long term

Stoddard 2010 (Steve Stoddard, "RETHINKING THE RELATIONSHIP BETWEEN DEMOCRACY AND TERRORISM", International Affairs Review, Spring/Summer 2010, http://www.iar-gwu.org/sites/default/files/articlepdfs/Democracy%20and%20Terrorism.pdf)

The most forceful efforts by outside actors to promote democracy involve direct military interventions to stabilize postconflict states, or hostile action to create a regime change. Allied reconstruction of Germany and Japan after World War II is widely considered as the gold standard for successful postconflict democratic nation building, but the overall record indicates that these two cases "appear as outliers: inspiring deviations from a prosaic pattern of long occupations with limited results."39 More often than not occupying powers quickly find that—as with most things—**breaking a nation is far easier than putting the pieces back together**. Large scale studies show that the overwhelming number of military interventions by the United States and other Western democracies, while somewhat successful in creating short-term increases in political liberalization, generally do not yield a lasting impact on the political systems of target states. Peceny's (1999) examination of U.S. military interventions from 1898 to 1992 found that 85 percent of the interventions did not result in democratic change.40 Similarly, a Norwegian study that examined all military interventions by democratic states from 1961-1996 found "that in the short run, democratic intervention does indeed promote democratization[…]However, over the period 1961–96 this democratization appears to have had relatively little effect in terms of moving countries up into the category of democracies."**41 In other words, Western military intervention may create some democratic improvements, but it is generally unable to fundamentally alter the regime type—particularly over the long-term.**¶ Pickering and Peceny (2006) differentiated between hostile and supportive interventions in target states with their comparative analysis of U.S., French, British, and UN military actions from 1946-1996. They found that while U.S. interventions were somewhat more likely to result in democratic change than intervention by France and the U.K., UN interventions were the most successful at bringing about lasting political change. In contrast, British interventions never resulted in lasting political liberalization. However, the small number of cases where liberal interventions did succeed in bringing democratic change—five UN, two U.S., and one French—comprise just eight of the total 49 incidents of successful democratization during the period, which make broad generalizations difficult. Because of the small number of cases, they also conclude that "liberal intervention does not appear to be a prominent explanatory variable in post- 1945 democratization[…]nearly 84 percent of the cases of democratization that occurred from 1946 to 1996 involved no liberal military intervention."42 That statistic should be kept in mind when policymakers consider committing resources to artificially accelerate the democracy timetable elsewhere in the world. ¶ Although these studies are important, they may depict an overly pessimistic view of outside efforts to promote democracy because the actual number of military interventions specifically designed to achieve that goal are much smaller. In an analysis of Peceny (1999) and other studies that examined America's record of military intervention from 1898 to 1992, Russet determined that there were "13 successes for a policy of democratization, and 16 failures. When democratization was not an explicit goal it virtually never happened."43 This study more accurately represents the track record of deliberate U.S. attempts to promote democracy through military methods, but it is also important to note that an explicit policy of democratization was more likely to fail if the target state had no prior history of democratic rule, or experienced a civil war either before or after the intervention.44

Non-military tactics to spread democracy fail-- Cuba and Iran economic sanctions prove

Stoddard 2010 (Steve Stoddard, "RETHINKING THE RELATIONSHIP BETWEEN DEMOCRACY AND TERRORISM", International Affairs Review, Spring/Summer 2010, http://www.iar-gwu.org/sites/default/files/articlepdfs/Democracy%20and%20Terrorism.pdf)

NON-MILITARY METHODS TO PROMOTE DEMOCRACY: The lackluster results of military efforts to promote democracy abroad fundamentally challenge the notion that it can be an effective strategy to combat terrorism, but there are less intrusive methods that states can use to pursue the same objective. Some of the most common non-military tactics are economic sanctions, conditionality of economic or military foreign aid, and technical assistance to help build democratic institutions.51 Most of the evidence indicates that these alternative strategies to promote democracy enjoy, at best, only marginal success.¶ Economic sanctions "do not appear to have any better results than military interventions do in changing regime structure or behavior;" a broad examination of all types of economic sanctions shows that since World War I, "only about one third were judged to be even partly successful at achieving their stated results."52 One need look only to the cases of Cuba and Iran to see how even decades of continued economic sanctions by the United States are ineffective in bringing about democratic change in the targeted regime. Economic sanctions can also easily create negative side effects that outweigh any marginal impact they may have on democratization; they often hurt the most vulnerable members of a society, affect the areas of the economy that would be most receptive to positive economic engagement, and can also inadvertently impact the economies of neighboring countries.53¶ Because authoritarian regimes maintain power by means of a much smaller electorate than democracies, targeted sanctions are generally considered to be more effective against those types of governments. By designing "narrow sanctions affecting the core groups supporting the regime," democratic states will be more likely to coerce authoritarian governments to yield to economic pressure.54 Under most circumstances, however, the goal of economic sanctions is usually to change a state's behavior rather than its governing structure. When threatened with sanctions ultimately designed to remove them from power, self preservation will likely trump even well-calibrated economic pressure against authoritarian regimes.¶ Conditionality of economic or military foreign aid is another tool used extensively to promote various foreign policy objectives, the results of which have been mixed for democracy promotion. Knack (2004) examined foreign aid's specific relationship to democratization from 1975-2000 and concluded "that either the favorable impacts of aid on democratization are minor, or they are roughly balanced by other democracy-undermining effects of aid dependence."55 Other studies of military aid found that "arms imports are significantly and negatively related to democracy[…but…]U.S. military educational exchanges are positively associated with liberalizing trends."56

ILaw CP

1NC ILaw CP

The United States federal government should cooperate with the International Criminal Court without ratifying the Rome Statute.

We have a solvency advocate and it avoids the link to politics.

Dietrich 11 (John W, Bryant University, "Time for the United States to Cooperate with the ICC", http://www.h-net.org/reviews/showrev.php?id=31374)

Lee Feinstein and Tod Lindberg argue that the United States should move to a policy of cooperation with the International Criminal Court (ICC) as a means of reaching the established U.S. goal of seeing gross violators of human rights and perpetrators of mass atrocities held accountable for their actions. U.S. cooperation also would please allies and be morally right. The authors move discussion of the ICC away from the well-worn theoretical debates on the merits of global governance and proper limitations on sovereignty to, first, the broader issue of how the United States works for international justice and, second, the practical question of whether cooperation with the ICC advances U.S. interests. Such intellectual moves force U.S. critics of the ICC into the difficult position of either questioning the merits of the U.S. goal of international justice or showing that this goal could be better achieved through other policies.¶ Feinstein and Lindberg also later add a third shift in the debate by suggesting that the issue should not be defined only as a choice of either U.S. opposition to the ICC or ratification of the Rome Statute, but should include a middle option of **U.S. cooperation with the court without ratification**, at least at this point. Cooperation would give the United States many of the benefits of joining the ICC without subjecting itself to the court's jurisdiction or requiring Senate approval.¶ Overall, the book raises an interesting perspective and advances many practical policy steps. Several of the latter have already been adopted by Barack Obama's administration. ICC critics, though, are likely to be less willing than the authors to move away from theoretical debates or to see the ICC's actions to date in positive terms. How long the United States could, or should, remain with the middle policy of cooperation without ratification also remains unclear.¶ Feinstein was at the Brookings Institution and has worked with notable Democratic politicians. Lindberg is at the Hoover Institution and has worked with key Republican politicians. Both have spent extensive time in Washington policy circles. They intend this work to be similar to other recent bipartisan efforts to assess in practical terms how U.S. interests can be furthered by international institutions. Their background and goal gives the book a different set of arguments and writing style when compared to works on the ICC by academics or lawyers.

2NC Solves CIL

Solves Customary International Law too (CIL)

MCKENNEY 13 (Sydney, writer on E-international relations, E-International Relations, http://www.e-ir.info/2013/05/17/the-united-states-need-to-ratify-the-rome-statute/)

The Rome Statute of the International Criminal Court establishes a permanent court to prosecute individuals who have committed atrocity crimes such as torture, genocide and crimes of war. Initially, the U.S. supported the Court, but several factors caused it to actively work against the Court during the Bush Administration. The main arguments against joining the Court are rooted in its constitutionality (especially the rights of due process), state sovereignty, the role of the UN Security Council and a fear of politicized prosecutions. But the Court is a supranational entity as well as a court of last resort; it does not override national courts but acts only in situations where nations' courts are unable or unwilling to prosecute. Upon examination, the U.S.' concerns reflect a unidirectional model for human rights in that the U.S. supports prosecuting criminals as long as they are not U.S. nationals. But the roots of the ICC are based in customary international law as well as the laws of nature, which should be denied by no state- especially the most powerful nation in the world. Based on the theory of natural law, the United States has an obligation to the international community to support the Court in prosecuting atrocity crimes. The United States has immense power to help shape the Court and often overlooks the option to amend or make reservations on areas of the Court that it sees as unfit. By refusing to ratify the Rome Statue, the United States disrespects the law of nations and fails to play the role in advancing international law that it should.¶Introduction¶The International Criminal Court, although a relatively new instrument in international law, plays a distinctive role in furthering the global community's dedication to human rights.[1] This permanent tribunal works closely with the United Nations, but is its own independent institution. The Court came into being in 2002 through the Rome Statute of the International Criminal Court:[2] the Court aims to prosecute individuals for genocide, crimes against humanity, war crimes and the crime of aggression.[3]

ICC outlaws sexual and gender based crimes while taking steps to help victims – New policies prove

CFR 14 (Council on foreign relations, independent, nonpartisan membership organization, think tank, and publisher, International Criminal Court's Policy Paper on Sexual and Gender-Based Crimes, http://www.cfr.org/violence-against-women/international-criminal-courts-policy-paper-sexual-gender-based-crimes/p35875#)

1. Over the past few decades, the international community has taken progressive steps to put an end to impunity for sexual and gender-based crimes. The Statute of the ICC is the first international instrument expressly to include various forms of sexual and gender-based crimes — including rape, sexual slavery, enforced prostitution, forced pregnancy, enforced sterilisation, and other forms of sexual violence — as underlying acts of both crimes against humanity and war crimes committed in international and non-international armed conflicts. The Statute also criminalises persecution based on gender as a crime against humanity. Sexual and gender-based crimes may also fall under the Court's jurisdiction if they constitute acts of genocide or other acts of crimes against humanity or war crimes. The Rules of Procedure and Evidence (‚Rules') and the Elements consolidate important procedural and evidentiary advancements to protect the interests of victims and enhance the effectiveness of the work of the Court.¶ 2. Recognising the challenges of, and obstacles to, the effective investigation and prosecution of sexual and gender-based crimes, the Office elevated this issue to one of its key strategic goals in its Strategic Plan 2012-2015. The Office has committed to integrating a gender perspective and analysis into all of its work, being innovative in the investigation and prosecution of these crimes, providing adequate training for staff, adopting a victim-responsive approach in its work, and paying special attention to staff interaction with victims and witnesses, and their families and communities. It will increasingly seek opportunities for effective and appropriate consultation with victims' groups and their representatives to take into account the interests of victims.¶ 3. The Office recognises that sexual and gender-based crimes are amongst the gravest under the Statute. Consistent with its positive complementarity policy, and with a view to closing the impunity gap, the Office seeks to combine its efforts to prosecute those most responsible with national proceedings for other perpetrators.

AT: ICC Bad

Ratifying the ICC would lead to international laws, the ICC is one of the largest forms of international law – Sets standards for many of the worse crimes and tries those crimes as well

Sandholtz 14 (Wayne, University of Southern California, "Implementing the International Criminal Court", http://ssrn.com/abstract=2454824)

The International Criminal Court (ICC) is a landmark in the development of international ¶ criminal law: the first permanent international tribunal with the authority to prosecute ¶ individual persons for the most serious international crimes. But the ICC is not a standalone¶ court. It sits atop a system of criminal justice that, in principle, integrates national ¶ and international levels. In fact, the system of international criminal law as a whole relies ¶ on national judicial institutions to carry most of the burden of prosecuting international¶ crimes (genocide, war crimes, and crimes against humanity). For national courts to fulfill ¶ that role, domestic legal provisions that implement international criminal law must be in ¶ place. That is, domestic judicial actors must have the legal tools to prosecute genocide, war ¶ crimes, and crimes against humanity in domestic courts. This study examines the domestic ¶ enactment of laws that would enable states to carry out their responsibilities with respect ¶ to the International Criminal Court. International relations and international law scholars ¶ have analyzed state commitments to human rights treaties and the effects of those treaties ¶ on human rights performance. But surprisingly little research examines why and when ¶ states enact the domestic laws that would enable them to fulfill their international human ¶ rights and international criminal law commitments.1¶ The ICC depends on states in two crucial ways. First, the ICC exercises ¶ "complementary" jurisdiction, prosecuting only when states cannot or will not do so (Rome ¶ Statute, 2002, Preamble, Arts. 1, 17). Domestic courts, under "complementarity," thus have ¶ 1 A recent exception is (Berlin 2014).¶ 3¶ primary responsibility for prosecuting ICC crimes (Schabas 2011). Second, when the ICC ¶ does prosecute, it will depend on the cooperation of national institutions and officials for ¶ everything from gaining custody of the accused to gathering evidence and securing ¶ witnesses. In order to play their role in the ICC system, states must enact legislation that ¶ addresses both aspects of their relationship with the ICC: complementarity and ¶ cooperation. Some states that ratified the Rome Statute of the International Criminal Court ¶ have acted quickly to pass both complementarity and cooperation legislation; other ¶ ratifiers have yet to enact any implementing legislation. This study seeks to identify the ¶ factors that distinguish these two categories of states.

The United States doesn't ratify enough global treaties to foster international law – Only by ratifying more internationally accepted treaties will the US be able to foster international law

Goldsmith and Posner 05 (Jack and Eric, Harvard Law School professor and American law professor, "The limits of international law", http://www.angelfire.com/jazz/sugimoto/law.pdf)

The biggest problem, from the perspective of¶ international law advocates, has been the United¶ States. Long the champion of international legalization¶ and the richest and most powerful country,¶ the United States was a laggard in the 1990s.¶ During treaty negotiations, the United States¶ consistently worked to weaken treaty language¶ and create exceptions. It ended up opposing the¶ International Criminal Court and has cajoled dozens of¶ countries into entering bilateral immunity agreements,¶ which require them

not to turn over Americans on their territory to the ICC. It refused to enter the Kyoto Global Climate Change Treaty. It refused to enter a treaty that banned landmines. It has refused to enter several human rights treaties, and it has entered others only subject to reservations that ensure that they do not change American policy. It led the illegal intervention in Kosovo. Although many other states have been recalcitrant about these and similar international institutions—including Russia, China, India, and other major powers—it has come as a shock to many American internationalists that the United States acts more like these countries than like western European countries. From their perspective, matters only became worse after 9/11. The American military response to the al Qaeda threat has raised grave questions of international law. So has both the invasion of Iraq—arguably, in violation of the UN Charter—and the conduct of the war there. The Bush administration also has forcefully reiterated American opposition to the ICC and to Kyoto, and withdrawn from the ABM treaty with Russia; and many of its officials have shown skepticism about the value of international law for American foreign policy. International law advocates now regard the United States as a rogue state but have no ideas about how to change American behavior. Defenders of American foreign policy sometimes argue that nobody pays attention to international law, and so therefore the United States should not; and, at other times, they argue that weak states are using international law to prevent the United States from acting in its national interest. The partisan debate is hampered by lack of understanding about how international law really operates. The Limits of International Law intends to fill that gap. The book begins with the premise that all states, nearly all the time, make foreign policy decisions, including the decisions whether to enter treaties and comply with international law, based on an assessment of their national interest. Using a simple game-theoretical framework, Goldsmith and Posner argue that international law is intrinsically weak and unstable, because states will comply with international law only when they fear that noncompliance will result in retaliation or other reputational injuries. This framework helps us understand the errors of the international law advocates and their critics. On the one hand, large multilateral treaties that treat all states as equal are unattractive to powerful states, which either refuse to enter the treaties, enter them subject to numerous reservations that undermine the treaties' obligations, or refuse to comply with them. The problem with these treaties is that they treat states as equals when in fact they are not, and they implicitly rely on collective sanctions when states prefer to free ride. Thus, many human rights treaties are generally not enforced, and so they have little effect on states' behavior. And the international trade system is mainly a framework in which bilateral enforcement occurs, so powerful states may cooperate with other powerful states but not with weaker states, whose remedies for trade violations are valueless. On the other hand, international law is not empty or meaningless, as many critics have argued. States are able to cooperate with each other, especially on a bilateral basis, and their patterns of cooperation eventually congeal into the customary international norms. Cooperation also occurs within bilateral treaties and within the general frameworks set up in multilateral treaties. In the absence of a world government, the cooperation remains relatively thin, and often erratic; its character changes as the interests and relative power of nations change. But none of this is to claim that international law is phony or illusory or a great public relations game.

Indo-Pak CP

1NC Indo-Pak CP

The United States federal government should offer Pakistan a formula for nuclear normalization modeled off of its 2008 nuclear cooperation deal with India.

Offering a nuclear cooperation deal to Pakistan would reduce nuclear risks
VCDNP 13

["Overcoming Pakistan's Nuclear Dangers", April 28 2013, Vienna Center for Disarmament and Non-Proliferation, http://vcdnp.org/140415_overcoming_pakistans_nuclear_dangers.htm] -Chan

Therefore, efforts should be made to stabilize the strategic environment in order to curtail the South Asian nuclear arms race. To overcome these nuclear dangers, Fitzpatrick proposed that Pakistan be offered "a formula for nuclear normalization" similar-but not identical-to the 2008 US-India nuclear cooperation deal. This path to nuclear normalization would entice Pakistan to adopt policies associated with global nuclear governance and non-proliferation norms. Under this scenario, Fitzpatrick asserted, Pakistan would be required to ratify the Comprehensive-Nuclear-Test-Ban Treaty, suspend all fissile material production, unblock the Fissile Material Cut-off Treaty negotiations, and make other concessions in return for nuclear legitimacy. Islamabad would have to lift a heavy burden of proof that it deserves such recognition because of its damaged track record due to the A. Q. Khan's network operations and the continuing terrorism threats from non-state actors. While such a proposition would reduce nuclear risks in Pakistan and the region, he conceded that options have yet to be explored that would prevent Islamabad's nuclear normalization from undermining non-proliferation efforts elsewhere, such as in North Korea, or weakening the international regime entirely. He further recommended a continuous focus on preventing acts of terrorism as well as efforts to lower the risk of a new Indo-Pakistani war. To this end, bilateral mechanisms should be developed to avoid a fully-fledged arms race and nuclear exchange in South Asia.

2NC – Solves – India Proves

Nuclear agreement in India worked
DOS 8

["U.S. - India: Civil Nuclear Cooperation", October 2 2008, http://2001-2009.state.gov/p/sca/c17361.htm] - Chan

Under the leadership of President Bush and Prime Minister Singh, the United States and India have moved forward on building the bonds of a strategic partnership. In July 2005, the two leaders announced a broad slate of initiatives as part of the new commitment to a comprehensive bilateral relationship. Among these, the Civil Nuclear Cooperation Initiative has garnered the greatest attention. The United States and India share three objectives in undertaking this initiative: to remove core differences that impeded our strategic relationship for more than 30 years, to support India's economic growth and energy security in an environmentally sound way, and to strengthen the global nonproliferation regime. On July 18, 2005, the U.S. and India announced the launch of the Civil Nuclear Cooperation Initiative. Under the parameters of this initiative, India will commit all of its civilian nuclear facilities to IAEA safeguards. On August 1, 2008 the IAEA Board of Governors approved India's safeguards agreement, paving the way for India's consideration at the Nuclear Suppliers Group. Currently, the United States is seeking a Nuclear Suppliers Group exemption in order to permit trade with India's expanding peaceful nuclear sector. The accompanying agreement for peaceful nuclear cooperation will permit American and Indian companies to partner together in ways that will foster growth in India's civil nuclear sector, create a clean energy source which will benefit the environment, and will offer India greater energy security with stable sources of energy for its large and growing economy. As part of the overall initiative, India will expand international safeguards, adhere to international nuclear and missile export guidelines, continue its voluntary moratorium on nuclear testing, and ensure that all civil nuclear trade will be used only for peaceful purposes. Because India will place a greater number of its reactors under safeguards, it reduces the nuclear infrastructure available for its weapons program. These commitments constitute significant gains for global nonproliferation efforts.

2NC – Third Party Solves

Third-party intervention solves

Ramsbotham, Chairman of the Oxford Research Group and President of the Conflict Research Society, 11

[*Contemporary Conflict Resolution* by: Ramsbotham, Woodhouse, and Miall Pg. 19 Ln. 23-Pg. 20 Ln. 5, February 4 2011] - Chan

Where two parties are reacting to each other's actions, it is easy for a spiral of hostility and escalation to develop through positive feedback. The entry of a third party may change the conflict structure and allow a different pattern of communication, enabling the third party to filter or reflect back the messages, attitudes and behavior of the conflictants. This intervention may dampen the feedback spiral. Although all third parties make some difference, 'pure' mediators have traditionally been seen as 'powerless' – their communications are powerful, but they bring to bear no new material resources of their own. In other situations there may also be powerful third parties whose entry alters not only the communication structure but also the power balance. Such third parties may change the parties' behavior as well as their communications by judicious use of the carrot and the stick (positive and negative inducement); and they may support one outcome rather than another. Of course, by taking action, powerful third parties may find themselves sucked into the conflict as a full party.

Leadership CP

1NC Leadership CP

The United States Congress should fully fund the Mandela Fellows Program.

Solves for leadership and is a better internal link.

Lord, 14

(Kristin Lord was the acting president of the United States Institute of Peace. Served as the Institute's executive vice president from 2013 until her appointment as acting president. "Soft Power Outage" http://foreignpolicy.com/2014/12/23/soft-power-outage/)

First, it has to "walk the walk," aligning actions and values, rhetoric and deeds. This is understandably difficult in a country with complex and wide-ranging foreign policy interests, but the United States could do better in one key respect: weighing potential damage to America's moral authority when considering policy options. Such considerations are often trumped, and not without cause. Policymakers are regularly forced to choose from a series of bad options, and when they do, clear and short-term consequences weigh more heavily than diffuse costs to notions like reputation. If the United States is serious about countering challenges to its national security interests and democratic ideals, however, this must change. Perceptions that the United States does not live up to its own values fundamentally undermine American power and inhibit the country's ability to defend not just its own interests, but also universal standards of what is right and just. They undermine America's ability to defend the time-proven value of the moral high ground, and they empower cynical actors eager to seize the propaganda advantage.? The constant din of social and traditional media is raising the stakes, subjecting policymakers to unrelenting scrutiny and empowering those who are loud and opinionated, whether or not they are right. The simultaneous trends of proliferating information and the decentralization of control over it present real challenges to leaders in government and elsewhere. These trends are a fact, for good or ill, but they are also opportunities. Scrutiny pressures the United States to be better, forcing it to reflect on how its actions will be perceived and whether those perceptions should lead it to behave differently in the first place. The link between scrutiny and virtuous behavior is long recognized. Indeed, Adam Smith's under-studied text The Theory of Moral Sentiments asks the just man to consider how his actions would be perceived by an impartial spectator as a test of their virtue. If the publicity of our actions and how they would be received gives us pause, Smith argued, perhaps we should reconsider those actions in the first place. The most challenging aspect of today's information environment is the constant presence of partial spectators, who are all too ready to eager to seize on any perceived failing, publicize it widely, and use it to their own advantage.? Second, soft power should also be used proactively, which entails actively exposing others to ideas. Confidence is required; others may not choose to share ideas to which they are introduced. But time and time again, people who are exposed to accurate information and universally held values become positive forces in their own communities and strong (if not entirely uncritical) partners.? All too often — and across presidential administrations — soft power falls down the list of foreign policy priorities, underweighted in comprehensive strategies that include diplomacy and defense. Dominating the moral high ground and using it to spur social change is not at the center of national security policymaking, but it should be. Dominating the moral high ground and using it to spur social change is not at the center of national security policymaking, but it should be. Serious public engagement strategies, which are natural components of soft power, are rare. The once frequently heard term "public diplomacy" is falling into increasing disuse.? A recent example of positive public engagement is the Obama administration's creation of the Mandela Fellows Program, also known as the Young African Leaders Initiative (YALI). Inaugurated last summer at the President's U.S.-Africa Leaders Summit, the program brings 500 rising African leaders to the United States for leadership and entrepreneurship training, and also creates sustained professional development for these and many more talented young people on the ground in Africa, in concert with American universities and companies. YALI is one part of a broader strategy to invest in the potential of Africa — a strategy that serves U.S. national security, economic, and humanitarian interests. To be effective, public engagement must be sustained. Though taxpayers may grow weary of funding international broadcasting, educational, and professional exchanges, teacher and journalist training, and mentoring of independent media outlets, such activities are high-yielding investments with costs that pale in comparison to what is spent on defense. Bringing high talent individuals to study in U.S. universities not only enriches the country's campuses and gives future leaders real skills they can use to build their own societies, it creates a network of people around the world who understand cherished American values and often work — on their own accord — to promote them. And supporting independent, professional media sectors not only helps other nations build their own young democracies, such media outlets are better poised than governments to counter politically motivated propaganda and often do, on their own initiative.

2NC – Solvency Ext

CP is key to solve Hegemony – hard power fails

Lord, 14

(Kristin Lord was the acting president of the United States Institute of Peace. Served as the Institute's executive vice president from 2013 until her appointment as acting president. "Soft Power Outage" http://foreignpolicy.com/2014/12/23/soft-power-outage/)

Take the example of nonviolent methods of preventing and resolving conflict, also known as peacebuilding, which entail substantial public engagement and also suffer from a sort of liquidity trap. Investments are often too minimal to achieve significant results, which means that peacebuilders struggle to demonstrate the sort of rigorously measured results they need to justify greater funding. This may change if donors properly fund and then insist on evidence-based peacebuilding strategies, the way the Gates Foundation and others have done in development. Such rigor is rarely applied in peacebuilding, and efforts to truly achieve scale are rarer still. During a recent trip to view peacebuilding projects conducted by the NGO Search for Common Ground (SCG) in the North Kivu province of Congo, I saw glimmers of what might be possible if peacebuilding could be conducted at scale. The evidence was most clear in the changing attitudes of the military and the measurable reduction in incidents of sexual violence. But such efforts are truly exceptional, and SCG's efforts in Congo dwarf its initiatives in other countries, despite intense needs to reduce violence. To be clear, investing in soft power does not negate the need for military force or investments in hard power. Meanwhile, undercutting the appeal of extremist ideologies can be accomplished most effectively through non-military means.

Solves Economy

Education is vital to Economic growth

The OECD Development Centre, 14 ((OECD) is a special platform for knowledge-sharing and evidence-based policy dialogue where developing countries, emerging economies and OECD member countries interact on an equal footing. http://www.oecd.org/innovation/press-release-leo-2015.htm "Better education and skills are key to shift the economy up a gear, says latest Latin American Economic Outlook")

Veracruz, Mexico, 9 December 2014 - Latin America's GDP growth rate has slowed down in 2014, dropping below 1.5%. This is the first time in a decade that the region grows less than the OECD average, according to the OECD Development Centre, the Commission for Latin American and the Caribbean (UN-ECLAC) and the development bank for Latin America (CAF). Given the projections in the past weeks, any recovery in 2015 is likely to be challenging.? In their jointly produced Latin American Economic Outlook 2015, the three organisations call for action to address this slowdown, focusing on the role of education and skills, and noting that despite some recent progress, more needs to be done to raise educational standards and address persistent and substantial socioeconomic inequalities.? "If we want to avoid a decade of low growth in Latin America, we must improve education standards, enhance skills in the workforce and boost innovation. Policymakers need to undertake ambitious efforts to unleash higher and more equitable growth", OECD Secretary-General Angel Gurría said while launching the Outlook at the Ibero-American Summit in Veracruz on 9 December. (presentation by Angel Gurría)? Structural change - such as the diversification of the economy towards knowledge-intensive sectors - is needed to supply the increasing demand for skilled workers. As noted by Alicia Bárcena, Executive Secretary of ECLAC, "without the transformation of the production structure there will be a link missing in the chain that connects education, productivity and innovation."? Such a link has important implications for income distribution. Diversification implies the creation of quality, better-paid jobs, which in turn entails less informality and underemployment - and hence less inequality. Policies for learning and diversification should be at the top of the agenda in the coming years in Latin America and the Caribbean.? "In the absence of an exceptionally favourable external environment, the region needs to deepen regional integration and address the structural challenges of development, to support its growth potential, primarily in the areas of innovation and production patterns, and education and technical capacities that these require", said Enrique García, CAF President and Chief Executive Officer.? The Outlook notes that, on average, the gap in education performance for a student in secondary school in Latin America relative to an OECD student is still quite high: the equivalent of 2.4 additional years of schooling. Furthermore, socioeconomic inequalities strongly influence both access and education outcomes in the region. Only 56% of students in the poorest quarter of the population attend secondary school, versus 87% of students in the wealthiest quarter.? Limitations in the quality of education are also reflected in the skill shortages and mismatches in the labour market, severely impacting the competitiveness of Latin American companies. The region's businesses face greater challenges in finding appropriately skilled employees than any other region in the world. The Outlook shows that the probability of a Latin American firm facing obstacles in finding staff with the adequate capabilities is three times higher than a similar firm in South Asia and 13 times higher than a firm in Pacific Asia. The issue is particularly prevalent in key sectors such as the automotive industry and machinery.? To tackle these acute skills shortages, targeted policies are needed in pre-primary, secondary, technical and professional education. Policymakers need to provide more and smarter investment in pre-primary education, where important soft-skills development takes place, such as socialisation and learning perseverance, which are of critical importance in the labour market. Policies are also needed to ensure that resources are redistributed to reduce socio-economic inequalities. Classroom practices need adaption to ensure better performance, including tutoring, managing teacher expectations and student motivation. Increasing the quality of teaching also relies on monitoring and evaluation, and better incentives.? Finally, government and the private sector should work together to better connect technical and vocational training with the demand for skills in a changing world economy.

CP = Popular

Education programs are popular – USAID proves
USAID, 2015 (The United States Agency for International Development is the lead U.S. Government agency that works to end extreme global poverty and enable resilient, democratic societies to realize their potential. http://www.usaid.gov/philippines/press-releases/mar-13-2015-us-government-extends-post-yolanda-education-support)

On March 9, the U.S. Embassy Manila's United States Agency for International Development (USAID) provided an additional Php 63 million and school equipment for post-disaster education needs in 19 municipalities in Iloilo, Capiz and Bohol.? USAID Mission Director Gloria D. Steele witnessed the signing of an agreement between the mayors, school principals and Synergeia Foundation, USAID's implementing partner for the Education Governance Effectiveness (EdGE) Project, which will help elementary public schools in the target provinces get back on track towards improving learning outcomes.? "Hugpong sa Pagbangon," Ilonggo vernacular for "rising up together," is the post-disaster component of EdGE that will provide community incentive grants, disaster preparedness workshops, and teaching and learning materials. Over 450 schools, 3,800 teachers and 35,000 early grade students will directly benefit from the assistance.? "USAID is your partner in building back better. In addition, this supports our broader goal of strengthening local education governance towards improving early grade reading for at least one million Filipino children," Director Steele said.? Iloilo Governor Arthur Defensor Sr. expressed his appreciation for the "sincerity and gesture of commitment of the American government to the Filipino people."? EdGE seeks to improve education governance at the local level through strengthened government effectiveness, increased transparency and accountability, and increased participation of stakeholders in education policy formulation and implementation.? USAID also led the ceremonial handover of audiovisual equipment such as laptops, printers, televisions and projectors at the Dumangas Municipal Gymnasium.? Dumangas Mayor Rolando Distura remarked that the school equipment provided by the U.S. Government will improve classroom instruction and enhance the quality of education. PTA Federation President Serafin Deduro Jr. added that with the school's inadequate resources, the teaching materials to be given by USAID will enhance students' learning.? Overall, the U.S. Government's support is estimated at approximately 6.3 billion to help the people of the Philippines respond to, and recover from, the devastating effects of Typhoon Yolanda.

Terrorism CP

1NC Terrorism CP

The United States federal government should implement a biometric entry/exit and transfer system.

Biometric technology solves for terrorism – stops passport fraud and able to track people's arrivals and departures

Kephart 15 (Janice, BORDERPOL North America Program Director and former 9/11 Commission counsel, Assuring identity against the growing terrorist travel threat." Biometric Technology Today, http://www.sciencedirect.com/science/article/pii/S0969476515300965)

Biographic information stored on a replicable document such as a passport is well known to be subject to fraud and counterfeiting. However, when a biometric is added to the biographic border process, it becomes extremely difficult for a fake or manipulated real passport to pass through a port of entry undetected.¶ Tracking the arrival and departure of foreign visitors is an essential part of immigration control, law enforcement and a nation's security. While a person may try to lie with his words and his travel document, a person's physiological characteristics cannot be lost, forgotten, stolen, or forged. When truth and lies mix in this environment, truth is much more likely to win. When that truth is against a terrorist, then security wins and maybe even lives are saved.¶ The need for arrival controls is obvious, but recording departures is also important; without it, there is no way to know definitively whether travellers have left when they were supposed to. Biometric entry/exit and transfer solutions are proven in their feasibility, low cost, added security value, increased efficiencies, travel convenience and accuracy. Good products are available off the shelf. They can be customised for many environments.¶ The biometric, secure document and identity management industry is well-versed in integration with back-end data systems while building in flexibility for the future. Biometric solutions such as facial recognition, fingerprints and iris scans assure identity when coupled with biographic information found in travel documents. Voice biometrics may soon provide sufficient reliability to be introduced in the border environment as well. Using only biographic information, however, such as names or passport numbers, provides no assurance that the person departing is the one whose original arrival was recorded.¶ **If the US had implemented a biometric entry/exit system prior to 9/11,** it is possible **that heinous act may have been prevented**. However, the technology was not available at the time. There was no good excuse why a biometric entry/exit system was not in place when Tamerlan Tsarnaev was planning his attack on the Boston Marathon in early 2013 and travelled to Chechnya for training immediately prior to that.¶ These examples are replicated around the world, every day, as terrorists are surging into ISIS controlled territory, training, and moving to points of attack around the world. Al Qaeda has changed its tactics to infiltrate and align in a more subtle, politically astute manner in Yemen, for example. Libya is fighting for its political life against ISIS elements. Europe is under siege with migrant flows fleeing war-torn areas while ISIS takes advantage of the chaos to move recruits and new members.

2NC Solvency

Biometric technology key to stopping terrorism

Amoore 06 (Louise, researches and teaches in the areas of global geopolitics, security, and political theory, "Biometric borders: Governing mobilities in the war on terror." Political geography, http://www.sciencedirect.com/science/article/pii/S0962629806000217)

The deployment of electronic personal data in order to classify and govern the movement of people across borders has become a key feature of the contemporary war on terror. The US VISIT programme, though, extends the use of integrated personal data into biometrics, a move that signals what Levi and Wall (2004, p. 194) have termed a 'new politics of surveillance'. To clarify this point, this is not to say that biometric identifiers have not historically been central to the governing of mobility – after all, signatures are a form of biometric (see Salter, 2003), nor that 'older' forms of surveillance are not still prevalent in the war on terror. Indeed, the historical emergence of body counts to enumerate and account for colonial subjects, as Appadurai (1996, p. 133) suggests in his discussion of systems of classification in colonial India, disciplines the 'unruly body', bringing it back into a zone of calculation and manageability, recuperating it and accounting for it within 'normal' ranges of acceptability. Contemporary biometric body counts bare out much of what Appadurai signals for the creation of 'boundaries around homogeneous bodies' that 'performatively limits their extent', flattening differences and idiosyncrasies into calculable categories. New forms of biometric technology extend this categorization and enumeration of the body via processes of risk profiling, such that they have themselves come to perform and represent a border that approves or denies access.¶ The US Patriot Act defined a set of practices for biometric applications that afforded their almost unlimited use in the investigation and identification of terrorism. In effect, the US VISIT system converges the data from integrated databases with biometric identifiers such as electronic fingerprints, facial and gait recognition, and iris scans. Though the implementation of biometric gateways has been beset by difficulties, the seductive allure of biometrics has taken a strong hold in the governmentality of mobility.6 Mike Davis, director of criminal justice for the FBI, for example, assured a conference of European technology companies that 'the war on terror has come to rely on biometric technology' in a world where 'the only way to trace a terrorist is through biometrics' (cited in "Biometrics: Great", 2004, p. 17). The allure of biometrics derives from the human body being seen as an indisputable anchor to which data can be safely secured. What van der Ploeg (2003, p. 58) has observed as a gradually extending intertwinement of individual physical characteristics with information systems' has served to deepen faith in data as a means of risk management and the body as a source of absolute identification.

More effective use of current technology prevent terrorism at the origin, not just as defense.

Riley, 06 (Jack, Vice President for Rand, August 2006, "Border Security and the Terrorist Threat" http://www.rand.org/content/dam/rand/pubs/testimonies/2006/RAND_CT266.pdf Access Date: 7/27/15) Sharma

Border protection begins far from our shores, airports, and crossing points. Border security is more effective when we have programs that reach toward the points of origin, rather than simply relying on defending the fixed points of the border. A wide variety of programs fall into this category and should be considered part

of the border security effort, including intelligence efforts to monitor the movements of suspected terrorists. The 9/11 Commission Report provides perhaps the most authoritative and comprehensive review weaknesses that were exploited. Efforts to reducing trafficking in stolen passports and make legitimate passports more tamperproof, and efforts to obtain advance information and conduct advance screening of passengers and cargo entering the United States. We can reduce the volume of work and the magnitude of the task through more effective use of information and technology. In some circumstances, we can use information and technology to help "profile out" and allow trusted passengers and cargo to circumvent routine inspection. That is, we can identify pools of passengers and cargo that do not merit attention beyond random checks and screening because they are trustworthy, have been verified by reliable allies, or because the content of their conveyance is known with a high degree of certainty. When low-risk passengers and cargo are profiled out, resources can be focused on remaining, and potentially more troubling, risks. A related concept is the need for faster, less expensive, and more reliable technologies. These technologies, which have uses such as screening cargo, detecting unconventional weapons, and monitoring the border, are vital to our ability to provide for homeland security.

AT: Biometrics Fails

Biometric technology is increasing and getting better – newer technology proves

Wilson 06 (Alyson, Associate Professor in the Department of Statistics and Principal Investigator for the Laboratory for Analytic Sciences at North Carolina University, Springer, Statistical Methods in¶ Counterterrorism¶ Game Theory, Modeling,¶ Syndromic Surveillance, and¶ Biometric Authentication, http://download.springer.com/static/pdf/57/bok%253A978-0-387-35209-1.pdf?originUrl=http%3A%2F%2Flink.springer.com%2Fbook%2F10.1007%2F0-387-35209-0&token2=exp=1438183583~acl=%2Fstatic%2Fpdf%2F57%2Fbok%25253A978-0-387-35209-1.pdf%3ForiginUrl%3Dhttp%253A%252F%252Flink.springer.com%252Fbook%252F10.1007%252F0-387-35209-0*~hmac=89cbd2c9715389450bd1d2adaac980002f5e94e8459d57caacda784a33f03127)

Face recognition is probably the most popular biometric-based method¶ because of its potential to be both accurate as well as nonintrusive and user friendly.¶ It analyzes facial characteristics to verify whether the image belongs¶ to a particular person. Faces are rich in information about individual identity,¶ mood and mental state, and position relationships between face parts, such¶ as eyes, nose, mouth, and chin, as well as their shapes and sizes, are widely¶ used as discriminative features for identification. Much research has been done¶ on face recognition in the past decades in the field of computer science, and¶ yet face authentication still poses many challenges. Several images of a single¶ person may be dramatically different because of changes in viewpoint, color,¶ and illumination, or simply because the person's face looks different from day¶ to day due to appearance-related changes like makeup, facial hair, glasses, etc.¶ Several authentication methods based on face images have been developed¶ for recognition and classification purposes. In face authentication, as in most¶ image processing problems, it is necessary to extract relevant discriminative¶ features that distinguish individuals. But one hardly knows in advance which¶ possible features will be discriminative. For this reason, most of the face authentication¶ systems today use some kind of efficient automatic feature extraction¶ technique. Jonsson et al. [JKL99] used support vector machines (SVM)¶ to extract relevant discriminatory information from the training data and¶ build an efficient face authentication system, and Li et al. [LKM99] used linear¶ discriminant analysis (LDA) for efficient face recognition and verification.¶ Liu et al. [LCV02] applied principal components analysis (PCA) for modeling¶ variations arising in face images from expression changes and registration¶ errors by using the motion field between images in a video clip. Havran et¶ al. [HHC02] performed face authentication based on independent component¶ Biometric Authentication Using Facial Images 49¶ analysis (ICA), and Palanivel et al. [PVY03] proposed a method for videobased,¶ real-time face authentication using neural networks. A recently developed¶ face authentication system is the minimum average correlation energy¶ (MACE) filter [VSV02, SVK02]. The MACE filter was originally proposed¶ by Mahalanobis et al. [MVC87] as an effective automatic target recognition¶ tool, and Vijaya Kumar et al. [VSV02] first used it to authenticate a facial¶ expression database, obtaining impressive results. Savvides and Vijaya Kumar¶ [SV03] showed that the filter-based methods produce more accurate authentication¶ results than traditional methods based on LDA and PCA, especially in¶ the presence of distortions such as illumination changes and partial occlusions.

Biometrics Increasing

Biometric use becoming easier to obtain and to use

Patrick 04 (Andrew, "Usability and acceptability of biometric security systems.", Financial Cryptography, http://www.andrewpatrick.ca/biometrics/NATO-BiometricsAbstract.pdf)

Biometric security systems are receiving a lot of attention because of the potential to increase the accuracy¶ and reliability of identification and authentication functions, especially in border-crossing and military¶ applications. A lot of research has been done to assess the performance of biometric systems, with an¶ emphasis on false acceptances and rejections. Much less research has been done on the usability and¶ acceptability of biometric security systems when used by IT professionals and the general public.¶ A number of factors are increasing the usability of biometric devices. The sensors are getting smaller, cheaper,¶ more reliable, and designed with better ergonomic characteristics. Biometric readers are also being integrated¶ into consumer products, such as mice, keyboards, and cell phones. The biometric algorithms are also getting¶ better, and many systems include features to train the users and provide feedback during use. In addition,¶ biometric devices are being integrated into associated security systems, such as access control and encryption¶ services, to provide a seamless environment.

Biometric technology estimated to grow tremendously in the coming years – Government as well as the private sector are increasing biometric use

Smith 15 (Sarah, Research Advisor at Reportbuyer, Reportbuyer is a leading industry intelligence solution that provides all market research reports from top publishers, "Global Biometrics Market (2014-2020): Market Forecast By Technologies, Applications, End Use, Regions and Countries", http://www.prnewswire.com/news-releases/global-biometrics-market-2014-2020-market-forecast-by-technologies-applications-end-use-regions-and-countries-300095676.html, June 8)

LONDON, June 8, 2015 /PRNewswire/ -- Biometrics market is one of the key growing electronic security markets in the global landscape. Increasing government spending, national ID projects, e-passports & visas, rising crime rates, growing terrorist activities, cybercrimes, and data thefts are the factors that are spurring the market for various biometrics technologies globally.¶ According to 6Wresearch, Global Biometrics Market is projected to reach $21.9 billion by 2020. North America leads the overall biometrics market, where the U.S. is the major revenue generating country in this region. Increasing homeland security, government spending, research and development activities are driving the growth of the U.S. in North American biometrics market.¶ Until 2014, North American region dominated overall biometrics market; however, by the end of 2015, the share of the region is expected to decline to become second largest in the industry. Growth in Asia-Pacific (APAC) biometrics market is exhibited as major factor for the declining share of North American region. Surging security spending, introduction of several government projects, increasing IT spending, data thefts, and shift from traditional smart card based systems towards biometric based systems are boosting the growth of Asia- Pacific biometrics market.¶ Fingerprint biometrics technology accounts for majority of the market share in the overall biometrics market. Ease of usage and affordable in nature have resulted for its market dominance. However, in the forecast period, share of fingerprint technology is expected to decline due to growth in other biometrics technologies such as Face, IRIS, Vein and also the adoption of multimodal biometrics

systems. ¶The key companies in global biometrics market include- Morpho Safran, 3M Cogent, NEC, Suprema, Nuance, Hitachi, Crossmatch Technologies, Iris ID, ZK Technologies and others.

US-China Relations CP

1NC US-China Rel CP

The President should use his 301 authority to enact tariffs on the Republic of China.

Aggressive strategies lead to balanced trade relationships between countries – key to becoming bilateral with China.

Brown, 10 (Sherrod, Senator of Ohio, "For Our China Trade Emergency, Dial Section 301" http://www.nytimes.com/2010/10/18/opinion/18brown.html?_r=0) sharma

Inexpensive products might sound nice, but we lose 13,000 net jobs for every $1 billion increase in our trade deficit. Our $226 billion deficit with China has meant shuttered factories, lost jobs and devastated communities across America. And it's no longer just Chinese bicycles and electronics that are flooding our markets. China will soon make half the world's wind turbines and solar panels, most of which it plans to export to America. And, as usual, China's clean-energy industry relies on large government subsidies, in direct violation of international trade laws. In response, the Obama administration recently accepted a petition, filed by the United Steelworkers under Section 301 of the 1974 Trade Act, to investigate China's state support for clean-energy exports. If the White House finds that the support violates international trade rules, Section 301 allows it to respond with a range of aggressive measures, including tariffs. This strategy has worked before: in the 1980s and '90s, the United States used its 301 authority to combat Japanese and Korean subsidies and trade barriers. Though critics warned of bitter trade wars, the get-tough approach actually **led to more balanced trade relationships,** and even encouraged foreign investors, like Asian auto companies, to build plants in America. In trying to get China to play fair, though, Washington has instead relied on rhetoric and moral suasion. It hasn't worked. Only rigorous enforcement of trade rules by the Obama administration can reverse the harm caused by the permanent normal trade relations agreement. Congress has a role to play, too: when the Senate reconvenes next month, it should vote, as the House did in September, to expand the president's authority to impose tariffs on China or any other country that unfairly manipulates its currency. Many politicians claim they support products "made in America." But the phrase is more than an empty slogan; it means standing up for American manufacturers. Only by learning the lessons of "normal" trade with China — and acknowledging buyer's remorse — can we **reach a truly balanced bilateral relationship** that works for America.

2NC – Solvency

Bilateral relations can be created with China using the authority of Section 301.

Hsieh, 9 (Pasha, Assistant Professor of Law at the Singapore Management University School of Law, China-United States Trade Negotiations and Disputes: The WTO and Beyond,http://ink.library.smu.edu.sg/cgi/viewcontent.cgi?article=1524&context=sol_research) Sharma

Both Washington and Beijing realize that they have much to lose and little to gain from an outright trade war. Consequently, both governments have resorted to various means of resolving bilateral trade conflicts. Among these measures are monitoring schemes, including government reports on trade barriers required under domestic laws, and the Trade Policy Review Mechanism and the Transitional Review Mechanism undertaken under the auspices of the WTO. These monitoring schemes have increased interactions among trading partners and enhanced their mutual understanding of where their differences lie. The governments of China and the U.S. have also held high-level negotiations, such as the Strategic Economic Dialogue, in order to settle trade conflicts without resorting to WTO litigation, which would incur substantial expenses and time. To understand China-U.S. trade relations, these monitoring schemes and negotiations are as important as the WTO dispute settlement process. A. Government Reports on Trade Barriers U.S. trade policy toward China is based on a careful analysis conducted under a monitoring scheme administered by an inter-agency group. This inter-agency group, headed by the United States Trade Representative (USTR), consists of several U.S .government agencies in Washington and China. This group is responsible for the "top-to-bottom" review of the United States' China policy and for providing recommendations on the trade strategy toward China. 27 Under the U.S.-China Relation Act of 2000, the USTR also submits to Congress annually a report on China's WTO compliance.28 Based on the USTR's own assessment, as well as written comments from industry groups and experts' testimonies, this report thoroughly reviews China's compliance with its WTO obligations, ranging from import/export regulations, agricultural policy, to intellectual property rights issues. In addition to these government-initiated efforts, private persons can also invoke Section 301 of the 1974 Trade Act to investigate foreign unfair trade practices. 29 This mechanism strengthens U.S. public-private collaboration in dealing with China on trade issues. Similar to the USTR reports, China's Ministry of Commerce (MOC) began issuing the Foreign Market Access Report in 2003.30 The purpose of this report is to assess trade barriers against Chinese businesses. For instance, the 2009 report examines trade measures imposed by 16 major trading partners, including the United States.31 It also emphasizes the importance of tackling foreign trade barriers because in 2008 alone, Chinese exports were subject to 93 trade remedy investigations in 21 countries, and the total value of these exports amounted to USD 61.4 billion.32 From 2009, the MOC's Fair Trade Bureau of Import and Export also began compiling and publishing information on foreign trade barriers.33 Furthermore, in 2005, China enacted the Foreign Trade Barrier Investigation Rules, under which a private person is able to petition to the government to investigate foreign trade barriers.34 As China-U.S. trade frictions grow, it is expected that these mechanisms will be used with increasing frequency.

AFF – Links to Politics

Asia trade bills face democratic opposition in Congress.

Nakamura, 4/15 (David, Washington Post Reporter, "Obama's proposal for more trade with Asia may not go over so well in his own party" http://www.washingtonpost.com/politics/obamas-evolution-on-trade-will-put-him-at-war-with-his-party/2015/04/15/dabd42f4-ccc8-11e4-a2a7-9517a3a70506_story.html) sharma

Ten years later, President Obama's answer to those questions — more trade with Asia — sounds to a lot of people like more of the same, exactly the kind of solution that led to the problems in the first place. As early as this week, Congress is expected to debate "fast-track" legislation that would give the administration more authority to complete a massive, 12-nation free trade pact in the Asia Pacific that Obama has called a cornerstone of his second term — a way to ensure U.S. competitiveness in the face of a rising China.¶ It will mark a leadership test for the president, who has pledged to invest his waning political capital to woo skeptical Democrats. White House allies said the danger is that Republicans are supporting the president on trade in large part because they know it could divide Democrats going into an election year.¶ Obama's embrace of the Trans-Pacific Partnership (TPP) faces fierce opposition from some of his closest political allies and the organizational heart of the Democratic coalition: labor unions, environmental groups and the progressive wing of Congress. His critics on the left contend the pact would help American corporations in state-controlled foreign markets but would lead to job losses and exacerbate the growing income gap at home.¶ If Obama pushes hard but fails, "Republicans will still be fine with that if they can ignite a civil war on the left," said Austan Goolsbee, who chaired Obama's Council of Economic Advisers from 2010 to 2011 and supports the trade push.¶ Already, the AFL-CIO has suspended all political contributions to focus on defeating the TPP. Rust Belt Democrats have accused Obama of betraying his past opposition to big trade deals as a senator. And Sen. Elizabeth Warren's fierce criticism of provisions favoring corporations has made it difficult for Hillary Rodham Clinton to embrace the pact in her White House bid — even though she touted it as secretary of state.¶ "Why, exactly, should the Obama administration spend any political capital . . . over such a deal?" asked the New York Times' liberal economic columnist Paul Krugman in a blog post.¶ For Obama, trade offers perhaps the best chance for him to secure a large-scale, bipartisan legislative achievement in his final two years. But aides described his push in more personal terms, suggesting that his beliefs were shaped by his upbringing in Hawaii and Jakarta and his time as a community organizer for displaced workers in Chicago, where he saw the human costs of international competition.¶ "The president understands that to do trade right we need to put American workers first, and he's seen that we haven't always done it right," said U.S. Trade Representative Michael Froman, Obama's Harvard Law School classmate. "But he's also an internationalist who sees that America's economic interests are intertwined with the rest of the world."

Plan increases numbers of women in STEM-early education is key to spark interest

Marvi **Matos,14**, Manager in engineering, "Women in STEM: Progress, Asymptote, and Equality ," http://www.huffingtonpost.com/marvi-matos/women-in-stem-progress-as_b_6150120.html

In a study published in the Harvard Educational Review by Espinosa, the author investigates which precollege characteristics and college experiences are predictors for the persistence of all women and women of color in STEM. It was found that women in college leave STEM "in part because of the inability of professors to make science accessible and aligned with their goals of contributing to society." For women of color, the college experience and environment was shown to be contributing factors for their persistence in STEM, more so than their background or high school performance. Among the specific college experiences correlated with retention of women of color are: (a) college community engagement activities, (b) participation in STEM related clubs, (c) co-curricular activities that improve scientific performance, and (d) academic peer relationships (as supposed to strictly social). In Engineering, a predictor for the retention of women is a clear intention to major in the field prior to college. This goal defines their High School curriculum, focusing more in math and, thus, preparing them for college. For anyone intending to study engineering, it is crucial to understand what Engineering is and what Engineers do while students are still in middle school or high school. To put this in perspective and in chronological order the student: (1) is exposed to the field of engineering via an inspiring teacher, science outreach, mentoring, science fairs, etc., (2) internalizes that engineering is a path to help, serve and impact society via innovation, (3) decides that engineering is a potential career to follow, (4) continues to enroll in all math requirements in middle school and high school to ensure a fair chance to be admitted in an engineering program, (5) applies to college engineering programs, (6) participates clubs, co-curricular activities and sustains healthy work/study peer relationships in preparation for industry or graduate school and (7) graduates as an engineer and is recruited.

Curriculum change must occur to spark interest in science- only CP solves

Eileen Pollack,13, teaches on the faculty of the Helen Zell MFA Program in Creative Writing at the University of Michigan, "Why Are There Still So Few Women in Science?," http://www.nytimes.com/2013/10/06/magazine/why-are-there-still-so-few-women-in-science.html

Some critics argue that no real harm is done if women choose not to go into science. David Lubinski and Camilla Persson Benbow, psychologists at Vanderbilt University, spent decades studying thousands of mathematically precocious 12-year-olds. Their conclusion? The girls tended from the start to be "better rounded" and more eager to work with people, plants and animals than with things. Although more of the boys went on to enter careers in math or science, the women secured similar proportions of advanced degrees and high-level careers in fields like law, medicine and the social sciences. By their mid-30s, the men and women appeared to be equally happy with their life choices and viewed themselves as equally successful. And yet the argument that women are underrepresented in the sciences because they know they will be happier in "people" fields strikes me as misdirected. The problem is that most girls — and boys — decide they don't like math and science before those subjects reveal their true beauty, a condition worsened by the unimaginative ways in which science and math are taught. Last year, the President's Council of Advisers on Science and Technology issued an urgent plea for substantial reform if we are to meet the demand for one million more STEM professionals than the United States is currently on track to produce in the next decade. But beyond strengthening our curriculum, we need to make sure that we

stop losing girls at every step as they fall victim to their lack of self-esteem, their misperceptions as to who does or doesn't go on in science and their inaccurate assessments of their talents

Women in STEM should be prioritized – their talents are wasted

NRC 11 – a private, nonprofit organization of the country's leading researchers (National Research Council, "Expanding Underrepresented Minority Participation," 2011, https://grants.nih.gov/training/minority_participation.pdf)

Nevertheless, critical issues for the nation's S&E infrastructure remain unsettled, in particular the future strength of our nation's science and engineering workforce in light of demographic trends in both the U.S. population and the science and engineering workforce. The Gathering Storm provided compelling recommendations for sustaining and increasing our knowledge workforce as part of a larger plan to sustain our scientific and technological leadership. These workforce recommendations focused on improving K-12 STEM education as well as providing incentives to students to pursue S&E education at the undergraduate and graduate levels.3 However, the recommendations are insufficient: A national effort to sustain and strengthen our science and engineering workforce must also include a strategy for ensuring that we draw on the minds and talents of all Americans, including **minorities who are underrepresented in science and engineering and currently embody an underused resource and a lost opportunity.**

The real story is that of international students. Non-U.S. citizens, particularly those from China and India, have accounted for almost all growth in STEM doctorate awards and, in some engineering fields, have for some time comprised the majority of new doctorate awards. Indeed, temporary residents accounted for more than half of the U.S. doctorates in engineering, computer science, and mathematics in 2006. We are coming to understand, then, that relying on the continued growth in the number of non-U.S. citizens in science and technology is an increasingly uncertain proposition, that it does not address our need for more STEM-trained U.S. citizens who are qualified for national security and defense industry positions, that the impending retirements in such fields as geosciences, mathematics, and physics must be a critical concern, and that **we must look for other sources of S&E talent for the long run**.5

solves econ decline

Act key to prevent economic decline- current efforts aren't enough

Joe **Kennedy III, 15**, Congressman, "Expanding the Conversation on STEM, http://www.huffingtonpost.com/joe-kennedy-iii/expanding-the-conversation-on-stem_b_6819090.html

The problem, however, is that federal and state STEM efforts to date have failed to reach three notable groups: women, minorities and low-income communities. Today only 26 percent of all STEM jobs in our country are held by women; 13 percent is held by Hispanics and African-Americans combined. By 2020 there will be an estimated one million unfilled computer programming jobs. But in 2013 there were 11 states where not a single African-American student took the computer science AP test. The numbers weren't much better for Hispanic or female students. This is a massive disconnect; a shortcoming that threatens to put these populations at an economic disadvantage for generations to come and keeps their potential on the sidelines at a time when our country needs it most. We need to dramatically expand our efforts around STEM. Down in Washington, I've introduced a piece of legislation called the STEM Gateways Act, which would help direct federal resources to state and local STEM initiatives that specifically target women, minorities and economically disadvantaged communities. As Congress debates several major updates to education policy in the weeks ahead, I will be working hard to push this key piece forward. Our failure to set up all students for success in an increasingly technology-driven economy is not just limiting their futures. It's limiting our country's future as well. From renewable energy to medical research to cybersecurity, there is no shortage of challenges facing us that can and will be addressed by the students sitting in our classrooms today. Each of those students, regardless of skin color, zip code or gender, should be given the chance to make an impact.

Minorities, women, and disadvantaged communities are key to US economic growth

Kirsten **Gillibrand** and Joe **Kennedy III**,14, congressman,"STEM jobs key to better economy: Column," http://www.usatoday.com/story/opinion/2014/01/10/engineering-mathematics-stem-gillibrand-kennedy-column/4361837/

In 2011, 26% of STEM workers were women and 74% were men. According to a 2011 report by the Department of Commerce, underrepresented minorities account for only 3 out of 10 professionals in STEM fields. Half of all STEM jobs are available to workers without a 4-year college degree, but the vast majority of federal funding is channeled into higher education institutions that students from economically distressed communities are priced out of from the start. These statistics underscore a disconnect in our STEM efforts that – left unchecked – will throw a wrench in our economic future. By excluding critical segments of the American workforce from the STEM pipeline, we don't just hurt those individuals, their families and their communities – we leave a staggering amount of economic potential on the table. Global leadership in the 21st century requires all hands on deck. If we want to preserve this country's competitive edge, we need to increase points of access to STEM for underrepresented populations. With that in mind, we were proud to introduce the STEM Gateways Act in Congress at the end of the year. The Gateways Act will create a grant program for elementary and secondary schools, community colleges, and partner organizations that support students from historically underrepresented and economically disadvantaged backgrounds. Grant funds can be used for classroom learning, career preparation, mentoring, internships, informal learning, and other relevant activities designed to encourage the interest and develop the skills that young women, underrepresented minorities, and students of all economic backgrounds will need to succeed in our country's STEM workforce. Broadening our STEM efforts isn't just about jobs today and tomorrow. It's about leveraging the collective capacity of the American workforce to tackle our most pressing modern

challenges, from renewable energy to medical research to cybersecurity. If we don't keep the doors of opportunity wide open to students of all genders, ethnicities and backgrounds then we will collectively forfeit a huge portion of the talent that these next generation challenges demand.

solves cyber security

Attracting women key to national cybersecurity

Allie **Bidwell, 14**, education reporter for U.S. News & World Report, “The Lack of Women in STEM Is a National Security Issue,” http://www.usnews.com/news/stem-solutions/articles/2014/09/09/attracting-more-women-to-stem-fields-is-a-matter-of-national-security

Attracting more women to study science, technology, engineering and math isn't just an aspirational goal for education leaders and the business community – it's a "national security prerogative," according to the chief operating officer of the National Geospatial-Intelligence Agency. It's no secret that women and minorities are significantly underrepresented in the STEM fields. Although women make up about half of the American workforce, they represent less than one-quarter of those employed in STEM fields, according to the U.S. Department of Commerce. Part of the key to overcoming that disparity, the NGA's Ellen McCarthy said, is continually showing young girls the options available to them in different fields, and engaging them in occupations that might be more meaningful. McCarthy, head of the NGA's daily business operations, said during a town hall discussion hosted by FedScoop on Tuesday that parents, teachers and the public and private business sectors all have a responsibility to push children to think outside the box when it comes to education and career pathways. McCarthy joined two others – Mary Jean Schmitt, business development manager at NetApp, and Veda Woods, chief intelligence security officer and chief intelligence officer of the Recovery and Accountability and Transparency Board – to discuss what business leaders can do to ensure young women are aware of the different opportunities in STEM fields. Jennifer Nowell, U.S. public sector senior director for Symantec, moderated the panel discussion. "This is not something that’s just nice, let’s go study science ... or data curation because that’s where you’re going to get a job. It’s a national security prerogative," McCarthy said. "For the NGA and for the broader intelligence community right now, it is imperative that we keep in front of this incredible technology revolution that we’re living in right now."

Introducing more women into STEM integrates feminist perspectives into a male-dominated field

Wajcman 91 – a Professor of Sociology at the London School of Economics and Political Science (Judy, "Feminism Confronts Technology," 1991, https://books.google.com/books?id=_Hiry47GtWsC&printsec=frontcover#v=onepage&q&f=false)

During the eighties, feminists have begun to focus on the gendered character of technology itself. Rather than asking how women could be more equitably treated within and by a neutral technology, many feminists now argue that Western technology itself embodies patriarchal values. This parallels the way in which the feminist critique of science evolved from asking the 'woman question' in science to asking the more radical 'science question' in feminism. **Technology, like science, is seen as deeply implicated in the masculine project of the domination and control of women and nature.**'2 Just as many feminists have argued for a science based on women's values, so too has there been a call for a technology based on women's values. In Joan Rothschild's (1983) preface to a collection on feminist perspectives on technology, she says that: 'Feminist analysis has sought to show how the subjective, intuitive, and irrational can and do play a key role in our science and technology'. Interestingly, she cites an important male figure in the field, Lewis Mumford, to support her case. Mumford's linking of subjective impulses, life-generating forces and a female principle is consistent with such a feminist analysis, as is his endorsement of a more holistic view of culture and technological developments.

Although women have been pursuing higher education now- still lacking in STEM fields

Marvi **Matos,14**, Manager in engineering, "Women in STEM: Progress, Asymptote, and Equality ," http://www.huffingtonpost.com/marvi-matos/women-in-stem-progress-as_b_6150120.html

In 2010, women were earning 57.2 percent of the bachelor's and 46.8 percent of the doctoral degrees in all fields. In Science and Engineering (S&E), women earned 50.3 percent of the bachelor's and 40.9 percent of the doctoral degrees. Compare these statistics to 1970, when women were awarded 43.3 percent of the bachelor's and 13.5 percent of the doctoral degrees in all fields, while in S&E women earned 28.0 percent of the bachelor's and 9.1 percent of the doctoral degrees. This is undoubtedly great progress towards inclusion and diversity. (National Science Foundation Report) Biological and Agricultural Sciences are examples of outstanding progress with, 58.6 percent of the bachelor's and 51.7 percent the doctoral degrees awarded to women. Other fields such as Psychology and Veterinary Sciences have even higher percentages. However, in math-intensive fields such as Engineering, Computer Science or Mathematics, progress has been limited. In 2010, women were only awarded 18.5 percent of bachelor's and 23.1 percent of doctoral degrees in Engineering. A bigger concern is the fact that progress in the field of engineering has somewhat stagnated since 2000.

Support for domestic STEM education is high

John **Boozman, 6/21**, Senator, "STEM - Gateway for future job opportunities," http://newtoncountytimes.com/stem---gateway-for-future-job-opportunities/article_82d8eda8-16b6-11e5-97a1-5ba743897e39.html

During the last decade, growth in STEM jobs was three times faster than growth in non-STEM jobs. The Department of Commerce (DOC) expects that trend to continue with an overall growth of 17 percent from 2008 to 2018. Unfortunately, American companies have been looking abroad to fill domestic positions because of the lack of skilled workforce in these areas. That's why we are working in Washington to grow STEM opportunities to get more young Americans prepared for the future. There is bipartisan support in both the Senate and the House to expand STEM education opportunities across the country.

No FEAR Act CP

***Credit to: Riley, Jack, and Andrew. BHL2015

The No FEAR Act was passed by congress in response to the EPA having an awful record in preventing sexual harassment and racial harassment. It is currently not enforced. Enforcement solves the ITP aff. The WPA(Whistleblower Protection Act) does not apply to most of the intelligence community. Whistleblowers shatter the groupthink culture. ***

No FEAR Act CP

1NC Shell

CP: The United States Federal government should:

1. **Strengthen enforcement and protections for Federal employees under the Notification and Federal Employee Antidiscrimination and Retaliation Act of 2002.**
2. **Extend the Whistleblower Protection act to all intelligence contractors, subcontractors, and grantees.**

The Counterplan does not link to PTX. More than 50 lobbying groups have endorsed it and Democrats are on board.

CP Solves: Whistleblowers and protecting them should be prioritized. Creates a more open government

McCaskill 15 – Claire Mccaskill is a Democratic Senator from Missouri who has been in office since 2006. McCaskill previously served as State Auditor of Missouri, and before that as Jackson County Prosecutor from 1993-1998. McCaskill has a B.A. and J.D. from University of Missouri and Columbia Law School, respectively. The report internally quotes McCaskill and was released by her office. 2015. ("Marking 'Sunshine Week,' McCaskill Introduces Whistleblower-Protection Package" Office of Claire McCaskill, March, 19. Available via LexisNexis. Accessed 07-21-2015.)

"Whistleblowers are the taxpayers' best friend," said McCaskill, a senior member of the Homeland Security and Governmental Affairs Committee. "These folks play a critical role in keeping our government accountable to its citizens by exposing waste, fraud and abuse—and we've got to surround them with the robust legal protections that enable them to come forward to report wrongdoing."

McCaskill is reintroducing a bill that was first introduced in the wake of the VA scandal last year, which included claims of whistleblower retaliation. The bill mandates the firing of any VA employee found to have retaliated against a whistleblower. Currently, a finding of retaliation against a whistleblower is punishable by a range of procedures, including fines and reprimand.

McCaskill's bill to protect whistleblowers in the intelligence community extends whistleblower protections to intelligence contractors, who are often doing similar jobs to federal employees. Last year, the same bill was endorsed by nearly 50 good government groups.

McCaskill is also introducing legislation to extend current whistleblower protections to grantees, subgrantees and subcontractors. Current protections apply only to contractors, but not to employees of grant recipients, even though the federal government plans to distribute $245 billion in grant funding in fiscal year 2015. The bill would also prohibit contractors from getting reimbursed for legal fees accrued in their defense against retaliation claims by whistleblowers.

The Counterplan solves: the problem is enforcement of the No FEAR Act itself

Fears 04 – Darryl Fears is reporting on environmental issues for The Washington Post newspaper. Darryl Fears covers affordable housing and poverty for The Washington Post. He previously worked on

the national desk, covering race, diversity, immigration, politics and criminal justice policy, and helped launch the "Being a Black Man" series. Before arriving at The Post, Fears worked for the Los Angeles Times, Atlanta Journal Constitution and Detroit Free Press. He is a graduate of Howard University. 2004. “Report Is Bleak For Whistle-Blowers” The Washington Post. March 11. Available via LexisNexis. Accessed on 07-21-2015.

A watchdog group issued a report card yesterday that gave failing grades to several federal agencies for allegedly allowing repeated verbal abuse, retaliation and harassment of employees by superiors who were the targets of discrimination complaints.

The No Fear Institute, a Washington-based organization that was formed to monitor treatment of workers after President Bush signed the **No Fear Act of 2002,** said **the law has had little effect on the federal workplace because the administration has not enforced it.**

"Tens of thousands of people are discriminated against on the basis of race, sex and because they are whistle-blowers," said Marsha Coleman-Adebayo, who chairs the institute. She said agencies are too slow to process complaints, investigate them and discipline managers who discriminate.

"We demand that agencies punish and fire managers who break the law," she said.

The institute based its report on data the agencies posted on their Web sites. But an Office of Personnel Management lawyer said the law did not go into effect until last October and does not require agencies to supply data until April 2005. The OPM is charged with collecting data from agencies to help enforce the law, formally titled the Notification and Federal Employee Antidiscrimination and Retaliation Act of 2002.

"It did not create any new employee rights or protections," said Mark A. Robbins, OPM general counsel. "All the No Fear Act did was force the agency to reimburse their budgets for judgments based on discrimination and whistle-blower complaints."

Under other regulations, federal agencies are required to file information about how complaints are processed to the Equal Employment Opportunity Commission, **but they often do not**.

"I share their frustrations," Robbins said of employees. "Clearly, there's a problem that Congress is trying to fix. Some of these agencies aren't complying the way they should. Congress tried to hit the agencies where it hurts, in their budgets. Only time will tell whether the law helps. I'm confident that it will work."

Prevents Groupthink

Whistleblowers are key to prevent terror attacks by breaking the echo chamber

Benkler 14 – Yochai Benkler, Benkler is the Jack N. and Lillian R. Berkman Professor of Entrepreneurial Legal Studies, Harvard Law School, Faculty Co-Director, Berkman Center for Internet and Society, Harvard University. 2014. ("A Public Accountability Defense for National Security Leakers and Whistleblowers," *Harvard Law & Policy Review,* Available via LexisNexis. Accessed on 07-22-2015.)

Secrecy insulates self-reinforcing internal organizational dynamics from external correction. In countering this tendency, not all leaks are of the same fabric. "War story"-type leaks that make an administration look good or are aimed to shape public opinion in favor of an already-adopted strategy or to manipulate support for one agency over another, trial balloons, and so forth, are legion. n23 While these offer the public color and texture from inside the government and are valuable to the press, they do not offer a productive counterweight to internal systemic failures and errors. Some leaks, however, provide a critical mechanism for piercing the national security system's [*285] echo-chamber, countering self-reinforcing information cascades, groupthink, and cognitive biases that necessarily pervade any closed communications system. It is this type of leak, which exposes and challenges core systemic behaviors, that has increased in this past decade, as it did in the early 1970s. These leaks are primarily driven by conscience, and demand accountability for systemic error, incompetence, or malfeasance. Their critical checking function derives from the fact that conscience is uncorrelated with well-behaved organizational processes. Like an electric fuse, accountability leaks, as we might call them, blow when the internal dynamics of the system reach the breaking point of an individual with knowledge, but without authority. They are therefore hard to predict, and function like surprise inspections that keep a system honest. n24 By doing so, these leaks serve both democracy and security. This failsafe view of whistleblowing is hardly unique to national security. American law in general embraces whistleblowing as a critical mechanism to address the kinds of destructive organizational dynamics that lead to error, incompetence, and abuse. In healthcare, financial, food and drug, or consumer product industries; in state and federal agencies, throughout the organizational ecosystem, whistleblowers are protected from retaliation and often provided with financial incentives to expose wrongs they have seen and subject the organizations in which they work to public or official scrutiny. n25 Whistleblowing is seen as a central pillar to address government corruption and failure throughout the world. n26 Unless one believes that the national security establishment has a magical exemption from the dynamics that lead all other large scale organizations to error, then whistleblowing must be available as a critical arrow in the quiver of any democracy that seeks to contain the tragic consequences that follow when national security organizations make significant errors or engage in illegality or systemic abuse.

Only strengthening Whistleblower Protections and enabling whistleblowing can challenge Groupthink culture.

Pacella 14 – Jennife M. Pacella, Assistant Professor of Law, City University of New York, Baruch College, Zicklin School of Business. 2014. ("INSIDE OR OUT? THE DODD-FRANK WHISTLEBLOWER PROGRAM'S ANTIRETALIATION PROTECTIONS FOR INTERNAL REPORTING" Temple Law Review, Summer 2014. Available via LexisNexis. Accessed 07-21-2015.)

Corporate and securities law scholar, James Fanto, suggests that negative reactions toward whistleblowers occur because the whistleblower threatens "groupthink," a phenomenon in which members of a group become uniform in their perspectives, acknowledging only the seeming positive aspects of group behavior and disciplining any member who challenges such uniformity. n232 "The whistleblower calls into question the totality of the decisions, and the worldview, of the group; the

whistleblower becomes the embodiment of the truth about the organization that the group cannot accept without admitting the massive impropriety at the heart of its [*755] existence." n233 In this way, the whistleblower brings to light a truth that his or her superiors would prefer to avoid, resulting in a collective sense of resistance toward the whistleblower.

t. In 2009, the Ethics Resource Center (ERC) conducted a survey of whistleblower-employees who experienced retaliation for their actions, noting that past research "has identified fear of retaliation as the leading indicator of misconduct in the workplace." n234 The ERC survey studied employees who observed some form of misconduct, reported their observations to someone within the company, and felt that they were punished as a result of reporting. n235 The survey reveals that, in 2009, fifteen percent of all those who observed and reported misconduct felt that they were retaliated agains n236 This rate is higher for organizations with 100 to 499 employees and for union employees, each at twenty-one percent. n237 One scholar notes that this figure is misleading, as the actual percentage of those who have experienced retaliation varies depending on the type of misconduct reported and the position of power of the person who reports, and that the risk of retaliation for reporting major misconduct is actually much higher. n238 The ERC survey revealed that of the various types of retaliation, the majority of respondents experienced the following with the most frequency: exclusion by supervisors or management from work decisions and activities (sixty-two percent); the cold shoulder by coworkers (sixty percent); and verbal abuse by management or supervisors (fifty-five percent). n239

Only strengthening legislation can solve the culture. The Counterplan solves better than the aff.

Pacella 14 – Jennife M. Pacella, Assistant Professor of Law, City University of New York, Baruch College, Zicklin School of Business. 2014. (“INSIDE OR OUT? THE DODD-FRANK WHISTLEBLOWER PROGRAM'S ANTIRETALIATION PROTECTIONS FOR INTERNAL REPORTING” Temple Law Review, Summer 2014. Available via LexisNexis. Accessed 07-21-2015.)

Further research has revealed that the two most common explanations for why employees do not report internally are fear of retaliation and feelings of futility if they choose to report, with fear of retaliation supported by a very real risk that internal whistleblowers will be penalized for disclosing misconduct. n240 The threat of reprisal itself is a major deterrent to blowing the whistle, causing potential whistleblowers to carefully weigh the possible costs and benefits of reporting wrongful acts. n241 A potential whistleblower's disincentive to report often exists whether or not the actual reprisal is carried out - "perceptions of the likelihood of retribution are just as important [in deciding whether to blow the whistle] as the reality, if not more so." n242 [*756] Such perceptions, which may include fears of being viewed as a troublemaker or liar, or punitive action such as threats, demotion, or termination from employment, have been found to depend on contextual factors that are largely based on the institution itself, making it less likely that an employee will report wrongdoing if the institution has a history of retaliating against past whistleblowers. n243

These disincentives for internal whistleblowers are extremely detrimental to bringing potential violations of the securities laws to the forefront, as those from the inside are the most valuable source of information. As one whistleblower scholar has articulated, "whistleblowing is the single most effective way to detect fraud," n244 because the government relies heavily on private individuals to detect misconduct through reporting. n245 Whistleblowers, as actual insiders, have "better and earlier access to information about the most serious instances of corporate fraud." n246 Over forty percent of

fraud detection results from whistleblower tips. n247 Tips from whistleblowers have been found to be thirteen times more effective than external audits in bringing possible violations to the forefront. n248 A study in which statistics of employee-whistleblowers were examined revealed that, **in eighty-two percent of cases,** the whistleblower experienced **retaliation, such as termination, quitting under duress, or had significantly altered responsibilities.** n249 This study also revealed that many employee-whistleblowers reported that they were forced to move to another industry or even another town to avoid harassment. n250 In fact, given these repercussions, it is surprising that internal whistleblowers decide to report at all.

A2 Whistleblowers undermine National security

Empirically false. Whistleblowers are key to effective National security

Benkler 14 – Yochai Benkler, Benkler is the Jack N. and Lillian R. Berkman Professor of Entrepreneurial Legal Studies, Harvard Law School, Faculty Co-Director, Berkman Center for Internet and Society, Harvard University. 2014. ("A Public Accountability Defense for National Security Leakers and Whistleblowers," *Harvard Law & Policy Review,* Available via LexisNexis. Accessed on 07-22-2015.)

Even if we understand that the national security establishment can make mistakes, there remains the argument that secrecy is vital to security; that the price of transparency is too high. The argument gains force from the fact that understanding how security is enhanced by secrecy is intuitively trivial. A military unit is on its way to execute an attack on an enemy, and someone tips off the enemy who escapes or ambushes the troops. This is classic "**transports on the way**" secrecy that could be subject to prior restraint under the Pentagon Papers case. n62 **Only one case of leaking to the press has ever involved a risk of this type**: the case of Morton Seligman, who leaked decoded Japanese naval dispatches in the midst of World War II, and whose publication after Midway could have disclosed that the United States had broken Japanese naval codes. n63 This is the threat most legitimately interjected against leaks, but in all but that one World War II case, it has been pat **hyperbole in criticisms of press leaks.** Private Manning's disclosures to Wikileaks, for example, were denounced as likely to cause deaths, a claim that the Pentagon was not willing to repeat when asked for a formal assessment by the Senate Armed Services Committee. n64 **Claims of secrecy of this sort** normally assert power in the relationship between **the national security system and the public opinion system.**

No Fear Act solves Terror

Solves terror

Herrara 8—Elizabeth Angela Herrera , August 2008 A Thesis Presented to the Faculty of the Graduate School of Cornell University In Partial Fulfillment of the Requirements for the Degree of Master of Public Administration ("STRIKING A BALANCE: WHISTLEBLOWING PROTECTIONS IN THE INTELLIGENCE COMMUNITY,", august 2008 Available Online athttp://ecommons.cornell.edu/bitstream/handle/1813/11249/Herrera%20Thesis.pdf;jsessionid=63F2A59C9EFD13F3B6F8D50A55C60592?sequence=1, Accessed 7-22-2015)

In the span of the two years it took Congress to succeed in finalizing the No FEAR Act and having it signed into law, the United States experienced the worst terrorist attack in its history on September 11, 2001. After the attack, several whistleblowers came forward about botched investigations, poor security in airports, and several other claims alleging that the federal government could have prevented the attack.19 These disclosures prompted the formation of the National Commission on Terrorist Attacks Upon the United States (also known as the 9-11 Commission), “an independent, bipartisan commission created by congressional legislation and the signature of President George W. Bush in late 2002.”20 Whistleblowers from various intelligence agencies received little protection from reprisal under the law and the enforcement of the No FEAR Act was sidelined while the federal government worked on protecting the U.S. from further attacks.21

No FEAR Solvency card (orig)

The original No FEAR Act solves for Federal workplace Harassment

Coleman-Adebayo 02 – Dr. Marsha Coleman-Adebayo, received her BA degree from Barnard College/Columbia University and her doctorate degree from the Massachusetts Institute of Technology (MIT). She is the author of No FEAR: A Whistleblower's Triumph over Corruption and Retaliation at the EPA. Dr. Coleman-Adebayo was a Senior Policy Analyst in the Office of the Administrator at the US Environmental Protection Agency. She has held various academic positions as Adjunct Professor at the Georgetown University _ School of Foreign Studies and Visiting Scholar in the Department of African-American Studies at George Mason University. On August 18, 2000, Dr. Coleman-Adebayo won an historic lawsuit against the EPA on the basis of race, sex, color discrimination, and a hostile work environment. She subsequently testified before Congress on two occasions. As a result, the Notification of Federal Employees Anti-discrimination and Retaliation Act [No FEAR] was introduced by Congressman F. James Sensenbrenner (R-WI), Congresswoman Sheila Jackson Lee (D-TX) and Senator John Warner (R-VA). Along with the No FEAR Coalition, she ushered the No FEAR Bill through Congress. President George W. Bush signed the No FEAR Act into law. Thousands of federal workers and their families have directly benefited from this law. She serves as a producer on the dramatic film: No FEAR!

WASHINGTON— On May 15, President Bush signed the first civil rights law of the 21st century. The No Fear Act (for Notification and Federal Anti-Discrimination and Retaliation) will change the way the government operates. Managers in federal agencies found guilty of discrimination will no longer find it easy to avoid responsibility for their actions, and their agencies will have to pay for the consequences of their conduct.

The new law will make it less likely that the kind of workplace discrimination and harassment I endured at the Environmental Protection Agency -- and over which I successfully sued -- will go unnoticed and unpunished. As I testified before the House Science Committee while advocating for this law, federal employees should not have to work in a culture of fear and intimidation. The threat of reprisal, including loss of their jobs, prevents them from reporting abuses. Intolerance may prevent them from performing at their most effective level.

My troubles were most intense when I served as the E.P.A. liaison for the environment on the Gore-Mbeki Commission, a Clinton administration foreign policy program with South Africa. After I reported that an American company was poisoning its African workers and their families with toxic waste, I was relieved of my responsibilities on the commission, my efforts to conduct an investigation were stifled and I was made a target of personal abuse. Racial epithets were hurled at me by senior officials; I was denied a promotion, supposedly because I made the choice to become pregnant; and I received threatening phone calls at home.

When I filed a discrimination complaint with the E.P.A.'s civil rights office, my situation grew worse. I sued, and in August 2000 a federal jury found the E.P.A. guilty of discrimination and creating a hostile work environment. It awarded me $600,000 in damages. It was my case that moved Congress to take up the No Fear bill.

Thousands of federal employees are working under the daily stress of discrimination. In 2000, female and nonwhite federal employees made nearly 25,000 complaints against the federal government. Settlements and judgments cost the federal government tens of millions a year, but total expenditures

have been hard to calculate and there has been little Congressional oversight. There is no accountability because most judgments were paid from a general government judgment fund without penalty to the agency at fault.

The No Fear Act will force federal agencies to pay all settlements and judgments for discrimination from their own budgets. It contains reporting requirements that will help determine whether a pattern of misconduct exists within an agency and whether that agency is taking action to address it. It requires that employees and managers be notified of their rights and responsibilities. And it strengthens protections for whistleblowers, who are often forced to choose between remaining silent about a dangerous or illegal situation and risking their careers by telling the truth.

The House and the Senate unanimously passed the No Fear Act. It was sponsored in the House by F. James Sensenbrenner, the conservative chairman of the House Judiciary Committee, and Sheila Jackson Lee, a liberal Democrat. In the Senate, John Warner took the lead on the bill. This bipartisan support shows that both political parties recognize the need to root out discrimination in the federal government and that they can come together to protect the rights of minorities and women.

The No Fear Act will serve society by making it possible for federal employees to raise red flags when they see misconduct. The government should be a leader in protecting employee rights, and the new law will push it in that direction.

No Fear Act Solves

The No FEAR Act can solve the case: it is the strongest legislation to prevent discrimination and allow for whistleblowing

Pell 05 – Lisa Pell, Editor-in-Chief, Cardozo Journal of Conflict Resolution. B.A., Brandeis University, 2001; J.D., Benjamin N. Cardozo School of Law, Yeshiva University, 2005. ("IS ALTERNATIVE DISPUTE RESOLUTION REALLY AN ALTERNATIVE FOR FEDERAL EMPLOYEES?: POSSIBLE SUGGESTIONS FOR ENCOURAGING FEDERAL EMPLOYEES TO PARTICIPATE IN ADR PROGRAMS" Yeshiva University Cardazo Journal of Conflict Resolution. Spring, 2005. Available via LexisNexis. Accessed 07-21-2015.)

In 2002, Congress passed the Notification and Federal Employee Anti-Discrimination and Retaliation Act, Pub. L. No. 107-174, 116 Stat. 566 (2002), in order to hold the federal government accountable for violations of anti-discrimination and whistleblower laws. One of the goals of the No FEAR Act was to protect whistleblowers from retaliation by their employers, particularly in recent times where corporations have come under fire for illegal practices. Additionally, No FEAR's relationship to the federal government is one of accountability. For this reason, the No FEAR Act is an essential aspect of the DOT's ADR program. Accountability regarding anti-discrimination is a method for creating an environment where there is less discrimination and fewer complaints. The hope of the No FEAR Act is to streamline the discrimination complaint process. The Department of Civil Rights hopes to use the No FEAR Act to improve the monitoring, accountability and enforcement of a fair and efficient complaint process, by having the No FEAR Act implemented **in a "timely and high quality fashion.**" See Office of the Secretary, Departmental Office of Civil Rights, State of Equal Employment Opportunity Discrimination Complaints Report, at 14 (2002) [hereinafter Discrimination Complaints Report].

The No FEAR Act as legislation solves, it is about enforcement

Roth 11 – Debra L. Roth is a partner at the law firm Shaw Bransford & Roth, a federal employment law firm in Washington, D.C. She is general counsel to the Senior Executives Association and the Federal Managers Association, host of the "FEDtalk" program on Federal News Radio, and a regular contributor to Federal News Radio's "Federal Drive" morning show. ("Managers should be wary of running afoul of No Fear Act", Ask The Lawyer, Available at: http://askthelawyer.federaltimes.com/2011/10/31/managers-should-be-wary-of-running-afoul-of-no-fear-act/, Accessed 7-26-2015)

Managers should be aware of and wary of the No FEAR Act — the Notification and Federal Employee Antidiscrimination and Retaliation Act — and its requirements. Numerous provisions of the law are potential land mines for managers. For example, the law requires agencies to report to Congress annually about violations of anti-discrimination and whistle-blower reprisal laws, including such information as the number of offending managers who were disciplined, the nature of the discipline and the agency's policy about taking discipline against managers who are found to have discriminated or retaliated against their subordinates.

This alone makes the threat to federal managers very real**, but the rate of actual disciplinary action because of discrimination or reprisal seems low.** This causes managers to relax a little too much and to

not take seriously the threat of discipline because of the No FEAR Act. The cultural change that was supposed to have occurred because of No FEAR has simply not occurred.

This creates frustration and statements of outrage from civil rights groups who believe that managers regularly discriminate, but are almost never held accountable. The result of this pressure means that agencies will begin to take findings of discrimination in EEO cases seriously and may look for a manager to be a scapegoat.

Enforcement Key

The current No FEAR Act is bogged down in red tape; inhibits effectiveness

Hall 2 — Hall, Debbie, Owner of the Village Enterprise and former federal employee, Banner Software. MA from Stanford University Graduate School of Business. 2002 ("Whistle-blower fears `No Fear' Act will be lost in red tape. ,"Insight on the News, 15 Oct. 2002, Available Online at http://go.galegroup.com.proxy2.cl.msu.edu/ps/i.do?p=AONE&u=msu_main&id=GALE|A93457379&v=2.1&it=r&userGroup=msu_main&authCount=1, Accessed 7-22-2015)

I am writing in reference to your article "Bush Must Keep Pledge to Whistle-Blowers" [the last word, Oct. 1-14]. Currently, I am having an experience very similar to Coleen Rowley of the FBI and I too am facing career-ending reprisal from senior federal management after reporting fraud. I can basically quote Rowley's story word for word; however, my headline would read: Will the Real Federal Government Please Stand Up?

It's sad to say that the federal government does not want, support or appreciate employees who expose fraud, waste and corruption. Furthermore**, with little to no support by agencies, it seems that the "No Fear" Act may in fact turn out to be another system of bureaucratic red tape.**

Didn't you see how swift the president was in pouncing on the fraud of corporate America? Where is that same system of punishment for the federal government?

I am very disappointed in the ethical responsibility shown by the federal government across the board. I work for an agency that services customers worldwide; therefore, we are entrusted with millions of dollars. The input of funds by taxpayers and output of mostly contracted services by our agency equates to gross mismanagement, fraud and abuse of power. The unqualified contractors in our office are paid salaries that would make Donald Trump blush! And Congress thinks we are saving money by replacing federal workers with this bombardment of contractors.

I have written our senior management and my congressional leaders on several occasions concerning the problems in my office, but to no avail--and the reprisal has always worsened.

I do not know how we are going to make it as a nation if this type of protected fraud continues.

The Current No FEAR Act has loopholes for enforcement that hinders effectivity.

Young 7 — Joseph Young is a staff writer at the Washington Informer, and online and print newspaper. 2007 ("Whistleblower Protection Law Sought for Federal Workers," No Publication, January 4th, Available via LexisNexis Accessed 7-22-2015)

They call themselves the No FEAR 7 - Marsha Coleman-Adebayo, Matthew F. Fogg, Blair Hayes, Janet Howard, Dennis E. Young, Joyce E. Megginson and Zena D. Crenshaw - all federal workers who blew the whistle on various federal government agencies for discrimination against minority workers.

The No FEAR 7 held a press conference last week at the Cannon House Office Building, announcing the Notification and Federal Employee Antidiscrimination and Retaliation Act (No Fear), which will be introduced in the 110th Congress next year by Rep. John Conyers (D-Mich.), who will chair the House Judiciary Committee when the Democrats take control of the chambers in January.

At the Capitol Hill press conference, Rep. Albert R. Wynn (D-Md.) said the No Fear Act of 2002 has loopholes, and it has not been effective in ending discrimination within the federal workplace. "It has not worked as well as we had hoped," said Wynn. "The bill needs more teeth."

Contractor Protections solve

The Worker's protection act does not protect contractors. We need more Snowdens.

Papandrea 14 – Mary-Rose Papandrea, Papandrea came to the University of North Carolina School of Law in 2015 from Boston College Law School. Her teaching and research interests include constitutional law, media law, torts, civil procedure, and national security and civil liberties. After graduating from Yale College and the University of Chicago Law School, Professor Papandrea clerked for U.S. Supreme Court Justice David H. Souter as well as Hon. Douglas H. Ginsburg of the D.C. Circuit and Hon. John G. Koeltl of the U.S. District Court for the Southern District of New York. 2014. 9"LEAKER TRAITOR WHISTLEBLOWER SPY: NATIONAL SECURITY LEAKS AND THE FIRST AMENDMENT" Boston University Law Review. March, 2014. Available via LexisNexis. Accessed on 07-22-2015)

The paucity of protections for national security employees stands in great contrast to the safeguards afforded to other government employees. The Federal Whistleblower Protection Act (WPA) protects a government employee who discloses information that he "reasonably believes" demonstrates a violation of any law, rule, or regulation, an instance of gross mismanagement, a gross waste of funds, an abuse of authority, or a substantial and specific danger to public health or safety, so long as he is not prohibited by law or required by executive order to keep the information secret. n257 Other federal laws in certain situations protect whistleblowers who act on a "reasonable belief" of wrongdoing n258; still others protect those who report "potential" n259 or "alleged" n260 violations of federal law. n261 The reason for protecting these good faith beliefs is to encourage disclosures. n262

The WPA offers virtually **no protection to national security employees and contractors**. n263 First, the WPA makes **no mention of contractors at all** and [*492] appears on its face to apply only to government employees. n264 **Second, government employees in national security agencies are generally excluded from the WPA's coverage**. n265 Third, federal employees covered under the WPA will find themselves without protection under the WPA if they disclose classified information that is marked as an executive order and regarding defense or foreign affairs to anyone except the Inspector General (IG) or Special Counsel. n266

Protecting private contractors is essential: status quo regulations fail.

Boyne 14 – Shawn Marie Boyne. Professor of Law, Indiana University Robert H. McKinney School of Law-Indianapolis. 2014 ("LABOR LAW: Whistleblowing" Indiana University Law Review. Available via LexisNexis. Accessed on 07-21-2015.)

In recent decades the shortcomings of the extent of whistleblower protection under the FCA have become clearer. In particular, the FCA's provisions did not give plaintiffs a cause of action for several common forms of retaliation. The largest loopholes included: coverage for individuals who were planning to file a qui tam action, individuals who attempted to blow the whistle without filing an action, employees who refused to participate in the fraudulent practices, retaliation [*435] against the whistleblower's family members and colleagues, and retaliation against contractors and agents employed by the defendant who did not fall under a strict construction of the word "employee." n46 In 2009, Congress attempted to close those loopholes in the Fraud Enforcement and Recovery Act (FERA), which is discussed below. In an effort to fight any potential liability, employers still found ways to fight qui tam suits. One of the chief impediments to an FCA suit was

the act's "Public Disclosure Bar." In cases in which some of the information contained in the suit was based on information available to the public, employers moved courts to dismiss suits by alleging that the suits did not further the public interest. The U.S. Supreme Court attempted to weigh in on this issue in Graham County Soil and Water Conservation District v. U.S. ex rel. Wilson, 559 U.S. 280 (2010), when the Court held that relators could not proceed with an action when that action relied in part on information available from publicly available state and local administrative reports, audits, and investigations. However, that portion of the decision was moot before it was announced as, one week prior to the Court's decision, the President signed into law the Patient Protection and Affordable Care Act. This new legislation precluded courts from dismissing future cases under this section of the FCA. Until 2010, the relator had to prove that he or she was the "original source" of the information and that the information provided by the whistleblower was not available from public sources to prevent courts from dismissing claims because they claimed to lack subject matter jurisdiction. n47

No FEAR Act CP Answers

No FEAR Act can't Solve

Alt casuse: espionage Act used to justify persecution of whistleblowers

Kines 13 – Candice M. Kines, JD, West Virginia University College of Law, Class of 2014; BA, Christopher Newport University, 2010. 2013. ("DEFINING THE RIGHTS OF JOURNALISTS AND WHISTLEBLOWERS TO DISCLOSE NATIONAL SECURITY INFORMATION" West Virginia Law Review, num. 735, Winter. Available via LexisNexis. Accessed on 07-26-2015.)

The Espionage Act of 1917 n2 - a law originally created to fight acts of espionage n3 and treason n4 - is increasingly being used to prosecute whistleblowers who, in an effort to raise public awareness, disclose to the media questionable government activity. n5 Consequently, the government has used the Espionage Act to deter whistleblowers from disclosing any information involving national security. n6 However, not all national security disclosures have the purpose or effect of harming our country. In fact, placing substantial restrictions on the disclosure of this kind of governmental information may be even more harmful. Although secrecy is important in preserving the nation's security, public disclosure of certain information or conduct is necessary for a healthy democracy because it adheres to fundamental notions of democracy and significantly increases government accountability. n7 In contrast, nondisclosure of government information creates greater opportunity for the government to engage in activities that are illegal, immoral, and publicly unpopular. n8 Additionally, by substantially restricting disclosure, [*737] the government can conceal such conduct in order to avoid public criticism. n9 Thus, public disclosure of certain government information is also necessary to prevent governmental abuse.

The increased prosecutions of whistleblowers not only demonstrates the government's complete disregard for the benefits of certain disclosures, but also its failure to recognize the fact that whistleblowers are not the only participants of disclosure. In fact, by nationally publishing disclosed information, the media plays an even greater role than whistleblowers in the distribution of classified government information. Without national or world-wide publication - whether through newspapers, online, television, or radio - such information would pose little to no threat because the likelihood of unwanted readers acquiring the information would be slim. Despite this fact, the government prosecutes only whistleblowers but allows journalists to widely distribute without fear of consequence the same information that the government is attempting to protect, namely, information that it believes to be harmful to national security. n10

The Counterplan does not bolster legislation to protect whistleblowers from prosecution

Kines 13 – Candice M. Kines, JD, West Virginia University College of Law, Class of 2014; BA, Christopher Newport University, 2010. 2013. ("DEFINING THE RIGHTS OF JOURNALISTS AND WHISTLEBLOWERS TO DISCLOSE NATIONAL SECURITY INFORMATION" West Virginia Law Review, num. 735, Winter. Available via LexisNexis. Accessed on 07-26-2015.)

As stated above, there are no current laws - including the First Amendment - that provide protection to whistleblowers for disclosing governmental information. Instead, the laws currently recognized only enable greater prosecution of whistleblowers and they do so regardless of the [*758] circumstances surrounding the disclosure (e.g., regardless of the type, purpose, or effect of the disclosure). n167 Part III of this Note analyzes these laws. The first section discusses the adequacy of the reporter's privilege. While the purpose of the privilege is to preserve the confidentiality of reporters' sources n168 - many of

which are whistleblowers - it rarely accomplishes this goal. The second section discusses the Espionage Act, which is increasingly being used to prosecute whistleblowers. n169 The Act allows for the prosecution of any individual who discloses classified information to a journalist; however, the Act does not provide for the prosecution of a journalist who chooses to publish that material for the world to see. n170 Thus, the reporter's privilege and the Espionage Act provide no protection for whistleblowers, but instead only create an avenue for their prosecution.

By failing to provide protection to whistleblowers, these laws also fail to recognize the benefits that disclosure has to offer, particularly the generation of thoughtful public debate and the encouragement of government accountability. Furthermore, by providing an unlimited ability for journalists to publish classified government information, these laws cannot truly protect the nation's security. Therefore, because neither the benefits of disclosure - thoughtful public debate and government accountability - nor the benefits of nondisclosure - protection of national security - are satisfied here, these laws fail to promote the overall public good. n171

Obama Administration doesn't care. Prosecution of whistleblowers ensures circumvention

Kines 13 – Candice M. Kines, JD, West Virginia University College of Law, Class of 2014; BA, Christopher Newport University, 2010. 2013. ("DEFINING THE RIGHTS OF JOURNALISTS AND WHISTLEBLOWERS TO DISCLOSE NATIONAL SECURITY INFORMATION" West Virginia Law Review, num. 735, Winter. Available via LexisNexis. Accessed on 07-26-2015.)

Due to the inability of the reporter's privilege to effectively protect whistleblowers, as demonstrated by Sterling's case, the current Administration has **more than doubled the number of whistleblowers previously prosecuted under the Espionage Act**. n51 Further, while the government's interest in prosecuting whistleblowers is to prevent disclosure of information that could be harmful to the United States, no legislative method is currently in place to deter the media from widely publishing that same harmful information. Therefore, absent any regulation of information published by the media, prosecuting whistleblowers for disclosing national security information cannot adequately serve the government's interest of preventing harmful disclosure.

Nevertheless, the Obama Administration has been increasingly persistent in prosecuting whistleblowers and attempting to force journalists to [*744] testify against them. n52 This aggressive and "unprecedented crackdown over leaks" has been termed Obama's "war on whistleblowers" n53 or more commonly, the "war on leaks." n54 The Obama Administration's reaction to recent disclosures of national security information highlights the disparity that exists between journalists and their sources regarding the ability to disclose information. n55

WhistleBlower Protection Fails

Whistle blower laws decrease the amount of whistle blowing taking place

Martin 03 – Brian Martin (born 1947) teaches in the interdisciplinary area of Science, technology, and society at the University of Wollongong in Australia, where he became a professor in 2007.[1] He was president of Whistleblowers Australia from 1996 to 1999 and remains their International Director. 2003. ("Illusions of Whistleblower Protection" UTS Law Review, No. 5. Available via LexisNexis. Accessed on 07-26-2015.)

Thoms (1992: 83), using a Weberian analysis, argues that "Whistleblower legislation strives to control the agenda of whistleblowers and to contain their disclosures to channels which are under the purview of the state. Under regimes of authorized whistleblowing, the potential for criticism and review of the operations of the state by the public it is said to serve are virtually non-existent." The cynical explanation of whistleblower laws is that they are intended to encourage employees to speak out, revealing their identity and, rather than protecting them, instead making them easier targets for attack. This explanation is espoused by a few disillusioned whistleblowers. These explanations are actually compatible. Promoters of whistleblower laws may be quite sincere but the laws in effect can serve to give the illusion of protection. They may also lead employees to believe, mistakenly, that they are protected and thus to become easier targets than if the laws did not exist.

Whistle Blower protection laws will fail – lots o. warrants why

Martin 03 – Brian Martin (born 1947) teaches in the interdisciplinary area of Science, technology, and society at the University of Wollongong in Australia, where he became a professor in 2007.[1] He was president of Whistleblowers Australia from 1996 to 1999 and remains their International Director. 2003. ("Illusions of Whistleblower Protection" UTS Law Review, No. 5. Available via LexisNexis. Accessed on 07-26-2015.)

A fundamental problem with whistleblower laws is that they usually come into play only after disclosures have been made and reprisals have begun. As in the example at the beginning of this article, many employees make disclosures in good faith, not thinking of themselves as whistleblowers. As a result, they seldom have gathered sufficient evidence about the alleged problem to withstand a concerted cover-up. Not anticipating any adverse reaction, they may not be in a position to document reprisals. As a result, invoking whistleblower laws is seldom a practical proposition. Another problem is that there are many subtle ways for employers to undermine employees without providing clear-cut evidence of reprisals. Rumours and ostracism are two of the most common responses encountered by whistleblowers but are virtually impossible to document. Petty harassment is also potent. It might mean such minor things as unavailability of a company car, awkward rosters, slowness in processing claims, or requests for excessive documentation. Ostracism itself can cause the equivalent of petty harassment, as a worker is denied access to everyday information needed to do the job efficiently. At a more serious scale are job reassignments that reduce or increase work demands, either setting up the employee for failure or making the job tedious; in both cases it is often easy to camouflage the changes as necessary due to changes in the work environment or to a more general organisational restructuring. Ironically, it can be more difficult for an employee to deal with subtle undermining than with a more obvious attack such as demotion or dismissal. Subtle harassment can lead some employees to blame themselves whereas blatant attacks are more readily understood as reprisals. Another problem with whistleblower

laws is that they typically pit a lone employee against a powerful organisation. The organisation can pay for expensive legal advice and has little to lose by making the case as protracted as possible. Individuals in the organisation have little at stake; indeed, many of them may have moved on in the years it takes for a case to run its course. On the other side, the whistleblower is often alone in pursuing the case, sometimes without any income and seldom with dedicated backing from an organisation. Whistleblower laws put the focus on whistleblowers and what is done to them. An unfortunate feature of this focus is a relative neglect of the original issue about which the employee spoke out. Whistleblower laws do not and perhaps cannot require an investigation into an employee's allegations. During the drawn-out process of assessing whether reprisals have occurred, the original issue is not addressed. For a dismissed whistleblower, "success" usually comes in the form of a settlement, not a reinstatement; **success in terms of organisational reform is not part of the agenda of whistleblower laws.** These **shortcomings of whistleblower laws are so systemic that it is worth asking why anyone would bother with them at all.** Three types of explanations can be labelled sincere, symbolic and cynical. Undoubtedly most of those who promote whistleblower laws are completely sincere. This includes many whistleblower activists whose sincerity cannot be doubted, given that they themselves are victims of reprisals. But sincerity of intent is no guarantee of effectiveness in execution. The flaws in the vehicle - whistleblower legislation - are seen as unfortunate weaknesses, due to poor drafting, inadequate resources or ineffectual implementation. A different explanation is that whistleblower laws are a form of symbolic politics (Edelman, 1964), serving to give the appearance of political action without any substantive change in institutional dynamics. Symbolic politics is deployed when popular pressure becomes strong. A law gives the appearance of government concern even though it may not lead to any change in behaviour. For example, governments can placate concerns about crime by passing laws even though there is little evidence that longer prison sentences form a deterrent to violent crime or that more than a tiny proportion of corporate crime is ever prosecuted.

Whistle blower Protection Act offers no protection, and the plan will be circumvented by executive branch.

DW 14 – Deutsche Wells, is an German and American international news organization that runs but US and international news with collaboration in Europa, the US, Latin America, and Beijing. 2014. ("US whistleblower laws offer no protection", DW, January 28th. Available at: http://www.dw.com/en/us-whistleblower-laws-offer-no-protection/a-17391500, accessed 7-26-2015)

Some eight months before Edward bySnowden leaked classified NSA programs to the press, US President Barack Obama issued an order extending whistleblower protections to employees of America's intelligence agencies. The White House often cites this fact when addressing the three felony charges against Snowden, in total carrying a maximum sentence of 30 years in prison. Two of those charges fall under the 1917 US Espionage Act.

In his January speech on NSA reform, President Obama said that he did not want to "dwell on Mr. Snowden's actions or his motivations." But five months earlier, the US commander-in-chief had already made clear that he did not view the 30-year-old as a whistleblower or patriot, saying that Snowden had failed to use official, non-public "proper channels" to express his concerns about NSA surveillance.

But Snowden has said that Obama's extension of whistleblower protections to the intelligence community, under Presidential Policy Directive 19 (PPD-19), does not cover government contractors.

Before his disclosures, Snowden was an employee of the company Booz Allen Hamilton, which contracted with the National Security Agency.

"If I had revealed what I knew about these unconstitutional but classified programs to Congress, I could have been charged with a felony," Snowden said in a live, online question and answer session last Thursday.

'Death by a thousand cuts'

For years, would-be whistleblowers in the US intelligence community had no legal protections to shield them from retaliatory measures by their superiors**. The Whistleblower Protection Act of 1989 covered most of the federal government with the glaring exception of the intelligence agencies.**

In an effort to close this legal gap, Congress passed the Intelligence Community Whistleblower Protection Act (ICWPA) a decade later. The law covers employees and contractors at the Central Intelligence Agency (CIA), the National Security Agency (NSA), the Defense Intelligence Agency (DIA), the National Imagery and Mapping Agency (NIMA) as well as the National Reconnaissance Office (NRO).

But according to Thomas Drake, the act failed to adequately protect whistleblowers from retaliation. A former senior executive at the NSA, Drake blew the whistle on a failed surveillance program called Trailblazer. He used what the government calls "proper channels" to express his concerns about the program's exorbitant cost and its lack of privacy protections, reaching out to his immediate supervisor, the office of the inspector general, and the congressional intelligence committees.

"I was reprised against severely within the proper channels," Drake told DW. "I was identified as a troublemaker."

Thomas Drake at NSA demonstration

Drake used "proper channels," but still faced retaliation

Drake called the NSA's response to his whistleblowing activities "death by a thousand cuts administratively and bureaucratically," saying that the agency found ways to change his job and cut his responsibilities. Ultimately, the NSA re-organized the section he worked in, leaving him with nothing but a "paper title." Drake resigned from the agency in 2008.

"There's nothing within the act that actually protects you. I don't have cause of action - I can't go to the courts for redress," he said, adding that his only recourse was to file evidence with the Defense Department inspector general's reprisal unit. According to Drake, the unit agreed that he had suffered from reprisal, but the case still has not completely resolved itself.

Drake only went public, contacting the Baltimore Sun newspaper, when he felt that the proper channels had failed. The federal government indicted him under the US Espionage Act for supposedly taking classified documents illegally, an allegation that unraveled before the trial. In the end, the government dropped the charges in exchange for Drake agreeing to plead guilty to one misdemeanor count of misusing a NSA computer. He was sentenced to a year of probation and 240 hours of community service.

Murky legal framework

Although the ICWPA covered both employees and contractors, US whistleblower laws have been changed through legislative and presidential action since the Drake case. In 2012, Congress passed and President Obama signed the Whistleblower Protection Enhancement Act. But the law excluded the intelligence agencies from coverage.

Although Obama had issued his directive that same year extending whistleblower protections to the entire intelligence community, PPD-19 only covers intelligence agency employees. Contractors, such as Edward Snowden, are not explicitly protected by the directive. Even for legal experts, it's unclear how exactly all of these different regulations interact with one another, and whether or not contractors such as Edward Snowden are covered by the *whistleblower* laws.

"No one knows exactly how those pieces are supposed to fit together," William C. Banks, an expert on national security law at Syracuse University College of Law, told DW. "But I think the trump card is the criminal law. Regardless of whether the contractor or a regular employee of a US agency is blowing the whistle, **if he or she is** at the same time **violating a criminal law of the United States, the whistleblower protection is worthless."**

And, defendors don't even use the whistleblower protection laws.

DW 14 – Deutsche Wells, is an German and American international news organization that runs but US and international news with collaboration in Europa, the US, Latin America, and Beijing. 2014. ("US whistleblower laws offer no protection", DW, January 28th. Available at: http://www.dw.com/en/us-whistleblower-laws-offer-no-protection/a-17391500, accessed 7-26-2015)

Mark Zaid, an attorney in Washington, D.C., represents intelligence community whistleblowers. Zaid doesn't make use of the whistleblower protection laws when representing his clients, calling the provisions "inadequate." Obama's presidential directive, for example, is largely discretionary and doesn't actually guarantee whistleblowers protection. It only provides a process by which their claims of suffering from retribution can be addressed.

Nevertheless, Zaid said that Edward Snowden had a legal obligation to use the proper channels, even if the protection laws were insufficient.

Edward Snowden Filmstill WikiLeaks

It's murky, at best, whether or not a contractor like Snowden was covered by the whistleblower laws

"He has a legal obligation to do so, and I think he has moral obligation to do so, to at least try to work through the system, as futile as it might be, before taking the last resort, which is to provide the information to third parties without authorization," Zaid told DW.

But according to NSA whistleblower Thomas Drake, the whistleblower system has been corrupted from within, which discourages people from coming forward.

"The reporting chains themselves largely serve to protect the institution from those that would expose it, even from those within," Drake said.

"…Especially when they see what happens to people like me, they will choose to remain silent, they will ultimately censor themselves and not report the wrongdoing, although they're in the best position to do so."

DW R

Cartels/Latin America Stability CPs

**Prosecute banks CP

The United States should prosecute bank employees who launder money.

The counterplan is comparatively better than the plan

Morris 2013 (Evelyn Krache [Research Fellow, International Security Program, Belfer Center for Science and International Affairs @ JFK School of Govt, Harvard]; Think Again: Mexican Drug Cartels; Dec 3;www.foreignpolicy.com/articles/2013/12/03/think_again_mexican_drug_cartels; kdf)

"We Need to Hit Them Where It Hurts: the Wallet." Exactly. **Despite the ongoing arguments about drug legalization** and border security, **the most effective** way to combat the scourge of the DTOs would be to interdict not drugs or people but money. As in any business, money is the fuel that keeps the cartels running. Even if Sinaloa, to give only one example, were to disappear tomorrow, other organizations would quickly rise to take its slice of the lucrative pie. One of the most basic tenets of business is that highly profitable markets attract lots of new entrants. This is true for legal and illegal enterprises alike. The staggering profits of illegal trade would be much less attractive if the DTOs could not launder, deposit, and ultimately spend their money. But shutting down the cartels' financial operations will be a formidable task, given the help they have had from multinational financial institutions, which have profited from the cartels' large-dollar deposits. In 2010, Wachovia bank (which was acquired by Wells Fargo in 2008) admitted that it had processed $378 billion of currency exchanges in Mexico -- an amount equal to about one-third of the country's GDP -- to which it had failed to apply anti-laundering restrictions. In 2012, British bank HSBC settled with the U.S. government for $1.9 billion to escape prosecution for, among other things, laundering hundreds of millions of dollars for the Sinaloa cartel. U.S. law enforcement has also implicated Bank of America and Western Union in DTO money laundering. Although illegal money transfers can happen without banks' knowledge, the volume and widespread occurrence of these transactions indicate just how easy it is for the cartels to clean their dirty money. Paying a fine to avoid prosecution is almost no punishment at all. The fines Wachovia paid amounted to less than 2 percent of its 2009 profit. Even the record fine assessed on HSBC amounted to only 12 percent of the bank's profits. Furthermore, banks can simply accrue funds to offset any possible fines, either by increasing what they charge cartels or by setting aside some of the earnings from laundering, even as they continue to do business with the DTOs. Prosecuting bank employees involved in money laundering, up through the highest levels of an institution, would be a better tack. Pictures of a chief compliance officer as he entered a courtroom for sentencing would have a far greater deterrent effect than any financial penalty. To that end, investigative techniques and legal precedents for going after global criminal networks are increasingly robust, and the political payoffs could be substantial. One of the more successful campaigns in the war on terrorism has been the financial one; experience gained in tracking the funds of al Qaeda could make it easier to similarly unravel Los Zetas' financing. Malfeasance in the financial industry is nothing new, but public sensitivity to banks' wrongdoing is arguably higher than it has been in decades. An enterprising prosecutor could make quite a reputation for herself by tracking DTO money through the financial system. The cartels, along with the violence and corruption they perpetrate, are threats to both Mexico and the United States. The problem is a complicated one and taps areas of profound policy disagreement. **The way to make progress in combating the DTOs is to ignore issues like gun control and illegal immigration and follow the money**. Stanching the cartels' profits will do more to end the bloodshed than any new fence or law.

--xt Solves drug violence

The CP controls the IL to solving drug violence

Murphy 2013 (Dylan; Money Laundering and The Drug Trade: The Role of the Banks; May 13; www.globalresearch.ca/money-laundering-and-the-drug-trade-the-role-of-the-banks/5334205; kdf)

Mexico is in the grip of a murderous drug war that has killed over 150,000 people since 2006. It is one of the most violent countries on earth. This drug war is a product of the transnational drug trade which is worth up to $400 billion a year and accounts for about 8% of all international trade. The American government maintains that there is no alternative but to vigorously prosecute their zero tolerance policy of arresting drug users and their dealers. This has led to the incarceration of over 500,000 Americans. Meanwhile the flood of illegal drugs into America continues unabated. One thing the American government has not done is to prosecute the largest banks in the world for supporting the drug cartels by washing billions of dollars of their blood stained money. As Narco sphere journalist Bill Conroy has observed **banks are "where the money is" in the global drug war.** HSBC, Western Union, Bank of America, JP Morgan Chase&Co, Citigroup, Wachovia amongst many others have allegedly failed to comply with American anti-money laundering (AML) laws. The Mexican drug cartels have caught the headlines again and again due to their murderous activities. The war between the different drug cartels and the war between the cartels and government security forces has spilled the blood of tens of thousands of innocent people. The drug cartels would find it much harder to profit from their murderous activity if they didn't have too big to fail banks willing to wash their dirty money. In March 2010 Wachovia cut a deal with the US government which involved the bank being given fines of $160 million under a "deferred prosecution" agreement. This was due to Wachovia's heavy involvement in money laundering moving up to $378.4 billion over several years. Not one banker was prosecuted for illegal involvement in the drugs trade. Meanwhile small time drug dealers and users go to prison. If any member of the public is caught in possession of a few grammes of coke or heroin you can bet your bottom dollar they will be going down to serve some hard time. However, if you are a bankster caught laundering billions of dollars for some of the most murderous people on the planet you get off with a slap on the wrist in the form of some puny fine and a deferred prosecution deal. Charles A. Intriago, president of the Miami-based Association of Certified Financial Crime Specialists has observed, "… If you're an individual, and get caught, you get hammered. "But if you're a big bank, and you're caught moving money for a terrorist or drug dealer, you don't have to worry. You just fork over a monetary penalty, and then raise your fees to make up for it. "**Until we see bankers walking off in handcuffs to face charges in these cases, nothing is going to change,"** Intriago adds. "These monetary penalties are just a cost of doing business to them, like paying for a new corporate jet." This failure on the behalf of the US government to really crack down on the finances of the drug cartels extends to British banks as well. In July 2012 the US Senate Committee on Homeland Security and Governmental Affairs issued a 339 page report detailing an amazing catalogue of "criminal " behaviour by London based HSBC. This includes washing over $881 for the Mexican Sinaloa Cartel and for the Norte del Valle Cartel in Colombia. Besides this, HSBC affiliated banks such as HBUS repeatedly broke American AML laws by their long standing and severe AML deficiencies which allowed Saudi banks such as Al Rajhi to finance terrorist groups that included Al-Qaeda. HBUS the American affiliate of HSBC supplied Al Rajhi bank with nearly $1 billion in US dollars. Jack Blum an attorney and former Senate investigator has commented, "They violated every goddamn law in the book. They took every imaginable form of illegal and illicit business." HSBC affiliate HBUS was repeatedly instructed to improve its anti-money laundering program. In 2003 the Federal Reserve Bank of New York took enforcement action that called upon HBUS to improve its anti-money laundering program. In September 2010 the Office of Comptroller of the Currency (OCC) sent a,"blistering supervisory letter" to HBUS listing numerous AML problems at the bank. In October 2010 this was followed up with the OCC issuing a cease and desist order requiring HBUS to improve its AML program a second time. Senator Carl Levin chairman of the Senate investigation into HSBC has commented that ,"HSBC's Chief Compliance Officer and other senior executives in London knew what was going on, but allowed the deceptive conduct to continue." Let us look at just a couple of the devastating findings in the Senate report. The main focus of the report is the multiple failures of HSBC to comply with AML laws and regulations: "The identified problems included a once massive backlog of over 17,000 alertsidentifying possible suspicious activity that had yet to be reviewed; ineffective methods foridentifying suspicious activity; a failure to file timely Suspicious Activity Reports with U.S. law enforcement; … a 3-year failure by HBUS [a HSBC affiliate] , from mid-2006 to mid-2009, to conduct any AML monitoring of $15 billion in bulk cash transactions … a failure to monitor $60 trillion in annual wire transfer activity bycustomers …inadequate andunqualified AML staffing; inadequate AML resources; and AML leadership problems. Sincemany of these criticisms targeted severe, widespread,and long standing AML deficiencies,….." The report catalogues in great detail the failings of HSBC affiliates HBUS in America and HMEX in Mexico: "from 2007 through 2008, HBMX was the single largest exporter ofU.S. dollars to HBUS, shipping $7 billion in cash to HBUS over two years, outstripping larger Mexican banks and other HSBC affiliates. Mexican and U.S. authorities expressed repeated concern that HBMX's bulk cash shipments could reach that volume only if they included illegal drug proceeds. The concern was that drug traffickers unable to deposit large amounts of cash in U.S. banks due to AML controls were transporting U.S. dollars to Mexico, arranging for bulk deposits there, and then using Mexican financial institutions to insert the cash back into the U.S. financial system. … high profile clients involved in drug trafficking; millions of dollars in suspicious bulk travelers cheque transactions; inadequate staffing and resources; and a huge backlog of accounts marked for closure due to suspicious activity, but whose closures were delayed." In the Senate hearing on 17 July 2012 Carl Levin Chairman of the Committee on Homeland Security and Governmental Affairs

explained how HMEX helped the Mexican drug cartels: ”Because our tough AML laws in the United States have made it hard for drug cartels to find a U.S. bank willing to accept huge unexplained deposits of cash, they now smuggle U.S. dollars across the border into Mexico and look for a Mexican bank or casa de cambio willing to take the cash. Some of those casas de cambios had accounts at HBMX. HBMX, in turn, took all the physical dollars it got and transported them by armored car or aircraft back across the border to HBUS for deposit into its U.S. banknotes account, completing the laundering cycle.” Senator Levin went on to note how: ”Over two years, from 2007 to 2008, HBMX shipped $7 billion in physical U.S. dollars to HBUS. That was more than any other Mexican bank, even one twice HBMX’s size. When law enforcement and bank regulators in Mexico and the United States got wind of the banknotes transactions, they warned HBMX and HBUS that such large dollar volumes were red flags for drug proceeds moving through the HSBC network.” In December 2012 the Department of Justice cut a deal with HSBC which imposed a record $1.9 billion dollar fine. It may sound a lot to ordinary folks but it is a tiny fraction of its annual profits which in 2011 totalled $22 billion. Assistant Attorney General Lanny Bauer announced the settlement at a press conference on 11 December 2012. His comments reveal why the US government decided to go soft on such criminal behaviour and show quite clearly how there is one law for the richest 1% and one law for the rest of us. Lenny Bauer said: ”Had the U.S. authorities decided to press criminal charges, HSBC would almost certainly have lost its banking license in the U.S., the future of the institution would have been under threat and the entire banking system would have been destabilized.”

**Deportation Policy CP

The United States federal government should increase funding for the Central American Regional Security Initiative and provide advanced warning when deporting criminals.

US policy, not drugs, is at root of Mexican instability

Bloomberg View 2014 (Exporting mayhem across the border; May 15; www.businessweek.com/articles/2014-05-15/u-dot-s-dot-deportations-fuel-violence-in-central-america; kdf)

To secure U.S. borders and win Republican support for immigration reform, President Obama stepped up deportations of unauthorized immigrants, especially those with criminal records. Whether the border is now more "secure" is debatable. **For the nations of Central America, these policies have been a disaster.** An influx of displaced deportees has fed crime and violence that were already out of control—spurring more El Salvadorans, Guatemalans, and Hondurans to seek safety in the U.S., which has led to more asylum requests and deportations. The U.S. government has a strong interest in stopping this perpetual mayhem machine. Central America's instability and weakness have helped make it a transshipment point for 80 percent of the cocaine entering the U.S. From 2000 to 2010, the number of Central American migrants to the U.S. rose by more than 50 percent; after Mexico, the three countries that produce the most unauthorized immigrants to the U.S. are El Salvador, Guatemala, and Honduras. What did the U.S. expect would happen when it dumped more criminals into countries already notorious for their high homicide rates, thriving made-in-the-USA gang networks, and weak judiciaries? With the overwhelming majority of murders—as many as 95 percent of them—going unpunished in the three countries, it's no wonder the number of Central Americans filing U.S. asylum claims based on "fear of return" more than doubled from 2012 to 2013. STORY: The Hostage Situation That Keeps Turkey From Going After Islamic State True, allowing these criminals to stay in U.S. cities and prisons is dangerous and expensive. But if Congress and the Obama administration are going to continue deporting them, they could do some things to make the U.S. and Central America safer. Instead of cutting funding for the Central American Regional Security Initiative by 20 percent this year, to $130 million, they should be raising it and speeding up its delivery. Never mind the immorality of the U.S. outsourcing the drug war to those least capable of prosecuting it and U.S. culpability in incubating Central America's gangs: Day to day, the region's lawlessness and violence affect more Americans than does, say, the war in Afghanistan. The U.S. also needs to shift more of its funding from helping with drug interdiction and beefing up Central American militaries and police to building up judicial and community institutions. To help Central American authorities cope with more deportees, the U.S. ought to provide more advance warning and better information on their criminal records.

--xt Solves instability

Only the CP addresses the root cause of instability

Chardy 2014 (Alfonso; Deportation of criminals blamed for exodus from Central America; Aug 3; www.miamiherald.com/2014/08/03/4270186/deporation-of-criminals-blamed.html; kdf)

The unprecedented surge in unaccompanied children at the U.S.-Mexico border was preceded by a sharp increase in the number of deportations to Central America of convicts, many of them gang members. Between fiscal years 2010 and 2012, almost 100,000 convicts were repatriated to Guatemala, El Salvador and Honduras — exceeding the total of criminal deportations in the previous six years. Immigrant-rights activists say the spike in criminal deportations likely played a key role in spreading gang violence in the three Central American countries — the situation many children cite as a reason for coming to the United States. "I would say that these **deportations are the most important factor** behind the spread of criminal violence in our countries, which is the chief reason behind the children coming here," said Francisco Portillo, president of Miami-based Francisco Morazán Honduran Organization, which assists families who have children at the border.

US deportation policy is the leading cause of crime in Central America

Berestein Rojas 2014 (Leslie; Transnational gangs: The Central American migrant crisis' LA connection; Jul 16; www.scpr.org/blogs/multiamerican/2014/07/16/17018/transnational-gangs-how-the-central-american-migra/; kdf)

As children, teens and families continue to arrive at the U.S.-Mexico border from El Salvador, Honduras and Guatemala, many of these migrants and their advocates have cited gang and drug related violence as one of the main factors driving them north. But much of that gang violence isn't rooted in Central America. It's rooted in the United States, particularly in Los Angeles. It's part of a long and complicated history between the U.S. and Central America, in which the deportation policies of recent decades figure prominently. "Gang violence has increased steadily over the last decade or two, and one factor that has contributed to it is that the U.S. has deported a lot of convicted criminals back to Central America," said Marc Rosenblum, deputy director of the U.S. immigration program for the Migration Policy Institute in Washington. "All three of the countries in the northern triangle are pretty weak states, and so that's given criminal organizations an opportunity to sort of establish themselves and flourish." The transnational gang phenomenon dates back decades, to the initial mass migration refugees fleeing civil war in El Salvador and Guatemala. Central Americans began arriving in the U.S. in large numbers in the 1980s, when both countries were suffering through the height of conflict. Many settled in Los Angeles, especially a large population of Salvadorans, who moved into working-class urban neighborhoods like Pico-Union and Koreatown. There was already heavy gang presence in Los Angeles, predominantly Mexican-American and African-American gangs. Some Central American youths began drawing together for protection, the kernel of what eventually became Mara Salvatrucha, an L.A. gang that has by now become now a powerful international criminal organization. Others joined the rival 18th Street gang, an offshoot of an established gang that accepted Central American youths. At the same time, U.S. immigration laws were growing tougher in relation to immigrants who committed crimes, especially those with gang ties. From the late 1980s on, a series of laws made it easier to deport immigrants with criminal records. But one particular 1996 law sharply stepped up criminal deportations to Central America. The Illegal Immigration Reform and Immigrant Responsibility Act, or IRAIRA, broadly expanded the list of crimes for which people could be deported, even if these offenses were committed in the past. It also took away protection for legal residents, meaning even people who were in the U.S. legally and had spent most of their lives here could be removed if they committed a deportable offense. It became, as former Mara Salvatrucha gang member Alex Sanchez recalls, like "a witch hunt." "What this created was a witch hunt of people that had been convicted of a crime 10 years prior, 20 years prior," said Sanchez, who now directs Homies Unidos, an organization that focuses on gang prevention and helping ex-gang members adjust to society. "That created masses of individuals that were detained, persecuted and picked up at their homes and then processed for deportation." Between the early 1990s and the late 1990s, IRAIRA essentially doubled the number of criminal deportees being flown back to Central America, Rosenblum said. And when these young men arrived, there was no infrastructure to help them adjust. Many did not speak Spanish well, if at all; some no longer had immediate relatives still living in the country. Sanchez, who came to the

U.S. with his parents during the war when he was 7, was deported when he was 22 in 1994, a couple of years before IRAIRA took effect. "I was one of those individuals that ... ended up in El Salvador in an airport with only a piece of paper and an address scribbled," Sanchez recalled. "I didn't know which way to go. Luckily for me, I had a home that belonged to my grandfather, where I went to. Many other individuals didn't have the same luck. Many ended up homeless." Some tried to seek shelter at churches, he said. Others tried to seek out relatives but were rejected for their gang tattoos or for "the stigma that was created in El Salvador and in Central America in general around tattooed individuals, who were considered the worst of the worst," Sanchez said. But there was one receptive audience: Disenfranchised local kids. Sanchez says **there were a few local gangs in El Salvador before deportees from the U.S. began arriving, but that the mass deportations created a monster.**

**Legalize Marijuana

Text: The United States federal government should legalize all uses of marihuana.

US legalization is the first step in reducing cartel violence – key to reconstructing the market structure

Reisenwitz 14 [Cathy, 8-11. Reisenwitz is Editor-in-Chief of a news and politics cite and her writing has appeared in Forbes and the Chicago Tribune. *US Marijuana Legalization Already Weakening Mexican Cartels, Violence Expected to Decline.* http://townhall.com/columnists/cathyreisenwitz/2014/08/11/us-marijuana-legalization-already-weakening-mexican-cartels-violence-expected-to-decline-n1876088/page/full 7/12]//kmc

America's first foray into rolling back prohibition 2.0 is barely underway, and already marijuana prices have dropped low enough to convince some cartel farmers in Mexico to abandon the crop. Mere months after two US states legalized marijuana sales, five Nobel Prize-winning economists released a UN report recommending that countries end their war on drugs. It would seem they were onto something. But in order to further decrease drug-trade violence in so-called producer states, the US first needs to legalize marijuana, but then also the US must stop using the UN to pressure producer countries into supply-based drug prohibition. Latin America is the largest global exporter of cannabis and cocaine. In 2011 the DOJ's now-shuttered National Drug Intelligence Center found that the top cartels controlled the majority of drug trade in marijuana, heroin, and methamphetamine in over 1,000 US cities. **Research into black markets shows that producer countries experience more violence than consumer countries**. In essence, the global war on drugs is a UN scheme to shrug drug war costs off rich countries' shoulders and onto poor Latin American countries, with horrifyingly violent results. Much of the recent child migrant crisis is a direct result of children fleeing cartel violence and conscription into criminal gangs. **When drug prices are high, cartels will step up and produce. By keeping demand for cannabis** and cocaine **high, but supply low, the US in essence forced the Latin America economy to revolve around drugs**. Under prohibition, **there is no more profitable export. And** of course **violence proliferates in illegal industries. So in countries where the dominant export is illegal, violence will be endemic.** That's exactly what the five economists found. Every single one of the 20 cities with the highest murder rates in the world are in Latin America. Half of the top 10 global kidnapping hotspots are Latin American countries. Time magazine reports that the violence in the murder capital of the world, San Pedro Sula, Honduras, is due to the influx of Mexican drug cartels that funnel U.S.-bound drugs through the country. **The cartels are also responsible for an increase in "atrocious crimes" like decapitation, usually used against rival gangs.** Ending the Drug Wars describes drug prohibition as "a transfer of the costs of the drug problem from consumer to producer and transit countries." It references a report called Drugs and Democracy: Toward a Paradigm Shift by the Latin American Commission on Drugs and Democracy, headed by former Latin American presidents Fernando Henrique Cardoso, Cesar Gaviria and Ernesto Zedillo found that Latin America's willingness to cave to first-world pressure has had horrific results, including: A rise in organized crime caused both by the international narcotics trade and by the growing control exercised by criminal groups over domestic markets and territories A growth in unacceptable levels of drug-related violence affecting the whole of society and, in particular, the poor and the young The criminalization of politics and the politicization of crime, as well as the proliferation of the linkages between them, as reflected in the infiltration of democratic institutions by organized crime The corruption of public servants, the judicial system, governments, the political system and, especially the police forces in charge of enforcing law and orders The 200-percent growth rate of the illegal drug market between 1994 and 2008 explains roughly 25 percent of the current homicide rate in Colombia, according to recent research. That means Colombia sees about 3,800 more homicides per year on average associated with the war on drugs. **But when drug prices drop, the cartels will move onto other schemes**. VICE News asked retired federal agent Terry Nelson whether legalization was hurting the cartels. "The cartels are criminal organizations that were making as much as 35-40 percent of their income from marijuana," Nelson said, "They aren't able to move as much cannabis inside the US now." America, the United Kingdom and other wealthy states are epicenters of demand. Not only do demand states prohibit drug production and sales within their borders, but have traditionally used the UN to bully producer countries to do the same through moves such as the United Nations Convention Against Illicit Traffic in Narcotic Drugs and Psychotropic Substances of 1988 or the US annual certification process. And for what? The report points out that worldwide drug prohibition has succeeded in raising prices on illicit drugs. This may have impacted rates of use in consumer nations. Even if higher prices suppress demand, for which there's little evidence, there is simply no way to look at the

worldwide cost of prohibition as being worth that possible outcome. “There is now a new willingness among certain states, particularly in Latin America, to be vocal about the inherent problems within the system and to try to extricate themselves from the global drug war quagmires,” according to Ending the Drug Wars. **Ending the Drug Wars acknowledges the “microeconomic contradictions inherent in the supply-centric model of control**.” It calls out the UN for trying to “enforce a uniform set of prohibitionist oriented policies often at the expense of other, arguably more effective policies that incorporate broad frameworks of public health and illicit market management.” However, the ultimately unresolvable problem with prohibition is that: In a world where demand remains relatively constant, suppressing supply can have short-run price effects. However, in a footloose industry like illicit drugs, these price increases incentivise a new rise in supply, via shifting commodity supply chains. This then feeds back into lower prices and an eventual return to a market equilibrium similar to that which existed prior to the supply-reduction intervention. **Fixing this problem might be the most exciting part about ending America’s war on cannabis. Prices will continue to drop as American growth flourishes. Get ready for cheap, high-quality weed. And as prices drop and the supply side moves into the white market, cartels will get out of the game. And just as ending alcohol prohibition greatly diminished the size, influence, and brutality of organized crime, so will legalizing weed diminish the size, influence, and brutality of Mexican cartels.** As the epicenters of supply, Latin American countries resemble America’s inner cities, wracked with violent crime and corruption. Demand countries, however, resemble America’s suburbs, where the size and scope of the violence pales in comparison. Considering the power wielded by rich countries compared with poor ones, it shouldn’t be surprising that they’d be successful in using international pressure to turn poor countries into lawless killing fields. What’s galling is that they would choose to use their power this way, and get away with it for decades. Prohibition doesn’t work. But the way it doesn’t work varies greatly depending on whether a state is primarily a producer or a consumer of illicit substances. Stopping international pressure on producer countries is the first step to a fairer, more effective international approach to drugs.

--xt solves cartel violence

Legalizing marijuana solves root causes of cartel violence – will decrease cartel violence and create comprehensive steps to combat cartels

Grillo 12 [Ioan, 11-1. Grillo is a journalist and author of "El Narco: Inside Mexico's Criminal Insurgency." *Hit Mexico's Cartels With Legalization.* http://www.nytimes.com/2012/11/02/opinion/hit-mexicos-cartels-with-legalization.html 7/12]//kmc

Instead, we have to face up to the hard reasons why thousands of young men (and some women) with full mental faculties have become serial killers. These reasons should be taken into account by residents of Colorado, Washington state and Oregon when they vote on referendums to legalize marijuana next Tuesday. The painful truth is that the monster of Mexican cartels has been pumped up by decades of Americans buying illegal drugs under the policies of prohibition. No one knows exactly how much money Mexican traffickers make, but reasonable estimates find they pocket $30 billion every year selling cocaine, marijuana, heroin and crystal meth to American users. Since 1980, the cumulative jackpot could be close to $1 trillion. **Under the law of the jungle, this money goes to the most violent and sadistic players, so the cartels have spent their dollars on building increasingly ferocious death squads.** There have been a tragic 60,000 killings under President Felipe Calderón that are described as drug-related. But even this description can be misleading. Most cartel assassins do not carry out these brutal acts because they are high on drugs. Their motive is to capture the profits that are so high because in the black market you can buy drugs for a nickel and sell them for a dollar. How many others would love to be in a business with a markup of more than 2,000 percent? Marijuana is just one of the drugs that the cartels traffic. Chemicals such as crystal meth may be too venomous to ever be legalized. But cannabis is a cash crop that provides huge profits to criminal armies, paying for assassins and guns south of the Rio Grande. The scale of the Mexican marijuana business was illustrated by a mammoth 120-hectare plantation busted last year in Baja California. It had a sophisticated irrigation system, sleeping quarters for 60 workers and could produce 120 metric tons of cannabis per harvest. Again, nobody knows exactly how much the whole Mexico-U.S. marijuana trade is worth, with estimates ranging from $2 billion to $20 billion annually. **But even if you believe the lowest numbers, legal marijuana would take billions of dollars a year away from organized crime. This would inflict more financial damage than soldiers or drug agents have managed in years and substantially weaken cartels.** It is also argued that Mexican gangsters have expanded to a portfolio of crimes that includes kidnapping, extortion, human smuggling and theft from oil pipelines. This is a terrifying truth. But this does not take away from the fact that the marijuana trade provides the crime groups with major resources. That they are committing crimes such as kidnapping, which have a horrific effect on innocent people, makes cutting off their financing all the more urgent. The cartels will not disappear overnight. U.S. agents and the Mexican police need to continue battling hit squads that wield rocket-propelled grenades and belt-driven machine guns. Killers who hack off heads still have to be locked away. Mexico needs to clean up corruption among the police and build a valid justice system. And young men in the barrios have to be given a better option than signing up as killers. All these tasks will be easier if the flow of money to the cartels is dramatically slowed down. Do we really want to hand them another trillion dollars over the next three decades?

Legalization brings a laundry list of benefits for both the US and Mexico – economic and social gains

Kleiman 14 [Mark, Spring. Kleiman is a professor of public policy at the University of California Los Angeles. *How Not to Make a Hash Out of Cannabis Legalization.* http://www.washingtonmonthly.com/magazine/march_april_may_2014/features/how_not_to_make_a_hash_out_of049291.php?page=all# 7/12]//kmc

The undeniable gains from legalization consist mostly of getting rid of the damage done by prohibition. (Indeed, as E. J. Dionne and William Galston have pointed out, polling suggests that support for legalization is driven more by discontent with prohibition than by enthusiasm for pot.) Right now, Americans spend about $35 billion a year on illegal cannabis. That money goes untaxed; the people working in the industry aren't gaining legitimate job experience or getting Social Security credit, and some of them spend time behind bars and wind up with felony criminal records. About 650,000 users a year get arrested for possession, something much more likely to happen to a black user than a white one. We also spend about $1 billion annually in public money keeping roughly 40,000 growers and dealers behind bars at any one time. That's a small chunk of the incarceration problem, but it represents a lot of money and a lot of suffering. The enforcement effort, including the use of "dynamic entry" raids, imposes additional costs in money, liberty, police-community conflict, and, occasionally, lives. **Cannabis dealing and enforcement don't contribute much to drug-related violence in the United States, but they make up a noticeable part of Mexico's problems.** Another gain from legalization would be to move the millions of Americans whose crimes begin and end with using illegal cannabis from the wrong side of the law to the right one, bringing an array of benefits to them and their communities in the form of a healthier relationship with the legal and political systems. Current cannabis users, and the millions of others who might choose to start using cannabis if the drug became legal, would also enjoy an increase in personal liberty and be able to pursue, without the fear of legal consequences, what is for most of them a harmless source of pleasure, comfort, relaxation, sociability, healing, creativity, or inspiration**. For those people, legalization would also bring with it all the ordinary gains consumers derive from open competition: lower prices, easier access, and a wider range of available products and means of administration, held to quality standards the illicit market can't enforce.**

--xt legalization key

Marijuana prohibition drives cartel violence---artificially high prices sustain criminal enterprises---legalization is key

Paul **Armentano 09**, Deputy Director of the National Organization for the Reform of Marijuana Laws, an expert in the field of marijuana policy, health, and pharmacology, has served as a consultant for Health Canada and the Canadian Public Health Association, "How to End Mexico's Deadly Drug War", 1/18/09, The Foundation for Economic Education, http://www.fee.org/the_freeman/detail/how-to-end-mexicos-deadly-drug-war

The U.S. Office of Drug Control Policy (more commonly known as the drug czar's office) says more than 60 percent of the profits reaped by Mexican drug lords are derived from the exportation and sale of cannabis to the American market. To anyone who has studied the marijuana issue, this figure should come as no surprise. An estimated 100 million Americans age 12 or older—or about 43 percent of the country—admit to having tried pot, a higher percentage, according to the World Health Organization, than any other country on the planet. Twenty-five million Americans admit (on government surveys, no less) to smoking marijuana during the past year, and 15 million say that they indulge regularly. This high demand, combined with the drug's artificially inflated black-market value (pot possession has been illegal under federal law since 1937), now makes cannabis America's top cash crop.¶ In fact, according to a 2007 analysis by George Mason University professor Jon Gettman, the annual retail value of the U.S. marijuana market is some $113 billion.¶ How much of this goes directly to Mexican cartels is difficult to quantify, but no doubt the percentage is significant. Government officials estimate that approximately half the marijuana consumed in the United States originates from outside its borders, and they have identified Mexico as far and away America's largest pot provider. Because Mexican-grown marijuana tends to fetch lower prices on the black market than domestically grown weed (a result attributed largely to lower production costs—the Mexican variety tends to be grown outdoors, while an increasing percentage of American-grown pot is produced hydroponically indoors), it remains consistently popular among U.S. consumers, particularly in a down economy. As a result, U.S. law officials now report that some Mexican cartels are moving to the United States to set up shop permanently. A Congressional Research Service report says low-level cartel members are now establishing clandestine growing operations inside the United States (thus eliminating the need to cross the border), as well as partnering with domestic gangs and other criminal enterprises. A March 23 New York Times story speculated that Mexican drug gangs or their affiliates are now active in some 230 U.S. cities, extending from Tucson, Arizona, to Anchorage, Alaska.¶ In short, America's multibillion-dollar demand for pot is **fueling the Mexican drug trade and much of the turf battles and carnage** associated with it. ¶ Same Old "Solutions"¶ So what are the administration's plans to quell the cartels' growing influence and surging violence? Troublingly, the White House appears intent on recycling the very strategies that gave rise to Mexico's infamous drug lords in the first place.¶ In March the administration requested $700 million from Congress to "bolster existing efforts by Washington and Mexican President Felipe Calderón's administration to fight violent trafficking in drugs . . . into the United States." These efforts, as described by the Los Angeles Times, include: "vowing to send U.S. money, manpower, and technology to the southwestern border" and "reducing illegal flows (of drugs) in both directions across the border." The administration also announced that it intends to clamp down on the U.S. demand for illicit drugs by increasing funding for drug treatment and drug courts.¶ There are three primary problems with this strategy.¶ First, marijuana production is a lucrative business that attracts criminal entrepreneurs precisely because it is a black-market (and highly sought after) commodity. As long as pot remains federally prohibited its retail price to the consumer will remain artificially high, and its production and distribution will attract criminal enterprises willing to turn to violence (rather than the judicial system) to maintain their slice of the multi-billion-dollar pie.¶ Second, the United States is already spending more money on illicit-drug law enforcement, drug treatment, and drug courts than at any time in our history. FBI data show that domestic marijuana arrests have increased from under 300,000 annually in 1991 to over 800,000 today. Police seizures of marijuana have also risen dramatically in recent years, as has the amount of taxpayer dollars federal officials have spent on so-called "educational efforts" to discourage the drug's use. (For example, since the late 1990s Congress has appropriated well over a billion dollars in anti-pot public service announcements alone.) Yet despite these combined efforts to discourage demand, Americans use more pot than anyone else in the world.¶ Third, law enforcement's recent attempts to crack down on the cartels' marijuana distribution rings, particularly new efforts launched by the Calderón administration in Mexico, are driving the unprecedented wave in Mexican violence—not abating it. The New York Times states: "A crackdown begun more than two years ago by

President Felipe Calderón, coupled with feuds over turf and control of the organizations, has set off an unprecedented wave of killings in Mexico. . . . Many of the victims were tortured. Beheadings have become common." Because of this escalating violence, Mexico now ranks behind only Pakistan and Iran as the administration's top international security concern.¶ Despite the rising death toll, drug war hawks at the U.S. Drug Enforcement Administration (DEA) remain adamant that the United States' and Mexico's "supply side" strategies are in fact successful. "Our view is that the violence we have been seeing is a signpost of the success our very courageous Mexican counterparts are having," acting DEA administrator Michele Lionhart said recently. "The cartels are acting out like caged animals, because they are caged animals." President Obama also appears to share this view. After visiting with the Calderón government in April, he told CNN he intended to "beef up" security on the border. When asked whether the administration would consider alternative strategies, such as potentially liberalizing pot's criminal classification, Homeland Security Secretary Janet Napolitano replied that such an option "is not on the table."¶ A New Remedy¶ By contrast the Calderón administration appears open to the idea of legalizing marijuana—or at least reducing criminal sanctions on the possession of small quantities of drugs—as a way to stem the tide of violence. Last spring Mexican lawmakers made the possession of personal-use quantities of cannabis and other illicit substances a noncriminal offense. And in April Mexico's ambassador to the United States, Arturo Sarukhan, told CBS's Face the Nation that legalizing the marijuana trade was a legitimate option for both the Mexican and U.S. governments. "[T]hose who would suggest that some of these measures [legalization] be looked at understand the dynamics of the drug trade," Sarukhan said.¶ Former Mexican President Vicente Fox recently echoed Sarukhan's remarks, as did a commission of former Latin American presidents. "I believe it's time to open the debate over legalizing drugs," Fox told CNN in May. "It can't be that the only way [to try to control illicit drug use] is for the state to use force."¶ Writing recently on CNN.com, Harvard economist and Freeman contributor Jeffrey Miron said that ending drug prohibition—on both sides of the border—is the only realistic and viable way to put a permanent stop to the rising power and violence associated with Mexico's drug traffickers. "Prohibition creates violence because it drives the drug market underground," he wrote. "This means buyers and sellers cannot resolve their disputes with lawsuits, arbitration or advertising, so they resort to violence instead. . . . **The only way to reduce violence**, therefore, **is to legalize drugs**."

Marijuana's key---legalization weakens the cartels sufficiently to allow current operations to succeed

Ioan **Grillo 12**, author, journalist, writer and TV producer based in Mexico City, has reported on Mexico and Latin American since 2001, "Hit Mexico's Cartels With Legalization", 11/1/12, NYT, http://www.nytimes.com/2012/11/02/opinion/hit-mexicos-cartels-with-legalization.html

Marijuana is just one of the drugs that the cartels traffic. Chemicals such as crystal meth may be too venomous to ever be legalized. But cannabis is a cash crop that provides **huge profits to criminal armies**, paying for assassins and guns south of the Rio Grande. The scale of the Mexican marijuana business was illustrated by a mammoth 120-hectare plantation busted last year in Baja California. It had a sophisticated irrigation system, sleeping quarters for 60 workers and could produce 120 metric tons of cannabis per harvest.¶ Again, nobody knows exactly how much the whole Mexico-U.S. marijuana trade is worth, with estimates ranging from $2 billion to $20 billion annually. But even if you believe the lowest numbers, legal marijuana would take billions of dollars a year away from organized crime. This would inflict more financial damage than soldiers or drug agents have managed in years and substantially weaken cartels.¶ It is also argued that Mexican gangsters have expanded to a portfolio of crimes that includes kidnapping, extortion, human smuggling and theft from oil pipelines. This is a terrifying truth. But this does not take away from the fact that the marijuana trade provides the crime groups with major resources. That they are committing crimes such as kidnapping, which have a horrific effect on innocent people, makes cutting off their financing all the more urgent.¶ The cartels will not disappear overnight. U.S. agents and the Mexican police need to continue battling hit squads that wield rocket-propelled grenades and belt-driven machine guns. Killers who hack off heads still have to be locked away. Mexico needs to clean up corruption among the police and build a valid justice system. And young men in the barrios have to be given a better option than signing up as killers.¶ All these tasks will be **easier if the flow of money to the cartels is dramatically slowed down**. Do we really want to hand them another trillion dollars over the next three decades?

--xt solves stability

Marijuana legalization causes a decrease in US crime – root cause of drug related violence is the use of illegal drugs, not the active THC ingredients

Ferner 14 [Matt, 3-27. *Legalizing Medical Marijuana May Actually Reduce Crime, Study Says.* http://www.huffingtonpost.com/2014/03/27/medical-marijuana-crime-study_n_5044397.html 7/12/15]//kmc

"We believe that medical marijuana legalization poses no threat of increased violent crime," Robert Morris, the study's lead author, told The Huffington Post. Morris, associate professor of criminology at UT Dallas, and his colleagues looked at crime rates for all 50 U.S. states from 1990 to 2006. During this period, 11 states legalized medical marijuana. The researchers examined legalization's effect on what the FBI calls Part I crimes, which include homicide, rape, robbery, aggravated assault, burglary, larceny and auto theft. **"After controlling for a host of known factors related to changes in crime rates** -- we accounted for factors such as poverty, employment, education, even per capita beer sales, among other things -- **we found no evidence of increases in any of these crimes for states after legalizing marijuana** for medical use," Morris said. "**In fact, for some forms of violence -- homicide and assault -- we found partial support for declines after the passing of this legislation."** Data for the study came from state websites, FBI Uniform Crime Reports, the census, The Bureau of Labor Statistics, The Bureau of Economic Analysis and the Beer Institute. The study did not explore a relationship between marijuana use and violent crime, Morris said. Rather, the research team looked at legalization's effect on crime. Other studies have failed to establish a link between marijuana use and crime. "The findings on the relationship between violence and marijuana use are mixed and much of the evidence points toward reductions in violent behavior for those who smoke marijuana," Morris said. "**In fact, researchers have suggested that any increase in criminality resulting from marijuana use may be explained by its illegality, rather than from the substance itself."** Other research suggests alcohol is a much more significant factor than marijuana when it comes to violent crime. A report from the National Institute on Alcohol Abuse and Alcoholism found that 25 percent to 30 percent of violent crimes are linked to alcohol use. A separate study in the journal of Addictive Behaviors noted that "alcohol is clearly the drug with the most evidence to support a direct intoxication-violence relationship," and that "cannabis reduces likelihood of violence during intoxication." The National Academy of Sciences found that in chronic marijuana users, THC -- the active ingredient in pot -- actually **causes a decrease in "aggressive and violent behavior."** Laws in 20 states and the District of Columbia allow marijuana for medical use. Colorado and Washington state have legalized marijuana for recreational use. About a dozen other states are likely to legalize marijuana in some form in the coming years. Michael Elliott, executive director of the Marijuana Industry Group, said he was pleased, but not surprised, by the new research. "As a trade association, we have supported the development of this comprehensive regulatory framework, including transparency, accountability, licensing, background checks, financial disclosures, seed to sale tracking, and consumer safety protections like packaging, labeling, and testing," Elliott said. "While this program is cumbersome for the small business owners in this industry, **it is far better than choosing black market operators who use violence to dominate the sale of marijuana and prey on our children."**

Drug violence via cartels endangers the US economy – only legalization solves

Tielemans 14 [Otto Raul, 6/16. Research Associate at the Council on Hemispheric Affairs. Authoritarianism On The Rise: The War on Drug's Erosion of Mexican Democracy. http://www.coha.org/authoritarianism-on-the-rise-the-war-on-drugs-erosion-of-mexican-democracy/ 7/13]//kmc

Mexico's progressive shift towards authoritarianism is not simply the result of the executive and military actively pursuing greater power; it is also the net result of a crippling economic environment and violent social atmosphere. Following a series of bank crises and global financial meltdowns, Mexico has been plagued with having to battle a series of economic catastrophes. Its economy has been estimated to have an annual GDP of $1.2 trillion USD, which is limited in its ability to expand due to the high cost of security that is needed for economic enterprises to operate within the country. According to some scholars, security expenditures add an additional 8 to 15 percent to business operations [24]. And although the Mexican government has been on an aggressive campaign to attract foreign investors to the country's burgeoning manufacturing sector, the fact of the matter is that the danger and high costs of business operations handicap economic prosperity. This, in combination with an increased level of militarized warfare, is estimated to decrease economic growth by approximately 1% [25]. The combination of these factors inhibits the government from creating jobs that would otherwise help employ some of the county's 6 million unemployed citizens. With more than 52 percent of the population living in extreme poverty, financial disparity makes the country's impoverished persons prime bait for drug cartels [26]. While dangerous, the hefty salary paid by organized crime ensures the loyalty and steady supply of countless workers. As it stands, drug cartels employ over half a million people in Mexico alone [27]. Their growing network of well-paid criminals not only ensures a steady flow of narcotics to North America and Europe, but also guarantees the perpetuation of the War on Drugs by having citizens feed into the very system that the Mexican government is attempting to dismantle. Due to the increasing scope of the conflict, the government is likely to restrict civil liberties and continue to endow the executive and military with relatively unchecked powers in order to resolve the issue at hand. This erosion of liberal democratic values, regardless of good intentions, will ensure the growth of authoritarianism in a country whose history is blotched with right-wing dictatorships and vast periods of oppression. The War on Drugs is approaching a decade of violence with increasing evidence that the endless violence is setting the stage for antidemocratic governance to engulf the country. With reports citing an approximate 1.6 million people as having been displaced, momentum has grown within the public to equip the government with the power necessary to end the drug cartels' reckless actions [28]. Polls from 2012 demonstrate that 80 percent of the Mexican population supports using the army to combat drug violence [29]. Studies show that almost three in every four individuals (73 percent) viewed the military positively in 2012. Moreover, trust in national government leaped from 54 to 65 percent between 2011 and 2012 [30]. With the average citizen demonstrating an increased sense of trust in their government and the armed forces, civil society has overwhelmingly rejected the notion of defending human rights and basic liberties. As a matter of fact, the argument could be made that the Mexican public has decided to trade basic liberties for security. Especially with one-third of the population being in favor of having the United States send troops to Mexico, sovereignty and civil liberties are viewed as insignificant by a considerable number of the Mexican populace when it comes to combating unmanageable levels of violence [31]. Finally, ambitious politicians and power-hungry military leaders are not the only catalyst in Mexico's reactionary shift towards an illiberal democracy. The government's failure to create an adequate number of jobs, in addition to prolonged warfare between government forces and criminal organizations, has driven desperate citizens into fostering a climate that favors the deterioration of democratic values in exchange for a perceived sense of security. Prospects For A Better Tomorrow? Mexico is cursed by its geography. Although blessed with vast oil reserves, the fact that the country is nestled between the United States (the world's largest consumer of illegal drugs) and South America (a region of vast narcotic production) ensures that it is constantly battling with drugs trafficking across its borders [32]. Needless to say, U.S. pressures to dismantle the operations of drug producers, in addition to social unrest, puts the Mexican government in a difficult position. While everyone who loves Mexico wants to see it flourish as a developed country, the fact is until Mexico can attract investments, create a greater number of jobs, and restore social tranquility; it is inevitable that criminal organizations will continue to prey on impoverished and poorly educated persons. These shortcomings will only add to the conflict, resulting in continued violence and countless fatalities. It is highly unlikely that Mexico's War on Drugs will be resolved in the near future. If violence does subside, then the country will have a much easier task addressing issues of

wealth disparity, lackluster education, and poor labor conditions. Sadly, the reality of the situation is that violence will continue and the government will actively attempt to grant itself with greater, unchecked powers to combat the problem. Doing so will inevitably dismantle what remains of the country's democratic fabric and condemn the nation and its people to oppression by corrupt government officials.

Mexican economy key to US economic stability

Buck 12 [Stephanie, 6-20. *Why You Should Care About Mexico.* http://www.cipe.org/blog/2012/06/20/why-you-should-care-about-mexico/#.VaLHmJNVikp 7/12]//kmc

In addition to providing each other with important export markets, **the Mexican and US economies are becoming increasingly integrated in ways that blur traditional understandings of trade.** The regional supply chains of US companies criss-cross the US-Mexico border, meaning that Mexico and the US work together to manufacture goods that are eventually sold on the global market. For example, cars built in North America may cross the border as many as eight times as they are being produced. In other words, the US and Mexico are more than just neighbors. Economic interdependence, shared cultural heritage, and grim security issues **that both countries must face together mean that what happens in Mexico affects the US in more ways than just immigration and drug trafficking**. Mexico's economic, political, institutional, social, and security challenges are all interconnected: whoever wins the Mexican presidential elections on July 1 will have to face a myriad of complex problems. He or she will help set policies that will both directly and indirectly affect everyone from US business leaders to migrant workers to white suburban teenagers. **A Mexico that is fully equipped with leaders who can help navigate the process to the reforms the country needs is an even more important economic and political ally that can help increase prosperity throughout the region. This is not a zero-sum game. If Mexico flourishes, the US will also flourish.**

at: Links to politics

Avoids the link to politics – states and bipart agreement will take the heat for legalization, not Obama

Ferber 6/16 [Matt, 2015. *Obama: If Enough States Decriminalize Marijuana, Congress May Change Federal Law*. http://www.huffingtonpost.com/2015/03/16/obama-marijuana-decriminalization_n_6881374.html 7/12]//kmc

President Barack Obama said if enough states reform their marijuana laws, Congress may change federal law that continues to make the drug illegal. Obama, during an interview with Vice Media co-founder Shane Smith released in full on Monday, said **he's encouraged that liberal Democrats and conservative Republicans seem to agree that current U.S. marijuana laws don't make sense.** "We may be able to make some progress on the decriminalization side," Obama said. "At a certain point, **if enough states end up decriminalizing,** then Congress may then reschedule marijuana." Last week, Sens. Cory Booker (D-N.J.), Rand Paul (R-Ky.) and Kirsten Gillibrand (D-N.Y.) introduced a bill that would reclassify marijuana from a Schedule I drug, which has high potential for abuse and no medical value, to a Schedule II drug, which has lower potential danger and recognized medical benefits. Nineteen states and the District of Columbia have decriminalized the possession of small amounts of marijuana for personal use. Twenty-three states have legalized marijuana for medical purposes. Four states, as well as D.C., have legalized recreational marijuana. "I'd separate out the issue of criminalization of marijuana from encouraging its use," Obama said. "I think there's no doubt that our criminal justice system, generally, is so heavily skewed towards cracking down on non-violent drug offenders that it has not just had a terrible effect on many communities -- particularly communities of color -- rendering a lot of folks unemployable because they got felony records, disproportionate prison sentences. It costs a huge amount of money to states and a lot of states are figuring that out. **"But what I'm encouraged by is you're starting to see not just liberal Democrats, but also some very conservative Republicans recognize this doesn't make sense -- including the libertarian wing of the Republican Party."** Obama cautioned that legalization or decriminalization of marijuana, or any other substance, isn't a panacea. "I think there is a legitimate concern about the overall effects this has on society, particularly vulnerable parts of our society," Obama said. "Substance abuse generally, legal and illegal substances, is a problem. Locking somebody up for 20 years is probably not the best strategy, and that is something we have to rethink as a society as a whole."

cp will be perceived as bipart – means Obama won't need to push

Angell 7/8 [Tom, 2015. Tom Angell is the founder and chairman of Marijuana Majority, and serves as media relations director of Law Enforcement Against Prohibition. Before joining LEAP's staff, Tom worked for six years with Students for Sensible Drug Policy, first as a student chapter leader and then as a national staffer. *House Bill Creates New Federal Category for Marijuana Research.* http://www.marijuana.com/blog/news/2015/07/house-bill-creates-new-federal-category-for-marijuana-research/ 7/15]//kmc

Some of the biggest supporters and opponents of marijuana law reform in Congress are teaming up on **new bipartisan legislation** that would create a new category of federal law to regulate cannabis research.ð The proposal, which is an amendment to a larger bill aimed at accelerating the development of new medicines, would set up a new section of the Controlled Substances Act, called Schedule I-R, that is "designed to facilitate credible research on the medical efficacy of marihuana."ð It also includes a "Sense of Congress" clause calling on the National Institutes of Health and the Drug Enforcement Administration to collaborate on studying the benefits and risks of using marijuana as a medical treatment.ð Sponsoring the amendment is a collection of strange bedfellows from both

parties, including Rep. Andy Harris (R-MD), who led unsuccessful efforts to block Washington, D.C. from implementing its marijuana legalization and decriminalization laws, and Rep. Earl Blumenauer (D-OR), who is the chief author of bills aimed at increasing military veterans' access to medical cannabis and providing fair tax rates for state-legal marijuana businesses. Also signed on are Rep. Sam Farr (D-CA), who co-led successful efforts to pass amendments prohibiting the Department of Justice from spending money to interfere with state medical marijuana laws, and Rep. Morgan Griffith (R-VA), who is the lead sponsor of legislation to allow use of cannabidiol-rich marijuana strains by children suffering from severe seizure disorders.∂ "Given the widespread use of medical marijuana, it is imperative that doctors better understand how it can be used to treat different people and conditions, as well as the risks involved," Rep. Blumenauer told Marijuana.com. "Our amendment shows members of Congress with widely varying views on marijuana policy are united in support of building a robust body of scientific information on medical marijuana."

Pc isn't key – interest groups and bipart efforts will push the cp through Congress

Hermes 15 [Kris, 3/10. *US Senators Introduce Unprecedented, Sweeping Bipartisan Medical Marijuana Bill Aimed at Protecting Patients*. http://www.thedailychronic.net/2015/41463/us-senators-introduce-unprecedented-sweeping-bipartisan-medical-marijuana-bill-aimed-at-protecting-patients/ 7/15]//kmc

WASHINGTON, DC — Comprehensive medical marijuana legislation was introduced Tuesday in the United States Senate for the first time in the country's history.∂ Senators Rand Paul (R-KY), Cory Booker (D-NJ), and Kirsten Gillibrand (D-NY) introduced the Compassionate Access, Research Expansion, and Respect States (CARERS) Act to end the federal prohibition on medical marijuana and allow states to set their own policies.∂ The CARERS Act is endorsed by several advocacy groups including Americans for Safe Access (ASA), which helped Senate authors develop the legislation.∂ The CARERS Act will reclassify marijuana for medical use, overhaul the banking laws so as not to punish licensed businesses, allow veterans to have access to medical marijuana, and eliminate current barriers to research.∂ Currently, twenty-three states and the District of Columbia have adopted medical marijuana laws, and another twelve states have adopted laws allowing for the consumption of a specific form of cannabis known as Cannabidiol or CBD commonly used to treat seizure disorders.∂ Despite the passage of medical marijuana laws in more than half of the United States, it remains illegal under federal law. Because of this, qualified patients who use medical marijuana in compliance with state law are still at risk of federal enforcement, as are dispensary owners and government regulators.

Census CPs

**Eliminate the Census

Text: The United States federal government should eliminate the census.

The process of naming that the census creates is bad—their author agrees that getting rid of it would solve better than the aff.

Mezey, 03- (Naomi Mezey is an Associate Professor of Law, Georgetown University Law Center) "Erasure and recognition: The census, race and the national imagination" Northwestern Law Review Vol. 94. Issue 4, Summer 2003, NU Law Publishinh, Proquest, //droneofark

One of the most effective ways in which the law calls people into being is by naming them. But it also unnames people, sometimes consciously, sometimes just as a necessary consequence of naming others. To the extent that law enforces some identities, it "unmakes" others.379 So it is with the census. By making and using some racial categories, the census effectively undoes other categorical possibilities. One of the reasons Asian Americans have lobbied to retain a list of specific national origins on the census form is so that the naming of Asians as Asians does not unname Chinese, Samoans, and Vietnamese.380 By failing to recognize a multiracial category, OMB incidentally unnamed those who understand themselves as multiracial. But the Census Bureau unnamed (or renamed) them more overtly by officially calling those who report more than one race "The Two or More Races Population." This is akin to the South African practice of calling African, colored, and Indian people "previously disadvantaged individuals."381 Of course, in naming themselves, groups must create and enforce boundaries of their own, and this is no less true of those within the multiracial movement who have keenly felt the boundaries of other groups.382 The census, by naming and counting, is engaged in a powerful business. "To ask some questions is to sacrifice others. The boundaries of official inquiry are the statistical counterpart to the boundaries of the political agenda; and it is an elementary point of political analysis that the control of such boundaries is a critical face of power."383 Official questions and government classifications are powerful in both creative and repressive ways. They create deep cognitive commitments as well as provide avenues of control. "Official categories may help to constitute or divide groups and to illuminate or obscure their problems and achievements."384 Official categories name, and by naming unname. They recognize, and through recognition erase. While ultimately I agree with David Theo Goldberg that, as paradoxical as it seems, we need "to count by race in order to undo racial counting,"385 the narrative of this Article is not directed toward a decision about whether race counting by the census is, on balance, worth it. Just as rights entail regulation and repression,386 just as culture constrains,387 I have attempted to show how legal and regulatory regimes that recognize identity also erase it. The census, as a powerful legal mechanism, has played a crucial role in affirming and disciplining groups, in making and unmaking, and in naming and unnaming the boundaries of group and national identity.

**Optional Category CP

Text: The United States federal government should make the race portion of the census optional.

The CP would solve polyculturalism better—the inclusion of the racial category has helped different racial groups form a common identity to be recognized which has the power to affirm identity

Mezey, 03- (Naomi Mezey is an Associate Professor of Law, Georgetown University Law Center) "Erasure and recognition: The census, race and the national imagination" Northwestern Law Review Vol. 94. Issue 4, Summer 2003, NU Law Publishinh, Proquest, //droneofark

Needless to say, the modern census classifications of race, like the nineteenth century classifications before them, have influenced the meanings and politics of race. Historian David Hollinger has called Statistical Directive 15 "the single event most responsible for the lines" that configure our understanding of race, an understanding which he calls the ethno-racial pentagon of African American, Asian American, Native American, Hispanic, and white.272 Other scholars mark Directive 15 as the point when "the use of racial classification shifted from one of exclusion to one of explicit inclusion of specific groups."273 In this context, where the census is one of the primary vehicles for the distribution of certain group protections and entitlements based on race, one sees the strategic investment in the politics of enumeration for many groups in the modern welfare state. The engagement with the politics of enumeration has been not only strategic, but also deeply symbolic for some communities of identity. The symbolic consequences of census inclusion might also be said to derive from the civil rights movement in the sense that it helped give rise to identity politics and multiculturalism, movements in their own right which spawned claims for "official" recognition by many groups. These recognition claims were often made on the basis of color, but as often served as a proxy for culture.274 With the demise of scientific accounts of racial difference, and the ascendancy of social and political explanations,275 identity politics became the arena in which communities and individuals alike struggled for cultural recognition by society at large. As Charles Taylor has made clear, identities are always dialogical, forged through interactions and relationships with others, and in that sense they rely on recognition by others (and conversely, can be harmed by misrecognition by others).276 In this way, identity politics emphasized the need to be affirmed by others and the overriding value of recognition by the state, itself symbolic of national inclusion. Thus the census has been an important mechanism for symbolic inclusion in the nation, quite apart from the material consequences of being counted that have inspired the strategic push for inclusion by groups. However, it is important to note that precisely because identities do not have an independent existence, but rather depend on social and cultural acknowledgment to be called into being, the race categories on the census have always played a dual role: of recognizing identity and also of conferring it. As Sharon Lee has observed, "One function of official race classifications is to create a sense of group membership or even community where there had been none before."277 Lee points to the way in which the creation of an official category coalesces a group that may not have understood itself as a group before, or at least was not commonly understood to be a group. For example, "the social construction of a pan-ethnic racial group called White served to minimize ethnic differences among the numerous European ethnic groups while fostering a common racial identity. It also hardened the division between White and Others."278 More recently, the census classification of Asian has had a similar effect of creating, among heterogeneous groups of Asian descent, a common pan-ethnic identity through which people have come to see themselves and others.279 This was also true much earlier of counting the Chinese as Chinese; it created a Chinese identity for people who had not necessarily thought of themselves that way before, and it created a Chinese race, which at least for a time did not include other Asians.280 The National Academy of Sciences report on federal race classification similarly claims that it was the Census Bureau's use of the then uncommon designation of "Hispanic" in the early 1970s that led to its wide circulation and use as an identity referent.281 As that report attests, "[t]here is a symbiotic relationship between categories for the tabulation of data and the processes of group consciousness and social recognition, which in turn can be

reflected in specific legislation and social policy."[282] Because official recognition has the power, not just of acknowledging an identity that already exists, but of conferring or solidifying an identity around a particular set of characteristics, it is not surprising that the census became one of the grand prizes in the politics of identity. More surprising is the easy assumption many make that recognition has effectively displaced erasure as the motivation for enumeration. Certainly the current rhetoric of inclusion adopted by the state has appeared to change the stakes of counting. But just as exclusion depends on categorical recognition, so categorical recognition depends on exclusions: every group that is officially identified as such creates new axes of visibility and power, and new erasures as well. Thus, it is somewhat ironic that roughly 100 years after first counting the Chinese in a retributive act of erasure, the census has become the principle vehicle of official recognition in the politics of identity and in political accounting.

**Ban Racial Profiling

Text: The United States federal government should extend the Justice Department's rules for racial profiling to all government agents.

Profiling is the basis for race-based discrimination- not allowing the government to profile solves for greater state-based instances of racism.

Horwitz, 14- (Sari Horwitz covers the Justice Department and criminal justice issues nationwide for The Washington Post) "Justice Dept. announces new rules to curb racial profiling by federal law enforcement" The Washington Post, December 8, 2014, https://www.washingtonpost.com/world/national-security/justice-dept-to-announce-new-rules-to-curb-racial-profiling-by-federal-law-enforcement/2014/12/07/e00eca18-7e79-11e4-9f38-95a187e4c1f7_story.html //droneofark

The Obama administration on Monday formally announced long-awaited curbs on racial profiling by federal law enforcement, but the new rules will not cover local police departments, which have come under criticism in recent months over allegations that their officers profile suspects. Attorney General Eric H. Holder Jr. expanded Justice Department rules for racial profiling to prevent FBI agents from considering gender, national origin, religion, sexual orientation and gender identity, in addition to race and ethnicity, when opening cases. The department also is banning racial profiling from national security cases for the first time. Holder's revised policy covers state and local law enforcement officers while they participate in federal law enforcement task forces. But it is considered only guidance for police officers in state and local departments. The profiling rules come at a time of racial tension around the country after the recent deaths of three African Americans at the hands of police in Ferguson, Mo., New York and Cleveland, and the absence of criminal charges against the white police officers who were involved. "As attorney general, I have repeatedly made clear that profiling by law enforcement is not only wrong, it is profoundly misguided and ineffective," Holder said. "Particularly in light of certain recent incidents we've seen at the local level, and the widespread concerns about trust in the criminal justice process, it's imperative that we take every possible action to institute strong and sound policing practices." A Justice Department official said the goal is for federal law enforcement agencies to "model" these policies, proving to state and local authorities that successful policing does not require profiling. Holder held a conference call Monday with local law enforcement leaders to brief them on the policy and encourage them to adopt it. "At this historic moment in our nation's race relations, the release of this revised guidance is an important signal of progress, but it does not completely address the need for reform of policing tactics at the state and local level," said Laura W. Murphy, director of the American Civil Liberties Union's Washington legislative office. The rules also apply for the first time to many activities at the Department of Homeland Security, including all Immigration and Customs Enforcement civil immigration enforcement, U.S. Coast Guard law enforcement activities, Border Patrol activities not near the border, DHS officers protecting government buildings and federal air marshals. But DHS officials will not be covered by the new racial profiling ban when they screen airline passengers and guard the country's Southwestern border. Customs and Border Protection, for example, still will be allowed to use profiling when conducting screenings and inspections at the country's ports of entry and interdictions of travelers at the border, government officials said. Secret Service protective activities also will not be covered by the rules. "Having a particular skin color, religious belief or last name is not a crime," said Rajdeep Singh, director of law and policy at the Sikh Coalition, the largest Sikh American civil liberties organization. "This is not a 50-50 issue. The Obama administration can either ban profiling or allow it. It sounds like they're committed to allowing it." A fact sheet on the policy said that some DHS activity is not covered by the policy because of the "unique nature of DHS's mission." "This does not mean that officers and agents are free to profile," according to the DHS fact sheet. "To the contrary, DHS's existing policies make it categorically clear that profiling is prohibited, while articulating limited circumstances where it is permissible to rely in part on these characteristics, because of the unique nature of border and transportation security as compared to traditional law enforcement." President George W. Bush banned racial profiling in 2003, but the prohibition did not apply to national security investigations and covered only race — not religion, national origin, gender or sexual orientation and gender identity. Civil rights groups and Democratic lawmakers have pushed for expanded anti-profiling protections since

President Obama was elected in 2008. Holder began the process to revamp the rules in 2009 and considers the new policy one of the signature accomplishments of his tenure. About six months ago, the Justice Department delivered the rules to the White House. But they applied only to the department, and White House officials wanted the polices to cover additional agencies. The rules have been delayed in part because DHS officials pushed the White House and the Justice Department to allow major exclusions for agencies such as the Transportation Security Administration, Immigration and Customs Enforcement, and Customs and Border Protection. In several high-level meetings, DHS Secretary Jeh Johnson argued that immigration and customs agents and airport screeners needed to consider a variety of factors to keep the nation safe, according to officials familiar with his personal efforts. TSA officials argued that the rules should not apply to them because the TSA is not a law enforcement agency. In its fact sheet, DHS officials said that they will review activities not directly covered by the guidance to ensure that "we are including every appropriate safeguard and civil rights protection in the execution of those important security activities, and to enhance our policies where necessary." But that was not enough assurance for civil liberties advocates. "It's baffling that even as the government recognizes that bias-based policing is patently unacceptable, it gives a green light for the FBI, TSA and CBP to profile racial, religious and other minorities," the ACLU's Murphy said. "This guidance is not an adequate response to the crisis of racial profiling in America."

**Gender Categories CP

Text: The United States federal government should

- **repeal the REAL ID Act and eliminate the requirement for listing gender on driver's licenses and state ID cards.**

- **further update the passport gender marker policy to allow for certification of gender change by licensed therapists, psychologists, and nurse practitioners, and to eliminate remaining burdensome procedural requirements.**

- **eliminate computer matching of gender data in all remaining data-matching programs.**

- **issue an updated Model State Vital Statistics Act that provides for gender change on birth certificates based on certification from a mental health or medical provider, without proof of specific medical or surgical procedures and without a court order**

- **should review all new government forms and updates to forms to eliminate collection of gender data in cases where it does not serve a clear programmatic purpose.**

The aff can't account for the ongoing violence done to groups outside of the census—the cp solves for greater polycultural efforts.

National Center for Transgender Equality, 15- (the nation's leading social justice advocacy organization winning life-saving change for transgender people.) "A Blueprint for Equality: Documents and Privacy (2015)" Transequality.org, 2015 http://transequality.org/issues/resources/a-blueprint-for-equality-id-documents-and-privacy-2015 //droneofark

In today's world, identification documents are needed to travel, open bank accounts, start new jobs, purchase alcohol, and even to purchase some cold medicines. Recent voter suppression efforts by some state legislatures have made voting an activity in which trans people without accurate ID may face unfair difficulties. Historically, state and federal governments have imposed intrusive and burdensome requirements—such as proof of surgery and court orders—that have made it impossible for many trans people to obtain accurate and consistent ID. For many people, financial barriers, medical contraindications or simply a lack of medical need for surgeries make these requirements impossible to satisfy. As a result, out of those National Transgender Discrimination Survey respondents who had transitioned, only one-fifth (21%) had been able to update all of their IDs and records with their new gender. One-third (33%) had not updated any IDs or records. At the time of the survey, only 59% had been able to update their gender on their driver's license or state ID; 49% had updated their Social Security Record; 26% their passport; and just 24% their birth certificate.1 The survey results also confirmed what most trans people already knew—that gender-incongruent identification exposes people to a range of negative outcomes, from denial of employment, housing, and public benefits to harassment and physical violence.2 Because of the work done by NCTE and activists around the country, this trend is now reversing quickly. About half of states no longer impose such burdensome requirements for driver's licenses and state IDs and growing numbers are streamlining procedures. NCTE has worked with the American Association of Motor Vehicles Agencies to educate state agencies about current best practices. Since 2010, onerous requirements for gender change on federal documents and records such as passports and green cards have also been eliminated. State-level efforts have won improvements in birth certificate laws and policies in California, Oregon, New York, Connecticut, Maryland, Vermont, Washington State and the District of Columbia. These developments represent a growing recognition that older, more restrictive policies have served little, if any, purpose, and that reasonable policies enabling everyone to obtain accurate and consistent ID best serve both government agencies and individuals. There is still more to do, however. While eliminating the most draconian requirements for ID change, many existing federal

and state policies are still unduly burdensome in requiring medical certifications from physicians, rather than accepting certifications from therapists or other non-physician health providers, or simply from the individuals themselves. In addition to ID documents, other government records and programs unintentionally cause the disclosure of information about a person's transgender status without their consent. Chief among these are computer matching programs used by the Social Security Administration (SSA) for identity verification, which have outed individuals when gender data is inconsistent between records. In response to NCTE's efforts, SSA announced in 2011 that it would halt gender matching in its Social Security Number Verification System, the largest matching service used by private employers. This change alone has prevented workplace problems for many trans people. However, automated gender matching has not yet been eliminated in other SSA programs used to share data with state programs and other entities. Government should not needlessly compel the disclosure of a person's medical history or transgender status. The federal government has taken important steps to end these problems and should act promptly to modernize and harmonize policies across agencies. Ultimately, listing gender on driver's licenses, state ID cards and many other documents is simply unnecessary and should be eliminated.

The CP solves

National Center for Transgender Equality, 11- (the nation's leading social justice advocacy organization winning life-saving change for transgender people.) "Policy Brief: Birth Certificate Gender Markers" Transequality.org, 2011 http://transequality.org/issues/resources/a-blueprint-for-equality-id-documents-and-privacy-2015 //droneofark

A birth certificate is an important document used to prove one's identity and citizenship. For those who can afford one, a passport can serve the same purposes. However, the ability to change one's sex designation on birth certificates remains an important issue for many transgender people. As lawyers at Lambda Legal point out, states have varying procedures for updating these documents, and a few actually prohibit changing the gender marker on birth certificates. Many states model their policies for amending birth certificates on the Model Vital Statistics Act and Regulations (or Model Law). Currently being revised, the Model Law is developed by consultation between the state and federal governments and was last updated in 1992. The Model Law is intended to be a guide for states, so that states can model their own vital statistics laws and regulations after its suggestions. What's wrong with these laws? The 1992 Model Law says that a person wanting to change their sex on their birth certificate should present a court order certifying that their sex "has been changed by surgical procedure." There are three problems with this approach, which many states still use. First, the requirement of a court order can create a barrier to those transgender people who don't have enough money to hire a lawyer or who don't have enough knowledge to navigate the legal system on their own. Also, some courts are hesitant to issue orders amending birth certificates that were issued by another state, creating problems for transgender people who want to change their birth certificate after they move away from the state where they were born. Second, the Model Law's requirement of "a surgical procedure" in every case is at odds with the medical community. The World Professional Association for Transgender Health (WPATH) recognizes that different patients will have different medical needs. Surgical treatments may be necessary and appropriate for some transgender individuals, but not for others. The Model Law' ignores the differing needs of transgender communities. Third, the Model Law does not say what the new birth certificate should look like after the proper documentation is submitted. Ideally, the state would create a new birth certificate that reflects the amended gender, and some states do this. However, other states simply change the existing birth certificate, issuing one that shows the previous gender, while others designate on the new birth certificate that the gender has been changed. These approaches out transgender people whenever birth certificates are used to verify their identity. NCTE's Proposal: An updated version of the Model Law is currently being developed by a group of state officials coordinated by the National Center for Health Statistics (a part of the CDC). NCTE and allies have been advocating with NCHS to change this outdated and restrictive policy about amending birth certificate sex designation. Specifically, NCTE has suggested that NCHS make three changes in its revisions of the Model Law based on approaches developed by some states and federal agencies. The revised Model Law should allow people to change the sex designation on their birth certificate by submitting the required documentation directly to the vital statistics agency, rather than requiring a court proceeding. This will eliminate the unnecessary costs and other obstacles sometimes associated with going through the state court systems. The revised Model Law should not require proof of specific medical procedures in order to amend birth certificates. Instead, the Model Law should reflect contemporary standards of care, and require only that an individual's physician certify that the individual has completed the treatment the physician deems necessary to achieve gender transition. This change would recognize that different people have different medical needs, and avoid disclosure of any confidential medical information. The revised Model Law should make clear that a new birth certificate should be issued after an individual presents the proper documentation, rather than a birth certificate that shows the original gender designation or states that the gender has been changed. These recommendations reflect a growing trend in state and federal policies. The Department of State modernized its policy on passports in 2009, and the policy for "Consular Reports of Birth Abroad," which are federal birth certificates for U.S. citizens born outside of the U.S., also no longer requires proof of surgery. Recent legislation in Vermont adopted the same approach for that state's birth certificates, and a similar bill is being considered in California. NCTE will continue to advocate for these changes in the new Model Law, and support the work of activists at the state level. Ensuring that transgender people are able to change their identity documents to reflect their gender identity is a major priority for NCTE.

Human Rights NB-_Can be used for any gender cp

The net benefit is human rights—not specifying gender allows trans people the basic human rights of recognition that cisgender people aren't subject to.

Cray and Harrison, 12- (Andrew Cray is a Research Associate for LGBT Progress at the Center for American Progress. Jack Harrison is Manager of the Policy Institute at the National Gay and Lesbian Task Force.) "ID Accurately Reflecting One's Gender Identity Is a Human Right" Center for American Progress, December 18, 2012 https://www.americanprogress.org/issues/lgbt/report/2012/12/18/48367/id-accurately-reflecting-ones-gender-identity-is-a-human-right/ //droneofark

This past week our nation joined others around the globe in celebrating International Human Rights Day, which marked the 64th anniversary of the U.N. Declaration of Human Rights, signed on December 10, 1948. This document declares that "inherent dignity" and "equal and inalienable rights" are the foundation for a just, peaceful, and free world. Decades later these principles continue to guide human rights policies established around the world, acting as a foundation for the evolving global understanding of what it means to acknowledge the equality of all people. Transgender people, however, continue struggling to attain this innate right to dignified treatment and equality. As the Council of Europe's Commissioner for Human Rights has stated, "It is clear that many transgender persons do not fully enjoy their fundamental rights both at the level of legal guarantees and that of everyday life." One way in which transgender people have struggled is in accessing identity documents that provide legal recognition of their gender identities. The failure of governments to acknowledge the gender identities of all people represents a rejection of the fundamental rights of self-determination, dignity, and freedom. Moving forward as a global community, it is essential that all people—transgender or not—be given access to official documents that accurately reflect each individual's gender identity and that respect the rights belonging to each of us as humans. The daily importance of identity documents Having access to identity documents is important because of the very reason they are taken for granted: They are an integral part of daily life in most cultures. Identity documents are needed for many activities of daily life—working, voting, traveling, accessing government institutions, and proving that one is who one claims to be. Yet for many transgender people, accessing this basic proof of identity is out of reach, pushing them further into the margins of society. Historically, many obstacles have been placed in the way of obtaining accurate ID. For many transgender people, these financial, medical, and legal barriers are impossible requirements to satisfy. Adding an additional layer of complexity to this landscape is the wide variety of identity requirements that citizens are required to have in many countries. In the United States alone, for example, most people need consistent access to accurate birth certificates, driver's licenses, passports, and social security cards. The requirements for these documents are set by different levels of government—both federal and state—often require different standards for amending the information they reflect, and utilize different administrative processes for amendment. The two most common forms of identity documents used by people across the globe, however, are birth certificates and passports. There is currently no international standard for verifying or amending the information contained on birth certificates. Moreover, the standards that are in place are set by each nation or by sub-jurisdictions within that nation. Similarly, standards for passport documentation are set at the national level. Passports, however, are subject to a foundational set of international standards established by the International Civil Aviation Organization. The standards set by this organization dictate that passports must include an individual traveler's name, date of birth, nationality, and sex. In the "sex" field, the standards dictate that permissible options are "M" for male, "F" for female, or "X" for unspecified gender. Countries, therefore, are given significant leeway to establish policies that affirm the identities of transgender and gender nonconforming citizens, and this flexibility should be exercised in a way that protects the human rights of the diverse people in each nation. Transgender people face significant consequences from policies preventing access to accurate identification When a government agency is unwilling to issue identification that reflects a person's identity, they are making a value judgment on the legitimacy of that identity and, as an extension, on an individual's right to citizenship. Yet being forced to live, move, and contribute in society without accurate, updated identification have impacts for transgender people that go far beyond an administrative lack of access. Presenting inaccurate identification all too often becomes a trigger for various forms of abuse and discrimination. Transgender people who may otherwise move through the world undetected by those who would discriminate against them are often "outed"

by an old gender marker, an old name, or an old photograph. The results of the National Transgender Discrimination Survey, conducted by the National Center for Transgender Equality and the National Gay and Lesbian Task Force, reveal how common these outcomes are in the United States. Forty percent of respondents who reported presenting ID that did not match their gender identity experienced harassment—3 percent were physically assaulted and 15 percent were asked to leave the premises where the ID had been presented. Furthermore, those respondents who were unable to update their driver's licenses reported much higher rates of discrimination in hiring and housing. Even when antitransgender bias is not specifically at play, a perceived mismatch between an individual and the information on a presented ID can trigger heightened scrutiny and create barriers to accessing services and spaces. This has been the case for many transgender voters in the United States. Leading up to the 2012 presidential election, Jody Herman, Peter J. Cooper public policy fellow at the Williams Institute at the University of Los Angeles School of Law, estimated that as many as 25,000 transgender voters in states with strict photo ID voter requirements could be disenfranchised, not just because of antitransgender bias but also because they simply may not have appeared to be the person on their ID. Transgender people are frequently subjected to excessive requirements to access accurate identity documents Many countries impose restrictive standards that require individuals seeking recognition of their gender to undergo unnecessary or unwanted medical procedures. In other countries, transgender people may be barred in some situations from changing their identity documents to accurately reflect their gender. And some places, including some jurisdictions in the United States, bar transgender people from changing their legally recognized gender under any circumstances. These are the harsh realities felt by transgender people throughout many parts of the world.

The cp solves the net benefit

Cray and Harrison, 12- (Andrew Cray is a Research Associate for LGBT Progress at the Center for American Progress. Jack Harrison is Manager of the Policy Institute at the National Gay and Lesbian Task Force.) "ID Accurately Reflecting One's Gender Identity Is a Human Right" Center for American Progress, December 18, 2012 https://www.americanprogress.org/issues/lgbt/report/2012/12/18/48367/id-accurately-reflecting-ones-gender-identity-is-a-human-right/ //droneofark

United States: Placing barriers to birth certificate changes, including outright prohibition U.S. states are permitted to set their own policies for the amendment of birth certificates, which creates a divided system of policies between state and federal identification documents. Even more confusing is the wide variation in state standards. First, some states issue entirely new birth certificates upon amendment, whereas others offer amended birth certificates, which make it apparent that an individual's gender has been changed, triggering privacy and safety concerns for many transgender people. Among those states offering some option for changing the gender marker indicated on a birth certificate, standards can range from having no requirement for specific medical treatments to requirements relating to genital surgery. The result is a system where a person would be eligible to have their birth certificate amended in one state but deemed ineligible to do so if they had born in a neighboring state. These arbitrary variations between state standards, however, are not the most disconcerting aspect of birth certificate policies in the United States. Most egregious are the states that refuse to issue amended birth certificates altogether. Though several states in practice refuse to allow transgender people access to birth certificates that accurately reflect their gender identity, Tennessee is the only state that has a statute specifically prohibiting the amendment of birth certificates for transgender people. But regardless of how these policies have been adopted, the intent and the effect are the same: Transgender people are specifically and intentionally isolated from the processes available to others to obtain accurate identity documentation. Thankfully, however, many jurisdictions in many countries have moved beyond discriminatory policies targeting transgender people to offer more equitable access to IDs that correspond with an individual's gender identity.

**Abolish Race on Birth Certificates CP

Text- The United States federal government should abolish the race portion of United States birth certificates.

The cp solves for state control and discrimination

Kertzer and Arel, 02- (David Kerzer is the Paul Dupee University Professor of Social Science and Professor Anthropoligy and Italian Studies at Brown University—Dominique Arel is Assistant Professor at the Watson Institute for International Studies at Brown University.) "Politics of Race, Ethnicity, and Language in National Census" p. 3-4, Cambridge University Press, 2001, print,//droneofark

The emergence of nationalism as a new narrative of political legitimacy required the identification of the sovereign "nation" along either legal or cultural criteria, or a combination of both. The rise of colonialism, based on the denial that the colonized had political rights, required a clear demarcation between the settlers and the indigenes. The "Others" had to be collectively identified. In the United States, the refusal to enfranchise Blacks and native Americans led to the development of racial categories. The categorization of identities became part and parcel of the legitimating narratives of the national, colonial, and "New World" state. States thus became interested in representing their population, at the aggregate level, along identity criteria. The census, in this respect, emerged as the most visible, and arguably the most politically important, means by which states statistically depict collective identities. It is by no means the sole categorizing tool at the state's disposal, however. Birth certificates are often used by states to compile statistics on the basis of identity categories. These include ethnic nationality (a widespread practice in Eastern Europe); mother tongue, as in Finland and Quebec (Courbage 1998: 49); and race, in the United States (Snipp 1989: 33). Migration documents have also, in some cases, recorded cultural identities. The Soviet Union, for instance, generated statistics on migration across Soviet republics according to ethnicity. The US Immigration Service, from 1899 to 1920, classified newly arrived immigrants at Ellis Island according to a list of forty-eight "races or peoples," generally determined by language rather than physical traits (Brown 1996). Parallel to the need for statistical representation was the need for control. In order to establish a "monopoly of the legitimate means of movement" (Torpey 2000: 1), states imposed the use of personal identity documents to distinguish the citizen from the foreigner (Noiriel 1996) and, in some cases, attempted to control the internal migration of their population through residency permits and internal passports (Matthews 1993). In a number of cases, such identification documents contained an identity category beyond the civic or legal status of the individual: for example, the Soviet Union, where citizens had their "nationality" (in the ethnic sense) indicated on their internal passports (Zaslavsky and Luryi 1979); Rwanda, with Hutu or Tutsi ethnicity (actually called "race") appearing in identity cards (Uvin, this volume); Greece, Turkey, and Israel, with religion recorded in identity cards (Courbage 1997: 114; Goldscheider, this volume) 1 ; and apartheid South Africa, with racial categories inscribed on identification papers (Petersen 1997: 97). The categorization of identities, along culturally constructed criteria, on individual documents can serve nefarious or well-meaning purposes. In the United States, a racial category in birth certificates was long used to discriminate against Blacks and Indians. Following the rigid principle of the "one-drop rule," according to which a single Black ancestor, however remote, made one Black, birth certificates were often used in Southern states to bar individuals of racially-mixed ancestry from marrying Whites (Davis 1991: 157). The rise of affirmative action, based on the notion that achieving true equality required special consideration to be given to historically disadvantaged minorities in access to jobs and education, implied the bureaucratic categorization of "minorities." As a consequence, particularly in the case of Blacks and Indians, it has meant continuing commitment to the determination of race according to "objective" ancestry, as opposed to simple self-definition. Thus, the Indian Health Service of the Bureau of Indian Affairs continuse to hold that eligible patients must have a minimum of one-fourth "blood quantum," which in practice entails that they must prove that at least one of their grandparents appeared on tribal enrollments (tribal rolls) of recognized tribes (Snipp 1989: 34). A similar policy was employed by Nazi Germany to identify both Jews and Germans. In spite of the shrill propaganda on the physical alienness of Jews, the criterion actually chosen to separate the Jews eventually targeted for destruction was a mixture of religion and descent, and not anthropometric measurement. Those

with at least three Jewish grandparents were categorized as Jews. Ancestry, in turn, was determined by birth certificates issued by religious institutions (Hilberg 1985). At the outset of World War II, when the Nazi government sought to transfer Germanspeaking populations from the East (Baltics, Ukraine, Romania) to newly annexed territories from Poland, the question of defining German identity arose. In this case, religion was not deemed determinative and ethnicity did not appear on birth certificates. In Estonia, where a liberal minority law in 1925 had established officially recognized ethnic associations, claimants had to show a certificate, delivered either by their German association or by the Estonian Ministry of the Interior, attesting to their German ancestry (Institut national de la statistique 1946: 80). 2 Interestingly, since post-war Germany has adopted a kind of Law of Return, granting automatic citizenship to ethnic Germans from abroad, the issue of legally documenting one's ethnic German affiliation remains germane today. After apparently relying on the self-declaration of applicants during the Cold War, the German state devised a complex questionnaire in the early 1990s to determine who can be deemed "German" (Brubaker 1996).

The aff can't take into account the discourse of trans people effected by effective control of the state—the CP solves this

Spade, 08- (Dean Spade is Spade is assistant professor at the Seattle University School of Law, teaching administrative law, poverty law, and law and social movements) "Documenting Gender" p. 806-88, Hasting's Law Journal, Vol. 59:731, March 2008, http://ssrn.com/abstract=1200902 //droneofark

Overall, a detailed examination of the gender classification rules of the United States exposes the internal contradictions and assumptions that are for the most part ignored or unrecognized in the numerous administrative contexts where these rules operate day-to-day. This Article makes the initial intervention of exposing the under-discussed policy matrix that messily and incoherently defines gender categories in the United States. The analytical insight provided by examining that rule matrix creates an opportunity to critique its problems and consequences and question the assumption that gender has more benefits than costs as a category of classification in administrative governance. Further, it allows us to see at work the production of insecurity and vulnerability for certain populations in the creation of systems of classification that administer caretaking programs. Because the administration of population caretaking interventions aimed at creating a healthy population and national security mobilizes and relies upon ideas of the characteristics of that population, subsequently naturalizing those characteristics such that they appear as "common sense" truths rather than political choices, the production of unhealth and insecurity for some subpopulations is obscured. Antidiscrimination discourses that rely on the perpetrator perspective individualize difference like transgender identity to the victim and individualize invidious intentions to the perpetrator, making invisible the systemic conditions producing identity categories from multiple locations. Finally, recognizing the high stakes of administrative governance— identifying it as a key location of legal production of equality/inequality and distribution of chances at security and insecurity, health and sickness, life and death—also enables us to understand the significance of the administrative nature of the War on Terror as more than a set of concerns over the accuracy of records and the privacy of individuals. Instead, it might be an opportunity to understand the key role of administrative governance in forms of domination that have often been conceptualized through individual discrimination. Further, it offers a chance to re-imagine political responses to surveillance and to question whether caretaking functions of the state, such as the redistribution of wealth through taxes and public benefits, national security, disease control, and even the remediation of long histories of oppression and exploitation, require the kinds of data collection that are increasing at a rapid pace in the United States, or whether they could be better accomplished through other means.

Spills over to broader criticism of state categorization

Spade, 08- (Dean Spade is Spade is assistant professor at the Seattle University School of Law, teaching administrative law, poverty law, and law and social movements) "Documenting Gender" p. 806-88, Hasting's Law Journal, Vol. 59:731, March 2008, http://ssrn.com/abstract=1200902 //droneofark

Conclusion As the work of Bowker and Star shows us, classification systems operate on the basis of norms that often appear non-controversial to most people but have significant ethical consequences. The operation of administrative governance in the United States, specifically the "caretaking" programs that intervene with the aim of health, safety and well-being for the population, require data collection that forms a basis of identity surveillance. This identity data, gathered by disparate agencies for varying purposes, is being mobilized in new ways by War on Terror innovations aimed at increasing immigration enforcement. The categories of classification used in this data collection are so ubiquitous in culture and law that rulemakers, judges, scholars, and advocates often fail to question their use and frequently presume their coherence and stability. Only those whose lives are subject to the conflicts between these rules and to the social and economic exclusion that results from not being legible in a ubiquitous classification system tend to be aware of the issues. Looking at the role of administrative governance in the modern state, the history of population-level intervention, and the creation of sub-populations that necessarily results from classification

processes central to standardization provides space to ask key questions. Even as we watch the ongoing process of privatization and deregulation in many realms advocated as reducing government intervention, we can see that a moment of steady expansion of state powers, often under the "law and order" or "anti-terrorism" rubric, is at hand.388 In this moment, it is useful to broadly and critically examine administrative governance as a productive process where the conditions of existence of individuals and groups are determined by fundamental assumptions and norms of the administrative state. It is imperative to neither uncritically embrace state caretaking projects as requiring growing levels of surveillance for purposes of security and health, nor to turn to individual privacy rhetoric wholeheartedly and valorize an end to government data collection. Recent political debates show that the pro-surveillance or antisurveillance position can be mobilized on either side of equality struggles articulated by marginalized groups. In some instances we see a push for "colorblind" governance opposed by groups interested in remedying racial inequality.389 In others we see the "privacy" argument articulated to stop race-based data collection and aggregation motivated by concerning theories of racial difference.390 In some instances we see advocates seeking reduced data collection about HIV status because of surveillance concerns.391 In others, advocates push for increased data collection seeking the distribution of resources to communities severely impacted by HIV.392 In these examples and many others, we can see "privacy" arguments and the demand for data articulated on both sides of a political divide about domination.393 This dilemma points to a need to develop analysis about the intertwined surveillance and caretaking roles of the state that can account for our frequently conflicting beliefs about data collection. Can we imagine a state that meets demands for caretaking without surveillance, for example by providing public benefits without a recordkeeping system to determine who has received a distribution of benefits? Can we imagine public health programs that collect health data without any link to individual identities? Would this resolve surveillance issues or could regional surveillance or other markers on data expose the same concerns? How might entire notions of property, criminality, individuality and collectivity have to be restructured in order to conceptualize a reduced reliance on data collection and identity verification? Exploring these questions may be initial steps in analyzing the complex role of data collection in state formation and assessing the political possibilities at hand for rethinking current data collection and standardization practices. Reaching out to these more distant visions of relations between caretaking and surveillance makes possible new understandings of the politics of current controversies about data collection and classification, and may enhance the potential to envision strategic approaches to change.

at: Permutation

Perm can't solve—the census data collected is actually used to help communities at large

Spade, 08- (Dean Spade is Spade is assistant professor at the Seattle University School of Law, teaching administrative law, poverty law, and law and social movements) "Documenting Gender" p. 806-88, Hasting's Law Journal, Vol. 59:731, March 2008, http://ssrn.com/abstract=1200902 //droneofark

Another area where compelling reasons for the continued use of gender classification exists is with respect to affirmative action and other programs focused on remedying the long-term effects of oppression of women and transgender people. Here, again, we can see parallels to controversies that have occurred regarding the use of other contested identity categories. In the context of race, the debates that occurred regarding putting a "multiracial" category on the U.S. Census are instructive.375 Those discussions focused on the proposal that a "multiracial" category would lead to more accurate data, because the Census requirement that people pick a single racial category obscured the fact that many people are multi-racial.376 Opponents of the proposal argued that while it is true that many people are multi-racial, certain groups would be undercounted if their identity categories were emptied by more people choosing "multi-racial" rather than the race category they would have previously chosen.377 This argument was especially made with regard to people of African ancestry in the United States378 While requiring multi-racial people with African heritage to only identify that heritage in their identification on the Census mirrored the racist rule of hypodescent also known as the "one drop rule," establishing a "multiracial" category would likely drastically reduce the number of people identifying as African-American.379 Opponents argued that because much discrimination and exclusion has occurred and continues to occur through the rule of hypodescent, with historical and present day racism regarding people through the one-drop lens, eliminating the ability to identify people of African descent specifically would impede the ability to use Census data to understand the conditions in that population and formulate appropriate policies related to redistribution and remediation.380 Thus, even though the racial categories formulated by the rule of hypodescent do not reflect a scientifically verifiable classification that would be desirable in many other areas of government identity classification, they still operate on individuals and communities impacted by racism. Tools like Census data that are used to evaluate policies aimed at remedying discrimination and exclusion and redistributing government services and support, therefore, need to measure race in ways that do not obscure the existence of communities and issues constituted around those categories. Similarly, we might suggest that in programs collecting data for purposes of evaluating efforts to remedy the impact of long-term discrimination and exclusion of women and transgender people collecting data about gender might be useful. Such data collection could be undertaken with an understanding that what is being measured is the impact of social processes of gender production that result in discrimination and exclusion in contexts where systemic sexism and transphobia exist. Again, as in the health context, the gender categories used in such collection might not simply be "male" and "female" depending on the kind of problems being assessed. If a deeper question were asked, one that addressed whether gender data was really necessary, and if so what aspect of gender data should be collected and how, more nuanced and effective policymaking might result. This is not an argument for a simplistically "gender-blind" government, but rather for a shift toward a more critical view of the use of gender data in government recordkeeping. If collecting data on gender had to be justified by a close connection to institutional purposes, and false assumptions about the use of gender data to verify identity fell by the wayside, the use of this data could have less unintended negative consequences for both individuals and institutions. The confusion currently being caused by batch checking procedures aimed at immigration enforcement and terrorism prevention exposes the incoherency of gender classification, allowing us to consider putting an end to the administrative attempts to make gender a stable marker of identity verification and a logical way of dividing and managing the population when it clearly does not achieve either purpose consistently. It is worth noting that this underlying question about the significance of gender classification has also played an important role in discrimination

law. The use of intermediate scrutiny rather than strict scrutiny for laws and policies distinguishing people on the basis of gender,381 controversies about sex as a bona fide occupational qualification,382 and debates about whether pregnancy discrimination is a form of sex discrimination383 all bear a relation to the fundamental concern over what kind of classification sex represents. Does it relate to a meaningful difference among humans that can be used as a legitimate basis for differential treatment in some instances?384 Or is it a classification arising from a system of dominance, such that differential treatment on this basis should be viewed under serious suspicion of discrimination? The jurisprudence related to gendered dress codes also relates to these questions,385 asking courts to determine whether cultural expectations about gendered appearances in certain industries are reasonable professional standards or illegal limitations on the lives of individuals based on discriminatory stereotypes. Similarly, the Title VII cases where courts have wrestled with whether discrimination against transgender people is prohibited by Title VII require a determination of basic understandings of how the law views gender classification.386 Are transgender people who are fired being impermissibly discriminated against because of failure to live up to a stereotype about masculinity or femininity,387 or is their gender expression so far outside cultural norms that it is beyond the ambit of what Title VII exists to protect? Many of the fundamental tensions in sex discrimination law have related to these questions about how the law views sex as a category—whether it is "real" enough to be a legitimate basis of differential treatment or whether we see it primarily as a set of social norms arising out of a system of domination. While these issues are too numerous to treat here, the insight into the instability of gender provided by the examination of the gender reclassification rule matrix might also be a helpful consideration in the resolution of these questions.

Cyber/Internet CPs

**Cyber-Vulnerability CP

The United States federal government should establish a cyber-vulnerability purchasing program.

The CP solves cyber-crime and internet governance

Brake 2015 (Benjamin [International Affairs Fellow at the Council on Foreign Relations]; The Bug Trade; Apr 22; https://www.foreignaffairs.com/articles/2015-04-22/bug-trade; kdf)

To ensure their efforts to control this industry succeed, cyber officials should pay close attention to the shifting economics of the software vulnerabilities market. As cyber security specialist Dan Geer proposed last year, the purchasing power of the United States can do much to **restructure the market** for software vulnerabilities. By becoming its largest customer, the United States can make the licit market more attractive and lower the quality of tools available to cybercriminals. According to NSS Labs, a vulnerability purchasing program would reduce economic losses resulting from cybercrime by at least ten percent. It would also increase the talent pool of skilled information security researchers and degrade the ability of foreign intelligence agencies to acquire sophisticated exploits or attract talented researchers. In addition, the likelihood of a catastrophic attack on critical U.S. infrastructure would be diminished if individuals had an incentive to look for and sell flaws to reputable vendors or the U.S. government (provided that U.S. agencies maintain an effective process to responsibly disclose a vast majority of the bugs to the public). Without such a program, the market for vulnerabilities could become a bazaar for a wide array of private purchasers with no interest in public disclosure of the bugs. The United States cannot, though, expect to buy its way out of the problem entirely. A newly announced study from researchers from MIT, Harvard, and the information security firm HackerOne maintains that while bug bounties are an effective tool, the market is not driven by price alone. For a more enduring solution that avoids the danger of drawing too much attention to finding bugs and not enough to fixing them, officials and software developers must also work to encourage the development of automated solutions for vulnerability discovery. Thomas Schelling observed in his work on economics and criminal enterprise that unsavory markets always offer policymakers several options to restructure the market: increasing the legal competition, relaxing prohibitions, or selective enforcement. There are no easy choices when it comes to dealing with the problem of commercial hacking, but at least there are choices. Private hacking firms will inevitably thrive as encryption becomes more ubiquitous, but the United States can affect the market in which these firms operate. **A bug-bounty program led by the United States** can drive up their costs of doing business, as well as the costs to U.S. adversaries in cyberspace. It may, as Dan Geer noted, be "the cheapest win we will ever get."

--xt Solves internet freedom (affs that read Kehl)

The CP discloses vulnerabilities which is sufficient to solve internet freedom – their author

Kehl et al 2014 (Danielle Kehl is a Policy Analyst at New America's Open Technology Institute (OTI). Kevin Bankston is the Policy Director at OTI, Robyn Greene is a Policy Counsel at OTI, and Robert Morgus is a Research Associate at OTI; Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity; Jul 2014; https://www.newamerica.org/downloads/Surveilance_Costs_Final.pdf; kdf)

The NSA's apparent stockpiling of security vulnerabilities in widely-used hardware and software products (rather than responsibly disclosing them to vendors so that they may be patched) threatens cybersecurity writ large. **The U.S. government needs to establish a clear and consistent policy of disclosing vulnerabilities to vendors by default.** To the extent such a policy allows vulnerability stockpiling at all, it must explicitly define when, under what circumstances, and for how long the government may delay disclosure, if ever. A central tenet of this policy should be that if the U.S. government holds onto security vulnerabilities for future exploitation at all, it should only do so in extraordinarily rare cases, such as where there are no other legitimate means to access information that is necessary to protect against an immediate national security threat. It is critical that any such policy authorizing the stockpiling of vulnerabilities spell out in explicit and precise terms the limited circumstances that would qualify for such an exception, as well as specific guidelines for when and how vendors should be informed of the flaw after it has been used for that limited purpose As Bellovin et al. write, "In a world of great cybersecurity risk… public safety and national security are too critical to take risks and leave vulnerabilities unreported and unpatched… Law enforcement should always err on the side of caution in deciding whether to refrain from informing a vendor of a vulnerability. Any policy short of full and immediate reporting is simply inadequate."364 Similarly, Recommendation #30 from the President's Review Group recommends that "US policy should generally move to ensure that Zero Days are quickly blocked, so that the underlying vulnerabilities are patched on US Government and other networks," carving out an exception for rare instances when "US policy may briefly authorize using a Zero Day for high priority intelligence collection, following senior, interagency review involving all appropriate departments."365 Additionally, any decision not to disclose a vulnerability should be subject to a rigorous review process. The President's Review Group recommends the creation of an interagency process to regularly review "the activities of the US government regarding attacks that exploit a previously unknown vulnerability in a computer application or system."366 To the extent such a "Vulnerabilities Equities Process" already exists as the Administration now claims, the government must be much more transparent about its operation and the standards under which it operates, in order to reassure users of American hardware and software products that both industry and government are fully dedicated ensuring the security of those products.

--xt Regulation solves

Regulating the sale of the info drives R&R and stops cyber-crime

Brake 2015 (Benjamin [International Affairs Fellow at the Council on Foreign Relations]; The Bug Trade; Apr 22; https://www.foreignaffairs.com/articles/2015-04-22/bug-trade; kdf)

The United Kingdom isn't the only country concerned about the rising abuse of spyware. As early as 2012, Dutch EU parliament member Marietje Schaake spearheaded a push for a ban on exports of surveillance software. Several dozen nations, including the United States, Canada, and all EU member states, have since pledged to introduce export controls on surveillance software and new export control procedures are beginning to evolve in countries where many of these firms are headquartered, including Germany, Italy, and France. But the multilateral framework used to contain and control the trade—a legacy regime originally developed to curb arms proliferation in a bipolar world—cannot address the challenge of this new digital industry alone. Countries will still be left with the question of how to regulate this market without pushing it underground, driving spyware developers into more permissive jurisdictions, or imposing unnecessary restrictions that stymie commercial and scientific development. SOFT LAW FOR SOFTWARE In late 2013, 41 countries pledged under the Wassenaar Arrangement to adopt export controls for the types of surveillance tools HackingTeam and other firms were selling around the world. Wassenaar is the successor to a Cold War effort aimed at preventing the sale of conventional military and dual-use capabilities to the Soviet bloc. As the political scientists Kenneth Abbott and Duncan Snidal pointed out soon after its adoption, Wassenaar was already hard enough to enforce with physical goods. Wassenaar had too many members and too little consensus. It was not directed at a common enemy, and the costs of export bans fell unevenly across countries. Finally, some states were more technically prepared than others to oversee an effective control system. Digital goods like spyware will be all the more challenging to control. In the case of hacking products, the size and expertise of the leading firms make them difficult to control through a treaty. Unlike the middle aged, Ph.D. wielding engineers at Lockheed Martin that develop advanced fighter jets, software developers that create malware are often young, some may be detached from the community, and many are willing to move around frequently—much like the hacking firms that recruit them. There is also little equipment that can be physically monitored or controlled. Traditional defense industries use assembly lines, machine tools, and other types of manufacturing infrastructure that are difficult and costly to duplicate abroad; hackers' most valuable products are often computer code, which can go wherever they go. With only a few dozen employees, firms like HackingTeam will have a relatively easy time recruiting or luring their best and brightest to countries with less oversight over the development and distribution of spyware. European officials have already warned that Vupen, a French vendor of exclusive zero-day exploits, may be moving its offices out of the EU due to tightening export control policies.

--xt Government purchasing good

The CP solves crime and is sound economics

Dunn 2014 (John; Governments urged to set up global bounty system to buy security vulnerabilities; Jan 7; www.techworld.com/news/security/governments-urged-set-up-global-bounty-system-buy-security-vulnerabilities-3495978/; kdf)

The criminal market for software vulnerabilities is now so sophisticated and dangerous that governments should consider setting up a global programme to purchase flaws before they fall into the wrong hands, a researcher has argued. Last month Dr Stefan Frei of NSS Labs calculated that criminals probably had access to around 100 zero-day software flaws known only to them at any moment in time, which represented a huge security risk to organisations, governments and consumers alike. In a follow-up report before Christmas Frei and co-author Francisco Artes suggested that the level of insecurity was now far beyond what could be mopped up by commercial software bounty programmes such as those run by Microsoft, Google, Yahoo or specialist firms such as HP TippingPoint. Flaws could take months to discover and possibly years to patch across the world's population of PCs, leaving criminals free to exploit them more or less at will. With the uncosted economic and social toll rising and the industry no nearer producing secure software or accepting liability for its effects, the time had come for governments to resort to more drastic measures, Frei said. Meanwhile a lucrative market has developed for flaws with security disclosures that depended on the efforts of a small population of security researchers, a worrying minority of whom were willing to sell flaws to the highest bidder, often criminals. One solution would be a fully-fledged International Vulnerability Purchase Program (IVPP), which would seek to purchase serious flaws before criminals got hold of them. The main advantage of this approach is that it could include software products not currently covered by bounty programs while also paying market rates high enough to encourage more security research as a whole. Even paying above market rates – as high as $150,000 (£100,000) per flaw - "the cost of purchasing all vulnerabilities in a given year, and at competitive prices, is remarkably low compared to the losses that are estimated to occur as a result of cybercrime, or the economic output of major countries, or the revenue of the software industry for the same time period," wrote Frei. If such a program had purchased every known flaw during 2012, he calculated that the bounty costs would still only represent only 0.3 percent of the revenue of the world software industry, about 0.01 percent of US GDP. Put another way, the costs of paying for all those flaws would be dwarfed by the economic effects of the same flaws once they are wielded by criminals. The price offered for a specific flaw would depend to some extent on the financial damage it might cause, a number that would always in theory be higher than the profit criminals could make from the same vulnerability.

at: Bad economics

Leading study – CP is good economics

Frei & Artes 2013 (Stefan and Francisco; International Vulnerability Purchase Program; https://www.nsslabs.com/sites/default/files/public-report/files/International%20Vulnerability%20Purchase%20Program%20%28IVPP%29-1.pdf; kdf)

Over the past few decades, the global economy increasingly has come to rely on information systems, and yet society remains in the early phases of adapting to the related opportunities and threats. Criminals, however, are fast adopters (as with any new technology), and worldwide financial losses occurring as a result of cyber crime are estimated in the billions of dollars per year. The continued discovery of new vulnerabilities in software and their subsequent abuse by cyber criminals is the root cause of a considerable portion of the losses experienced by society. Every exploitable security vulnerability in the possession of cyber criminals (particularly those vulnerabilities that affect popular products) subsequently induces significant direct and indirect losses for users and for society as a whole. There is no indication that the status quo will change any time soon, not least because software manufacturers have yet to produce secure software and, since they do not bear the costs and consequences of the vulnerabilities within their products, there is little to indicate that they ever will. Experience has shown that traditional approaches based on "more of the same" do not deliver better overall security. The question to ask is: "How much are those that bear the costs willing to pay to reduce their losses incurred as a result of cyber crime?" It is time to examine the economics of depriving cyber criminals' access to new vulnerabilities through the systematic purchase of all vulnerabilities discovered at or above black market prices. By comparing the total losses occurring as a result of cyber crime against the costs involved in purchasing all vulnerabilities a compelling case is made for a centralized vulnerability purchase program. NSS Labs has discovered that the cost of purchasing all of the vulnerabilities of a given software vendor is minimal when compared with that vendor's revenue for the same period of time. Further, the cost of purchasing all of the vulnerabilities for all of the vendors is minimal when weighed against the expected overall reduction in losses incurred as a result of cyber crime. NSS' data reveals that it is **economically viable for governments** to make largescale purchases of vulnerabilities to reduce losses, establish proper incentives, provide transparency, and transfer costs to the appropriate parties.

**Cybersecurity Treaty 1NC

Text: The United States Federal Government should establish and ratify an international cybersecurity treaty.

Treaties with other countries prevents miscalc and intentionally targeting other countries

Mueller 14—Benjamin is the Stonex PhD scholar in international relations at the London School of Economics. His report, The Laws of War in the Era of Cyber conflict, is published by LSE IDEAS ("Why we need a cyberwar treaty" June 2, 2014 http://www.theguardian.com/commentisfree/2014/jun/02/we-need-cyberwar-treaty)//JLee

One decisive act of statesmanship could drastically turn this picture around. There is no regulation whatsoever of war in cyberspace – unlike conventional forms of battle, **which are subject to an extensive set of international treaty laws signed** and respected by the vast majority of the world's states. The laws of armed conflict regulate when a nation state may legally use military force against another state, and what means it may use to do so. Official military doctrine in many countries is that these laws apply to cyberspace as they do to all other domains of warfare. But cyberspace is unlike any of these domains. Attacks can take place from someone's desk, thousands of miles removed. The very meaning of the word "attack" is unclear: is any unauthorised digital incursion into another state's networks an offensive attack? Need it bring about destructive consequences to count as one? **An international treaty on cyberwar must clarify the meaning of cyber attack,** set out permissible responses, and include an obligation for states to assist one another in the investigation of digital crimes. A nation's failure to cooperate in the aftermath of a cyber incident must imply a degree of culpability. Digital industrial espionage falls under the World Trade Organisation, which ought to take steps to outlaw what is an anti-competitive tactic, and expand the scope of its dispute settlement mechanism to include such behaviour. Some argue that because attributing acts of cyber hostility is so difficult, a treaty would be a fool's errand. In fact, anonymity on the internet is impossible by definition: all internet traffic consists of electronically fired communication impulses which are traceable (as Mandiant's report shows). Attacks can be analysed using a mixture of digital forensics and traditional investigative methods. A cyberwar treaty will bring about three profound benefits. First, militaries will no longer have to perpetuate a boundless arms race in a domain that is currently unconstrained by rules and conventions: expectations of military behaviour in cyberspace will be anchored in norms (just as most states do not have to fear attack by nuclear, chemical or biological weapons). Second, setting out response structures to cyber attacks will finally establish a modicum of deterrence in cyberspace. Third, once the military applications of cyberspace become more predictable, states can devote more effort to cross-border law enforcement cooperation in the pursuit of cyber criminals.

--xt Solves privacy and internet

CP solves threats—doesn't violate privacy, allows free information flow

Mueller 14—Benjamin is the Stonex PhD scholar in international relations at the London School of Economics. His report, The Laws of War in the Era of Cyber conflict, is published by LSE IDEAS ("The laws of war and cyberspace on the need for a treaty concerning cyber conflict" June 2014 http://www.lse.ac.uk/IDEAS/publications/reports/pdf/SU14_2_Cyberwarfare.pdf)//JLee

The overall aim is to move the international community of states into a position where cyber-related cross-border cooperation of law enforcement is a matter of routine, regulated by treaty. An accord on cyber war is needed to clarify the definitions of LOAC in cyberspace, helping to bring clarity into what is currently an underregulated domain of warfare. By creating a degree of certainty as regards permissible state behaviour in cyberspace, governments can step away from the risky game of maximising cyber operations without breaching the armed attack threshold, and focus on the scourge of cyber criminality, which is undermining confidence in the Internet as a whole. An institutionalised basis for international cooperation on cyber crime would make life harder for cyber criminals. As an added benefit, a treaty on cyber crime would lessen the attribution dilemma, since non-cooperation by a state can then be seen an indication of a degree of state responsibility for a cyber incident.45 In practical terms, it is up to states to initiate the treaty process. The Budapest Convention provides a solid basis for combating cyber crime; it could be amended as per the points above and an effort launched to bring on board more signatories. The UN Disarmament & International Security Committee appears to be the most appropriate forum for talks to commence on a cyber war treaty. The incentive structure for states to engage in such a process is easily framed in the game theory terms that are familiar to students of bargaining and cooperation under anarchy.46 The simplest explanatory analogy is the Prisoner's Dilemma: it is in the interest of all states if cyberspace becomes a more ordered military domain, by anchoring expectations and introducing a degree of certainty for governments. It is in the private interest of each state to defect from this regime and secure the benefits of unrestrained cyber warfare on its own. To avoid all states from following their private interest and defecting, it is necessary to monitor compliance, ideally through an institution charged with this task (which generates what Axelrod and Keohane call the 'shadow of the future'). Curiously, although international law has no formal enforcement mechanism, states' adherence to it, as has been noted, is widespread and consistent. The reasons are likely to be a mixture of enlightened self-interest in an ordered international community, legitimacy (both of international law and of the compliant state in the eyes of its population as well as the international community) and the norms of socialisation that have built up over the past century as international law grew in depth and breadth.47 The main hurdle facing this scheme is that states fear giving up a military advantage – a fear that is nullified if all states sign up to the treaty – and the worry that regulating a decentralised, non-hierarchical network like cyberspace is antithetical to its fundamental purpose. Specifically, concerns have been voiced that regulating cyberspace will generate momentum for those states that seek to exert censorship and state control over the Internet.48 The idea that information is free, with the Internet as the medium to decentralise the global flow of knowledge and empower citizens across the globe, is indeed appealing to those who believe in freedom of speech as a fundamental force for good in the world. At the same time, it is easy to romanticise this point. Whether or not citizens enjoy a 'free web' still depends first and foremost on the domestic legal situation in which they find themselves. A state intent on censoring the Internet can do so easily, with or without a treaty on cyber war. What advocates for an open Internet seem to miss is that a key ingredient of the web is trust between the disparate nodes and actors in the network. A gradual militarisation of cyberspace will hamper cyberspace's effectiveness as a tool for commercial and social exchange. Moreover, the arms race dynamic that can develop absent a treaty on cyber war is a boon to cybercriminals, who, if left unchecked, will make e-commerce an increasingly slow, costly and cumbersome affair. That is in nobody's interest.

Japan Solvency

Japan is totally on-board

Bennett 15—Cory is a Cybersecurity reporter for The Hill. He was the Assistant Editor at Warren Communications News covering the Federal Trade Commission and Internet privacy/surveillance regulations and legislation ("US, Japan near cyber defense agreement" April 8, 2015 http://thehill.com/policy/cybersecurity/238264-us-japan-near-cyber-defense-agreement)//JLee

The U.S. and Japan are close to striking a bargain on bilateral defense rules that would bolster joint efforts to defend cyberspace. The move comes amid growing hacking threats from Asian power China and the reclusive North Korea. The agreement will update a standing defense alliance that has not been revisited since 1997 Japanese Minister of Defense Gen Nakatani said at a press conference Wednesday with his U.S. counterpart, Defense Secretary Ashton Carter. The revised defense guidelines will "give us the opportunity to extend [the alliance's] reach into new domains like space and cyber," said Carter, who is making his first trip to Asia since being installed as head of the Pentagon. Cybersecurity, Nakatani said, "has become a common security issue for both nations." The press conference was short on specifics regarding the cyber arrangement. The rules are expected to be finalized when Japan's prime minister visits President Obama in Washington later this month. Cybersecurity is increasingly dominating geopolitical relationships across Asia. China has moved to implement a broad set of new cybersecurity rules that would require companies to implement Beijing-approved encryption and open all source code to government inspection. Japan and the U.S. have aligned in opposition to the rules, which they argue will unfairly discriminate against foreign companies who do not want to expose customer data to the Chinese government. Security experts have widely accused China of hacking many major foreign companies operating in the region. Elsewhere, North Korea has emerged as a burgeoning cyber power in the region, launching digital attacks on South Korean nuclear plants and Sony Pictures Entertainment in the U.S., which is owned by Japan-based Sony. The restructured defense guidelines will help defend against instability resulting from these type of cyberattacks, as well as cyberattacks that look to knock out critical infrastructure. The rules "detail how our two governments will continue to work together around the world and in new domains such as space and cyberspace ... to ensure Japan's peace and security," Carter said. "And they will help us respond flexibly to the full scope of challenges we face, both in the Asia Pacific and around the globe." The world has changed since the U.S. and Japan last reviewed their guidelines, more than 17 years ago, Nakatani said. "During this time in the areas surrounding Japan, the security situation has become even more severe," he said. "And also in cyberspace and outer space, in these new fields there are various issues that we need to respond to."

China Solvency

CP Solves—a treaty would prevent espionage against China and solve miscalc

AP 14—Associated Press ("US seeks resumption of cyber talks with China" June 27, 2014 http://www.cnbc.com/2014/06/27/us-seeks-resumption-of-cyber-talks-with-china.html)//JLee

The United States next month will urge China to resume discussions on cybersecurity that were suspended abruptly after the U.S. charged five Chinese military officers with hacking into U.S. companies to steal trade secrets, a U.S. official said Thursday. Assistant Secretary of State Daniel Russel told The Associated Press the U.S. would push for a resumption of the cyber working group when Cabinet-level officials of both sides meet at the annual U.S.-China Security and Economic Dialogue in Beijing in the second week of July. After the indictments against the five officers were unsealed in May, Beijing pulled the plug on the group. It had been set up a year ago in what Washington viewed at the time as a diplomatic coup after President Barack Obama and China's President Xi Jinping held a summit in California, aiming to set relations between the two global powers on a positive track. Those ties have come under growing strain, also because of China's assertive actions in the disputed South and East China seas. Russel, the top U.S. diplomat for East Asia, reiterated those concerns Thursday, saying the U.S. views it as essential that China show greater restraint and use diplomacy to manage its differences on territorial issues. Asian nations, particularly treaty allies like Japan and the Philippines, look to the U.S. to counter China's increasingly muscular actions, but some in the region have voiced doubts about whether the second-term Obama administration can follow through on its commitment to focus on the Asia-Pacific, because of its preoccupation with the chaos in the Middle East. Russel said Asia remains a strategic U.S. priority, even as Washington considers some form of military action to combat the rapid advances of Sunni militants in Iraq who now straddle the border with Syria. "The fact that events conspired to demand high-level U.S. attention in the Middle East or elsewhere is simply a fact of life," Russel said. "It's always been thus. The strategic imperative, though, that's made the Asia-Pacific region a priority for us in security, economic and political terms is unaffected by the short-term demands of crises here and there. "I have no trouble in enlisting Secretary (of State John) Kerry's efforts on our agenda in the region," Russel added, "and that applies to the president and vice president as well." Kerry and Treasury Secretary Jack Lew will lead the U.S. delegation at the talks in Beijing, which are an annual fixture and viewed as important in forging a more cooperative relationship with Beijing, notwithstanding current frictions and China's growing challenge to America's post-World War II military predominance in the Asia-Pacific. The two sides will discuss issues including turmoil in the Middle East, North Korea's nuclear program and cooperation on climate change, and the U.S. will raise human rights. They'll also address a slew of economic and trade issues, including progress on a bilateral investment treaty that China agreed to negotiate in earnest at last year's talks. While the cyber working group remains on hold, Russel said the U.S. side will raise concerns over cyber-enabled theft of U.S. corporate data and intellectual property that the U.S. contends is shared with Chinese state-owned enterprises for commercial gain. "That's an economic problem as well as a bilateral problem, and that kind of behavior risks undermining the support for the U.S.-China relationship among the U.S. and international business community," Russel said. "It's a problem we believe the Chinese must and can address." Although the revelations from former National Security Agency contractor Edward Snowden on U.S. surveillance tactics have embarrassed Washington - leaving it open to accusations of hypocrisy when it accuses others of cyber espionage - the Obama administration has taken an increasingly trenchant stance on intrusions from China. The indictment accused the Chinese officers of targeting U.S. makers of nuclear and solar technology, stealing confidential business information, sensitive trade secrets and internal communications for competitive advantage. But after the indictments were unsealed, the five men were not placed on a public, international list of wanted criminals. There is no evidence that China would even entertain a formal request by the U.S. to extradite the five officers. It has rejected the charges and demanded they be withdrawn.

Solves—prevents further tensions with each other

Wroughton et al 6/24—Lesley is a staff writer for Reuters. Idrees Ali, Arshad Mohammed, Anna Yukhananov and Krista Hughes are also staff writers for Reuters ("US airs deep concerns over cyber security in China meetings" June 24, 2015 http://www.channelnewsasia.com/news/world/us-airs-deep-concerns/1936630.html)//JLee

WASHINGTON: The United States said on Tuesday that cyber theft sponsored by the Chinese government was a major problem and stressed the need to keep Asian sea lanes open as the world's two biggest economies held annual talks aimed at maintaining working relations in spite of rising tensions. At the wide-ranging Strategic and Economic Dialogue in Washington, both sides expressed a desire for constructive relations, with China saying the two countries could manage differences and should avoid confrontation. But tensions over security matters, including cyber attacks on U.S. government computers that U.S. officials have blamed on Chinese hackers and China's pursuit of territorial claims in the disputed South China Sea, have threatened to hamper efforts to deepen economic ties worth US$590 billion in two-way trade last year. "On cyberspace, in particular, we remain deeply concerned about Chinese government-sponsored cyber-enabled theft," U.S. Treasury Secretary Jack Lew said at the forum, which has brought together more than 400 Chinese officials and eight U.S. Cabinet secretaries. Lew said the targets of this hacking were U.S. firms and did not mention recent attacks on computers of the Office of Personnel Management. U.S. Vice President Joe Biden said the two sides might not resolve all of their differences in the meetings, which began on Monday and continue until Wednesday, but should commit to working on them. "We have to keep at it, day after day after day after day," Biden said. "T**his relationship is just too important.** Not only do we depend on it, but the world depends on our mutual success."China's Vice Premier Liu Yandong said differences could be managed "as long as our two countries adopt an overall perspective, respect and accommodate each other's core interests."

China says yes

Robinson 6/26—Teri is an Associate Editor for the SC Magazine. Teri writes many articles about cybersecurity problems for the SC Magazine. ("U.S., China agree to cybersecurity code of conduct" June 26, 2015 http://www.scmagazine.com/us-china-summit-talks-turn-to-cybersecurity/article/423175/)//JLee

After a tumultuous couple of years of exchanging accusations and expressing distrust over cyberespionage and spying – most recently with Director of National Intelligence (DNI) John Clapper laying responsibility for the Office of Personnel Management (OPM) breaches squarely at the feet of the Chinese – the U.S. and China said they've reached an accord of sorts, a code of conduct for cybersecurity going forward. The code emerged after a three-day U.S.-China Strategic and Economic Dialogue where delegates from the two countries covered the gamut of topics likely to affect future collaboration and relations. While details of a specific code were not released, nor did it appear on a 127-item outcomes list, both China's Vice Premier Wang Yang and U.S. Secretary of State John Kerry in the fifth round of the meeting's Strategic Security Dialogue pledged to cooperate on cybersecurity measures. After the close of the meet-up, Kerry told members of the press that "there was not a direct kind of confrontational pushback" on cybersecurity during the talks. Instead, the two countries orchestrated what Kerry called for "an honest discussion," minus finger-pointing and accusations "about the problem of cyber theft and whether or not it was sanctioned by government or whether it was hackers and individuals that the government has the ability to prosecute." The Secretary of State said the U.S. made it "crystal clear" that that type of activity is "not acceptable," but noted that "China also has a very clear interest in making certain that everybody is behaving by a certain set of standards." Kerry refused to comment specifically on the breaches at the OPM, which exposed a treasure trove of sensitive information, much of it confidential, because the incident is still being investigated by the FBI "and we have not come out with specific statements from the government." DNI Clapper didn't show similar restraint, with the Wall Street Journal reporting that he fingered China as the "leading suspect" during remarks made an intelligence conference in Washington. "You have to kind of salute the Chinese for what they did," the Journal quoted Clapper as saying.

**Online Gambling 1NC

The United States federal government should legalize online gambling.

The US has set a double-standard on internet freedom—only repealing UIGEA allows for it on a massive scale

Gardner 2010 (April; Gambling regulations will help Obama's world internet freedom mandate; Sep 23; www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html; kdf)

President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet, so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." That statement may have been much better received had the US not had their own blocks on Internet freedom. The Internet gambling industry currently is operating as a black market in the US due to the 2006 Unlawful Internet Gambling Enforcement Act. The law is a form of Internet censorship that Representative Barney Frank and other lawmakers have been trying to repeal. In the quest for Internet freedom, the US proclaims themselves as leaders, however, the country must be careful with their plea. If the US can place Internet bans on certain industries, then little could be done to stop other countries from banning different industries or websites because of their beliefs. For instance, in countries where religion is unified, there could be bans on any material that the country finds outside the rules of their particular religion. In other countries, bans could be placed on industries that are run largely by foreign operators. President Obama took a strong first step today by promoting Internet freedom. The next step will be making sure the US leads by example, and one area to start would be by lifting the ban on Internet gambling. The president has laid down the gauntlet, and now it is time for him to follow his own lead.

--xt Solves internet freedom

CPlan solves internet freedom

Kibbe 4/28/14 (Matt, FreedomWorks, "Coalition Letter: No Federal Ban on Internet Gambling")

We, the undersigned individuals and organizations, are writing to express our deep concerns about the Restoration of America's Wire Act (H.R. 4301), which would institute a de facto ban on internet gaming in all 50 states. The legislation is a broad overreach by the federal government over matters traditionally reserved for the states. H.R. 4301 will reverse current law in many states and drastically increase the federal government's regulatory power. As we have seen in the past, **a ban** will not stop online gambling. Prohibiting states from legalizing and regulating the practice only ensures that it will be pushed back into the shadows where crime can flourish with little oversight. In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior. Perhaps even more concerning is the fact that this bill allows the federal government to take a **heavy hand in regulating the Internet**, opening the door for increased Internet regulation in the future. By banning a select form of Internet commerce**, the federal government is setting a troubling precedent** and providing fodder to those who would like to see **increased Internet regulation in the future**. We fear that H.R. 4301 will begin **a dangerous process of internet censorship** that will simultaneously be circumvented by calculated international infringers while constraining the actions of private individuals and companies in the United States.

Current gambling laws gut any and all US cred on internet freedom

Minton 2011 (Michelle; Fed's online poker shutdown assaults internet freedom; May 13; www.breitbart.com/Big-Government/2011/05/13/Feds----Online-Poker-Shutdown-Assaults-Internet-Freedom; kdf)

On April 15, a day now known as "Black Friday", the U.S. Department of Justice (DOJ) effectively shut down three major online poker websites by seizing their domain names. The DOJ's heavy-handed prosecution of the websites, all of which are based abroad, has made a mockery of America's stated commitment to Internet freedom. The seizures have also hindered the online gambling operations in nations where Internet poker is completely lawful and the U.S. government has no jurisdiction. Given that the seized poker websites are housed and regulated by foreign nations—Poker Stars is registered in the Isle of Man, Full Tilt in Ireland, and Absolute Poker in Antigua—how could the U.S. government unilaterally seize their domain names? The short answer is that all of the sites end in ".com." All such domains are registered in the U.S. and, hence, are subject to U.S. civil forfeiture laws. Author and legal scholar Larry Downes has critiqued civil asset forfeiture laws on the Technology Liberation Front blog. He argues that the laws are actually intended to punish suspects before they are convicted. "The purpose of forfeiture laws," Downes laments, "is to help prosecutors fit the punishment to the crime, especially when restitution of the victims or of the cost of prosecution is otherwise unlikely to have a deterrent effect." Domain name seizures often occur without a trial and often without any warning to the owners, as was the case in Black Friday's seizure of poker domains. The government's move has reignited the controversy over U.S. federal agencies using domain seizures to punish foreign entities allegedly in violation of U.S. laws. While the DOJ did not technically "take down" the poker websites, federal agents obtained a court order that compelled Verisign, the global operator of the .com registry, to reroute the poker sites' domain names to a government page featuring intimidating federal logos notifying users of the seizure. As a result of the seizure, no computer in the world—even those in countries where poker is explicitly legal—could access the poker sites via their domain names. This latest round of seizures follows a series of similar actions taken in recent months by Immigration and Customs Enforcement (ICE), which has seized the domain names of dozens of websites alleged to be engaged in copyright infringement. One such site, the Spain-based Rojadirecta.com, had actually been deemed legal by Spanish courts. Perhaps in an effort to stem discussion of seizures' legality, the DOJ agreed to unfreeze the .com domains for Poker Stars and Full Tilt to allow players to cash out their accounts and allow foreign gamblers to continue playing on the sites. In return, the websites were required to promise to prevent American-based customers from playing poker games for money on their websites. The third major site, Antigua-based Absolute Poker, has reportedly been offered the same "privilege" in exchange for agreeing to bar U.S. customers from playing for money. However, Antigua's finance minister issued a statement last week accusing the U.S. of shutting the sites down in order to stamp out competition. Online gambling is Antigua's second largest employer after the tourism industry, so it comes as little surprise that Antigua is considering rejecting DOJ's "compromise" and instead challenging the U.S. government's action before the World Trade Organization (WTO). It is deeply troubling that the United States, a country that purports to value individual freedom, has so miserably failed to protect it when it comes to politically incorrect pursuits like online gambling. In effect, our government is bullying its own citizens and holding innocent foreign companies hostage. Hopefully, the events of Black Friday will focus public attention on the flaws of civil asset forfeiture laws and encourage foreign nations to stand up to U.S.

authorities. The DOJ's war of intimidation may have put a temporary hold on Internet poker in the United States, but its heavy-handed tactics should outrage anybody who values freedom and individual rights.

Legalizing online gambling key to internet freedom – it's a Trojan horse for widespread regulation

Telford 10/20/14- Erik Telford is senior vice president at the Franklin Center for Government & Public Integrity, The Hill, October 20, 2014, "Ending the cycle of casino cronyism", http://thehill.com/blogs/congress-blog/politics/221124-ending-the-cycle-of-casino-cronyism

When powerful gaming interest are spearheading **the fight to ban online gambling**, it should give you pause. Their main policy objective **is** focused on federal legislation to ban online gambling outright – **stifling** their **competition** before it ever reaches the market. **It** is a glimpse of crony capitalism in its most naked form, and **represents a very troubling assault on Internet freedom**, **giving government a foot in the door for a broader regulatory regime** and usurping our federalist system. The 2011, the Department of Justice's position interpretation on Internet gambling threw the issue to state legislatures--where it should be. Almost immediately, Nevada, Delaware, and New Jersey passed legalizing legislation. The Restoration of America's Wire Act, sponsored by Sen. Lindsey Graham (R-S.C.) and Rep. Jason Chaffetz (R-Utah) would prohibit interstate sports betting using wire services, effectively killing online gambling across the states where it's legal. While their pretense is to advance a moral good, this policy would undermine the free market, encourage crime, and erodes the constitutional concept of states' rights. Proponents of the regulation have brought in political heavyweights to undermine legalized online gambling, including former Arkansas Sen. Blanche Lincoln (D), who represents the Coalition to Stop Internet Gambling, claiming that legalizing online gambling would promote fraud, addiction, and money laundering. "I think it's going to be very difficult to work something out," Lincoln said, "I think it's important to put a time-out on this and to stop and think about what it's going to mean to us as a nation in our economy, to our children and to our society." However, these **problems already exist with black market gambling** mostly **run from overseas with profits** funding shady and potentially dangerous operations outside the jurisdiction of state regulation and consumer protections. Alan Feldman, an executive vice president of MGM notes that online gambling "is here, and **it's been here for a very long time.**" **Legalizing online gambling would** likely **see more** of **a shift from illegal to legal play** instead of funneling customers away from traditional casinos and their trappings. Free market advocates agree that consumers would enjoy more security were this pursuit made legal. "In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior." wrote officials of the Institute For Policy Innovation to several congressmen. They then shared wider concern that "Perhaps **even more concerning is the fact** that this bill **allows the federal government to take a heavy hand in regulating the Internet, opening the door for increased Internet regulation in the future."** Just like Prohibition in the 1920's, **banning this vice** would **actually incentivize criminal behavior.** Those fearful of fraud, child participation, and profits diverted to gangs or terrorists **should push for legalization in every state to make the industry as transparent as possible.** Legalizing this long-established, multibillion dollar business gets the profits out of the shadows, expands market opportunities, and puts revenue into the coffers of both legitimate business and state governments that will benefit.

--xt – International Signal

Legalization signals return to internet freedom

Legal Casino 14 Portal for gambling news and articles http://legalcasinous.com/

The United States must **change their online gambling laws** to **show** to the other nations that the time of the **disrespect for the international agreements** is ended. One of these agreements is with the European Union. The European Commission has warned USA a long time ago that their online casino laws violates the economic agreements with the European union. The actual Obama administration has shown, finally, the good wish to conform with such agreements. The Representative Barney Frank has been a proponent for years of the online games legalization. He has tried to oppose to the UIGEA (Unlawful Internet Gambling Enforcement Act) last year, but not in vain. The Republicans had the control, but now, with the democrats, in the US there is the hope for a new law Internet Gambling Law. Frank believes that all the citizens of the United States have the right to play for money at the online casino, in the privacy of their houses. Even some Republicans in past had fought for **the Internet freedom.**

**Internet Federalism CP

The fifty states of the United States should legalize nearly all online gambling in the United States.

State level regulation allows internet federalism

King, 10 [J.D. candidate 2010, Northwestern University School of Law, B.A. Middlebury College 2002, ARTICLE: GEOLOCATION AND FEDERALISM ON THE INTERNET: CUTTING INTERNET GAMBLING'S GORDIAN KNOT, Lexis]

V. CONCLUSION Gambling, like most divisive social issues, is best regulated **at the state level**. n190 Yet migration of gambling to the Internet has complicated matters greatly, giving rise to difficult questions as to which governmental entities are best suited to regulate and what the proper substantive regulatory regime ought to be. The failure of energetic federal and state efforts to prohibit Internet gambling over the past decade suggests that the issue may present a nearly impregnable problem, or as this Article terms the matter, an Internet gambling Gordian knot. The rise of geolocation technologies in recent years offers a new opportunity to cut through that Gordian knot via a jurisdictionally differentiated regulatory framework for Internet gambling. Geolocation technologies are not perfect. However, when they are integrated into a federal-state framework in which **states choose their** own substantive policies from a limited "menu" of options, these technologies can **dramatically improve the democratic responsiveness of Internet gambling laws, increase compliance with the rule of law, and internalize the large and increasing costs associated with prohibition of Internet gambling.** Such an approach is not immune to criticism, particularly in terms of its potential impact on the fundamental openness of the Internet in the long-term. In light of the market advantages associated with jurisdictional differentiation and the need for law to be supreme over code in divisive areas such as Internet gambling, those drawbacks [*75] fail to outweigh the potential benefits offered by aggressive use of geolocation technologies. These conclusions **carry implications that go well beyond the Internet gambling debate**. If jurisdictional differentiation is a **normatively superior approach** with respect to Internet gambling, then it **may be in other market sectors as well**. This consequence, along with the degree to which technological advances have undermined previous court decisions on electronic commerce issues, suggests that geolocation technologies may **play a role in enabling federalism on the Internet for years to** come.

**Internet Freedom Agenda CP

Text: The United States federal government should submit a review of [the plan] to the Freedom Online Coalition to insure international standards of internet freedom are being met.

CP solves 100% of case – creates an internationally modeled form of internet freedom, checks the circumvention disad

Kehl et al. 14 [Danielle, Kevin Bankston, Robyn Greene, Rober Morgus July, 2014. Kehl is a Senior policy analyst at New America's Open Technology Institute. Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity. Pdf. 7/13]//kmc

The United States must act immediately to restore the credibility of the Internet Freedom agenda, lest it become another casualty of the NSA's surveillance programs. As described in Part IV, various agencies within **the U.S. government have taken initial steps** to demonstrate goodwill in this area, particularly through the NTIA's announcement that it intends to transition stewardship of the IANA functions to a global multistakeholder organization and the State Department's speech outlining six principles to guide signals intelligence collection grounded in international human rights norms. However, it will take a broader effort from across the gov- ernment to demonstrate that the United States is fully committed to Internet Freedom, includ- ing firmly establishing the nature of its support for the evolving multistakeholder system of Internet governance and directly engaging with issues raised by the NSA surveillance programs in international conversations. **Supporting international norms that in- crease confidence in the security of online communications and respect for the rights of Internet users all around the world is integral to restoring U.S. credibility in this area**. "We have surveillance programmes that abuse human rights and lack in transparency and ac- countability precisely because we do not have sufficiently robust, open, and inclusive debates around surveillance and national security pol- icy," writes Matthew Shears of the Center for Democracy & Technology.339 It is time to begin having those conversations on both a national and an international level, particularly at key upcoming Internet governance convenings including the 2014 Internet Governance Forum, the International Telecommunications Union's plenipotentiary meeting, and the upcoming WSIS+10 review process.340 Certainly, the United States will not be able to continue promoting the Internet Freedom agenda at these meetings without addressing its national security appa- ratus and the impact of NSA surveillance on individuals around the world. Rather than being a problem, this **presents an opportunity for the U.S. to assume a leadership role in the promo- tion of better international standards around surveillance practices.** Moreover, the U.S. should take steps to further internationalize its Internet Freedom efforts writ large and work with foreign governments to broadly promote democracy and human rights online. In 2011, Richard Fontaine and Will Rogers of the Center for a New American Security wrote that **"the United States should counter the view that Internet Freedom is merely an American project cooked up in Washington, rather than a notion rooted in universal human rights**... The response to [concerns about the Internet Freedom agenda's ties to U.S. foreign policy should be] to internationalize the effort."341 Today, more than ever, **it is critical that the United States heed this advice and take steps to broaden the base of support for the Internet Freedom agenda. Future meetings and activities of the Freedom Online Coalition,** which the State Department played a key role in convening**, will serve as one test of these efforts as the group attempts to transition from a discussion forum for like-minded governments into a more ac- tion-oriented coalition.**342 The United States has the opportunity to urge other member countries to live up to the commitments they made at the 2014 meeting in Tallinn with respect to account- ability, transparency, and other policies ground- ed in human rights. As Toomas Hendrik Ilves, the President of Estonia, articulated in his remarks at the 2014 meeting, "We must be honest with ourselves and admit that recent developments

regarding purported surveillance by the NSA and similar organisations in different countries make the defense of an open Internet more difficult. That, too, is a challenge that Freedom Online Coalition must face."343 Outside of the Freedom Online Coalition, but consistent with its goals, the U.S. can urge both companies and foreign governments to join organizations like the Global Network Initiative or commit to other voluntary processes that promote the centrality of human rights in the policymaking process.344

They say yes

DDP 15 [Digital Defenders Partnership, a subset of Freedom Online Coalition. *WG 3 – Privacy and Transparency Online* . https://www.freedomonlinecoalition.com/how-we-work/working-groups/working-group-3/ 7/14]//kmc

FOC working group (WG) "Privacy and Transparency Online" focuses on the relationship between governments and information & communications technology (ICT) **companies, with a particular emphasis on respecting human rights online, including freedom of expression and privacy**. In furtherance of that objective, this group intends to explore the privacy and transparency practices of governments and companies, including through requests for user data, content restriction, and network shutdown. This group will remain mindful of the applicability of key principles from the Tallinn Agreement, such as the rule of law, collection for a legitimate purpose, non-arbitrariness, and effective oversight, which should guide the interaction between ICT companies and governments**.ð The discussion on transparency in the ICT sector has largely focused on major Internet companies in the United States, Canada, and Europe. With the proliferation of new laws and regulations in this area, and the growing range of companies handling user data and content, this conversation should have a global framework, applying to governments from all regions and companies from all parts of the ICT sector.**ð By bringing together governments, companies, civil society experts, and academics, this WG aims to contribute to the global discussion on transparency and accountability with respect to ICT relationships by seeking to provide clarity to the following areas:ð General understandings of the laws, policies, and processes through which governments make requests to ICT companies that may impact privacy.ð How ICT companies in such countries receive and process government requests.ð The implications of these practices for the privacy and freedom of expression of users, as well as broader considerations related to law enforcement and national security.ð Opportunities for and challenges to greater transparency, including legitimate law enforcement, national security, and other considerations.ð The WG will focus, at least initially, on the practices of ICT companies and governments in areas that could implicate privacy and free expression as described above, and may also include broader multi-stakeholder discussions on how ICT companies can respect human rights, and how governments can help or hinder company efforts to do so.

AT: perm

perm doesn't solve FOC credibility – causes international backlash

IFEX 14 [4-22. In letter to Freedom Online Coalition, NGOs speak out on surveillance of rights organisations. https://www.ifex.org/international/2014/05/01/surveillance_rights_organisations/ 7/14]//kmc

In response to Edward Snowden's testimony before the Council of Europe that the NSA and GCHQ monitored the confidential communications of human rights and civil society organisations, PEN International as part of a coalition human rights organisations sent a letter to members of the Freedom Online Coalition (FOC) on April 22, 2014 before its upcoming annual meeting in Tallinn, Estonia on April 28-29. The FOC is a leading intergovernmental coalition, currently with 22 members, established in 2011 with the express purpose of advancing Internet freedom (in particular, free expression, assembly, association and privacy online). Both the US and UK are members of the coalition. ∂ The April 22, 2014 letter follows. ∂ Dear Minister, ∂ On April 8, 2014, former US National Security Agency (NSA) contractor Edward Snowden testified before the Parliamentary Assembly of the Council of Europe (PACE) via video-conference that the NSA and the United Kingdom Government Communications Headquarters (GCHQ) have used their surveillance capabilities to spy on the communications of human rights organizations and civil society groups, both domestically and internationally. Snowden did not reveal which groups the NSA or GCHQ have spied upon, but indicated that the types of organizations whose communications had been compromised included major global organizations similar to Amnesty International and Human Rights Watch, and other NGOs. ∂ Snowden explicitly told PACE members that the NSA had "specifically targeted the communications of either leaders or staff members in a number of purely civil or human rights organizations … including domestically, within the borders of the United States." ∂ If Snowden's assertion is accurate, such facts would not only point to fresh dimensions of the overreach of NSA surveillance, but also would constitute an outrageous breach of the US government's stated commitment to human rights and freedom online. It also raises the very real possibility that these organizations' communications with confidential sources have been intercepted. Sharing this information with other governments could put victims and human rights defenders the world over in imminent danger. ∂ The US frequently criticizes repressive states for unjustified government spying on human rights organizations, media organizations, and civil society because such surveillance has a chilling effect on freedom of expression and association and constitutes a clear form of harassment and intimidation. ∂ Furthermore, as you are well aware, the US and the UK have taken leadership roles in the Freedom Online Coalition (FOC), the leading intergovernmental coalition, established in The Hague on December 8, 2011, for the purpose of "advancing Internet freedom - free expression, association, assembly, and privacy online - worldwide." **FOC members have joined in a shared commitment to work together to voice concern over measures that restrict Internet freedom and to support individuals whose human rights online are curtailed.** ∂ **FOC members also have undertaken obligations to adopt and encourage policies and practices, domestically and internationally, which ensure the protection of human rights and fundamental freedoms online, in particular freedom of expression, the right to privacy, freedom of assembly and access to information.** ∂ If the allegations about US and UK surveillance of human rights and civil society organizations are true, such practices would contradict the express commitments made by the US and the UK to the FOC. ∂ We, the undersigned civil society and human rights organizations, seek clarification as to the allegations that the NSA and GCHQ monitored or are monitoring the communications of our organizations, or of other civil society organizations, media organizations, and human rights groups. Where the facts support these claims, we ask the US and UK governments to explain the reasons why this is occurring or has occurred in the past, and the extent of such monitoring, its continuance, and its justification. ∂ We call upon members of the FOC to live up to their stated commitment to support civil society members or journalists whose human rights online may have been violated. We seek FOC member assistance in ascertaining the underlying factual basis for the Snowden allegations with respect to NSA and/or GCHQ spying on civil society and human rights groups, and in ensuring a halt to any violations of our privacy, freedom of expression and other human rights

online. ∂ Sincerely, ∂ Access ∂ Advocacy for Principled Action in Government ∂ AGEIA DENSI ∂ Alternative Informatics Association ∂ Amnesty International ∂ ARTICLE 19 ∂ Asociación de Internautas ∂ Association for Progressive Communications (APC) ∂ Benetech ∂ Big Brother Watch ∂ Bits of Freedom ∂ Breadboard Society ∂ Bytes for All, Pakistan ∂ Center for Constitutional Rights ∂ Center for Democracy & Technology ∂ Center for Freedom of Expression and Freedom of Information (CELE), Palermo University School of Law ∂ Centre for Internet and Society, Bangalore, India ∂ Charity & Security Network ∂ Committee to Protect Journalists ∂ The Constitution Project ∂ ContingenteMX ∂ Council on American-Islamic Relations (CAIR) ∂ Digital Rights Foundation ∂ Digital Rights Ireland ∂ Electronic Frontier Foundation ∂ Electronic Privacy Information Center (EPIC) ∂ Foundation for Information Policy Research ∂ Free Press ∂ Freedom House ∂ Freedom of the Press Foundation ∂ Global Voices Advocacy ∂ Hiperderecho ∂ Human Rights in China ∂ Human Rights Watch ∂ Institute for Reporters' Freedom and Safety ∂ International Federation for Human Rights (FIDH) ∂ La Quadrature du Net ∂ Movimento MEGA ∂ New America Foundation's Open Technology Institute ∂ Online Policy Group ∂ Open Net Korea ∂ OpenMedia.org ∂ OpenTheGovernment.org ∂ Panoptykon Foundation ∂ PEN American Center ∂ PEN International ∂ Privacy International ∂ Project On Government Oversight (POGO) ∂ Reporters sans frontières ∂ Samuelson-Glushko Canadian Internet Policy & Public Interest Clinic (CIPPIC) ∂ Son Tus Datos ∂ Thai Netizen Network ∂ World Press Freedom Committee ∂ World Privacy Forum

AT: Surveillance Key (Aff that reads Fontaine)

They author says the US can push internet freedom and maintain surveillance

Fontaine 2014 (Richard; Bring Liberty Online; Sept; www.cnas.org/sites/default/files/publications-pdf/CNAS_BringingLibertyOnline_Fontaine.pdf; kdf)

Reenergizing the Internet freedom agenda begins with acknowledging that the United States must promote that agenda **even as it continues to engage in electronic surveillance** aimed at protecting national security. The U.S. government will simply have to endure some significant amount of continuing criticism and opposition. At the same time, it should continue to draw a sharp distinction between surveillance for national security purposes (in which all governments engage) and monitoring as a means of political repression (which democracies oppose). To those who see no distinction between American surveillance and that of autocracies, government officials should point out that key legal guarantees matter: the U.S. Constitution's first amendment protects against censorship and political repression at home, while in autocratic systems such safeguards are nonexistent or not enforceable.49

Text: The USFG should revise its election process by:

-Encouraging voter participation in primaries

-Updating elections information

-Redrawing congressional districts to avoid partisanship

-AND requiring disclosure of political contributions

The counterplan addresses partisanship and low voter turnout which stifle democracy

Snowe and Glickman 14 [Olympia Snowe and Dan Glickman. Former Sen. Olympia Snowe (R-Maine) and former Agriculture Secretary and Rep. Dan Glickman (D-Kan.) "Ten Ways to Strengthen American Democracy." June 24, 2014. http://www.politico.com/magazine/story/2014/06/10-ways-to-strengthen-american-democracy-108203.html#ixzz3fnopvI9E]//EMerz

The current level of dysfunction in Washington is like nothing we could have imagined when we began our journeys in public service. Yet we are convinced, based on our decades of experience encompassing the legislative and executive branches, that the status quo of today need not constitute the new normal of tomorrow. As such, on Tuesday, as part of the Bipartisan Policy Center's Commission on Political Reform, we released more than 60 concrete and achievable recommendations that will improve the federal government's ability to function regardless of the deep ideological divides that exist both among lawmakers and the American public, while addressing some of the root causes of the polarization. What are some politically realistic reforms that could significantly improve the way we govern? Here are 10 key ideas to fix the electoral process, return Congress to legislating and enhance public service. **1**. **Increase voter participation in primaries.** Only 20 percent of eligible voters vote in congressional primaries. The commission recommends that states and political parties aim for 30 percent by 2020 and 35 percent by 2026. Rather than a yearlong process that confuses voters, we recommend a single June congressional primary date, more open primaries and eliminating congressional caucuses and conventions. **2. Balance access and integrity in our elections**. We recommend that states use the data revolution to (1) identify eligible, unregistered voters and offer them the opportunity to register and (2) greatly improve the accuracy of voter rolls. **3. Ensure a fair process for drawing congressional districts** To reduce distrust between the two parties, we urge the adoption of redistricting commissions with the bipartisan support of state legislatures and the electorate, to avoid the kind of single-party gerrymandering that has contributed to political polarization. **4.** Tackle money in politics All political contributions, including those made to outside and independent groups, should be disclosed. **Congress should also pass legislation requiring detailed disclosure of spending by congressional leadership PACs** and mandate that those funds be used solely for political activities, not personal use. 5. Reform the filibuster and Senate debate Eliminate the ability to filibuster the motion to proceed; in other words, don't allow filibusters on whether to move to debate a bill. And, at the same time, guarantee a minimum number of 10 amendments, split between the majority and minority, on each bill debated.

Elections are the I/L to democracy

Elections with integrity are key to democracy

Annan 13 (Kofi Annan. Annan is a Ghanaian diplomat who served as the seventh Secretary-General of the United Nations. "Deepening Democracy: Why Elections with Integrity Matter." March 4, 2013. http://theelders.org/article/deepening-democracy-why-elections-integrity-matter)//EMerz

Elections with integrity are the foundation of democracy. In a true democracy, our elected leaders are simply the temporary custodians of political power; the power ultimately rests with the people. We elect leaders to act on our behalf so that we can go about our lives, caring for our families, teaching at our schools, staffing our hospitals and running our businesses. At election time, the power returns to the people – and they in turn empower the elected. Elections also provide people in each society with the opportunity to resolve political conflict peacefully. When citizens go to the polls and cast their votes – whether in Kenya, the United States or Indonesia – they aspire not only to elect their leaders, but to choose a direction for their nation. The Commission defines an election with integrity as one that is "based on the democratic principles of universal suffrage and political equality as reflected in international standards and agreements, and is professional, impartial and transparent in its preparation and administration throughout the electoral cycle." At its core, the ideal of electoral integrity means that all voters should have an equal opportunity to participate in public debate and cast their ballots, all votes are counted equally, and all candidates seeking election do so on a level playing field.

"Presidential Commission on Election Administration offers worthwhile ideas for reform (but don't hold your breath)." January 23, 2014. https://compliancecampaign.wordpress.com/2014/01/23/presidential-commission-on-election-administration-offers-ideas-for-reform-but-dont-hold-your-breath/)//EMerz

The Presidential Commission on Election Administration yesterday presented its final report with a series of recommendations designed to help elections officials improve the voting process in the United States. The report is the result of a six-month study conducted by the bipartisan 10-member commission focused on the election day problems that have plagued voting in recent U.S. elections. At first glance, it may appear to some that the commission is attempting to limit discussion of U.S. electoral problems to simple and relatively uncontroversial issues such as modernizing voting technology and reducing average wait times for voters. (The commission proposes a maximum nationwide wait time of 30 minutes.) As Ben Jacobs at the Daily Beast pointed out, "The commission dodged issues normally associated with partisan battles, such as voter ID and the Voting Rights Act." Avoiding even more contentious matters such as opening up the two-party system to multi-party competition or leveling the playing field by implementing genuine campaign finance reform, the commission's key recommendations call for: modernizing the registration process through continued expansion of online voter registration and expanded state collaboration in improving the accuracy of voter lists; improving access to the polls through expansion of the period for voting before the traditional Election Day, and through the selection of suitable, well-equipped polling place facilities, such as schools; introducing state-of-the-art techniques to assure efficient management of polling places; and, reforming the standard-setting and certification process for new voting technology to address soon-to-be antiquated voting machines and to encourage innovation and the adoption of widely available off-the-shelf technologies. Delving a little deeper into the report, there appear to be several worthwhile recommendations that are surprisingly frank in their criticism of the highly flawed U.S. electoral system. Some of the document's most useful recommendations arguably pertain to improving the general professionalism of election administration in the United States. The report explains the unique nature of the U.S. electoral system in relation to the rest of the world, with most other electoral systems having central election commissions that govern national elections. "Other countries exhibit one or another of these features in their election systems, but none have the particular combination that characterizes administration in the United States," the report explains. "Decentralization and reliance on volunteers ensure that the quality of administration varies by jurisdiction and even by polling place. The **involvement of officials with partisan affiliations means that the rules or their interpretations will be subject to charges of partisanship depending on who stands to win from the officials' decisions**." One overriding problem that the commission identified was the partisan nature of election administration. Because all election officials (whether elected or appointed) are selected on a partisan basis, "those who run our elections are subjected to competing pressures from partisans and political constituencies, on the one hand, and their obligation to the voting public as a whole, on the other," the commission noted. Because the selection of election officials on a partisan basis can risk public confidence in the quality and impartiality of administration, the commission recommended that the responsible agency in every state should have on staff individuals chosen solely on the basis of experience and expertise. In a section of the report on "Incorporation of Recommendations Made by Other Commissions and Organizations," there is curiously no mention of recommendations made by the Organization for Security and Cooperation in Europe, which has been observing U.S. elections since 2002, or the long-outstanding recommendations of the 2005 Commission on Federal Election Reform, the so-called Carter-Baker Commission. In its preliminary post-election statement issued in November 2012, the OSCE reminded U.S. authorities of the 87 recommendations of the Carter-Baker Commission, most of which have never been implemented. One of that commission's most important recommendations was for the United States to move toward nonpartisan election administration. Carter-Baker recommended in particular that states strip election responsibilities from partisan elected secretaries of state, placing them instead in the hands of professional election administrators appointed by governors and approved by a supermajority vote of state legislators. There are several other important issues that are conspicuously absent from the report released yesterday by the Presidential Commission on Election Administration, some of which have been repeatedly highlighted as problematic by international election observers of the OSCE. There is no mention in the report, for example, of the election-rigging practice known as gerrymandering, which enabled Republicans to keep control of the House of Representatives despite losing the popular vote nationwide by 1.4 million votes in 2012. In a recent publication outlining best electoral practices for OSCE member states (including the U.S.), the OSCE Office for Democratic Institutions and Human Rights tacitly criticized the American system of drawing congressional districts. "Electoral constituencies should be drawn in a manner that preserves equality among voters," noted ODIHR, adding that "the manner in which constituencies are drawn should not circumvent the principle of equal suffrage." Yet, many U.S. states use an arcane and highly politicized system of drawing district

boundaries based on past voting histories and racial composition in order to dilute the voting power of certain groups and virtually ensure preferred electoral outcomes. Following the 2010 census and redistricting process, the GOP gerrymandered congressional districts in such a way to guarantee Republican victories. There is also the matter of permanent felon disenfranchisement in many U.S. states, which contravenes the international obligation of the United States to ensure universal and equal suffrage to each citizen who has reached the age of majority. Yet, in the U.S., an estimated 5.85 million Americans are denied the right to vote (or seek office) because of laws that disenfranchise people with felony convictions. Because of institutionalized racial disparities in the criminal justice system, these policies have resulted in one of every 13 African Americans unable to vote. The OSCE has repeatedly expressed serious concerns over the disproportionate impact of felon disenfranchisement in the United States. As explained in its final report on Election 2012, Minorities are disproportionately affected and it is estimated that 2.2 million African-Americans are disenfranchised. Prisoner and exprisoner voting rights are determined by state law and vary widely. Citizens from different states, who have committed the same crime, have their voting rights affected differently. Restrictions are often disproportionate to the crime committed and some states do not differentiate between types of crimes. Four states deprive all people with a criminal conviction of the right to vote, irrespective of the gravity of the crime or if the sentence has been served, unless pardoned by the state governor. Another major problem in the United States is the discriminatory laws against independent, or "third," parties. "The legal framework should ensure that all political parties and candidates are able to compete in elections on the basis of equal treatment before the law," explained the OSCE. Despite some of these notable ommissions, the reaction from election reform advocates to the report released yesterday seems to be generally positive. The League of Women Voters President Elisabeth MacNamara said, We are pleased to see that the bipartisan Commission was able to roll up their sleeves and get to work on some of the endemic troubles plaguing our nation's polling places. PCEA's prescription for what to do about lack of resources, inadequate compliance with federal laws, the need for professionalization of the election workforce, and creating a benchmark of no one waiting to vote longer than 30 minutes, are badly needed fixes for election administrators and voters. Common Cause's Karen Hobert Flynn noted that While some of the commission's recommendations require legislative action and appropriations, state and local election officials should act on others on their own initiative. For example, voting locations often can be better organized, and sample ballots printed more clearly and distributed earlier without added costs. All that's needed is the will to act. But unfortunately, **as the commission itself points out, due to "the complexity and variation in local election administration … no set of practices can be considered 'best' for every jurisdiction."** Some reforms that work well in certain contexts will be unnecessary or fail in others, noted the commission. In other words, don't hold your breath for any meaningful and comprehensive nationwide election reform.

Doctor Patient Trust

**1nc

Text: The United States Federal Government should track healthcare companies' quality of care using the Department of Health and Human services to evaluate health care companies.

Institutional trust is key to patient doctor trust

Rowe and Calnan 6 (Rosemary Rowe and Michael Calnan. Professor of Medical Sociology, School of Social Policy, Sociology and Social Research at the University of Kent. "Trust Relations in Health Care- the New Agenda." 2006. http://eurpub.oxfordjournals.org/content/eurpub/16/1/4.full.pdf)//EMerz

Given that trust remains important, how can new forms of trust relations be developed and sustained? There is considerable evidence as to what factors encourage patient trust in clinicians: the clinician's technical competence, respect for patient views, information sharing, and their confidence in patient's ability to manage their illness.8 Patient participation per se does not necessarily result in higher trust, rather it is associated with value congruence regarding participation, patient involvement produced higher trust where patients wanted to participate.9 In contrast, evidence as to what builds institutional trust is sparse, with trust relations between providers and between providers and managers a particularly neglected area. Hall et al US survey of HMO members found that system trust could help the development of interpersonal trust, where there was no prior knowledge of the clinician, but it is not known how interpersonal trust affects institutional trust. Medical errors and cost containment are associated with distrust of health care systems, whereas relationship building with the local community is regarded as an important trust building mechanism. However, little research has been conducted to identify how different modes of governance affect institutional trust. The focus of trust relationships may of course differ according to the model of health care delivery; **in market based systems such as the US patient trust may be more important to secure loyalty to particular providers** whereas in tax-financed systems which are organized by national or regional agencies public trust may be more necessary. However, as health systems converge and increasingly share common challenges including: providing adequate patient choice; managing a mixed economy of provision; and more explicit rationing, then both interpersonal and institutional trust will continue to be important for all health systems. In conclusion, we would argue that clinicians and managers need to address and respond to the changing nature of trust relations in health care. The benefits of trust demonstrate the value to be Trust and the sociology of the professions 5 gained from ensuring that both interpersonal and institutional trust are developed, sustained, and where necessary rebuilt. Trust is still fundamental to the clinician–patient relationship but as that relationship has changed so has the nature of trust. Trust is now conditional and has to be negotiated but, whilst clinicians may have to earn patients' trust, there is good evidence as to what is required to build and sustain such interpersonal trust. The lack of knowledge about how institutional trust can be developed indicates the need for research, ideally through inter-country comparisons to identify whether such trust varies by health system and how it can be generated. The cost of failing to recognize the importance of trust and to address the changing nature of trust relations could be substantial: economically, politically, and most important of all, in terms of health outcomes.

Government monitoring of healthcare quality ensures trust in patients

CQHCA '1 (Committee on the Quality of Health Care in America. "Crossing the Quality Chasm: A New Health System for the 21st Century." March 1, 2001. http://www.ncbi.nlm.nih.gov/books/NBK222265/)//EMerz

Recommendation 2: All health care organizations, professional groups, and private and public purchasers should pursue six major aims; specifically, health care should be safe, effective, patient-centered, timely, efficient, and equitable. The committee believes substantial improvements in safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity are achievable throughout the health care sector. This opportunity for improvement is not confined to any sector, form of payment, type of organization, or clinical discipline. Problems in health care quality affect all Americans today, and all can benefit

from a rededication to improving quality, regardless of where they receive their care. The committee applauds the Administration and Congress for their current efforts to establish a mechanism for tracking the quality of care. Title IX of the Public Health Service Act (42 U.S.C. 299 et seq.; Agency for Healthcare Research and Quality Part A) provides support for the development of a National Quality Report, which is currently ongoing. Section 913(a)(2) of the act states: "Beginning in fiscal year 2003, the Secretary, acting through the Director, shall submit to Congress an annual report on national trends in the quality of health care provided to the American people."

Recommendation 3**: Congress should continue to authorize and appropriate funds for, and the Department of Health and Human Services should move forward expeditiously with the establishment of, monitoring and tracking processes for use in evaluating the progress of the health system in pursuit of the above-cited aims of safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity.** The Secretary of the Department of Health and Human Services should report annually to Congress and the President on the quality of care provided to the American people. Without ongoing tracking of quality to assess the country's progress in meeting the aims set forth in this chapter, interested parties—including patients, health care practitioners, policy makers, educators, and purchasers—cannot identify progress or understand where improvement efforts are most needed. Continued funding for this activity should be ensured.

Drone Strikes CP

**1nc

Text: The United States Federal Government should

- **End signature strikes**
- **Limit targeted killings to a limited number of specific terrorists**
- **Improve congressional oversight of drone strikes**
- **Continue restrictions on armed drone sales**
- **Work internationally to establish rules and norms governing the use of drones**

Zenko 13—Micah is a Senior Fellow in the Center for Preventive Action (CPA) at the Council on Foreign Relations (CFR). Previously, he worked for five years at Harvard University's Kennedy School of Government, and in Washington, DC, at the Brookings Institution, Congressional Research Service, and State Department's Office of Policy Planning. ("Reforming U.S. Drone Strike Policies" January 2013 http://www.cfr.org/wars-and-warfare/reforming-us-drone-strike-policies/p29736)//JLee

Zenko puts forward a substantive agenda. He argues that the United States should end so-called signature strikes, which target unidentified militants based on their behavior patterns and personal networks, and limit targeted killings to a limited number of specific terrorists with transnational ambitions. He also calls Congress to improve its oversight of drone strikes and to continue restrictions on armed drone sales. Finally, he recommends that the United States work internationally to establish rules and norms governing the use of drones.

--xt Solves US-EU Relations

CP solves—Drones are hated more than surveillance by the EU—encourages a limiting of drone strikes

Dworkin 13—Anthony is a senior policy fellow at ECFR, where he leads the organisation's work in the area of human rights, democracy, and justice. ("Actually, drones worry Europe more than spying" July 18, 2013 http://www.ecfr.eu/article/commentary_actually_drones_worry_europe_more_than_spying)//JLee

Relations between the United States and Europe hit a low point following revelations that Washington was spying on European Union buildings and harvesting foreign email messages. Behind the scenes, though, it is not data protection and surveillance that produces the most complications for the transatlantic intelligence relationship, **but rather America's use of armed drones to kill terrorist suspects away from the battlefield**. Incidents such as the recent killing of at least 17 people in Pakistan are therefore only likely to heighten European unease. In public, European governments have displayed a curiously passive approach to American drone strikes, even as their number has escalated under Barack Obama's presidency. Many Europeans believe that the majority of these strikes are unlawful, but their governments have maintained an uneasy silence on the issue. This is partly because of the uncomfortable fact that information provided by European intelligence services may have been used to identify some targets. It is also because of a reluctance to accuse a close ally of having violated international law. And it is partly because European countries have not worked out exactly what they think about the use of drones and how far they agree within the European Union on the question. Now, however, Europe's muted stance on drone strikes looks likely to change. Why? For one thing, many European countries are now trying to acquire armed drones themselves, and this gives them an incentive to spell out clearer rules for their use. More importantly, perhaps, Europeans have noticed that drones are proliferating rapidly, and that countries like China, Russia and Saudi Arabia are soon likely to possess them. There is a clear European interest in trying to establish some restrictive standards on drone use before it is too late. For all these reasons, many European countries are now conducting internal reviews of their policy on drones, and discussions are also likely to start at a pan-European level. But as Europeans begin to articulate their policy on the use of drones, a bigger question looms. Can Europe and the United States come together to agree on when drone strikes are permissible? Until now, that would have seemed impossible. Since the September 11 attacks, the United States has based its counterterrorism operations on the claim that it is engaged in a worldwide armed conflict with al Qaeda and associated forces — an idea that President Obama inherited from President George W. Bush and has been kept as the basis for an expanded drone strike campaign. European countries have generally rejected this claim. However, the changes to American policy that President Obama announced in May could open the way to at least the possibility of a dialogue. Obama suggested that he anticipated a time in the not-too-distant future when the armed conflict against al Qaeda might come to an end. More substantially, he made clear that his administration was in the process of switching its policy so that, outside zones of hostilities, **it would only use drone strikes against individuals who posed a continuing and imminent threat to the U.S.** That is a more restrictive standard than the claim that any member of al Qaeda or an associated force could lawfully be killed with a drone strike at any time. European countries might be more willing to accept an approach based on this kind of "self-defense" idea. However, there remain some big stumbling blocks. First, a good deal about Obama's new standards is still unclear. How does he define a "zone of hostilities," where the new rules will not apply? And what is his understanding of an "imminent" threat? European countries are likely to interpret these key terms in a much narrower way than the United States. Second, Obama's new approach only applies as a policy choice. His more expansive legal claims remain in the background so that he is free to return to them if he wishes. But if the United States is serious about working toward international standards on drone strikes, as Obama and his officials have sometimes suggested, then Europe is the obvious place to start. And there are a number of steps the administration could take to make an agreement with European countries more likely. For a start, **it should cut back the number of drone strikes** and be much more open about the reasons for the attacks it conducts and the process for reviewing them after the fact. It should also **elaborate its criteria for determining who poses an imminent threat** in a way that keeps attacks within tight limits. And, as U.S. forces prepare to withdraw from Afghanistan in 2014, it should keep in mind the possibility of declaring the war against al Qaeda to be over. All this said, Europe also has some tough decisions to make, and it is unclear whether European countries are ready to take a hard look at their views about drone

strikes, addressing any weaknesses or inconsistencies in their own position. If they are, the next few years could offer a breakthrough in developing international standards for the use of this new kind of weapon, before the regular use of drones spreads across the globe.

--xt Solves Terrorism

Top military official – drone strikes cause terror

Hussain 2015 (Murtaza; Retired General: Drones Create More Terrorists Than They Kill, Iraq War Helped Create ISIS; Jul 16; https://firstlook.org/theintercept/2015/07/16/retired-general-drones-create-terrorists-kill-iraq-war-helped-create-isis/; kdf)

Retired Army Gen. Mike Flynn, a top intelligence official in the post-9/11 wars in Iraq and Afghanistan, says in a forthcoming interview on Al Jazeera English that **the drone war is creating more terrorists than it is killing.** He also asserts that the U.S. invasion of Iraq helped create the Islamic State and that U.S. soldiers involved in torturing detainees need to be held legally accountable for their actions. Flynn, who in 2014 was forced out as head of the Defense Intelligence Agency, has in recent months become an outspoken critic of the Obama administration's Middle East strategy, calling for a more hawkish approach to the Islamic State and Iran. But his enthusiasm for the application of force doesn't extend to the use of drones. In the interview with Al Jazeera presenter Mehdi Hasan, set to air July 31, the former three star general says: "When you drop a bomb from a drone … you are going to cause more damage than you are going to cause good." Pressed by Hasan as to whether drone strikes are creating more terrorists than they kill, Flynn says, "I don't disagree with that." He describes the present approach of **drone warfare as "a failed strategy."**

The CP solves—drones do not do anything to solve terrorism—other military tech solves

Zenko 13—Micah is a Senior Fellow in the Center for Preventive Action (CPA) at the Council on Foreign Relations (CFR). Previously, he worked for five years at Harvard University's Kennedy School of Government, and in Washington, DC, at the Brookings Institution, Congressional Research Service, and State Department's Office of Policy Planning. ("Reforming U.S. Drone Strike Policies" January 2013 http://www.cfr.org/wars-and-warfare/reforming-us-drone-strike-policies/p29736)//JLee

T**he combination of persistence and responsiveness, high-quality¶ intelligence infrastructures, and tacit host-state support have made¶ drones the preeminent tool for U.S. lethal operations against suspected¶ terrorists** and militants where states are unable to singlehandedly¶ deal with the threat they pose. As a result, **drones** are not just another¶ 8 Reforming U.S. Drone Strike Policies¶ weapons platform. Instead, they **provide the United States with a distinct¶ capability that significantly reduces many of the inherent political,¶ diplomatic, and military risks of targeted killings**.¶ Compared to other military tools, **the advantages of using drones**—¶ particularly, that they avoid direct risks to U.S. servicemembers—¶ **vastly outweigh the limited costs and consequences**. Decision-makers¶ are now much more likely to use lethal force against a range of perceived¶ threats than in the past. Since 9/11, over 95 percent of all nonbattlefield¶ targeted killings have been conducted by drones—the remaining attacks¶ were JSOC raids and AC-130 gunships and offshore sea- or air-launched¶ cruise missiles. And the frequency of drone strikes is only increasing¶ over time. George W. Bush authorized more nonbattlefield targeted¶ killing strikes than any of his predecessors (50), and Barack Obama¶ has more than septupled that number since he entered office (350). Yet¶ **without any meaningful checks**—imposed by domestic or international¶ political pressure—or sustained oversight from other branches of government,¶ U.S. drone strikes create a moral hazard because of the negligible¶ risks from such strikes and the unprecedented disconnect between¶ American officials and personnel and the actual effects on the ground.14¶ However, targeted killings by other platforms would almost certainly¶ inflict greater collateral damage, and **the effectiveness of drones makes¶ targeted killings the more likely policy option** compared to capturing¶ suspected militants or other nonmilitary options.

CP solves terrorism

Zenko 13—Micah is a Senior Fellow in the Center for Preventive Action (CPA) at the Council on Foreign Relations (CFR). Previously, he worked for five years at Harvard University's Kennedy School of Government, and in Washington, DC, at the Brookings Institution, Congressional Research Service, and State Department's Office of

Policy Planning. ("Reforming U.S. Drone Strike Policies" January 2013 http://www.cfr.org/wars-and-warfare/reforming-us-drone-strike-policies/p29736)//JLee

The U.S. use of armed drones has two unique advantages over manned¶ aircraft, distant missile strikes, and special operations raids when¶ it comes to destroying targets. First, **drones allow for sustained persistence¶ over potential targets**. **The existing U.S. arsenal of armed¶ drones**—primarily the Predator and Reaper—**can remain aloft**, fully¶ loaded with munitions, **for over fourteen hours**, **compared to four¶ hours or less for F-16 fighter jets** and A-10 ground attack aircraft.5 And¶ unlike manned aircraft or raids, **drones fly directly over hostile territory¶ without placing pilots or ground troops at risk of** injury, capture,¶ or **death**.¶ Second, **drones provide a near-instantaneous responsiveness—¶ dramatically shrinking** what U.S. military targeting experts call **the¶ "find-fix-finish" loop**—that most other platforms lack. For example,¶ **a drone-fired missile travels faster than the speed of sound, striking a¶ target within seconds**—often before it is heard by people on the ground.¶ This ability stands in stark contrast to the August 1998 cruise missile¶ salvo targeting Osama bin Laden, which had to be programmed based¶ on projections of where he would be in four to six hours, to allow time¶ to analyze the intelligence, obtain presidential authorization, program¶ the missiles, and fly them to the target.6 Intercontinental ballistic missiles¶ (ICBMs) loaded with conventional munitions can reach distant¶ targets much faster than cruise missiles, but they carry the dire risk of¶ misattribution as a U.S. nuclear first strike against Russia or China, for¶ instance. Finally, **drone-fired missiles can be—and have been—diverted¶ at the last moment if noncombatants enter the likely blast radius.7**

--xt Solves Credibility

CP solves credibility—drone strikes will always be blamed on the US

Zenko 13—Micah is a Senior Fellow in the Center for Preventive Action (CPA) at the Council on Foreign Relations (CFR). Previously, he worked for five years at Harvard University's Kennedy School of Government, and in Washington, DC, at the Brookings Institution, Congressional Research Service, and State Department's Office of Policy Planning. ("Reforming U.S. Drone Strike Policies" January 2013 http://www.cfr.org/wars-and-warfare/reforming-us-drone-strike-policies/p29736)//JLee

The problem with maintaining that drone strikes are covert is that both the American and international publics often misunderstand how drones are used. And in affected states, citizens often blame the United States for collateral damage that could have been caused by the host states' own weapon systems. According to a recent report from Yemen: It's extremely difficult to figure out who is responsible for any given strike. . . . It could be a manned plane from the Yemeni Air Force or the U.S. military. Or it could be an unmanned drone flown by the U.S. military or the CIA. . . . But no matter who launches a particular strike, Yemenis are likely to blame it on the Americans. What's more, we found that many more civilians are being killed than officials acknowledge.37 Congressional oversight of drone strikes varies depending on whether the CIA or the U.S. military is the lead executive authority. The CIA, according to the chair of the Senate Select Committee on Intelligence, Senator Dianne Feinstein, meets its "fully and currently informed" legal obligations through "monthly in-depth oversight meetings to review strike records and question every aspect of the program."38 Individual JSOC strikes are not reported to the relevant armed services committees, but are covered under the broad special access program biannual reporting to Congress. According to senior staff members on the Senate Foreign Relations Committee and House Foreign Affairs Committee, many of their peers have little understanding of how drone strikes are conducted within the countries for which they are responsible for exercising oversight. Even serving White House officials and members of Congress repeatedly make inaccurate statements about U.S. targeted killings and appear to be unaware of how policies have changed over the past decade.39 At the same time, the judiciary committees have been repeatedly denied access to the June 2010 Office of Legal Counsel memorandum that presented the legal basis for the drone strike that killed U.S. citizen and alleged leader of AQAP Anwar al-Awlaki in September 2011.40 Finally, despite nearly ten years of nonbattlefield targeted killings, no congressional committee has conducted a hearing on any aspect of them.2

at: Links to the Terrorism DA

Wrong—they just are just a recruitment tool for terrorist—CP solves

Abbas 13—Hassan is a senior advisor at Asia Society and the author of the forthcoming book The Taliban Revival. ("How Drones Create More Terrorists" August 23, 2013 http://www.theatlantic.com/international/archive/2013/08/how-drones-create-more-terrorists/278743/)//JLee

Drone strikes may create more jihadi militants. (Ibraheem Abu Mustafa/Reuters) Recently, strong evidence has begun to suggest that terrorists use drone strikes as a recruitment tool. Of course, the value of drones in the arena of intelligence-gathering and secret surveillance of foes (and even friends) is unmistakable. In warzones too, it can support ground operations in significant and even decisive ways. None of this is controversial, though the ones on the receiving end will certainly not like it. What is debatable is its use as a counter-terrorism instrument in theaters that are not declared war zones, or in cases where a sovereign state is not fully and publicly on board with this policy. Lack of transparency in regulations that govern this new type of warfare, the unverifiable nature of targets, and questions over the credibility of intelligence only complicates the matter. Mark Bowden's important contribution to the drone debate raises critical questions that policy makers will be wise to consider for the future use of this new tool of war. One of the important arguments mentioned in the piece revolves around the notion that drone strikes might be less provocative than ground assaults for terrorists, meaning that standard warfare might create more terrorists than drones do. Lets first accept what is obvious: more civilians are killed in standard warfare, and the history of warfare in the 20th century sufficiently proves the point. When it comes to drones strikes, the ratio of civilian deaths is certainly lower, but the issue is not about the number of civilian casualties alone. The inherently secret nature of the weapon creates a persistent feeling of fear in the areas where drones hover in the sky, and the hopelessness of communities that are on the receiving end of strikes causes severe backlash -- both in terms of anti-U.S. opinion and violence. Response to drone strikes comes in many varieties. First, revenge is targeted at those within the easy range of the insurgents and militants. The victims of those revenge terrorist attacks also consider the drone strikes responsible for all the mayhem. Consequently, terrorists and ordinary people are drawn closer to each other out of sympathy, whereas a critical function of any successful counter-terrorism policy is to win over public confidence so that they join in the campaign against the perpetrators of terror. Poor public awareness -- which is often a function of inadequate education -- about terrorist organizations indeed plays a role in building this perspective. Public outrage against drone strikes circuitously empowers terrorists. It allows them space to survive, move around, and maneuver. Pakistan is a perfect example of this phenomenon. Many in Pakistan now believe that drone strikes tend to motivate Al Qaeda and the Pakistani Taliban to conduct terrorist attacks that target Pakistan's security forces as well as civilians. The duplicity of Pakistan's political and military elite in giving a green light to the U.S. drone policy proved to be counterproductive. The sponsors and supporters of drone strikes in U.S. policy circles apparently ignored the wider socio-political impact and indirect costs when evaluating its efficacy.

Drone Strikes are unpopular—most attempts of terrorism are because of drone strikes

Gerges 13—Fawaz is Professor of International Relations at the London School of Economics and Political Science (LSE), and holder of the Emirates Professorship in Contemporary Middle East Studies. He was also the inaugural Director of the LSE Middle East Centre from 2010 until 2013. Gerges' most recent books are The New Middle East: Protest and Revolution in the Arab World (Cambridge University Press, January 2014) and Obama and the Middle East: The End of America's Moment? (Palgrave Macmillan, September 2013). On the ten-year anniversary of 9/11 , Oxford University Press released Gerges' book, The Rise and Fall of Al Qaeda. In his highly anticipated counterterrorism speech last month, U.S. President Barack Obama publicly acknowledged -- for the first time -- the human toll that drone attacks inflict on Muslim civilians. ("Why drone strikes are real enemy in 'war on terror'" June 21, 2013 http://www.cnn.com/2013/06/21/opinion/terrorism-gerges/)//JLee

"It is a hard fact that U.S. strikes have resulted in civilian casualties," he admitted, adding, "These deaths will haunt us." While he pledged to curtail the use of drone strikes in the future, those words rang hollow when he went on to reaffirm his commitment to the targeted killings because, in his view, any alternative would invite far more civilian casualties. Obama's drone calculus ignores the CIA's warning about the continuing "possibilities of blowback." Officials in Washington ignore the high-cost ways in which the U.S. "war on terror" and the use of tactics such as drone strikes fuel the fires of home-grown radicalization in Western societies. This is a rising phenomenon that has not been seriously debated, despite a string of high-profile attacks. While trials have yet to take place, the Woolwich attack in London and the Boston Marathon bombings are suspected to be the latest cases in point. In case after case over the past few years, attackers and would-be attackers have cited the war on terror, first in Iraq and now in Afghanistan, Pakistan, Yemen, Somalia and elsewhere as proof that the West is at war with Islam. The presence of Western boots in Muslim lands and the continuing use of drone strikes have triggered a backlash among scores **of deluded young Muslims** who live in America and Europe, and who come from different educational and class background, including high achievers. What is surprising is that these attackers are not unified by a core set of ideological beliefs, or a belonging to a particular terrorist group, but by a core set of grievances, real or imagined. These are a different set of terrorists, in that they radicalized themselves -- enraged by specific grievances, while also having been integrated into life in Western society. Falling under the influence of militant preachers mostly online, they have internalized the kind of religious-political worldview that justified their taking matters into their own hands -- in short, a license to kill. Instead of trying to dismiss how the manner in which the US "war on terror" has been waged has motivated these angry, deluded young men to kill, it behooves us to take stock of their voices and to understand the drivers behind this pattern of violent rage. The goal is not to rationalize or justify their murders but to make sense of their violent actions. Boston Marathon bombing suspect Dzhokhar Tsarnaev, for example, allegedly left a note claiming responsibility for the April attack, describing it as retribution for U.S. wars in Afghanistan and Iraq. The purported message was handwritten on the interior wall of the boat where he hid from authorities, bleeding from gunshot wounds. In the note, Tsarnaev is said to have described the bombing victims as "collateral damage": "When you attack one Muslim, you attack all Muslims," Tsarnaev wrote. He described his brother Tamerlan, who died in a shootout with police, as a martyr. And after his Times Square bombing attempt, Faisal Shahzad -- who held a master's degree in business administration and who seemed fully integrated into American life - reportedly told investigators that he acted out of anger over the CIA's **Predator strikes** in Pakistan, especially a drone attack that took place while he was visiting the country. Asked later by U.S. District Judge Miriam Cedarbaun whether he was sure he wanted to plead guilty, Shahzad replied that he wanted "to plead guilty 100 times because unless the United States pulls out of Afghanistan and Iraq, until they stop drone strikes in Somalia, Pakistan and Yemen **and stop attacking Muslim lands,** we will attack the United States and be out to get them." Pressed by the judge to explain his motivations, Shahzad answered: "I consider myself a Mujahedeen and a Muslim soldier," he said. Asked by Cedarbaum whether he understood that children and other innocents might have been among his victims, Shahzad was unapologetic. "They don't see the drones killing children in Afghanistan," he said. "It's a war and I'm a part of it." Shahzad is not unique. Najibullah Zazi, who pleaded guilty to plotting to detonate a bomb in the New York subway, is also an example of bottom-up radicalization. Like Shahzad, Zazi told the court that in August 2008 he decided to go with friends to Pakistan to join the Taliban in fighting the **United States' invasion of Afghanistan**. He went to the Taliban, not the other way around, and while in Pakistan he was persuaded by al Qaeda operatives to return to America to be a suicide bomber. "I would sacrifice myself to bring attention to what the United States was doing to civilians in Afghanistan by sacrificing my soul for the sake of saving their souls," Zazi told the court. Likewise, the Pakistani-born suspect charged in an alleged plot to blow up the Washington subway system in October 2010 came to the FBI's attention because he had asked people about ways to fight U.S. troops in Afghanistan and Pakistan, according to unsealed court records. Farooque Ahmed, a 34-year-old naturalized U.S. citizen, reportedly hoped to journey to his native country and to fight there. The Taliban and al Qaeda did not recruit him. Ahmed, an engineer with a bachelor's degree from the City College of New York, was supposedly radicalized by the conflict in Afghanistan-Pakistan. His ultimate goal, according to an FBI affidavit, was "traveling to Afghanistan to fight and kill Americans." Similarly, the Sweden suicide bomber, Taimour Abdulwahab al-Abdaly, who blew himself up in Stockholm, studied in Britain and was married with three children. Al-Abdaly's friends paint a picture of man who enjoyed basketball and a good party, yet who had become increasingly angry over the past few years. His Facebook wall posts give a hint of his gradual radicalization. One shows a blindfolded Iraqi man being taunted and abused by U.S. soldiers. Several more are part of a series on

"Russia war crimes in Chechnya." According to the New York Times, al-Abdaly sent an audio recording to Swedish authorities minutes before the explosions warning his actions would "speak for themselves." "Now, your children -- daughters and sisters -- will die like our brothers and sisters and children die," The Times reported. "As long as you do not end your war against Islam and the insult against the prophet and your stupid support for that pig Vilks" (Sweden has about 500 signals intelligence specialists in the NATO force in Afghanistan). As a round-up of these violent voices show, home-grown extremism is a phenomenon driven by identity politics, a blowback against what they see as the U.S. "war on terror" in Muslim countries, a war that kills more civilians than al Qaeda operators. In this sense, the fight disproportionately inflames anti-Western sentiments and creates more terrorists at home. According to a 2006 Pew poll, the U.S. "War on Terror" is very unpopular among Muslims in Europe, with 83% of Muslims in Spain opposed, 78% in France, 77% in Britain, and 62% in Germany. Three years later, a survey of British Muslims for the BBC showed that 75% said it was wrong for the "West" to intervene militarily in Pakistan and Afghanistan, though a majority of respondents -- 78% -- said they opposed Taliban attacks against Western troops there. In his national security address, Obama hinted that the U.S. might begin to bring a closure to the "war on terror". With al Qaeda's core now "on the path to defeat," he argued, "this war, like all wars, must end." Although Obama did not go far enough by suspending drone strikes, his scaling back of the targeted killing and recommitting to closing the prison at Guantánamo Bay, Cuba, are steps in the right direction. The importance of Obama's speech lies in educating the nation about the diminishing terrorist threat. One would hope that the president would level with Americans about the limits and costs of force in international affairs. Terrorism cannot be eradicated by pushing a button, as in drone attacks, or even military intervention that might cause a backlash that spurs more, not less, terrorism. Deescalating the "war on terror" by halting the questionable use of tactics such as drone attacks might not bring an end to home-grown radicalization. But it could go a long way to deactivating the cultural and religious minefields that entrap disillusioned Muslim teens and spur some of them down a violent path.

at: Links to Politics - Bipart support

Bipart support exists for limiting drone use

Serle 2014 (Jack; New bill would force Barack Obama to publish US drone strike casualties; Apr 5; https://www.thebureauinvestigates.com/2014/04/05/new-bill-would-force-president-obama-to-publish-drone-strike-casualties/; kdf)

A bipartisan Bill that would force President Obama to reveal casualties from covert US drone strikes has been put before the US Congress. If successful, the bill would require the White House to publish an annual report of casualties from covert US drone strikes. The reports would include the total number of combatants killed or injured, the total number of civilians killed or injured, and the total number of people killed or injured by drones who are not counted as combatants or civilians. The Bill would also compel the White House to reveal how it defines combatants and civilians in its covert drone war. However the annual casualty counts proposed by the bill will not include those killed and injured in drone attacks on conventional battlefields, including Afghanistan and any country where the US officially declares war in the future. The Bureau revealed the US and UK had launched almost 1,200 drone strikes in Afghanistan between 2008 and 2012. However in March 2013 the Bureau discovered the US military had stopped publishing data on drone use in Afghanistan and had deleted the few months' data it had previously released from its publicly available records. The bill says the first report would include casualties from the strikes in covert operations from the six previous years, ensuring all drone strikes under President Obama were included. There have been at least 397 drone strikes in Pakistan, Yemen and Somalia during Obama's two terms. They have killed at least 2,183 people including 279 civilians according to the Bureau's estimates, based on open-source information. While there were fewer drone strikes launching during President Bush's administration – 52 strikes between 2002 and January 2009 – they killed more people on average than the Obama's strikes. At least 416 people died in Bush era strikes, including 167 civilians. The bill is co-sponsored by California Democrat Adam Schiff and North Carolina Republican Walter Jones. Schiff said: 'An annual report will provide a modest, but important, measure of transparency and oversight regarding the use of drones.' 'Despite our best efforts to ensure to a near-certainty that no civilians will be killed or injured, sometimes strikes do result in civilian casualties. We must be more transparent and accountable, both with ourselves and with the world, and narrow the perception gap between what really happens, and what is reported or assumed.' Jones said: 'Our government's use of drones for targeted killings should be subject to intense scrutiny and oversight.' He added: 'I believe this legislation is an important step in that direction,' he added. The sponsors are trying to gather bipartisan support for their bill which has been referred to the House Permanent Select Committee on Intelligence and the House Armed Services Committee. The intelligence committee then armed services committee will consider whether to allow the bill to progress to be debated by the House of Representatives. The independent legislative-data-analysis firm GovTrack gives the bill a negligible chance of passing the committee stage. However the bill has similar language to the Intelligence Authorisation Act and could be offered as an amendment to that bill if it reaches the House. Calls for transparency over drone strikes have grown steadily over the past 18 months. In October 2013 both Amnesty International and Human Rights Watch (HRW) called for greater transparency and accountability after investigating US drone attacks in Pakistan and Yemen.

at: Links to Politics - No Obama Push

Obama doesn't push the CP

Baker and Davis 2015 (Peter and Julie Hirschfeld; Amid Errors, Obama Publicly Wrestles With Drones' Limits; Apr 24; www.nytimes.com/2015/04/25/us/politics/hostage-deaths-show-risk-of-drone-strikes.html; kdf)

And yet, for all of Mr. Obama's achingly public struggle over the right approach to terrorism and war, he does not seem likely to overhaul his drone-oriented strategy. Reviews of the strike that killed the hostages may yield better ways to conduct the war — officials were already talking about forming a "fusion center" that would link agencies to deal with hostage situations — but aides gave no sense that Mr. Obama would embrace a wholesale shift. "These kinds of counterterrorism operations have diminished the effectiveness of Al Qaeda," said Josh Earnest, the White House press secretary. "This kind of pressure has been effective in enhancing the national security of the United States." Aides say that the president views the strikes as a critical tool in confronting Al Qaeda in dangerous and remote regions such as the one where Mr. Weinstein and Mr. Lo Porto died. They argue that the practice has undermined Al Qaeda's ability to plot and execute attacks against the United States, recruit followers and operate a military organization.

International Model Net-Benefit

The CP gets modeled—creating a drone framework solves terrorism and promotes human rights

Zenko 13—Micah is a Senior Fellow in the Center for Preventive Action (CPA) at the Council on Foreign Relations (CFR). Previously, he worked for five years at Harvard University's Kennedy School of Government, and in Washington, DC, at the Brookings Institution, Congressional Research Service, and State Department's Office of Policy Planning. ("Reforming U.S. Drone Strike Policies" January 2013 http://www.cfr.org/wars-and-warfare/reforming-us-drone-strike-policies/p29736)//JLee

Beyond the United States, drones are proliferating even as they are¶ becoming increasingly sophisticated, lethal, stealthy, resilient, and¶ autonomous. At least **a dozen other states and nonstate actors could¶ possess armed drones** within the next ten years **and leverage the technology¶ in unforeseen and harmful ways**. It is the stated position of **the¶ Obama** administration that its **strategy toward drones will be emulated¶ by other states and nonstate actors**. In an interview, President Obama¶ revealed, "I think creating a legal structure, processes, with oversight¶ checks on how we use unmanned weapons is going to be a challenge for¶ me and for my successors for some time to come—partly because technology¶ may evolve fairly rapidly for other countries as well."71¶ **History shows that how states adopt and use new military capabilities¶ is often influenced by how other states have—or have not—used¶ them in the past**. Furthermore, **norms can deter states from acquiring¶ new technologies**.72 Norms—sometimes but not always codified as¶ **legal regimes—have dissuaded states from deploying blinding lasers¶ and landmines, as well as chemical, biological, and nuclear weapons**. **A well-articulated and internationally supported normative framework,¶ bolstered by a strong U.S. example, can shape armed drone proliferation¶ and employment in the coming decades**. **Such norms would** not¶ hinder U.S. freedom of action; rather, they would **internationalize¶ already-necessary domestic policy reforms** and, of course, they would¶ be acceptable only insofar as the limitations placed reciprocally on U.S.¶ drones furthered U.S. objectives. And **even if hostile states do not accept¶ norms regulating drone use, the existence of an international normative¶ framework, and U.S. compliance with that framework, would preserve¶ Washington's ability to apply diplomatic pressure**. **Models for¶ developing such a framework would be based in existing international¶ laws that emphasize the principles of necessity, proportionality, and¶ distinction—to which the United States claims to adhere for its drone¶ strikes**—and should be informed by comparable efforts in the realms of¶ cyber and space.¶ In short, **a world characterized by the proliferation of armed¶ drones—used with little transparency or constraint—would undermine¶ core U.S. interests, such as preventing armed conflict, promoting¶ human rights, and strengthening international legal regimes**. It would¶ be a world in which targeted killings occur with impunity against anyone¶ deemed an "enemy" by states or nonstate actors, without accountability¶ for legal justification, civilian casualties, and proportionality. Perhaps¶ more troubling, **it would be a world where such lethal force no longer¶ heeds the borders of sovereign states. Because of drones' inherent¶ advantages over other weapons platforms, states and nonstate actors¶ would be much more likely to use lethal force against the United States¶ and its allies.¶**

Economy

**H1-B Visas

Text: The United States federal government should increase the amount of H1-B visas rewarded in a fiscal year to 195,000.

Increasing h-1b visas to 195,000 solves

Sherk 2009 [James, 5/13. Sherk is Bradley Fellow in Labor Policy in the Center for Data Analysis at The Heritage Foundation. *Restricting H-1B Visas Is Bad for Business and the Economy*. http://www.heritage.org/research/reports/2009/05/restricting-h-1b-visas-is-bad-for-business-and-the-economy 7/16]//kmc

Unfounded Fears of the H-1B. Current law restricts the H-1B visa to highly skilled foreigners who have an undergraduate degree or higher. Each year, the federal government allows 65,000 visas to be issued, with an additional 20,000 visas for people who have masters degrees or higher. The visas are granted to individuals who have been offered employment in the United States. It is valid for three years and can be renewed once for an additional three years. Many believe H-1B workers merely compete with Americans looking for work. They are wrong. **The U.S. workforce is not a "zero-sum game**." One hired H-1B worker does not mean an American is out of a job. In fact, the National Foundation for American Policy found that **employers hired four new American workers for each new H-1B employee they hire.** Additionally, hiring H-1B employees does not lower the wages of American workers. Current law requires that when employers apply for H-1B visas, they must attest that they will pay the visa recipient the same wage they would pay an American with similar skill sets. Rather than limiting the ability of employers to hire H-1B workers by adding more rules and restrictions, Congress should ensure the federal government exercises appropriate oversight in enforcing current laws. Closing the Doors on H-1B. **Preventing companies from hiring foreign workers harms the U.S. economy's ability to rapidly adapt to marketplace demands**. Companies must be able to hire persons best suited to fill positions based on their skill sets—not their nationality. People have varying skill sets unrelated to their country of residence. Simply requiring companies to hire Americans means that the company may not get the best qualified person or even the individual with the right set of professional skills to do the job. The federal government should not be making personnel decisions for American businesses. Keeping the Visa Successful. Adding regulations to the H-1B program would be a serious setback to U.S. visa policy and would only end up hurting the U.S. economy. Instead, Congress should: • Return the cap to the 2001 quota of 195,000 visas a year. • Make the program flexible. If the visa quota is met the year before, the cap should be automatically increased by a preset amount legislated by Congress. In addition, unused visas should be recaptured and used the following year. • Create interoperable databases. Making sure the Department of Labor and the Department of Homeland Security databases are interoperable will help minimize the number of fraudulent cases. • Increase oversight. The federal government should keep employers who have hired H-1B employees accountable to the program rules. Random site visits should be conducted to ensure employers are following the rules. **By improving and expanding the H-1B visa program, Congress can ensure that American businesses have the workforces necessary for further economic growth.**

H-1B Immigrants key to maintaining many parts of the economy – laundry list of advantages: agriculture, start ups, patents

Mills 15 [Karen, 2/3. Mills is a senior fellow with the Harvard Business School and was a member of President Obama's Cabinet, serving as Administrator of the U.S. Small Business Administration from 2009 to 2013. *What's missing in America's immigration debate.* http://fortune.com/2015/02/03/whats-missing-in-americas-immigration-debate/ 7/16]//kmc

The immigration debate continues to be driven by politics instead of putting fact-based analysis at the forefront of our policies. In Washington, policy makers should be focused on the critical question of whether or not steps toward

reform will actually grow the American economy and create jobs and prosperity, both for legal immigrants and native-born job seekers.ð The discussion should include substantive considerations like:ð **Immigrants are filling engineering, computer science and other high-skilled jobs, and in doing so, helping create other jobs**. A recent paper by Harvard Business School professor William Kerr showed firms that hired immigrants into high-skilled jobs **through programs like the H1B visa program created additional jobs**, including for non-immigrant workers.ð The rate of new startups has been declining. A worrisome trend considering they are part of our economic formula for job creation. But, data from The Partnership for a New American Economy, and the SBA shows that immigrants are more than twice as likely to start a business than native-born citizens.ð **Innovation is a key driver of our future economic growth.** Interestingly, immigrants were involved in more than 75% of the nearly 1,500 patents awarded at the nation's top 10 research universities in 2011. Yet, many foreign-born graduate students of these universities can't stay in the country once they get their degree. As a result, they take their ideas to their home countries where some governments have established funds to help them bring their innovations to market.ð **Foreign-born workers over-index in maintenance, construction and manufacturing production jobs, according to the U.S. Bureau of Labor Statistics. They also play a critical role in our nation's agriculture economy. There is critical demand for this workforce and employers continue to have trouble finding workers to fill many of these available jobs.**ð A crucial catalyst for the spirit and aspiration that drives the U.S. economy is the fact that throughout our history immigrants have come to the U.S. in pursuit of the American Dream. And, in doing so, they've created opportunities for themselves and countless other Americans.

Avoids the link to politics – interest group and bipartisan support pushing the counter plan
Wallsten 13 [Peter, 3/20. *Visas for high-skilled workers could double under bipartisan Senate plan*. http://www.washingtonpost.com/politics/visas-for-high-skilled-workers-could-double-under-bipartisan-senate-plan/2013/03/20/8b74c08a-9194-11e2-bdea-e32ad90da239_story.html 7/16]//kmc

The expansion of the visas, known as H1Bs, is one element of talks among a bipartisan group of eight senators, whose legislation is expected to serve as the basis for a deal between Congress and the White House to retool the immigration system. The number of visas available would approximately double from the current limit of 65,000 per year. The H1B program was created in 1990 to attract high-skilled workers from around the world, but it has become a way for outsourcing firms to bring lower-paid employees to the United States.ð Most of the top 10 employers of H1B visa holders, for instance, are India-based technology consultancies with large U.S. operations. Those firms often train workers in the United States before sending them back home to do the same jobs for considerably less money, say critics of the program on the Hill and in the labor movement.ð Sen. Richard J. Durbin (D-Ill.), a member of the bipartisan immigration working group, has been trying to persuade the negotiators to accept two key restrictions on the visas, according to people familiar with the talks. One would prevent certain firms that rely heavily on H1B visas from hiring more workers under the program, and the other would require companies to make a "good faith" effort, subject to federal oversight, to recruit American workers.ð But instead, the group has tentatively agreed to impose stiff fees on some outsourcing companies that hire H1B workers and to require modest measures to encourage the hiring of Americans, such as advertising the jobs, but with limited federal oversight. And while Durbin has pushed to increase the lowest wage levels permitted by the visa program, it's likely that only certain firms would be required to pay more.ð Durbin, who has been a lone voice in the room on the issue, is likely to back down, according to people familiar with the talks, because he has gotten his way on other points, such as a path to citizenship for the estimated 11 million illegal immigrants living in this country. A Durbin spokesman declined to comment, stressing that negotiations were continuing into the night Wednesday and that nothing was final.ð Andrea Zuniga DiBitetto, a lobbyist for the AFL-CIO, said in an interview that the plan could be a "reckless" change that may keep Americans from getting good jobs.ð But advocates for tech companies welcomed the developments, describing the still-evolving immigration plan as a potential watershed moment.ð "We're encouraged," said Scott Corley, executive director of Compete America, a coalition of companies that includes Intel, Google, IBM and other tech giants. Explaining why the industry has sought such a big increase in high-skilled visas and

other means to attract workers, Corley said: “On an issue where the politics are so hard, you can’t overbuild when you know you might not get another shot at it for 25 years.”

--xt: solves the economy

Visas are key – the number of jobs and students that require are visas are up – the CP is a key starting point to solving economy

Baron 6/21 [Ethan, 2015. *Why Business Schools Want More H-1B Visas.* http://poetsandquants.com/2015/06/21/why-business-schools-want-more-h-1b-visas/ 7/16]//kmc

APPLICATIONS SURGE FOR MBAS' VISA OF CHOICEð In the latest round of H-1B visas, awarded by lottery, U.S. immigration services received 233,000 applications from companies for the Congressionally mandated 85,000 work permits. Last year, 172,500 applications were submitted, up significantly from 124,000 a year earlier.ð Meantime, **U.S. schools have significantly expanded the percentage of international students in their classrooms so the need for more work visas is greater than ever**. At the University of Virginia's Darden School of Business, some 36% of the latest entering class were born outside the U.S., triple the 12% representation of 20 years ago. At Duke University's Fuqua School of Business, MBA students with non-U.S. passports now account for 38% of the class, up from only 19% two decades ago. And at Northwestern University's Kellogg School of Management, some 36% of the latest class is composed of international, compared to only 24% 20 years earlier.

Solves the economy – creates jobs and economic competition

Bier 12 [David, 6/17. *H1-B Visa Quotas Greatly Restrain Small Business Expansion.* http://www.forbes.com/sites/realspin/2012/06/17/h1-b-visa-quotas-greatly-restrain-small-business-expansion/ 7/16]//kmc

U.S. Citizenship and Immigration Services (CIS) announced this week that it had filled its annual H-1B visa quota for foreign high-skilled workers. The announcement comes about five months earlier than last year, signaling that U.S. businesses are expanding again. But many companies must now wait until next year to attempt to hire needed talent. This constraint is slowing their renewed growth, while unfairly disadvantaging small businesses that lack the resources necessary to navigate America's complex immigration code.ð **As America's technology and service-based economy has expanded over the last decade, its demand for high-skilled labor has increased greatly**. Global competition requires access to the world's best talent. Yet during this same period, Congress has allowed the H-1B quota for high-skilled workers to drop in half—from 195,000 in 2001 to 85,000 today. In 2006, the quota was tapped in less than two months. In 2008, it vanished in less than a day—nearly 125,000 applications were received in just two days.ð Market-driven demand grew while government-controlled supply shrank. "In most years," the Government Accountability Office found last year, "demand for new H-1B workers exceeded the cap." This mismatch is further exacerbated by fees and regulations that prevent businesses, particularly small firms, from even applying. One company estimated the cost of the H-1B and green card process at $16,000. More than sixty percent of small businesses surveyed by the GAO "incurred significant business costs resulting from petitions denied due to the cap, delays in processing H-1B petitions, and other costs."ð **H-1B regulations advantage large companies because they can absorb application costs and afford more qualified consultants**. Complicated forms and regulations—and the imperative of speed and accuracy—force most businesses to hire experts for $3,000 for a single applicant. Multinational companies surveyed by the GAO "were generally able to hire their preferred candidates because the firms were skilled at navigating the immigration system." **This legal inequity places start-ups and small firms at a disadvantage.**ð "Some companies would not want to be bothered with foreign students because it would require a lawyer to do all the paperwork," Elias Shiu, a professor at the University of Iowa's department of statistics and actuarial science, told The Des Moines Register earlier this year. International students constitute more than sixty percent of Shiu's department, like many science, engineering, and technology departments at other universities. Yet finding jobs for these highly-qualified workers in the U.S. is almost impossible due to H-1B regulations.ð Not only can big players navigate the system better

than small firms, they often manage to avoid it completely. Large firms like Principal can afford to have actuary offices in China and Brazil. Similarly, Microsoft recently opened offices in Vancouver to make use of Canada's more expeditious immigration system for foreign software designers. Not only is stimulating off-shoring bad policy, it is unfair to small U.S. competitors who cannot afford offices overseas to avoid visa constraints.∂ Multinational firms do not always need to leave the U.S. to hire the workers they want—they can also use an L-1 visa to bring workers from their foreign offices to a U.S. site for up to seven years, or they can use a B-1 visa to conduct short-term activities like holding business conferences. While these options are unavailable to most small firms and start-ups, the best response to such inequality isn't to restrain multinationals, but to open competition for all American businesses by eliminating H-1B restrictions.∂ Highly-skilled foreign workers do not "take jobs"—they make jobs. H-1B applications fell dramatically during the recession because companies use H-1B visas not to replace Americans during downtimes, but to recruit workers during expansion. A 2009 National Foundation for American Policy study found that **every H-1B request is correlated with five new jobs at major firms and more than seven jobs at firms with less than 5,000 employees. H-1B restrictions slow this expansion and hurt economic growth.**∂ Immigration quotas and restrictions are fundamentally unfair and stand in the way of America's future prosperity. **Increasing the H-1B quota would constitute progress**. But better yet, abolishing the quota system and H-1B constraints entirely would not only allow more highly-skilled workers to come, but also make America's immigration system fair for small competitors. Fairer competition would increase innovation, entrepreneurship, and job creation, **benefiting all Americans.**

--xt: k2: solve brain drain

Reform key to solve the brain drain

Case et al. 11 [Steve 5/19. Case, CEO of Revolution, John Doerr, Partner, Kleiner Perkins Caufield & Byers ; Paul Otellini, CEO of Intel Corporation, and Sheryl Sandberg, COO of Facebook, are members of the President's Council on Jobs and Competitiveness. *America needs a 21st century immigration policy.* http://blogs.reuters.com/great-debate/2011/05/19/america-needs-a-21st-century-immigration-policy/ 7/16]//kmc

President Obama's recent focus on immigration highlights America's "broken" system and its impact on our economy. Fixing it requires Republicans and Democrats to show political courage and implement reforms to expand and strengthen the American economy. As members of the President's Council on Jobs and Competitiveness, we share his deep concern that our nation's ability to compete economically is being damaged by the two parties battling over immigration laws and policies.∂ To some, **the link between immigration reform and economic growth** may be surprising. To America's most innovative industries, it is a link we know **is fundamental.**∂ The global economy means companies that drive U.S. job creation and economic growth are in a worldwide competition for talent. While other countries are aggressively creating policies and incentives to attract a highly educated workforce, America has stagnated. Once a magnet for the world's top minds, America now faces a "reverse brain drain" and is no longer the first choice for many entrepreneurs creating new companies and jobs.∂ **America needs a pro-growth immigration system that works for U.S. workers and employers in today's global economy**. And we need it now.∂ First, we need to invest in homegrown talent that is educated and trained in the critical science, technology, engineering and math fields. The U.S. education system must be improved, top to bottom, so that our most precious resource – our children – can compete in the increasingly global world economy. Statistically our K-12 students are falling farther behind students in Korea, China and elsewhere in the physical sciences. We can and must do better.∂ Second, the United States must allow employers to recruit and retain the world's best brains. We need a pro-growth based green card system to replace the current system that is plagued with years-long backlogs. Waiting a decade or more during the H1B specialty visa and green card process demoralizes the next great American immigrant Nobel laureate. More of them are returning to their home countries, like China and India, and driving new scientific breakthroughs and innovations there.∂ Third, we should staple a green card to every advanced diploma in critical fields to keep foreign-born students graduating from a U.S. university or college here in America, working for our future. Today foreign nationals account for 50% of master's degrees and 70% of Ph.D. degrees in electrical and electronic engineering in the U.S. Yet, our antiquated immigration laws numerically limit the numbers of these individuals, by the thousands, from entering our country annually. What kind of strategy is it to train the world's best and brightest in our great universities – and then require them to leave?∂ America's cutting-edge job creating industries – from computing to biotech – rely on immigrant scientists, engineers and entrepreneurs to remain competitive. And as the President said in his speech, they are responsible for founding iconic companies like Google, Yahoo and eBay.∂ According to a Kauffman Foundation study, 40 million jobs have been created in the past 25 years by high growth U.S. entrepreneurial companies. Of those, according to a Duke and UC Berkeley report, more than a quarter of U.S. technology and engineering businesses launched between 1995 and 2005 had a foreign-born founder. And in 2005, companies created by immigrants produced $52 billion in sales and employed 450,000 workers, so getting this right is paramount.∂ Silicon Valley offers a good example of the impact foreign nationals make on U.S. innovation – and the arduous process companies must go through to retain them. With 80% of Intel R&D conducted in the U.S., employing people with specific expertise in U.S. facilities is imperative. Right now, there are software engineers in the UK, who cannot come to work in a U.S. Intel facility until visas are available in the next fiscal year. And experts in next-generation mobile technology who must remain in Finland, rather than joining an Intel research and development team in the U.S.∂ At Facebook, Javier Olivan was instrumental in creating the technology that has translated the site into more than 70 languages, connecting people and businesses in the U.S. with markets around the world. Despite making a significant contribution to economic growth, Javier was lucky to be able to stay in this country. The year he applied for an H-1B visa, there were 150,000 applicants and only 65,000 visas.∂ **U.S. employers must look ahead to coming talent shortages and plan their workforce needs years in advance. They need policy certainty from Washington to know they will be able to hire the very best talent to meet the demands of the global innovation marketplace. It is time for Congress and the Administration to pass bi-partisan immigration reforms. In particular, taking quick action to attract and retain science and engineering talent is critical to the**

growth of our economy. Let's create a pro-growth immigration system that works. Our global competitiveness should not be a partisan debate, it should be a top American priority.

aff answers

H-1B is politically unpopular – immigration is too polarizing of an issue

Baron 6/21 [Ethan, 2015. *Why Business Schools Want More H-1B Visas.* http://poetsandquants.com/2015/06/21/why-business-schools-want-more-h-1b-visas/ 7/16]//kmc

Of course**, immigration issues in the U.S. generate highly polarizing debate,** and recent allegations that Disney and utility Southern California Edison used outsourcing companies to replace American workers with foreign H-1B employees have complicated the politics even more. D**emocrats join Republicans in unholy legislative alliances, none of which have so far found success**. Major U.S. corporations have also banded together in pressure groups – one boasts Facebook CEO Mark Zuckerberg and Microsoft founder Bill Gates among its leaders, and wants immigration policy changes that will give companies more access to educated, skilled foreign workers; another group, pushing for similar changes, is led by titans including former Microsoft CEO Steve Ballmer and News Corp. chairman Rupert Murdoch – but also by Bob Iger, CEO of Disney, a firm now mired in allegations that it forced American workers to train foreign, H-1B-carrying replacements before being laid off.ð "I'm sure there are violators out there," Piemonte says. "But they're not the companies that are hiring our graduate students from the United States."

No shortage of STEM workers

Eidelson 14 [Josh, 11/24. *The Tech Worker Shortage Doesn't Really Exist.* http://www.bloomberg.com/bw/articles/2014-11-24/the-tech-worker-shortage-doesnt-really-exist 7/16]//kmc

Along with temporary deportation relief for millions, President Obama's executive action will increase the number of U.S. college graduates from abroad who can temporarily be hired by U.S. corporations. That hasn't satisfied tech companies and trade groups, which contend more green cards or guest worker visas are needed to keep tech industries growing because of a shortage of qualified American workers. **But scholars say** there's a problem with that argument: **The tech worker shortage doesn't actually exist.**ð "There's no evidence of any way, shape, or form that there's a shortage in the conventional sense," says Hal Salzman, a professor of planning and public policy at Rutgers University. "They may not be able to find them at the price they want. But I'm not sure that qualifies as a shortage, any more than my not being able to find a half-priced TV."ð For a real-life example of an actual worker shortage, Salzman points to the case of petroleum engineers, where the supply of workers has failed to keep up with the growth in oil exploration. The result, says Salzman, was just what economists would have predicted: Employers started offering more money, more people started becoming petroleum engineers, and the shortage was solved. In contrast, Salzman concluded in a paper released last year by the liberal Economic Policy Institute, real IT wages are about the same as they were in 1999. Further, he and his co-authors found, only half of STEM (science, technology, engineering, and mathematics) college graduates each year get hired into STEM jobs. "We don't dispute the fact at all that Facebook (FB) and Microsoft (MSFT) would like to have more, cheaper workers," says Salzman's co-author Daniel Kuehn, now a research associate at the Urban Institute. "But that doesn't constitute a shortage."ð The real issue, say Salzman and others, is the industry's desire for lower-wage, more-exploitable guest workers, not a lack of available American staff. "**It seems pretty clear that the industry just wants lower-cost labor,"** Dean Baker, the co-director of the Center for Economic and Policy Research, wrote in an e-mail. A 2011 review by the U.S. Government Accountability Office found that the H-1B visa program, which is what industry groups are lobbying to expand, had "fragmented and restricted" oversight that weakened its ostensible labor standards. "Many in the tech industry are using it for cheaper, indentured labor," says Rochester Institute of Technology public policy associate professor Ron Hira, an EPI research associate and co-author of the book Outsourcing America.

PRISM Specific CP

Counterplan: The United States federal government should

-reform U.S. intelligence collection law and processes in line with the President's Review Group on Intelligence and Communications Technologies ,

-create a senior U.S. government position to serve as the primary contact person and advocate for U.S. industry global data issues,

-add Germany and France to the "Five Eyes" intelligence sharing group,

-elevate the issue of data flows within the global trade bodies; include data flow issues within existing and future trade negotiations

-encrypt all user traffic to the extent commercially and logistically possible,

Solves their perception internal link to data localization – as long it is perceived that privacy is protected, it doesn't matter how effective in actuality these reforms are

Hill 14, (Jonah Force, Internet Policy Specialist at the US Department of Commerce, "THE GROWTH OF DATA LOCALIZATION POST-SNOWDEN: ANALYSIS AND RECOMMENDATIONS FOR U.S. POLICYMAKERS AND BUSINESS LEADERS")

Recommendations for the U.S. Government 1. Reform U.S. intelligence collection law and processes in line with the President's Review Group on Intelligence and Communications Technologies120 The primary justification raised in favor of data localization policies is the need to protect citizens and companies from government surveillance of the like orchestrated by the NSA. While the U.S. government should not compromise what it perceives as essential national security objectives in the face of threats to American businesses (especially in light of the hypocrisy involved in some of those threats), it should nevertheless seriously address the concerns of the international community. Specifically, the U.S. can start by adopting some of the important recommendations of the President Review Group on Communications and Technologies, in particular, "Chapter IV: Reforming Foreign Intelligence Surveillance Directed at Non-United States Person," recommendations 12-15, focusing on reforming section 702 of the Foreign Intelligence Surveillance Act, such as applying the 1974 Privacy Act to non U.S. persons. These are serious recommendations, and their implementation ought to go a long way towards reducing (though surely not eliminating) international concerns over the surveillance policies of the United States. Implementation will demonstrate a willingness on the part of the U.S. government to respect global opinion and to impose limits on the reach of its intelligence agencies. 2. Create (or refocus) a senior U.S. government position to serve as the primary contact person and advocate for U.S. industry global data issues. At present, there is no single point-person in the U.S. government coordinating data flow issues, or advocating on behalf of the U.S. for freedom of data flows. The head of the Federal Trade Commission, the U.S. Trade Representative, the Privacy and Civil Liberties Oversight Board, the Department of Commerce (importantly, the Deputy Assistant Secretary for Services), the Chief Privacy Officer of the NSA, several individuals within the Department of State (importantly the U.S. Coordinator for International Communications and Information Policy) as well as many, many others, are all working on the problem, but largely separately, with inevitably separate institutional viewpoints and objectives. While multiple individuals and agencies should be addressing the issue simultaneously, there is a need for a single coordinating office to track and manage this vital economic issue. Perhaps an office of Chief Privacy Officer in the U.S. State Department and/or U.S. Trade Representative could be developed, or the newly-created White House Chief Privacy Officer position could take on this broader international responsibility. President Obama has suggested, in a speech delivered at the U.S. Department of Justice on January 17, 2014, that his administration plans to create a new position at the U.S. State Department "to coordinate [American] diplomacy on issues related to technology and signals intelligence."121 This new role – which has only been vaguely described – could also potentially fill the leadership vacuum within the U.S. government on these issues. However the reorganization happens, is clear that the current

bureaucratic arrangement needs to be restructured to ensure that the antilocalization outreach strategy is effectively coordinated and harmonized across the entire U.S. government and among U.S. industry leaders. 3. Reform and streamline the Mutual Legal Assistance Treaty process. The cumbersome MLAT process has proven to be one of the leading motivations behind many localization proposals. In order to expedite the MLAT process, the Department of Justice's should develop an online MLAT submission form, and devote the resources necessary to respond in a timely fashion, recognizing the urgency of many law enforcement requirements. In addition, the Department of Justice should (consistent with the reasonable confidentiality requirements of sound law enforcement) also publish regular government transparency reports, including breakdowns of number of requests received from different countries, the response provided, the crimes to which the requests relate, and the time each request required, and should provide clear, public guidance on what information can be obtained through an MLAT. These reports would not only result in an anticipated speed-up of response time (no one wants publicly to be shown to be dilatory), but would also demonstrate to foreign law enforcement personnel that their queries are receiving treatment not meaningfully less prompt than are other nations' requests of a similar nature.1224. Consider adding Germany (and perhaps France and other European nations) to the "Five Eyes" intelligence sharing group, or another intelligence-sharing organization and agreement. This recommendation may be the most difficult for the United States government to entertain, because, as we know, intelligence agencies are loathe to share their information, even with sister agencies within their own governments. Nevertheless, the United States surely recognizes that Germany, France, and other European nations have become essential partners in a variety U.S. national security endeavors over the past decade, assisting in national security operations from Afghanistan to Libya, and perhaps most significantly, in anti-terrorism. Yet these nations, and especially Germany (and to a lesser degree, France) have been especially troubled by the Snowden disclosures, in large part due to the fact that the U.S. is supposed to be an ally. As Viviane Reding, a European Commission Vice President, lamented (surely disingenuously), "Friends and partners do not spy on each other."123 In response, some U.S. lawmakers have proposed the idea of including Germany in the privileged "five eyes" intelligence group, 124 the group of the U.S., U.K., Australia, Canada, and New Zealand that have agreed to share significant intelligence information. It is a proposal that merits continued discussion, as would the inclusion of France, the Scandinavian nations, Holland, and perhaps others.125 To the extent that these friendly governments are recipients of significant American intelligence information, they are likely to accept as credible future American assurances that their citizens, their leadership and their companies are not the subject of broad surveillance (or, if they are so subject, the sound security reasons for that surveillance). 5. Elevate the issue of data flows within the global trade bodies; include data flow issues within existing and future trade negotiations To the extent possible, the U.S. government should elevate data localization and global data flow issues within the global trade bodies, including the G8, G20, APEC, OECD, and WTO. Towards that end, the U.S. should strongly identify data restrictions as a global barrier to economic growth and trade. In addition, the U.S. should use multilateral trade negotiations, such as the Trans Pacific Partnership, the Transatlantic Trade and Investment Partnership, and the Trade in Services Agreement, as well as bilateral trade negotiations, to include provisions on open data flows.1266. Encourage independent studies on the potential economic and security impacts of data localization for the countries considering them, and disseminate the findings of those studies to key global stakeholders A March 2014 survey by NTT Communications of over 1000 "IT decisionmakers" found that ICT decision-makers are broadly in favor of localization measures.127 Part of the reason this may be the case is that too few leaders are aware of the potential negative effects of such policies. They should be exposed to analyses not tainted by national or industry self-interest. To that end, industry ought to encourage the production of truly disinterested, peer-reviewed studies of the economic, security, and other effects of localization, and the dissemination of these studies to key stakeholders around the globe. 7. Work to reframe the privacy and surveillance discussion to one of security and economics Localization has been debated since the beginning of Snowden's revelations largely as an answer to privacy and surveillance concerns. Certainly, there is another "narrative" worthy of discussion, and to that end industry should work to alter the one-sided nature of the current discussion by including the issues of cybersecurity, cyber crime, economic integration, and Internet freedom. For developed countries, messaging to counter localization should focus on the urgent need to combat cybercrime and improve cyber security,128 the adverse effects on freedom of expression, and interference with the expansion of Internet-borne commerce at just the time that their economies are emerging from the Great Recession. These views might resonate within developing countries as well, as would the additional argument that localization could leave them permanently on the poorer side of the "digital divide." 8. To the extent commercially and logistically possible, encrypt all user traffic to reassure customers of the security of their data In order to reassure foreign customers (as well as American customers for that matter), U.S. technology companies should seek to encrypt all data traffic. Encrypting information flowing among servers will not make it impossible for intelligence agencies to snoop on individual users of Internet services, and it will not have any significant effect on valid subpoenas for data. Still, widespread use of encryption technology makes mass surveillance more difficult, whether conducted by governments or

other sophisticated hackers, and would serve to give customers some reason to believe that American firms were sensitive to their concerns. 9. Expand joint ventures with foreign enterprises, and increase technology sharing, particularly with companies in developing countries. The calls for localization may be muted if American technology firms can be seen as supportive of foreign enterprises, and particularly of the efforts of developing countries to build Internet sectors able to provide efficient and inexpensive services to their populations. To that end, American companies ought to use some of their resources to launch joint ventures with foreign companies, especially companies in the developing world. This process will inevitably entail some technology transfers with the attendant risk of the loss of proprietary intellectual property, but the mitigation of that risk is largely within the control of the sharing company, unlike the political risks involved in data localization. While joint ventures and technology sharing would be especially welcome in developing countries (and thus turn down the heat generated by their political elites), ventures with the companies of developed countries might also serve the anti-localization cause – would Deutsche Telekom be so eager to exclude American companies if it would profit more immediately, and perhaps more securely, as a partner, rather than as a competitor, of its American counterparts?

Federalism CP

**1nc

Text: The USFG should substantially reduce its aid directed to state governments and decrease its regulation of state commerce.

Federal aid programs to states increases federalism- it forces state governments to spend more to resolve new problems and limits the ways states can use the funds

Edwards 13 (Chris Edwards. Director of tax policy studies at Cato "Fiscal Federalism." June 2013. P. 3-4. http://www.downsizinggovernment.org/sites/downsizinggovernment.org/files/pdf/fiscal-federalism_0.pdf)//EMerz

The theory behind grants-in-aid is that the federal government can create subsidy programs in the national interest to efficiently solve local problems. The belief is that policymakers can dispassionately allocate large sums of money across hundreds of activities based on a rational plan designed in Washington. The federal aid system does not work that way in practice. Most federal politicians are not inclined to pursue broad, national goals, but are consumed by the competitive scramble to secure subsidies for their states. At the same time, **federal aid stimulates overspending by state governments and creates a web of top-down rules that destroy state innovation**. At all levels of the aid system, **the focus is on maximizing the money spent and regulatory compliance, not on delivering quality services**. The following are eight reasons why the federal aid system doesn't make any economic or practical sense and ought to be downsized or eliminated. 1. No magical source of federal funds. Aid supporters bemoan the "lack of resources" at the state level and believe that Uncle Sam has endlessly deep pockets to help out. But every dollar of federal aid sent to the states is ultimately taken from federal taxpayers who live in the 50 states. It's true that the federal government has a greater ability to run deficits than state governments, but that's an argument against the aid system not in favor of it. By moving the funding of state activities up to the federal level, the aid system has tilted American government toward unsustainable deficit financing. 2. Grants spur wasteful spending. The basic incentive structure of aid programs encourages overspending by federal and state policymakers. One reason is that policymakers at both levels can claim credit for spending on a program, while relying on the other level of government to collect part of the tax bill. Another cause of overspending is that federal policymakers create program structures, such as matching, that prompt the states to increase spending. A typical match is 50 percent, which means that for every $2 million a state expands a program, the federal government chips in $1 million. Matching reduces the "price" of states' added spending, thus prompting them to expand programs. Most federal aid is for programs that have matching requirements, with Medicaid being the largest such program. One way to reduce spending incentives is to convert open-ended matching grants to block grants. Block grants provide a fixed sum to states and give them flexibility on program design. The best example of such a reform was the 1996 welfare overhaul, which turned Aid to Families with Dependent Children (an open-ended matching grant) into TemporaryAssistance for Needy Families (a lump-sum block grant). Similar block grant reforms should be pursued for Medicaid and other programs. Converting programs to block grants would reduce incentives for states to overspend, and it would make it easier for Congress to cut federal spending in the future. 3.Aid allocation doesn't match any consistent idea of need. Supporters of federal grants assume that funding can be optimally distributed to those activities and states with the greatest needs. But even if such redistribution was a good idea, the aid system has never worked that way in practice.A 1940 article in Congressional Quarterly lamented: "The grants-in-aid system in the United States has developed in a haphazard fashion. Particular services have been singled out for subsidy at the behest of pressure groups, and little attention has been given to national and state interests as a whole."22And a 1981 report by the Advisory Commission on Intergovernmental Relations concluded that "federal grant-in-aid programs have never reflected any consistent or coherent interpretation of national needs."23 It's the same situation today. With highway aid, for example, some states with greater needs due to growing populations—such as Texas—consistently get the short end of the stick on funding.24 Even if funds were allocated to the states based on need, state-level decisions can nullify federal efforts. For example, the largest education grant program, Title I, is supposed to target aid to the poorest school districts. But evidence indicates that state and local governments use Title I funds to displace their own funding of poor schools, thus making poor schools no further ahead than without federal aid.25 4. Grants reduce state policy diversity**. Federal grants reduce state diversity and innovation because they come with one-size-fiscal mandates**. A good example

was the 55-mile-per-hour national speed limit, which was enforced between 1974 and 1995 by federal threats of withdrawing highway grant money. It never made sense that the same speed should be imposed in uncongested rural states and congested urban states, and Congress finally listened to motorists and repealed the law. Another example of top-down federal rules is the No Child Left Behind education law of 2002. To receive NCLB grant funding, the law required states to meet federal mandates, such as ensuring that all teachers were "highly qualified," that Spanish-language versions of tests be administered, and that certain children be tutored after school. Many states passed resolutions attacking NCLB for undermining states' rights. The Davis-Bacon labor rules are another example of harmful regulations tied to federal aid. state public works projects that receive federal aid must pay workers "prevailing wages." Since that generally interpreted to mean higher union-level wages, Davis-Bacon rules increase construction costs on government investments, such as highway projects. 5. Grant regulations breed bureaucracy. Federal aid is not a costless injection of funding to the states. Federal taxpayers pay the direct costs of the grants, but taxpayers at all levels of government are burdened by the costly bureaucracy needed to support the system. The aid system engulfs government workers with unproductive activities such as proposal writing, program reporting, regulatory compliance, auditing, and litigation**. Many of the 16 million people employed by state and local governments must deal with complex federal regulations related to hundreds of aid programs.** There are specific rules for each program, which may be hundreds or even thousands of pages in length. There are "crosscutting requirements," which are provisions that apply across aid programs, such as labor market rules.And there are "crossover sanctions," which are the penalties imposed on the states if they don't meet federal requirements. Each of the more than 1,100 aid programs have different rules, and the activities funded by the programs often overlap, which causes more confusion. For example, state and local officials deal with 16 different federal programs that fund first responders, such as firefighters.26 **That tangle of programs not only creates a lot of paperwork, it may also lead to more fragmented planning of disaster response**. 6. Grants cause policymaking overload. One consequence of the large aid system is that the time spent by federal politicians on state and local issues takes away from their focus on truly national issues. In the years after 9/11, for example, investigations revealed that most members of the House and Senate intelligence committees did not bother, or did not have time, to read crucial intelligence reports.27 Many of these members were probably spending their time trying to steer budget monies toward local activities in their home states. The federal involvement in hundreds of nonfederal policy areas overloads Washington's policy agenda. President Calvin Coolidge was right in 1925 when he argued that aid to the states should be cut because it was "encumbering the national government beyond its wisdom to comprehend, or its ability to administer" its proper roles.28 7. **Grants make government responsibilities unclear**. The three layers of government in the United States no longer resemble the tidy layer cake that existed in the 19th century. Instead, they are like a jumbled marble cake with responsibilities fragmented across multiple layers. Federal aid has made it difficult for citizens to figure out which level of government is responsible for particular policy outcomes. All three levels of government play big roles in such areas as transportation and education, thus making accountability difficult. To make matters worse, politicians have become skilled at pointing fingers of blame at other levels of government, as was evident in the aftermath of Hurricane Katrina in 2005. When every government is responsible for an activity, no government is responsible.

--xt: solvency

The federal government uses state funding to extend its power further by attaching conditions to the aid- that increases federalism- only cutting funding can solve

Waters 15 (Jim Waters. President of the Bluegrass Institute. He cites topic experts in the card. "Bluegrass Beacon: The Seduction of States." April 10, 2015. http://www.bipps.org/tag/federal-funding-to-states/)//EMerz

"When our emotions are engaged, we often have trouble seeing things as they are," Robert Greene writes in his international bestseller "The Art of Seduction." It happens frequently with politicians. When the federal government waves big money in front of state lawmakers – especially for sexy projects that politicians can rush back to their districts, wave big checks and claim credit for – it's almost impossible for policymakers from a poor state like Kentucky not to feel the euphoria and gladly accept it. Federal dollars now comprise more than 35 percent of Kentucky's general revenues. More than $8 billion of the $23 billion that Kentucky collected in general revenues in 2013 came from Washington. According to State Budget Solutions, only four states received more federal-aid dollars than Kentucky. Nationwide spending on federal grants to states and local governments has grown from $24 billion in 1970 to $640 billion today. In 2010, there were 1,100 different grants totaling $608.4 billion – 17 percent of the entire federal budget – waved in front of states. Most troublesome is the rapid growth we've seen in federal grants-in-aid spending in states just since the turn of this century. The number of state depending on the federal government for at least one-third of their total revenues has more than doubled – from 11 in 2001 to 24 states in 2012 to 30 states in 2013. Only nine states have not increased their dependency on federal-government revenues since 2001. Don't be fooled into thinking that Washington is just filled with benevolent betters who simply want states to have resources to spend as they see fit. **An increase in federal funding results in a corresponding decrease in state and local control "while threatening the states' long-run autonomy,"** writes Washington Examiner commentator David Freddoso. "The reason is that with f**ederal patronage comes federal leverage**." Perhaps no more blatant example of this occurred when the Obama administration threatened to cut off all federal matching funds if states didn't expand their Medicaid programs. While that particular scheme was struck down by the Supreme Court, the courts dismayingly have upheld the right of Congress to wave federal dollars to get states to submit to its authority – even when such power is completely outside the feds' constitutional purview. "Congress may achieve by seduction what it has no power to compel directly," James L. Buckley writes in his new book "Saving Congress from Itself: Emancipating the States and Empowering the People." In 1987, for example, the high court in South Dakota v. Dole upheld the constitutionality of withholding federal funds from states whose legal drinking age did not conform to what Washington wanted. The court's majority completely ignored limits on federal power and the Ninth and Tenth amendments – which place a majority of authority in states' hands – and instead ruled that the Constitution's "general welfare" clause essentially invites the federal government to seduce states with its money. However, "if the spending power is to be limited only by Congress' notion of the general welfare, the reality … is that the Spending Clause gives power to the Congress … to become a parliament of the whole people, subject to no restrictions save such as are self-imposed," Justice Sandra Day O'Connor wrote in her Dole dissent. "This was not the Framers' plan and it is not the meaning of the Spending Clause." The debate here is not about whether establishing a legal drinking age, education al standards, requiring seatbelts or myriad other policies forced upon states by Washington are good or bad ideas. Rather, it's about which scope of authority – the feds or state and local governments – is most constitutionally appropriate in which to enact such policies, and whether Washington's use of seduction to get its way is acceptable.

State dependence on federal assistance is increasing rapidly- that leaves states at the hands of federal power

Freddoso 14 (David Freddoso. American political conservative commentator, journalist, and author. "Exography: State government dependence on federal funding growing at alarming rate." April 15, 2014. http://www.washingtonexaminer.com/state-government-dependence-on-federal-funding-growing-at-alarming-rate/article/2547209)//EMerz

Only 11 states depended on the federal government for more than one-third of their total revenues in 2001. By 2012, 24 states found themselves in this situation. State-by-state data from the U.S. Census Bureau, compiled by the State Budget Solutions nonprofit, illustrates the trend of increasing state dependence on federal financial assistance. Forty-one of the 50 states have become more dependent on the federal government since 2001 — with federal dollars accounting for an increasing share of their total revenues. This trend of increased state dependency on Washington reduces state and local control, while threatening the states' long-run autonomy. The reason is that with federal patronage comes federal leverage. The original Obamacare plan, for example, was to force states to expand Medicaid by threatening them with loss of all federal matching Medicaid funds if they refused. Although that particular scheme was struck down by the Supreme Court, **state governments hate to turn down revenue, and federal dollars have strings attached that force states either to operate as Washington prefers or lose the money.** This problem is exacerbated by the federal government's control of the currency and ability to borrow virtually unlimited amounts of money. No state can print money, and most states must balance their annual or biennial budgets. States that depend on federal funds are also vulnerable when Washington cuts programs. Below is a look at the five states whose financial dependency on Washington grew the most between 2001 and 2012. Keep in mind that this is not merely a measure of federal dollars spent in any particular state, but rather a look at the share of federal money making up a state's overall budget, and how fast that share has grown since 2001. The federal money that goes to states -- known officially as "intra-governmental revenue" -- includes everything from one-time stimulus and disaster grants to highway funds and federal contributions to state-run welfare programs. Also note that some states with lower taxes and smaller governments will appear to be more dependent because federally funded programs necessarily comprise bigger portions of their budgets.

Hege CPs

**Seabasing 1NC

Text: The United States Federal Government should develop and implement a mobile Sea Basing naval capability aimed at ensuring adequate United States forward deployment and power projection capabilities.

Seabasing solves hegemony—allows rapid deployment and global deterrence

Perry 9—Michael is a US Navy Commander ("IMPORTANCE OF SEABASING TO LAND POWER GENERATION" 2009 Lexis Nexus)//JLee

Seabasing supports numerous aspects of America's National Security, Defense and Military Strategies. This is best summarized by President George W. Bush recently declaring that the U.S. is "developing joint sea bases that will allow our forces to strike from floating platforms close to the action, instead of being dependent on land bases far from the fight." 36 In particular, U.S. National Defense Strategy relies upon the "ability to rapidly deploy and redeploy forces" as the "keystone" of U.S. National Military Strategy.37 Seabasing facilitates rapidly assembling and projecting the forces required to address any traditional, irregular, catastrophic and/or disruptive challenge and denies the sanctuary needed to plan attacks against the U.S. and develop weapons of mass destruction. 38 This directly addresses national objectives regarding "strategic access" to "retain freedom of action," "strengthening alliances and partnerships" and establishing "favorable security conditions."39 Thus, Seabasing reassures our allies, helps deter and defeat potential adversaries, maximizes use of the "global commons" of the high seas, and ensures "timely generation and deployment of military forces" throughout the world. 40 This approach to force design and planning "focuses less on a specific adversary" and more on flexibly responding to how an "adversary might fight" at a nearly unlimited number of locations.41 Thus, the extremely flexible capabilities of Seabasing are ideally aligned with the extremely flexible requirements of the National Security, Defense and Military Strategies of the United States.

--xt: Solves Hegemony

Leverages our best military asset to boost flexibility and reduce response times

Perry 9—Michael is a US Navy Commander ("IMPORTANCE OF SEABASING TO LAND POWER GENERATION" 2009 Lexis Nexus)//JLee

The rise of the Soviet Navy during the Cold War presented a new peer competitor and slowed development of sea based support of land power generation. However, **the fall of the Soviet Union has renewed interest in "Seabasing." 3 Once again, the U.S. lacks a peer competitor on the high seas and must reconsider its relevance to national security**. The primary difference is that Huntington's advice has become even more relevant and important. In particular, **Seabasing supports the National Security Strategies of the U.S. with mobile operational and logistics platforms that help offset the dramatic decline in U.S. access to overseas bases**. These **national security strategies require rapid access to potential Joint Operating Areas and deployment of follow-on forces as necessary to deter potential aggressors and execute and reinforce U.S. Foreign Policy**. In response, **Sebasing allows the U.S. Navy to project military power on short notice anywhere in the globe either unilaterally or in support of Joint and combined operations**. This **eliminates the need to support marginally democratic regimes for fear of losing access to overseas bases or forcibly seize or establish marginally useful expeditionary air and sea ports.** Rather, Joint Force **Commanders can apply force directly to an objective at the time and place of their choosing from the relative safety of the high seas** As a result, **Seabasing has become a Joint Integrating Concept of great importance to all aspects of the U.S. Department of Defense**. Specifically, **Sebasing forms one of the "Pillars" of the "Sea Power 21" strategy to evolve the U.S. Navy from a "blue-water, war-at-sea" force to a "global joint operations**" force, **which is capable of confronting "regional and transnational dangers" on land as well as sea.**4 Similarly, **Seabasing is essential to transforming the U.S. Army and Air Force to a more responsive and truly joint force**. Yet, over 50 years after Huntington first described its importance, the U.S. Navy and Department of Defense are still struggling to clearly define the goals and objectives of Seabasing and overcome the "mythology and misunderstanding" that has "stifled" its development.5

**Compensation CP

Text: The Department of Defense must reduce its civilian payroll expenses using furloughs, reform its compensation system by using the preference-based benefits optimization approach, and reexamine the size and structure of the Department of Defense civilian workforce.

Solves Hegemony and has bipartisan support

Adams et al. 13—Gordon is a Professor in the US Foreign Policy Program at the School of International Service, American University. He is also a Distinguished Fellow at the Stimson Center. A striking bipartisan consensus exists today across the think tank community on the need for Pentagon and Congressional leaders to address the growing imbalances within the defense budget that threaten the health and long-term viability of America's volunteer military.¶ **It is our** shared **belief that the Department of Defense** urgently **needs to close excess bases and facilities, reexamine the size and structure of the DoD civilian workforce, and reform military compensation**. While we do not all agree on the best approach to reform in each case, we agree **that if these issues are not addressed**, **they will gradually consume the defense budget from within**. **This will leave a smaller share of the budget to pay for the manning, training and equipping of our armed forces that make the U.S. military second to none.**¶ There is no shortage of useful ideas on how to begin addressing these pressing matters. The challenge has been getting Congress and the administration to admit change is required and take action. For example, many in Congress are understandably fearful of repeating the mistakes of the most recent round of base closures in 2005. This round of closures was an anomaly in many respects because it occurred during a period of growth in defense spending and emphasized moving and consolidating facilities instead of outright closures. Consequently, DoD's inventory of buildings only fell from 2.4 billion square feet to 2.3 billion — roughly 85 percent of which is within the United States. This did not yield the kind of historical savings previous rounds of base closures have brought the taxpayer. Yet by DoD's own estimates, it currently pays to maintain some 20 percent excess capacity in its infrastructure—resources that could be better used to sustain our military muscle. To its credit, the administration has asked Congress to initiate another round of closures to reduce this excess capacity. **Members of Congress on both sides of the aisle should partner with the Pentagon to identify the true scale of excess capacity and then work expeditiously to better match the Department's vast network of facilities to its shrinking force.**¶ **The size and structure of the civilian workforce is another area in need of careful examination** and restructuring that Pentagon leadership has been reluctant to address. From 2001 to 2012, the active duty military grew by just 3.4 percent. Yet over the same timeframe the number of civilian defense employees grew by 17 percent, an increase five times greater than the armed forces. While this large workforce supports essential missions of the Department and warfighter, its growth over the past decade has, by and large, been unchecked and imbalanced. In the last four years alone, **DoD civilians have grown by ten percent, but it is unclear if that growth was appropriately matched to the changing**

needs of a downsizing military and shifting strategy. This is a critical unanswered question for policymakers since DoD civilians are directly employed by the government, consuming $74 billion of the annual defense budget. Under sequestration, **DoD must reduce its civilian payroll expenses in 2013 using furloughs**, **but furloughs are merely a temporary means of reducing costs**. When the new fiscal year begins on October 1, DoD will still have more civilian employees than it can afford and quite possibly more than it needs. It is past time for the Pentagon to rightsize this workforce and make permanent reductions in a thoughtful and targeted manner.¶ Finally, **we all agree on the need for a comprehensive evaluation and modernization of the military compensation system**. **This system has remained** essentially **unchanged** for forty years, yet America's highly-mobile youth expect and value various forms of compensation differently today. Better meeting the needs of a 21st century workforce should be the driving force behind reform. But cost should be a consideration, as should the outdated forms of payment for the 80 percent of service members who serve less than a full 20-year career. From FY 2001 to FY 2012, the compensation cost per active duty service member grew 56 percent, adjusting for inflation, or a rate of 4.1 percent annually**. DoD has proposed many incremental changes to the compensation system** over the past five years to reduce this rate of growth, **but each time Congress has largely rejected DoD's proposals**. **Yet if Congress fails to curb the growth in military compensation costs**, **they will continue to grow as the defense budget shrinks, crowding out funds needed for training, readiness and for the replacement of worn out equipment**. Congress took a modest step forward on this issue in 2012 by establishing a bipartisan commission to examine the military compensation system but stopped short of requiring itself to act on the commission's recommendations. To make meaningful progress on this issue, leaders of both parties should, at a minimum, commit to bringing the recommendations of this commission to a vote in both chambers.¶ None of these **reforms** will be easy, painless, or popular. But they **are** absolutely **essential to maintaining a strong national defense over the long term.** These smart and responsible initiatives should be undertaken by Pentagon and Congressional leaders regardless of the level of defense spending. While these reforms are necessary, they are not of themselves sufficient to meet the fiscal and strategic challenges the military currently faces. Those of us who have joined together in support of these efforts find ourselves with differing views on many other issues, including the proper level of defense spending and how that money can best be allocated. But **we are all in strong agreement on the need to pursue these key reforms for a transforming military**. To paraphrase President Eisenhower, every unnecessary base that remains open, every excess civilian employee that remains on the payroll, and every mis-targeted dollar of military compensation signifies, in the final sense, a theft from both the training and equipping of our young men and women in uniform and, ultimately, the security of our citizens. **It is time for Congress and the Obama administration to act.**

Indefinite Detention CP

**Release or Trial 1NC

The United States federal government should either grant a habeas trial to prisoners within a reasonable time or granting them release.

The CP guarantees that

Chow 2011 [Samuel [JD @ Cardozo]; The Kiyemba Paradox: Creating a Judicial Framework to Eradicate Indefinite, Unlawful Executive Detentions; 19 Cardozo J. Int'l & Comp. L. 775; kdf)

This Note examines the availability of habeas review in executive terrorist detentions. Specifically, the scope of habeas is examined in light of recent interpretations of the judicial branch's ability, or lack thereof, to order release as a remedy. Courts have a rightful place in the foreign relations debate and recent detainee cases point to habeas review as a means to exercise that role. n41 For habeas review to be meaningful, the ability to order functional release, or release where the detainees are no longer being physically detained, must be available. The restraints Munaf has placed on functional release are not problematic so long as the detainees' liberty interests are adequately accounted for. This Note will argue that Kiyemba poses the archetypal situation where detainees have been unlawfully held for an unreasonable length of time, eroding that liberty interest. If release-plus is necessary to effectuate functional release under these conditions, courts must have the authority to grant it - even if those circumstances only occur in a limited class of cases. Indeed, both historical evidence of the judicial branch's role in such circumstances and the Zadvydas v. Davis n42 line of cases has already answered the question of what balance must be struck between the liberty interests of a detainee held unlawfully and the executive immigration prerogative. **Limits must be placed** on how long a detainee may be held and the liberty interest, under circumstances where the detention has become unreasonably lengthy, must win out. n43 Functional release, therefore, must apply when unlawful detentions reach a point where they can be characterized as unreasonable.

Part II examines the historical evolution of habeas corpus and demonstrates that its significance as a judicial remedy depends on the courts' ability to order a detainee's functional release. Part III [*782] introduces the contemporary application and scope of habeas corpus in the context of executive terrorist detentions. Part IV examines the application of immigration paradigms to habeas jurisprudence. Part V argues, based on the Kiyemba paradox, that the courts' role in reviewing such detention cases is substantially diminished if they are unable to meaningfully offer release as a remedy for unlawful detentions. Ultimately, this Note concludes that under particular circumstances, the courts must have the authority to order release into the United States because the availability of release as a remedy is an essential element of habeas corpus. Furthermore, if the availability of habeas review is constitutionally-guaranteed, then as a general rule, the availability of release as a remedy must also be guaranteed. This Note will show that these propositions do not, contrary to what the government argued in Kiyemba, run counter to current understandings of the executive immigration authority.

--xt Solves deference

The CP will create a restriction on the president's power

Chow 2011 [Samuel [JD @ Cardozo]; The Kiyemba Paradox: Creating a Judicial Framework to Eradicate Indefinite, Unlawful Executive Detentions; 19 Cardozo J. Int'l & Comp. L. 775; kdf)

The Kiyemba petitioners were seventeen Uighurs from China's Xinjiang Province who had traveled to Afghanistan and then to Pakistan prior to September 11, 2001. n124 They were subsequently captured by United States military in Pakistan during its military campaign in Afghanistan. n125 All seventeen had been held in Guantanamo Bay since 2002 on CSRT determinations made in 2004 that they were enemy combatants. n126 After Parhat v. Gates, n127 the government retracted that determination. n128 There, the D.C. Circuit Court determined that there was insufficient evidence linking the petitioner, Huzaifa Parhat, to the ETIM. n129 In fact, the court acknowledged that even if it had determined that Parhat was affiliated with the ETIM, that determination would be insufficient to sustain an enemy combatant status in light of the unreliability of the evidence linking the group to al Qaeda or the Taliban. n130 This finding was subsequently applied to all the [*794] Kiyemba petitioners. n131¶ Following Parhat, the government conceded that the Uighurs' detention was unlawful. n132 In Kiyemba, the government admitted that it no longer had a legal basis to hold the Uighurs. n133 Indeed, the D.C. Circuit Court agreed that the Uighurs may be entitled to release based on their habeas petition. n134 However, it also held that it did not have the authority to release the detainees into the United States nor could it overturn the government's transfer determinations. n135 This conclusion was based on the understanding that the court had no authority to intrude on the Executive's immigration authority, n136 which effectively precluded the court's ability to provide a meaningful remedy for release. The Uighurs sought release into the United States because the United States government could not legally return them to their home country of China on the basis of a high likelihood of torture upon their return. n137 Additionally, despite the Executive's attempts to find an alternative asylum destination, no other third-party countries were willing to receive them. n138 Political pressure from the Chinese government n139 and the Executive's prior [*795] determination that the Uighurs were enemy combatants n140 may have contributed to the government's inability to resettle them.¶ After the D.C. Circuit Court issued its opinion and while the petition for certiorari was pending, the Executive expressly recognized the troubling scenario that the continued detention of the Kiyemba petitioners posed. Defense Secretary Robert M. Gates concluded that it was "difficult for the State Department to make the argument to other countries they should take these people that we have deemed, in this case, not to be dangerous, if we won't take any of them ourselves." n141 Indeed, the Executive was poised to send as many as seven of the petitioners to the United States in 2009. n142 However, in response to the threat of such action, Congress attached a rider to the Supplemental Appropriations Act which prevented the use of defense funds to release any Guantanamo detainees into the United States. n143 Congress also passed two additional pieces of legislation restricting the ability of Guantanamo detainees to enter the United States. n144 The National Defense Authorization Act n145 granted Congress a substantial degree of control over such releases and a spending provision banned the Department of Homeland Security from effectuating such release. n146 The detainees' hope for release, therefore, turned again on the pending petition for certiorari.¶ By the time the Supreme Court granted certiorari in Kiyemba on October 2009, ten of the seventeen petitioners had been [*796] granted refuge and transferred; four to Bermuda and six to Palau. n147 The offer extended by Palau was qualified as being an offer for temporary relocation pending permanent resettlement without the hope of obtaining citizenship. n148 Six of the remaining seven petitioners were also given the opportunity to transfer to Palau, but declined. n149 Only one petitioner, Arkin Mahmud, had not received an offer of refuge from any country, prompting his brother and the five other petitioners to reject the offer from Palau. n150 A favorable decision by the Supreme Court seemed to be Arkin Mahmud's only hope of escaping his unlawful detention, until the Swiss government announced it would provide refuge for both Mahmud and his brother. n151 The Supreme Court, deciding that the underlying facts of the case had changed because all of the petitioners had now received at least one offer of resettlement, vacated the D.C. Circuit Court decision and remanded the case to allow the lower courts to make a determination in the first instance. n152 The D.C. Circuit Court promptly reinstated its original decision, holding that regardless of any settlement offers (of lack thereof), the petitioners had "no right to be released into the United States." n153 The remaining five petitioners, still detained at Guantanamo, have since filed a second petition for writ of certiorari. n154¶ The facts in Munaf and Kiyemba are vastly different. Yet, both sets of petitioners sought release-plus, and in both circumstances, the "plus" they sought was release into the United States. The courts' reasoning for refusing such a remedy, however, is entirely distinguishable in each respective case. In Munaf, the immigration issue faced by the Kiyemba petitioners was absent since both Munaf petitioners had been American citizens. n155 In that case, denial of the "plus" factor turned on the fact that the petitioners were attempting to ride roughshod over an international obligation the United States had to hand over [*797] individuals who had committed crimes on Iraqi soil to Iraqi officials, n156 an analogous element that did not exist in Kiyemba.¶ Ultimately, the outcomes in Munaf and Kiyemba point to the overarching principle that courts may have the legal authority to hear a habeas petition, but are limited as to the allocation of relief. A desirable remedy may not be appropriate, particularly when the remedy sought is release-plus. However, it is unlikely that Munaf intended to preclude release-plus in all circumstances because doing so could potentially create unconstitutional suspension. With this in mind, the next issue that must be confronted is

determining when restrictions on the effectiveness of release are appropriate and when they are not. Munaf serves as an example of the former, where limits on release are appropriate. Kiyemba, arguably, serves as an example of when such limits are inappropriate.¶ IV. Immigration in Habeas Jurisprudence¶ ¶ It is well-established that the availability of habeas in the context of executive detentions is its most significant role. n157 "At its historical core, the writ of habeas corpus has served as a means of reviewing the legality of Executive detention, and it is in that context that its protections have been strongest." n158 A remedy is typically granted where the detention is unlawful; for executive detentions, that remedy has historically meant release. n159 Munaf's relevance after Boumediene concerned the Supreme Court's interpretation of "release." While Munaf is factually different from Kiyemba, it provided a window into the government's interpretation of what constitutes release. Munaf is also instructive in determining, ultimately, how release should be viewed as a constitutional matter.¶ The historical development of habeas corpus and the holding in Boumediene demonstrated first, that release is imperative to maintain the integrity of the writ n160 and second, that habeas corpus [*798] is a constitutionally-guaranteed right for certain individuals. n161 These two principles support the argument that efforts to limit the availability of release as a habeas remedy should, in the very least, require a high degree of scrutiny. Indeed, in Boumediene, Justice Kennedy noted that there are instances of unlawful detention where release may not be appropriate. n162 Therefore, in a limited set of circumstances the grant of release may not be constitutionally required. Munaf suggested that requests for release-plus go beyond what the Constitution requires. In Kiyemba, the government successfully argued that the detainees should be denied release into the United States based on Munaf's release-plus analysis. n163 However, preclusion of functional release is arguably inappropriate there. In fact, this understanding of release-plus in Kiyemba may have been an unconstitutional reading of the immigration laws that the court had relied on.¶ The government's argument in Kiyemba was based on Shaughnessy v. Mezei n164 and broad interpretations of Boumediene and Munaf. n165 The government's argument was twofold. First, the government relied on Mezei to ground the legal authority for excluding the Kiyemba petitioners from entering the United States. n166 Second, Munaf was used to reconcile the petitioners' right to release with their continued detention. n167¶ A. Mezei and the Government's Immigration-Based Framework¶ ¶ In Mezei, the Supreme Court held that the indefinite detention of a non-citizen on Ellis Island was not a "[deprivation] of any statutory or constitutional right." n168 The petitioner, Ignatz Mezei, was born in Gibraltar and lived in the United States for [*799] over twenty-five years. n169 He left to visit his dying mother in Romania but was denied entry to the country and attempted to return to the United States, only to discover that a change in immigration laws while he was abroad meant that he could no longer legally re-enter. n170 He was stuck on Ellis Island and attempts at resettling him failed miserably. n171 The government argued that rather than viewing Mezei's confinement as detention, it should be construed as exclusion n172 - the authority of which was, the government argued, based on well-founded legal foundations in United States immigration law. n173 The Court agreed. n174 Employing habeas corpus to order the release of Mezei into the United States, it argued, was an improper exercise of judicial discretion. n175 In Kiyemba, much like in Mezei, the government argued that releasing the petitioners into the United States would amount to an unlawful intrusion into the authority of the political branches to exclude non-citizens from entering United States territory. n176¶ However, there are serious flaws with the government's Mezei-based argument. The government was correct in asserting that it was "unprecedented" to grant the courts authority to order the Executive to release detainees into the United States. n177 It is also true, however, that a Kiyemba-type situation is unprecedented. One of the glaring differences between the immigration analysis adopted in Mezei and the facts in Kiyemba is the nature of the detentions. First, in immigration cases, detainees voluntarily come under the jurisdiction of the United States government upon choosing to enter the country - this is simply the nature of immigration-based detentions. The Uighurs, in contrast, [*800] were captured in Pakistan and forcibly brought under the jurisdictional umbrella of the United States. n178 This is relevant to determine the source of the detainees' predicament, or how the detainees came under United States authority. This suggests that indefinite executive detention is less disconcerting when the situation is created by the detainee himself. The government recognized, despite its reliance on immigration-based analysis, that judicial review based on immigration laws is inappropriate. n179 Second, the government in Mezei determined that the plaintiff posed a threat to national security. n180 The same cannot be said for the petitioners in Kiyemba. While the petitioners were initially characterized as enemy combatants - and, therefore, national security threats - the government has since withdrawn support for that determination. n181 Additionally, the government had not made any further allegations or arguments to that effect. This indicates the government conceded there was no legal basis for the indefinite detention of the Uighurs. By applying Mezei in the Kiyemba proceedings, the government ignored the significant elements that distinguish immigration-based detentions founded on the concept of exclusion from terrorist detentions. In light of the pronounced factual differences, that application is troubling.

--xt solves EU Relations

The CP solves—closing Gitmo would help end the friction between the US-EU relations

Archick 14—Kristin is a specialist in European Affairs for the Congressional Research Service ("U.S.-EU Cooperation Against Terrorism" December 1, 2014 https://www.fas.org/sgp/crs/row/RS22030.pdf)//JLee

U.S. and European officials alike maintain that the imperative to provide freedom and security at home should not come at the cost of sacrificing core principles with respect to civil liberties and upholding common standards on human rights. Nevertheless, the status and treatment of suspected terrorist detainees has often been a key point of U.S.-European tension. Especially during the former George W. Bush Administration, a number of U.S. policies were subject to widespread criticism in Europe; these included the U.S.-run detention facility at Guantánamo Bay, Cuba; U.S. plans to try enemy combatants before military commissions; and the use of "enhanced interrogation techniques." The U.S. practice of "extraordinary rendition" (or extrajudicial transfer of individuals from one country to another, often for the purpose of interrogation) and the possible presence of CIA detention facilities in Europe also gripped European media attention and prompted numerous investigations by the European Parliament, national legislatures, and judicial bodies, among others. Some individuals held at Guantánamo and/or allegedly subject to U.S. rendition have been European citizens or residents. Many European leaders and analysts viewed these U.S. terrorist detainee and interrogation policies as being in breach of international and European law, and as degrading shared values regarding human rights and the treatment of prisoners. Moreover, they feared that such U.S. policies weakened U.S. and European efforts to win the battle for Muslim "hearts and minds," considered by many to be a crucial element in countering terrorism. The Bush Administration, however, defended its detainee and rendition polices as important tools in the fight against terrorism, and vehemently denied allegations that such policies violated U.S. human rights commitments. Bush Administration officials acknowledged European concerns about Guantánamo and sought agreements with foreign governments to accept some Guantánamo detainees, but maintained that certain prisoners were too dangerous to be released. **U.S.-EU frictions over terrorist detainee policies** have subsided to some degree since the start of the Obama Administration. EU and other European officials welcomed President Obama's announcement in January 2009 that the United States intended to close the detention facility at Guantánamo within a year. They were also pleased with President Obama's executive order banning torture and his initiative to review Bush Administration legal opinions regarding detention and interrogation methods. In March 2009, the U.S. State Department appointed a special envoy to work on closing the detention facility, tasked in particular with persuading countries in Europe and elsewhere to accept detainees cleared for release but who could not be repatriated to their country of origin for fear of torture or execution. Some EU members accepted small numbers of released detainees, but others declined. At the same time, the Obama Administration has faced significant challenges in its efforts to close Guantánamo. Some observers contend that U.S. officials have been frustrated by the reluctance of other countries, including some in Europe, to take in more detainees. Congressional opposition to elements of the Administration's plan for closing Guantánamo, and certain restrictions imposed by Congress (including on the Administration's ability to transfer detainees to other countries amid concerns that some released detainees were engaging in terrorist activity), have also presented obstacles. Consequently, the Obama Administration has not **fulfilled** its promise to shut down Guantánamo. In March 2011, President Obama signed an executive order that in effect created a formal system of indefinite detention for those detainees at Guantánamo not charged or convicted but deemed too dangerous to free. The Administration also announced in March 2011 an end to its two-year freeze on new military commission trials for Guantánamo detainees.73 Some European policy makers continue to worry that as long as Guantánamo remains open**, it helps serve as a recruiting tool for Al Qaeda,** its affiliates, and other Islamist extremist groups. European officials have also voiced concern about the physical well-being of those detainees at Guantánamo who began hunger strikes in early 2013 to protest their ongoing incarceration. In May 2013, the European Parliament adopted a resolution that expressed concern for those on hunger strike, and again called upon the United States to close the detention facility.74 The Obama Administration asserts that it remains committed to closing Guantánamo. In late May 2013, President Obama renewed his pledge to work toward this goal, and announced that U.S. authorities would restart the process of sending home or resettling in third countries those detainees already cleared for transfer. In August 2013, the Administration released two Algerian detainees (the first such releases in nearly a year), after certifying to Congress that they no longer posed a threat to U.S. national security. Media sources indicate that

nine additional detainees were transferred to other countries during the remainder of 2013, including three to Slovakia. In December 2013, Congress passed a measure in the FY2014 defense authorization bill (P.L. 113-66) easing restrictions on the Administration's ability to transfer low-risk detainees to other countries. In signing the bill into law, President Obama asserted that it was a "welcome step" toward ultimately closing the detention facility, but urged Congress to lift other restrictions that still prevent the transfer of Guantánamo detainees to prisons on U.S. soil for trial in U.S. courts. Some commentators suggest, however, that Congress may not be inclined to take further action aimed at shuttering Guantánamo amid the controversy that erupted in late May 2014 following the Administration's transfer of five Taliban prisoners from Guantánamo to Qatar (without prior congressional notification) in exchange for the release of Sgt. Bowe Bergdahl from captivity in Afghanistan. Of the almost 800 individuals detained at Guantánamo since early 2002, press reports indicate that 143 remained as of the end of November 2014.75 European concerns also linger about the past role of European governments in U.S. terrorist detainee policies and practices. In September 2012, the European Parliament passed a nonbinding resolution (by 568 votes to 34, with 77 abstentions) calling upon EU member states to investigate whether CIA detention facilities had existed on their territories.76 The resolution urged Lithuania, Poland, and Romania in particular to open or resume independent investigations, and called on several other member states to fully disclose all relevant information related to suspected CIA flights on their territory. Meanwhile, some U.S. and European officials worry that allegations of U.S. wrongdoing and rendition-related criminal proceedings against CIA officers in some EU states (stemming from the Bush era) continue to cast a long shadow and could put vital U.S.-European intelligence cooperation against terrorism at risk.77

--xt Solves Soft Power

The counterplan is key to solve soft power

Shulz 9 – Senior Fellow, Center for American Progress William F. Schulz, 2009, Center for American Progress, "The Future of Human Rights: Restoring America's Leadership", www.policyarchive.org/handle/10207/bitstreams/10918.pdf, 7/15/2015, \\BD

What has been far more problematic over the last few years than random disparities between domestic and international interpretations of human rights law has been a fundamental disparagement of the authority of the international community itself. Such depreciation started early: in 2000 Condoleezza Rice, then foreign policy advisor to candidate George W. Bush, wrote in Foreign Affairs magazine, "Foreign policy in a Republican administration…will proceed from the firm ground of the national interest, not from the interests of an illusory international community [emphasis added]." Over the past seven years the U.S. has repeatedly demonstrated its contempt for that allegedly chimerical community by doing such things as "unsigning" the Rome statute of the International Criminal Court (ICC); declaring the Geneva Conventions inapplicable to prisoners at Guantanamo Bay and other so-called "unlawful combatants;" ignoring UN findings and resolutions in the run-up to the Iraq War; or refusing to stand for election to the UN Human Rights Council. The consequences have been devastating for the reputations both of the U.S., which has seen its favorability ratings drop precipitously around the world,5 and, paradoxically, of human rights themselves. The U.S. has long prided itself on being a champion of human rights and with much good reason. We would have had no Universal Declaration of Human Rights had it not been for Eleanor and Franklin Roosevelt; the U.S. pushed hard for the civil rights provisions of the Helsinki Accords, thereby contributing to the eventual liberation of Eastern Europe; the U.S. judicial system with its wide array of due process protections has been a model emulated by newly emerging countries around the world; U.S. diplomats have frequently intervened on behalf of political dissidents; the Kosovo War was spearheaded by an American commitment to prevent ethnic cleansing; and the annual State Department human rights reports have long been an invaluable resource to the cause of human rights. The current U.S. administration's commitment to battling HIV/AIDS in Africa and its outspokenness on Darfur are consistent with this tradition. But for the most powerful nation in the world, long looked to as a model of human rights virtue, to undermine the international system itself—the very framework upon which human rights are predicated—is to cause immeasurable damage to the struggle for liberty. Backtracking on our commitments to international treaties and norms in the name of defending human rights is not just ironic. One of the consequences of the Iraq War with its latter-day human rights rationale and of the "War on Terror" with its oft-stated goals of defending freedom and the rule of law is that human rights themselves have come to be identified with America's worldwide ambitions. For human rights to be conflated with, fairly or not, in the words of the critic David Rieff, "the official ideology of American empire,"6 only exacerbates the customary suspicion in which human rights have been held by some in the developing world who see them as a guise for the imposition of Western values. The truth is that if human rights and the U.S.'s pursuit of them are discredited, American interests are put in peril. Reserving the option to torture prisoners, denying them habeas corpus, sending them into "black site" prisons—all this makes it harder to defend America against the charge of hypocrisy; the claim that we are carrying out a war in defense of the rule of law by abandoning that very rule. Such a charge hands fodder for recruitment to our adversaries and makes the world less safe for Americans. No country can claim protection for its own citizens overseas (be they soldiers taken as prisoners, nationals charged with crimes, or corporations faced with extortion) if it fails to respect international norms at home. Global relations are based in good part on reciprocity. Nor can the U.S. offer effective objection to the human rights violations of others if it is guilty of those same violations itself or has shunned cooperation with international allies. No nation, no matter how powerful, can successfully pursue improvements in human rights around the world independent of the international community. Unilateral sanctions imposed upon a country to protest human rights abuses will inevitably fail if they lack the support of others

Indefinite detention collapses international cooperation

Scheinin 12 – Professor of International Law, former UN Special Rapporteur on Human Rights and Counter-Terrorism

Martin Scheinin, 1/11/2012, "Should Human Rights Take a Back Seat in Wartime?", www.realclearworld.com/articles/2012/01/11/national_defense_authorization_act_scheinin_interview-full.html, 7/15/2015, \\BD

CLC: As a world leader and active promoter of universal human rights, the practice of indefinite detention without charge would seem to clash with U.S. ideals. Could you comment on this contradiction? MS: One of the main lessons learned in the international fight against terrorism is that counter-terrorism professionals have gradually come to learn and admit that human rights violations are not an acceptable shortcut in an effective fight against terrorism. Such measures tend to backfire in multiple ways. They result in legal problems by hampering prosecution, trial and punishment. The use of torture is a clear example here. They also tend to alienate the communities with which authorities should be working in order to detect and prevent terrorism. And they add to causes of terrorism, both by perpetuating "root causes" that involve the alienation of communities and by providing "triggering causes" through which bitter individuals make the morally inexcusable decision to turn to methods of terrorism. The NDAA is just one more step in the wrong direction, by aggravating the counterproductive effects of human rights violating measures put in place in the name of countering terrorism. CLC: Does the NDAA afford the U.S. a practical advantage in the fight against terrorism? Or might the law undermine its global credibility? MS: It is hard to see any practical advantage gained through the NDAA. It is just another form of what I call symbolic legislation, enacted because the legislators want to be seen as being "tough" or as "doing something." The law is written as just affirming existing powers and practices and hence not providing any meaningful new tools in the combat of terrorism. By constraining the choices by the executive, it nevertheless hampers effective counter-terrorism work, including criminal investigation and prosecution, as well as international counter-terrorism cooperation, markedly in the issue of closing the Guantanamo Bay detention facility. Hence, it carries the risk of distancing the United States from its closest allies and the international community generally. And of course these kinds of legal provisions are always open for bad faith copying by repressive governments that will use them for their own political purposes. CLC: Do you think the U.S. adoption of the indefinite detention provisions sets a precedent for other countries to do so? MS: Of course, these kinds of legal provisions are always open for bad faith copying by repressive governments that will use them for their own political purposes. Nevertheless, one of the conclusions I drew at the end of my six-year tenure as United Nations Special Rapporteur on human rights and counter-terrorism was that such copying of bad laws is less frequent than expected. It is much more common that countries are willing to learn from each other about what really works in the fight against terrorism, and for my part I did my best to identify and promote such best practice. There are a lot of good models showing how laws can at the same time comply with human rights and produce real results in the fight against terrorism. I don't think countries genuinely concerned about terrorism will be tempted to follow the NDAA approach. But repressive governments may do so for their own political purposes.

Ending indefinite detention is sufficient to solve

UNU 10 – United Nations University

United Nations University, 3/3/2010, “Event report: Obama and the World: One Year Later, With Jean-Marc Coicaud and Tom Farer”, http://www.ony.unu.edu/events/Obama%20and%20the%20world_Event%20report.pdf, 7/15/2015, \\BD

The Ambassador of Zambia asked Dean Farer to give an assessment of Obama’s policy towards Africa, given that he made no reference to this continent during the talk. Dean Farer explained that he saw an overlap between the policies of George W. Bush and Obama in relation to Africa. Indeed, the US has increased the flow of resources to the continent and has placed an emphasis on medical assistance, in particular for HIV/AIDS, as well as for improved governance (openness, pluralism, and corruption reduction). He also mentioned that the message of both presidents was very much focused on development, stability and increased production of public goods in order to make African countries attractive to private investment. Finally, a UNICRI representative criticized the Obama administration’s lack of action in closing Guantanamo. Dean Farer responded that the president had to consider the intensity of the domestic political opposition he would encounter. Moreover, the Guantanamo issue, a very important symbol of **soft power**, is closely related to matters such as **indefinite detention** without trial and trial by

special military tribunal. Further issues arose when Obama was briefed about the legal and political complexities of convicting dangerous individuals for whom evidence was secured through forms of intelligence that cannot be disclosed.

**Torture Reports 1NC

Text: The Central Intelligence Agency should release all torture reports. The Central Intelligence Agency should institute a ban on torture.

Releasing torture reports solves – that's their internal link evidence

The CIA already banned torture, but the counterplan's durable fiat means it's not circumvented

Lewis 6/16 – writer for The Guardian

Paul Lewis, 6/16/2015, The Guardian, "Senate passes torture ban despite Republican opposition", http://www.theguardian.com/law/2015/jun/16/senate-passes-torture-ban-republicans, 7/15/2015, \\BD

She described the bipartisan support of the amendment as "a huge repudiation" of the former Bush administration officials who, she said, have fought hard since publication of the Senate report to defend the CIA's tactics and "turn this into a partisan issue".ð Laura Pitter, a senior national security counsel at Human Rights Watch, said that the techniques used by the CIA were "already clearly prohibited under US law" when they were practiced, and it was possible a future administration could once again find a way around the rules.ð However she argued the legislation cementing Obama's order, which mandates the US military and agencies to only use techniques permitted in the army manual, would serve as an additional bulwark and "help reinforce the ban in the future".Opponents of the McCain-Feinstein amendment, Pitter added, may have raised reservations about the US committing to rules over detention that are contained in the army manual, which is a public document.ð Prior to the vote, Feinstein told fellow senators that Obama's ban on torture was "only guaranteed for as long as a future president agrees to leave them in place". Although the techniques employed by the CIA were illegal, Feinstein added, there was also a possibility that flawed legal opinions justifying the techniques "could be written again".ð She pointed out that CIA director John Brennan agreed with the president's 2009 prohibition of enhanced interrogation techniques and called on fellow senators "to recommit ourselves to the fundamental precept that the United States does not torture, without equivocation, without exception".ð However that was not a position that more than a third of Republican senators could agree with. McConnell and his majority whip, John Cornyn - the two most senior lawmakers in the Senate – were among the 21 senators to oppose the measure. All those who voted against the amendment were Republican.ð McCain used a speech before the vote to read out a list of senior military figures who he said backed the permanent ban on those past interrogation practices which, he said, "compromised our values, stained our national honor and did little good".

Internet Freedom CPs

**Internet Gambling

The United States federal government should legalize nearly all online gambling in the United States.

Solves internet freedom

Kibbe 4/28/14 (Matt, FreedomWorks, "Coalition Letter: No Federal Ban on Internet Gambling")

We, the undersigned individuals and organizations, are writing to express our deep concerns about the Restoration of America's Wire Act (H.R. 4301), which would institute a de facto ban on internet gaming in all 50 states. The legislation is a broad overreach by the federal government over matters traditionally reserved for the states. H.R. 4301 will reverse current law in many states and drastically increase the federal government's regulatory power. As we have seen in the past, **a ban** will not stop online gambling. Prohibiting states from legalizing and regulating the practice only ensures that it will be pushed back into the shadows where crime can flourish with little oversight. In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior. Perhaps even more concerning is the fact that this bill allows the federal government to take a **heavy hand in regulating the Internet**, opening the door for increased Internet regulation in the future. By banning a select form of Internet commerce**, the federal government is setting a troubling precedent** and providing fodder to those who would like to see **increased Internet regulation in the future**. We fear that H.R. 4301 will begin **a dangerous process of internet censorship** that will simultaneously be circumvented by calculated international infringers while constraining the actions of private individuals and companies in the United States.

Current gambling laws gut any and all US cred on internet freedom

Minton 2011 (Michelle; Fed's online poker shutdown assaults internet freedom; May 13; www.breitbart.com/Big-Government/2011/05/13/Feds----Online-Poker-Shutdown-Assaults-Internet-Freedom; kdf)

On April 15, a day now known as "Black Friday", the U.S. Department of Justice (DOJ) effectively shut down three major online poker websites by seizing their domain names. The DOJ's heavy-handed prosecution of the websites, all of which are based abroad, has made a mockery of America's stated commitment to Internet freedom. The seizures have also hindered the online gambling operations in nations where Internet poker is completely lawful and the U.S. government has no jurisdiction. Given that the seized poker websites are housed and regulated by foreign nations—Poker Stars is registered in the Isle of Man, Full Tilt in Ireland, and Absolute Poker in Antigua—how could the U.S. government unilaterally seize their domain names? The short answer is that all of the sites end in ".com." All such domains are registered in the U.S. and, hence, are subject to U.S. civil forfeiture laws. Author and legal scholar Larry Downes has critiqued civil asset forfeiture laws on the Technology Liberation Front blog. He argues that the laws are actually intended to punish suspects before they are convicted. "The purpose of forfeiture laws," Downes laments, "is to help prosecutors fit the punishment to the crime, especially when restitution of the victims or of the cost of prosecution is otherwise unlikely to have a deterrent effect." Domain name seizures often occur without a trial and often without any warning to the owners, as was the case in Black Friday's seizure of poker domains. The government's move has reignited the controversy over U.S. federal agencies using domain seizures to punish foreign entities allegedly in violation of U.S. laws. While the DOJ did not technically "take down" the poker websites, federal agents obtained a court order that compelled Verisign, the global operator of the .com registry, to reroute the poker sites' domain names to a government page featuring intimidating federal logos notifying users of the seizure. As a result of the seizure, no computer in the world—even those in countries where poker is explicitly legal—could access the poker sites via their domain names. This latest round of seizures follows a series of similar actions taken in recent months by Immigration and Customs Enforcement (ICE), which has seized the domain names of dozens of websites alleged to be engaged in copyright infringement. One such site, the Spain-based Rojadirecta.com, had actually been deemed legal by Spanish courts. Perhaps in an effort to stem discussion of seizures' legality, the DOJ agreed to unfreeze the .com domains for Poker Stars and Full Tilt to allow players to cash out their accounts and allow foreign gamblers to continue playing on the sites. In return, the websites were required to promise to prevent American-based customers from playing poker games for money on their websites. The third major site, Antigua-based Absolute Poker, has reportedly been offered the same "privilege" in exchange for agreeing to bar U.S. customers from playing for money. However, Antigua's finance minister issued a statement last week accusing the U.S. of shutting the sites down in order to stamp out competition. Online gambling is Antigua's second largest employer after the tourism industry, so it comes as little surprise that Antigua is considering rejecting DOJ's "compromise" and instead challenging the U.S. government's action before the World Trade Organization (WTO). It is deeply troubling that the United States, a country that purports to value individual freedom, has so miserably failed to protect it when it comes to politically incorrect pursuits like online gambling. In effect, our government is bullying its own citizens and holding innocent foreign companies hostage. Hopefully, the events

of Black Friday will focus public attention on the flaws of civil asset forfeiture laws and encourage foreign nations to stand up to U.S. authorities. The DOJ's war of intimidation may have put a temporary hold on Internet poker in the United States, but its heavy-handed tactics should outrage anybody who values freedom and individual rights.

--xt: solves internet freedom

Legalizing online gambling key to internet freedom – it's a Trojan horse for widespread regulation
Telford 10/20/14

Erik Telford is senior vice president at the Franklin Center for Government & Public Integrity, The Hill, October 20, 2014, "Ending the cycle of casino cronyism", http://thehill.com/blogs/congress-blog/politics/221124-ending-the-cycle-of-casino-cronyism

When powerful gaming interest are spearheading **the fight to ban online gambling**, it should give you pause. Their main policy objective **is** focused on federal legislation to ban online gambling outright – **stifling** their **competition** before it ever reaches the market. **It** is a glimpse of crony capitalism in its most naked form, and **represents a very troubling assault on Internet freedom**, **giving government a foot in the door for a broader regulatory regime** and usurping our federalist system. The 2011, the Department of Justice's position interpretation on Internet gambling threw the issue to state legislatures--where it should be. Almost immediately, Nevada, Delaware, and New Jersey passed legalizing legislation. The Restoration of America's Wire Act, sponsored by Sen. Lindsey Graham (R-S.C.) and Rep. Jason Chaffetz (R-Utah) would prohibit interstate sports betting using wire services, effectively killing online gambling across the states where it's legal. While their pretense is to advance a moral good, this policy would undermine the free market, encourage crime, and erodes the constitutional concept of states' rights. Proponents of the regulation have brought in political heavyweights to undermine legalized online gambling, including former Arkansas Sen. Blanche Lincoln (D), who represents the Coalition to Stop Internet Gambling, claiming that legalizing online gambling would promote fraud, addiction, and money laundering. "I think it's going to be very difficult to work something out," Lincoln said, "I think it's important to put a time-out on this and to stop and think about what it's going to mean to us as a nation in our economy, to our children and to our society." However, these **problems already exist with black market gambling** mostly **run from overseas with profits** funding shady and potentially dangerous operations outside the jurisdiction of state regulation and consumer protections. Alan Feldman, an executive vice president of MGM notes that online gambling "is here, and **it's been here for a very long time.**" **Legalizing online gambling would** likely **see more** of **a shift from illegal to legal play** instead of funneling customers away from traditional casinos and their trappings. Free market advocates agree that consumers would enjoy more security were this pursuit made legal. "In this black market, where virtually all sites are operated from abroad, consumers have little to no protection from predatory behavior." wrote officials of the Institute For Policy Innovation to several congressmen. They then shared wider concern that "Perhaps **even more concerning is the fact** that this bill **allows the federal government to take a heavy hand in regulating the Internet, opening the door for increased Internet regulation in the future."** Just like Prohibition in the 1920's, **banning this vice** would **actually incentivize criminal behavior.** Those fearful of fraud, child participation, and profits diverted to gangs or terrorists **should push for legalization in every state to make the industry as transparent as possible.** Legalizing this long-established, multibillion dollar business gets the profits out of the shadows, expands market opportunities, and puts revenue into the coffers of both legitimate business and state governments that will benefit.

The US has set a double-standard on internet freedom—only repealing UIGEA allows for it on a massive scale
Gardner 2010 (April; Gambling regulations will help Obama's world internet freedom mandate; Sep 23; www.casinogamblingweb.com/gambling-news/gambling-law/gambling_regulations_will_help_obama_s_world_internet_freedom_mandate_55752.html; kdf)

President Obama gave a speech today in front of the United Nations General Assembly, and his message was largely one of individual freedom. During the speech, Obama touched on many issues, perhaps the most aggressive of which was having a Palestinian state separate from Israel. Obama spoke of allowing the Palestinians their own state with the hope that Israelis and Palestinians could live side by side in peace. Obama acknowledged that this could take a long time, but that the goal could become a reality. During the speech, Obama spoke about how the Internet should remain free from government interference everywhere in the world. The freedom to surf the Internet would allow people all across the globe to research issues and learn from the wide array of news that is currently found on the Internet. "We will support a free and open Internet,

so individuals have the information to make up their own minds," said Obama. "And it is time to embrace and effectively monitor norms that advance the rights of civil society and guarantee its expansion within and across borders." That statement may have been much better received had the US not had their own blocks on Internet freedom. The Internet gambling industry currently is operating as a black market in the US due to the 2006 Unlawful Internet Gambling Enforcement Act. The law is a form of Internet censorship that Representative Barney Frank and other lawmakers have been trying to repeal. In the quest for Internet freedom, the US proclaims themselves as leaders, however, the country must be careful with their plea. If the US can place Internet bans on certain industries, then little could be done to stop other countries from banning different industries or websites because of their beliefs. For instance, in countries where religion is unified, there could be bans on any material that the country finds outside the rules of their particular religion. In other countries, bans could be placed on industries that are run largely by foreign operators. President Obama took a strong first step today by promoting Internet freedom. The next step will be making sure the US leads by example, and one area to start would be by lifting the ban on Internet gambling. The president has laid down the gauntlet, and now it is time for him to follow his own lead.

--xt: internet on brink

Legalization signals return to internet freedom
Legal Casino 14 Portal for gambling news and articles http://legalcasinous.com/

The United States must **change their online gambling laws** to **show** to the other nations that the time of the **disrespect for the international agreements** is ended. One of these agreements is with the European Union. The European Commission has warned USA a long time ago that their online casino laws violates the economic agreements with the European union. The actual Obama administration has shown, finally, the good wish to conform with such agreements. The Representative Barney Frank has been a proponent for years of the online games legalization. He has tried to oppose to the UIGEA (Unlawful Internet Gambling Enforcement Act) last year, but not in vain. The Republicans had the control, but now, with the democrats, in the US there is the hope for a new law Internet Gambling Law. Frank believes that all the citizens of the United States have the right to play for money at the online casino, in the privacy of their houses. Even some Republicans in past had fought for **the Internet freedom.**

**internet federalism

The fifty states of the United States should legalize nearly all online gambling in the United States.

State level regulation allows internet federalism

King, 10 [J.D. candidate 2010, Northwestern University School of Law, B.A. Middlebury College 2002, ARTICLE: GEOLOCATION AND FEDERALISM ON THE INTERNET: CUTTING INTERNET GAMBLING'S GORDIAN KNOT, Lexis]

V. CONCLUSION Gambling, like most divisive social issues, is best regulated **at the state level**. n190 Yet migration of gambling to the Internet has complicated matters greatly, giving rise to difficult questions as to which governmental entities are best suited to regulate and what the proper substantive regulatory regime ought to be. The failure of energetic federal and state efforts to prohibit Internet gambling over the past decade suggests that the issue may present a nearly impregnable problem, or as this Article terms the matter, an Internet gambling Gordian knot. The rise of geolocation technologies in recent years offers a new opportunity to cut through that Gordian knot via a jurisdictionally differentiated regulatory framework for Internet gambling. Geolocation technologies are not perfect. However, when they are integrated into a federal-state framework in which **states choose their** own substantive policies from a limited "menu" of options, these technologies can **dramatically improve the democratic responsiveness of Internet gambling laws, increase compliance with the rule of law, and internalize the large and increasing costs associated with prohibition of Internet gambling.** Such an approach is not immune to criticism, particularly in terms of its potential impact on the fundamental openness of the Internet in the long-term. In light of the market advantages associated with jurisdictional differentiation and the need for law to be supreme over code in divisive areas such as Internet gambling, those drawbacks [*75] fail to outweigh the potential benefits offered by aggressive use of geolocation technologies. These conclusions **carry implications that go well beyond the Internet gambling debate**. If jurisdictional differentiation is a **normatively superior approach** with respect to Internet gambling, then it **may be in other market sectors as well**. This consequence, along with the degree to which technological advances have undermined previous court decisions on electronic commerce issues, suggests that geolocation technologies may **play a role in enabling federalism on the Internet for years to** come.

**Freedom Online Coalition

Text: The United States federal government should submit a review to [the plan] to the Freedom Online Coalition to insure international standards of internet freedom are being met.

CP solves 100% of case – creates an internationally modeled form of internet freedom, checks the circumvention disad

Kehl et al. 14 [Danielle, Kevin Bankston, Robyn Greene, Rober Morgus July, 2014. Kehl is a Senior policy analyst at New America's Open Technology Institute. Surveillance Costs: The NSA's Impact on the Economy, Internet Freedom & Cybersecurity. Pdf. 7/13]//kmc

The United States must act immediately to restore the credibility of the Internet Freedom agenda, lest it become another casualty of the NSA's surveillance programs. As described in Part IV, various agencies within **the U.S. government have taken initial steps** to demonstrate goodwill in this area, particularly through the NTIA's announcement that it intends to transition stewardship of the IANA functions to a global multistakeholder organization and the State Department's speech outlining six principles to guide signals intelligence collection grounded in international human rights norms. However, it will take a broader effort from across the gov- ernment to demonstrate that the United States is fully committed to Internet Freedom, includ- ing firmly establishing the nature of its support for the evolving multistakeholder system of Internet governance and directly engaging with issues raised by the NSA surveillance programs in international conversations. **Supporting international norms that in- crease confidence in the security of online communications and respect for the rights of Internet users all around the world is integral to restoring U.S. credibility in this area**. "We have surveillance programmes that abuse human rights and lack in transparency and ac- countability precisely because we do not have sufficiently robust, open, and inclusive debates around surveillance and national security pol- icy," writes Matthew Shears of the Center for Democracy & Technology.339 It is time to begin having those conversations on both a national and an international level, particularly at key upcoming Internet governance convenings including the 2014 Internet Governance Forum, the International Telecommunications Union's plenipotentiary meeting, and the upcoming WSIS+10 review process.340 Certainly, the United States will not be able to continue promoting the Internet Freedom agenda at these meetings without addressing its national security appa- ratus and the impact of NSA surveillance on individuals around the world. Rather than being a problem, this **presents an opportunity for the U.S. to assume a leadership role in the promo- tion of better international standards around surveillance practices.** Moreover, the U.S. should take steps to further internationalize its Internet Freedom efforts writ large and work with foreign governments to broadly promote democracy and human rights online. In 2011, Richard Fontaine and Will Rogers of the Center for a New American Security wrote that **"the United States should counter the view that Internet Freedom is merely an American project cooked up in Washington, rather than a notion rooted in universal human rights**… The response to [concerns about the Internet Freedom agenda's ties to U.S. foreign policy should be] to internationalize the effort."341 Today, more than ever, **it is critical that the United States heed this advice and take steps to broaden the base of support for the Internet Freedom agenda. Future meetings and activities of the Freedom Online Coalition,** which the State Department played a key role in convening**, will serve as one test of these efforts as the group attempts to transition from a discussion forum for like-minded governments into a more ac- tion-oriented coalition.**342 The United States has the opportunity to urge other member countries to live up to the commitments they made at the 2014 meeting in Tallinn with respect to account- ability, transparency, and other policies ground- ed in human rights. As Toomas Hendrik Ilves, the President of Estonia, articulated in his remarks at the 2014 meeting, "We must be honest with ourselves and admit that recent developments regarding purported surveillance by the NSA and similar organisations in different countries make the defense of an open Internet more difficult. That, too, is a challenge that Freedom Online Coalition must face."343 Outside of the Freedom Online Coalition, but consistent with its

goals, the U.S. can urge both companies and foreign governments to join organizations like the Global Network Initiative or commit to other voluntary processes that promote the centrality of human rights in the policymaking process.344

They say yes

DDP 15 [Digital Defenders Partnership, a subset of Freedom Online Coalition. *WG 3 – Privacy and Transparency Online* . https://www.freedomonlinecoalition.com/how-we-work/working-groups/working-group-3/ 7/14]//kmc

FOC working group (WG) "Privacy and Transparency Online" focuses on the relationship between governments and information & communications technology (ICT) **companies, with a particular emphasis on respecting human rights online, including freedom of expression and privacy**. In furtherance of that objective, this group intends to explore the privacy and transparency practices of governments and companies, including through requests for user data, content restriction, and network shutdown. This group will remain mindful of the applicability of key principles from the Tallinn Agreement, such as the rule of law, collection for a legitimate purpose, non-arbitrariness, and effective oversight, which should guide the interaction between ICT companies and governments.ð **The discussion on transparency in the ICT sector has largely focused on major Internet companies in the United States, Canada, and Europe. With the proliferation of new laws and regulations in this area, and the growing range of companies handling user data and content, this conversation should have a global framework, applying to governments from all regions and companies from all parts of the ICT sector.**ð By bringing together governments, companies, civil society experts, and academics, this WG aims to contribute to the global discussion on transparency and accountability with respect to ICT relationships by seeking to provide clarity to the following areas:ð General understandings of the laws, policies, and processes through which governments make requests to ICT companies that may impact privacy.ð How ICT companies in such countries receive and process government requests.ð The implications of these practices for the privacy and freedom of expression of users, as well as broader considerations related to law enforcement and national security.ð Opportunities for and challenges to greater transparency, including legitimate law enforcement, national security, and other considerations.ð The WG will focus, at least initially, on the practices of ICT companies and governments in areas that could implicate privacy and free expression as described above, and may also include broader multi-stakeholder discussions on how ICT companies can respect human rights, and how governments can help or hinder company efforts to do so.

perm doesn't solve FOC credibility – causes international backlash

IFEX 14 [4-22. In letter to Freedom Online Coalition, NGOs speak out on surveillance of rights organisations. https://www.ifex.org/international/2014/05/01/surveillance_rights_organisations/ 7/14]//kmc

In response to Edward Snowden's testimony before the Council of Europe that the NSA and GCHQ monitored the confidential communications of human rights and civil society organisations, PEN International as part of a coalition human rights organisations sent a letter to members of the Freedom Online Coalition (FOC) on April 22, 2014 before its upcoming annual meeting in Tallinn, Estonia on April 28-29. The FOC is a leading intergovernmental coalition, currently with 22 members, established in 2011 with the express purpose of advancing Internet freedom (in particular, free expression, assembly, association and privacy online). Both the US and UK are members of the coalition. ∂ The April 22, 2014 letter follows. ∂ Dear Minister, ∂ On April 8, 2014, former US National Security Agency (NSA) contractor Edward Snowden testified before the Parliamentary Assembly of the Council of Europe (PACE) via video-conference that the NSA and the United Kingdom Government Communications Headquarters (GCHQ) have used their surveillance capabilities to spy on the communications of human rights organizations and civil society groups, both domestically and internationally. Snowden did not reveal which groups the NSA or GCHQ have spied upon, but indicated that the types of organizations whose communications had been compromised included major global organizations similar to Amnesty International and Human Rights Watch, and other NGOs. ∂ Snowden explicitly told PACE members that the NSA had "specifically targeted the communications of either leaders or staff members in a number of purely civil or human rights organizations … including domestically, within the borders of the United States." ∂ If Snowden's assertion is accurate, such facts would not only point to fresh dimensions of the overreach of NSA surveillance, but also would constitute an outrageous breach of the US government's stated commitment to human rights and freedom online. It also raises the very real possibility that these organizations' communications with confidential sources have been intercepted. Sharing this information with other governments could put victims and human rights defenders the world over in imminent danger. ∂ The US frequently criticizes repressive states for unjustified government spying on human rights organizations, media organizations, and civil society because such surveillance has a chilling effect on freedom of expression and association and constitutes a clear form of harassment and intimidation. ∂ Furthermore, as you are well aware, the US and the UK have taken leadership roles in the Freedom Online Coalition (FOC), the leading intergovernmental coalition, established in The Hague on December 8, 2011, for the purpose of "advancing Internet freedom - free expression, association, assembly, and privacy online - worldwide." **FOC members have joined in a shared commitment to work together to voice concern over measures that restrict Internet freedom and to support individuals whose human rights online are curtailed.** ∂ **FOC members also have undertaken obligations to adopt and encourage policies and practices, domestically and internationally, which ensure the protection of human rights and fundamental freedoms online, in particular freedom of expression, the right to privacy, freedom of assembly and access to information.** ∂ If the allegations about US and UK surveillance of human rights and civil society organizations are true, such practices would contradict the express commitments made by the US and the UK to the FOC. ∂ We, the undersigned civil society and human rights organizations, seek clarification as to the allegations that the NSA and GCHQ monitored or are monitoring the communications of our organizations, or of other civil society organizations, media organizations, and human rights groups. Where the facts support these claims, we ask the US and UK governments to explain the reasons why this is occurring or has occurred in the past, and the extent of such monitoring, its continuance, and its justification. ∂ We call upon members of the FOC to live up to their stated commitment to support civil society members or journalists whose human rights online may have been violated. We seek FOC member assistance in ascertaining the underlying factual basis for the Snowden allegations with respect to NSA and/or GCHQ spying on civil society and human rights groups, and in ensuring a halt to any violations of our privacy, freedom of expression and other human rights

online. ∂ Sincerely, ∂ Access ∂ Advocacy for Principled Action in Government ∂ AGEIA DENSI ∂ Alternative Informatics Association ∂ Amnesty International ∂ ARTICLE 19 ∂ Asociación de Internautas ∂ Association for Progressive Communications (APC) ∂ Benetech ∂ Big Brother Watch ∂ Bits of Freedom ∂ Breadboard Society ∂ Bytes for All, Pakistan ∂ Center for Constitutional Rights ∂ Center for Democracy & Technology ∂ Center for Freedom of Expression and Freedom of Information (CELE), Palermo University School of Law ∂ Centre for Internet and Society, Bangalore, India ∂ Charity & Security Network ∂ Committee to Protect Journalists ∂ The Constitution Project ∂ ContingenteMX ∂ Council on American-Islamic Relations (CAIR) ∂ Digital Rights Foundation ∂ Digital Rights Ireland ∂ Electronic Frontier Foundation ∂ Electronic Privacy Information Center (EPIC) ∂ Foundation for Information Policy Research ∂ Free Press ∂ Freedom House ∂ Freedom of the Press Foundation ∂ Global Voices Advocacy ∂ Hiperderecho ∂ Human Rights in China ∂ Human Rights Watch ∂ Institute for Reporters' Freedom and Safety ∂ International Federation for Human Rights (FIDH) ∂ La Quadrature du Net ∂ Movimento MEGA ∂ New America Foundation's Open Technology Institute ∂ Online Policy Group ∂ Open Net Korea ∂ OpenMedia.org ∂ OpenTheGovernment.org ∂ Panoptykon Foundation ∂ PEN American Center ∂ PEN International ∂ Privacy International ∂ Project On Government Oversight (POGO) ∂ Reporters sans frontières ∂ Samuelson-Glushko Canadian Internet Policy & Public Interest Clinic (CIPPIC) ∂ Son Tus Datos ∂ Thai Netizen Network ∂ World Press Freedom Committee ∂ World Privacy Forum

Minimum Wage CP

**1nc

Text: The United States federal government should establish a Federal Minimum Wage Advisory Board.

The Counterplan boosts the economy and provides lawmakers with political cover

Reeves 2015 (Richard V [is a senior fellow in Economic Studies @ Brookings]; Can we take the politics out of the federal minimum wage?; Apr 15; www.brookings.edu/blogs/fixgov/posts/2015/04/15-politics-of-minimum-wage-reeves; kdf)

Two options for taking the political heat out of the U.S. minimum wage Can the U.S. follow suit? And if it can, what might the new system look like? Two options at least are worth considering. 1. A Federal Minimum Wage Advisory Board. This could be made up (like the U.K. version) of nine members: three representatives of employer organizations, three from labor organizations, and three independent labor economists. The Board would recommend a rate for the national minimum wage each year, which would then be enacted by Congress in the usual manner. The Board would have a strong incentive to set a rate likely to be adopted by Congress, in order to establish and maintain its reputation: there is, after all, little point in sitting on a Board that is ignored. The Board's recommendation would not be binding and would not become the legal 'default' level. But because the advice is likely to be sensible, Congress would likely be inclined to follow it. 2. Wage Indexation. An alternative—favored by my Brookings colleague Gary Burtless—would be to simultaneously raise the minimum wage and introduce automatic indexing, lifting the minimum wage at the same rate as either consumer prices or the median wage—preferably the latter. In effect, this would do for the minimum wage what President Nixon did for Social Security. Congress would have the power to suspend a rise—perhaps if unemployment reached a certain threshold—but the default position would be to link changes in the minimum wage to changes in the median wage or in the broader consumer economy. Policy commitment devices in action These are both examples of what I have called policy commitment devices—in a new paper, Ulysses Goes to Washington—that help to overcome political myopia in order to support longer-term policy objectives. In the first case, taking advice from an independent commission, the commitment is somewhat less binding, although as James Madison knew, 'the counsels and checks of friends' can carry plenty of weight. Indexation would be a tighter form of binding, since inaction on the part of politicians would lead to an uprating of minimum wage, rather than the current stasis. For both sides, there are political attractions to sub-contracting some decision-making power over the minimum wage. By accepting the advice of an independent body or allowing indexation to do its silent work, Republicans can keep their business donors and right-wing critics at bay; Democrats can do the same for unions and the political left. Sometimes the most powerful thing politicians can do is give some power away. The minimum wage is now perhaps a case in point.

--xt Solves Econ

Raising the minimum wage stabilizes jobs for low skill workers- that's the internal link to the economy

Patton 14 (Mike Patton. Certified Financial Planner, Accredited Estate Planne, Board Certified in Estate Planning; Certified Tax Specialist (CTS); and Chartered Mutual Fund Counselor (CMFC). "The Facts on Increasing the Minimum Wage." November 26, 2014. http://www.forbes.com/sites/mikepatton/2014/11/26/the-facts-on-the-minimum-wage-increase/)//EMerz

Is the minimum wage a good thing? It depends on who you ask. For example, famed economist Milton Friedman was opposed to a minimum wage stating that, "…people whose skills are not sufficient to justify that kind of a wage will be unemployed." He further conveyed that it was no coincidence that the unemployment rate for teens at the time was twice that of adults. Of course this was taken from an interview conducted several decades ago. More recently, **Nobel Prize winning economist Paul Krugman debunked this argument by suggesting that raising the minimum wage to $15 per hour would not cause big companies like McDonald's to cut jobs because these jobs cannot be moved overseas or replaced by machines.** He's probably correct about a large company like McDonald's. However, many smaller companies might disagree. As I've stated, the merits of raising it depends on who you ask. Personally, I have no dog in the hunt. Although I do have an opinion after examining the facts, I have no bias on the matter. Another proponent is the U.S. Department of Labor which suggests that raising the minimum wage would help the economy in a number of ways. For example, it would increase consumer purchasing power and reduce employee turnover. I'll address that in a moment. Would raising the minimum wage to $15 per hour help our economy? Follow along as I provide some facts (data is from 2012-13). The total U.S. labor force was roughly 158.7 million. About 47%, or 75.3 million workers, were paid an hourly wage. Of all hourly workers about 4.7%, or 3.54 million, earned a wage equal to or below the minimum wage. For our discussion, let's assume the entire group earned the minimum wage. If you multiply the number of workers who earned the minimum wage by the current minimum wage, you'd get the total wages earned by this group (3.54 million X $7.25 = $26.1 million). If every one of these workers received an increase to $15 per hour, the total wage earned by this group would be $54.0 million. This represents an increase of $27.9 million. If 100% of this income was spent on products and services, it would only equate to 1.25% of total U.S. GDP. Here's my point. This increase, even if completely spent (which is doubtful), would not be very significant. Therefore, in my view, the economic benefit "argument" is a red herring. What should a worker be paid?

Raising the minimum wage improves the economy and creates more jobs- empirics from other states prove

Reich 15 (Robert Reich. Former U.S. Secretary of Labor, American political economist, professor, author, and political commentator. "Why We Should Raise the Minimum Wage." April 27, 2015. http://www.cnbc.com/2015/04/27/why-we-should-raise-the-minimum-wage-commentary.html)//EMerz

Across America, the ranks of the working poor are growing. While low-paying industries such as retail and food preparation accounted for 22 percent of the jobs lost in the Great Recession, they've generated 44 percent of the jobs added since then, according to a report from the National Employment Law Project. Last February, the Congressional Budget Office estimated that raising the national minimum wage to $10.10 an hour from $7.25 would lift 900,000 people out of poverty. Seattle estimates that, before its historic decision, almost a fourth of its workers earned below $15 an hour. That translates into about $31,000 a year for a full-time worker. In a high-cost city like Seattle, that's barely enough to support a family. Most minimum-wage workers aren't teenagers these days. They're major breadwinners who need a higher minimum wage in order to keep their families out of poverty. The gains from a higher minimum wage extend beyond those who receive it. More money in the pockets of low-wage workers means more sales, especially in the locales they live in — which, in turn, creates faster growth and more jobs. A major reason the current economic recovery is anemic is that so many Americans lack the purchasing power to get the economy moving again. With a higher minimum wage, moreover, we'd all end up paying less for

Medicaid, food stamps and other assistance the working poor now need in order to have a minimally decent standard of living. Some worry about job losses accompanying a higher minimum wage. I wouldn't advise any place to raise its minimum wage immediately to $15 an hour from the current federal minimum of $7.25. That would be too big a leap all at once. Employers — especially small ones — need time to adapt. But this isn't what Seattle is doing. It's raising its minimum to $15 incrementally over several years from $9.32 (Washington State's current statewide minimum). Large employers (with over 500 workers) that don't offer employer-sponsored health insurance have three years to comply; those that offer health insurance have four; smaller employers, up to seven. (That may be too long a phase-in.) My guess is Seattle's businesses will adapt without any net loss of employment. Seattle's employers will also have more employees to choose from – as the $15 an hour minimum attracts into the labor force some people who otherwise haven't been interested. That means they'll end up with workers who are highly reliable and likely to stay longer, resulting in real savings. Research by Michael Reich (no relation) and Arindrajit Dube confirms these results. They examined employment in several hundred pairs of adjacent counties lying on opposite sides of state borders, each with different minimum wages, and found no statistically significant increase in unemployment in the higher-minimum counties, even after four years. (Other researchers who found contrary results failed to control for counties where unemployment was already growing before the minimum wage was increased.) They also found that employee turnover was lower where the minimum was higher. Not every city or state can meet the bar Seattle has just set. But many can — and should.

at: Hurts job growth

Empirically wrong

Neuman 2014 (Scott; States That Raised Minimum Wage See Faster Job Growth, Report Says; Jul 19; www.npr.org/sections/thetwo-way/2014/07/19/332879409/states-that-raised-minimum-wage-see-faster-job-growth-report-says; kdf)

New data released by the Department of Labor shows that raising the minimum wage in some states does not appear to have had a negative impact on job growth, contrary to what critics said would happen. In a report on Friday, the 13 states that raised their minimum wages on Jan. 1 have added jobs at a faster pace than those that did not. The data run counter to a Congressional Budget Office report in February that said raising the minimum wage to $10.10 an hour, as the White House supports, could cost as many as 500,000 jobs. The Associated Press writes: "In the 13 states that boosted their minimums at the beginning of the year, the number of jobs grew an average of 0.85 percent from January through June. The average for the other 37 states was 0.61 percent. "Nine of the 13 states increased their minimum wages automatically in line with inflation: Arizona, Colorado, Florida, Missouri, Montana, Ohio, Oregon, Vermont and Washington. Four more states — Connecticut, New Jersey, New York and Rhode Island — approved legislation mandating the increases."

at: Not enough people on minimum wage

The ripple effect of the CP lifts wages of 35 million people

Harris and Kearny 2014 (Benjamin H [was the Policy Director of The Hamilton Project; a Fellow in Economic Studies at Brookings] and Melissa S [Director of the Hamilton Project; a Senior Fellow at the Brookings Institution];The "Ripple Effect" of a Minimum Wage Increase on American Workers; www.brookings.edu/blogs/up-front/posts/2014/01/10-ripple-effect-of-increasing-the-minimum-wage-kearney-harris; kdf)

The Ripple Effects of Minimum Wage Policy Although relatively few workers report wages exactly equal to (or below) the minimum wage, a much larger share of workers in the United States earns wages near the minimum wage. This holds true in the states that comply with the federal minimum wage, in addition to those states that have instituted their own higher minimum wage levels. An increase in the minimum wage tends to have a "ripple effect" on other workers earning wages near that threshold. This ripple effect occurs when a raise in the minimum wage increases the wage received by workers earning slightly above the minimum wage. This effect of the statutory minimum wage on wages paid at the low end of the wage distribution more generally is well recognized in the academic literature. Based on this recognition, we quantify the number of workers potentially affected by minimum wage policy using the assumption that workers earning up to 150 percent of the minimum wage would see a wage increase from a higher minimum wage. We hasten to note that a complete analysis of the net effects of a minimum wage increase would also have to account for potential negative employment effects. Our main goal of this empirical exercise is to dispel the notion that the minimum wage is not a relevant policy lever, which is based on the faulty premise that only a small number of workers would be affected. Using data from the Bureau of Labor Statistics, combined with information on the binding minimum wage in each state, we are able to calculate these shares. Just 2.6 percent of workers are paid exactly the minimum wage, but 29.4 percent of workers are paid wages that are below or equal to 150 percent of the minimum wage in their state. Furthermore, the hours worked by this group represent nearly one-quarter—24.7 percent—of hours worked, which indicates that a large share of the impacted group is working close to full time hours. In 2012, 32 states complied with the federally set minimum wage of $7.25 per hour. In these states adhering to the federal floor, 3.7 million workers earn the minimum wage or less. An additional 15.2 million are near minimum wage, earning more than $7.25 per hour but less than $10.88 per hour. Therefore, 18.9 million workers in these states would likely benefit from an increase in the federal minimum wage. The Ripple Effect by State States have the opportunity to set a minimum wage above the federal floor. Eighteen states, plus the District of Columbia, had minimum wages that exceeded the federal wage floor in 2012, ranging from $7.40 in Michigan and Rhode Island to $9.04 in Washington. In these states, 3.9 million workers earn their state's minimum wage and an additional 12.1 million workers earn between the mandated floor but less than 150 percent of the minimum level. Overall, up to 16.0 million workers would likely see a raise in their wages if the minimum wage were increased in these states. Indeed, every state in the country has a substantial share of workers who would be impacted by an increase in the minimum wage in that state, as seen in figure 1 below. In 2012, Montana had the highest share of workers—37.2 percent—with wages equal to or less than 150 percent of the minimum wage. Even in Alaska, which boasts higher wages compared to the rest of the country, 16.9 percent of workers had wages equal to or lower than 150 percent of the minimum. In the high-population state of California, 4.6 million workers would likely see a wage increase if the minimum wage were raised in that state. Not surprisingly, the eighteen states with a higher minimum wage level than the federal benchmark tended to have higher shares of workers with wages within 150 percent of the minimum wage. However, in every state in the country, at least one in six workers had wages that were equal to 150 percent of the minimum wage or lower. Figure 1 To see the new state-by-state interactive chart, click here. The December Jobs Gap As of December, our nation faces a jobs gap of 7.8 million jobs. The chart below shows how the jobs gap has evolved since the start of the Great Recession in December 2007, and how long it will take to close under different assumptions of job growth. The solid line shows the net number of jobs lost since the Great Recession began. The broken lines track how long it will take to close the jobs gap under alternative assumptions about the rate of job creation going forward. Figure 2 If the economy adds about 208,000 jobs per month, which was the average monthly rate for the best year of job creation in the 2000s, then it will take until September 2018 to close the jobs gap. Given a more optimistic rate of 321,000 jobs per month, which was the average monthly rate of the best year of job creation in the 1990s, the economy will reach pre-recession employment levels by August 2016. To explore the outcomes under various job creation scenarios, you can try out our interactive jobs gap calculator by clicking here. You can also see the jobs gap in each state by clicking here. Conclusion The minimum wage debate currently underway tends to narrowly focus on those workers making exactly the minimum wage. This approach misses a large number of low-wage workers whose wages would likely be raised through a ripple effect resulting from an increase in the minimum wage. As our economy continues to recover, a minimum wage increase could provide a much-needed boost to the earnings of low-wage workers. A significant 35 million workers from across the country could see their wages rise if the minimum wage were increased, allowing them to earn a better livelihood and lead more economically secure lives. When discussing the minimum wage, this is the magnitude of the impact that policymakers should consider

Nuclear Power CP

**1nc

Text (WIP): The United States federal government should provide incentives for the construction of nuclear power plants and increase funding for research into power plant improvement and efficiency.

The counterplan is key to nuclear energy

NEDEC 11 Nuclear Engineering Division and Energy Committee, January 2011, “EXPANDING NUCLEAR POWER IN THE UNITED STATES”, https://www.asme.org/getmedia/9c644347-2222-4d2b-a96a-a5cf028a9a9d/PS1104.aspx, 7/14/2015, \\BD

XI. CONCLUSIONSð The Energy Committee of the ASME’s Knowledge & Community Sector and ASME’s ð Nuclear Engineering Division strongly support increased use of nuclear power in the ð United States as a way to ensure a continued diversity of power supplies, ease increasing ð reliance on natural gas to fuel power plants, and decrease overall emissions. ð The stakes are too high to simply allow the status quo with the myriad of correctable ð problems to remain unchanged. Likewise, the road to success is so complex that it ð demands a comprehensive strategy.12ð ð Nuclear power has been proven safe, efβicient, and reliable. The Energy Committee of the ð ASME’s Knowledge & Community Sector and ASME’s Nuclear Engineering Division ð recommends that the federal government, in cooperation with the private sector, should ð do what is necessary to preserve and increase nuclear energy’s share of the power mix in ð the United States by providing tax incentives for construction of new plants, providing ð funds for research into power plant improvement and efβiciency, and encouraging the ð education and training of the next generation of nuclear scientists and engineers. ▪

Nuclear energy is key to solve biodiversity

Science Daily 14 Science Daily, 12/15/2014, University of Adelaide, “Nuclear should be in the energy mix for biodiversity”, http://www.sciencedaily.com/releases/2014/12/141215094155.htm, 7/14/2015, \\BD

Leading conservation scientists from around the world have called for a substantial role for nuclear power in future energy-generating scenarios in order to mitigate climate change and protect biodiversity.ð In an open letter to environmentalists with more than 60 signatories, the scientists ask the environmental community to "weigh up the pros and cons of different energy sources using objective evidence and pragmatic trade-offs, rather than simply relying on idealistic perceptions of what is 'green' ."ð Organized by ecologists Professor Barry Brook and Professor Corey Bradshaw from the University of Adelaide's Environment Institute, the letter supports their recent article 'Key role for nuclear energy in global biodiversity conservation', published in the journal Conservation Biology.ð "Full decarbonization of the global electricity-generation sector is required soon to avoid the worst ravages of climate change," says Professor Bradshaw, Director, Ecological Modelling at the Environment Institute and recently appointed Sir Hubert Wilkins Chair of Climate Change.ð "Biodiversity is not only threatened by climate disruption arising largely from fossil-fuel derived emissions, it is also threatened by land transformation resulting from renewable energy sources, such as flooded areas for hydro-electricity, agricultural areas needed for biofuels and large spaces needed for wind and solar farms."ð In the article, the researchers evaluated land use, emissions, climate and cost implications of three different energy scenarios: 'business as usual' fossil-fuel dominated; a high renewable-energy mix excluding nuclear; and an energy mix with a large nuclear contribution plus some renewable and fossil-fuel sources.ð They also used "multi-criteria decision-making analysis" to rank seven major energy types based on costs and benefits, testing the sensitivity of their rankings to bias stemming from philosophical ideals.ð "When compared objectively with renewables, nuclear power performs **as well or better** in terms of safety, cost, scaleability, land transformation and emissions," says Professor Barry

Brook, Chair of Climate Change at the Environment Institute for this study, and now Professor of Environmental Sustainability at the University of Tasmania.ð "Not only does next-generation nuclear power provide emissions-free electricity, it is a highly concentrated energy source that consumes legacy waste and minimises impacts to biodiversity compared to all other energy sources."ð They argue that there is strong evidence for supporting advanced nuclear power systems with complete fuel recycling as part of a portfolio of sustainable energy technologies that also includes appropriate use of renewables, energy storage and energy efficiency.ð "Idealized mixes of nuclear and renewables are regionally dependent, and should be compared objectively without prejudice or preconceived notions of what is 'green'," says Professor Bradshaw.

--xt Subsidies Solvency

Increasing subsidies is key – even if nuclear energy is economical now, new power plants are not

Cochran 4 - director of NRDC's nuclear programThomas B. Cochran, 4/15/2004, Natural Resources Defense Council, "The Future Role of Nuclear Power in the United States", http://www.nrdc.org/nuclear/pnucpwr.asp, 7/14/2015, \\BD

On the other hand, the last unit to enter commercial operation was TVA's Watts Bar Unit 1 in June 1996, and the last successful order for a U.S. commercial nuclear power plant was in 1973. No energy generation company in the Unites States has been willing to order and construct a new nuclear plant in more than thirty years, and none have taken anything more than preliminary steps towards purchasing and constructing a new nuclear plant today in the absence of a **promise of huge Federal subsidies**. This is not because of public opposition; not for want of a licensed geologic repository for the disposal of spent fuel; and not because of the proliferation risks associated with commercial nuclear power. Rather, it is because **new** commercial nuclear power plants are **uneconomical** in the United States.

The government has already instituted incentives for other renewables – nuclear power incentives are key

REI 10 – Renewable Energy Insights 6/1/2010, "Proposed New Tax Incentives for Nuclear Energy", http://www.renewableinsights.com/2010/06/proposed-new-tax-incentives-for-nuclear-energy/, 7/14/2015, \\BD

Senators John Kerry and Joe Lieberman have sponsored "The American Power Act" ("APA"), a comprehensive energy and climate change bill. For a summary of the bill, please visit this alert. Among other things, the APA includes significant incentives for the nuclear power industry, including several tax provisions intended to encourage construction of new nuclear power plants. The APA would also establish an expedited procedure for issuing construction and operating licenses for new nuclear reactors, expand the federal loan guarantee program for nuclear energy development, and fund spent fuel recycling research.ð Investments in wind, solar and other renewable energy projects currently benefit from a 30% federal investment tax credit and an election to convert the credit into a cash grant from the Treasury Department. Nuclear power plants **do not benefit** from these incentives and the APA would address this deficiency for new nuclear power plants. The following tax provisions would be effective for property placed in service on or after the date of enactment.

--xt Research Solvency

New research in nuclear power is key to being economically viable

Magill 6/16 – writer for Climate Centra Bobby Magill, 6/16/2015, Climate Central, "New Research Projects Could Revitalize Nuclear Power", http://www.climatecentral.org/news/nuclear-research-targets-emissions-19113, 7/14/2015, \\BD

Nuclear power, a low-carbon but expensive source of electricity, isn't likely to grow much in the United States, even as President Obama pushes to slash greenhouse gas emissions from electric power plants.∂ But the U.S. Department of Energy is betting that $60 million in new research and development could eventually breathe some new life into nuclear power in the U.S., helping to reduce greenhouse gas emissions under the Obama administration's Clean Power Plan. Nuclear power accounts for about 20 percent of all electricity generated in the U.S. The U.S. Energy Information Administration expects that number to fall to 16 percent by 2040 with or without the Clean Power Plan. If finalized in August, the plan will slash emissions from existing power plants.∂ The $60 million the Department of Energy is dedicating to nuclear research will go to more than 40 different projects at universities across the U.S. focusing on nuclear energy modeling, nuclear security and safety and new reactor concepts and fuels.∂ U.S. Energy Secretary Ernest Moniz, speaking Monday at the Energy Information Administration's annual energy conference in Washington, said he is bullish on nuclear power as a clean energy source. However, the high costs of developing nuclear energy have to come down, he said.

--xt Nuke Power Solves BioD

Nuclear energy solves the environment – we have strong academic support

Brown 14 – writer for Climate News Network Paul Brown, 12/26/2014, Climate News Network, "Professors tell greens to accept nuclear power", http://www.climatenewsnetwork.net/professors-plead-greens-accept-nuclear-power/, 7/14/2015, \\BD

LONDON, 26 December, 2014 – Seventy-five professors from the world's leading universities have signed a letter urging environmentalists to re-think their attitude to nuclear power as a way to save the planet from climate change and preserve its animals, plants and fish.ð Ironically, it is two Australian academics who came up with the research. They come from a country whose government has repudiated the Kyoto Protocol, reversed measures to cut climate change, is one of the world's biggest coal exporters, and has no nuclear power. Australia has just recorded the hottest spring since records began 100 years ago.ð The two professors are Barry W. Brook, Chair of Environmental Sustainability at the University of Tasmania, and Corey J.A. Bradshaw, Sir Hubert Wilkins Chair of Climate Change at the University of Adelaide's Environment Institute. Their backers include many leading experts on ecology, biodiversity, evolution and geography from the US, UK, China and India.ð The letter is significant because previous pleas for a role for nuclear power have mostly come from physics professors, who could reasonably be said to love the technology for its own sake.ð But this group has no stake in nuclear power, and their argument is based purely on the need to save the planet and its species from overheating and excess use of valuable land for renewables. Professors Brook and Bradshaw have had a paper published in the magazine Conservation Biology, in which they evaluated all possible forms of energy generation. Wind and nuclear power had the highest "benefit-to-cost ratio".ð "…we entreat the conservation and environmental community to weigh up the pros and cons of different energy sources…"ð The letter urges environmentalists to read the paper, and says the two professors "provide strong evidence for the need to accept a substantial role for advanced nuclear power systems with complete fuel recycling − as part of a range of sustainable energy technologies that also includes appropriate use of renewables, energy storage and energy efficiency.ð "This multi-pronged strategy for sustainable energy could also be more cost-effective and spare more land for biodiversity, as well as reduce non-carbon pollution (aerosols, heavy metals).ð "Given the historical antagonism towards nuclear energy amongst the environmental community, we accept that this stands as a controversial position.ð "However, much as leading climate scientists have recently advocated the development of safe, next-generation nuclear energy systems to combat global climate change, we entreat the conservation and environmental community to weigh up the pros and cons of different energy sources, using objective evidence and pragmatic trade-offs, rather than simply relying on idealistic perceptions of what is 'green'.ð "Although renewable energy sources like wind and solar will likely make increasing contributions to future energy production, these technology options face real-world problems of scalability, cost, material and land use, meaning that it is too risky to rely on them as the only alternatives to fossil fuels.

Even if we don't access the aff's internal links, nuclear energy is a necessary prerequisite to solving biodiversity – means if the counterplan doesn't solve, it's a terminal solvency deficit for the aff

Connor 1/4 - writer for The IndependentSteve Connor, 1/4/2015, The Independent, "Nuclear power is the greenest option, say top scientists", http://www.independent.co.uk/news/science/nuclear-power-is-the-greenest-option-say-top-scientists-9955997.html, 7/14/2015, \\BD

Nuclear power is one of the least damaging sources of energy for the environment, and the green movement **must accept** its expansion if the world is to avoid dangerous climate change, some of the world's leading conservation biologists have warned.ð Rising demand for energy will place ever greater burdens on the natural world, threatening its rich biodiversity, unless societies accept nuclear power as a key part of the "energy mix", they said. And so the environmental movement and pressure groups such as Friends of the Earth and Greenpeace should drop their opposition to the building of nuclear power stations.ð In an open letter published on the Brave New Climate blog, more than 65 biologists, including a former UK government chief scientist, support the call to build

more nuclear power plants as a central part of a global strategy to protect wildlife and the environment.ð The full gamut of electricity-generation sources, including nuclear power, must be used to replace the burning of fossil fuels such as oil, coal and gas if the world is to have any chance of mitigating severe climate change, their letter says. The letter is signed by several leading British academics including Lord May of Oxford, a theoretical biologist at Oxford University and former chief scientific adviser; Professor Andrew Balmford, a conservation biologist at Cambridge; and Professor Tim Blackburn, an expert in biodiversity at University College London.ð As well as reducing the sources of carbon dioxide, the chief man-made greenhouse gas implicated in climate change, the expansion of nuclear power will leave more land to support biodiversity and so curb the extinction of species, they say.

--xt Popular GOP

The GOP loves nuclear energy

Cama 14 – energy and environment reporter for The Hill Timothy Cama, 12/6/2014, The Hill, "GOP gains put nuclear power back on the table", http://thehill.com/policy/energy-environment/226209-gop-gains-put-nuclear-power-back-on-the-table, 7/14/2015, \\BD

Republicans and the nuclear power sector are hopeful that GOP control of the Senate will improve the political landscape for an industry that hasn't opened a new generator in nearly two decades.ð As Senate Democrats this week held their tenth hearing on nuclear safety since Japan's Fukushima Daichii meltdown three years ago, Republicans and observers looked forward to a future with a more business-friendly approach to the industry.ð Sen. Jim Inhofe (R-Okla.), long a champion of nuclear power and a critic of environmental rules, is set to become chairman of the Environment and Public Works Committee, which oversees nuclear safety. The committee is also likely to retain nuclear fans like Sens. Jeff Sessions (R-Ala.), John Barrasso (R-Wyo.) and Deb Fischer (R-Neb.).ð "It'll be clearly a more favorable committee, and there may be some things that we can do" to help the industry," Sessions said.ð An Inhofe aide said the Obama administration and the Nuclear Regulatory Commission (NRC) have been far too adversarial to nuclear energy, hurting the industry and making it difficult to justify investments in new plants.ð "When you think about federal regulations on the nuclear industry, they've certainly had a chilling effect lately," the staffer said. "The NRC has been very aggressive in their regulatory agenda, proposing a number of regulations that aren't justified from a cost-benefit standpoint and are duplicative of other regulations that are already in place."ð The aide drew a contrast between Inhofe, who wants to set a high bar for new regulations to prove they are beneficial and Sen. Barbara Boxer (D-Calif.), the current chairwoman of the environment panel. Sens. Ed Markey (D-Mass.) and Bernie Sanders (I-Vt.) have also made names for themselves as diligent advocates for nuclear safety.ð Boxer has pushed for years for NRC to improve its rules on storing spent nuclear fuel, emergency response procedures for plants and seismic requirements, among other protections. Republicans and the industry have characterized her response to the Fukushima earthquake, tsunami and meltdown as an overreaction.ð Sen. Lamar Alexander (R-Tenn.) will also be in a powerful position chairing the appropriations panel responsible for the Energy Department. He's known to advocate for nuclear research, which keeps his state's Oak Ridge National Laboratory busy.ð "I look forward to exploring ways our new Republican majority can **clear the way** for nuclear energy to power our 21st-century economy," he said in a statement.ð To the industry, a Republican Senate majority increases the odds that Congress will pass a comprehensive energy bill for the first time in seven years. That could deliver a lot of the nuclear power industry's priorities, said a lobbyist for an energy company.ð Plant owners are also looking for Congress to rein in the NRC's rules.ð "We would expect some more aggressive oversight of the NRC certainly," the lobbyist said. "You've seen that in the House already, and I would imagine that Sen. Inhofe would follow that line of reasoning."ð The lobbyist predicted that senators, especially Democrats, wouldn't stop pressing NRC and the industry to improve rules after Fukushima.ð "But there will be a recognition that while there are a lot of things to do in response to that, you need to prioritize them, put them in order and work through it in a deliberative manner," he said.ð Nuclear waste rules could get new life in the Senate as well. Republicans and businesses want the Energy Department to finally build a permanent nuclear waste storage facility at Yucca Mountain in Nevada.

March Senate bill proves

AP 3/6 – Associated Press Associated Press, 3/6/2015, Komo News, "Senate OK bills to promote nuclear energy in Washington", http://www.komonews.com/news/local/Senate-OK-bills-to-promote-nuclear-energy-in-Washington-295413471.html, 7/14/2015, \\BD

OLYMPIA, Wash. (AP) - The Senate has approved a measure to **advance nuclear power** as part of Washington's future energy mix.ð Senate Bill 5113, which passed on a 27-21 vote Friday, requires the Commerce Department to coordinate and advance the sitting and manufacturing of small-scale reactors. Small nuclear reactors are about one-third the size of traditional nuclear plants, producing less than 300 megawatts.ð The Senate also passed a measure, on a **44-5 vote**, that would create a nuclear-education program to award grants for science

teachers to attend workshops on nuclear energy and to bring in nuclear ambassadors" to introduce nuclear science and technology to students in grades 8-12.ð Both measures now head to the House for consideration.

Even if the GOP normally hates renewable energy, nuclear energy is key – cost effective

Fisher 13 - former Republican science-policy staffer and legislative director in the House of Representatives Mischa Fischer, 12/11/2013, The Atlantic, "The Republican Party Isn't Really the Anti-Science Party", http://www.theatlantic.com/politics/archive/2013/11/the-republican-party-isnt-really-the-anti-science-party/281219/, 7/14/2015, \\BD

The catch: Conservatives believe many of the policies put forward to address the problem will lead to unacceptable levels of economic hardship. It's not inherently anti-scientific to oppose cap and trade or carbon taxes. What most Republicans object to are policies that unilaterally make it more expensive in the United States to produce energy, grow food, and transport people and goods but are unlikely to make much long-term difference in the world's climate, given that other major world economies emit more carbon than the United States or have much faster growth rates of carbon emissions (China, India, Russia, and Brazil all come to mind).ð The more important question on climate change is not "how do we eliminate carbon immediately?" but "how best do we secure a cleaner environment and more prosperous world for future generations?"ð It is on this subject that many on the political left deeply hold some serious anti-scientific beliefs. Set aside the fact that twice as many Democrats as Republicans believe in astrology, a pseudoscientific medieval farce. Left-wing ideologues also frequently espouse an irrational fear of nuclear power, genetic modification, and industrial and agricultural chemistry—even though all of these scientific breakthroughs have enriched lives, lengthened lifespans, and produced substantial economic growth over the last century. ð Examining greenhouse-gas emissions in exact terms, three of our biggest sources of emissions are electricity generation, transportation, and agriculture. With widespread adoption of nuclear technology, we could conceivably cut out more than 70 percent of our total emissions by eliminating the pollution from burning petroleum for transportation and coal for electricity generation (Nobel Prize-winning physicist Burton Richter explains this in his slightly technical but readable Beyond Smoke and Mirrors).ð Nuclear power is the **only energy source** that can actually meet base-load power requirements for a cost competitive KW/h price with almost zero carbon emissions. One of the largest hurdles to nuclear energy is storage of byproduct waste, something Obama dealt a huge blow when he halted the development of Yucca Mountain for what the Government Accountability Office called strictly political reasons. Republicans in Congress have **repeatedly supported** moving forward with Yucca Mountain.

--xt Popular Dems

Even Democrats like nuclear energy

Garber 9 – writer for US News Kent Garber, 11/30/2009, US News, “Democrats Change Tune on Nuclear Energy”, http://www.usnews.com/news/energy/articles/2009/11/30/democrats-change-tune-on-nuclear-energy, 7/14/2015, \\BD

During the 2008 presidential campaign, it was Sen. John McCain, not then Sen. Barack Obama, who touted nuclear power. Obama, for the most part, was noncommittal on the subject. But in the year since being elected, President Obama and congressional Democrats increasingly appear to be **embracing** nuclear power.ð Democrats' support has not been entirely rock solid. Obama's decision, last spring, to scrap a decades-old plan to store nuclear waste at Yucca Mountain in Nevada was interpreted by some critics as an early sign of an antinuke stance within the administration. But many less high-profile moves, especially in recent weeks, suggest that Democrats in the White House and on Capitol Hill, far from turning their backs on nuclear power, now see it as a way of **advancing their goals** on energy and climate policy.ð Perhaps the most telling sign is that representatives of the nuclear industry are giving the administration relatively high marks for its nuclear policies thus far.ð "This administration has been very seriously engaged on nuclear issues," says Alex Flint, the Nuclear Energy Institute's top lobbyist. "There is no longer a political stigma associated with it.""We are pleased with the of support the administration has expressed," says Buzz Miller, who heads up nuclear development for Southern Nuclear, which operates three nuclear plants in the Southeast and is starting to work on building two more reactors near Augusta, Ga.ð New reactors, according to industry estimates, will probably cost at least $6 billion each. Like several other nuclear companies, Southern has applied for financial help from the Department of Energy. It's also still waiting for final approval from the Nuclear Regulatory Commission. But it's on **funding** and **policy** issues that Democrats are proving surprisingly supportive.ð Sen. Barbara Boxer, a liberal California Democrat, has included a whole set of goodies for nuclear energy in her climate bill in an effort to win Republicans' and moderate Democrats'support. Democratic Sen. John Kerry of Massachusetts, the bill's cosponsor, recently penned an op-ed with South Carolina Republican Sen. Lindsey Graham calling for expanding the industry.ð And earlier this month, Democratic Sen. Jim Webb of Virginia and Republican Sen. Lamar Alexander of Tennessee proposed legislation to double the U.S. production of nuclear power in the next 20 years.ð All these proposals are notable for the emerging political reality they represent. Nuclear power is low in carbon emissions, domestically generated, and it's particularly popular in the Southeast and some Midwestern states.That means liberal Democrats, who have often railed against nuclear energy because of the radioactive waste it produces, will almost certainly have to fork over money for nuclear to win the votes for their climate bill.

Prison CPs

**Prison Healthcare

Text: The fifty states of the United States should pass geriatric release legislation.

The counterplan reduces prison populations and balances state budgets

Chokshi 2013 (Niraj; State spending on prison health care is exploding. Here's why.; Oct 30; www.washingtonpost.com/blogs/govbeat/wp/2013/10/30/state-spending-on-prison-health-care-is-exploding-heres-why/; kdf)

Health care and prisons are two of the biggest drivers of state spending. So, when you throw them together you get… a whole lot of state spending. The median growth on prison health care among states was slightly more than 50 percent from 2001 to 2008, according to official data from 44 states analyzed as part of a joint initiative of the Pew Charitable Trusts and the John D. and Catherine T. MacArthur Foundation. **Those 44 states spent $36.8 billion on prisons in 2008**, and health care accounted for more than one-sixth of that spending. (2008 was the last year covered in the study by the Bureau of Justice Statistics, which Pew used for its analysis.) Three factors in particular are driving up state prison health-care costs, according to Pew: aging inmates, a prevalence of physical and mental illness and the costly nature of delivering health care to a prison's inmates. The nation's elderly prison population is still relatively small, but it's taken up an increasingly larger share of the total population. In 1999, about 3.4 percent of the prison population was 55 and over. By 2011, it was 8.6 percent. And an older population means more expensive health care. In Michigan, a state study found that in a single year (2009) health care for inmates ages 55 to 59 cost more than four times more than for those aged 20 to 24. In Georgia, caring for prisoners ages 65 or older costs about $8,565 per inmate each year. The average annual health-care cost for Georgian prisoners under 65? $961 per inmate. So, what's a state to do? According to experts interviewed by Pew, states are trying to rein in costs by providing remote health care, outsourcing it altogether, enrolling prisoners in Medicaid and paroling elderly or sick inmates. Mississippi's three-year-old program to enroll prisoners in Medicaid generates about $6 million annually in federal reimbursements. Louisiana saved $2.6 million over fiscal years 2009 and 2010 through federal Medicaid reimbursements. And New York's comptroller estimates that the state could save up to $20 million annually through such reimbursements. Under the new federal health-care law, eligibility for Medicaid will be expanded in 25 states, meaning more inmates will be able to qualify, offsetting state prison health-care costs. Releasing low-risk older prisoners could help drive down costs and prison size, too. Ohio expects to save more than $46 million and slash the prison population by 7 percent over three years by granting parole to more of its elderly prison population. New York, Illinois, California and Connecticut have also pursued similar policies for low-risk elderly and/or sick inmates.

--xt: Prisons are main reason for deficits

Geriatric release is the best way to balance state budgets

Cray 2012 (David; Elderly inmates: Aging prison population strains tight state budges; Jan 27; www.huffingtonpost.com/2012/01/27/elderly-inmates_n_1236028.html; kdf)

NEW YORK — In corrections systems nationwide, officials are grappling with decisions about geriatric units, hospices and medical parole as elderly inmates – with their high rates of illness and infirmity – make up an ever increasing share of the prison population. At a time of tight state budgets, it's a trend posing difficult dilemmas for policymakers. They **must address soaring medical costs** for these older inmates and ponder whether some can be safely released before their sentences expire. The latest available figures from 2010 show that 8 percent of the prison population – 124,400 inmates – was 55 or older, compared to 3 percent in 1995, according to a report being released Friday by Human Rights Watch. This oldest segment grew at six times the rate of the overall prison population between 1995 and 2010, the report says. "Prisons were never designed to be geriatric facilities," said Jamie Fellner, a Human Rights Watch special adviser who wrote the report. "Yet U.S. corrections officials now operate old age homes behind bars." The main reasons for the trend, Fellner said, are the long sentences, including life without parole, that have become more common in recent decades, boosting the percentage of inmates unlikely to leave prison before reaching old age, if they leave at all. About one in 10 state inmates is serving a life sentence; an additional 11 percent have sentences longer than 20 years. The report also notes an increase in the number of offenders entering prison for crimes committed when they were over 50. In Ohio, for example, the number of new prisoners in that age group jumped from 743 in 2000 to 1,815 in 2010, according to the report. Fellner cited the case of Leonard Hudson, who entered a New York prison at age 68 in 2002 on a murder conviction and will be eligible for parole when he's 88. He's housed in a special unit for men with dementia and other cognitive impairments, Fellner said. A.T. Wall, director of the Rhode Island Department of Corrections and president of the Association of State Correctional Administrators, said he and his colleagues regularly exchange ideas on how to cope with the surging numbers of older prisoners. "We are accustomed to managing large numbers of inmates, and it's a challenge to identify particular practices that need to be put into place for a subset," he said. "There are no easy solutions." Wall said prison officials confront such questions as whether to retrofit some cells with grab bars and handicap toilets, how to accommodate inmates' wheelchairs, and how to deal with inmates who no longer understand instructions. "Dementia can set in, and an inmate who was formerly easy to manage becomes very difficult to manage," he said. States are trying to meet the needs. Some examples: _Washington state opened an assisted living facility at its Coyote Ridge prison complex in 2010, with a capacity of 74 inmates. It's reserved for inmates with a disability who are deemed to pose little security risk. _The Louisiana State Penitentiary has had a hospice program for more than a decade, staffed by fellow prisoners who provide dying inmates with care ranging from changing diapers to saying prayers. _In Massachusetts, a new corrections master plan proposes one or more new facilities to house aging inmates who need significant help with daily living. Some critics object, saying inmates shouldn't get specialized care that might not be available or affordable for members of the public. _Montana's corrections department is seeking bids for a 120-bed prison that would include assisted-living facilities for some elderly inmates and others who need special care. In Texas, legislators have been considering several options for addressing the needs of infirm, elderly inmates. State Rep. Jerry Madden, chairman of the House Corrections Committee, said no decisions have been made as the experts try to balance cost factors and public safety. "You can't just generalize about these prisoners," he said. "Some are still extremely dangerous, some may not be.... Some you wouldn't want in the same assisted living facility with your parents or grandparents." Fellner, who visited nine states and 20 prisons during her research, said corrections officials often were constrained by tight budgets, lack of support from elected officials, and prison architecture not designed to accommodate the elderly. She noted that prison policies traditionally were geared to treat all inmates on an equal basis. So it may not be easy for prison officials to consider special accommodations for aging inmates, whether it be extra blankets, shortcuts to reduce walking distance, or sparing them from assignments to upper bunks. The report said the number of aging prisoners will continue to grow unless there are changes to tough-on-crime policies such as long mandatory sentences and reduced opportunities for parole. "How are justice and public safety served by the continued incarceration of men and women whose bodies and minds have been whittled away by age?" Fellner asked. One of the problems facing prisons is that many of their health care staff lack expertise in caring for the elderly, according to Linda Redford, director of the geriatric education center at the University of Kansas Medical Center. "It's a big struggle for them to keep up," said Redford, who has helped train prison staff and inmates in geriatric care. "They're used to having to deal with issues of younger prisoners, such as HIV and substance abuse," she said. Under a Supreme Court ruling, inmates are guaranteed decent medical care, but they lack their own insurance and states must pay the full cost. In Georgia, according to Fellner's report, inmates 65 and older had an average yearly medical cost of $8,565, compared with $961 for those under 65.

Prison growth is the cause of budget overstretch

Skolnick 2011 (Adam; Runaway prison costs thrash state budgets; Feb 9; www.thefiscaltimes.com/Articles/2011/02/09/Runaway-Prison-Costs-Thrash-State-Budgets; kdf)

The prison system in the U.S. is in crisis mode. States across the country are grappling with massive budget shortfalls, much of which can be credited to the runaway growth of prison budgets over the past 25 years. At $50 billion spent on corrections a year nationwide, it's the second-largest state expenditure behind Medicaid. To put it another way, one out of every 15 state dollars is spent on corrections in this country. Not coincidentally, one in 31 American adults are adrift in this bloated corrections matrix, stretching resources razor thin. Now swing the recession sledgehammer, and you have a nationwide crisis requiring states to come up with creative solutions to meet enormous budget deficits. California's prison system, the second largest in the country, has had its budget slashed for two years running, and its prisons filled to over 160 percent capacity. Thirty-three of them are operating at double capacity. Temporary beds, half of which are filled by probation or parole violators, are triple stacked in gyms and classrooms and crowding out sound rehabilitation programs. Sometimes two and three inmates share a cell designed for one man. Recent court rulings have mandated the California Department of Corrections and Rehabilitation (CDCR) reduce the prison population to 137.5 percent capacity by 2012. All of which has forced the state to fashion solutions that look, at first blush, like a gamble. It costs $44,563 to incarcerate a prisoner for a year in California — nearly the same price as a year at Harvard University with room and board. According to state projections nearly 23,000 prisoners in California have been released on what has been called Non-Revocable Parole (NRP) over the past year. These prisoners, all of whom are non-violent and deemed to be low risk re-offenders, will not be released early, but once they are they will be on their own to sink or swim in the community, with no oversight from parole officers. The idea is to ease the case burden on the parole system, reduce the Department of Corrections budget and perhaps most importantly, reduce overcrowding in prisons. There is certain to be some budgetary benefit. It costs $44,563 (the average for the U.S. is $28,817) to incarcerate a prisoner for a year in California — nearly the same price as a year at Harvard University with room and board. And nationally half of all state prisoners are incarcerated for probation or parole violations. However, there is no conclusive research to suggest how these ex-cons will function in society with no oversight from a parole officer. Unemployment among ex-offenders is common, and many will likely end up on state welfare. The first 14 months are critical for an ex-con's transition back into the community, and having no state help with job placement or continued rehabilitation could put them right back behind bars. "Think of this economy we're in. We have people with master's degrees applying for entry-level jobs. How is a prisoner going to compete?" asks Terry Thornton of the California Department of Corrections and Rehabilitation. Which begs the question, would leaving them out to dry actually cut state spending, or simply transfer it? California is not alone in the wilderness. South Carolina's prison population tripled between 1983 and 2009. Over that same period of time, spending increased by 500 percent to $394 million, and not only did recidivism actually increase, the FBI ranked South Carolina at the top of per capita violent crime rate. With 3,200 additional inmates projected by 2014, an additional $458 million in spending would be required. The good news is that all this pressure has produced some policy gems that may just reform the American prison system forever. "Think of this economy we're in. We have people with Masters degrees applying for entry-level jobs. How is a prisoner going to compete?" Enter Pew Center on the States. "What we do is a year-long process," says Pew's Adam Gelb. In a bipartisan working group, legislators from both sides of the aisle, corrections officials and Pew analysts look at the data, formulate new policy and get it to the governor's desk. The result in South Carolina was the Omnibus Crime Reduction and Sentencing Reform Act of 2010. It included sentencing reform, and a risk-and-needs assessment tool that determines the likelihood of an inmate to re-offend prior to parole. It strengthened parole supervision to set up newly released inmates for success in the community, and make it more difficult for non-violent parolees to be sent back to prison. The law is projected to save the state up to $175 million in construction costs and avoid more than $66 million in operating costs during the next five years. Another historically conservative state is hoping to follow suit. "Louisiana is the poster child for criminal justice improvement," says Louisiana State Secretary of Public Safety and Corrections, Jimmy Le Blanc. "We lock up more than any other state per 100,000 and our rate of violent crime is higher than most, so this hard on crime sell just isn't working." Put it all together and you have a state with overcrowded prisons and parish jails. Part of the problem is mandatory minimum sentencing for non-violent drug offenses, a nationwide scourge. "The longer you've been in prison, the quicker you go back," says Le Blanc. "That's a proven fact." Alison Shames, from the VERA Center for Justice, agrees. "If I'm a drug offender, I'll be a better drug offender with more criminal friends, less family ties, less options, and I'll be a greater risk to society if go to prison for three years instead of one." Recidivism is a vicious cycle for taxpayers as well as prisoners, but it's not completely unavoidable. When Le Blanc served as warden at Dixon State Prison, he brought the recidivism rate down to 38 percent from 47 percent on the strength of progressive re-entry initiatives. "Most of it is common sense stuff," he says. "We make sure our inmates have a residence plan, a job or a potential job, and a continuum of care for substance abuse and mental health." Before release, inmates also go through a basic risk-and-needs assessment, like the one implemented in South Carolina, to determine what kind of education or vocational training they want or need and there's a community care component too. Le Blanc is even working to get some parole and probation cases into the hands of community social workers rather than law enforcement officers. It's all very warm and fuzzy, yet such policies have been championed by the likes of Newt Gingrich and Louisiana governor Bobby Jindal. "It's conservative states with conservative leaders that are out front tackling this issue," says Gelb. The trend started in Texas, when in 2007 the state scuttled a plan to build eight new prisons at a cost of $2 billion and replaced it with beefed up community treatment and supervision that cost $241 million. The reason is clear, according to Le Blanc. "If we get these things accomplished, it's going to bring down recidivism." Which in turn will ease the state's financial burden. Typically parole programs cost taxpayers $7.47 per day per parolee, while prisons cost $78.95 per day per inmate nationwide. Getting it accomplished won't be easy. Le Blanc points to a statewide $1.6 billion budget shortfall, which translates as a 35 percent cut, or $151 million, from the corrections budget. Thankfully, hard times have ushered what Le Blanc sees as a new era of political collaboration in Baton Rouge, and he promises to maintain his re-entry initiatives. "If we want to reduce the prison population we have to maintain our parole and probation divisions," he says. "Seventy percent of parole or probation revocations happen within the first 14 months. That's for violent and non-violent offenders. They need to be connected, followed up with. You can't just let them cold turkey out of prison." Yet that's what California continues to do. There's no argument that California is a state with its back against the

wall. The budget for the Department of Corrections and Rehabilitation was slashed by $1 billion in 2010, and under Governor Brown's new budget the hope is $1.4 billion more can be saved in 2011, but that includes a $150 million reduction in rehabilitation programs at a time when recidivism is at an alarming rate — 67 percent and 55 percent of California's inmates are locked up for parole or probation violations rather than a new crime. Organizations like Pew and VERA and a growing chorus of conservative politicians argue that it is much smarter to couple non-revocable parole with an investment in beefed up parole programs that include pillars like substance abuse, job placement and cutting edge cognitive behavioral therapy programs that according to Gelb, "help identify triggers that spur criminal behavior and train parolees how to avoid them and maximize positive influences in their lives." Typically parole programs like these cost taxpayers $7.47 per day per parolee, while prisons cost $78.95 per day per inmate nationwide. Trouble is those budget cuts are coming. "And what could be easier than cutting programs that help convicted felons?" Asks Gelb. "But that could be pennywise and pound foolish. Especially if your goal is to get taxpayers a better return on their security and law enforcement investment." - See more at: http://www.thefiscaltimes.com/Articles/2011/02/09/Runaway-Prison-Costs-Thrash-State-Budgets?page=0%2C2#sthash.sDlXYMmU.dpuf

at: States have already done this

States that have already done geriatric release have too much red tape—cp fixes that McGarry 2010 (Peggy [Director, Center on Sentencing and Corrections @ Vera]; It's about time; Apr; www.vera.org/sites/default/files/resources/downloads/Its-about-time-aging-prisoners-increasing-costs-and-geriatric-release.pdf; kdf)

Throughout the United States, state corrections systems face significant challenges: many prisons are operating over capacity, budgets have been cut, and decisions about who goes to prison and for how long are made by policymakers who often lack good information about the impact of their actions. State legislatures and corrections departments are tackling these challenges by looking for new ways to reduce their prison populations without jeopardizing public safety. Some states, like Colorado, are considering evidence-based riskassessment tools to help paroling authorities make better-informed decisions about safe releases, while others, like New York, are using such tools to inform supervision and violation decisions. This report examines an underused strategy that is increasingly attracting attention as a way to reduce the prison population, save costs, and maintain public safety. Geriatric and medical release policies target inmates whose advanced age or waning health limit the risk they pose to the community. Because the cost of maintaining these individuals in state prisons is significantly higher than that for younger inmates, releasing older inmates has the potential to save corrections departments substantial amounts of money. Nevertheless, many states that have enacted such policies have not realized a decrease in their prison populations or the savings they may have anticipated. The lessons from this analysis of mostly ineffectual geriatric release provisions can also be applied to other areas of criminal justice policy. Perhaps the most important lesson is that intent is not enough to achieve a legislative or agency policy's desired impact. Policymakers must use available data to understand their corrections population and not be overly restrictive in defining the subset eligible for early release. Instead, they must craft policies and legislation to ensure that exceptions and procedural requirements do not overwhelm a provision's intent. To achieve their maximum impact, policies must be based on evidence and proven outcomes. Finally, legislation and policy change alone are usually not sufficient: attention and resources must also be directed toward careful implementation.

at: Why 55?

55 is the best age to start- multiple warrants

Vera Institute 2010 (It's about time; Apr; www.vera.org/sites/default/files/resources/downloads/Its-about-time-aging-prisoners-increasing-costs-and-geriatric-release.pdf; kdf)

There is no national consensus about the age at which an inmate qualifies as "old" or "elderly." The U.S. Census Bureau defines the general "elderly" population as those 65 and older, but the National Commission on Correctional Health Care uses 55 as its threshold for "elderly" inmates.7 At least 27 states have a definition for who is an "older prisoner," according to a recent survey: 15 states used 50 years as the cutoff, five states used 55, four states used 60, two states used 65, and one used age 70.8 Although most 50-year-olds are not considered elderly, the aging process appears to accelerate for people who are incarcerated.9 Some contributing elements include a person's poor physical or mental health prior to incarceration— often the result of factors such as substance abuse, lack of access to health care or inadequate care, poverty, and lack of education—as well as the physical and psychological stresses associated with prison life itself. Specific stressors include separation from family and friends; the prospect of living a large portion of one's life in confinement; and the threat of victimization, which disproportionately affects older inmates.10 For these reasons, correctional administrators, health practitioners, and academics agree that an incarcerated person's physiological age may exceed his or her chronological age.11

at: Release violent criminals

Violent criminals won't be released

Vera Institute 2010 (It's about time; Apr; www.vera.org/sites/default/files/resources/downloads/Its-about-time-aging-prisoners-increasing-costs-and-geriatric-release.pdf; kdf)

In developing geriatric release statutes and **procedures**, policymakers often exclude individuals convicted of violent offenses or sex offenses and those sentenced to life imprisonment. For these populations, punishment as a goal of incarceration may outweigh considerations of correctional cost savings or the prospect that age has rendered a person less dangerous. Although this rationale is understandable, the result is that geriatric release policies may apply to only a small subset of older inmates. In **2008**, one in 11 U.S. prisoners—more than 140,000 individuals—were serving a life sentence; 29 percent of them (roughly 41,000 people) have no possibility of parole.29 In Pennsylvania, a 2003 study of inmates 50 and older found that older prisoners were more likely to have been incarcerated for serious offenses, including rape, murder, robbery, aggravated assault, and burglary; 66 percent were serving maximum sentences of 10 years or more, with 21 percent serving life sentences.30 A 2006 report on North Carolina prisoners showed that almost 60 percent of inmates ages 50 and older were serving sentences for violent or sex crimes, including sexual assault, habitual felonies, and murder in the first or second degree. Most were serving a sentence of life or of 10 years to life.31 As larger numbers of people convicted of serious and violent crimes grow old in prison, categorically excluding them from consideration may result in fewer releases and less potential cost savings.

at: Not Effective

States will quickly learn how to make the CP effective

Vera Institute 2010 (It's about time; Apr; www.vera.org/sites/default/files/resources/downloads/Its-about-time-aging-prisoners-increasing-costs-and-geriatric-release.pdf; kdf)

The need to reduce corrections costs without jeopardizing public safety provides states with an opportunity to introduce or refine geriatric release policies. The challenge is to make existing policies more effective and to identify and assess new approaches to managing an aging population that is expected to grow. States with provisions for geriatric release can lead the way by making greater use of them and evaluating the outcomes. States that have not created such policies can test innovative strategies and help the criminal justice field learn more about what works, particularly with regard to reentry and community supervision for an elderly population that is ill, infirm, or both.

**Mandatory Sentencing 1NC

The United States federal government should eliminate mandatory sentencing and repeat offender laws. The states of the United States should revise their truth-in-sentencing laws in order to grant increased decision-making to the criminal justice system.

Raphael and Stoll 2014 (Steven [Goldman School of Public Policy, UC Berkeley] and Michael [Luskin School of Public Affiars, UCLA]; A New Approach to Reducing Incarceration While Maintaining Low Rates of Crime; May; www.hamiltonproject.org/files/downloads_and_links/v5_THP_RaphaelStoll_DiscPaper.pdf; kdf)

We propose that states take a hard look at their truth-in-sentencing laws and either modify the parameters to reduce scope and severity or abandon the practice entirely. To be specific, states could alter the minimum percent of sentences to be served, reduce the scope of the set of crimes subject to truth-in-sentencing constraints, reduce the scope of truth-insentencing constraints by applying them to repeat offenders only, or abandon the practice altogether. These changes would permit parole review for greater proportions of inmates in indeterminate sentencing states while increasing the proportion of inmates able to earn good time credits in states with more-structured sentencing practices. Making these changes would necessarily increase the discretion of parole boards in the decision-making process and allow criminal justice professionals to have a greater role in deciding who is and who is not ready for release. Such a change would free the hands of corrections authorities to release those inmates who, through objective risk assessment, are deemed low risk. The potential benefits from such a change are illustrated by a recent provocative analysis of prison release decisions in Georgia conducted by Ilyana Kuziemko (2013). Using administrative data on prison releases and recidivism, Kuziemko documents the following: First, recidivism risk declines with time in prison, likely due to the aging of the inmate and the well-documented fact that the propensity to offend declines sharply with age. Second, parole boards are quite good at distinguishing high-risk from low-risk inmates based on observation during the inmate's incarceration, and on information that extend beyond the inmate's age, demographics, and criminal history on entering prison. Third, when discretion is wrested from parole boards via truth-in-sentencing type practices, inmates engage in more institutional misconduct, are less likely to participate in rehabilitative programming, and are more likely to recidivate after release. Through a series of back-of-the-envelope calculations, Kuziemko concludes that restricting the discretion of parole boards both increases the incarceration rate through longer sentences and increases crime through higher recidivism rates among those with little incentive to rehabilitate while incarcerated. Truth-in-sentencing not only creates allocative inefficiency, but may also increase the postrelease offending of some inmates beyond what it otherwise would be. The first factor occurs due to the one-size-fits-all nature of this sentencing practice. Namely, regardless of one's behavior, efforts made toward rehabilitation, and objective signals of low recidivism risk, the practice ties the hands of parole authorities, leading to incarceration spells that are unjustifiably long for some inmates. The second factor occurs through the elimination of the incentive to behave and conform.3 Precluding the possibility of early release through parole eliminates incentives to not engage in misconduct and to participate in programming, increasing the likelihood that the individual will be returned to custody soon after release. Of course, one could increase the role of parole boards in release decisions in a more-structured manner while creating incentives for inmates to engage in rehabilitated programming and to behave in a positive manner while incarcerated. Moreover, such an effort could be targeted at offenders who commit relatively less-serious crimes rather than those who come under the purview of truth-in-sentencing laws. For example, Pennsylvania's Recidivism Reduction Incentive (RRI) legislation passed in 2008 creates a parallel sentencing structure for relatively low-risk inmates whereby in addition to the specified minimum and maximum sentences handed down at sentencing, offenders are given an alternative RRI minimum sentence below the standard minimum. For the lower minimum to apply, the inmate must refrain from institutional misconduct and must participate in several predetermined rehabilitative programs to be deemed RRI certified. Through 2013 the Pennsylvania Department of Corrections estimates that roughly 9,000 inmates have served approximately five months less on average due to the RRI program, saving the state roughly $14,000 per inmate (Bucklen, Bell, and Russell 2014). In a nonexperimental evaluation of the program, RRIcertified inmates are found to be rearrested over the threeyear period following their release at a rate that is 8 percentage points lower than that for a matched comparison group. There is no statistically measurable effect on reincarceration, however. Moreover, because the program is targeted toward relatively low-risk inmates with short sentences, a sizable minority are released prior to participating in the prescribed programming. Take inventory of and reevaluate legislatively mandated minimum sentences. Mandatory sentencing laws specify minimum prison sentences for specific offenses or offenses with aggravating

circumstances that are targeted by specific legislation. Stemen, Rengifo, and Wilson (2006) note that mandatory minimum sentences usually constrain both the decision regarding whether an offender should be sentenced to prison and the minimum amount of time that an inmate must serve. Between 1975 and 2002 every state, the District of Columbia, and the federal government adopted some form of mandatory minimum sentencing targeted at a specific offense. Nearly three quarters of all states and the federal government enacted mandatory minimum sentences for possession or trafficking of illegal drugs. Mandatory minimum penalties are also often encountered for violent offenses, offenses involving weapons, carjackings, offenses victimizing minors, and offenses committed in close proximity to schools. Federal law is riddled with mandatory minimum sentences, with disproportionate mandatory minimums for drug offenses involving crack cocaine receiving perhaps the greatest scrutiny. Closely related to mandatory minimum sentences are state laws mandating specific sentencing for repeat offenders. Repeat-offender laws refer to sentence enhancements for criminal offenders who repeatedly commit crimes. The laws are often described using the baseball metaphor "three strikes and you're out," conveying the idea that those who serially offend may ultimately face life terms. Repeat-offender laws first appeared in most states during the early- to mid-1990s under the label of "three strikes," with the first in Washington state in 1993. By the close of the twentieth century, roughly half of all states had such provisions in their sentencing systems. The provisions of actual repeat-offender laws vary considerably across states. For example, in California a "second striker" (someone with a prior conviction for a violent offense convicted of a second felony) receives a sentence equal to twice the sentence normally handed down for the specific second offense. Until recently, all "third strikers" (someone with two prior violent felony convictions) were given an indeterminate sentence of twenty-five years to life for any additional felony offenses.4 In contrast, Pennsylvania's "three strikes" law is triggered only when an offender who has already been convicted of two prior felonies is subsequently convicted of one of eight specified offenses. Moreover, the law gives the sentencing court discretion to increase the sentence for the underlying offense by up to twenty-five years. Similar to truth-in-sentencing provisions, mandatory minimum sentences and repeat-offender laws often tie the hands of criminal justice actors (judges and parole boards, in particular) and greatly increase the bargaining power of prosecutors in criminal proceedings. In addition to increasing the likelihood of a prison term and sentence length for convicted offenders, research has shown that these practices often result in stiffer penalties for those convicted of lesser yet related offenses than those covered directly by the statute, which likely reflects a net-widening with regard to the range of offenses experiencing enhanced penalties under the law (Owens 2011).

The counterplan reduces the socially harmful components of prison sentencing

Raphael and Stoll 2014 (Steven [Goldman School of Public Policy, UC Berkeley] and Michael [Luskin School of Public Affiars, UCLA]; A New Approach to Reducing Incarceration While Maintaining Low Rates of Crime; May; www.hamiltonproject.org/files/downloads_and_links/v5_THP_RaphaelStoll_DiscPaper.pdf; kdf)

The explosive growth in the U.S. incarceration rate, coupled with crime-fighting benefits that rapidly diminish with the scale of incarceration, implies that there is currently substantial room to reduce incarceration rates without impacting crime. Even absent a compensating social investment, a selective scaling back of the use of incarceration as punishment would likely have relatively small effects on crime rates. However, such a scaling back would reduce corrections costs and generate budgetary savings that could be diverted to other, more-cost-effective, and less-socially harmful interventions. While there are multiple reasons why we use prison to punish felony offenders, crime control is clearly high on the list of objectives and motivations. That being said, the policy options that we outline below are intended to increase the general allocative efficiency of the use of prison beds—that is, to increase the degree to which prison is reserved for those who pose the greatest risk to society. Hence, we propose two broad policy strategies: introduce a greater degree of discretion into U.S. sentencing and parole practices, and incentivize local authorities to reserve prison for those who pose the greatest risk.

--xt Solves Racism

Mandatory minimums are the largest form of structural racism in the prison system

McCurdy 2006 (Jesselyn [ACLU Legislative counsel]; Testimony of Jesselyn McCurdy, ACLU Legislative Counsel, At A United States Sentencing Commission Hearing On Cocaine and Sentencing Policy; Nov 14; https://www.aclu.org/racial-justice_prisoners-rights_drug-law-reform_immigrants-rights/testimony-jesselyn-mccurdy-aclu-le; kdf)

The 100 to 1 Disparity in Federal Cocaine Sentencing Has a Racially Discriminatory Impact and has had a Devastating Impact on Communities of Color Data on the racial disparity in the application of mandatory minimum sentences for crack cocaine is particularly disturbing. African Americans comprise the vast majority of those convicted of crack cocaine offenses, while the majority of those convicted for powder cocaine offenses are white. This is true, despite the fact that whites and Hispanics form the majority of crack users. For example, in 2003, whites constituted 7.8% and African Americans constituted more than 80% of the defendants sentenced under the harsh federal crack cocaine laws, while more than 66% of crack cocaine users in the United States are white or Hispanic. Due in large part to the sentencing disparity based on the form of the drug, African Americans serve substantially more time in prison for drug offenses than do whites. The average sentence for a crack cocaine offense in 2003, which was 123 months, was 3.5 years longer than the average sentence of 81 months for an offense involving the powder form of the drug. Also due in large part to mandatory minimum sentences for drug offenses, from 1994 to 2003, the difference between the average time African American offenders served in prison increased by 77%, compared to an increase of 28% for white drug offenders. African Americans now serve virtually as much time in prison for a drug offense at 58.7 months, as whites do for a violent offense at 61.7 months. The fact that African American defendants received the mandatory sentences more often than white defendants who were eligible for a mandatory minimum sentence, further supports **the racially discriminatory impact of mandatory minimum penalties.** Over the last 20 years, federal and state drug laws and policies have also had a devastating impact on women. In 2003, 58% of all women in federal prison were convicted of drug offenses, compared to 48% of men. The growing number of women who are incarcerated disproportionately impacts African American and Hispanic women. African American women's incarceration rates for all crimes, largely driven by drug convictions, increased by 800% from 1986, compared to an increase of 400% for women of all races for the same period. Sentencing policies, particularly the mandatory minimum for low-level crack offenses, subject women who are low-level participants to the same or harsher sentences as the major dealers in a drug organization. The collateral consequences of the nation's drug policies, racially targeted prosecutions, mandatory minimums, and crack sentencing disparities have had a devastating effect on African American men, women, and families. Recent data indicates that African Americans make up only 15% of the country's drug users, yet they comprise 37% of those arrested for drug violations, 59% of those convicted, and 74% of those sentenced to prison for a drug offense. In 1986, before the enactment of federal mandatory minimum sentencing for crack cocaine offenses, the average federal drug sentence for African Americans was 11% higher than for whites. Four years later, the average federal drug sentence for African Americans was 49% higher. As law enforcement focused its efforts on crack offenses, especially those committed by African Americans, a dramatic shift occurred in the overall incarceration trends for African Americans, relative to the rest of the nation, transforming federal prisons into institutions increasingly dedicated to the African American community. The effects of mandatory minimums not only contribute to these disproportionately high incarceration rates, but also separate fathers from families, separate mothers with sentences for minor possession crimes from their children, leave children behind in the child welfare system, create massive disfranchisement of those with felony convictions, and prohibit previously incarcerated people from receiving social services such as welfare, food stamps, and access to public housing. For example, in 2000 there were approximately 791,600 African American men in prisons and jails. That same year, there were only 603,032 African American men enrolled in higher education. The fact that there are more African American men under the jurisdiction of the penal system than in college has led scholars to conclude that our crime policies are a major contributor to the disruption of the African American family. One of every 14 African American children has a parent locked up in prison or jail today, and African American children are 9 times more likely to have a parent incarcerated than white children. Moreover, approximately 1.4 million African American males – 13% of all adult African American men – are disfranchised because of felony convictions. This represents 33% of the total disfranchised population and a rate of disfranchisement that is 7 times the national average. In addition, as a result of federal welfare legislation in 1996, there is a lifetime prohibition on the receipt of welfare for anyone convicted of a drug felony, unless a state chooses to opt out of this provision. The effect of mandatory minimums for a felony conviction, especially in the instance of simple possession or for very low-level involvement with crack cocaine, can be devastating, not just for the accused, but also for their entire family.

at: CP links to politics

The counterplan is bipartisan

Gingrich and Nolan 2014 (Newt and Pat; An opening for bipartisanship on prison refom; Jul 14; online.wsj.com/articles/newt-gingrich-and-pat-nolan-an-opening-for-bipartisanship-on-prison-reform-1405380090; kdf)

The reforms have developed in the states, as conservatives tend to prefer. But now that there is proof that prison reform can work, the debate has gone from an ideological discussion to evidence-based changes that can be applied to the federal system. Republican Sens. John Cornyn and Ted Cruz, who have seen the benefits firsthand in Texas, have been joined by Republican Senate colleagues such as Rob Portman, Marco Rubio, Mike Lee, Jeff Flake and Ron Johnson in backing one or more prison-reform bills. Two bills, the Recidivism Reduction and Public Safety Act (S. 1675) and the Smarter Sentencing Act (S. 1410) have already passed the Senate Judiciary Committee and await action by the full Senate. In the House, Republican Reps. Jason Chaffetz, Raúl Labrador, Trey Gowdy and others are backing similar legislation. This push for reforming the federal prison system has support on the other side of the aisle as well. Such liberal stalwarts as Sens. Dick Durbin, Patrick Leahy and Sheldon Whitehouse, and Reps. John Conyers, Bobby Scott and Jerrold Nadler have signaled their backing. On Tuesday, the House Subcommittee on Crime, Terrorism and Homeland Security HOMS -5.88% will hear from witnesses who are experts on state reforms. With luck, their testimony will provide even more impetus for Congress to take advantage of the unusually strong bipartisanship in the air on Capitol Hill and fix a criminal-justice system badly in need of repair.

**Prison Labor CP

Text: The USFG should increase the minimum wage for prisoners doing prison labor. (still working on this)

Cheap prison labor is uniquely rooted in institutionalized racism

Browne 7 [Jaron Browne. Organizer with People Organized to Win Employment Rights (POWER). "Rooted in Slavery: Prison Labor Exploitation." 2007. http://reimaginerpe.org/node/856]//EMerz

It may surprise some people that as the number of people without jobs increases, the number of working people actually increases—they become prison laborers. **Everyone inside has a job**. There are currently over 70 factories in California's 33 prisons alone. Prisoners do everything from textile work and construction, to manufacturing and service work. Prisoners make shoes, clothing, and detergent; they do dental lab work, recycling, metal production, and wood production; they operate dairies, farms, and slaughterhouses. United States Prisons mirror Free Enterprise Zones in Africa, Asia, and Latin America; the prison is a reflection of the Third World within the United States. Prisoners are not protected by minimum wage laws or overtime, and are explicitly barred from the right to organize and collectively bargain. In fact, the conditions for the overwhelmingly Black and Latino men and women inside the United States prison system are so similar to that of workers in the maquiladoras and sweatshops of the global South that in 1995, Oregon politicians were even courting Nike to move their production from Indonesia into Oregon prisons. "We propose that (Nike) take a look at their transportation costs and their labor costs," Oregon State Representative Kevin Mannix explained in an interview with researcher Reese Erlich, "We could offer [competitive] prison inmate labor" in Oregon.2 To understand the conditions that have allowed such an exploitative industry to develop, we have to look at the origin of the United States prison system itself. Before the abolition of slavery there was no real prison system in the United States. Punishment for crime consisted of physical torture, referred to as corporal or capital punishment. While the model prison in the United States was built in Auburn, New York in 1817, it wasn't until the end of the Civil War, with the official abolition of slavery, that the prison system took hold. In 1865, the 13th Amendment officially abolished slavery for all people except those convicted of a crime and opened the door for mass criminalization. Prisons were built in the South as part of the backlash to Black Reconstruction and as a mechanism to re-enslave Black workers. In the late 19th-century South, an extensive prison system was developed in the interest of maintaining the racial and economic relationship of slavery. Louisiana's famous Angola Prison illustrates this history best. In 1880, this 8000-acre family plantation was purchased by the state of Louisiana and converted into a prison. Slave quarters became cell units. Now expanded to 18,000 acres, the Angola plantation is tilled by prisoners working the land—a chilling picture of modern day chattel slavery. Black Codes and Convict Leasing When slavery was legally abolished, a new set of laws called the Black Codes emerged to criminalize legal activity for African Americans. Through the enforcement of these laws, acts such as standing in one area of town or walking at night, for example, became the criminal acts of "loitering" or "breaking curfew," for which African Americans were imprisoned. As a result of Black Codes, the percentage of African Americans in prison grew exponentially, surpassing whites for the first time.3 A system of convict leasing was developed to allow white slave plantation owners in the South to literally purchase prisoners to live on their property and work under their control. Through this system, bidders paid an average $25,000 a year to the state, in exchange for control over the lives of all of the prisoners. The system provided revenue for the state and profits for plantation owners. In 1878, Georgia leased out 1,239 prisoners, and all but 115 were African American.4 Much like the system of slavery from which it emerged, convict leasing was a violent and abusive system. The death rate of prisoners leased to railroad companies between 1877 and 1879 was 16 percent in Mississippi, 25 percent in Arkansas, and 45 percent in South Carolina.5 The stories of violence and torture eventually led to massive reform and abolition movements involving alliances between prisoner organizations, labor unions, and community groups. By the 1930s, every state had abolished convict leasing.6 As the southern states began to phase out convict leasing, prisoners were increasingly made to work in the most brutal form of forced labor, the chain gang. The chain gangs originated as a part of a massive road development project in the 1890s. Georgia was the first state to begin using chain gangs to work male felony convicts outside of the prison walls. Chains were wrapped around the ankles of prisoners, shackling five together while they worked, ate, and slept. Following Georgia's example, the use of chain gangs spread rapidly throughout the South.7 For over 30 years, African-American prisoners (and some white prisoners) in the chain gangs were worked at gunpoint under whips and chains in a public spectacle of chattel slavery and torture. Eventually, the brutality and violence associated with chain gang labor in the United States gained worldwide attention. The chain gang was abolished in every state by the l950s, almost 100 years after the end of the Civil War.8 Prison Labor Exploitation in the 21st Century Just a few decades later, we are witnessing the return of all of these systems of prison labor exploitation. Private

corporations are able to lease factories in prisons, as well as lease prisoners out to their factories. Private corporations are running prisons-for-profit. Government-run prison factories operate as multibillion dollar industries in every state, and throughout the federal prison system. In the most punitive and racist prison systems, we are even witnessing the return of the chain gang. Prisoner resistance and community organizing has been able to defeat some of these initiatives, but in Arizona, Maricopa County continues to operate the first women's chain gang in the history of the United States.9 **Shifts in the United States economy and growing crises of underemployment and poverty in communities of color have created the conditions for the current wave of mass incarceration and the boom in prison labor exploitation.** In the Bayview Hunters Point neighborhood of San Francisco, a historically Black community with an estimated 50 percent unemployment rate, the community is facing criminalization, incarceration and mass displacement as a result of gentrification. San Francisco, along with eight other counties in California, is implementing gang injunctions—curfews, anti-loitering, and anti-association laws that function very similar to Black Codes for Black, Latino, and Asian youth—using the pretext of gang prevention to track young men into the prison system to become prison labor, while preparing the community for redevelopment and gentrification. People Organized to Win Employment Rights (POWER) is building power among Bayview residents and fighting for economic development that addresses the interests of the Black community, which will create alternatives to prison labor exploitation.10 Struggles like this are being waged all across the country and provide an opening to link the demands for worker rights, community rights, and prisoner rights. The fight against the exploitation of prison labor is at once a fight against racial profiling and mass incarceration, and also for genuine economic development in Black, Latino, Asian, and Pacific Islander communities. The labor movement in the United States has a responsibility to support prisoner unions such as the Missouri Prison Labor Union (MPLU), which is fighting for higher wages and collective bargaining, and to challenge labor unions who dismiss prisoners as stealing jobs from the "good law-abiding workers" on the outside. As Sidney Williams of the MLPU states, "In this struggle we seek to regain our human dignity." That is the demand of the slavery abolition movement of the 21st century.

--xt: solvency

The USFG has the jurisdiction to increase prison wages- the counterplan decreases recidivism which drives racism

Decker 13 (Charles Decker. Political Science graduate from Yale and contributor to the peer reviewed Yale Institution for Social and Policy Studies. October 2013. http://isps.yale.edu/team/charles-decker#.VaQm4_lViko)//EMerz

These challenges alone clearly make the case for expanded work opportunities in prison. Of course, prison labor is alive and well. According to the Federal Bureau of Prisons, federal inmates earn 12 cents to 40 cents per hour for jobs serving the prison, and 23 cents to $1.15 per hour in Federal Prison Industries factories. Prisoners are increasingly working for private companies as well. A significant cut of even these token wages goes to criminal justice system fees. **Offenders thus have little hope of saving money while in prison, and this lack of money combined with fragile post-release support systems is an explosive formula for recidivism and reincarceration**. As such, the time has come to institute a living wage for prison labor. This wage need not be at the same level in prison as it would be outside. But prison wages must be high enough to cover the fees imposed by the criminal justice system while allowing offenders to reserve enough money to have a fair start upon release. **Such a policy could make a big difference in reducing recidivism and bringing down the incarceration rate even further.** While much prison policy is determined at the state level, the Federal Government does have power over prison labor policy, even for non-federal inmates. In 1979, Congress created the Prison Industries Enhancement Certification Program (PIECP). Under PIECP, goods made by prisoners are banned from interstate transport unless inmates are paid "prevailing wages," or wages comparable to those in the private sector. These criteria, however, are routinely circumvented. PIECP has laid the groundwork for government regulation of prison labor—what is needed now is better enforcement. Two major objections to these proposals may arise. The first is concrete: free workers will cry foul over competition from prison labor. The second is philosophical: nobody is forced to work, but prison labor is at its heart coercive. Both concerns are accurate and complex, but the answer to each stems from the same fact: prison labor is not going anywhere. It has existed for as long as the American criminal justice system, and ignoring its problems serves the interests of no worker, free or incarcerated. Bringing these realities out into the open is the first step toward bringing the issue of prison labor into the movement to reform the carceral state.

Racial Profiling CP

**1nc

Text: The states of the United States should prohibit racial profiling.

States need to have comprehensive racial profiling laws – solves the aff

Eversley 14 – writer for USA Today Melanie Eversley, 9/26/2014, USA Today, "NAACP finds many states lack laws barring profiling", http://www.usatoday.com/story/news/nation/2014/09/25/naacp-racial-profililng-report/16229867/, 7/12/2015, \\BD

Just after a heated summer that included a handful of fatalities at the hands of police that raised questions of racism, the NAACP has released a report that says many states do not have laws that explicitly prohibit racial profiling.ə The civil rights organization on Thursday released the 68-page report, Born Suspect: Stop and Frisk and the Continued Fight to End Racial Profiling in America. The group launched the study after the Feb. 26, 2012, death of Florida teen Trayvon Martin, shot by neighborhood watch volunteer George Zimmerman, said lead author Niaz Kasravi, the NAACP's director of criminal justice.ə Kasravi told USA TODAY that what stood out most for her was that the findings were similar to another study she did after the 2001 terror attacks while working for Amnesty International. Back then, the focus was on alleged racial profiling against Muslims.ə "Not much has changed. The numbers are pretty stagnant," Kasravi said.ə She said "probably a couple of states" passed laws prohibiting racial profiling -- stopping and questioning people based on racial stereotypes -- over the past decade. She said the NAACP has a litmus test -- things such as data collection and enhanced police training -- to measure the effectiveness of racial profiling laws. "**It's sad that not one state has all those components."**ə The report found that:ə 20 state racial profiling laws are not clear and specific in prohibiting racial profiling.ə33 states do not require mandatory data on stops and searches.ə33 states do not require establishment of racial profiling commissions to review complaints.əThe release of the report comes as tension still brews in Ferguson, Mo., where 18-year-old Michael Brown was shot and killed by police officer Darren Wilson on Aug. 9, and in New York City, where Eric Garner died in a chokehold by police on July 17.ə On Thursday, national activists and family members of Brown and Garner were in Washington to ask the Justice Department to investigate the two deaths.ə NAACP President Cornel Brooks, among those at a press conference, said African American communities are "in the midst of a pandemic of police misconduct."ə Benjamin Crump, the lawyer for the Brown family, said of predominantly black neighborhoods, "Probable cause happens in our community with no evidence at all."ə Alleged racial profiling and police misconduct are the main reasons members and leaders of NAACP chapters contact the organization's Baltimore headquarters, Kasravi said.

--xt Solvency

The counterplan is key – not one state has adequate racial profiling laws

Clark 14 – writer for MSNBC Meredith Clark, 9/25/2014, MSNBC, "Racial profiling report finds 'not one state' with acceptable protections", http://www.msnbc.com/msnbc/racial-profiling-report-finds-not-one-state-acceptable-protections, 7/12/2015, \\BD

Racial profiling is still a major part of life for communities of color across the country, and a new report has found that legal protections from such profiling **vary wildly** from state to state. The NAACP report came the same day the families of three black men killed by police officers in recent months called for justice for their loved ones.ð After several noteworthy killings of black men by white police officers, the NAACP on Thursday released Born Suspect: Stop-and-Frisk Abuses and the Continued Fight to End Racial Profiling in America, which looked at racial profile laws in all 50 states. It also examined how activists and civil liberties advocates in New York City successfully fought the NYPD's discriminatory "stop and frisk" police search policy, which disproportionately targeted black and Hispanic residents.ð "In 2014 there is **not one state** that has a statute that can stand up against this pandemic of police misconduct," NAACP President Cornell Brooks said of the report. According the NAACP's review, 20 states don't have a ban on racial profiling, and **only 17** states with anti-profiling laws make violations a crime.ð The kind of data collected by law enforcement varies from state to state, the report found, making it difficult to compare communities and strategies effectively.ð Connecticut and Rhode Island were both singled out for having the most protections for their citizens against racial profiling, but neither state met every one of the NAACP's criteria for constitutional safeguards. And Kentucky, "which basically lacks all of the necessary components for a good law," landed at the bottom of the list.

at: Fed Profiling

The federal government is already banning racial profiling – it's just a question of states and localities

Horwitz 14 – writer for The Washington Post Sari Horwitz, 12/8/2014, The Washington Post, "Justice Dept. announces new rules to curb racial profiling by federal law enforcement", https://www.washingtonpost.com/world/national-security/justice-dept-to-announce-new-rules-to-curb-racial-profiling-by-federal-law-enforcement/2014/12/07/e00eca18-7e79-11e4-9f38-95a187e4c1f7_story.html, 7/12/2015, \\BD

The Obama administration on Monday formally announced long-awaited curbs on racial profiling by federal law enforcement, but the new rules will **not cover** local police departments, which have come under criticism in recent months over allegations that their officers profile suspects.ð Attorney General Eric H. Holder Jr. expanded Justice Department rules for racial profiling to prevent FBI agents from considering gender, national origin, religion, sexual orientation and gender identity, in addition to race and ethnicity, when opening cases. The department also is banning racial profiling from national security cases for the first time.ð Holder's revised policy covers state and local law enforcement officers while they participate in federal law enforcement task forces. But it is considered **only guidance** for police officers in state and local departments.ð The profiling rules come at a time of racial tension around the country after the recent deaths of three African Americans at the hands of police in Ferguson, Mo., New York and Cleveland, and the absence of criminal charges against the white police officers who were involved.ð "As attorney general, I have repeatedly made clear that profiling by law enforcement is not only wrong, it is profoundly misguided and ineffective," Holder said. "Particularly in light of certain recent incidents we've seen at the **local** level, and the widespread concerns about trust in the criminal justice process, it's imperative that we take every possible action to institute strong and sound policing practices."

Federal action is irrelevant – state and local actions are key

Natarajan 14 – clinical professor and director of the Civil Rights Clinic at The University of Texas School of Law Ranjana Natarajan, 12/15/2014, The Washington Post, "Racial profiling has destroyed public trust in police. Cops are exploiting our weak laws against it.", http://www.washingtonpost.com/posteverything/wp/2014/12/15/racial-profiling-has-destroyed-public-trust-in-police-cops-are-exploiting-our-weak-laws-against-it/, 7/12/2015, \\BD

The #BlackLivesMatter movement has sparked nationwide protests and has raised awareness worldwide about the unequal treatment of black people by police in the United States.ð Listening to the voices from the movement — and learning from the death of Eric Garner and the series of other deaths of unarmed black men — it's clear that two issues need to be addressed: racial profiling and police use of excessive force. Both run afoul of the U.S. Constitution, but remain common practices in law enforcement, too often with tragic results.ð In Garner's case, for example, police targeted him for the petty crime of selling loose cigarettes — the types of crimes black people are targeted for at higher rates — and then attempted to arrest him with a chokehold, banned by the department. Whatever else we have learned from the recent tragedies of police violence, it is clear that we need comprehensive federal, **state and local policies** that outlaw racial profiling and rein in police excessive force.ð Racial profiling — as well as profiling based on religion, ethnicity and national origin — continues to plague our nation despite the constitutional guarantee of equal treatment under the law. In a 2011 report, the Leadership Conference on Civil Rights found evidence of widespread racial profiling, showing that African Americans and Hispanics are disproportionately likely to be stopped and searched by police, even though they're less likely to be found possessing contraband or committing a criminal act. In Illinois, for example, black and Hispanic drivers were twice as likely to be searched after a traffic stop compared to white drivers, but white drivers were twice as likely to have contraband. The NYPD's controversial stop-and-frisk program shows similar evidence of racial profiling, with police targeting blacks and Latinos about 85 percent of the time. In nearly nine out of 10 searches, police find nothing.ð Likewise, excessive force by police persists despite the Constitution's prohibition on unreasonable searches and seizures. In lawsuits and investigations, the U.S. Department of Justice has concluded that a number of major police departments have engaged in a pattern or practice of excessive force. The Cleveland Police Department was most recently found to be an offender, but it follows a long line of other wayward law

enforcement agencies: Seattle, New Orleans, Portland, Newark and Albuquerque among them. Clearly, cases like Eric Garner's are not isolated — police use of excessive force is a systemic, national problem. The DOJ has recommended revising and clarifying local policies regarding appropriate uses of force, improving officer training and supervision, and implementing rigorous internal accountability systems, among other things. But recommendations are not enough. Conquering this systemic issue demands a national mandate.∂ Profiling undermines public safety and strains police-community trust. When law enforcement officers target residents based on race, religion or national origin rather than behavior, crime-fighting is **less effective** and community distrust of police grows. A study of the Los Angeles Police Department showed that minority communities that had been unfairly targeted in the past continue to experience greater mistrust and fear of police officers. To root out this ineffective tactic that undermines public confidence, we need stronger policies against racial profiling at all levels — from **local** to federal — as well as more effective training and oversight of police officers, and systems of accountability.∂ Twenty states have no laws prohibiting racial profiling by law enforcement, according to an NAACP report released in September. Among states that do, the policies vary widely in implementation and effectiveness. Only 17 of those states require data collection on all police stops and searches, and only 15 require analysis and publication of other racial profiling data. Limited and inconsistent data collection makes it impossible to devise effective remedies for racial profiling.

Relations—Asia

**1nc

Counterplan: The United States federal government should substantially increase its engagement with ASEAN.

Solves the advantage

Task Force on Multilateral Engagement in U.S.-East Asia Relations 11, (“U.S.–East Asia Relations: A Strategy for Multilateral Engagement”)

ASEAN can serve as a foundation. ASEAN’s role in building a more integrated regional society based on shared norms and values should be fully recognized and supported. Asia currently faces tensions between two competing trends: Asia as a community of norms and values, and Asia as a region shaped by power relations, given the presence of the United States and China. Although ASEAN is not considered an emerging power, the group of ten medium and smaller-sized countries has promoted modes of cooperation through its own example of developing a community. In the ASEAN Treaty of Amity and Cooperation and other efforts and practices in regional diplomacy, ASEAN’s role in engaging the emerging powers of Asia deserves recognition and support. Deeper ASEAN engagement with the United States can reinforce ASEAN’s role in promoting values and building norms. This may be a more productive focus for U.S.–ASEAN relations, rather than simply seeking to use U.S.–ASEAN ties as a means of balancing rising regional actors such as China. 6. Recognize that integration on different economic and security issues will continue at different speeds in the region. Each side has a different tenor that should be noted. With economic ties, many in Asia seek to become closer to China, though there is some wariness over issues such as cheap goods. On security ties, however, there are questions about China and its future intentions. Many recognize the need for a future place to integrate. With the East Asian Summit, some are leaning toward one place to integrate, while others are talking about network diplomacy. Integration on different issues will continue at separate speeds, and this may signal a need for more network diplomacy. 7. A new U.S. diplomacy with ASEAN is needed. There is a need and an opportunity for the United States to engage with ASEAN more closely as a hub for a wider Asia. Building on the newly established U.S.–ASEAN Summit and the appointment of Ambassador David Carden as the first U.S. resident representative to ASEAN in March 2011, the United States should continue to deepen its understanding of ASEAN and seek out like-minded countries in the grouping. This should not be limited to its allies—the Philippines and Thailand—but also should include ties with Indonesia, Singapore, Vietnam, and Malaysia and cross-border projects such as the Greater Mekong Subregion. In this context, challenges in relations with Myanmar have to be addressed.

Relations—EU

**Death Penalty 1NC

Text: The United States Federal Government should abolish the death penalty.

The CP solves relations with the EU—the EU has been putting restrictions on the US

Ford 14—Matt is an associate editor at The Atlantic, where he covers law and the courts. ("Can Europe End the Death Penalty in America? An EU export ban on lethal-injection drugs is making U.S. executions more difficult to perform." February 18, 2014 http://www.theatlantic.com/international/archive/2014/02/can-europe-end-the-death-penalty-in-america/283790/)//JLee

Why did Ohio, which has used lethal injection since it resumed executions in 1999, suddenly try an unproven chemical mixture on McGuire? The answer lies in a growing shortage of standard lethal-injection drugs brought about primarily by a 2011 export ban by the European Union, the effects of which are starting to be felt in death-row chambers across America. The ban severed U.S. prisons from the last large-scale manufacturers of sodium thiopental, a key anesthetic in lethal injections. In recent years, some smaller drugmakers elsewhere in the world have also declined to sell sodium thiopental and other lethal-injection drugs to U.S. states, citing activist pressure, the fear of lawsuits, and their ethical obligations. "The EU embargo has slowed down, but not stopped executions," Richard Dieter, executive director of the Death Penalty Information Center in Washington, D.C, told me. "It has made the states seem somewhat desperate and not in control, putting the death penalty in a negative light, with an uncertain future." Lethal injection is by far the predominant method of execution in the United States. Before the drug shortage, virtually every lethal-injection protocol used the same three-drug method. A first drug, sodium thiopental, anesthetized the prisoner. Then a second drug, pancuronium bromide, paralyzed the inmate and halted his or her breathing. Finally, an injection of potassium chloride stopped the heart. Jay Chapman, an Oklahoma medical examiner with little pharmacology experience, first proposed the three-drug protocol in 1977. Asked about his qualifications by a New York Times reporter 30 years later, Chapman described himself as "an expert in matters after death but not in getting people that way." Texas became the first state to use lethal injection when it executed Charles Brooks, Jr. on December 7, 1982. Since then, U.S. states have executed over 1,000 death-row inmates by lethal injection. By the time the three-drug cocktail's constitutionality came before the U.S. Supreme Court in 2008 in Baze v. Rees, lethal injection had become the preferred method of execution for 36 states and the federal government. Thirty of those states used Chapman's method. The U.S. Supreme Court upheld the three-drug protocol in a 7-2 decision. The European Union, for its part, makes no secret of its death-penalty stance. EU guidelines call for its **"universal abolition"** and declare that doing so would "[contribute] to the enhancement of human dignity and the progressive development of human rights." EU diplomats and leaders **frequently** petition U.S. governors and state parole boards to halt forthcoming executions. Sometimes, the supranational organization even works in more subtle ways: EU agencies contributed over $4.8 million in donations to U.S. anti-death-penalty organizations between 2009 and 2013. Kennedy wrote that world opinion, "while not controlling our outcome, does provide ... confirmation for our own conclusions." The EU's influence extends to the U.S. Supreme Court, where justices have drawn upon the organization's amicus curiae briefs from time to time in death penalty cases. Justice John Paul Stevens' majority opinion in 2002's Atkins v. Virginia cited the EU's brief on worldwide opposition to executing the mentally disabled as a factor in the Court's decision to forbid the practice in the United States. During oral arguments for Roper v. Simmons in 2005, Justice Anthony Kennedy pondered whether European views should be considered when assessing the "unusual" aspect of the Eighth Amendment's prohibition of "cruel or unusual punishment." The EU had already told the Court in an amicus brief that imposing the death penalty on persons who were minors at the time of the crime "violates widely accepted human rights norms and the minimum standards of human rights set forth by the United Nations." Writing for the Court's majority in Roper, Kennedy agreed with the EU's assessment and wrote that world opinion, "while not controlling our outcome, does provide respected and significant confirmation for our own conclusions." Not all of the justices were as appreciative. "Though the views of our own citizens are essentially irrelevant to the Court's decision today," said Justice Antonin Scalia in his Roper dissent, "the views of other countries and the so-called international community take center stage." "I think the constant reminder that our closest allies are opposed on fundamental human-rights grounds to the death penalty goes a long way in our gradual re-evaluation of this issue," Dieter told me. And that moral and ethical case, enforced by export bans on the materials necessary to perform lethal injections, is changing how America executes the men and women it sentences to death. Of the three drugs used in standard lethal injections, potassium chloride and pancuronium bromide are widely available. But sodium thiopental has been superseded by newer anesthetics. Few U.S. hospitals, if any, still use it, and even fewer manufacturers produce it worldwide. Most importantly, sodium thiopental only has a shelf life of about four years, making stockpiling the drug difficult given the lengthy and arduous appeals process for death-penalty cases. As a result of this vulnerable supply line, sodium thiopental has become a pressure point for activists in the U.S. and Europe. Initially, individual European countries moved to cut off supply of the drug. British officials at first refused to restrict it, arguing that the anesthetic had legitimate medical uses, until activists provided data showing that Europe's customers for the drug included U.S. prisons. Business Secretary Vince Cable then reversed course and imposed an export ban in November 2010, citing **Britain's** longstanding support of the death penalty's worldwide abolition. Hospira, the last U.S. company to market sodium thiopental, stopped production of the drug in January 2011 under intense pressure from

authorities in **Italy**, where their pharmaceutical plant is located. As sources began to dry up, some states banded together to find new suppliers. South Dakota and Nebraska approached Kayem Pharmaceuticals in India, which sold each state sodium thiopental before halting U.S. sales in April 2011. In Arkansas, corrections officials obtained sodium thiopental from British distributors and then shared it for free with Mississippi, Oklahoma, and Tennessee. But the states soon ran afoul of federal regulators for violating trade restrictions. The Drug Enforcement Agency seized Georgia's supply of sodium thiopental in 2011 after records suggested that state officials might have broken the law by purchasing and importing the drug from Dream Pharma, a British distributor operating out of the back of a driving school in London. Kentucky handed over its sodium thiopental to the DEA that same year. Georgia purchased sodium thiopental from Dream Pharma, a British distributor operating out of the back of a driving school in London. By June 2011, the sodium thiopental supply had run so low that U.S. Secretary of Commerce Gary Locke asked his German counterpart, Economics Minister Philipp Rösler, for assistance in alleviating the shortage. "I noted the request and declined," Rösler publicly declared, citing his Catholic faith, and then announced plans to forbid German pharmaceutical companies from selling sodium thiopental to the United States. Around the same time, in neighboring Denmark, Lundbeck, the sole pharmaceutical company licensed to manufacture pentobarbital in the United States, announced it would stop selling the medicine, another commonly used execution drug, to U.S. prisons. Sarah Ludford, a British member of the European Parliament and vice chair of its delegation to the U.S., helped lead the fight for a Europe-wide export ban. "I am proud to have helped lead the campaign to stop EU-produced medicines being hijacked for such appalling uses, in line with the UK and EU commitment to abolish the death penalty around the world," she told me in a statement. "I am determined to continue ensuring that Europe is not complicit in the deaths of American citizens." Then, in December 2011, the hammer fell. The European Commission, the EU's executive body, expanded its Regulation on Products used for Capital Punishment and Torture to include "products which could be used for the execution of human beings by means of lethal injection," including "short and intermediate acting barbiturate anaesthetic agents" like pentobarbital and sodium thiopental, among others. The U.S. government's current position on the export ban or on state efforts to circumvent is unclear. Federal agencies and departments contacted on the matter either did not respond to requests for comment or deferred to the Food and Drug Administration, the federal agency charged with regulating the manufacture, importation, and sale of pharmaceutical drugs in the U.S. Some have raised concerns about the ways in which the FDA regulates imports of drugs used in lethal injections. A group of inmates recently mounted a successful legal challenge to the FDA's refusal to block sodium thiopental imports to Arizona, California, and Tennessee, arguing that the agency had improperly allowed drugs from unregistered distributors into the United States. In his March 2012 ruling, the federal judge Richard Leon agreed, and castigated FDA regulators for acting "arbitrarily and capriciously" and abusing their discretion by not blocking unregulated sodium thiopental imports themselves. When asked for its position on the EU export ban and whether the agency had taken steps to alleviate shortages of lethal-injection drugs, an FDA spokesman replied with a statement: "The FDA does not approve drugs for use in lethal injection settings. Our work on drug shortages focuses on ensuring the continued availability of medically necessary drugs. We cannot comment on this issue further."

CP solves—only way to get be a part of the EU is to abolish the Death Penalty

Stone 15—Jon is a reporter for independent.co.uk mainly covering politics. He has previously worked for PoliticsHome, BuzzFeed, and others. ("America is running out of lethal injection drugs because of a European embargo to end the death penalty" March 13, 2015 http://www.independent.co.uk/news/world/americas/america-is-running-out-of-lethal-injection-drugs-because-of-a-european-embargo-to-end-the-death-penalty-10106933.html)//JLee

Prison authorities in Texas are one lethal injection away from running out of executioners' drugs, the state's justice department has confirmed. The near-exhaustion of supplies in Texas comes amid a shortage of lethal injection drugs across the United States, prompted by European efforts to keep the poisons out of American hands. In recent years European countries have imposed export controls on a range of execution drugs in a bid to force American states to stop killing prisoners. Two of the drugs, pentobarbital and sodium thiopental, are used in the vast majority of executions in the United States, where the death penalty is still commonplace for serious crimes. The UK unilaterally restricted the export of death penalty drugs to the United States in 2010 under the direction of the Business Secretary Vince Cable. Abolishing the death penalty across the world is a European Union foreign policy objective The European Union followed suit at the end of 2011, putting the poisons on a list of controlled exports that could be used as part of "capital punishment, torture or other cruel, inhuman or degrading treatment or punishment". "The decision today contributes to the wider EU efforts to abolish the death penalty worldwide," Catherine Ashton, the vice president of the Commission at the time, said. While the ban appears to have had an effect, a spokesperson Texas's justice department told the Independent that the state was looking at alternative drugs to use in its executions. "The Texas Department of Criminal Justice is actively exploring all options at this point including the continued use of pentobarbital or an alternate drug or drugs to use in lethal injections," he explained. Other states have taken more drastic measures to circumvent the controls. On Tuesday this week Utah's state legislature approved proposals to carry out executions by firing square in the event of a drug shortage. State-level representatives in Oklahoma are even considering a proposal to kill prisoners in gas chambers if supplies of anaesthetics run out. Some states have had to delay executions because of shortages. Authorities in Ohio delayed at least one killing after an attempt to use an alternative drug was branded "a failed, agonising experiment" because of its slow and distressing effect on its target. 32 US states still practice the death penalty, with the practice abolished in only 18. Partly owing to its size and population, Texas carries out far more executions than any other state. Abolition of the death penalty is mandatory for countries wanting to join the European Union, and the European Commission describes the practices worldwide abolition as **"a key objective for the Union's human rights policy"**.

**LNG CP

Text: The United States Federal Government should substantially increase its liquefied natural gas exports.

CP solves—creates US-EU relations and prevents Russia Rise

Goldwyn 14—David L. is a nonresident senior fellow in the Energy Security and Climate Initiative at Brookings and president of Goldwyn Global Strategies, LLC, an international energy advisory consultancy. He served as the U.S. State Department's special envoy and coordinator for international energy affairs from 2009 to 2011, reporting directly to Secretary of State Hillary ("Refreshing European Energy Security Policy: How the U.S. Can Help" March 18, 2014 http://www.brookings.edu/research/articles/2014/03/18-european-energy-security-policy-goldwyn)//JLee

The U.S. can help Central and Eastern Europe and Ukraine by refreshing its European energy security policy. The current crisis validates America's long-term policy goal of diversifying Europe's energy supply to diminish Russia's ability to use energy as a coercive tool against its neighbors. While much progress has been made, with bipartisan support, Russia still dominates Central and Eastern European (CEE) natural gas supply, and recent events call for refocusing our efforts. Stiffening the EU's spine to create a truly competitive internal energy market, promoting the efforts of the International Monetary Fund (IMF) on internal market reform in CEE countries, supporting indigenous gas production and taking steps to building a reliable energy bridge to Europe through U.S. exports should be the cornerstones of U.S. policy. While no panacea, respected U.S. energy experts have been too quick to dismiss a linkage between Europe (and Ukraine's) energy insecurity and the utility of expediting U.S. hydrocarbon exports. Indeed, a clear signal that liquefied natural gas (LNG) exports to European allies are "deemed to be in the national interest"[1] would indeed have an immediate impact on Russia's market power and help accelerate the build out of gas transportation infrastructure in Europe. The U.S. has already caused Russia to renegotiate current gas contracts and discount renewed contacts due to the displacement of LNG flows once meant for our markets. An immediate signal that future U.S. LNG exports will be available to Europe will send a message to Russia that within a few years, despite its current ability to pressure Ukraine and other nations once part of the USSR, this will no longer be possible. Expectations of future supply will impact price expectations and infrastructure investment decisions made today. Ukraine's future energy security lies in greater reverse flows of gas from Europe and well managed gas storage in Ukraine. To the extent that the firm promise of U.S. LNG exports in the 2017-2022 period sustain lower LNG prices and help finance new interconnections from LNG import terminals on the continent, Ukraine will benefit indirectly as well. Success in Ensuring European Energy Security Since 2009 U.S. policy has promoted redundant infrastructure as a cornerstone of energy security policy since the 1990s. Long gestating projects like the Baku-Tbilisi-Ceyhan (BTC) pipeline and the Southern Corridor were fundamental goals. Enhancing pipeline interconnections to move gas freely across the continent, internal pricing and efficiency reform and development of clean energy alternatives were the additional core elements. Much progress has been made over two decades. BTC is operational, Azeri gas flows to Turkey and there will be a Southern Gas Corridor (although not as ambitious as the Nabucco project), which will bring gas to Turkey, Italy, Greece and Albania. Norway is providing competitively priced gas to the continent. The European Union's Third Energy Package[2] has eliminated destination clauses (allowing free sale of gas) and should advance internal reforms. EU competition policy should restrict Russia's ability to monopolize midstream and downstream energy infrastructure as well as gas supply, including barring Russia from completing the South Stream pipeline intended to allow Russia's gas flows to bypass Ukraine. The U.S. shale gas boom, as noted above, has had the greatest impact on the competitiveness of the European gas market by creating a glut of LNG supply that has opened a spot market and driven down long-term contract prices.

Exports key to prevent Russia Expansion in the Crimea

Emmott 14—Robin is a senior correspondent for Reuters in Brussels ("Ukraine crisis gives new impetus to EU-U.S. trade talks, U.S. says" March 22, 2014 http://www.reuters.com/article/2014/03/22/ukraine-crisis-usa-trade-idUSL6N0MJ08520140322)//JLee

BRUSSELS, March 22 (Reuters) - Russia's annexation of Crimea underlines the need for the United States and the European Union to substantially deepen their economic ties, Washington's top trade official said on Saturday, opening the door to U.S. exports of natural gas to Europe. Days before U.S. President Barack Obama and EU officials hold a summit in Brussels, U.S. Trade Representative Michael Froman said the rationale "could never be stronger" for a U.S.-EU free-trade pact, despite growing public hostility to it. "Right now as we look around the world, **there is a powerful reason for Europe and the United States to come together to demonstrate that they can take their relationship to a new level**," Froman told reporters. "Recent developments just underscore the importance of the transatlantic relationship. "From both a strategic and economic perspective, the rationale for the T-TIP could never be stronger," he said, referring to the proposed accord's official name, the Transatlantic Trade and Investment Partnership. Brussels and Washington say a trade pact encompassing almost half the world's economy could generate $100 billion in additional economic output a year on both sides of the Atlantic, as well as creating a market of 800 million consumers. But since talks were launched eight months ago, reports of U.S. spying in Europe and accusations that an accord would pander to big companies have combined to erode public support. **Moscow's seizure of the Crimea region from Ukraine and Europe's reliance on Russian energy**, have focused minds across Europe about the need for stronger ties with the United States. EU leaders dedicated a summit in Brussels on Thursday and Friday to rethinking relations with Moscow and accelerating their quest to reduce the bloc's reliance on Russian oil and gas, an area where the United States can play a role. Froman laid out how European companies could export U.S. liquefied natural gas in tankers to Europe via the proposed trade accord, or possibly even before then, as France, Germany and Britain would like. Under U.S. rules, the department of energy must issue licenses to exporting companies, but license approval becomes automatic under a free-trade agreement, or FTA. "Clearly, when the T-TIP is done, assuming it is done, there will be an FTA relationship with the European Union," he said. TENSIONS OVER TARIFFS Asia is for now a more lucrative export market for U.S. liquefied natural gas, but Froman said it was also up to European companies to decide where gas goes and that exports did not depend on a transatlantic trade deal. "Even right now there have been four or five licenses approved for export to non-FTA countries. There are several European companies who are the contractors," he said, naming France's Total and GDF Suez. "Where that gas goes is up to them. Conceivably European governments have an interest in them bringing that gas to Europe," Froman said. The European Union's top two officials, Herman Van Rompuy and Jose Manuel Barroso, are expected to press Obama on the issue of energy on Wednesday when they meet in Brussels. Beyond Ukraine, other difficult issues include how to open up to each other's markets, removing barriers to business and customs duties that cost companies billions of dollars each year, particularly automakers such as Ford, General Motors and Volkswagen. Washington and Brussels are at odds over an initial exchange of offers to open up markets and cut tariffs, with both sides saying the other has not been ambitious enough. "We reaffirm that the goal of negotiations should be elimination of all tariffs. We would welcome Europe reaffirming that goal," Froman said.

Russia Expansionism leads to nuclear war

Blank 10 – Stephen Blank is a US Army War College and Strategic Studies Institute Russia Expert. ("Beyond the Reset Policy: Current Dilemmas of US-Russia Relations", Survival, October, 2010)

Here **Shvaichenko went beyond the previous line that nuclear weapons may be used to defend Russia's vital interests in a first-strike mode if the vital interests of the country are at risk or deemed to be at risk**, as stated in the 2000 military doctrine. 103 That posture translated into a peacetime strategy of using Russia's nuclear forces as a deterrent against any aggression launched against either Russia or its CIS neighbors or against Russia if it made war upon those states, as in Georgia's case in 2008. 104 In other words, the nuclear warning's strategic political purpose is to demarcate a theater of both military and peacetime operations wherein Russia would have relative if not full freedom of action to operate as it saw fit, free from foreign interference. In political terms it not only represents a "no go" sign for potential enemies, it also is an attempt to intimidate NATO allies, indicating that they will be targets of Russian nuclear strikes if they try to invoke Article V of the Washington Treaty should Russia move on the Baltic States. Given Russia's emphasis on securing a sphere of influence in the CIS, the centrality of nuclear weapons in assuring that objective works to

preclude significant reductions in that force's capability or number. Consequently in these remarks we also see a hidden or at least unnoticed mission of **nuclear weapons** for Russia. They serve to **demarcate its sphere of influence, by setting up a no-go zone for foreign military entities, for as we said the Russian elite almost unanimously believes that without such weapons the whole of the CIS would be open to NATO intervention in a crisis**. Thus **if Russia is to have a sphere of influence there it must extend its deterrence umbrella throughout it to make its claim credible and with that its claim to great or even superpower status**. Neither is Russia's professed **readiness to use nuclear weapons** confined to land-based systems. Burtsev's remarks above confirm that. This is clearly something that is clearly unacceptable as a threat to European security. Certainly **we cannot assume this to be mere rhetoric**, for as Swedish Foreign Minister Carl Bildt has long since stated regarding Russian threats in the Baltic, "according to the information to which we have access, **there are already tactical nuclear weapons in the Kaliningrad area. They are located both at and in the vicinity of units belonging to the Russia fleet." This means that Russia effectively violated the Bush-Yeltsin** Presidential Nuclear **Initiatives** of 1991–92 barring TNW from naval vessels. **Key officials confirmed this interpretation, conceding limited nuclear war as Russia's officially acknowledged strategy against many different kinds of contingencies**. 107 In September 2008, at a roundtable on nuclear deterrence, Solovtsov noted that Russia was giving explicit consideration to the concept of "special actions" or "deterring actions of the RVSN aimed at the prevention of escalation of a non-nuclear military conflict of high intensity against Russia." Solovtsov further stated that, These actions may be taken with a view to convincingly demonstrating to the aggressor [the] high combat potential of Rusian nuclear missile weapons, [the] determination of the military-political leadership of Russia to apply them in order to make the aggressor stop combat actions . . . In view of its unique properties, the striking power of the Strategic Missile Forces is most efficient and convincing in the deescalation actions. 108 This strategy also openly reflects Moscow's bizarre, unsettling, and unprecedented belief that Russia can control escalation and nuclear war by initiating it, despite forty years of Soviet argument that no such control was feasible. Meanwhile current procurements display a reliance on new, mobile, survivable, and allegedly indefensible nuclear weapons even as numbers fall. For example, Russia seeks to keep its mobile missile systems of the nuclear forces invisible to foreign reconnaissance systems while also developing means to suppress such reconnaissance and surveillance systems. 109 Accordingly, as Russian officials regularly proclaim, nuclear procurements are intended to develop missiles against which America has no defense, e.g. mobile missiles, MIRVs, and fusion, low-yield nuclear weapons that can also be used on the battlefield. Thus **nuclear weapons are warfighting weapons. Moscow's threats** from October 2009 not only follow previous doctrine, **they expand on it to openly admit that limited nuclear war is its** option or **hole card. If Russia should decide to invade or seize one or more Baltic states, then that would mean it is prepared to wage nuclear war against NATO and the U.S. to hold onto that acquisition although it would prefer not to or thinks it could get away with it without having to do so**. The idea behind such a "limited nuclear war" is that Russia would seize control of the intrawar esclation process by detonating a first strike even in a preventive or preemtpive mode and this would supposedly force NATO (or China) to negotiate a political solution that allows it to hold onto at least some of its gains. Apart from the immensity of Moscow's gamble that NATO or China will not have the stomach to retaliate for nuclar strikes, which for Moscow will be carried out to inflict a "preset" amount of damage that it believes will signal its "limited" intent, **Moscow is** essentialy **engaging in a game of nuclear chicken** or blackmail. In fact **the real risk here is that the West** will not acquiesce but rather that it **will retaliate or even escalate, further adding to the inherent unpredictability of any conceivable nuclear war scenario**.

EU needs the US to combat energy insecurity—Russia is expanding and the only place they can get natural gas without Russia blocking it

Mix 15—Derek E. Mix is an analyst in European Affairs for the Congressional Research Service ("The United States and Europe: Current Issues" February 3, 2015 https://www.fas.org/sgp/crs/row/RS22163.pdf)//JLee

Tensions between the EU and Russia have also refocused attention on the issue of European energy security. Europe is a major importer of natural gas, and over the past decade energy security has become a major European concern in the context of rising global energy demand. The EU as a whole is dependent on Russia for about one-third of its gas imports and one-quarter of its total gas and oil supplies. These percentages are expected to grow substantially over the next 20 years. For some individual countries, dependence on Russian gas is already much greater. In recent years, Moscow has increasingly sought to use energy supplies as an instrument of foreign policy leverage. Russia has actively sought bilateral energy deals with a number of European countries and acquired large-scale ownership of European energy infrastructure. At the same time, analysts assert that Russia has not applied Western standards of transparency and market reciprocity regarding business practices and investment policy. In addition, the possibility of upstream gas cutoffs, as occurred in disputes between Russia and Ukraine in 2006 and 2009, has posed a concern for many of the countries dependent on Russian natural gas supplies, especially given tensions between Russia and Ukraine over the past year. Many U.S. officials and Members of Congress have regarded European energy security **as a U.S. interest.** In particular, there has been concern in the United States over the influence that Russian energy dominance could have on the ability to present a united transatlantic position when it comes to other issues related to Russia. Successive U.S. Administrations have encouraged EU member states to reduce energy dependence on Russia through diversification of supply and supported European steps to develop alternative sources and increase energy efficiency. However, Europe faces numerous challenges in its attempts to diversify its energy supply. North Africa is often viewed as the most likely alternate supplier of natural gas, but political and economic instability in the region have thus far hindered the expansion of its role. Increased supply from Central Asia has been largely dependent on the construction of new pipelines, but among other complications, Russia has worked to prevent the development of alternative pipelines outside its control that would link Europe directly to Central Asian suppliers. Many European countries have also emphasized the development of renewable energy, but there are questions about how much of a contribution these sources will ultimately provide. European leaders have sought, with mixed success, to develop a stronger common European energy strategy that coordinates member states' energy policies. The EU has pursued initiatives to liberalize and integrate the internal European energy market, including by expanding the interconnection of grids and pipelines. Recent events in Ukraine and Crimea have created a renewed sense of urgency in relation to such efforts. Several European countries have built liquefied natural gas (LNG) terminals, expanded pipeline interconnectivity with neighbors, and developed the ability to reverse the flow of gas in pipelines in order to mitigate the consequences of a crisis, such as a cut-off of Russian gas. In April 2014, then-Prime Minister Tusk of Poland suggested the formation of an EU "energy union" in which a single European agency would purchase natural gas for all 28 members, rather than the current system of bilateral negotiations and contracts. Such an energy union would also include "solidarity mechanisms" for member states to aid one another in cases of supply disruption. Before recent events in Ukraine, the EU had already adopted legislation seeking to introduce more competition and transparency in the energy sector by "unbundling" the ownership of gas production from distribution, and requiring an independent operator of transit and transmission systems. This legislation, combined with a European Commission investigation against the business practices of Gazprom, has been sharply criticized by Russia. In December 2014, Russia announced the cancellation of the South Stream project, a pipeline that would have run from Russia under the Black Sea to Bulgaria and then onto other European countries, bypassing Ukraine. Some analysts interpreted the cancellation as a product of Russian frustration, both with EU bureaucratic obstacles to the pipeline's construction and European criticism of Russia's actions in Ukraine. Other observers suggest that these reasons provided a cover to abandon a project that had become politically and financially burdensome for Russia. Although Europe is likely to remain Russia's main gas buyer

for some years, Russia is also seeking to diversify its markets by concluding pipeline construction deals with China and Turkey.

The EU wants US LNG—the US has enough to export to the EU and prevent Ukraine Crisis

DePillis 14—Lydia is a reporter for the Washington Post ("A leaked document shows just how much the EU wants a piece of America's fracking boom" July 8, 2014 http://www.washingtonpost.com/blogs/wonkblog/wp/2014/07/08/could-a-trade-deal-lift-the-u-s-longstanding-ban-on-crude-oil-exports-europe-thinks-so/)//JLee

The European Union is pressing the United States to lift its longstanding ban on crude oil exports through a sweeping trade and investment deal, according to a secret document from the negotiations obtained by The Washington Post. It's not entirely surprising. The EU has made its desire for the right to import U.S. oil known since the U.S. started producing large amounts of it in the mid-2000s. It signaled again at the outset of trade negotiations, and its intentions have become even more clear since. This time, though, the EU is adding another argument: Instability on its Eastern flank threatens to cut off the supply of oil and natural gas from Russia. "**The current crisis in Ukraine** confirms the delicate situation faced by the EU with regard to energy dependence," reads the document, which is dated May 27. The leak comes in advance of another round of discussions on the Transatlantic Trade and Investment Partnership, which kicked off last fall and is expected to encompass $4.7 trillion in trade between the U.S. and the European Union when it's finished (here's an explainer on the deal). That won't happen for several years — if ever — but knowledge of the E.U.'s position has inflamed the already-hot debate over whether to allow the U.S.' newfound bounty of crude oil to be exported overseas. Particularly irksome to environmentalists is the EU's request that the U.S. make a "legally binding commitment" to export its oil and gas, which U.S. negotiators have so far resisted, according to the correspondence. (The U.S. Trade Representative declined to comment on a leaked document, except to say that it's too early to characterize its position on any matter). "We find it particularly outrageous that a trade agreement negotiated behind closed doors is being used as a means to secure automatic access to both crude oil and natural gas," said Ilana Solomon, director of the responsible trade program at the Sierra Club. "By lifting the ban, you're creating a whole new market for the oil industry to export to, and windfall profits for oil companies, which means more money to frack more, to produce more, to burn more." The issues of natural gas and oil are closely related, but distinct. The U.S. already allows more natural gas to be exported, especially to countries with which it already has trade agreements. Crude oil is the one thing that's remained at essentially zero exports since 1975, when Congress banned its sale to preserve access if something like the Arab oil embargo were to occur again. The U.S. has been exporting more refined petroleum products in recent years. (EIA) Now, Europe feels that it's in a similar situation. Although fossil fuel use has been declining, it's still not ready to transition to renewable energy sources, and remains heavily dependent on imported oil — 39 percent of which comes from the tumultuous Middle East and Africa, and 42 percent from the former Soviet Union. The U.S. is a huge potential source of supply, having recently overtaken Saudi Arabia as the world's largest producer of oil and gas. Also, while U.S. refiners had retrofitted their operations to process heavier oil imported from the Canadian tar sands before the fracking boom delivered a flood of new supply, Europe's refineries are well-equipped to handle it. But who, exactly, is pushing for more U.S. crude behind the EU's unified veneer? The Council of the European Union did not respond to a request for comment. Industry watchers, though, point out that Germany still depends on oil as its primary source of energy — as opposed to, say, France, which gets 75 percent of its electricity from nuclear plants (though oil still supplies about a third of its energy needs*). Half of Germany's oil comes from former Soviet Union nations, and some of it used to come from Libya before rebels shut down export terminals there (the supply only just started flowing again). Germany is very influential within the EU, and may have pushed the trading bloc to raise its voice on measures that would help it diversify its supply over the long term; the letter itself admits that there's no way to stabilize Ukraine with U.S. oil imports soon enough to make a

difference. Plus, Europe's protest isn't just about oil. It's also about messaging. The first message is external. The letter emphasizes that both parties give lip service to the idea of free trade, and America lifting its own giant violation of that principle — the crude oil export ban — would demonstrate to countries like China that the two economic superpowers are serious about tearing down barriers. "Combatting resource nationalism, together vis-à-vis third countries, while at the same time allowing for export restrictions to exist between us sends the wrong message to our partners," the letter reads, "and offers some of these resource-rich countries a great opportunity to interpret trade rules in a way which is detrimental to our economies." The second message, though, is internal: Securing additional energy supplies may help the EU negotiators to sell the agreement to their member states, especially when they might also have to give up some of their protectionist sacred cows, like the agricultural subsidies that have propped up European farmers for decades. "The Europeans really want to set a precedent, to make a point, that they want free trade and a more liquid market," says Iana Dreyer, who edits the EU trade analysis service Borderlex, where she wrote about a previous leak on the treaty's energy chapter. "After the oil shock in the 1970s, energy has been so securitized, that the mindset has really changed — now we need a big flexible global market so that nobody can control it." For its part, the White House has made some moves in recent weeks to free up some subcategories of oil for export, which excited the industry and alarmed environmentalists. And in its letter, the EU expresses confidence that automatically granting export licenses to treaty parties would "not require that the U.S. amend its existing legislation on oil and gas." It's unclear how that would happen. Senator Ed Markey (D.-Mass) — who thinks Ukraine should kick its Russian fossil fuel habit through better energy efficiency — has outlined the legal reasons why the White House couldn't just lift the ban outright through executive action. Meanwhile, however, the ban itself may be illegal under international trade law. Although no one has ever challenged the U.S. at the World Trade Organization, the American Petroleum Institute — composed of oil majors like Exxon, ConocoPhillips, and BP — intimated late last year that it might do so if the restriction isn't lifted through other means. And while the U.S. and European governments may not be on the same page on this issue, very large corporate interests on both sides of the pond see it as a top priority. "Because U.S. and European companies, including energy companies, have invested heavily on both sides of the Atlantic, U.S. and EU negotiators are essentially representing the same company interests," the U.S. Chamber of Commerce's vice president for Europe Peter Chase told Bloomberg. That legal challenge has a non-zero chance of success, says Jim Bacchus, a former chair of the WTO's appellate body who argued for the National Association of Manufacturers that natural gas export restrictions would run afoul of international trade rules as well. "Generally speaking, WTO rules prohibit restrictions on exports of any kind, unless they take the form of taxes," Bacchus says. "There has always been this notion that somehow energy products are not products that follow the scope of the WTO treaty. There's no legal basis for that view." If the ban stayed in place, however, there's no guarantee the oil would stay in the ground, as environmentalists would prefer. Rather, U.S. refineries would likely just reconfigure themselves again to process the stuff, and import less heavy oil from Canada. That's already started, and will likely move even faster if it becomes apparent that the U.S. isn't going to do what Europe wants. Overall, the effects of lifting or weakening the ban might not be as large as either proponents or opponents say — especially compared to measures like fuel efficiency standards, which have already driven down demand on both sides of the Atlantic.

--xt: NB: Russia Expanding Now

Putin is using Gazprom as an aggressive political tool to decrease democracy in the Baltics

Valkov 14—Volodymyr is a human rights activist, researcher, and political analyst, as well as a project manager at the American Jewish Ukrainian Bureau for Human Rights "UCSJ" in Lviv, Ukraine. He holds an MA in International Affairs from the Graduate Institute of International and Development Studies in Geneva. ("Expansionism: The Core of Russia's Foreign Policy" August 12, 2014 http://www.neweasterneurope.eu/articles-and-commentary/1292-expansionism-the-core-of-russia-s-foreign-policy)//JLee

Vladimir Putin's **Russia is becoming increasingly expansionist** on the international arena. **The annexation of Crimea, the naming of Ukraine's eastern regions as Novorossiya (New Russia)** using tsarist terminology, **revival of Soviet symbolism** and mythology, **the sponsorship of** terrorism and **separatism in Ukraine**, the organisation of frozen conflicts in Moldova, Georgia, Armenia **and** Azerbaijan, coercive creation of the Eurasian Union, **aggressive use of Gazprom as a political tool**, and the formulation of a right to protect Russian speakers abroad – **it is not hard to find examples of Russia's aggressive expansionism**. Russian expansionist foreign policy is clearly marked by anti-Americanism. **Russia seems to be** particularly **interested in issues that have a high potential of breaking coalitions between the United States and its European partners**. One of them is Russian facilitation of activities that expose American intelligence practices. Perhaps symbolically, Russia is reviving the direct geographical rivalry with the US as might be seen from the cancellation of Cuba's Soviet era debt, Putin's Latin American tour and the creation of the BRICS development bank, opposition to the US on Syria and repeated attempts at intensifying Russian-Chinese relations. Russia is still a backward country in the political, social and economic aspects. **Russian politics is run mostly by a network of former communists and ex-KGB officers**. Russia continues to dwell on the glory of the Soviet Union, uncertain as it may be, and victory in the Second World War. Human capital is underestimated and human life in general is one of the cheapest, most undervalued resources in Russia. Human rights do not exist in Russia and Russia's budget and export consists mainly of oil and gas revenues. Most of the budget is spent on arms acquisition. The list of Russian backwardness continues, but at this point from **what we have seen happening in Ukraine due to Russian actions compellingly indicates that Russian expansionism is a very dangerous development in the international system**. The downing of Malaysian flight MH17 also demonstrates Russia's extremely poor judgment in creating, equipping and using terrorist groups for achieving dubious foreign policy objectives. **Russian expansionism is directly opposed to the spread of democracy, especially in the former Soviet republics and even more so in Ukraine. Russian current leadership** views Ukraine as part of its own "original" territory and **considers Ukrainians as part of the same Russian people**. This position was presented clearly by Putin during a state-organised live TV call-in show in April 2014 as well as on many other occasions. The EuroMaidan is now being vilified by the Russian puppet media as a fascist coup d'état. **The Russian government is using every available opportunity to smear Ukraine's growing commitment to democracy**. One of the most disturbing examples of such government-sponsored Ukraine bashing was performed at the open-air show in Crimea on August 9th, where Ukraine was theatrically portrayed to the audience as a having been overrun by fascist forces and later gloriously liberated by Russian troops. Until the Maidan protest that united most Ukrainians in their choice for a democratic future, Russian expansionism was not clearly visible. Now, **as Ukraine is making another attempt to leave Moscow's authoritarian geopolitical orbit, overcome Soviet-era corruption and build democracy, Russia is desperate to use force in order to prevent a successful democratic transformation of Ukraine**. Ukraine's resistance to Russia has led to the greatest conflict in the post-Soviet area, surpassing the fighting during the Russo-Georgian War of 2008 in terms of infrastructure damage and casualties. Today Russia's militarism has reached its highest level. **Putin's territorial claims, distortion of history, incitement of inter-ethnic hatred, provocative preludes to war, invasive military and foreign policy doctrines, anti-democratic, anti-European and anti-American rhetoric all suggest** the following: **Putin's dictatorship is Europe's greatest threat. Ukraine's resistance to Russia's unprovoked aggression demonstrates that the dissemination and spread of democratic values works. Democracy has succeeded in Poland and it is now changing Ukraine**. Democratic and European aspirations are transforming **Georgia**

and Moldova. They will eventually work in Russia, but never under Putin's regime and only if Ukraine does not fail as a democracy. After the economic misery of the 1990s, the Russian people are distrustful of democracy. That is the fear that Putin has exploited so far to steal their liberties in return for his "effective management". Putin offers a minimum standard of living and "stability" in exchange for the curtailment of individual freedoms. **Another national fear that the Russian government is manufacturing to intimidate the society is that of democracy itself. The Kremlin seeks to show that democracy is incompatible with the Russian tradition of government, incapable to meet the needs of the Russian people, and – citing the Ukrainian example – that democracy in a weak state can bring fascists to power. Without a successful example of democracy in a country that most Russians can most easily relate to, the corrupt Russian ruling elite will continue to promote xenophobic and anti-democratic fears in the Russian society, enticing the people to accept dictatorship** as a preferred model. **The democratisation of Ukraine is the most pragmatic, realistic and affordable long-term strategy against Russia's expansionism** and authoritarian values. **The West must double its support for the democratisation of the former Soviet countries** that are showing their interest in such values. Almost 70 years of Soviet communism and 44 years of Cold War did not suddenly end in 1991. It must be clearly understood by the western countries, many of whom have little or no experience of the Soviet system, that some parts of the population in the former Soviet republics, including Ukraine, still feverishly hope for the restoration of some semblance of the Soviet Union. This is the section of population that is being used by Putin in eastern Ukraine in order to sustain his expansion. While the core of Russia's foreign policy is expansionism, the essence of its internal policy is isolation. The most recent example of the disappearing freedom of expression in Russia is the law adopted in April 2014 that requires a registration of bloggers who have more than 3000 subscribers. Another law adopted by the Russian parliament in May 2014 prescribes criminal responsibility for saying that Crimea is a part of Ukraine. Clearly, Putin's regime is intent on blocking ideas and shutting down criticism not only from outside but also from its own people. The internal restriction of political and civil rights provides an important insight. It illustrates that Russia is not only at war with the West, but also at war with itself. And it also means that the Russian-Ukrainian War is not simply a war of military muscle, but a war of values. The toughest European and American sanctions are absolutely justified and necessary to stop Russia from acquiring control over Ukraine, or parts of Ukraine, including the illegal annexation of Crimea, which must be reversed. **The occupation of eastern parts of the Ukrainian territory is evidently on the Kremlin's immediate agenda, as seen from the Russian earlier unaccomplished efforts on August 9th to send "humanitarian aid" escorted by Russian troops to the areas controlled by the Russia-sponsored** terrorists and **separatists. The repeated attempt on August 12th to deliver humanitarian aid from Russia**, which is said to consist of a convoy of 280 trucks, this time presumably cleared of any Russian military supervision and the process of its distribution **is also highly likely to become a source of provocation with the potential to create a pretext for the deployment of Russian military forces in Ukraine. If Russia succeeds in swallowing Ukraine**, or any of its parts, **by imposing its own vision of order, it will subsequently enable Russia to impose its decision-making authority over other post-Soviet states, continuing to change the map of Europe, inflaming conflict areas** in other parts of the world and professionalising terrorism.

Relations—France

**Counter-Terrorism Cooperation 1NC

Text: The United States Federal Government should substantially increase its counter-terrorism programs with the French Republic.

Terror coop solves relations

Tinti 14—Peter is an independent journalist who has written for Foreign Policy, the New York Times, the Wall Street Journal, and many other publications. ("The US and France Are Teaming Up to Fight A Sprawling War on Terror in Africa" September 15, 2014 https://news.vice.com/article/the-us-and-france-are-teaming-up-to-fight-a-sprawling-war-on-terror-in-africa)//JLee

In July of this year, France launched Operation Barkhane, an ambitious counterterrorism initiative spread across five countries in Africa's Sahel and Sahara regions. The mission seeks to build upon the success of the French military intervention that drove al Qaeda-linked jihadi militants from northern Mali in 2013, and comes at a time when the US is expanding its own counterterrorism operations on the continent, setting the stage for what some analysts consider a burgeoning Franco-American alliance in Africa. "**This is a new chapter in French-American relations**," Michael Shurkin, a former CIA analyst who is now a political scientist at the RAND Corporation, told VICE News. "**There is an unprecedented level of cooperation going on."** In an August 11 memo to US Secretary of State John Kerry and US Secretary of Defense Chuck Hagel, President Barack Obama, citing an "unforeseen emergency," authorized the transfer of up to **$10 million** "to assist France in its efforts to secure Mali, Niger, and Chad from terrorists and violent extremism." The move hints at a division of labor in which the US foots the bill for a cash-strapped French military that is both logistically and politically better placed than the US to engage in combat operations in the Sahel. An even more striking example of US-French counterterror cooperation in Africa may have taken place earlier this month, when US airstrikes in Somalia killed Ahmed Godane, co-founder of the al Shabaab Islamist group. Subsequent reporting by French magazine Le Point suggests that the actionable intelligence leading to Godane's death came from the **French**, an indication that the two nations already have mechanisms in place for tight cooperation at a highly sensitive level.

**Space Cooperation 1NC

Text: The United States Federal Government should increase its cooperation with the French Republic on Science and Technology.

CP solves—the US and France collaboration solves relations

White House 14—The White House is the house where President Barack Obama lives in. ("FACT SHEET: U.S.-France Cooperation on Science and Technology" February 11, 2014 https://www.whitehouse.gov/the-press-office/2014/02/11/fact-sheet-us-france-cooperation-science-and-technology)//JLee

The United States and France have long collaborated on science and technology, which enhances the well-being of our citizens, promotes commercial innovation and economic growth, and advances the human condition not just for our citizens, but for people across the globe. In 2008, the United States and France signed agreements on science and technology, including in the area of homeland security. Significant work has been carried out under these agreements, and the United States remains firmly committed to collaborating with France over a wide range of disciplines – including civil space, global health, innovation and research exchanges, the environment, and protecting our citizens. Hallmarks of our bilateral cooperation include: Civil Space The United States and France have a strong partnership in civil space activities, including human space flight, space science, and Earth observation. In human space flight, the French Space Agency (CNES) has been indispensable to Europe's partnership on the International Space Station, and the Government of France was a key participant in the recent International Space Exploration Forum, where spacefaring nations renewed their commitment to cooperative exploration of the solar system. CNES has been a key partner with the National Aeronautics and Space Administration (NASA) in Mars exploration over the past 20 years and continuing into the future with the MAVEN mission that will arrive at Mars later this year. The United States and France are signing an agreement for the Mars Insight mission planned for launch in 2016 and are continuing to negotiate an agreement on solar activity and space weather, both of which will push the boundaries of scientific exploration. Earth Science collaboration with France on a series of currently operating missions is improving life on Earth by enhancing our ability to observe changes in the Earth's systems, which provides such benefits as more accurate weather forecasting and increased understanding of global climate change. Global Health In 2014 and 2015, the United States and France will both host events building on the G8 Summit on Dementia, hosted by the United Kingdom in 2013. The United States and France partner on HIV/AIDS research, as well as on neurological aspects of substance abuse. The United States also continues to work jointly with France on computational neuroscience, which is part of President Obama's Brain Research through Advancing Innovative Neurotechnologies (BRAIN) Initiative. Cooperation between the U.S. government and French and American NGOs includes work to prevent meningococcal meningitis in Africa. Nearly 300 French researchers were involved in National Institutes of Health (NIH) supported grants in FY 2013. Innovation and Research Exchanges The U.S. National Science Foundation (NSF) currently supports several hundred research projects involving U.S. and French investigators. This includes 13 bilateral research projects in the areas of nanomaterials, nanochemistry, and joint multi-million dollar investments on supercomputing research infrastructure. France hosts 16 NSF Graduate Research Opportunities Worldwide (GROW) graduate research fellows, the largest number in GROW's first year, which expands international research opportunities and furthers collaborative research between our two countries. The U.S. National Institute of Standards and Technology (NIST) has worked with French partner institutions on nanometrology, metals speciation, fire research, information technology, optical lattices, and muonic hydrogen with visiting researchers from each country working in the other. Environment The U.S. Environmental Protection Agency (EPA)'s Office of Research and Development and a French cosmetics firm are investigating new screening methods that

are faster, cheaper, and reduce the use of laboratory animals and, if successful, could be used to evaluate thousands of chemicals found in commonly used products. EPA collaborated with another French firm to evaluate nitrogen and ozone air sensor performance, which contributes to efforts to advance low-cost sensor technology for monitoring air quality. Additionally, work between NIST and the University of Pau has advanced understanding of measurement of metal species, particularly in situations associated with environmental contamination.

Relations—Germany

**1nc

Text (WIP): The United States federal government should end foreign surveillance of Germany.

The counterplan solves German relations – they're down now due to the Snowden revelations

Chollet 4/6 – writer for Politico

Derek Chollet, 4/6/2015, Politico, "US-German relations need a reboot", http://www.politico.eu/article/us-german-relations-reboot/, 7/12/2015, \\BD

The Snowden revelations were the spark that ignited the current firestorm. Germans remain apoplectic over reports about US intelligence operations on German soil, especially the monitoring of Merkel's cell phone, as well as the German intelligence services' close cooperation with the NSA. This lit a large stack of kindling, with many Germans already anxious about the dominance of US technology companies like Google, the implications of American-promoted trade deals, and the sense that they are on the short-end of the US strategic shift to Asia.ð Germans discuss these concerns with an abundance of emotion, complaining of betrayal and a lack of trust. Seven years ago, more than 200,000 Germans swooned at Obama's appearance in Berlin's Tiergarten, but recent polls show that Obama's German approval ratings on foreign policy and overall favorability are plummeting.

--xt Solvency

German surveillance collapses US-German relations – the counterplan solves

Faiola 5/1 - Berlin Bureau Chief for The Washington Post Anthony Faiola, 5/1/2015, The Washington Post, "Germans, still outraged by NSA spying, learn their country may have helped", https://www.washingtonpost.com/world/europe/nsa-scandal-rekindles-in-germany-with-an-ironic-twist/2015/04/30/030ec9e0-ee7e-11e4-8050-839e9234b303_story.html, 7/12/2015, \\BD

BERLIN — The uproar shaking the halls of power here could aptly be titled, "NSA Scandal II: The Sequel." But in this latest spy drama, the nefarious Americans have a co-conspirator: the recalcitrant German intelligence service.ð Outrage in Germany over American snooping erupted in 2013, after data released by whistleblower Edward Snowden disclosed U.S. surveillance of friendly European targets up to and including Chancellor Angela Merkel. But fresh revelations suggest that the Bundesnachrichtendienst — Berlin's foreign intelligence arm, also known as the BND — may have separately aided U.S. agents with snooping on hundreds of European companies, regional entities and politicians. The targets, according to a report in the German newspaper Süddeutsche Zeitung on Thursday, included French and European Commission officials.ð The new disclosures center on a list of 2,000 suspicious "selectors" — including phone numbers, IP addresses and e-mails — provided by the United States and plugged into German intelligence data systems that the Germans later determined exceeded the operation's mandate. The German government has privately acknowledged the existence of the list to select lawmakers but has not clarified the targets, according to one of the parliamentarians briefed on the issue but who spoke on the condition of anonymity because the briefing was classified.ð After the Snowden disclosures, Merkel berated Washington by saying that spying on friends is "a no-go." The new revelations are now rocking the government to its core. A bevy of German lawmakers is demanding answers to highly uncomfortable questions, some aimed at top figures in Merkel's cabinet. Next week, they will summon intelligence officials before two parliamentary committees to testify; some are even threatening to call Merkel.

It's comparatively the largest internal link – surveillance is pushing Germany to Russia

Smith 14 – writer for NBC News Alexander Smith, 8/2/2014, NBC News, "U.S. Spy Scandal Triggers Outrage, Paranoia in Germany", http://www.nbcnews.com/storyline/nsa-snooping/u-s-spy-scandal-triggers-outrage-paranoia-germany-n170366, 7/12/2015, \\BD

A slew of allegations that Washington has been spying on longtime ally Germany has plunged Berlin's corridors of power into a state of paranoia reminiscent of the Cold War era.ð Some analysts even suggest the crisis could even end with the "nightmare scenario" of Germany being pushed away from the West and embracing Russia.ð The relationship has been rocky since NSA files leaked by Edward Snowden last year alleged that U.S. intelligence officials bugged the cellphone of Germany's leader, Chancellor Angela Merkel. Bitter memories of the Nazi Gestapo and East Germany's Stasi mean spying isn't as accepted by the public as in the U.S.ð The crisis exploded last month when two German government staffers were accused of spying for the U.S. This led to the top CIA official stationed in Germany being asked to leave the country – an **unprecedented** move between friendly nations.ð It has left sections of the German parliament, the Bundestag, taking counter-measures to make sure sensitive discussions remain private. The parliamentary committee set up to investigate NSA-type surveillance has resorted to using soundproof rooms, playing loud classical music during briefings, and even considering ditching email in favor of typewriters in a bid to protect against further breaches, its chair Patrick Sensburg told NBC News.ð Merkel's public statements on the topic have been terse and she is said to be **furious** about the breach of trust.ð "We have questions to the U.S. government and these questions are not answered yet, and maybe that's why the chief of intelligence had to leave the country?" said Sensburg, a lawmaker in Merkel's Christian Democratic Union party. "To bring back trust I think the U.S. government needs to start providing **answers**."ð According to the German newspaper Sueddeutsche Zeitung, Germany's own spies have even shifted some of their focus from old antagonists

like China and Iran to watching the clandestine activities of American operatives on their own soil.ð "The situation has become extremely bad and it is seriously regrettable it has gotten to this stage," said Professor Anthony Glees, director of the Centre for Security and Intelligence Studies at England's University of Buckingham. "With the Middle East in turmoil it is not a good time for a country that is democratic and Western to be at loggerheads with the U.S. It's not yet at the nightmare scenario - one in which Germany gets closer to Russia - but it's **heading toward that**."

Relations—Russia

**1nc

Text: The United States federal government should repeal its sanctions on the Russian Federation.

Repealing sanctions solves US-Russia relations – current sanctions fail – EU models

Wang 3/26 – School of Government, Beijing Normal University, China Wan Wang, 3/26/2015, Journal of Politics and Law, "Impact of Western Sanctions on Russia in the Ukraine Crisis", http://www.ccsenet.org/journal/index.php/jpl/article/viewFile/45567/25287, 7/12/2015, \\BD

Russia will not change its targets related to its core interests. Russia cannot lose influence in Ukraine, at least notð in letting Ukraine be a one-sided ally to the west. Therefore, on the Crimea and Ukraine issues, Russia will notð give up its position, which is bound to prompt the US and Europe to continue to impose sanctions against Russiað and to intensify the **antagonism** between Russia and the West. As stated by President Barack Obama at theð quarterly Business Roundtable meeting on December 3, 2014, "But if you ask me if I'm optimistic that Putinð suddenly changes his mindset, I don't think that will happen until the politics inside Russian catch up withð what's happening in the economy, which is why we are going to continue to maintain that pressure." "Theð challenge is [that] this is working for him politically inside of Russia, even though it is isolating Russiað completely internationally" (Expert Online, 2014, December 3). Thus, Western sanctions against Russia will notð end any time soon, which will continue to undermine **US-Russian relations**, which were uncertain even beforeð the Ukraine crisis. Currently, the EU stands in a united front with the US to impose sanctions against Russia.ð However, as the negative consequences of Russia's retaliatory measures against the EU become increasinglyð serious, the outcries to end the sanctions within the EU will get louder, and the EU may lose interest in theð sanctions against Russia along with the US. Ultimately, on the Ukraine and Crimea issues, certain compromisesð between Russia and the US-Europe must be reached; nevertheless, the US's containment of Russia will not endð soon.

--xt Solvency

Russian sanctions are the largest internal link to relations

Ibragimova 1/7 – writer for Russia direct, citing the director of the Russian International Affairs Council Galiya Ibragimova, 1/7/2015, Russia Direct, "What's next for US-Russia relations in 2015?", http://www.russia-direct.org/debates/whats-next-us-russia-relations-2015, 7/12/2015, \\BD

As the year draws to a close, it is customary for Russia Direct to poll experts about the prospects for U.S.-Russian relations in the coming year. In 2014, the military confrontation in the southeast of Ukraine and Crimea's incorporation into Russia prompted the West to impose sanctions against Russia and sharply aggravated U.S.-Russian relations. There was even talk of a new Cold War.ð Not surprisingly, when it comes to relations between the two countries in 2015, expert forecasts are not overly optimistic. However, all recognize the importance of maintaining at least a minimum level of dialogue between Moscow and Washington.ð Andrei Kortunov, general director of the Russian International Affairs Council (RIAC)ð I see no grounds to be optimistic about U.S.-Russian relations in 2015. The **main problem** will be the impact of **anti-Russian sanctions** on relations between Moscow and Washington. It is not a question of whether relations between the Kremlin and the White House will be neutral or bad, but of how bad.ð The main thing is to avert a worsening of the crisis and to try to maintain a dialogue. Issues such as combating terrorism, preventing the proliferation of weapons of mass destruction, Iran's nuclear program and Syria could provide a way to extend opportunities for dialogue.ð Environmental issues and climate change could also be points of tentative contact between Russia and the West next year. But under U.S. President Barack Obama's present administration, no one should expect U.S.-Russian relations to stabilize.

Even Putin admits the counterplan is the best way to solve Russian relations

Anishchuk 14 – writer for Reuters, citing Putin Alexei Anishchuk, 7/14/2014, Reuters, "U.S. sanctions will take Russia relations to a dead end: Putin", http://www.reuters.com/article/2014/07/17/us-ukraine-crisis-usa-putin-idUSKBN0FL2VA20140717, 7/12/2015, \\BD

Russian President Vladimir Putin warned on Wednesday that U.S. sanctions will **take relations with Russia to a "dead end"** and damage U.S. business interests in his country.ð "Sanctions have a boomerang effect and without any doubt they will push U.S.-Russian relations into a dead end, and cause **very serious damage**," he said to reporters on a visit to Brazil.ð The U.S. government on Wednesday, because of what it views as Russia's interference in Ukraine, imposed its most wide-ranging sanctions yet, on key players in the country's economy, including Gazprombank and Rosneft Oil Co, and other major banks and energy and defense companies.ð Putin said he needed to see the details of the sanctions to understand their full scope. But he added that he was sure the sanctions would damage the **national interests** of the United States in the long run.ð "This means that U.S. companies willing to work in Russia will lose their competitiveness next to other global energy companies," he said.ð Putin said the sanctions will hurt Exxon Mobil Corp which has been given the opportunity to operate in Russia.ð "So, do they not want it to work there? They are causing damage to their major energy companies," he said.ð The new sanctions also target senior Russian officials, including the deputy head of the State Duma, or parliament, the minister of the Crimea, a commander of the Russian intelligence agency FSB, and a Ukrainian separatist leader, several of whom had already been targeted by the European Union.

Russian sanctions only embolden Putin – the counterplan solves

Charap 15 - Senior Fellow for Russia and Eurasia at the International Institute for Strategic Studies based in the IISS–US in Washington, DC Samuel Charap, March 2015, Carnegie Corporation of New York, "Why Sanctions on Russia Will Backfire", http://perspectives.carnegie.org/us-russia/sanctions-russia-will-backfire/, 7/12/2015, \\BD

Fourth, by imposing sanctions on Russia when it was already falling into a downward economic spiral, Washington has given Mr. Putin a powerful political instrument to deflect blame for the consequences of his own baleful decisions in Ukraine. The Kremlin's model of "state capitalism" was already struggling and its performance would have been poor without the geopolitical upheaval that Mr. Putin has created. American sanctions arrived with perfect timing, providing him an **alibi** that he has skillfully used to confuse the Russian people about the cause of their economic woes.∂ Fifth, even if sanctions are carefully crafted to punish specific actors, ordinary Russians perceive the West's sanctions to be directed against them and it is they who are being forced to bear the real costs of soaring inflation, the ruble's collapse and slowing growth. Russians' sense that they are under attack has generated an understandable "**rallying around the flag**" phenomenon. Mr. Putin's **all-time-high** approval ratings are one result; the other is the near-complete marginalization of dissenting voices. Sadly, Sunday's march to memorialize the slain opposition leader, Boris Nemtsov, will not change this.∂ If Russia faces greater economic turbulence in the coming months and years, America could face far more intractable problems than those that exist today. Russia is likely to become more belligerent if externally inflicted economic blows deepen the country's crisis. Moreover, a deeper downturn in Russia would worsen the economic woes of the European Union, with potential knock-on effects globally.

Russian Econ Mod

Russian sanctions are collapsing Russia's economy – the counterplan is key

Wang 3/26 – School of Government, Beijing Normal University, China Wan Wang, 3/26/2015, Journal of Politics and Law, "Impact of Western Sanctions on Russia in the Ukraine Crisis", http://www.ccsenet.org/journal/index.php/jpl/article/viewFile/45567/25287, 7/12/2015, \\BD

4.1.1 The Sanctions against Russia Have Caused a **Significant Impact** on Russia's Economyð Under the sanctions, from early 2014 to the present, the ruble-dollar exchange rate has fallen by nearly 50 %; onð December 16, the rate plummeted 20 % in just one day. Russia's domestic inflation rate has been as high asð 11.4 %. Devaluation of the ruble against the dollar has been largely caused by falling oil prices. Russia's oil andð gas-related revenue accounts for approximately 50 % of revenues. The US and European countries specificallyð targeted Russia's heavy revenue dependence on oil and gas exports and focused their sanctions on the oilð industry. The international price of oil price has dropped from to $ 115/barrel in 2014 to the current price ofð approximately $ 50/barrel; oil prices plunged precipitously this past December, **severely impacting** Russia'sð heavy reliance on oil exports. Russia's foreign exchange reserves have decreased to $ 416 billion. In 2014,ð Russia's capital outflow reached nearly $ 130 billion; the Bank of Russia predicted that the capital outflow inð 2015 would be approximately $ 120 billion (Expert Onlin, 2014 December 11). Because the sanctions againstð Russia's energy, finance and defence sectors have caused tremendous capital outflows and plummeting foreignð exchange reserves, the Russian economy has been **gravely affected**; in October 2014, the international creditð rating agency Moody lowered Russia's sovereign credit rating from Baa1 to Baa2. Since 2011, Russia's annualð gross domestic product (GDP) growth rate has shown a downturn. Under the impact of the sanctions, Russia'sð GDP growth in 2014 was not very optimistic at all, being merely 0.2 % according to the estimate by theð International Monetary Fund (IMF), 0.5 % according to the Organisation for Economic Co-operation andð Development (OECD) and 0 according to the European Bank for Reconstruction and Development (EBRD).ð Russian experts have estimated the losses caused by the sanctions at approximately $4-5 billion per yearð (Inozemtsev, 2014, December 1). Economic officials believe that the long-term severe sanctions may shake theð financial system and limit scientific and technological modernization due to the restrictions in technologyð introduction, investment and application (Yurgens, 2014, October 9).

at: Sanctions Solve Russian Aggression

No risk of offense – sanctions have no effect on Russia's policies

Wang 3/26 – School of Government, Beijing Normal University, China Wan Wang, 3/26/2015, Journal of Politics and Law, "Impact of Western Sanctions on Russia in the Ukraine Crisis", http://www.ccsenet.org/journal/index.php/jpl/article/viewFile/45567/25287, 7/12/2015, \\BD

4.1.3 The Sanctions Have Not Led Russia to Change Its Position on the Issues of Ukraine and Crimeað Vladislav Inozemtsev, the director of the Russian think-tank the Post-Industrial Research Center, believes thatð the sanctions have not changed the status quo: Crimea is still under Russian control, while Russia's actions inð eastern Ukraine are mostly in response to internal factors in Ukraine rather than as a reaction to the behavior ofð the West (Inozemtsev, 2014, November 15). A senior administration official in the White House admitted that,ð despite economic indicators showing that the sanctions have crippled the Russian economy, they have notð changed the situation in Ukraine and Crimea to date. At a meeting with high-ranking military leaders onð December 19, Putin **vowed** that Russia would never abandon the patriots who supported the Crimean peninsulað (Boxun, 2014, December 21).ð Some people have thought that Russia respected the election results in Ukraine by not responding to the requestð of Donetsk in eastern Ukraine for the reunification of Oblast to the Russian Federation that was proposed afterð the referendum, indicating that the US and European sanctions have played a certain deterrent role in Russia'sð attitudes and behaviors towards Ukraine (Jian Jisong &Wang Hongxin, 2014). It is undoubtable that sanctionsð have had an impact to a certain extent. However, it should be noted that Russia might never intend to allow theð pro-Russian cities in eastern Ukraine to duplicate the Crimean annexation and eventually join the Russianð Federation. What Russia wanted probably was to maintain its influential power in the eastern region of Ukraine.ð The international sanctions led by the US and Europe have hindered the development of the Russian economy.ð However, Russia still maintains political stability domestically, and Putin's support rate has been at all-time highð levels; thus, Russia still adheres to its original positions on the Crimea and Ukraine issues.

State Budgets

**1nc

The United States federal government should pass the Marketplace Fairness Act.

The CP solves state budget shortfalls, generates economic growth, and saves the economy

Lawson 2014 (Sherry [general manager of Westlake Center]; Guest: Tax online and in-store sales equally with Marketplace Fairness Act; Jun 6; seattletimes.com/html/opinion/2023787731_sherrylawsonopedonlinesalestaxxxxml.html; kdf)

Congress needs to pass the Marketplace Fairness Act so there is real and fair competition reflecting 21st century commerce. America was built on promoting economic growth and business in a fashion that ensures fair competition for all. Today, online-only retailers are not required to charge and collect sales tax while local businesses must. However, the sales tax (in all but five states) is still owed. The collection of these taxes is difficult to enforce unless online sellers have either a physical store or a warehouse within the state. When sales tax is not collected at the time of purchase, the burden falls on the consumer to report and pay. Compliance is virtually nonexistent. Based on a recent Ohio State University study, states are estimated **to lose $23 billion a year from uncollected sales taxes on online goods**. The current sales-tax code is confusing for consumers and companies. For example, Amazon.com is now legally required to collect sales tax in 21 states, including the four most populous: California, New York, Florida and Texas. The Marketplace Fairness Act is not an additive tax. It's about ensuring all companies, regardless of the type of business, pay the same taxes. The tax disparity puts local businesses at a significant economic disadvantage **and stifles the overall economy**. According to a July 2013 study conducted by Arthur B. Laffer and Donna Arduin, federal legislation that would allow states to close the online sales-tax loopholes would result in a more efficient tax system, a larger tax base and lower tax rates for all taxpayers. This would increase states' prosperity and employment, increasing gross domestic product by more than $563 billion and adding more than 1.5 million jobs in the next 10 years. It is time for Congress to grant states the ability to correct the unfair application of sales-tax laws. How would the Marketplace Fairness Act impact our community? Westlake Center is one of the top shopping and tourist attractions in Seattle. The center contributes more than $7.1 million annually in property and sales taxes that pay for public services such as law enforcement, fire department, education and other services. Passage of the Marketplace Fairness Act would allow Westlake Center and other brick-and-mortar retailers to compete fairly with online retailers. Brick-and-mortar retailers are the economic engine that drives the local economy. The Marketplace Fairness Act passed the U.S. Senate in early May 2013 and is currently under consideration in the House. U.S. Sens. Patty Murray, D-Wash., and Maria Cantwell, D-Wash., both supported the bill in the Senate. Passing the act is simply about enforcement of current tax law. Whether you shop at a store or online, taxation should be fair.

Federal Action Key

Federal action is key to growth and jobs—ensures e-fairness

Laffler and Arduin 2013 (Arthur B [best known for the Laffler curve-- Co-Chairman of the Free-Enterprise Fund] and Donna [balanced budgets in a bunch of states]; Pro-growth tax reform and e-fairness; Jul; standwithmainstreet.com/ArtLafferStudy.pdf; kdf)

Federal legislation can also empower states to implement pro-growth tax reform. States that rely on a low rate, broad-based consumption tax have been struggling with the problem of a declining sales tax base for many years. For states like Texas, Florida and Tennessee that have eschewed an income tax, this declining base is particularly troubling. There are several drivers behind this trend including inequities in the application of state sales taxes (e-fairness); certain states offering special exemptions to certain goods; and the bias toward taxing goods and not services, despite the service sector's growing share of the national economy. E-fairness legislation addresses the inequitable treatment of different types of retailers based on whether the retailer is a.) located in the state (either a traditional brick and mortar store or an Internet/ remote retailer with a physical presence in the state) or b.) an Internet retailer/remote seller that is solely located in another state. In-state retailers collect the sales tax that is owed at the time of purchase. Out-ofstate retailers without in-state nexus are not obliged to collect the sales tax. When in-state residents purchase from out-of-state retailers, they are legally required to report these purchases and pay the sales taxes owed—typically referred to as a use tax. As you can imagine, few people do. And just so you don't go away surprised, there are some in-state retailers who also evade their collection obligations and some out-of-state retailers that do collect taxes. You may recall the story of former Tyco International Chairman Dennis Kozlowski, who, among other things, evaded $2+ million in state and local sales taxes owed to New York by having over $10 million of paintings shipped to New Hampshire instead of to his home in Manhattan.3 This narrowing of the sales tax base has led to several inefficiencies that, on balance, diminish potential job growth and growth in gross state product (GSP). This Internet exemption creates a tax-based price advantage that encourages consumers to make purchases from out-of-state retailers. Worse, the tax distortion incentivizes consumers to use in-state retailers as a showroom to evaluate purchases prior to ultimately buying the product from out-of-state Internet retailers. Such a practice reduces the need and costs for Internet sellers to put forth the effort to display products. Thus, states are incentivizing residents to burden in-state businesses with retailing costs, but ultimately purchase their goods from out-of-state businesses. Such incentives increase overall in-state retail costs and reduce overall in-state sales. It's a lose/lose situation for in-state retailers. The practice of treating in-state and Internet retailers differently has also accelerated the decline in states' sales tax bases, particularly in light of the explosive growth of Internet-based sales. As opposed to effectively controlling government spending, however, the narrowing of the state sales tax base (as a result of Internet sales estimated to be in the hundreds of billions of dollars**), has led to higher tax rates** in some instances. As with any pro-growth tax reform, the effective sales tax base should be broadened by treating out-of-state retailers on the same level playing field as in-state retailers, and the marginal tax rate should be reduced such that the total static revenues for the government are held constant or reduced. If done properly, expanding the state sales tax base by including Internet sales could reinvigorate economic growth. Addressing the e-fairness problem from a pro-growth perspective creates several benefits for the economy. An inequity is addressed—all retailers would be treated equally under state law.4 It also provides states with the opportunity to make their tax systems more efficient and to increase competition amongst all retailers. May the best business plan win, without government picking winners and losers. As a consequence of more state by state efficiencies, the overall economic growth incentives of the U.S. economy will be improved.

Solves Economy

Leading economists find that the cp leads to economic growth and jobs

Laffler and Arduin 2013 (Arthur B [best known for the Laffler curve-- Co-Chairman of the Free-Enterprise Fund] and Donna [balanced budgets in a bunch of states]; Pro-growth tax reform and e-fairness; Jul; standwithmainstreet.com/ArtLafferStudy.pdf; kdf)

Summary and Conclusion The principles behind addressing the online sales tax loophole and enacting policies that will jumpstart economic growth are straightforward: ``While online and other remote sales are subject to state and local sales and use taxes, they are often inaccurately perceived as "tax free" because the taxes legally owed on these purchases go largely uncollected by remote sellers due to a Supreme Court ruling that pre-dates the Internet. ``Sales taxes and other broad-based tax regimes with fewer loopholes and lower rates are the least damaging taxes to state economies and state employment. ``The 45 states with sales taxes could use the additional revenues from the collection of taxes on remote sales already in the sales tax base to lower other tax rates and reduce far more burdensome taxes. This more efficient system and lower taxes would, in turn: Increase state prosperity and employment on a dollar-for-dollar basis resulting in the following increases in gross state product (GSP) and state employment over a decade based upon Internet sales as a percent of projected state retail sales in 2022.

Solves state budgets

The counterplan generates upwards of $45 billion in state sales taxes

Laffler and Arduin 2013 (Arthur B [best known for the Laffler curve-- Co-Chairman of the Free-Enterprise Fund] and Donna [balanced budgets in a bunch of states]; Pro-growth tax reform and e-fairness; Jul; standwithmainstreet.com/ArtLafferStudy.pdf; kdf)

The state sales tax burden, i.e. sales tax revenues as a share of GDP (see Figure 3), has been concentrated on a declining sales tax base—retail sales as a percentage of GDP (see Figure 3). Current purchasing trends (e.g. the growing market share of Internet sales versus brick and mortar retail sales) will for sure continue if Internet sales remain effectively tax exempt. Figure 4 shows the growth in e-commerce's share of the retail trade as estimated by the U.S. Census. Over the past 13 years, while the sales tax base has been shrinking, e-commerce has been steadily growing. But clearly, factors other than e-commerce sales are at work as well. E-commerce sales account for only a portion of the loss of taxable retail sales. Linearly projecting out the current growth path of e-commerce, by 2022, 8.6% of all retail trade sales will be conducted via e-commerce, which is almost 60% larger than total sales a decade prior. Bruce et al. have produced a series of papers that estimate state and local sales tax losses arising from e-commerce for the District of Columbia and 45 states (remember there are five states without general state sales tax: Alaska—which does have local sales taxes—Oregon, Delaware, New Hampshire and Montana).ii Bruce et al. use both a baseline forecast and an optimistic forecast for e-commerce growth. In the baseline case, they estimate that annual national, state, and local sales tax losses on e-commerce would grow to $11.4 billion by 2012 for a six-year cumulative loss of $52 billion.iii According to Forrester Research, U.S. online retail sales grew 12.6% in 2010, reaching $176.2 billion. With an expected 9.6% compound annual growth rate from 2010 to 2022, U.S. e-commerce is expected to reach $530 billion in 2022.iv Second, our analysis of trends in online retailing confirms the Bruce et al. and Forrester Research assessments, albeit at a lower 2012 estimate than the Bruce 2012 estimate. Retail sales over the Internet represent a growing erosion of states' sales tax base projected out through 2022 (see Figure 4). The basis for our estimate is the U.S. Census E-Stats, which the U.S. Census uses to measure the electronic economy.v According to the U.S. Census, back in 1998, Internet retail sales held a trivial share of total retail sales in the U.S. (around 0.2%). However, as Figure 4 illustrated, this share has been growing rapidly. Furthermore, the growth in market share over time has thus far very closely followed a linear growth pattern of around 0.35 percentage points per year.vi While a constant percentage linear growth can't last forever, it sure fits well over the recent past. Some estimates are predicting faster growth. The aforementioned Forrester Research estimates predict a faster 9.6% compound annual growth rate, yet this is still not as fast as the growth in online sales may actually turn out to be. There is also another estimate that we feel is both important and realistic. Since 2000, the U.S. has gone through a period of decidedly bad economics—tax increases, out-of-control government spending, regulatory overreach, damaged trade relations and wildly expansive money creation. The consequence of these policy aberrations has been the decade plus-long underperformance of the U.S. economy. With the political changes reflected in the states and critical elections in 2014 and, of course, in 2016 as well, there is a significant possibility that the U.S. will return to sound economic policies, and, as a result, economic growth will return to its pre-2000 rate. We will use a growth rate of 3.5%, which reflects the growth between 1960 and 1999 (see Figure 1) as an alternative projection of retail sales over the coming years. Total state taxable sales are estimated to be $4.3 trillion in 2012, based on quarterly data from the U.S. Census.vii Of these total sales, 5.2% (see Figure 4), or $224.4 billion were categorized as e-commerce. In order to determine the lost state sales tax revenues through 2022 due to Internet taxable sales not being taxed, we need to estimate the total Internet retail sales through 2022. We estimated the total U.S. Internet sales tax base between 2013 and 2022 using three different methods that are summarized in Figure 5: `` The average growth rate in total taxable retail sales ($4.3 trillion) between 2001 and 2010 (2.2% per year) coupled with the growth in the retail Internet market share of 0.35 percentage points per year (2022 number is 8.6%) yields taxable Internet retail sales in 2022 of $460 billion, `` Forrester Research estimated 9.6% average growth in Internet sales applied to estimated Internet retail sales through 2022, yielding additional taxable retail sales in 2022 of $560 billion, and `` An additional estimate based on a return to prosperity being achieved in the U.S. economy over the period 2013 to 2022 (3.5% growth) yielding $520 billion in additional retail sales in 2022. Based on current market trends and forecasts, we estimate that total Internet retail sales will grow from $224.4 billion to a range of $460 billion to $560 billion by 2022. While these sales are potentially subject to the state sales tax, the questions are (a) how many of these sales are intended to be part of the sales tax base, i.e. do they or do they not fit into categories that are exempted even for in-state sales?; (b) how many of these sales that are intended to be part of the sales tax base are not currently paying sales tax to the government; and, (c) what proportion of these non-tax submitting taxable sales can be captured. There is also the question of how these sales would change if their tax status changes. Third, according to a National Conference of State Legislatures analysis, total uncollected taxes on goods and services sold via the Internet were $8.6 billion in 2010.ix Based on an average state sales tax rate (state sales tax revenues ÷ retail sales) of 5.81%, this equates to a national non-taxed Internet sales tax base of $150 billion.x The $150 billion represents close to 100% of the total estimated 2010 Internet retail sales base of $166 billion, based on the U.S. Census 2010 estimated Internet retail sales base. As an aside, it should be noted that Internet sales are not the only category of remote sales leading to the gap between theoretically taxable sales and actual sales taxes paid. It is often the case that non-electronic sales between states also go untaxed—remember our Dennis Kozlowski story on page four. In a study by Fox et al.,xi estimated uncollected taxes on non-electronic sales add up to $11.9 billion for 2012 alone. Apportioning total e-

commerce sales to each state by its share of national retail sales, the estimated Internet sales tax base multiplied by the appropriate state sales tax rate provides an estimate of revenues that each state can capture (see Figure 6.) To state the obvious, the actual implementation of taxing Internet sales is far more complicated and less certain than our estimates imply. Overall, in 2012 our estimates show that states are currently losing $13 billion in potential sales tax revenues due to Internet retailers not collecting sales taxes on taxable sales. We estimate that these losses will grow to between $27 billion and $33 billion by 2022 without corrective action. As mentioned, there is an also enormous amount of taxes due, but not paid, on non-electronic remote sales. By our estimates of U.S. retail sales growth, according to the 2001 to 2010 average growth and the 1960 to 1999 return to prosperity projections, we are currently losing a total of $25 billion in potential sales tax revenue due to both Internet retail sales taxes going uncollected and unpaid use taxes on non-electronic remote sales. Without changes being made, we estimate total uncollected sales taxes on e-commerce sales and non-electronic remote sales to grow to between $41 and $47 billion by 2022 (Figure 7.)

Solves FISM

The counterplan solves the biggest internal link to federalism—economic cooperation

Laffler and Arduin 2013 (Arthur B [best known for the Laffler curve-- Co-Chairman of the Free-Enterprise Fund] and Donna [balanced budgets in a bunch of states]; Pro-growth tax reform and e-fairness; Jul; standwithmainstreet.com/ArtLafferStudy.pdf; kdf)

Many of our closest friends believe that treating all retail sales within a state—whether in-state or out-of-state, such as Internet based—as part of the appropriate sales tax base constitutes an overall tax increase. It is clear from the data that the declining state sales tax base, some of which comes from Internet sales, has not been a means to control government spending or taxes (Figure 2). The chart below shows that states have increased taxes during the very time periods when non-taxed Internet sales were expanding. Declining sales tax bases have been exerting constant pressure to raise marginal tax rates (see Figure 3). As Figure 3 illustrates, the total state sales tax base has been in decline for many years. However, the declining sales tax base has been more than offset by rising sales tax rates (e.g. higher marginal tax rates), which have had the effect of increasing sales tax revenues as a share of gross state product. In fact, based on our estimates of the states' sales tax bases (retail sales as a percent of GDP), the total state sales tax base is down 19.4% from 1970 to the present, while the average state sales tax rate (state sales tax revenue as a percent of retail sales) has increased 40.7% over the same time period. In other words, states have been increasing the marginal sales tax rate to offset the declining sales tax base and to increase total sales tax revenues to around 1.5% of gross state product. Rising tax rates, whether at the federal or state level, are detrimental to national economic growth. With respect to the economic impact of the e-fairness proposal, states should not use an expansion of the total sales tax base as an excuse to raise the overall tax burden. In fact, as Figure 3 illustrates, the declining sales tax base has already encouraged larger percentage rises in the state sales tax rates; consequently, the correct economic policy would be to expand the states' sales tax bases, but reduce marginal tax rates elsewhere to keep total state government revenues flat as a share of GSP. Simply put, fixing inequities in the tax system, through such measures as broadening the tax base, should not be used to justify an expansion of the size of government. Opposition to addressing the inequities inherent in Internet taxes has arisen because some states may use the problem of e-fairness as an excuse to raise their state's overall tax burden. However, the states do not need Washington D.C.'s permission to change their tax rates. Just look at recent tax increases in Illinois (an increase of the state's income tax rate from 3% to 5% and an increase in the state's corporate income tax rate as well), Minnesota (new personal income tax bracket above $150,000 with a rate of 9.85% starting in 2014), California (Governor Jerry Brown's new 13.3% top personal income tax rate retroactive to Jan 1, 2012 from Proposition 30), New York (raised top income tax rates), Maryland (raised top income tax rates), Vermont, Massachusetts (Governor Deval Patrick has proposed higher tax rates on high income earners) or Connecticut (raised top income tax rates) if you don't believe us. These states know how to raise taxes, believe you me. Some states—such as North Carolina, Kansas (cut the top state income tax rate from 6.45% to 4.9%), Oklahoma (will cut the top personal income tax rate from 5.25% to 5% effective 2015), and Ohio (which recently repealed its estate tax),—have been proposing pro-growth tax reforms. More importantly, governors in Wisconsin and Ohio recently signed into law budgets that earmark all revenue from e-fairness legislation towards reducing income taxes in their state, a win-win scenario. Implementing different tax policies in different states is the essence of fiscal federalism—states should have the power to experiment with alternative approaches to fiscal policy. In other words, states should have the right to be wrong. The value of fiscal federalism does not diminish simply because some states may implement policies that are detrimental to economic growth, or in this case, use the need to address an inequity in the application of the sales tax as an excuse to expand the size and scope of government. Additionally, **mistakes at the federal level should not be justified because states might exercise the freedom of fiscal federalism and,** in so doing, implement the right policy in the wrong way. As we describe below, states are already using Internet sellers to collect sales taxes where the retailers have a nexus in the state. Furthermore, costs have been an important justification for exempting out-of-state retailers. These costs have declined significantly due to advances in technology. Legislation under consideration in Congress would lower the compliance costs further due to the requirement that states provide the necessary tax compliance software for Internet retailers. Due to the declining costs of compliance coupled with the large economic consequences created by the current Internet tax exemption, there is a strong case for out-of-state retailers to collect the state sales taxes that are owed on purchases in the same manner as local retailers.

at: Links to politics

The counterplan has bi-partisan support

Harrison 14 (JD; Online sales tax is back — and this time, it might actually have a shot at passing; Jul 21; www.washingtonpost.com/business/on-small-business/online-sales-tax-is-back--and-this-time-it-might-actually-have-a-shot-at-passing/2014/07/17/ed056016-0dd0-11e4-8c9a-923ecc0c7d23_story.html; kdf)

when the Senate passed legislation last year allowing states broader latitude to collect sales on online purchases, the proposal was immediately cast aside in the House — and there is has remained, stuck on a shelf. Until now. Suddenly, even with the midterm elections nearing, the bill's supporters believe they have found the perfect opportunity to try to push it through the lower chamber. The House last week easily approved a bill dubbed the Permanent Internet Tax Freedom Act that would renew a longstanding ban on taxing access to the Internet. Considered a must-pass proposal, the legislation would prohibit state and local governments from charging residents fees to browse the Web. So far, the bill has faced virtually no opposition. But that could soon change. A bipartisan group of senators last week introduced what they're calling the Marketplace and Internet Tax Fairness Act, which couples an extension of the ban on access taxes with their online sales tax proposal. In short, that second portion would grant states the authority to collect sales taxes from out-of-state retailers who sell and ship products to consumers within their borders. Currently, officials can only levy sales taxes on retailers who have a physical presence, be it a store or warehouse, in their states. It's an issue that has divided retailers based on how they sell their goods. Most of those who sell via brick-and-mortar stores are lobbying hard for the bill, which they say would level the playing field for all retailers. Those who sell their goods online, on the other hand, say they would struggle to monitor and collect any number of the hundreds of local and state sales tax rates that exist across the country. House Judiciary Committee Chairman Bob Goodlatte (R-Va.) has expressed the same concerns as that second camp, warning that the Senate proposal would swing the advantage in the opposite direction by confront ing online retailers with tax compliance nightmares not suffered by their brick-and-mortar counterparts. He has thus far refused to take the bill up for consideration in the House. So, in what appears to be a last-ditch effort to at least force a vote in the opposite chamber, the senators behind the sales-tax legislation will be urging their colleagues not to send the access-tax bill back without the sales-tax portion attached. Question is, will it work? Standing in their way will likely be Senate Finance Committee Chairman Ron Wyden (D-Ore.), who authored the original Internet access legislation and has called that ban and online sales tax "separate issues." Short of a change of heart from him, the Senate Democratic leadership would have to be convinced to go against the wishes of the committee in charge of online tax issues and move forward on the combined package — not impossible, but a tough sell. Should the Senate link the two measures, though, lawmakers could be headed for yet another standoff, as the current access-tax ban is scheduled to expire in November. That could force the House to decide between allowing states to suddenly start taxing Web access and swallowing the pill on the online sale tax legislation.

at: Common Objections

Common objections are hyperbolic—leading expert

Wood 2013 (Robert W [practices law with Wood LLP, in San Francisco]; Online Sales Tax Inevitable, Senate Passes Marketplace Fairness Act; Mar 23; www.forbes.com/sites/robertwood/2013/03/23/online-sales-tax-inevitable-senate-passes-marketplace-fairness-act/; kdf)

They must collect sales tax from out-of-state customers only if they have a physical presence (store, warehouse or office) in the customer's state. Since then, a growing number of states are extending sales taxes to online retailers with in-state sales affiliates. Amazon recently started collecting tax in Pennsylvania, Texas, California and Connecticut and according to the Marketplace Fairness Act website, is now allied with supporters of the bill. eBay opposes it. Some of the claims about the law are hyperbolic. Opponents say it would obliterate the physical presence standard, something they assert is a baseline protection shielding taxpayers from harassment by out-of-state collectors. It's hard to support that claim, although there's no question the law would help harmonize brick-and-mortar and online sales. Another claim is that the law would force remote retailers to interrogate their customers about where they live, look up regulations in thousands of taxing jurisdictions across the country, and then collect and remit taxes for distant authorities. See Letter to Congress: Oppose the Marketplace Fairness Act! Of course, customers already must state a delivery address, and credit card companies verify them too. Opponents also invoke ultra-complexity, claim interstate commerce will be harmed, and say online sellers will be burdened with 9,600 separate taxing jurisdictions, each with its own unique definitions, holidays, and rates. They claim the law triggers a massive expansion in state tax collection authority, dismantling a vital taxpayer protection upon which virtually all tax systems are based. Most of this is at least overstated.

States Islamaphobia CP

**1nc

The fifty state governments of the United States should end surveillance of the Muslim body.

States are currently implementing anti-Muslim policies

Khan and Beutel 14 - Co- Principal Investigator, ISPU Fellow and Lecturer in the Department of Near Eastern and Asian Studies at Wayne State University, Co-Principal Investigator and Project Manager for Islamophobia: A Threat to All Study, ISPU Policy and Research Engagement Fellow Saeed Khan and Alejandro Beutel, 2014, "Manufacturing Bigotry: A State-by-State Legislative Effort to Pushback Against 2050 by Targeting Muslims and Other Minorities", 7/15/2015, \\BD

With regard to anti-sharia specifically, iv. 630 of the total 3813 (16.5%) Republican state legislators have sponsored or co-sponsored an anti- sharia/anti-"foreign law" bill. v. And 80% of the 102 anti-sharia bills were sponsored or co-sponsored by an overlap legislator, or legislator who sponsored or co-sponsored a restrictive law in another of the six issue areas. vi. It is critical to note that the greatest overlap with anti-sharia/anti-"foreign law" legislation is not with anti-immigration laws as might be thought but with strict Voter ID laws and Right-to-Work laws. Both of these types of laws negatively and disproportionately impact African-Americans, women and Latinos. Thus, if a lawmaker wants to support legislation marginalizing the most people at one time, anti- sharia along with Voter ID and/or Right-to-Work would help to achieve that end. vii. Although the linkage between anti-immigrant and anti-Muslim advocacy is very strong, research indicates that anti-immigration law proposals are limited in number because of the high political and financial costs of implementing legislation that faces widespread opposition from religious groups and business interests alike5.

--xt: Solvency

State actions are creating a discursive policy of Islamophobia

Khan and Beutel 14 - Co- Principal Investigator, ISPU Fellow and Lecturer in the Department of Near Eastern and Asian Studies at Wayne State University, Co-Principal Investigator and Project Manager for Islamophobia: A Threat to All Study, ISPU Policy and Research Engagement Fellow Saeed Khan and Alejandro Beutel, 2014, "Manufacturing Bigotry: A State-by-State Legislative Effort to Pushback Against 2050 by Targeting Muslims and Other Minorities", 7/15/2015, \\BD

The fact that anti-sharia/anti-"foreign law" bills, the legislative vehicle for anti-Muslim sentiment, track more closely to Voter ID and Right-to-Work related bills than anti-immigration bills lends credence to the idea that the current legislative agenda is about preserving power. It also indicates that, despite the rhetoric around sharia, these legislative efforts targeting "foreign laws" are actually branches of a wider domestic policy initiative targeting the changing nature of America. Ultimately, the data supports the fact that there is deep anxiety around the changing demographic nature of American society and the approaching demographic tipping point. This is the wider domestic context in which of anti- Muslim prejudice and animus operate. In the years since 9/11, anti-Muslim sentiment has been considered more socially acceptable6 than animus directed at other racial, ethnic, or religious groups.7 Notwithstanding that American Muslims are increas- ingly working in partnership with various communities on a growing array of public policy issues,8 the narratives to counter Islamophobia have often been narrow, largely treat- ing the issue as its own isolated phenomenon—whether in- tentional or not. While not seeking to downplay the unique challenges anti-Muslim bigotry poses to American pluralism, the findings clearly suggest Islamophobia is part of a broader trend of exclusion that various minority communities have experienced, and continue to experience.

State action is key

Khan and Beutel 14 - Co- Principal Investigator, ISPU Fellow and Lecturer in the Department of Near Eastern and Asian Studies at Wayne State University, Co-Principal Investigator and Project Manager for Islamophobia: A Threat to All Study, ISPU Policy and Research Engagement Fellow Saeed Khan and Alejandro Beutel, 2014, "Manufacturing Bigotry: A State-by-State Legislative Effort to Pushback Against 2050 by Targeting Muslims and Other Minorities", 7/15/2015, \\BD

This brief summarizes ISPU research that identifies anti- 2050 resistance trends, and documents the link between anti-Muslim activism and support for other forms of bigotry by analyzing state-level laws passed and bills proposed on a number of key public policy issues. ISPU's research offers docu- mented evidence, across all 50 state legislatures, of the current lawmaking efforts, successful and unsuccess- ful to restrict or reverse the rights of various groups his- torically marginalized for their race, ethnicity, national origin, gender, sexual orientation, or religious affiliation. This report also places Islamophobia within a broader context of overlapping legislative cam- paigns that target or dispro- portionately impact the above- mentioned communities.

at: Only Fed Does Surveillance

States surveil Muslims – New York proves

Apuzzo 14 – writer for the New York Times Matt Apuzzo, 4/15/2014, The New York Times, "New York Drops Unit That Spied on Muslims", http://www.nytimes.com/2014/04/16/nyregion/police-unit-that-spied-on-muslims-is-disbanded.html, 7/15/2015, \\BD

The New York Police Department has abandoned a secretive program that dispatched plainclothes detectives into Muslim neighborhoods to eavesdrop on conversations and built detailed files on where people ate, prayed and shopped, the department said.ð The decision by the nation's largest police force to shutter the controversial surveillance program represents the first sign that William J. Bratton, the department's new commissioner, is backing away from some of the post-9/11 intelligence-gathering practices of his predecessor. The Police Department's tactics, which are the subject of two federal lawsuits, drew criticism from civil rights groups and a senior official with the Federal Bureau of Investigation who said they harmed national security by sowing mistrust for law enforcement in Muslim communities.ð To many Muslims, the squad, known as the Demographics Unit, was a sign that the police viewed their every action with suspicion. The police mapped communities inside and outside the city, logging where customers in traditional Islamic clothes ate meals and documenting their lunch-counter conversations. "The Demographics Unit created psychological warfare in our community," said Linda Sarsour, of the Arab American Association of New York. "Those documents, they showed where we live. That's the cafe where I eat. That's where I pray. That's where I buy my groceries. They were able to see their entire lives on those maps. And it completely messed with the psyche of the community."ð Ms. Sarsour was one of several advocates who met last Wednesday with Mr. Bratton and some of his senior staff members at Police Headquarters. She and others in attendance said the department's new intelligence chief, John Miller, told them that the police did not need to work covertly to find out where Muslims gather and indicated the department was shutting the unit down.ð The Demographics Unit, which was renamed the Zone Assessment Unit in recent years, has been largely inactive since Mr. Bratton took over in January, the department's chief spokesman, Stephen Davis, said. The unit's detectives were recently reassigned, he said.ð "Understanding certain local demographics can be a useful factor when assessing the threat information that comes into New York City virtually on a daily basis," Mr. Davis said. "In the future, we will gather that information, if necessary, through direct contact between the police precincts and the representatives of the communities they serve."

Space Debris CP

**EUSO CP

The United States federal government should provide funding for the Extreme Universe Space Observatory.

EUSO is the most feasible way to eliminate space debris

The Economist 2015 (Char wars; Apr 25; www.economist.com/news/science-and-technology/21649443-how-clean-up-space-shooting-down-bits-junk-char-wars; kdf)

SPACE, as the late Douglas Adams pointed out, is very big. But the bit near Earth is also very crowded. Half a century of rocket launches has turned the high frontier into a junkyard. Around 3,000 tonnes of empty rocket stages, defunct satellites, astronauts' toothbrushes and flecks of paint are thought to be in orbit. Besides being messy, such debris can be dangerous. Anything circling Earth is moving pretty quickly, so collisions between space junk and satellites can happen at closing velocities of 10km a second or more. Large bits of junk are routinely tracked by radar. The International Space Station (ISS), for instance, regularly tweaks its orbit to avoid a particularly menacing piece of litter. But at such high speeds, even a small, hard-to-follow object can do tremendous damage. Rocket scientists have been pondering how to deal with this problem for years. But a paper just published in Acta Astronautica by Toshikazu Ebisuzaki and his colleagues at RIKEN, a big Japanese research institute, has gone further and proposed actually building a test device. Like all the best ideas, Dr Ebisuzaki's plan involves zapping things with lasers. He proposes to point these lasers in the right direction using a telescope intended for a different job entirely. This is the Extreme Universe Space Observatory (EUSO). It is designed to be bolted on to the ISS. From that vantage point it will monitor Earth's atmosphere, looking for showers of radiation caused by cosmic rays hitting air molecules. Dr Ebisuzaki, however, realised that the characteristics of a telescope designed for this job—namely a wide field of view and the ability to register even fleeting flashes of light—would also be well-suited for spotting small bits of debris as they whizz past the ISS. Having identified something, the next step is to get it out of orbit—and that is where the zapping comes in. Shining a sufficiently powerful laser at something will boil away its surface. The resulting jet of vapour will, as Newton's third law of motion requires, cause an equal and opposite reaction on the object it came from, pushing that object away. Fire a laser head-on at a piece of space debris for long enough, then, and you can slow it down to the point where its orbit will decay and it will burn up in Earth's atmosphere. This idea is not new. But putting lasers into orbit is tricky. Those powerful enough to do the job need lots of electricity and this is hard to deliver with the solar panels from which satellites typically draw their power. Dr Ebisuzaki proposes instead to employ a new, more efficient laser called a coherent-amplification network device, which was developed for use in high-energy physics. He and his colleagues suggest a three-stage test. The first, with a smaller version of the EUSO and a fairly weedy laser, would serve as a proof of concept. The second would use the actual EUSO telescope and a much more potent laser. Finally, he says, the equipment could be mounted on a purpose-built satellite, from which it would be able to shoot down tens of thousands of bits of space junk every year, thus gradually sweeping the skies clean.

--xt CP Solves

Funding is the critical internal link to EUSO success – CP resolves this

Lant 2015 (Karla; How the ISS Plan s of getting rid of space debris-plans to vaporize comets in space; May 19; www.sciencetimes.com/articles/6481/20150519/how-the-iss-plans-on-getting-rid-of-space-debris-plans-to-vaporize-comets-in-space.htm; kdf)

The new Riken proposal, however, focuses on the Extreme Universe Space Observatory (EUSO). Although it was not designed for the purpose of obliterating space junk, the system, created for monitoring ultraviolet emissions caused by cosmic rays, may solve this problem. Astrophysicist Toshikazu Ebisuzaki says that use of the EUSO, which will be used on Japan's 2017 ISS module, is a good strategy. The laser system uses a Coherent Amplification Network (CAN) laser, now under development for use in atom smashers, to blast pieces of junk by vaporizing its surface. The CAN laser generates a single, powerful beam by combining many small lasers together. This in turn pushes the debris into the atmosphere with the plume of plasma created by the blast. The junk would then burn up in the atmosphere. A 100,000-watt ultraviolet CAN laser, the full-scale version of this system, would have a range of about 60 miles. It would be able to fire about 10,000 pulses per second, each pulse of a one-tenth of one-billionth of a second duration. This set of capabilities should be adequate to secure the ISS. The system's laser would need lithium-ion batteries weighing about 17 pounds. "The EUSO telescope, which was originally designed to detect cosmic rays, could also be put to use for this useful project," Ebisuzaki says. If the proof-of-concept and full-scale prototypes work, the researchers propose that a satellite version of the system be produced solely for the purpose of blasting space junk. The satellite would then orbit over both poles of the Earth. They believe it could zap about 100,000 pieces of space junk annually, one piece of junk every five minutes. Most space junk is at an altitude of about 500 miles. The satellite would start its orbit at about 620 miles and over time drift downward at about 6 miles per month until most troublesome junk was gone-in about 50 months' time. **"The biggest obstacle is funding,"** says Ebisuzaki. "There are some technical challenges, of course, but the main issue is getting funding for development and launch."

**Space Elevator CP

Counterplan: The United States federal government should build a space elevator.

Solves Debris

Edwards and Ragan 6, (Bradley Edwards, Ph.D. in Physics from the University of Wisconsin – Madison, Leaving the Planet by Space Elevator)

One strategy is to avoid the areas of space with the highest density of debris. This is not as hard as it sounds. Each of the main spaceports on Earth tends to launch rockets into the same orbits, so their debris follows that orbit too. We can track great circles of debris in space that originate from Cape Canaveral, Baikonur, etc. Much debris follows the Equator, noting the number of satellites that are lifted into geostationary orbit above the Equator. Therefore, by selecting an anchor point for the Earth Port away from the Equator and common rocket orbits we will reduce the potential amount of debris that our ribbon encounters. (Also, in the event that anyone still launches rockets anymore, we really don't want our ribbon cutting through the likely trajectory!) A more proactive strategy is to clean up the mess. With our Elevator having reduced the cost of deploying into space, maybe we could deploy a catcher-satellite, equivalent to a gigantic carbon nanotube garbage bag, to orbit the Earth and gradually collect the debris.

Solves Asteroids/communication/weather/spacecol

Edwards and Raitt 4, Bradley Edwards, Ph.D. in Physics from the University of Wisconsin – Madison, David Raitt, Senior Technology Transfer Officer, Technology Transfer & Promotion Office, European Space Agency, "THE SPACE ELEVATOR: ECONOMICS AND APPLICATIONS", "http://images.spaceref.com/docs/spaceelevator/iac-2004/iac-04-iaa.3.8.3.09.raitt.pdf")

The Space Elevator will be capable of placing into various orbits, including LEO and GEO and beyond, large payloads such as very long optical booms, huge radio dishes, complex planetary probes, and manned modules including hotels and penal colonies. It will be particularly suited to oversized, awkwardly-shaped and/or fragile structures and components since there will be no restrictions on size (up to a point, of course), nor will the payloads be subject to launch forces. This in turn implies that spacecraft can be constructed more cheaply since delicate components will not need to be protected against vibration to the same degree. Examples of payloads and applications include telescopes, interplanetary spacecraft and probes, Moon and Mars access, space tourism, power beaming, asteroid mining, telecommunications, weather stations, and asteroid detection to mention but a few. And no doubt the military will also be interested for its own activities.

Solves Warming

Edwards and Raitt 4, Bradley Edwards, Ph.D. in Physics from the University of Wisconsin – Madison, David Raitt, Senior Technology Transfer Officer, Technology Transfer & Promotion Office, European Space Agency, "THE SPACE ELEVATOR: ECONOMICS AND APPLICATIONS", "http://images.spaceref.com/docs/spaceelevator/iac-2004/iac-04-iaa.3.8.3.09.raitt.pdf")

One major use envisioned at the outset is that of launching solar energy platforms which will collect the limitless energy of the sun and beam it down to Earth for a constant source of clean, renewable power. This would have enormous implications for the environment and sustainable development by cutting fossil fuel consumption and thus eliminating harmful greenhouse gases. It would also avoid the necessity of constructing tall solar towers which, of necessity, have huge ground footprints. The solar tower under development in Australia, for instance, will have a collector nearly 6km in diameter and require over 50 square kilometers for the construction.

Solves Disease and Famine

Edwards and Raitt 4, Bradley Edwards, Ph.D. in Physics from the University of Wisconsin – Madison, David Raitt, Senior Technology Transfer Officer, Technology Transfer & Promotion Office, European Space Agency, "THE SPACE ELEVATOR: ECONOMICS AND APPLICATIONS", " http://images.spaceref.com/docs/spaceelevator/iac-2004/iac-04-iaa.3.8.3.09.raitt.pdf")

In a period when the days of the ISS seem numbered, the Space Elevator could step in to fulfill the promise of providing facilities to test and develop new drugs and materials in microgravity. Specialist automated labs could be placed at various locations adjoining the ribbon to create and manufacture components for the pharmaceutical and electronics industries. Other labs could house space gardens to grow plants and crops – not only to develop improved varieties for terrestrial use, but also to provide food for people living and working in space.

TTIP

**Econ

Test: The United States Congress should pass the Transatlantic Trade Investment Partnership.

The CP Solves the global economy—doesn't link to politics

Lejour, Mustili, Pelkmans, and Timini **14**- (Arjan Lejour is Programme Leader in Public Finance at CPB Netherlands; Federica Mustilli is Researcher at CEPS; Jacques Pelkmans is Senior Fellow at CEPS and Professor at the College of Europe; and Jacopo Timini is Researcher at CEPS. The views expressed in this report are those of the authors only and do not necessarily represent those of CEPS or CPB Netherlands.) "Economic Incentives for Indirect TTIP Spillovers", No. 94 / October 2014 [TTIP Series No. 2], Center for European Policy Studies, 2014, pdf,//droneofark

The Transatlantic Trade and Investment Partnership (TTIP) negotiations take place between two of the three biggest economies in the world and over a very wide spectrum of regulatory and trade policy domains. They cannot therefore be seen in isolation. One major issue is whether TTIP engenders spillovers to third countries. This CEPS Special Report represents a first attempt to understand the underlying economics of such spillovers. The idea is that TTIP, in setting regulatory practices for the North Atlantic, which reduce costly regulatory divergence, may apply on a MFN (most-favoured-nation) basis, or even that new TTIP regulatory 'standards' might be adopted by third countries, which thereby can reduce the nontariff barriers (NTBs) for their exports to TTIP economies. Both imply positive spillovers. Whilst there is some talk about spillovers from the regulatory accomplishments of TTIP to third countries, there seems to be no economic theory or analysis helping negotiators or observers to appreciate the drivers behind such spillovers. The only simulation of the impact of TTIP that has incorporated positive spillovers (Francois et al. 2013) does not offer any further insight in this respect; all it does is to stipulate an arbitrary 'size' of spillovers without any further explanation. Therefore, the present authors seek to provide some simple empirical economics to appreciate the incentives for spillovers. Even if the relative economic significance of the EU and the US together in the world economy is shrinking steadily, in many respects they undoubtedly remain preponderant economic powers: their joint size of world goods trade is impressive (in 2013, the EU imported €196 billion in goods from the US and exported €288 billion to the US), similarly in services trade (in 2012, the EU imported €149 billion and exported €160 billion) and their dominance in foreign direct investment (FDI) stocks is overwhelming (in 2012, EU inward stocks from the US amounted to €1.53 trillion while outward stocks to the US amounted to €1.65 trillion).1 This preponderance and their former leadership in the World Trade Organization (WTO) bring with it a special responsibility when embarking upon TTIP. A deep, comprehensive and ambitious FTA-plus over the North Atlantic should not undermine or otherwise negatively affect the WTO and its signatories. This is not so much a question of violating the rules (as the EU and the US can be expected to stick to WTO rules) but rather of the 'regionalisation' of new, especially regulatory, frameworks and the risks of generating new forms of trade diversion that disadvantages third countries. Beyond a general but vague awareness, expressed in trade diplomacy, the debate on the possible economic impact on third countries has hardly taken off. In particular, positive spillovers remain at best speculative. Countries such as Turkey and Mexico have understood the danger and both the US and the EU have opened or intensified their bilateral trade policy channels to keep these governments posted and reflect on further initiatives. Given the preponderance of the US and the EU together, it is therefore crucial that efforts are undertaken to reduce or pre-empt any such negative effects and stimulate positive spillovers. This report has a modest purpose. It seeks to complement the empirical economic study underlying the Commission's Impact Assessment of TTIP (Francois et al., 2013), which – rightly – introduces the possibility of TTIP generating (positive) spillovers for third countries, both direct and indirect. The simulation by Francois et al. (op. cit.) without these spillovers results in small but non-trivial negative effects on trade and GDP for the third countries included. These negative effects disappear or become positive once the spillovers are included. However, Francois et al. (2013) do not explain or model these spillovers; their size is merely (and arbitrarily) postulated as respectively 20% of the NTB reduction for direct spillovers and 10% for indirect ones. In our report on the Francois et al. (2013) study for the European Parliament Committee on International Trade (INTA) (Pelkmans et al., 2014),2 we have already pointed out that spillovers should be far better understood and that the incentives for third countries to align with TTIP and hence enjoy indirect spillovers ought to be analysed. The present Special Report provides some elementary quantification, which helps understand the incentives for third countries to seek either individual or (perhaps) plurilateral alignment with TTIP's regulatory aspects where relevant, and for which TTIP should be 'open'. The regulatory options and mechanisms which would facilitate both direct and indirect spillovers

to third countries have to be treated in another study. The following focuses merely on rather aggregate economic incentives, not on the various modalities of regulatory cooperation in TTIP. The structure of the present report is as follows: Section 2 defines spillovers more precisely and sets out how spillovers have been quantified in Francois et al. (2013). Sections 3 and 4 propose a possible way to identify potential spillovers for a specific country. In particular, Section 3 analyses which countries, divided into three distinct groups, are most likely to be influenced by the negotiations according to the geographical trade pattern. Section 4 sheds light on which are the most sensitive sectors in each country to this influence. Both sections take advantage of the adoption of the global value chain approach. Section 5 concludes.

**Relations

Test: The United States Congress should pass the Transatlantic Trade Investment Partnership.

The CP boosts US relations and soft power—Solves the aff

Hamilton and Quinlan, 15- (Daniel S. Hamilton and Joseph P. Quinlan are Director and Senior Fellow, respectively, at the Johns Hopkins University Center for Transatlantic Relations, and co-authors of The Transatlantic Economy 2015 (Washington, DC: Center for Transatlantic Relations, 2007)) "More than trade, TTIP leads to confident Atlanticism" Euractiv.com, March 18, 2015 http://www.euractiv.com/sections/trade-society/more-trade-ttip-leads-confident-atlanticism-313006 //droneofark

The US-EU Transatlantic Trade and Investment Partnership (TTIP) is generating more heat than light when it comes to most European debates, which tend to cast TTIP as yet another free trade agreement. Yet TTIP is about more than trade. It is about creating a more strategic, dynamic and holistic US-EU relationship that is more confident, more effective at engaging third countries and addressing regional and global challenges, and better able to strengthen the ground rules of the international order. To the extent that TTIP can help generate jobs, spark growth and reinvigorate the US and European economies, it promises to renew confidence among publics and elites and ameliorate some of the political dysfunction afflicting many Western societies. Greater confidence and economic vigor at home, in turn, has the potential to increase the magnetic pull of Western values elsewhere, underwrites US and EU diplomatic capacity, and enhances possibilities for strategic outreach. TTIP can also reassure each side of the Atlantic about each other. Europeans are more likely to have greater faith in America's security commitments if they are anchored by strong trade and investment links. TTIP would be an important US validation of EU legitimacy, while reassuring Americans that the EU is looking outward rather than inward. TTIP can be an assertive, yet not aggressive, means to defend and advance basic values shared across the Atlantic. TTIP's fundaments are those of democratic societies rooted in respect for human rights and the rule of law. The US and the EU are among the few entities that include basic labor, environmental and consumer protections in their trade agreements. They boast the two most sophisticated regulatory systems anywhere. An agreement that commits both parties to sustain and uphold such principles and protections, not only vis-a-vis each other but together around the world, would be a strong affirmation of common values and a powerful instrument to ensure that such standards advance globally. Second, TTIP is important in terms of how the transatlantic partners together might best relate to rising powers. Whether those powers choose to challenge the current international order and its rules or promote themselves within it depends significantly on how the US and Europe engage, not only with them but also with each other. The stronger the bonds among core democratic market economies, the better their chances of being able to engage rising partners as responsible stakeholders in the international system. The looser or weaker those bonds are, the greater the likelihood that rising powers will challenge this order. TTIP has particular meaning for US and EU relations with China. TTIP is lazily portrayed as an effort to confront and isolate China. Yet is less about containing China than about the terms and principles guiding China's integration and participation in the global order. China's burgeoning trade with both the United States and Europe attests to US and EU interest in engaging China, not isolating it. Yet Beijing has yet to embrace some basic tenets of the international rules-based order. TTIP, TPP and related initiatives are important instruments to help frame Beijing's choices -- by underscoring China's own interests in an open, stable international system as well as the types of norms and standards necessary for such a system to be sustained. TTIP is also important with regard to US and EU relations with Russia and Eurasia. TTIP is a values-based, rules-based initiative that is likely to strengthen Western economic and social cohesion, reinforce US commitment to Europe, strengthen transatlantic energy ties, and

contribute to greater attractiveness of the Western model. TTIP would also bolster the resilience of central and east European economies, stimulate US investment and enable such countries to more easily resist Russian encroachment. These changes are likely to resonate across Wider Europe, especially Ukraine, Moldova, Georgia and even Belarus. This is anathema to the current leadership in the Kremlin. TTIP presents a huge challenge to the Kremlin's efforts to divide Europeans from Americans. It offers something that the Kremlin cannot match: a transparent, mutually beneficial agreement that creates a rules-based framework for international cooperation. A reinvigorated transatlantic marketplace among highly-connected, highly-competitive democracies, whose people enjoy greater economic growth and rising standards of living, would challenge the Kremlin's version of ''managed democracy'' and render Russia's own one-dimensional natural-resource-based economic model unattractive. Greater US-EU energy cooperation would blunt Russia's monopolistic approach to European energy markets. And if such benefits extended to non-EU neighbors, particularly Ukraine, Russians themselves are likely to ask why their own country can't be better run. Third, TTIP can help strengthen the international rules-based order. Europeans and Americans share an interest in extending prosperity through multilateral trade liberalization. But the Doha Round is stuck and the WTO system is under challenge. EU and US officials are using TTIP to unblock the WTO Doha negotiations, jumpstart multilateral negotiations, and extend the multilateral system it to new areas. TTIP could result in clearer, transparent rules of origin that could facilitate global trade and serve as a common public good. It could pioneer new ways to ensure high standards for consumers, workers, companies and the environment while sustaining the benefits of an open global economy. Without TTIP, Americans and Europeans could become standard-takers rather than standard-makers. Getting a TTIP deal will be tough. Yet if we grasp the moment, America's first 'Pacific President' and his EU partners may well become best known for having re-founded the Atlantic Partnership. If we do not, then issues of failing trust and confidence, so visible today, will continue to eat at the relationship like termites in the woodwork.

--XT Solves Rx/at: Links to Politics

The CP solves relations better than the aff- doesn't link to politics

Lejour, Mustili, Pelkmans, and Timini **14**- (Arjan Lejour is Programme Leader in Public Finance at CPB Netherlands; Federica Mustilli is Researcher at CEPS; Jacques Pelkmans is Senior Fellow at CEPS and Professor at the College of Europe; and Jacopo Timini is Researcher at CEPS. The views expressed in this report are those of the authors only and do not necessarily represent those of CEPS or CPB Netherlands.) "Economic Incentives for Indirect TTIP Spillovers", No. 94 / October 2014 [TTIP Series No. 2], Center for European Policy Studies, 2014, pdf,//droneofark

For present purposes, we focus solely on a more aggregate approach for trade policy-makers and regulators of any country X having important economic intercourse with the TTIP twins. The most obvious and important incentive is found in mutual trade relations, possibly in combination with FDI stocks both ways. In the following, we assume that the relative importance of aggregate goods trade with the TTIP partners is a reasonable first proxy of a third country's incentive to consider 'alignment' of its rules and regulatory practices on goods with TTIP. We focus on goods trade, not services, because much of the regulatory cooperation in the High Level Group Report5 is about goods trade. Before moving to the analysis of each sector, we first provide a general picture where we select candidates potentially interested in joining TTIP at a later stage or that can be influenced by its outcome. The main variable underlying trade incentives is the "domestic value added embodied in the foreign final demand" as a percentage of the total value added produced by the exporting country. The reason why we prefer this variable to the classical gross exports figures is explained in Box 1. Countries have been clustered in three groups: first, we considered the so-called 'closest neighbours', including those countries already linked to the TTIP twin through legal and deep commercial trade relations, namely NAFTA for the US, and Switzerland, Iceland, Norway and Turkey for the EU. Before inspecting the data, we expect a strong interest from those countries in the negotiations induced by the existing deep trade relations. A second group includes important commercial players according to their relative contribution to global trade, namely: Brazil, China, India, Indonesia, Japan, Republic of Korea, South Africa (defined as the seven 'biggest traders', other than TTIP itself).7 A third group consists of 'other developed open economies', namely, Australia, New Zealand, Singapore, Hong Kong, Israel and Chile, which, in the WTO, can never hope to be 'principal traders' that assume leadership on regulatory regimes, but are keen to benefit from effective market access to TTIP.8 The following simple exercise shows that spillovers – quite apart from their specific regulatory substance – are incentivised far more in NAFTA and in Europe with the EU's closest economic neighbours (Switzerland, Iceland, Norway and Turkey) than in the second and third groups of world traders. Specifically, with Turkey, Switzerland, Iceland and Norway the EU already has credible channels for regulatory convergence and a lot of harmonisation and standardisation has already taken place.9 In NAFTA, regulatory convergence used to be no more than marginal, but both Mexico and Canada now have active Regulatory Councils with the US. Table 1 shows that 'closest neighbours' have export shares in terms of domestic value added embodied in the foreign final demand for TTIP (in their world goods exports) ranging from 56% to 74%, which would seem to reflect powerful incentives to seek effective forms of regulatory accommodation with TTIP. There is no obvious basis to define a critical aggregate threshold beyond which a third country would be incentivised or not; it is probably not a binary issue anyway. Indeed, an aggregate threshold might be inappropriate as the practical approach for alignment will likely be sectoral, in combination with some broader regulatory cooperation principles and some institutional arrangements. But 56% to 74% shares are so high that one may speak of TTIP dominance in trade relations. If these trade shares are combined with the overall merchandise trade openness of countries, the TTIP openness share is about 37%; only for Turkey is it much lower (22%).10 The latter result is not surprising, because Turkey is also orientating itself towards the Middle East and former Soviet Union countries. Often, trade openness is combined with strong relations in markets via FDI stocks that further strengthen the impetus. This TTIP 'dominance' is, in part, the result of accomplished, 'deep' market integration, underpinned by strong obligations of 'negative integration' and, depending on the case, some or even far-reaching agreements on positive integration, especially regulatory ones (more in Europe than in North America). In other words, regulatory and institutional relations inside NAFTA are developing and,

inside Europe, are already advanced, which should make it feasible to find acceptable accommodation sooner or later, or even renders it conceivable that TTIP would be extended in some chapters to the 'closest neighbours'. The global debate on spillovers might well be more focused on the second and third groups, which do not have anywhere near the same depth in regulatory convergence in goods trade. Table 1 shows that the 'other developed countries' score TTIP shares of between 24% (Australia) and 57% (Israel). The overall TTIP openness varies from 8% (for Australia) to 138% (for Hong Kong). Concerning the group of the seven biggest commercial partners, TTIP shares vary from 31% (Indonesia) to 49% (China), while the TTIP openness of Korea and South Africa more or less matches that of Turkey. In particular for Brazil, India, Indonesia and Japan, it does not seem likely that their shares would give enough incentive to initiate a process of domestic re-regulation for the purpose of effective market access only to TTIP. This is also the case for Australia and New Zealand.

Warming (Carbon Taxes)

**Shadow Taxes CP

The United States federal government should establish a committee to explore the feasibility of carbon shadow pricing by the federal government.

The CP is the first step to solve warming

Morris 2015 (Adele [a senior fellow and the policy director for the Climate and Energy Economics Project]; Why the federal government should shadow price carbon; Jul 13; www.brookings.edu/blogs/planetpolicy/posts/2015/07/13-carbon-footprint-governement-shadow-prive-morris?rssid=LatestFromBrookings; kdf)

A First Step One potential first step would be to establish an expert committee and/or interagency process to explore the feasibility of carbon shadow pricing by the federal government. The committee could examine which kinds of federal expenditures and operations are best suited to shadow pricing, and which sources of emissions (direct and indirect) could be reasonably priced. The committee could review methods used by the private sector for possible application in the federal government and consider which federal agencies, such as DOE, OMB, CBO, and GSA, are in the best position to provide leadership for the endeavor. It would also think through potential budget implications and how shadow pricing could be piloted or phased-in across the government. The committee could also analyze options for how to set an appropriate shadow price trajectory, such as whether the price should be tied to the social cost of carbon the government uses for regulatory analysis or a path that minimizes the cost of achieving a long term cumulative emissions goal. The committee could also propose metrics for monitoring the emissions performance of the policy and, potentially, identify more costly abatement measures the federal government could consider phasing out. Finally, the committee could suggest ways to engage contractors, companies with carbon shadow pricing experience, and other stakeholders in the process to amplify the broader benefits.

--xt Solves Warming

Federal government leadership is sufficient to spark large scale carbon shadowing

Morris 2015 (Adele [a senior fellow and the policy director for the Climate and Energy Economics Project]; Why the federal government should shadow price carbon; Jul 13; www.brookings.edu/blogs/planetpolicy/posts/2015/07/13-carbon-footprint-governement-shadow-prive-morris?rssid=LatestFromBrookings; kdf)

The Role for the Federal Government The U.S. federal government has two key leadership opportunities here. First, the government could shadow price its own emissions in ways analogous to those used by companies but customized to the particular needs of federal agencies. For example, in analyzing energy efficiency retrofits to federal facilities, agencies could use energy prices that take into account the carbon intensity of the fuels and electricity involved, thus economizing on energy where the emissions benefits are highest. This would help manage the federal government's fiscal risk as a major energy user, harmonize abatement incentives across agencies, and rationalize federal investments across competing objectives.[1] Second, the government could use the process by which it develops its shadow pricing policy to catalyze an even broader public discussion. Although hard to quantify, the spillover potential of the federal government's leadership could be substantial as it would raise the profile of shadow pricing, provide practical approaches that other entities can adopt, and further prove the principle that carbon pricing can cost effectively reduce emissions. At the very least, the policy would draw the attention of the firms that receive the over $500 billion in federal contracts annually. With thoughtful stakeholder outreach, the impact could be even broader.

This solves warming

Morris 2015 (Adele [a senior fellow and the policy director for the Climate and Energy Economics Project]; Why the federal government should shadow price carbon; Jul 13; www.brookings.edu/blogs/planetpolicy/posts/2015/07/13-carbon-footprint-governement-shadow-prive-morris?rssid=LatestFromBrookings; kdf)

A growing number of companies are putting a shadow price on carbon to reduce their carbon footprint cost effectively. Shadow pricing is method of investment or decision analysis that adds a hypothetical surcharge to market prices for goods or services that involve significant carbon emissions in their supply chain. For example, if a firm is analyzing acquisitions of new energy-using equipment, it would use expected energy costs of expected market prices plus a charge associated with the carbon dioxide that would be released when the fuel is combusted. Shadow prices can apply in all sorts of analyses of investments, procurements, and other strategic decisions to give an edge to options that are more emissions-efficient, other things equal. These decisions then allow firms to reduce their emissions gradually up to the incremental cost reflected in the carbon price they apply. Why would companies do this? Economists widely argue that imposing a price on greenhouse gas emissions, such as through a tax on the carbon content of fossil fuels, is a crucial measure to control the growing risk of global climatic disruption. Carbon shadow pricing is an explicit way to anticipate such future policies and avoid stranded or inefficiently allocated capital. By analyzing capital expenditures and other important corporate plans with an eye to future regulatory or tax conditions, firms can manage the economic risk of a carbon-constrained future and assure shareholders and the SEC they are appropriately forward-thinking. This is particularly important for companies that invest in energy-intensive long-lived facilities such as power plants and oil refineries. Second, shadow pricing is a concrete way to signal to investors and the public that a firm takes its commitment to climate change mitigation seriously. It can also induce more consistently cost-effective abatement than alternative approaches such as targets for renewable energy procurement or internal energy efficiency standards. A 2013 report by CDP (formerly the Carbon Disclosure Project) identified over thirty companies —including large electric utilities, major integrated energy companies, technology companies, airlines, and more— that set an internal price on greenhouse gas emissions associated with their activities. Gradually, standard approaches for

carbon shadow pricing are emerging, but methodologies are not nearly as developed for shadow pricing as they are for greenhouse gas emissions inventories. The price per metric ton of carbon dioxide emissions that firms apply ranges between about $6 to $60, and their approaches vary by year, scope of coverage, and pricing methodology. **Companies that wish to adopt shadow pricing have few public examples of how to do it.**

**Carbon Taxes –Revenue Neutral

Counterplan: The United States Federal Government should institute a revenue-neutral tax on the carbon dioxide content of fossil fuels, at a rising statutory rate based on the social cost of carbon dioxide emissions.

A carbon tax is fair and guarantees a transition into a sustainable economy

Reitze 2009 (Arnold W [Prof of Law @ U of Utah, prof emeritus of law @ George Washington]; Federal Control of Carbon Dioxide Emissions: What are the Options; kdf)

Coal is a mixture of various chemicals. A typical coal molecule is C[13]H[10]O. Gasoline also is a mixture of hydrocarbons. Indoline is a common fuel and is expressed as C[7]H[13]. Natural gas is a mixture that may contain ethane (CH[3]CH[3]), propane (CH[3] CH[2] CH[3]), butane (CH[3] CH[2] CH[2] CH[3]) or other similar gases. The ratio of carbon to hydrogen bonds is about thirteen to ten for coal, seven to thirteen for gasoline, and two to five for butane. Because coal has fewer hydrogen atoms per carbon atom than oil or natural gas, it produces more carbon dioxide per Btu than the other fossil fuels. Because the carbon to hydrogen ratio varies among fuels, a carbon tax should be imposed on natural gas, petroleum and coal in a ratio of approximately 0.6, 0.8 and 1 per Btu respectively. This means that a carbon tax would impact those who use coal far more than users of petroleum or natural gas. To produce a kilowatt hour of electricity results, on average, in emission of 0.57 lbs of carbon from coal, 0.54 lbs of carbon from petroleum, and 0.36 pounds of carbon from natural gas. n129 The carbon from any fuel reacts with [*21] oxygen in the air in a three to eight ratio by weight. n130 Thus, for example, burning a gallon of gasoline weighing 6.32 pounds will release 5.47 pounds of carbon, which will combine with oxygen to create a little over twenty pounds of CO[2].¶ In the United States we tax labor and savings, which are activities that we should seek to encourage. Taxes should be imposed on activities we wish to discourage, such as pollution and fossil energy use. The impact that carbon taxes would have on the national economy depends primarily on how the revenues from the tax are used, and what other taxes are affected. Taxes on GHGs could be developed that are revenue neutral. The best approach would be to return the money collected equally to every citizen. Those who purchased less than the average amount of energy would benefit financially. Ultimately, the economic and environmental benefits of a pollution tax are determined by how it is designed and implemented. n131 An ideal tax would be set at the lowest amount that modifies behavior but that does not have an unacceptable adverse impact on those subject to the tax. n132 This may not be possible to accomplish.¶ A carbon tax has advantages and disadvantages, but its advantages make this approach a useful policy choice. n133 It would promote fuel efficiency, provide a wide variety of opportunities for energy conservation, and be "resilient and equitable" because its impacts would be diffuse, thus easing the burdens on sensitive sectors of the economy such as the automobile and farming industries. n134 A carbon tax would be less regressive than other energy taxes, such as a gasoline tax, because the "wealthy consume a greater share of electricity and 'intermediate energy' from manufactured goods than gasoline." n135 A tax on coal, petroleum and natural gas would be shared more equally and generate the same revenue as a much larger gasoline tax. The disadvantage of a carbon tax would be its disproportionate effect on the coal industry and [*22] their customers because coal contains more carbon than other fossil fuels of equal heat values. n136 Coal is produced domestically, and reducing its use would adversely impact the U.S. economy.

--xt Commitment Solves

The counterplan demonstrates maximum commitment – only solution to warming
Reeves 2015 (Richard [Senior fellow of Economic Studies @ Brookings]; Carbon taxes as commitment devices; Apr 14; www.brookings.edu/research/opinions/2015/04/14-carbon-taxes-commitment-devices-reeves?rssid=LatestFromBrookings; kdf)

The economic and environmental cases for a carbon tax are very strong. A carbon tax could help to raise productivity in key sectors, as well as helping to reduce emissions, as William Gale has pointed out on these pages and Adele Morris has argued in a series of papers.ð Carbon taxes attract proponents from commentators on the political left and political right, but few expect to see a national carbon tax anytime soon (indeed, the best hope may now be at the state or metro level). This is because the short-term politics are difficult. Climate change is an example of a myopic policy area, requiring long-term decisions but vulnerable to short-term political pressures.ð Since the costs of heating the planet will be incurred at some uncertain point in the future, the temptation to delay any action is strong: especially when it involves short-term political pain. So the gas can gets kicked down the road.ð As economist Alan Blinder puts it in Foreign Affairs:ð "Myopia is a serious practical problem for democratic governments because politics tends to produce short time horizons -- often extending only until the next election, if not just the next public opinion poll. Politicians asked to weigh short-run costs against long-run benefits may systematically shortchange the future."ð Energy and climate change policy is such a practical problem. It is also an area where consistency and reliability in policy is substantively important, most obviously in terms of capital allocation. As I argue in a new paper, Ulysses goes to Washington, one solution to the problem of myopia is a policy commitment device, that binds policy-makers to a long-term path. These devices include institutions (eg. the Fed, or the Base Closure and Realignment Commissions) and the setting of goals (eg. withdrawing from Afghanistan by 2014).ð A key feature of a policy commitment device is exit pain. Byran, Karlan and Nelson define a commitment device as, "An arrangement entered into by an agent which restricts his or her future choice set by making certain choices more expensive." ð What kind of policy commitment device could be deployed to reduce carbon emissions? International agreements have been shown to be weak. There are a range of other contenders, ranging from a "carbon central bank," with power to set carbon emission levels; the passing of "carbon budgets"; carbon bonds; cap and trade systems; targets for reduction of carbon emissions; or the establishment of independent agencies to provide public advice to governments. Each implies a different degree of commitment; each also has their advantages and disadvantages. The tighter commitment devices are beyond the wildest dreams of the greenest U.S. campaigner; on the other hand, the weaker ones have little traction.ð A carbon tax, in addition to its other attractions, could bring commitment benefits. While politicians love to position themselves as anti-tax, history shows that once a tax is established, it is highly unlikely to be abolished. The only way to get rid of a tax, and thereby lose the associated revenue, is to cut spending or raise taxes elsewhere—either of which carries some political cost.ð There are two ways to further increase the commitment value of a carbon tax. First, all revenues could be used to cut income tax—shifting towards taxing "what we burn, not what we earn." If abolishing the tax meant increasing income tax, it would be more likely to remain in place. ð Second, as Adele Morris and Aparna Mathur suggest, firms could be encouraged to pay their carbon tax bills in advance, perhaps through the use of tradable tax compliance credits. This would create a constituency with a vested interest in the maintenance of the tax.ð In an ideal world, legislators and executives would work together to consistently address long-term problems with sustainable policy solutions—and voters would reward them for doing so. But like the rest of us politicians often discount tomorrow too heavily. On an issue as important as the future of the planet, perhaps we can hope that they might see the wisdom of greater commitment, and the deployment of a commitment device.

--xt-> Clean Tech

Price guarantees from the CP causes renewable innovation

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 70; kdf)

First, a carbon tax introduces a steadier price signal that would generally not be present in a cap-and-trade program. Tax levels and cap levels can both change, but both can be too lenient or too stringent. But all other things being equal, a cap-and-trade program presents one extra source of price volatility: the fact that it is regulating a quantity, and not a price. Innovation in new alternative technologies will generally require as stable a price as possible on carbon dioxide emissions. At least for risk-averse firms thinking of investing in innovations in, say, renewable energy, they will only do so if the payback, or recoupment of the investment from savings from not paying for carbon dioxide emissions (through either carbon taxes or for emission allowances), is sufficiently quick and secure. All other things being equal, the shorter the payback period and the more certain the payback, the more attractive is the investment. Risk-loving investors may be willing to invest when the paybacks are volatile, but in general, investment dollars are more abundant for projects that yield a steadier stream of benefits.

Carbon taxes lead to innovation

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 72-3; kdf)

A second reason that a carbon tax stimulates more innovation than a cap-and-trade program is that, over time, innovation will reduce the price of allowances, and if innovation is successful enough it will cheapen the price of allowances so that innovation will no longer be worthwhile. Firms innovate to reduce compliance costs, and they will not do so if the marginal compliance cost savings are too small to pay for the innovation. Since innovation will reduce the cost of emissions allowances, there comes a point eventually at which the marginal compliance cost savings— the cost of allowances— are outweighed by costs of innovation. For carbon taxes, the marginal compliance costs savings does not change unless the tax rate changes. In this way, a steady tax rate produces a steadier price signal than a cap-and-trade program. Of course, both cap-and-trade programs and carbon tax programs contemplate increasing stringency over time. The 2009 Waxman-Markey bill specified a declining cap on emissions. Carbon tax programs would contemplate an increasing price over time, to adjust for inflation and to track marginal damages from carbon dioxide emissions, which are expected to increase over time. While both programs contemplate a price that increases with time, only cap-and-trade programs have to fight the price-deflating effects of innovation. There is a third and final reason, related to the second, that a carbon tax stimulates more innovation than a cap-and-trade program, which is only true if a cap-and-trade program gives away allowances instead of auctioning them. In a cap-and-trade program in which some entities are given allowances— either on the basis of historical emissions, or simply as a product of political horse-trading, as was the case under the Waxman-Markey bill— the incentives to innovate will be diluted because innovation reduces the value of those allowances. The free allocation of allowances creates an asset in the hands of emit ters, something that does not happen under a tax regime. The fact that innovation could reduce the value of that asset is a disincentive for cost-saving innovation. 113 It could still be, of course, that few innovations are truly great enough to significantly change the market for compliance. In such cases, the private benefits of innovation— from either technological invention or process changes— are probably still great enough to outweigh whatever diluting effects the innovation might have on the value of allowances. However, some technological innovations could be so monumental that the way that an industry thinks about compliance could fundamentally change, such that allowance prices could plummet. Imagine a breakthrough for carbon emissions: for example, a technological breakthrough in battery technology that could dramatically increase energy storage capabilities, making all kinds of renewable technologies feasible, since location and intermittency would no longer pose logistical obstacles to adoption. It seems safe to say that the coal-fired utilities, which received 35 percent of the initial allocation of allowances (worth about $100 billion) under Waxman-Markey, may not be quite as engaged in the development of such technology as it would be if, under a carbon tax regime, it truly had to pay for every ton of CO 2 it emitted.

--xt Solves Volatility

A carbon tax solves volatility

Kerr 2010 (Alex Rice [Alex holds a J.D. from the University of Colorado School of Law (2009) and a B.A. from Amherst College (2003) where he graduated magna cum laude]; Why we need a carbon tax; 34 Environs Envtl. L. & Pol'y J. 69; kdf)

A carbon tax can maximize the objectives discussed above because it fosters experimentation and rewards numerous solutions simultaneously. The exact method of implementing a carbon tax is the subject of a different article. n123 There are many possibilities, such as an add-on tax or a revenue neutral tax. One important idea in any approach is the imposition of a variable tax rate that fluctuates to keep the price of oil stable. The tax should be higher when oil prices drop and lower when prices rise. n124 Keeping the price of oil at a stable, high price creates a consistent benchmark that new energy sources can aim for in achieving price parity. n125 Such a system would dampen the boom and bust volatility of innovation that drives investors away. n126 For example, renewable energy exploded in the 1970s when oil prices skyrocketed. n127 Much of the solar and wind technology being pursued today originated from the "70s energy crisis. That technology, however, was largely shelved until recent record oil prices of $ 150 per barrel rekindled interest. n128 As if to prove the point, a 2008 plunge in oil prices swiftly dampened the prospects of many renewable energy businesses. n129

The predictability of a carbon tax solves volatility

Hamilton 2011 (Sophia [Symposium Editor for Pepperdine's Journal for Business, Entrepreneurship & the Law]; WHEN SCIENTIFIC PALMERS n1 MAKE POLICY: THE IMPACT AND FUTURE OF CAP-AND-TRADE IN THE UNITED STATES; 4 J. Bus. Entrepreneurship & L. 269; kdf)

Early in 2009, ExxonMobil's chief executive, Rex Tillerson ("Tillerson"), announced his support of a carbon tax system that would aim to reduce carbon emissions as an alternative to a cap-and-trade system. n401 ""A carbon tax would be a more direct and transparent approach,'" Tillerson said. n402 This is because the cost imposed on companies by the tax would be predictable. n403 Another notable supporter of a carbon tax, and one of the most "high-profile spokesmen for the [*310] virtues of a carbon tax over a cap-and-trade program," n404 has been Peter Orszag ("Orszag"), the current Director of the Office of Management and Budget. n405 In a 2007 report to the U.S. House of Representatives discussing both the cap-and-trade system and a carbon tax, Orszag stated that "a tax is generally the more efficient approach." n406 He based this conclusion on several factors. First, Orszag noted that studies indicated that over the next few decades "a well-designed tax would yield higher net benefits than a cap-and-trade approach." n407 This is partly because "[a] tax creates relative certainty about the cost of emission reductions each year, because firms will undertake such reductions until the cost of decreasing emissions by another ton just equals the tax on an additional ton of emissions." n408 A cap-and-trade program, by contrast, reliably limits the quantity of carbon regardless of cost. n409 However, Orszag points out that, in terms of the impact emission reductions have on the climate, "it does not matter greatly whether a given cut in emissions occurs in one year or in the next." n410 Taking this into account, he points out that a tax would have an "important advantage: it [would] allow[] emission reductions to take place in years when they are relatively cheap." n411 Numerous factors, such as weather, level of economic activity, and availability of low-carbon technologies, can affect the cost of reducing emissions from year to year. n412 "By shifting emission-reduction efforts into years when they are relatively less expensive, a tax can allow the same cumulative reduction to occur over many years at lower cost than can a cap-and-trade program with specified annual emission levels." n413 Also, because a tax would avoid potential volatility of allowance prices, a tax "could be less disruptive for affected companies." n414 It seems that even a small amount of savings and stability would appeal to businesses and industries in the United States.

at: Renewables

Renewable energies are a trap within the cheap electricity rationale—empirically ineffective

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 23-5; kdf)

The trouble with so many plans to reduce greenhouse gas emissions is that they fall into this trap again: that capital is needed to spur growth in some way that is desirable, such as by supporting the development of "clean coal technology." As noted above, "refined coal" even qualifies for the renewable energy production tax credit, giving the phrase "renewable energy" an adventurous interpretation only lawyers could find sensible. 36 Government subsidization of renewable energy technologies may seem more desirable on the grounds that the few environmental costs are more than outweighed by the prospects of reducing carbon dioxide emissions. This, however, is dangerously close to the "cheap electricity" rationale that sustained coal development for such a long time. In Spain, where the government embraced solar energy as an end in and of itself, extremely generous government incentives created not only a national glut, but a worldwide glut for solar panels. The New York Times reported that solar panel manufacturing plants in Spain began producing too many solar panels and of poor quality, only to have the Spanish government belatedly learn that it could not afford to sustain this subsidy. Spanish cities, towns, and local economies that sprouted up around the solar panel manufacturing industry dried up overnight, leaving behind new forms of economic dislocation and hardship. 37 And in the rush to boost renewable energy, not much has been said about the potential environmental harms of these technologies. Not very much has been said about the ecological side effects of wind energy, such as its effects on wildlife that may be harmed by turbines, or the effects of solar photovoltaic energy (such as its effects on the desert biota or the toxic materials generated by the semiconductor fabrication process), but these effects should have a fair hearing over the course of time.

at: Renewables/Future Tech

The counterplan is comparatively better- only a risk the aff locks in a bad tech

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 43-; kdf)

The overlooked danger is that by supporting specific renewable energy technologies now, we run the risk of effectively locking them in for decades, and perhaps missing the chance to find renewable technologies with even smaller carbon or environmental footprints. Wind turbines have an expected lifespan of twenty to twenty-five years, 38 solar photovoltaic panels about the same. 39 Although these seem like environmentally and economically sensible renewable energy technologies, what will be learned in the next twenty or thirty years? Already, concentrated solar power has emerged as a possibly cheaper and simpler alternative to the previously dominant solar technology, photovoltaic solar energy. 40 Environmental organizations, oriented by their missions to "get things done," have again fallen into the trap of wedding themselves to certain technologies. Today's environmental savior may be tomorrow's environmental pariah, and the problem with mandating an expensive environmental technology is the economic irreversibility of capital expenditures. A recent technological mandate sought by some environmental groups was Integrated Gasification Combined Cycle technology, a technology that gasifies coal so as to be able to separate out the carbon for later capture and sequestration underground. The Natural Resource Defense Council and other organizations sued the EPA to force it to require IGCC as part of any new coal-fired power plant as part of its "New Source Review" program. 41 Failing to learn the past lessons of the New Source Review program, the NRDC seemed to have overlooked the possibility that if coal-fired power plants with IGCC were actually built, carbon dioxide emissions might be abated but better and environmentally cleaner opportunities to reduce emissions would be lost for generations. Presuming that somehow we have identified the "best" greenhouse gas reduction ideas is dangerous because we live with these decisions for the next twenty, thirty, or fifty years. It is far less dangerous to spur growth by taxing that which is undesirable, than encouraging capital formation around that which we think, at this time, is desirable. First, as argued above, some measures to reduce greenhouse gases do not involve capital at all, but are simple measures to conserve energy and use it more efficiently. No capital formation is necessary for people to figure out how to drive less by bundling tasks, carpooling, riding the bus, bicycling, or embracing any number of other ways to reduce their transportation emissions. Second, if incentives are required to form capital around a meritorious capital project that reduces greenhouse gas emissions, a carbon tax, if it presents a stable enough of a price signal, provides the economic stimulus for private capital to flow into those supposedly desirable areas. Underlying this argument is the belief that private capital is at least as able to discern the value of investment as government. Admittedly, at recent times private capital has been spectacularly and widely mistaken. But it is hard to believe that government can actually do better than private capital over the long run in picking clean technologies. And finally, as the climate change problem is one that will play itself out over the better part of a century, it is essential to maintain an open economy for innovation and for new technologies. To the greatest extent possible, greenhouse gas policy should not encourage the formation of expensive capital. To the extent that it does, it guarantees some "stickiness" and some longevity that is in part born of the difficulty of changing course.

at: Subsidies

Carbon taxes are comparatively better than subsidies

-high energy costs->conservation

-subsidies take tax payer money, sends it to industry; cp recycles money

-aff -> rebound effect

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 35-7; kdf)

The case for government subsidization is, as a theoretical matter, straightforward. An unpriced externality like carbon dioxide emissions can be remedied by either a positive price imposed by carbon taxes or by a negative price created by subsidization. If we know, for example, that lowering the carbon dioxide emissions from the energy sector will require the development and deployment of renewable energy technologies, then it would seem to make sense to provide government funding for wind, solar, and other renewable energy technologies. This would be true whether the subsidy takes the form of a per-unit production subsidy, or direct funding for research and development: either way, the goal is to lower costs and concomitantly lower prices. Compare, then, the effects of taxing carbon and of subsidizing renewable energy. At the margins, raising the price of carbon-emitting energy has the same competitive effect of lowering the price (through subsidies) of renewable energy. The net effect of subsidizing renewable energy instead of pricing carbon is a transfer of money from taxpayers to the entire energy industry— to the renewable energy industry through subsidies, and to the carbon-emitting energy industries by not taxing them. Since pricing carbon would raise energy prices, the net effect on the average person, who is both a taxpayer and an energy consumer, would appear to be roughly a wash. There are three core problems with this argument. First, and most simply**, higher energy prices are needed to spur energy conservation**. Low energy costs undermine incentives to make industrial processes more energy-efficient, drive less, better insulate homes and construct more energy-efficient buildings, and to develop and sell (and buy) energy-efficient appliances. Energy conservation measures may in fact turn out to be the greatest source of greenhouse gas reductions. A recent report by the consulting firm McKinsey found that some fairly routine and well-known energy conservation measures could produce a whopping $680 billion dollars worth of net energy savings, and reduce projected energy demand by the year 2020 by 23 percent. 20 Many energy conservation measures actually have a negative abatement cost— that is, their energy savings exceeded the amortized cost of the upfront investments. These included insulation retrofits for residential and commercial buildings (especially the latter), switching residential lighting from incandescent bulbs to LEDs (light-emitting diodes), and capturing methane escaping from landfills to generate electricity. 21 As Dieter Helm has observed, a problem with climate policy is that it has by and large focused on reducing greenhouse gases from production, and not consumption. 22 Reducing consumption does not sound like a good thing for love-starved politicians who have no stomach to curb energy consumption through taxation, even as we waste energy in mind-boggling ways. But the simple truth is that efforts to combat climate change will be unsuccessful without steps to reduce consumption. And there is nothing as effective as higher prices if the goal is to reduce consumption. Second, there is a limit on how low energy prices can be made through subsidization. Lowering the price of renewable energy lowers the demand for fossil fuels. But lowering demand for fossil fuels means that it will lower the price of fossil fuels. A lower price for fossil fuels encourages its use, exactly what we don't want. This "rebound" effect of lowering fossil fuel prices by subsidizing its alternatives dampens the effectiveness of subsidies in altering consumption choices. Rebound effects for various renewable fuel standards policies in the United States are estimated to be on the order of a quarter to a third of reduced emissions. 23 Moreover, at a certain point, energy prices become so low that they become irrelevant. If, hypothetically, you had a choice between buying electricity from a coal-fired plant for 3.7 cents per kilowatt-hour or buying electricity from a wind farm for 3.4 cents per kilowatt-hour, which would you chose? The answer could well be, "who cares?" For many energy consumers, the savings does not justify the time needed to investigate. Such is the pushing-on-a-string effect of trying to lower prices for everyone instead of raising them. So while¶ higher taxes and lower energy costs may seem to be a wash, they are not. Third, the effectiveness of government subsidies assumes without justification— in fact, in the face of a mountain of evidence to the contrary— that it is possible to identify the "best" renewable energy technologies, or in general the "best" ideas to reduce greenhouse gas emissions. Too often, legislators think they catch wind of a great idea— such a revolutionary way of doing something that they can hardly resist the temptation to lend some assistance (all the better if the idea comes from a

constituent or potential donor). It requires a bit of gullibility to ignore the failure of these supposedly great ideas to attract sufficient private financing. The danger is not so much in the waste of taxpayer dollars— this is addressed in another part of this chapter— but that emissions reductions will be both smaller and costlier than if a better instrument was used. worth noting a few instances in which subsidization may be option. Some greenhouse gas problems are genuinely difficult address without a carrot (subsidy), rather than a stick (tax). For example, it is hard to imagine a regulatory scheme dealing comprehensively and effectively with the prevention of deforestation, which accounted for 12 percent of greenhouse gas emissions in 2005. 24 How, for example, is anybody to stop the deforestation of the Amazon rainforest by those that either legally or illegally have the ability to cut down trees? Where state enforcement of illegal logging has been poor, the offer of periodic cash payments to private individuals to keep trees standing may be more effective. In situations involving poor enforcement mechanisms— most prominently in developing countries— the infusion of money may be required. In some developing countries, there is insufficient economic wealth for markets to actually exist, so that market mechanisms do not create markets at all. Generally, however, subsidization as a governmental policy on reducing greenhouse gases has not been targeted at developing countries, or other situations in which subsidies genuinely work better. Government subsidization has been mere political grease, an overused salve for the perceived pain from the prospect of economic restructuring. Rather than actually minimize the pain, however, it merely shifts it into onto unwitting taxpayers, current and future. Government subsidization should be viewed with skepticism, rather than being the presumptive first option.

Subsidies are a waste of money- nearly anything can be considered a "renewable energy"

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 23-5; kdf)

Finally, there is never any shortage of proposals that involve, to varying degrees of chutzpah, government subsidies for various programs or projects that may or may not lower greenhouse gas emissions, but at least purport to do so. In theory, government subsidies could accomplish the exact same things as carbon taxes or cap-and-trade programs. While carbon taxes and cap-and-trade programs seek to raise the price of all things carbon, subsidies seek to lower the price of things noncarbon or lower-carbon. All of these programs seek to address externalities— costs that result from an action that are not fully taken into account. Pollution externalities are thus the costs of pollution that the polluter does not fully consider when deciding how much and how to produce. By raising the price of carbon emissions, carbon taxes and cap-and-trade programs seek to internalize the externality of carbon dioxide emissions— the contribution to climate change made by the emitter, be it a large industrial emitter as it makes decisions about production, or by an individual as she decides whether to drive or take the bus to work. A carbon tax or a cap-and-trade program would raise the cost of emitting, inducing the industrial emitter to produce less or emit less, and making driving more costly for the commuter. A subsidy might internalize the externality by rewarding the emitter for emitting less, or rewarding the commuter for taking the bus by reducing her fare. On the blackboard, then, one might see taxes and subsidies as mirror images of the same price-oriented approach. In practice, subsidies raise a number of issues that make them much less effective and much more costly than either carbon taxes or cap-and-trade programs. is worth distinguishing between two kinds of government subsidies in the climate change context: price-oriented subsidies and research and development funding. Price-oriented subsidies are commonly awarded to some renewable energy sources. Certain specific renewable energies enjoy the benefit of a payment for every kilowatthour of electricity generated. 17 Utilized in this way, subsidies really do internalize an externality generated by greenhouse gas emission. Burning fossil fuels and emitting carbon dioxide is forgoing a marginal benefit in the form of the per-unit subsidy. Two things are worth noticing about this kind of subsidy, however. First, offering a subsidy for renewable energy requires a definition of "renewable energy." In the Internal Revenue Code, the production tax credit applies to "certain renewable resources," (emphasis added) which includes "refined coal," which must be certified by the emitter as producing a "qualified emission reduction." 18 It excludes many other renewable energy technologies that have not yet been discovered or been recognized by lawmakers as having economic or environmental potential. Second, the subsidy does not necessarily scale with the environmental harm prevented, like a carbon tax does. A renewable energy subsidy helps all renewable energy sources as against any energy source not on the list of recognized "renewable resources." Thus, it provides a comparative advantage as against all fossil fuel sources, without discriminating— carbon-intensive coal and much less carbon-intensive natural gas are disadvantaged equally. In fact, depending on how "refined coal" is treated, an electricity producer could receive a subsidy for burning coal instead of natural gas. A second kind of subsidy in the climate change context is direct government support of research and development, including the funding of pilot projects and prototypes. The subsidized projects are believed, in the long run, to help lower emissions. For example, a great deal of attention

and government support is currently offered for development of “carbon capture and sequestration” technology, which seeks to suck out the carbon dioxide from fossil fuel combustion (mostly coal) at some stage, and store it in leakproof containers or underground caverns, where it will not affect the Earth’s climate. This type of subsidy seeks to address the public benefits of research and development, boosting activity because it may produce knowledge and discoveries in a market that does not fully reward such pursuits. It also recognizes that research and development with respect to low-carbon technologies is doubly under-supplied since, in the absence of a carbon price, markets do not yet fully reward the development of lowcarbon technologies. An almost uncountable number of other seemingly greenhouse gas-reducing programs, initiatives, projects, and research ideas also vie for public monies. Subsidies take on a very wide variety of forms, and are difficult to define. Even the US federal home mortgage interest deduction is a subsidy. In this book, however, a government subsidy is defined as a policy with two characteristics: an explicit reference to carbon dioxide or another greenhouse gas, and an explicit reference to government funds. In other words, the definition of subsidies is limited to those with relatively direct price tags.

at: CCS

The plan is a last-ditch effort to save the coal industry, the counterplan is comparatively better

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 56-; kdf)

Both the United States and Canada appear headed down this treacherous path again. Another impending and potentially misguided government initiative is the subsidization of "carbon capture and storage" technology. "Carbon capture" refers to the capture of carbon dioxide emitted as a result of any combustion process, while "storage" refers to the permanent containment of the carbon dioxide, so that it does not enter the atmosphere and contribute to climate change. Carbon dioxide would typically be injected into underground "pore spaces" where it would be stored for, it is hoped, eternity. While the carbon capture and storage concept may be applied to all industrial combustion processes (and even for some noncombustion carbonemitting processes), most of the discussion and technological development has been for coal-fired power plants. The technology seems attractive, salvaging trillions of dollars of capital worldwide wrapped up in fuel combustion, and what enthusiastic policy wonks would call a potential "game-changer." Some have likened the urgency of developing carbon capture and storage to the development of the atomic bomb. In a 2009 floor speech, US Senator Lamar Alexander said "we should launch another mini-Manhattan Project and reserve a Nobel Prize for the scientist who can get rid of the carbon from existing coal plants, because coal provides half our energy." 63 But the lofty rhetoric seems misplaced for a technology that remains prohibitively expensive. As recently as 2008, demonstration costs remained in the range of 60 to 90 Euros per ton of CO 2 stored (approximately 88 to 131 US dollars per ton 64), but were expected to "come down to" about 30 to 45 Euros per ton by 2030 (approximately $45 to $62 per ton, using a 2010 currency conversion). 65 Even if this bears out, this would still be much more expensive than many dozens of other emissions abatement and reduction strategies, even notoriously expensive nuclear power. 66 Moreover, the physical challenge of capturing and storing even a modest amount of American carbon emissions is staggering. The United States currently emits around 1.5 billion tons per year of carbon from coal-fired power plants, 67 and the world's largest sequestration project, at the Sleipner gas field in the North Sea, is sequestering 1 million tons a year of carbon dioxide, or about 0.06 percent of United States emissions. 68 If carbon capture and storage were to capture all of the carbon dioxide from US coal-fired power plants, the total weight that would need to be transported would equal three times the annual volume of natural gas transported in the United States by pipeline. Dr. Joan Brennecke, director of the Notre Dame Energy Center where researchers have been working on carbon capture and storage technology for years under DOE grants, laments that despite recent advances, economical carbon capture technology is still at least a decade away from commercial application, remarking that "no matter what, it is going to be painful to do CO capture." 69 2 It is surely telling that an industry consortium formed to pursue and support a pilot carbon capture and storage project, FutureGen, lost two of its biggest industry backers, the two largest electricity providers in the United States: the American Electric Power Company and the Southern Company, in the face of the high costs of development. 70 Given these challenges and setbacks, it seems slightly overenthusiastic to call for another Manhattan project for such an expensive technique, and one that has been studied for decades with disappointing results. Once again, an expensive idea has emerged from the convergence of politics, rent-seeking, and the convenient illusion that government can provide (i.e., fund) a solution. Not all of the motivation is scandalous: the temptation for such an important problem is to see the greenhouse gas reduction effort as a "war," in which carbon capture and sequestration can be a "game-changer" in much the same way that the atomic bomb was perceived to be the game-changer needed to stop the Axis powers. Wishful thinking creates a desire to find "gamechangers." Recent technologies labeled as game-changers include: electric vehicle batteries, 71 electricity storage technology generally, 72 shale gas, 73 small nuclear reactors, 74 nuclear reactors that burn spent fuel, 75 underground coal combustion, 76 ocean thermal power, 77 a transmission line linkage, 78 and General Motors' plug-in hybrid vehicle. 79 Some of these could actually be significant breakthroughs. But most often, **politicians proposing technology subsidies for speculative technologies seems more like the behavior of the destitute and desperate, sadly spending their last dollars on lottery tickets instead of undertaking the hard work of change.** Nothing insulates a polity from its government's appetite for waste and profligacy, not even carbon taxes. But at least spending money is not the point of a carbon tax, as it is with a government subsidy. Indeed, if the goal is to reduce greenhouse gas emissions, then a policy instrument should draw on what government does well— tax— rather than on what it does poorly— make strategic market decisions. With a worrying problem such as climate change, it is too easy and too dangerous to fall into the trap of thinking that governments can "fix" the problem directly, funding a potential "home run" or

"gamechanger." 80 It is harder to create the markets that will spur development of a solution, harder to trust markets, and hardest still to tell voters that they have to help pay for the solution through higher prices.

The plan is a move by politicians to take advantage of the cognitive dissonance of the public

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 179; kdf)

People are conflicted about what to do about climate change. On the one hand, a solid majority of people, even Canadians and Americans, favor action on climate change. 61 Even though the public continues to trail scientists and probably even politicians in their understanding of climate change, they seem to have an intuitive understanding that catastrophic things could happen if greenhouse gases continue to increase, and that avoiding this risk would be good policy. 62 On the other hand, climate change is usually trumped by other issues, most prominently economic ones, when people are asked to rank them in importance. 63 So how does one reconcile these two somewhat contradictory public positions? The path of least cognitive dissonance is to be in favor of some grand-sounding, and yet not obviously painful measures to address climate change. Hence, there is appeal to "launching a Manhattan Project" to perfect carbon capture and storage, or the government launch of a hydrogen fuel cell automobile project, or a supposedly "economy-wide" cap-and-trade program that covers all polluters. These all sound grand enough to match the size of the climate change problem, and yet do not obviously cost the taxpayer, the consumer, or the voter anything. Politicians that stand to gain political support from proposing climate policy are happy to nurture these misperceptions, and public opinion polls unwittingly assist them by supplying survey results that perpetuate these misperceptions.

at: Geoengineering

Geoengineering fails- only a carbon tax solves

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p14-15; kdf)

Finally, excluded from consideration in this book are adaptation and geo-engineering measures. Adaptation is the general term for a wide range of things that can be done by a country to prepare for and adjust to life in a climate-changed world, at least as it can best be foreseen. Adaptation could include, for example, relocation of populations away from areas vulnerable to tropical storms, or the genetic modification of seeds to yield more drought-resistant crops, or the construction of sea walls to protect a city from the intruding sea. Geo-engineering measures aim to directly reduce the heat-increasing effects of greenhouse gases, by either reducing atmospheric concentration of greenhouse gases or by reducing the amount of solar radiation that is absorbed. Like adaptation, **geo-engineering consciously does not address the sources of the greenhouse gases. Proposed geo-engineering measures have included the promotion of ocean algal growth** (which would in theory capture carbon dioxide from the atmosphere), the launching of tiny particlesized mirrors into the upper stratosphere so as to reflect sunlight and prevent it from reaching the Earth, and simply painting roofs white so as to reflect sunlight more effectively and increase the amount of heat that is radiated back out into space. As I have noted in my other work, adaptation and geo-engineering, despite their own significant risks, begin to look like more palatable options as international climate negotiations continue to founder. 2 The problem of international coordination among countries (which I argue in this book is best addressed by a carbon tax) currently seems challenging enough to warrant some diversification of approaches to climate change. While the international legal community balks at the unilateralism inherent in adaptation and geo-engineering as a climate strategy, options that do not require global and crosscultural politicking begin to look attractive. Moreover, the potentially catastrophic effects of climate change are such that a portfolio of policies is likely required. 3 All that said, it is most sensible from the perspective of greenhouse gas mitigation to cabin off these kinds of strategies from the question of how to reduce emissions. It is complicated enough to consider what mitigation policies should be pursued, without complicating the question by adding in analysis of adaptation and geo-engineering measures. To reduce greenhouse gas emissions, I consider four main options: (1) a carbon tax (2) traditional environmental regulation, sometimes referred to as “command-and-control” regulation, (3) “cap-andtrade” programs in which allowances to emit are allocated and freely traded, and (4) government subsidies targeted at low-carbon technologies and processes. Again, many other ideas and combinations of ideas are a part of the wide climate change discourse, but in order to focus in on the advantages and disadvantages of the carbon tax as a fundamental approach, this book frames the discussion in the context of the main alternative policy approaches.

at: Australia Failed

The Australian carbon tax was effective – statistics prove -

McDonnell 15, (Tim, associate producer for "Climate Desk", "Even climate villain Australia might be thinking about cleaning up its act", http://grist.org/climate-energy/even-climate-villain-australia-might-be-thinking-about-cleaning-up-its-act/)

Almost a year ago, Australia made a very different kind of climate announcement: It became the world's first country to repeal a price on carbon. Back in 2012, after several years of heated political debate, Australia's parliament had voted to impose a fixed tax on carbon pollution for the country's several hundred worst polluters. The basic idea — as with all carbon-pricing systems, from California to the European Union — is that putting a price on carbon emissions encourages power plants, factories, and other major sources to clean up. Most environmental economists agree that a carbon price would be the fastest way to dramatically slash emissions, and that hypothesis is supported by a number of case studies from around the world — British Columbia is a classic success story. (President Obama backed a national carbon price for the U.S. — in the form of a cap-and-trade system — in 2009, but it was quashed in the Senate.) In Australia, the carbon tax quickly became unpopular with most voters, who blamed it for high energy prices and the country's sluggish recovery from the 2008 global recession. Abbott rose to power in part based on his pledge to get rid of the law. In July 2014, he succeeded in repealing it. Now, new data from the Australian Department of the Environment reveal that whether or not you liked the carbon tax, it absolutely worked to slash carbon emissions. And in the first quarter without the tax, emissions jumped for the first time since prior to the global financial crisis. The new data quantified greenhouse gas emissions from the electricity sector (which accounts for about a third of total emissions, the largest single share) in the quarter from July to September 2014. As the chart below shows, emissions in that same quarter dropped by about 7.5 percent after the carbon tax was imposed, and jumped 4.7 percent after it was repealed: oz-carbon-emissions4. It's especially important to note that the jump came in the context of an overall decline in electricity consumption, as Australian climate economist Frank Jotzo explained to the Sydney Morning Herald: Frank Jotzo, an associate professor at the Australian National University's Crawford School, said electricity demand was falling in the economy, so any rise in emissions from the sector showed how supply was reverting to dirtier energy sources. "You had a step down in the emission intensity in power stations from the carbon price — and now you have a step back up," Professor Jotzo said. … [Jotzo] estimated fossil fuel power plants with 4.4 gigawatts of capacity were taken offline during the carbon tax years. About one-third of that total, or 1.5 gigawatts, had since been switched back on.

British Columbia proves carbon taxes are effective

Roberts 15, (David, What we can learn from British Columbia's carbon tax", http://grist.org/climate-energy/what-we-can-learn-from-british-columbias-carbon-tax/)

For seven years, the Canadian province of British Columbia has had a carbon tax. It is, on its own terms, a resounding success – carbon emissions are falling even as the economy continues to grow. Not only is it effective, but it is, from a policy standpoint, incredibly elegant: It is predictable, rising according to a set schedule (though it topped out in 2012 — more on that later). It is broad, covering 70 percent of the province's emissions. It is simple, levied on a relatively small number of fossil fuel extractors and importers, piggybacking on an existing tax, thus requiring almost no additional administration or enforcement resources. It is revenue-neutral, offset entirely by cuts to other taxes, mainly corporate and personal income. (In fact, each year the B.C. government publishes a table showing what tax cuts were enabled by the carbon tax.)

at: International Trade

Carbon taxes wont cause a trade dispute—EVEN IF it does, it's worth the costs

Meltzer 2014 (Joshua [Fellow in Global Economy and Development, Brookings Institution, and adjunct professor at the Johns Hopkins School for Advanced International Studies]; A CARBON TAX AS A DRIVER OF GREEN TECHNOLOGY INNOVATION AND THE IMPLICATIONS FOR INTERNATIONAL TRADE; ENERGY LAW JOURNAL [Vol. 35:45]; kdf)

The United States should introduce a carbon tax. This would be a means to raise revenues to address the fiscal deficit and **complement bipartisan efforts** to incentivize innovation in the green technology sector in an effort to reduce CO2 emissions. In fact, U.S. capacity on the innovation front could end up being the greatest contribution the United States makes to reducing global CO2 emissions. Should the United States succeed in pricing carbon, a range of international trade issues will arise. Some of these are positive as they reinforce the need for liberalized trade as a driver of innovation and the production of cheap green technology. 178 For instance, a carbon price in the United States would send a strong market signal that there are commercial opportunities in finding cost-effective ways to reducing CO2 emissions, whether through incremental improvements in energy efficiency or the development of breakthrough technologies which change the energy paradigm. Maximizing this signal will require an international system that promotes international scientific collaboration but also facilitates the free flow of people, ideas, and capital to countries where they can be best used. In this world, the United States could expect to be a significant beneficiary, not only from reduced CO2 emissions but also as the world's talent migrates to places like Silicon Valley to produce another high-tech sector in clean energy technologies. Currently, there is also significant government involvement in the clean energy space, and this is likely to continue for some time. This involvement has raised a range of trade concerns and in a number of instances has been challenged at the WTO.179 Balancing efforts to stimulate green technologies with the gains from an open trading system based on WTO rules is an ongoing challenge. There is no reason climate change needs to be tackled at the expense of liberalized trade, an outcome which would make developed countries and in particular developing countries significantly worse off. This is particularly true in the Asia-Pacific region that is deeply enmeshed in global supply chains.180 Ensuring that government support is developed in ways that are WTO consistent will leave governments with plenty of room to promote ambitious climate change action but in ways that do not discriminate against goods and services based on their country of origin. Moreover, as outlined above, climate change policies that are also WTO consistent will lead to the production of green technologies at lower costs. That said, the global impact of climate change suggests that there is need for negotiation to ensure that the WTO rules do not raise unnecessary legal risks for government when considering how best to act. A carbon tax in the United States will also inevitably raise domestic concerns about carbon leakage and the impact on the competitiveness of U.S. industry.181 These concerns were prominent during the debate in 2009 and 2010 over a cap and trade system, and there is no reason to think that similar concerns would not be raised by a carbon tax.182 Addressing these concerns will likely lead to some form of border tax adjustment. This will raise trade tensions that will need to be navigated. And resolving these issues through negotiation rather than WTO dispute settlement is the preferred path. In many respects, what the United States does will be central to how the development of green technologies and trade proceeds. As the world's largest economy with an unrivalled capacity for innovation and R&D, should the United States price carbon, how this incentivizes clean technology R&D and manages the implications for international trade will largely define whether the climate change and trade regimes are mutually supportive or are developed at the expense of each other.

at: Other countries

The inaction other countries does not justify inaction by the U.S.

Carbon Tax Center 2012 (Jun 29; http://www.carbontax.org/introduction/; kdf) China's leap-frogging the U.S. as the World's #1 annual carbon emitter is being cited to defend American inaction on carbon reductions. This stance ignores several central points.

For one thing, the U.S. will continue to be the world's biggest contributor to global climate change long after China, or even India, surpasses us in annual emissions. That's because carbon dioxide molecules, once emitted, remain "resident" in the atmosphere for approximately a century. Considering the many decades in which America's carbon emissions dwarfed everyone else's, of the CO2 now warming Earth, more than three times as much is the product of American emissions as Chinese emissions. Based on present trends, the earliest that China will surpass the United States as the leading source of CO2 is mid-century, i.e., around 2050. (See Slideshow, slide #8.)¶ Second, the United States will continue to dump the most CO2 into the atmosphere on a per capita basis for years to come. The average American is responsible for creating as much CO2 in a day as do people in developing countries in a week.¶ Third, just as corporations here use China's inaction on carbon to justify U.S. inaction, so too are industry and government in China using our temporizing on carbon to rationalize theirs. The way out of this "alliance of denial," as The New York Times terms it, is to stop delaying and start acting. Breaking this cycle should be easier for the United States, insofar as our per capita use of energy (and emissions of carbon) is many times greater than China's, and given our well-developed political and administrative institutions.¶ Last, while it is true that only concerted action by all the world's nations and peoples can meet the climate crisis head-on, it is equally true that every action that reduces carbon emissions helps protect and stabilize climate. The injunction that the perfect must not become the enemy of the good has never been so apt as it is here and now, in Earth's climate emergency.

If the US doesn't take the lead no one else will

Pascual and Zambetakis 2010 (Carlos [US Ambassador to Mexico, Served as VP of foreign policy @ Brookings] and Evie [Brookings]; The Geopolitics of Energy: From Security to Survival; Energy Security; 26-27; kdf)

Among these groups, the United States has the capacity to play a pivotal¶ role. China and India will not move toward more proactive domestic¶ policies if the United States does not set the example. Along with Europe¶ and Japan, the United States has the capacity to demonstrate that green¶ technology and conservation can be compatible with growth and a foreign¶ policy that is more independent of energy suppliers. The United States also stands to benefit from accelerated commercialization of green technologies¶ and the development of global markets in energy-efficient and¶ clean energy technologies. The ability of the United States to lead, however,¶ will depend on domestic action-on whether it will undertake on a¶ national basis a systematic strategy to price carbon and curb emissions. If¶ it does the scale and importance of the U.S. market can be a driver for¶ global change. If it fails to act, then the United States will find that over¶ time the opportunity for leadership to curb climate change will be replaced¶ by the need for crisis management as localized wars, migration, poverty,¶ and humanitarian catastrophes increasingly absorb international attention¶ and resources. Eventually, its failure to act will come back to U.S.¶ borders in a way that will make the Katrina disaster seem relatively tame.

Only carbon taxes create international coordination

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 93-4; kdf)

In terms of international coordination, carbon taxes provide an advantage over cap-and-trade in three subtle ways. First, if a country legislates a cap-and-trade program expecting it to be incorporated into an international cap-and-trade program such as that contemplated by the Kyoto Protocol, it cannot realistically expect developing countries, most notably China and India, to join such an international cap-andtrade program. China and India have thus far signaled an utter refusal to consider quantitative limits on emissions. China and India are likely to be more open to a carbon tax that does not smack of a mandate externally imposed by wealthy countries. Moreover, for a carbon tax, governments get to keep the proceeds. Second, along similar lines, cap-and-trade programs that have been implemented thus far have included offsets, which have the perverse incentive of discouraging international participation in greenhouse gas reduction. Since offsets provide a means for capital flow from developed countries to developing countries, joining an international accord would carry with it the added disadvantage (in addition to the costs) of giving up this source of foreign capital. Finally, under international trade law, a carbon tax will provide a stronger basis for levying import and export adjustments when a country that reduces carbon dioxide emissions trades with a country that doesn't. I expand on these reasons below. First, cap-and-trade has simply not been an acceptable concept to developing countries. China, in particular, has been very specific about what it will not agree to. It has agreed to "voluntarily" reduce its greenhouse gas "intensity"—its greenhouse gas emissions per GDP— which will not reduce actual greenhouse gas emissions. 149 But at the time of writing of this book, China had steadfastly refused to accept a binding numerical limit on emissions, or any sort of "cap." 150 For those familiar with Chinese foreign relations, it should come as no surprise that China is reluctant to be part of an accord in which international negotiators come up with a worldwide cap on emissions and dole them out to the different countries. For one thing, any cap-and-trade allocation is likely to be anchored to some degree in historical emissions, even if subconsciously, which would heavily favor developed countries. Developing countries can and should argue that a time dimension should be introduced, and some per capita dimension should be introduced, so that developing countries have a chance to catch up, so to speak, to developed countries that have already emitted so much carbon dioxide (and for the benefit of relatively small populations). While this has an obvious deontological appeal, there is no indication at all that this would be an efficient path of emissions reduction. It is difficult, moreover, to imagine that the huge emissions reduction necessary in developed countries in order to create room for emissions growth in developing countries— on the order of 90 percent in short order— would be possible at any reasonable cost. It follows, parenthetically, that this has little chance of political acceptance among the developed countries. Also, cap-and-trade would have poor optics of having mostly Caucasian bureaucrats from Europe and North America decide how much China should get in terms of its "cap." This is likely to always be an irritant for countries like China and India, even it is left unspoken.

Carbon taxes lead to international accords—solves warming

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 94-5; kdf)

But if one reads between the lines of the steadfast opposition by China, India, and other developing countries, one sees room for a carbon tax. An international accord based on a carbon tax scheme would avoid the unfortunate appearance of China being allocated some cap amount by an external bureaucracy, and most important, would not represent, at least in their eyes, a binding limit to economic growth. Moreover, China and the developing countries that sign on get to keep the carbon tax proceeds. These proceeds could be redistributed in whatever way they deemed fit, even to industries that emit greenhouse gases. Of course, distributions should be decoupled from consumption, in order to preserve the marginal emissions reduction incentives created by a carbon tax. There is no point in collecting a carbon tax only to have the proceeds given back to emitters in proportion to their payments— that would obviously negate any marginal incentives to reduce emissions. So would distributions be, in fact, decoupled from emissions? There is no reason to believe that, for example, a central government such as that in China would be particularly keen to simply rebate carbon tax proceeds. Carbon tax proceeds represent an opportunity for central governments to use however they wish— redistributing money to poor households, improving health care, or even subsidizing clean energy technologies. **With Chinese leadership so concerned about**

wealth inequalities, it seems unlikely that carbon tax proceeds would be used to undo the marginal incentives to reduce emissions. A carbon tax, if it could be scaled up to an international accord, represents a better chance of engaging China, India, and developing countries and providing their governments with the incentives to put in place and keep in place policies to reduce emissions. Cap-and-trade programs currently have little chance of accomplishing this on either of these objectives.

International businesses get on board

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 95-6; kdf)

Finally, a third reason that carbon taxes will better encourage international coordination has to do with its subtle legal superiority in terms of justifying relief for domestic industries that might suffer a competitive disadvantage from domestic carbon pricing. International competition has remained a widespread and powerful political concern with greenhouse gas regulation. Addressing this concern has sometimes involved relief in the form of import or export adjustments, essentially rebating domestic industries that have to pay a carbon tax or are subjected to other costly greenhouse gas regulation. Even though this competitive disadvantage of paying a carbon tax is probably overblown, the possibility of relief goes a long way toward overcoming opposition to greenhouse gas regulation. 152 The problem is that this kind of relief may be inconsistent with international trade rules.

Even if other countries don't use carbon taxes, the cp still causes them to conform

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 96; kdf)

There is a way, however, to not unilaterally disarm, and a carbon tax offers the best chance to regulate domestically without doing so. If a country regulated greenhouse gas emissions and could, via border tax adjustments, equalize the international playing field, then greenhouse gas regulation would not necessarily put domestic industries at a competitive disadvantage. A border tax adjustment could take many forms, but most commonly would be the levy of an import tax on products imported from countries that did not regulate greenhouse gas emissions. So products made in countries that do not regulate greenhouse gas emissions would face a tax when they seek to export to countries that have domestic greenhouse gas regulations (with a border tax adjustment) in place, eliminating any cost disparities. Similarly, if a regulating country could subsidize the export of a product to a country that did not regulate greenhouse gases, then its exporters would be on the same footing as domestic manufacturers in that nonregulating country. Without casting any normative judgments, the countries that clearly fit the roles of this drama are the United States and China. Equal access to the huge markets in the United States for all sorts of products is a big deal, and whether a border tax adjustment could be levied on products from prolific producers such as those in China is a question of enormous importance. In the United States, this has the potential to swing legislators around to supporting regulation of greenhouse gases. Also, rising consumption levels in China suggest that the ability of American exporters to send goods to Chinese markets could be of great importance as well. The stakes of the legality of border tax adjustments at least appear to be large.

at: Feasibility

Carbon taxes will be politically feasible- cap-and-trade proves

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 121-2; kdf)

Moreover, what seems "politically infeasible" at one time, over time, can change. For decades, economists argued that cap-and-trade programs represented a paradigm-shifting approach to environmental law, one that could vastly improve not only the efficiency of pollution abatement, but also produce better environmental outcomes. For decades, this instrument languished, as did the economists that advocated it. For decades, cap-and-trade faced seemingly insurmountable political economies that favored the status-quo command-and-control style of regulation. Industries were comfortable with having certainty in their compliance— buy a piece of equipment, and be confident of compliance. Regulators were comfortable with regulating that which they could actually see and confirm: the installation of a piece of equipment. Environmental lawyers and environmental organizations were comfortable and very much invested in a tangled legal system with the ambiguities that command-and-control produces, and with the possibilities for litigation that these ambiguities produce. There was a time in which this iron triangle of vested interests would have seemed difficult to dislodge. And it was not as if command-andcontrol regulation accomplished nothing; on the contrary, a costbenefit analysis of the first twenty years of the Clean Air Act— a command-and-control-only era— found that the benefits outweighed the costs by an order of magnitude. 7 But cap-and-trade could promise more. Over time, the constant haranguing of economists and other academics found more and more audiences, and over time, new political actors emerged, and others began to pick up on the benefits of capand-trade as representing a substantial improvement over commandand-control. Some environmental organizations, infused with economic literacy for the first time, came to appreciate the benefits of cap-and-trade. Some conservative politicians, traditionally hostile to government regulation, came to appreciate the libertarian streak in cap-and-trade. It was President George H. W. Bush, and his combatively conservative chief counsel, C. Boyden Gray, who helped push the sulfur dioxide emissions trading program through Congress in 1990. And with the growth of environmental economics as an academic field of study, a new breed of policy analysts were produced from colleges and universities that began to populate government agencies and think tanks and gradually transform the conventional wisdom of environmental regulation. The coalitions that formed to support the sulfur dioxide cap-and-trade— small government advocates and environmental advocates— seemed like strange bedfellows at first but, over time, became viewed as being, if not normal, at least unsuspicious.

at: Regressive

Revenue recycling guarantees that carbon taxes aren't regressive

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 131-3; kdf)

All that said, calls for redistributions as part of greenhouse gas policy should not be ignored. Even most advocates for a carbon tax would concede that if the revenues from a carbon tax were simply absorbed into the governmental treasury, then the carbon tax would indeed be regressive, as several studies seem to indicate. 21 The question is, however, how to address these effects. In part this is such a compelling question because the revenues from a carbon tax can be used to address the regressiveness. This problem is solvable. The key to addressing the regressiveness problem of carbon taxes is to return, or "recycle," at least a large portion of the carbon tax revenues. A number of schemes have been proposed or implemented to recycle the tax revenues back to taxpayers in a way that blunts or even reverses the economic pain suffered by poor households. Provided that the recycling or return of revenues to taxpayers is decoupled from consumption decisions, the revenue "recycling" schemes can preserve the incentive for people to consume less while serving as a wealth redistributive scheme. Revenue recycling has a very limited history, with only a few examples. Sweden instituted a per-kilogram tax on NO x emissions which, as noted above, has been highly successful, which refunded the proceeds back to the taxpaying NO x emitters. This revenue recycling scheme, covering only electricity generating plants with more than 25 GWh of production per year, refunded the proceeds back in proportion to energy production. The Swedish NO x charge thus provides a reward in the form of a net subsidy to those electricity-generation plants that are able to produce electricity more efficiently— those that produce more electricity per unit of emitted NO x . It is an interesting experiment, and one that may have a tangential effect on regressiveness, by keeping electricity rates down while offering a positive incentive to innovate. But it does not substantially address concerns with regressiveness, since ratepayers of the firms that lose out under such a scheme— the electricity generating firms that are less clever and do not find a way to emit less NO x —could themselves be paying more for electricity. The British Columbia carbon tax is thus the most prominent experiment to date with revenue recycling to reduce regressiveness. Political economy considerations played prominently in the design and implementation of the BC carbon tax. Because the only serious rival in British Columbia to the governing Liberal Party was the politically more liberal New Democratic Party, it was important for the carbon tax to address concerns with regressiveness. It was, in fact, a very interesting political move to split the NDP's traditional base of environmentalists and those concerned with economic inequality. This was done by a promise to recycle revenues. So seriously did the governing British Columbia Liberal Party take this bit of political strategizing that, as noted above, the carbon tax legislation includes a provision that penalizes the minister of finance personally to the tune of a 15 percent salary cut if somehow the proceeds from the carbon tax were not fully returned in the form of revenue give-backs to taxpayers. 22 Included in the revenue give-backs are: (i) a low-income refundable credit (the "Climate Action Tax Credit") of $100 per adult and $30 per child, (ii) a reduction in personal income taxes by 5 percent on the first $70,000 of income, and (iii) reductions for corporate income taxes 23 In addition, along with the rollout of the provincial budget that detailed the carbon tax and the revenue recycling schemes, the province issued a one-time Climate Action Dividend of $100 per person for every resident of British Columbia as of December 31, 2007. 24 It is easy to claim that the revenue recycling solves the regressiveness problem of the BC carbon tax— as the governing Liberal Party emphatically did— but it is not entirely clear that it was successful, nor what exactly what that would mean. It is an almost impossible claim to falsify, as it impossible to know exactly how much each household paid in carbon taxes. Clearly, it would be impossible to make determinations on a household-by-household basis, but besides that, there are direct carbon emissions— driving a car and burning gasoline— and indirect emissions— buying goods that were made from greenhouse gasemitting processes, those embedded emissions of products consumed by each household. Determining direct emissions in disaggregated income classes would be challenging, and determining indirect emissions impossible. Even gasoline has an uncertain carbon footprint, some of it being produced by traditional methods, and some of it being produced in Canada's oil sands region by extremely energyintensive refining methods. And aside from fossil fuel consumption, what about the carbon footprint of produce (locally grown producers paying the carbon tax, importers not), or a myriad of electronic components in a myriad of consumer products? Almost every single good consumed has a carbon footprint, and few of them are measurable. Finally, there is adjustment and substitution: even poor households are apt to be willing and able to change some things to economize if there is a price on carbon dioxide. But as the West and Williams study illustrates, it requires some econometric estimations.

Studies claiming carbon taxes appeal to emotions, not economic logic

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 137-8; kdf)

Regressiveness is an important consideration when weighing changes to tax policy, but the obstacles to designing a progressive carbon tax seem to be solvable. Because economic expenditures are uncertain and because regressiveness itself is susceptible to many definitions, it is probably impossible to prove that revenue recycling reverses the regressive effects of carbon pricing. But it is simple enough to formulate a package of tax policies that utilize carbon tax proceeds (or auctioned allowance proceeds under cap-and-trade) to subsidize lowincome households and lessen, if not entirely eliminate, any regressive impacts. **Those who oppose carbon taxes on grounds of regressiveness often ignore these possibilities, relying on emotion rather than economic facts.** At the same time, policy makers have been incredibly timid in shying away from carbon pricing, and allowing the shrill to steer the debate away from carbon taxation. So, we are left with the self-reinforcing notion that even mentioning carbon taxes is political suicide. Moreover, of all of the types of government policies that are held hostage to income inequality issues, carbon pricing is quite possibly the most important policy, and the one with the smallest regressive effect. In the past several years, the US government has spent tens of billions of dollars saving from bankruptcy two of the most stubbornly inefficient firms in the history of human industry: automakers General Motors and Chrysler. In addition, the United States government has spent billions more on bailouts of financial firms that made unwise strategic investments that they did not even understand. Acknowledging that there were macroeconomic benefits to these bailouts, most of the net winners of this generosity have been shareholders, which are by and large the affluent half of the US population (and of foreign shareholders of these corporations, which are likely to be even more affluent). The effects of spending these billions of dollars will not be obvious to most Americans for a long time, but cannot portend well for taxpayers of modest means. For all of the great many reasons for the unacceptable present and future levels of economic inequality in the developed countries of the world, especially in North America, carbon pricing leading to higher energy prices would be a long, long way from being the most egregious one.

at: Ineffectiveness

Short-term reductions matter less than long-term reductions in the aggregate

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 140-1; kdf)

Most energy analysis is conducted on own-price elasticities, although income also figures very prominently in energy consumption. There are short-term and long-term elasticities— adjustments that are made in the relatively short term— on the order of a few months— and those that are made for the longer term. Long-term elasticities are invariably greater, since at any given time, the timing may or many not be right for any individual household to make an adjustment. Over a longer period of time, there arise more and more times during which an adjustment— some decision that might be affected by a price— seems appropriate. For example, a family that has just purchased a new sport-utility vehicle would not contemplate replacing it even if gasoline prices rose sharply. One would expect very few adjustments of that sort. However, over a fiveor ten-year period, as the sport-utility vehicle starts to age and incur more maintenance costs, and as it nears the end of its useful life, a replacement decision is more likely to take into account gasoline prices. As the same family contemplates what they will buy to replace that sport-utility vehicle, the family has a wider array of options available than it does when it has a brand-new shiny SUV. And in the aggregate, over a longer period, more and more households are likely to arrive at that decision point at which they contemplate replacing an aging vehicle, and more adjustments are likely to be made. As long-term elasticity takes into account this greater number of adjustments, it would naturally be larger than short-term elasticities. Among commodities, fossil fuel usage is one of the more studied phenomena, and the likelihood that people adjust to even small price changes in fossil fuel price is so well-established that it almost rises to the level of an economic maxim. While one might ask oneself whether a family might change their mind about anything if the carbon price is as small as $9 per ton of CO 2 (translating into 2.4 cents per liter at the gas pump), there are a myriad of other decision makers that could well change their behavior. As argued above, the University of British Columbia is just such an entity. Facing a tax liability that would be considered small by industrial standards, but significant to an academic institution or a medium-sized business or industry, it set about finding ways to reduce its reliance on fossil fuels for powering the campus. For decades, economists have been studying the aggregate responses to change in energy prices. The range of estimates can be quite large, as some studies are limited to certain regions or countries, and some are limited in time, so the economic environment in which price changes are studied can be quite varied. As an empirical matter, it is safe to say that long-term elasticities are indeed greater than shortterm elasticities. It is also likely that industrial and commercial consumers have larger long-term elasticities than residential consumers. 43 So it might be misleading for individuals to examine their own personal situation and ask themselves, "would I turn down my thermostat if the price of natural gas went up by 5 percent?" The point is how much, in the aggregate, all consumers of energy change their behavior, and on this score, industrial and commercial consumers, which accounted for half of all energy consumption in the United States in 2008 (with residential accounting for 22 percent), 44 would provide a different answer.

Even if the cp isn't 100 percent effective, it is still beneficial

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 142-3; kdf)

But none of this is an argument against carbon taxes. It may be true that there are barriers to energy efficiency that carbon pricing cannot solve by itself. That does not mean that there should be no carbon price at all. To return to a theme in this book, a carbon tax could well complement other policies designed to bring about behavioral and structural change to reduce energy usage and carbon dioxide emissions. The mistake with arguing that a carbon tax is ineffective is that it confuses individual instances of ineffectiveness with predictions about behavior in the aggregate. For small carbon taxes, there is indeed no guarantee that even a significant portion of energy consumers would change their behavior at all, let alone turn down their thermostats. A carbon tax would have to be significant, and would have to increase over time to keep pace with inflation, and with what economists believe is an increasing urgency over time to reduce emissions. If a reasonably large carbon tax can be implemented, there would be a myriad of opportunities to reduce emissions that, in the aggregate, could make a difference. From the Dogfish Head Craft Brewery in Delaware to the University of British Columbia to restaurants and universities buying James Peret's Vegawatt generator, changes

large and small are made to reduce carbon dioxide emissions. It could even be unimportant if the vast majority of households in British Columbia simply ignored the BC carbon tax. The BC carbon tax would serve a valuable purpose if, in aggregate, other carbon dioxide-reducing changes throughout the provincial economy add up to something substantial. The vast amounts of economic research on energy usage strongly suggests that this will be the case.

at: CCPA Study

The CCPA study is flawed- 2 reasons

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 133-4; kdf)

There are at least two significant flaws in the CCPA analysis, however. First, as the CCPA report explains, "household size increases with income." 26 This is an acknowledgment that individuals and households move up income strata over time. Over time, singleperson households marry and have children, and over time, incomes tend to increase. There is thus an ignored time dimension to the CCPA analysis that was studied by Hassett and his coauthors. Making sure that poorest British Columbians benefit more than others is in part helping people at a certain stage of their lives. It is thus an oversimplification to characterize the British Columbia tax as choosing the rich over the poor, as if everyone in the poor category were chronically poor. This also undermines the notion that individuals in higher-income households have larger carbon footprints. Larger households do, but because there are more members of larger households. The second flaw in the CCPA analysis is its admission that it does not take into account any substitution effects. 27 It asserts that a "dynamic analysis would not change the results in a meaningful way in the short term. Because of the small size of the tax, it will have little impact on consumer behaviour." 28 Knowing from the West and Williams study that the lowest quintiles often make the most substitutions, this is a significant leap. Because the carbon tax is quite small, the differences in incidence of the carbon tax are quite small, so even a little bit of substitution has the potential to change the results. It could be that after substitution, CCPA's conclusions do not hold. The West and Williams study used consumer expenditure data to calculate price elasticities of households broken down into five quintiles by income. 29 Incorporating this extra important step would seem to be a reasonable refinement of the CCPA study.

at: Policy Crowd out

Policy crowd out arguments only feed climate skepticism—not a reason to vote aff

Hsu 2011(Shi-Ling [Larson Professor Florida State University College of Law] The case for a carbon tax: Getting past our hang-up to effective climate policy; p 145; kdf)

Another response to the serial-policy problem is simply that climate policy cannot be a one-and-done proposition. This unhappy truth is typical of the difficult things that need to be effectively communicated about climate change to a general public still lagging in understanding of the climate problem and the feasible solutions. That a general public would like some finality to climate policy and carbon prices has not stopped economists from prescribing a carbon tax that rises over time, matching the increasing marginal social damages of carbon dioxide emissions. Nor should it. Emitting greenhouse gases will become more costly as the world approaches a likely future with increasingly severe climatic changes. Abating greenhouse gases too much at any given time detracts from efforts to abate at other times. Along similar lines, while people may balk at taking a costly first step that will not necessarily provide a complete solution, the iterative nature of climate science and climate policy is such that this is likely inevitable. This disquieting indeterminacy is fodder for climate skeptics, who have tapped into the uncertainty to sow doubt about the risk of climate change. But honest, forthright policy is not playing into the hands of climate skeptics. Attempting to evade or obfuscate the inconveniences and costs of climate policy is playing into the hands of climate skeptics. Further, it has to be courageously said there is uncertainty about climate science, and that a current policy may be too much or may be too little. Again, policy making under extreme uncertainty is not really new; it is just that the analogies to familiar policies need to be made. Very little is known about when the next major earthquake will strike California or the Pacific Northwest. That does not render the policy of seismic upgrading of public schools and nuclear reactors irrational.

at: Competitiveness

A carbon tax would have no impact on competitiveness

Mann 2002 (Roberta [Associate Professor of Law, Widener University School of Law, Wilmington, Delaware; J.D., Arizona State University School of Law; LLM, Georgetown University Law Center]; 51 Am. U.L. Rev. 1135; kdf)

The United States has the lowest environmental taxes of all OECD countries. n607 Imposing a carbon tax would provide revenue for increased reductions in other forms of taxes, while providing collateral benefits. The collateral benefits would include decreased health risks, lowered chance of catastrophic flooding, and preservation of climate dependent ecosystems. A carbon tax would not necessarily reduce American industry's competitiveness. The OECD notes that competitive concerns are lessened when **substitutes are available** (such as fuel cell technology) **and when the carbon tax revenues are recycled back into the business sector**. n608 A carbon tax would provide the "stick" to go along with the "carrot" of tax incentives for alternative energy sources and carbon sequestration. Furthermore, pollution taxes avoid some of the pitfalls of other market-based instruments. n609 The Bush Administration appears to favor voluntary emission reductions over mandatory caps. n610 While a carbon tax is theoretically a voluntary measure because industry can choose to reduce emissions to avoid the tax, it seems unlikely that this Congress would impose another tax on business, even if it planned to recycle the revenues from that tax to reduce other tax burdens. n611

at: Politics Links- Popular

A carbon tax would be popular- three reasons

Rausch and Reilly 2012 (Sebastian and John [John M. Reilly is co-director for the Joint Program on the Science and Policy of Global Change at the Massachusetts Institute of Technology and a senior lecturer at MIT's Sloan School of Management. Sebastian Rausch is an assistant professor of energy economics at ETH Zurich and contributes to research at the Joint Program on the Science and Policy of Global Change at MIT]; Carbon Tax Revenue and the Budget Deficit: A Win-Win-Win Solution?; MIT Joint Program on the science and policy of global change; Rep No. 228; Aug; kdf)

While raising taxes is never popular, a carbon tax is potentially a win-win-win solution. First, ¶ carbon tax revenue can allow revenue-neutral relief on personal income taxes, corporate income ¶ tax, or payroll taxes, or could be used to avoid or limit cuts to social programs (Medicare, ¶ Medicaid, Social Security, Food Assistance) or Defense spending. Among the revenue raising ¶ options evaluated by the CBO was a carbon tax that would start at $20 in 2012 and rise at a ¶ nominal rate of 5.8% per year, approximately 4% in real terms given the underlying inflation rate ¶ they projected. By their estimate it would raise on the order of $1.25 trillion over a 10-year ¶ period. Second, economic analysis has demonstrated the potential for a tax interaction effect ¶ whereby recycling of revenue from a carbon tax to offset other taxes could reduce the cost of a ¶ carbon policy or even under some circumstances boost economic welfare (Bovenberg and ¶ Goulder, 1996). The Bush tax cuts and other temporary tax relief measures are due to expire at ¶ the end of 2012. A carbon tax could allow their further extension. And, third, a carbon tax would ¶ lower fossil fuel use, reducing carbon dioxide emissions; and lowering oil imports.

A carbon tax is politically feasible

Colman 2012 (Zack; Study: Carbon tax could raise $1.5 trillion; Aug 27; http://thehill.com/blogs/e2-wire/e2-wire/245587-study-carbon-tax-could-raise-15-trillion; kdf)

Taxing carbon would generate $1.5 trillion, potentially giving politicians cover from making politically difficult decisions on taxes and social spending cuts, according to a study by the Massachusetts Institute of Technology (MIT) released Monday.¶ A carbon tax would take pressure off Congress to find "tradeoffs" between closing the deficit gap and reviving the economy, according to John Reilly, an author of the study. ¶ "Congress will face many difficult tradeoffs in stimulating the economy and job growth while reducing the deficit," Reilly, the co-director of MIT's Joint Program on the Science and Policy of Global Change, said in a statement. ¶ "But with the carbon tax there are virtually no serious tradeoffs. Our analysis shows the overall economy improves, taxes are lower and pollution emissions are reduced."

at: Politics- Unpopular

Not politically feasible

Spence 2011 (David [Assoc prof of Law @ U of TX]; Regulation, "Republican Moments," and Energy Policy Reform; 2011 B.Y.U.L. Rev. 1561; kdf)

Oil refineries would face similar costs. Many of these costs would be passed on to consumers. Expensive electricity or gasoline not only upsets consumers (read: voters), but also poses a risk to the already struggling American auto industry whose congressional representatives come from political swing states in the Midwest. Some fossil fuel companies have indicated that they would favor a carbon tax over Clean Air Act regulation or a marketable permit system, n185 but they prefer no emissions reductions at all. n186 Of course, [*1604] these interests perceive mandatory greenhouse gas emissions reductions as a threat regardless of the regulatory instrument used to pursue that goal.

Executive CP

1NC - XO

CP Text: The president should issue an executive order [insert plan].

An executive order can stop mass surveillance, the president just doesn't want to

Chambers 5/25 – White House correspondent (Francesca Chambers, May 25, 2015, "'What's he waiting for?': Rand Paul says Obama should end the NSA's mass surveillance program through an executive order - but the White House says that's not possible," http://www.dailymail.co.uk/news/article-3097634/What-s-waiting-Rand-Paul-says-Obama-end-NSA-s-mass-surveillance-program-executive-order-s-against-it.html), acui

But Republican Senator Rand Paul says there's another option: an executive order.¶ 'Here's the thing about the president: He's disingenuous about this. The president started this program through executive order — he could end it anytime,' Paul said during an appearance today on CBS This Morning. ¶ If the president does not believe the NSA's bulk data collection program should continue in its current form, Paul said, according to the Washington Times, 'Why doesn't he stop it? What's he waiting for?'¶ Paul, paraphrasing the president, said that Obama has approached reforms to the program by saying, 'Oh, Congress can stop it.' ¶ 'He started it on his own. He should stop it,' the Republican presidential candidate charged, 'and I've asked the president repeatedly, "Stop the program." '¶ Earnest said this afternoon, however, that Obama does not have the ability to alter the program with a swish of his pen.¶ 'The authorities that are used by our national security professionals to keep us safe are authorities that were given to those national security professionals by the Congress and those authorities can only be renewed by the United States Congress through an act of Congress,' he said. ¶ Earnest said he'd not yet listened to Paul's interview, but disputed his claim that the president could address the surveillance program through an executive order.¶ 'If the Senate doesn't act, then there is no way to prevent those authorities from expiring,' he said.¶ Asked by the Daily Mail to point to the executive order that Senator Paul was referring to during is TV appearance earlier today, which he also mentioned on a separate occasion last week in an overnight Senate speech, his office said that it was secret, just like the program was until Edward Snowden blew the whistle on it two years ago.¶ The program was begun without the knowledge of Congress, his office pointed out, and a court ruled recently that the Patriot Act did not authorize its creation. That is why Paul is under the impression that the president could unilaterally put a stop to it as the highest ranking member of the executive branch. ¶ The White House doesn't want to completely shackle the NSA, however. It wants continue the data collection program - but it wants those records to be stored by phone companies, not the NSA.

1NC – Self-Restraint

CP Text: The executive branch should substantially curtail [insert plan].

Presidential Policy Directive-28 proves executive action solves where the other two branches have failed

Edgar 4/13 -- visiting fellow at the Watson Institute at Brown University, ACLU's national security policy counsel (Timothy H. Edgar, April 13, 2015, "The Good News About Spying," https://www.foreignaffairs.com/articles/united-states/2015-04-13/good-news-about-spying), acui

Although rising public anger is welcome, it is misdirected. A fair examination of the Obama administration's record over the last 18 months shows real accomplishments on surveillance reform. In sharp contrast to the inaction of Congress and U.S. courts, Obama has taken several meaningful steps to limit government surveillance and make surveillance policies more transparent.¶ Despite high hopes for a fresh start on civil liberties, during his first term in office, Obama ratified and even expanded the surveillance programs that began under former President George W. Bush. After NSA contractor Edward Snowden began revealing the agency's spying programs to The Guardian in 2013, however, Obama responded with a clear change of direction. Without great fanfare, his administration has made changes that open up the practices of the United States intelligence community and protect privacy in the United States and beyond. The last year and a half has been the most significant period of reform for national security surveillance since Senator Frank Church led the charge against domestic spying in the late 1970s. ¶ In 2013, at Obama's direction, the Office of the Director of National Intelligence (ODNI) established a website for the intelligence community, IC on the Record, where previously secret documents are posted for all to see. These are not decades-old files about Cold War spying, but recent slides used at recent NSA training sessions, accounts of illegal wiretapping after the 9/11 attacks, and what had been highly classified opinions issued by the Foreign Intelligence Surveillance Court about ongoing surveillance programs.¶ Although many assume that all public knowledge of NSA spying programs came from Snowden's leaks, many of the revelations in fact came from IC on the Record, including mistakes that led to the unconstitutional collection of U.S. citizens' emails. Documents released though this portal total more than 4,500 pages—surpassing even the 3,710 pages collected and leaked by Snowden. The Obama administration has instituted other mechanisms, such as an annual surveillance transparency report, that will continue to provide fodder for journalists, privacy activists, and researchers.¶ The transparency reforms may seem trivial to some. From the perspective of an intelligence community steeped in the need to protect sources and methods, however, they are deeply unsettling. At a Brown University forum, ODNI Civil Liberties Protection Officer Alexander Joel said, "The intelligence community is not designed and built for transparency. Our culture is around finding our adversaries' secrets and keeping our own secrets secret." Accordingly, until only a few years ago, the intelligence community resisted making even the most basic information public. The number of FISA court opinions released to the public between 1978 and 2013 can be counted on one hand.¶ Beyond more transparency, Obama has also changed the rules for surveillance of foreigners. Until last year, privacy rules applied only to "U.S. persons." But in January 2014, Obama issued Presidential Policy Directive 28 (PPD-28), ordering intelligence agencies to write detailed rules assuring that privacy protections would apply regardless of nationality. These rules, which came out in January 2015, mark the first set of guidelines for intelligence agencies ordered by a U.S. president—or any world leader—that explicitly protect foreign citizens' personal information in the course of intelligence operations. Under the directive, the NSA can keep personal information in its databases for no more than five years. It must delete personal information from the intelligence reports it provides its customers unless that person's identity is necessary to understand foreign intelligence—a basic rule once reserved only for Americans.¶ The new rules also include restrictions on bulk collection of signals intelligence worldwide—the practice critics call "mass surveillance." The NSA's bulk collection programs may no longer be used for uncovering all types of diplomatic secrets, but will now be limited to six specific categories of serious national security threats. Finally, agencies are no longer allowed simply to "collect it all." Under PPD-28, the NSA and other

agencies may collect signals intelligence only after weighing the benefits against the risks to privacy or civil liberties, and they must now consider the privacy of everyone, not just U.S. citizens. This is the first time any U.S. government official will be able to cite a written presidential directive to object to an intelligence program on the basis that the intelligence it produces is not worth the costs to privacy of innocent foreign citizens.

Solvency

General – XO

Credibility checks -- executive order is at least as binding as legislation

Posner and Vermeule 11 – Kirkland & Ellis Distinguished Service Professor of Law & Arthur and Esther Kane Research Chair at University of Chicago and John H. Watson Professor of Law at Harvard, respectively (Eric A. Posner and Adrian Vermeule, February 16, 2011, "The Executive Unbound: After the Madisonian Republic," p. 138-9, https://books.google.com/books?id=yaWuHE_PrJ4C&printsec=frontcover&source=gbs_atb#v=onepage&q&f=false), acui

Many of our mechanisms are unproblematic from a legal perspective, as they involve presidential actions that are clearly lawful. But a few raise legal questions; in particular, those that involve self-binding.59 Can a president bind himself to respect particular first-order policies? With qualifications, the answer is "yes, at least to the same extent that a legislature can." Formally, a duly promulgated executive rule or order binds even the executive unless and until it is validly abrogated, thereby establishing a new legal status quo.60 The legal authority to establish a new status quo allows a president to create inertia or political constraints that will affect his own future choices. In a practical sense, presidents, like legislatures, have great de facto power to adopt policies that shape the legal landscape for the future. A president might commit himself to a long-term project of defense procurement or infrastructure or foreign policy, narrowing his own future choices and generating new political coalitions that will act to defend the new rules or policies. More schematically, we may speak of formal and informal means of self-binding: 1. The president might use formal means to bind himself. This is possible in the sense that an executive order, if otherwise valid, legally binds the president while it is in effect and may be enforced by the courts. It is not possible in the sense that the president can always repeal the executive order if he can bear the political and reputational costs of doing so. 2. The president might use informal means to bind himself. This is not only possible but frequent and important. Issuing an executive rule providing for the appointment of special prosecutors, as Nixon did, is not a formal self-binding.61 However, there may be political costs to repealing the order. This effect does not depend on the courts' willingness to enforce the order, even against Nixon himself. Court enforcement makes the order legally binding while it is in place, but only political and reputational enforcement can protect it from repeal. Just as a dessert addict might announce to his friends that he is going on a no-dessert diet in order to raise the reputational costs of backsliding and thus commit himself, so too the repeal of an executive order may be seen as a breach of faith even if no other institution ever enforces it. In what follows, we will invoke both formal and informal mechanisms. For our purposes, the distinction between the authority to engage in de jure self-binding (legally limited and well-defined) and the power to engage in de facto self-binding (broad and amorphous) is secondary. So long as policies are deliberately chosen with a view to generating credibility, and do so by constraining the president's own future choices in ways that impose greater costs on ill-motivated presidents than on well-motivated ones, it does not matter whether the constraint is formal or informal.

General – Self Restraint

Only executive self-restraint solves

Will 14 – columnist on politics and domestic and foreign affairs (George F. Will, November 28, 2014, "A case for self-restraint," http://www.washingtonpost.com/opinions/george-will-a-case-for-self-restraint/2014/11/28/f129c8cc-7585-11e4-9d9b-86d397daad27_story.html), acui

Before conservatives had the disorienting delight of Ronald Reagan's presidency, they had a healthy suspicion of executive power and an inclination to favor congressional supremacy. (See "Congress and the American Tradition" by James Burnham, one of William F. Buckley's collaborators in founding National Review.) Congress, however, has long since ceased to be a reliable custodian of its own powers.¶ And now it has permanent and deepening attention deficit disorder: It can neither control nor even maintain meaningful oversight over the sprawling government it has created. According to historian Morton Keller in "America's Three Regimes," members of early Congresses were more numerous than federal bureaucrats. Today there are many more than 535 executive departments, agencies and other entities that Congress funds without effective supervision and to which a harried, distracted Congress delegates discretion tantamount to legislative power. James Buckley, in his forthcoming book "Saving Congress from Itself," reports:¶ "Shortly after my election to the Senate in 1970, I was handed a recently completed study of Congress that had concluded that the workload of the average congressional office had doubled every five years since 1935. . . . I can certify that during my own six years in office, I witnessed a sharp increase in the already frenetic pace of the Senate and an equally sharp decline in its ability to get very much done that could honestly be labeled 'thoughtful.' "¶ There have been 1,950 senators since the Constitution was ratified, and none has done as much damage to the institution's deliberative capacity as Harry Reid has done as majority leader. He has broken its rules in order to rewrite its rules and has bent its procedures, all in the service of presidential preferences. He and his caucus exemplify how progressives, confident that they know history's proper destination, are too results-oriented to be interested in institutional conservation.¶ America's two vainest presidents, Woodrow Wilson and Obama, have been the most dismissive of the federal government's Madisonian architecture. Wilson, the first president to criticize America's Founding, was especially impatient with the separation of powers, which he considered, as Obama does, an affront to his dual grandeur: The president is a plebiscitary tribune of the entire people, monopolizing true democratic dignity that is denied to mere legislators. And progressive presidents have unexcelled insight into history's progressive trajectory, and hence should have untrammeled freedom to act.¶ Courts will not try to put a bridle and snaffle on a rampaging president, and perhaps Congress cannot, even if it summons the will to try. So we are reduced to hoping for something Madison was reluctant to rely on — executive self-restraint in response to a popular demand for it.

Intent to self-restrain and Merkel proves solvency

Gerstein 13 – White House reporter, BA in government from Harvard (Josh Gerstien, December 15, 2013, "Obama plans new limits on NSA surveillance," http://www.politico.com/politico44/2013/12/obama-plans-new-limits-on-nsa-surveillance-178986.html), acui

President Barack Obama said Thursday that he'll be reining in some of the snooping conducted by the National Security Agency, but he did not detail what new limits he plans to impose on the embattled spy organization.¶ "I'll be proposing some self-restraint on the NSA. And...to initiate some reforms that can give people more confidence, " Obama told Chris Matthews in an interview recorded for MSNBC's "Hardball."¶ The president insisted that the NSA's work shows respect for the rights of Americans, but he conceded that its activities are often more intrusive when it comes to foreigners communicating overseas.¶ "The N.S.A. actually does a very good job about not engaging in domestic surveillance, not reading people's emails, not listening to the contents of their phone calls. Outside of our borders, the NSA's more aggressive. It's not constrained by laws," Obama said.¶ The president pointed to an outside panel he set up in August to look into how the government was collecting surveillance data in the era of 'big data.' The five-member group is set to deliver its final report to Obama by Dec. 15.¶ The White House has already acknowledged imposing some limits on overseas surveillance, publicly promising not to intercept phone calls of German Chancellor Angela Merkel and indicating that surveillance on leaders of other allies has also been curtailed. The moves came after Merkel complained following news reports that said her mobile phone had been tapped by the NSA. The reports, like a slew of others published in recent months on NSA surveillance, were drawn from documents leaked by former NSA contractor Edward Snowden.

FISA

Executive actions are secret and only rubber-stamped by FISA Court – means only the executive branch can curtail surveillance

Greenwald 13 -- former columnist on civil liberties and US national security issues and ex-constitutional lawyer (Glenn Greenwald, June 18, 2013, "Fisa court oversight: a look inside a secret and empty process," http://www.theguardian.com/commentisfree/2013/jun/19/fisa-court-oversight-process-secrecy), acui

The way to bring actual transparency to this process it to examine the relevant Top Secret Fisa court documents. Those documents demonstrate that this entire process is a fig leaf, "oversight" in name only. It offers no real safeguards. That's because no court monitors what the NSA is actually doing when it claims to comply with the court-approved procedures. Once the Fisa court puts its approval stamp on the NSA's procedures, there is no external judicial check on which targets end up being selected by the NSA analysts for eavesdropping. The only time individualized warrants are required is when the NSA is specifically targeting a US citizen or the communications are purely domestic.¶ When it is time for the NSA to obtain Fisa court approval, the agency does not tell the court whose calls and emails it intends to intercept. It instead merely provides the general guidelines which it claims are used by its analysts to determine which individuals they can target, and the Fisa court judge then issues a simple order approving those guidelines. The court endorses a one-paragraph form order stating that the NSA's process "'contains all the required elements' and that the revised NSA, FBI and CIA minimization procedures submitted with the amendment 'are consistent with the requirements of [50 U.S.C. §1881a(e)] and with the fourth amendment to the Constitution of the United States'". As but one typical example, the Guardian has obtained an August 19, 2010, Fisa court approval from Judge John Bates which does nothing more than recite the statutory language in approving the NSA's guidelines.¶ Once the NSA has this court approval, it can then target anyone chosen by their analysts, and can even order telecoms and internet companies to turn over to them the emails, chats and calls of those they target. The Fisa court plays no role whatsoever in reviewing whether the procedures it approved are actually complied with when the NSA starts eavesdropping on calls and reading people's emails.¶ The guidelines submitted by the NSA to the Fisa court demonstrate how much discretion the agency has in choosing who will be targeted. Those guidelines also make clear that, contrary to the repeated assurances from government officials and media figures, the communications of American citizens are – without any individualized warrant – included in what is surveilled.¶ The specific guidelines submitted by the NSA to the Fisa court in July 2009 – marked Top Secret and signed by Attorney General Eric Holder – state that "NSA determines whether a person is a non-United States person reasonably believed to be outside the United States in light of the totality of the circumstances based on the information available with respect to that person, including information concerning the communications facility or facilities used by that person." It includes information that the NSA analyst uses to make this determination – including IP addresses, statements made by the potential target, and other information in the NSA databases.¶ The decision to begin listening to someone's phone calls or read their emails is made exclusively by NSA analysts and their "line supervisors". There is no outside scrutiny, and certainly no Fisa court involvement. As the NSA itself explained in its guidelines submitted to the Fisa court:¶ "Analysts who request tasking will document in the tasking database a citation or citations to the information that led them to reasonably believe that a targeted person is located outside the United States. Before tasking is

approved, the database entry for that tasking will be reviewed in order to verify that the database entry contains the necessary citations."¶ **The only oversight for monitoring whether there is abuse comes from the executive branch itself**: from the DOJ and Director of National Intelligence, which conduct "periodic reviews … to evaluate the implementation of the procedure." At a hearing before the House Intelligence Committee Tuesday afternoon, deputy attorney general James Cole testified that every 30 days, the Fisa court is merely given an "aggregate number" of database searches on US domestic phone records.

Only the executive branch knows secret interpretations of the Constitution

Wyden 13 – senator (Ron Wyden, 2013, "Remarks As Prepared for Delivery for the Center for American Progress Event on NSA Surveillance," http://nsarchive.gwu.edu/NSAEBB/NSAEBB436/docs/EBB-104.pdf), acui

When the FISA court was created as part of the 1978 FISA law its work¶ was pretty routine. It was assigned to review government applications for¶ wiretaps and decide whether the government was able to show probable¶ cause. Sounds like the garden variety function of district court judges¶ across America. In fact, their role was so much like a district court that the¶ judges who make up the FISA Court are all current federal district court¶ judges. After 9/11, Congress passed the Patriot Act and the FISA Amendments Act.¶ This gave the government broad new surveillance powers that didn't much¶ resemble anything in either the criminal law enforcement world or the¶ original FISA law. The FISA Court got the job of interpreting these new,¶ unparalleled authorities of the Patriot Act and FISA Amendments Act.¶ They chose to issue binding secret rulings that interpreted the law and the¶ Constitution in the startling way that has come to light in the last six¶ weeks. They were to issue the decision that the Patriot Act could be used¶ for dragnet, bulk surveillance of law-abiding Americans.¶ Outside the names of the FISA court judges, virtually everything else is¶ secret about the court. Their rulings are secret, which makes challenging¶ them in an appeals court almost impossible. Their proceedings are secret¶ too, but I can tell you that they are almost always one-sided. The¶ government lawyers walk in and lay out an argument for why the¶ government should be allowed to do something, and the Court decides¶ based solely on the judge's assessment of the government's arguments. That's not unusual if a court is considering a routine warrant request, but it's very unusual if a court is doing major legal or constitutional analysis. I¶ know of absolutely no other court in this country that strays so far from the¶ adversarial process that has been part of our system for centuries.

Drones

XO for drone transparency solves – far reaching

Whitlock 14 – reporter (Craig Whitlock, Sepetember 26, 2014, "White House plans to require federal agencies to provide details about drones," https://www.washingtonpost.com/world/national-security/white-house-plans-to-require-federal-agencies-to-provide-details-about-drones/2014/09/26/5f55ac24-4581-11e4-b47c-f5889e061e5f_story.html), acui

The White House is preparing a directive that would require federal agencies to publicly disclose for the first time where they fly drones in the United States and what they do with the torrents of data collected from aerial surveillance.¶ The presidential executive order would force the Pentagon, the Justice Department, the Department of Homeland Security and other agencies to reveal more details about the size and surveillance capabilities of their growing drone fleets — information that until now has been largely kept under wraps.¶ The mandate would apply only to federal drone flights in U.S. airspace. Overseas military and intelligence operations would not be covered.¶ President Obama has yet to sign the executive order, but officials said that drafts have been distributed to federal agencies and that the process is in its final stages. "An interagency review of the issue is underway," said Ned Price, a White House spokesman. He declined to comment further.¶ Privacy advocates said the measure was long overdue. Little is known about the scope of the federal government's domestic drone operations and surveillance policies. Much of what¶ has emerged was obtained¶ under court order as a result of public-records lawsuits.¶ "We're undergoing a quiet revolution in aerial surveillance," said Chris Calabrese, legislative counsel for the American Civil Liberties Union. "But we haven't had all in one place a clear picture of how this technology is being used. Nor is it clear that the agencies themselves know how it is being used."¶ Most affected by the executive order would be the Pentagon, which conducts drone training missions in most states, and Homeland Security, which flies surveillance drones along the nation's borders round-the-clock. It would also cover other agencies with little-known drone programs, including NASA, the Interior Department and the Commerce Department. Military and law enforcement agencies would not have to reveal sensitive operations. But they would have to post basic information about their privacy safeguards for the vast amount of full-motion video and other imagery collected by drones.¶ Until now, the armed forces and federal law enforcement agencies have been reflexively secretive about drone flights and even less forthcoming about how often they use the aircraft to conduct domestic surveillance.

Obama key to set international precedent on surveillance policy – soft power

Singer and Wright 13 – Strategist and Senior Fellow at the New America Foundation, former director of the Center for 21st Century Security and Intelligence, senior fellow in Foreign Policy at Brookings and senior fellow at Brookings, respectively (Peter W. Singer and Thomas Wright, February 17, 2013, "Obama, own your secret wars," http://www.nydailynews.com/opinion/obama-secret-wars-article-1.1265620), acui

Obama has a unique opportunity — in fact, an urgent obligation — to create a new doctrine, unveiled in a major presidential speech, for the use and deployment of these new tools of war.¶ While the Republicans tried to paint the President as weak on security issues in the 2012 elections, history will record instead that his administration pushed into new frontiers of war, most especially in the new class of technologies that move the human role both geographically and chronologically further from the point of action on the battlefield.¶ The U.S. military's unmanned systems, popularly known as "drones," now number more than 8,000 in the air and 12,000 on the ground. And in a parallel development, the U.S. Cyber Command, which became operational in 2010, has added an array of new (and controversial) responsibilities — and is set to quintuple in size.¶ This is not just a military matter. American intelligence agencies are increasingly using these technologies as the tips of the spear in a series of so-called "shadow wars." These include not only the more than 400 drone strikes that have taken place from Pakistan to Yemen, but also the deployment of the Stuxnet computer virus to sabotage Iranian nuclear development, the world's first known use of a specially designed

cyber weapon.¶ Throughout this period, the administration has tried to have it both ways — leaking out success stories of our growing use of these new technologies but not tying its hands with official statements and set policies.¶ This made great sense at first, when much of what was happening was ad hoc and being fleshed out as it went along.¶ But that position has become unsustainable. The less the U.S. government now says about our policies, the more that vacuum is becoming filled by others, in harmful ways.¶ By acting but barely explaining our actions, we're creating precedents for other states to exploit. More than 75 countries now have military robotics programs, while another 20 have advanced cyber war capacities. Rest assured that nations like Iran, Russia and China will use these technologies in far more crude and indiscriminate ways — yet will do so while claiming to be merely following U.S. footsteps.¶ In turn, international organizations — the UN among them — are pushing ahead with special investigations into potential war crimes and proposing new treaties.¶ Our leaders, meanwhile, stay mum, which isolates the U.S. and drains its soft power. The current policy also makes it harder to respond to growing concerns over civilian casualties. Indeed, Pew polling found 96% levels of opposition to U.S. drones in the key battleground state of Pakistan, a bellwether of the entire region. It is indisputable than many civilians have been harmed over the course of hundreds of strikes. And yet it is also indisputable that various groups have incentives to magnify such claims.¶ Yet so far, U.S. officials have painted themselves into a corner — either denying that any collateral losses have occurred, which no one believes, or reverting to the argument that we cannot confirm or deny our involvement, which no one believes, either.¶ Finally, the domestic support and legitimacy needed for the use of these weapons is in transition. Polling has found general public support for drone strikes, but only to a point, with growing numbers in the "not sure" category and growing worries around cases of targeting U.S. citizens abroad who are suspected of being terrorists.¶ The administration is so boxed in that, even when it recently won a court case to maintain the veil of semi-silence that surrounds the drone strike program, the judge described the current policy as having an "Alice in Wonderland" feel.¶ The White House seems to be finally starting to realize the problems caused by this disconnect of action but no explanation. After years of silence, occasional statements by senior aides are acknowledging the use of drones, while lesser-noticed working level documents have been created to formalize strike policies and even to explore what to do about the next, far more autonomous generation of weapons.¶ These efforts have been good starts, but they have been disjointed and partial. Most important, they are missing the much-needed stamp of the President's voice and authority, which is essential to turn tentative first steps into established policy.¶ Much remains to be done — and said — out in the open.¶ This is why it's time for Obama's voice to ring loud and clear. Much as Presidents Harry Truman and Dwight Eisenhower were able keep secret aspects of the development of nuclear weapons, even as they articulated how and when we would use them, Obama should publicly lay out criteria by which the United States will develop, deploy and use these new weapons.¶ The President has a strong case to make — if only he would finally make it. After all, the new weapons have worked. They have offered new options for military action that are more accurate and proportionate and less risky than previously available methods.¶ But they have also posed many new complications. Explaining our position is about embracing both the good and the bad. It is about acknowledging the harms that come with war regardless of what technology is being used and making clear what structures of accountability are in place to respond.¶ It's also about finally defining where America truly stands on some of the most controversial questions. These include the tactics of "signature" strikes, where the identity is not firmly identified, and "double tap" strikes, where rescuers aiding victims of a first attack are also brought under fire. These have been reported as occurring and yet seem to run counter to the principles under which the programs have been defended so far.¶ The role of the President is not to conduct some kind of retrospective of what we have done and why, but to lay out a course of the future. What are the key strategic goals and ethical guidelines that should drive the development and use of these new technologies? Is current U.S. and international law sufficient to cover them?¶ There are also crucial executive management questions, like where to draw the dividing line between military and civilian intelligence agency use of such technologies, and how to keep a growing range of covert actions from morphing into undeclared and undebated wars.¶ And, finally, the President must help resolve growing tensions between the executive branch and an increasingly restive Congress, including how to handle situations where we create the effect of war but no U.S. personnel are ever sent in harm's way.¶ Given the sprawling complexity of these matters, only the President can deliver an official statement on where we stand. If only we somehow had a commander in chief who was simultaneously a law professor and Nobel

Peace Prize winner!¶ The President's voice on these issues won't be a cure-all. But it will lay down a powerful marker, shaping not just the next four years but the actions of future administrations.

Obama can curtail drone surveillance

EPIC 2/15 – independent non-profit research center (Electronic Privacy Information Center, February 15, 2015, "President Orders Federal Agencies to Adopt Privacy Rules for Drone Use, FAA Proposes Weak Rules for Commercial Users," https://epic.org/2015/02/president-orders-federal-agenc.html), acui

The President has issued a new Executive Order requiring all federal agencies to adopt privacy rules for drone use. The Order is intended to limit the collection and use of personally identifiable information. The rules will also require agencies to adopt transparency and accountability procedures for drone use. The Order incorporates recommendations made by EPIC in testimony to Congress and comments to several federal agencies. The Federal Aviation Administration has also proposed new regulations for commercial drone use in the United States. These rules will establish safety procedures for drone use, including maximum height, weight and line-of-sight operation, but the rules do not address the privacy impact of commercial drone use. EPIC petitioned the FAA to establish clear privacy rules for commercial drone operators.

Dual Use

Obama has used an XO for exports reform

White House 13 – (Office of the Press Secretary, March 8, 2013, "Fact Sheet: Implementation of Export Control Reform," https://www.whitehouse.gov/the-press-office/2013/03/08/fact-sheet-implementation-export-control-reform), acui

Today, the Administration announced two key steps to further the goals of President Obama's Export Control Reform Initiative, which is a common sense approach to overhauling the nation's export control system. President Obama signed an Executive Order today to update delegated presidential authorities over the administration of certain export and import controls under the Arms Export Control Act of 1976, and yesterday the Administration notified Congress of the first in a series of changes to the U.S. Munitions List.¶ Executive Order¶ Executive Order 11958 delegated authority to control exports of defense articles and services to the Secretary of State and delegated the comparable authority to control imports to the Secretary of the Treasury. The Department of State controls the export of defense articles and services on its U.S. Munitions List (USML); the Department of Justice controls their import pursuant to the U.S. Munitions Import List (USMIL) administered by the Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF). The USMIL was previously a subset of State's USML. The most recent comprehensive delegation of these authorities was in Executive Order 11958 of January 18, 1977. The President's new Executive Order updates delegated authorities consistent with the upcoming changes to our export control lists. It supersedes and replaces Executive Order 11958 and amends Executive Order 13222 of August 17, 2001, that pertains to the Department of Commerce-administered controls. The new Executive Order makes the following changes:¶ Consolidation of All Brokering Responsibilities with the Department of State: The Arms Export Control Act requires the registration and licensing of brokering activities for defense articles and services for both exports and imports. A broker is a person who acts as an agent for others in negotiating or arranging contracts, purchases, sales or transfers of defense articles or services. The Executive Order consolidates and delegates to the Secretary of State all statutory responsibility for maintaining registration and licensing requirements for brokering of defense articles and services on either the State or ATF lists which both control defense articles and services under the Arms Export Control Act. This one-stop approach provides better clarity for the defense trade community and makes it easier for industry to comply and for the U.S. Government to enforce.¶ Elimination of Possible "Double Licensing" Requirements: Today the Department of State licenses entire systems, including any accompanying spare parts, accessories, and attachments, yet many of these items will be moved to the Commerce list which may mean that an exporter would need two licenses instead of one. The President's delegation, via an amendment to Executive Order 13222, will allow the Department of State to authorize those accompanying items that may have moved to the Commerce list and prevent any potential double-licensing requirement. This ensures that the prioritization of our controls, in which we facilitate secure trade with Allies and partners, does not add new red tape. Items licensed or otherwise approved by the Secretary of State under this delegation remain subject to the jurisdiction of the Department of Commerce, including for enforcement purposes.¶ Congressional Notification Process: The President has directed that the Department of Commerce establish procedures for notifying Congress of approved export licenses for a certain subset of items that are moved or that may move from the State list to the Commerce list. A key feature of the President's reform initiative is to

enhance transparency with Congress and the public in the administration of our export control system. This Executive Order ensures that, going forward, the Executive Branch will continue this transparency and notify Congress about export licenses for those certain items that, while no longer subject to the statutory notification requirements of the Arms Export Control Act, warrant continued transparency and notification to Congress.¶ Other Administrative Updates: The Executive Order delegates to the Attorney General the functions previously assigned by Executive Order 11958 to the Secretary of the Treasury, reflecting the 2003 move of ATF to the Department of Justice from the Treasury (accommodated by Executive Order 13284). It also makes a number of other necessary updates to ensure that the authorities to administer our export control system are current.¶ Changes to the U.S. Munitions List¶ The cornerstone of the President's Export Control Reform Initiative is the rebuilding of the two primary export controls lists, State's USML and the Department of Commerce's Commerce Control List (CCL) which primarily controls dual-use items, i.e., commercial items with possible military applications, and some military items of lesser sensitivity. By law, everything on the USML is controlled equally, whether an F-18 fighter or a bolt that has been modified for use on that F-18, and each of these items requires an individual license. This system has created significant obstacles and delays in providing equipment to Allies and partners for interoperability with U.S. forces in places like Afghanistan, and harms the health and competitiveness of the U.S. industrial base. Rebuilding our export control lists and moving less sensitive items from the State to the Commerce list will provide us the flexibility to more efficiently equip and maintain our partner's capabilities while allowing us to focus on preventing potential adversaries from acquiring military items that they could use against us.

Obama has authority to direct Department of Commerce with XO

McNeal 14 -- Associate Professor of Law and Public Policy at Pepperdine University, specializes in security, technology and crime (Gregory S. McNeal, November 30, 2014, "Drones Face Critical Moment As White House Prepares To Act," http://www.forbes.com/sites/gregorymcneal/2014/11/30/drones-face-critical-moment-as-white-house-prepares-to-act/), acui

The second part of the executive order will address the privacy concerns associated with private uses of drones. In the order, the President will direct that the Department of Commerce's, National Telecommunications & Information Administration (NTIA) chair a process for creating privacy rules for private drone operators. The NTIA typically creates these rules by convening stakeholder meetings with individuals from industry, consumer groups, and advocacy groups.¶

Gender Aff

Presidents can unilaterally manage agencies

Waterman 9 (Richard Waterman, Professor of political science at the University of Kentucky, March 2009,Presidential Studies Quarterly, The Administrative Presidency, Unilateral Power, and the Unitary Executive Theory)

Presidents have consistently used their unilateral powers to influence the bureaucracy. Presidents can create agencies through executive orders .According to Howell and Lewis (2002) and Lewis (2003), when they do so, they create structures that are more amenable to presidential control. On the other hand, agencies tend to be more insulated from presidential power when they are created by Congress. Presidents also use executive orders to directly influence policy making at the administrative level. Reagan used executive orders to devise a system, managed through the Office of Management and Budget, by which all major rules and regulations had to pass a cost-benefit test before they could be implemented. Not surprisingly, most proposed regulations were rejected because of cost concerns, particularly in policy areas that were not favored by the Reagan administration (e.g., the environment). Reagan also used an administrative order to set up a more efficient central clearance procedure for all new rules and regulations, again monitored by the Office of Management and Budget and again generally stifling new policy initiatives. Reagan's innovations, with some modifications, have been enacted and implemented by his successors, thus establishing clear precedents for presidential action using executive orders to control the bureaucracy.

XO's can fund private sector research

XO 12591 87 (Executive Order 12591, 4/10/87 "Facilitating access to science and technology" http://www.archives.gov/federal-register/codification/executive-order/12591.html)

By the authority vested in me as President by the Constitution and laws of the United States of America, including the Federal Technology Transfer Act of 1986 (Public Law 99-502), the Trademark Clarification Act of 1984 (Public Law 98-620), and the University and Small Business Patent Procedure Act of 1980 (Public Law 96-517), and in order to ensure that Federal agencies and laboratories assist universities and the private sector in broadening our technology base by moving new knowledge from the research laboratory into the development of new products and processes, it is hereby ordered as follows: Section 1. Transfer of Federally Funded Technology. (a) The head of each Executive department and agency, to the extent permitted by law, shall encourage and facilitate collaboration among Federal laboratories, State and local governments, universities, and the private sector, particularly small business, in order to assist in the transfer of technology to the marketplace. (b) **The head of each Executive department and agency shall, within overall funding allocations** and to the extent permitted by law: (1) delegate authority to its government-owned, government-operated Federal laboratories: (A) to enter into cooperative research and development agreements with other Federal laboratories, State and local governments, universities, and the private sector; and (B) to license, assign, or waive rights to

intellectual property developed by the laboratory either under such cooperative research or development agreements and from within individual laboratories.

President Can control contracts within the private industry

Hinds 12 (Sarah Hinds, staff writer for the college conservative, March 19, 2012, "Executive Order: National Defense Resources Preparedness," http://thecollegeconservative.com/2012/03/19/executive-order-national-defense-resources-preparedness/

Section 201, if taken out of context, could lead one to assume that this executive order allows for executive control over all US resources, but it actually delegates, "the authority of the President…to require acceptance and priority performance of contracts or orders (other than contracts of employment) to promote the national defense of any other contracts or orders, and to allocate materials, services, and facilities as deemed necessary or appropriate to promote the nation defense." The secretaries of Agriculture, Energy, Health and Human Services, Transportation, Defense, and Commerce are delegated this authority to require acceptance and priority performance of contracts and orders involving certain resources. Just as the Defense Production Act gives the President the authorities to "prioritize and force contracts," this executive order gives the secretaries of executive agencies the authorities to prioritize and force contracts involving certain resources that may be necessary, in their judgment, to promote the national defense.

International Perception

Presidential action is perceived globally

Sunstein 95 Arkansas Law Review 1995 48 Ark. L. Rev. 1 ARTICLE: An Eighteenth Century Presidency in a Twenty-First Century World NAME: Cass R. Sunstein * * Karl N. Llewellyn Professor of Jurisprudence, University of Chicago Law School and Department of Political Science. l/n

6. With the emergence of the United States as a world power, the President's foreign affairs authority has become far more capacious than was originally anticipated. For the most part this is because the powers originally conferred on the President have turned out - in light of the unanticipated position of the United States in the world - to mean much more than anyone would have thought. The constitutionally granted authorities have led to a great deal of unilateral authority, simply because the United States is so central an actor on the world scene. The posture of the President means a great deal even if the President acts clearly within the scope of his constitutionally-granted power. Indeed, mere words from the President, at a press conference or during an interview, can have enormous consequences for the international community.

SSRA

PCLOB and independent review group say Obama can end dragnet phone surveillance without Congress

RT 1/30 – (January 30, 2015, "Review group says Obama can stop NSA phone surveillance 'at any time'," http://rt.com/usa/228015-pclob-assessment-telephony-metadata/), acui

A review group assembled by the White House to recommend changes concerning the United States' intelligence gathering operations is calling out the Obama administration for not yet halting the bulk collection of Americans' telephone records.¶ US President Barack Obama could heed a recommendation made one year ago by its own Privacy and Civil Liberties Oversight Board (PCLOB), and end the National Security Agency's dragnet phone surveillance program "at any time," the review group said in an assessment report published this week. But instead, the White House continues to let the NSA routinely sweep up metadata pertaining to millions of calls.¶ The assessment report, released by PCLOB on Thursday, comes one year after the group offered recommendations to the White House concerning Section 215 of the Patriot Act – a provision that compels telecommunication companies to regularly supply the NSA with call records collected in bulk from American customers – and six months after a similar report was published on the Foreign Intelligence Surveillance Act rule, Section 702, that lets the US government conduct electronic eavesdropping on the internet.¶ Yet while PLCOB acknowledges in the assessment that the White House has accepted the bulk of the 22 recommendations made in the two reports, not a single suggestion has been fully implemented – with the exception of one calling on the Foreign Intelligence Surveillance Court, a secretive body that authorizes these types of wiretaps, "to obtain technical assistance and expand opportunities for legal input from outside parties."¶ According to a statement from the review group that accompanies the 29-page report, a key finding made during its assessment of the administration's progress is that the government continues to collect phone data through Sec. 215 – even though it doesn't have to, and, in the board's opinion, shouldn't.¶ "The Administration has not implemented the Board's recommendation to halt the NSA's telephone records program, which it could do at any time without congressional involvement. Instead, the Administration has continued the program, with modifications, while seeking legislation to create a new system for government access to telephone records under Section 215," the statement reads in part.¶ A year ago, PCLOB concluded that the government should end its bulk phone record collection program due to "constitutional concerns under the First and Fourth Amendments," and said the Sec. 215 program "raises serious threats to privacy and civil liberties as a policy matter, and has shown only limited value."¶ "The Administration accepted our recommendation in principle. However, it has not ended the bulk telephone records program on its own, opting instead to seek legislation to create an alternative to the existing program," this week's report reads.¶ A bill that sought to strip from the government its ability to collect that metadata in bulk, the USA Freedom Act, ultimately failed to advance in the Senate when it was up for discussion last November. According to the review group, though, curbing that collection doesn't rely squarely on Congress.¶ "It should be noted that the Administration can end the bulk telephone records program at any time, without congressional involvement," the assessment report reads. "While legislation like the USA FREEDOM Act would be needed to retain the unique capabilities of the program without collecting telephone records in bulk, the Board examined those capabilities and concluded that they have provided only 'limited value' in combatting terrorism."

PCLOB says Obama has authority to end bulk surveillance

Lucas 5/26 -- White House correspondent (Fred Lucas, May 26, 2015, "White House Swipes at Rand Paul's 'Political Ambitions' in Patriot Act Debate," http://www.theblaze.com/stories/2015/05/26/white-house-swipes-at-rand-pauls-political-ambitions-in-patriot-act-debate/), acui

In an interview with CBS News Tuesday, Paul said that Obama could have implemented the USA Freedom Act without Congress.¶ "Here's the thing about the president – he's disingenuous about this. The president started the program through executive order, he can end it at any time," Paul said. "The Second Court of Appeals – the court right below the Supreme Court – said that it's illegal. Why doesn't he stop it? What's he waiting for? He says, 'Oh, Congress can stop it.' He started it on his own, he should stop it. And I've asked the president repeatedly to stop the program."¶ Earnest told reporters that the matter is something Congress would have to act on.¶ However, in January, the bipartisan Privacy and Civil Liberties Oversight Board issued a report saying the president has the authority to end the bulk data collection entirely.

Privacy Bill of Rights solves and XO promotes private-public relations

Obama 2/13 – president (Barack Obama, February 13, 2015, "Remarks by the President at the Cybersecurity and Consumer Protection Summit," https://www.whitehouse.gov/the-press-office/2015/02/13/remarks-president-cybersecurity-and-consumer-protection-summit), acui

In recent years, we've worked to put these principles into practice. And as part of our comprehensive strategy, we've boosted our defenses in government, we're sharing more information with the private sector to help those companies defend themselves, we're working with industry to use what we call a Cybersecurity Framework to prevent, respond to, and recover from attacks when they happen.¶ And, by the way, I recently went to the National Cybersecurity Communications Integration Center, which is part of the Department of Homeland Security, where representatives from government and the private sector monitor cyber threats 24/7. And so defending against cyber threats, just like terrorism or other threats, is one more reason that we are calling on Congress, not to engage in politics -- this is not a Republican or Democratic issue -- but work to make sure that our security is safeguarded and that we fully fund the Department of Homeland Security, because it has great responsibilities in this area.¶ So we're making progress, and I've recently announced new actions to keep up this momentum. We've called for a single national standard so Americans know within 30 days if your information has been stolen. This month, we'll be proposing legislation that we call a Consumer Privacy Bill of Rights to give Americans some baseline protections, like the right to decide what personal data companies collect from you, and the right to know how companies are using that information. We've proposed the Student Digital Privacy Act, which is modeled on the landmark law here in California -- because today's amazing educational technologies should be used to teach our students and not collect data for marketing to students.¶ And we've also taken new steps to strengthen our cybersecurity -- proposing new legislation to promote greater information sharing between government and the private sector, including liability protections for companies that share information about cyber threats. Today, I'm once again calling on Congress to come together and get this done.¶ And this week, we announced the creation of our new Cyber Threat Intelligence Integration Center. Just like we do with terrorist threats, we're going to have a single entity that's analyzing and integrating and quickly sharing intelligence about cyber threats across government so we can act on all those threats even faster.¶ ¶ And today, we're taking an additional step -- which is why there's a desk here. You were wondering, I'm sure. (Laughter.) I'm signing a new executive order to promote even more information sharing about cyber threats, both within the private sector and between government and the private sector. And it will encourage more companies and industries to set up organizations -- hubs -- so you can share information with each other. It will call for a common set of standards, including protections for privacy and civil liberties, so that government can share threat information with these hubs more easily. And it can help make it easier for companies to get the classified cybersecurity threat information that they need to protect their companies

SOX

President can mitigate the worst harms of SOX and keep checks in place for fraud

Bainbridge 14 – William D. Warren Distinguished Professor of Law at the UCLA School of Law (Stephen Bainbridge, November 22, 2014, "As long as Presidents aren't enforcing laws, why not add a few from Dodd-Frank and Sarbanes-Oxley?" http://www.professorbainbridge.com/professorbainbridgecom/2014/11/as-long-as-presidents-arent-enforcing-laws-why-not-add-a-few-from-dodd-frank-and-sarbanes-oxley.html), acui

The President doesn't have the same powers over the Securities and Exchange Commission that he does over the Justice Department, of course, but still the President could do a few things to unilaterally unwind some of the damage that the Sarbanes-Oxley and Dodd-Frank laws have done. First, the Justice Department could be told to exercise prosecutorial discretion not to pursue criminal cases arising out some of the worst provisions of those laws. No more criminal cases under SOX section 906, for example. No more criminal cases to be brought under Section 807 where the defendant did not act with scienter and no more cases in which the alleged fraud was not committed in connection with the purchase or sale of a security.¶ As for Dodd-Frank, it's replete with provisions that are "unworkable." The Bureau of Consumer Financial Protection is a travesty, of course, so stop enforcing the criminal provisions of Dodd-Frank that relate to it.¶ The most important thing the new President could do, of course, would be to install SEC Commissioners--especially a Chairman--who are equally committed to exercising prosecutorial discretion over the agency's civil enforcement program so as to gut the more egregious provision of SOX and Dodd-Frank. Maybe starting with conflict minerals disclosure?

Privacy

Consumer Privacy Bill of Rights solves right to privacy

Hunton Privacy 3/2 – privacy & information security blog of Hunton & Williams, a law firm that specializes in privacy and cybersecurity (Hunton Privacy Blog, Hunton & Williams LLC, March 2, 2015, "White House Releases Discussion Draft for a Consumer Privacy Bill of Rights," https://www.huntonprivacyblog.com/2015/03/02/white-house-releases-discussion-draft-consumer-privacy-bill-rights/), acui

On February 27, 2015, the White House released a highly-anticipated draft of the Consumer Privacy Bill of Rights Act of 2015 (the "Act") that seeks to establish baseline protections for individual privacy in the commercial context and to facilitate the implementation of these protections through enforceable codes of conduct. The Federal Trade Commission is tasked with the primary responsibility for promulgating regulations and enforcing the rights and obligations set forth in the Act.¶ The Act's baseline of consumer protections would apply broadly (with certain stated exceptions) to the privacy practices of covered entities that collect, create, process, retain, use or disclose personal data in or affecting interstate commerce. "Personal data" is broadly defined under the Act as "any data … under the control of a covered entity, not otherwise generally available to the public through lawful means, and … linked, or as a practical matter linkable by the covered entity, to a specific individual, or linked to a device that is associated with or routinely used by an individual." The Act carves out from the definition of personal data several types of information, including de-identified data, cybersecurity data and employee data that is collected or used by an employer in connection with an employee's employment status.¶ The Act sets forth individual rights for consumers and corresponding obligations of covered entities in connection with personal data. Key examples of the proposed privacy protections and obligations include:¶ Transparency. Covered entities shall provide individuals with clear, timely, conspicuous and easily understandable notice about the entity's privacy and security practices. The Act sets forth various content requirements for such notices.¶ Individual Control. Individuals must be provided with reasonable means to control the processing of their personal data that are proportionate to the privacy risk to the individual and are consistent with context, which is defined to mean the circumstances surrounding a covered entity's processing of personal data.¶ Respect for Context. If a covered entity processes personal data in a manner that is not reasonable in light of context, the entity must conduct a privacy risk analysis, and take reasonable steps to mitigate any identified privacy risks. If the privacy risk analysis is conducted under the supervision of an FTC-approved Privacy Review Board, the covered entity may be excused from certain heightened requirements under this section.¶ Focused Collection and Responsible Use. Covered entities may collect, retain and use personal data only in a manner that is reasonable in light of context. This limitation requires businesses to consider ways to minimize privacy risk, as well as to delete, destroy or de-identify personal data within a reasonable time after fulfilling the purposes for which the personal data were first collected.¶ Security. Covered entities are expected to identify reasonably foreseeable internal and external risks to the privacy and security of personal data that could result in the unauthorized disclosure, misuse, alteration, destruction or other compromise of the information. Based on this analysis, covered entities must establish, implement and maintain safeguards reasonably designed to ensure the security of such personal data, including but not limited to protecting against unauthorized loss, misuse, alteration, destruction, access to, or use of the business' information.¶ Access and Accuracy. Upon request, a covered entity must provide an individual with reasonable access to, or an accurate representation of, personal data that pertains to the individual and is under the control of the covered entity. This obligation entails providing the individual with a means to dispute and resolve the accuracy and completeness of his or her personal data.¶ Accountability. Covered entities must take measures appropriate to the privacy risks associated with its personal data practices, including training employees, conducting internal or independent evaluations, building appropriate consideration for privacy and data protections into the design of systems and business practices, and contractually binding third parties to comply with similar requirements prior to disclosing personal data to them.

The President can authorize billions of dollars for the plan without any Congressional involvement

Mayer 01 (Kenneth R, Professor of Political Science at the University of Wisconsin-Madison. 4/12, http://pup.princeton.edu/chapters/s7095.html)

In response Clinton unilaterally authorized $20 billion in loan guarantees on his own authority, relying on a little-noticed program called the Exchange Stabilization Fund, or ESF. Many members of Congress were outraged, arguing that the ESF, created in 1934 to allow the U.S. government to protect the dollar in international currency markets, was never intended for such a use.3 Yet Congress could not stop the president.4 Clinton, though humiliated by the Republican sweep in the 1994 elections and weakened by mass defections within his own party, was still able to commit to a multibillion dollar program without any meaningful interference.

Congress normally sets the budget and allocates funding for federal programs

Citizen Schools, an organization that partners with middle schools to expand the learning day for low-income children across the country, July 20**09**, "Citizen Schools Legislative Update - Federal Budget and Appropriations", Citizen Schools, http://capwiz.com/citizenschools/issues/alert/?alertid=12897531

What Does all this Mean for Actual Funding of these Programs and What Happens Next? Congress makes the ultimate decisions on spending levels for individual discretionary programs in the federal budget through the annual appropriations process. That process is moving forward, now that Congress has established its overall budget blueprint of spending levels via the budget resolution process. The more than $1 trillion Congressional budget resolution is nonbinding, but sets the general spending ceiling for the coming fiscal year (which begins October 1, 2009). This year, Congress is expected to provide spending levels roughly in line with the President's request. Congressional appropriations committees begin work in earnest on setting spending levels for individual discretionary programs. This process is expected to go on until at least the end of the current fiscal year on September 30th. There is some discussion in Washington that Congress could arrive at spending decisions by the start of FY 2010 on October 1, 2009 - in recent appropriations cycles, this process has lasted far beyond the start of the new fiscal year.

Logistics

Presidential action solves better than Congress – Multiple warrants

Lansford and Pauly 03 Tom Lansford received his Ph.D. from Old Dominion University, Norfolk, Va. Currently he is an assistant professor of political science, University of Southern Mississippi, Gulf Coast Campus. Robert J. Pauly, Jr., holds a Ph.D. from Old Dominion University, He is adjunct professor of history and political Science at Norwich University, Northfield, Vermont, and Midlands Technical College. http://www.unc.edu/depts/diplomat/archives_roll/2003_04-6/lansfordpauly_exec/lansfordpauly_exec.html

France and the United States have presidential systems which give their nations' highest elected official wide powers to conduct foreign and security policy. To different degrees, the division of responsibilities for both nations' highest office reflects Wildavsky's concept of "two-presidencies" in which one facet represents domestic policy and one represents foreign policy.1 In writing about the U.S. chief executive, Wildavsky summarized contemporary scholarship on the foreign policy powers of the presidency and identified five main reasons for the concentration of power: 1) since foreign policy and security issues often need "fast action", the executive rather than the legislative branch of government is the more appropriate decision-making structure; 2) the Constitution grants the president broad formal powers; 3) because of the complexities involved voters tend to delegate to the president their "trust and confidence" to act; 4) the "interest group structure is weak, unstable and thin"; and 5) the legislature follows a "self-denying ordinance" since tradition and practicality reinforce the power of the chief executive.2 Wildavsky's work is echoed by many scholars, including Logan, who contends that in Western democracies, "the mass public consciously or unconsciously cedes influence" to politicians and policy elites.3

Agencies

AT: Solvency Deficits

AT: Illegal

Both interpretations of the Constitution give XOs legality

Westmoreland 10 (Joshua Westmoreland, Boston College Environmental Affairs Law Review, 1/1/10 "Global Warming and Originalism: The Role of the EPA in the Obama Administration:" http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=1027&context=ealr&sei-redir=1#search=%22presidential%20power%20global%20warming%20obama%22)

One prominent theory regarding presidential power is the unitary executive theory.60 It is based on the Vesting Clause in Article II, Section 1 of the United States Constitution,61 which states that "[t]he executive power shall be vested in a President of the United States of America."62 The unitary executive theory posits that the President has complete power to execute the law and, consequently, has complete control over the actions of all executive agencies.63 Conversely, the theory states that, since power has not been vested in either of the other two branches of government, the President alone has the power to execute the laws of the land.64

AT: Separation of Powers

1. Turn – Congress has too much power now, unitary executive power is key to restoring SOP

Ginsburg and Menashi 10 (Douglas H Ginsburg, U.S. Court of Appeals for the District of Columbia, and Steven Menashi, Georgetown University Law Center, Kirkland and Ellis LLP, Universtity of Pennsylvania Journal of Constitutional Law, Vol. 12, No. 2, p. 251, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1567819)

In fact, the theory of a unitary executive has nothing to do with the extent of presidential power but only with who is to exercise those powers, however broad, allocated to the executive. Its proponents seek not to evade the limitations of separated powers, but rather insist— especially when dealing with the other branches— that the President alone is responsible for the actions of the executive branch. The idea seems ominous today because so many functions have been allocated to the now-fragmented executive branch that reuniting it under presidential leadership seems to the present generation both to enhance presidential authority unimaginably and to create an unmanageable administrative structure. We suggest the "**unitary executive" has fallen into ill repute and apparent obsolescence not because of an executive bent upon autocracy but because of a legislature freed from the constraints of the separation of powers.** In Part I we introduce the nondelegation doctrine as a necessary corollary of the unitary executive and examine the failure of the Supreme Court to enforce that doctrine. In Part II we examine the similar failure of the President to resist encroachments by the Congress. In Part III we explore the implications of these failures.

Turn- Court granted prez more power in order to balance SOP

(**Anne** E. [J.D. Candidate, University of Arizona James E. Rogers College of Law, 20**10**]; From Muddled to Medellin: A Legal History of Sole Executive Agreements; 51 Ariz. L. Rev. 1035; kdf)

Can the President of the United States unilaterally make federal law? For ¶ most students of American Government, the knee-jerk reaction to this question is ¶ an emphatic "no," as they are taught that it is the legislature's role to create laws ¶ and the President's role to see that the laws are faithfully executed.1¶ Indeed, the ¶ United States' political identity depends on a delicate separation of powers that ¶ prevents the President from accumulating too much power.2¶ Over time, however, transformed the delicate separation of powers balance has shifted, and this emphatic "no" has into a more muddled "maybe," with the President's use of sole ¶ executive agreements.¶ the delicate separation of powers balance has shifted, and this emphatic "no" has¶ Sole executive agreements present a unique challenge to traditional ¶ separation of powers principles. These agreements are legal tools the President can ¶ use to unilaterally resolve foreign disputes with other countries. **The Supreme ¶ Court has upheld the President's authority** to enter into sole executive agreements ¶ and has broadly held that these agreements, being analogous to treaties, are fit to ¶ preempt conflicting state law. Thus, sole executive agreements are a means by ¶ which the President can sideline the legislature and unilaterally create federal law. ¶ Sole executive agreements have been used since the early days of the ¶ Republic.3¶ Since the turn of the twentieth century and the rise of the United States ¶ as a global power, Presidents have **aggressively used sole executive agreements** to ¶ resolve significant matters of foreign policy. The

expansive use of sole executive ¶ agreements has attracted debate amongst scholars as to their constitutional validity, ¶ why they have been held to preempt federal law, and, most importantly, how the ¶ preemptive effect of these agreements could be limited to better harmonize with ¶ the Supremacy Clause and traditional separation of powers principles.4¶ Until recently, the Supreme Court has not provided much guidance to this ¶ debate. In a series of decisions,5¶ the Supreme Court has sanctioned the use of sole ¶ executive agreements and concluded that such agreements can be considered "the ¶ supreme Law of the Land."6¶ In doing so, the Court has granted sweeping power to ¶ the President to effectively create federal law through sole executive agreements ¶ without any meaningful limitations.

2. Non Unique – Thousands of XOs have been passed, the CP is no different

3. SOP is a myth – branches should overlap in order to best serve the society and protect democracy

Barnes '04 (Jeb, Assistant Professor of Political Science at the University of Southern California, "Adversarial Legalism, the rise of judicial policy making and the separation of powers doctrine" In M. Miller & J. Barnes (Eds). Making Policy, Making Law, p. 35-37)

This chapter takes a different tack. Instead of challenging heightened judicial policymaking and adversarial legalism on separation-of-powers grounds, it questions the separation-of-powers doctrine as traditionally applied to the policymaking process. Specifically, this chapter argues that the U.S. Constitution does not assign mutually exclusive policymaking roles to each branch of government; instead, it cre- ates overlapping branches of government that are designed to respond to different constituencies and approach policymaking differently. The goals of this system are redundant and diversely representative lawmakers are to (1) hinder any single branch or interest group from dominating the process and (2) encourage broad participation in the making of policy. From this perspective, the crucial issue in evaluating contemporary interbranch relations is not whether Congress, agencies, an courts adhere to neatly defined roles, but whether-and under what conditions interbranch relations promote important democratic outcomes, such as open deliberation and coalition-building among varied interests.

4. All your authors are wrong – unitary executive is key to check the power of Congress and maintain SOP

Ginsburg and Menashi 10 (Douglas H Ginsburg, U.S. Court of Appeals for the District of Columbia, and Steven Menashi, Georgetown University Law Center, Kirkland and Ellis LLP, Universtity of Pennsylvania Journal of Constitutional Law, Vol. 12, No. 2, p. 251, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1567819)

No reader of this Journal will be surprised to hear that Dick Cheney did not originate the idea that the executive power should be united under presidential control. That was part of the original constitutional design. In fact, **the provision of a unitary executive was a response to the fear, seldom heard today, that the Congress would become tyrannical**. Indeed, for all the contemporary hysteria over the unitary executive, few seemed to recognize, until Professors Calabresi and Yoo began to publish their research on the subject,11 how important the idea has been in American history. Contentious debate over the separation of powers and over the unitary executive in particular has been a perennial feature of American politics, about which the Founders left warnings worth revisiting today**. In The Federalist No. 51, Madison wrote, "[i]n republican government, the legislative authority necessarily predominates."12 His remedy for this tendency toward domination was to divide the legislature into different chambers, while the executive was to remain unitary so it would not be overmatched in its battles with the legislature.** "As the weight of the legislative authority requires that it should be thus divided," explained Madison, "the weakness of the executive may require, on the other hand, that it should be fortified."13 Today, Madison's warning seems quaint. Having seen the socially transformative power of the courts,14 many scoff at Hamilton's characterization of the judiciary as the "least dangerous" branch.15 Editorialists, as we have seen, conclude the executive is the most powerful branch and the legislature weak by comparison.16 Against this newly received wisdom, we argue that Madison was right, and his modern inversion mistaken. We start with the simple reminder that the Framers of our Constitution did not establish a parliamentary system with a prime minister dependent upon the national legislature. The President is not selected by the Congress; his salary is protected against any congressional diminution; and his term in office is fixed. Thus did our Founders seek to establish a President who was more than an agent of the legislature, as was the prime minister under the British constitution. To quote Madison again**: In order to lay a due foundation for that separate and distinct exercise of the different powers of government, which to a certain extent is admitted on all hands to be essential to the preservation of liberty, it is evident that each department should have a will of its own; and consequently should be so constituted that the members of each should have as little agency as possible in the appointment of the members of the others**.17 The theory of the unitary executive focuses upon the extent to which Article II, Section 1, Clause 1 of the Constitution—"The executive Power shall be vested in a President of the United States of America"— protects the President's authority to appoint, direct, and remove officers within the executive branch.18 Complementing this positive grant of authority to the President is the understanding that the other branches would be confined to their own respective spheres. A necessary corollary of the theory of the unitary executive, then, finds expression in the nondelegation doctrine—the idea that the Congress cannot delegate its lawmaking powers to the executive or the judiciary. It is the demise of that doctrine that has allowed the Congress both to augment and to fragment the executive branch by establishing federal agencies within the executive tasked with making policy pursuant to broad mandates from the Congress, agencies that effectively exercise legislative power through rulemaking**. The nondelegation doctrine was once recognized as a foundational principle of the separation of powers**.19 Its roots go back to John Locke, who put it this way:

5. Traditional views of SOP should be rejected in favor of an inter-branch perspective

Barnes '04 (Jeb, Assistant Professor of Political Science at the University of Southern California, "Adversarial Legalism, the rise of judicial policy making and the separation of powers doctrine" In M. Miller & J. Barnes (Eds). Making Policy, Making Law, p. 47-48)

The gist of the argument thus far is that the standard view of the separation of powers seems a house of cards, resting on a series of shaky formal, functional, and normative foundations. Thus, we should consider toppling the standard view and no longer hold the branches of government to formal categories of legislative, executive, and judicial functions. It should be added that rejecting the standard view of the separation of powers as applied to the policymaking process does not require the wholesale rejection of the separation-of-powers doctrine. As was alluded to above, we can accept the concept of the separation of powers as creating a general arrangement of primary powers that is distinct from other forms of democratic governance, such as parliamentary systems, while we jettison the concept of the separation of powers as creating rigid and static policymaking roles for the branches of government.

Congressional power of the purse that interferes with Presidential powers in foreign policy should be actively defied – this best preserves constitutionality

Brownell 1 (Roy E. Brownell II, attorney at the Washington, D.C. law firm of Muldoon Murphy & Faucette LLP and a member of the Maryland and District of Columbia Bars, Fall 2001 (THE CONSTITUTIONAL STATUS OF THE PRESIDENT'S IMPOUNDMENT OF NATIONAL SECURITY FUNDS, 12 Seton Hall Const. L.J. 1)

It necessarily follows that Congress, under the guise of the spending power, may not interfere with the national security powers assigned exclusively to the President under the Constitution. 469 Justice Kennedy, who was joined by Chief Justice Rehnquist and Justice O'Connor in his concurrence in Public Citizen v. United States Dept. of Justice, 470 noted, "in a line of cases of equal weight and authority ... where the Constitution by explicit text commits the power at issue to the exclusive control of the President, we have refused to tolerate any intrusion by the Legislative Branch." 471 By extension, areas of national security [*86] which fall under the President's exclusive purview, such as diplomatic recognition and negotiation, would be insulated from congressional interference through the spending power (or any other legislative prerogative for that matter). In areas of concurrent authority between the President and Congress, the Court has indicated it would use a balancing test. In Nixon v. Administrator, General Services, the Supreme Court stated that "in determining whether the Act disrupts the proper balance between the coordinate branches, the proper inquiry focuses on the extent to which it prevents the Executive Branch from accomplishing its constitutionally assigned functions." 472 In essence, **if Congress**, through its spending power, inhibits the Executive from performing his own specific constitutional duties even though Congress may also possess some authority over the matter, the statute would be a nullity. For example, both Congress and the President share authority over the armed forces. The President has strategic and tactical authority over the military, but Congress has the power to declare war and make rules for the armed forces. While the President cannot declare war, by the same token, Congress cannot interfere with tactical decisions. More specifically, a lower court has suggested that the President's national security power cannot be limited by an appropriation bill. In Federal Employees v. United States, 473 a district court, relying upon the "role of the Executive in foreign relations," struck down a statute forbidding the use of appropriated funds to enforce or implement nondisclosure agreements. Thus, judicial precedent specifically limiting Congress' spending power within a national security context does exist. A number of authorities have also pointed out the limits of the spending power with respect to national security affairs. Senator Robert Byrd, no shrinking violet when it comes to asserting Congress' Power of the Purse, has written that Congress may not use its appropriation power to prevent the President from receiving foreign ambassadors. 474 Professor Henkin

has written that "even [*87] when Congress is free not to appropriate, it ought not to be able to regulate Presidential action by conditions on the appropriations of funds to carry it out, if it could not regulate the action directly." 475 Henkin continued that "Congress cannot impose conditions which invade Presidential prerogatives to which the spending is at most incidental, or which violate individual rights ... ." 476 Professor Kate Stith has argued that "Congress cannot ... deny the President sufficient money to carry out his Article II duties (by, for example, stipulating that no money be expended by the Executive on receiving foreign ambassadors, in contravention of section 3), or make treaties." 477 In short, the spending power, similar to the commerce power, may be among the most elastic of legislative powers, may not do indirectly what Congress is forbidden from doing directly. 478 Because of these limits on the spending power, when Congress exceeds these limits, the President must not enforce these laws since they are unconstitutional. These limits are exceeded when Congress either (1) tries to appropriate in too much detail within a national security context, thus brushing up against the President's discretionary power as Chief Executive, or (2) when Congress attempts through the spending power to force the President to perform certain acts the decision of which is the President's alone. Either of these factors may be enhanced by a factor of two if congressional actions take place during wartime and/or involve funds to be expended overseas. When Congress impinges on the [*88] President's constitutional power by mandating that certain specific national security funds be spent, the President may impound the funds. In such situations, Congress has at best concurrent power with the President, with both theoretical and practical considerations seeming to lean in favor of the President.

AT: Imperialism

1.Pres Powers outweigh and Politics outweigh

1. Turn – Congress has too much power now, unitary executive power is key to restoring SOP

Ginsburg and Menashi 10 (Douglas H Ginsburg, U.S. Court of Appeals for the District of Columbia, and Steven Menashi, Georgetown University Law Center, Kirkland and Ellis LLP, Universtity of Pennsylvania Journal of Constitutional Law, Vol. 12, No. 2, p. 251, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1567819)

In fact, the theory of a unitary executive has nothing to do with the extent of presidential power but only with who is to exercise those powers, however broad, allocated to the executive. Its proponents seek not to evade the limitations of separated powers, but rather insist— especially when dealing with the other branches— that the President alone is responsible for the actions of the executive branch. The idea seems ominous today because so many functions have been allocated to the now-fragmented executive branch that reuniting it under presidential leadership seems to the present generation both to enhance presidential authority unimaginably and to create an unmanageable administrative structure. We suggest the "**unitary executive" has fallen into ill repute and apparent obsolescence not because of an executive bent upon autocracy but because of a legislature freed from the constraints of the separation of powers.** In Part I we introduce the nondelegation doctrine as a necessary corollary of the unitary executive and examine the failure of the Supreme Court to enforce that doctrine. In Part II we examine the similar failure of the President to resist encroachments by the Congress. In Part III we explore the implications of these failures.

2. No Link - The President can directly spend money from the Treasury to fulfill executive responsibilities – Congressional appropriation isn't needed

Sidak 89 (J. GREGORY SIDAK, Covington & Burling, Washington, D.C. A.B. 1977, A.M., J.D. Stanford University, 1989 "THE PRESIDENT'S POWER OF THE PURSE.", 1989 Duke L.J. 1162, *)

In the first category are the duties that article II explicitly imposes on the President. In the second category are the President's prerogatives, also enumerated in article II. This Part argues that the President has the right under the Constitution to perform these explicit duties and exercise these explicit prerogatives **even if Congress has not appropriated funds** for him to do so. The Constitution commands the President to act with respect to the subjects listed in article II -- even if, as in the case of the President's prerogatives, the command is to exercise discretion. The Constitution does not condition its commands in article II on Congress periodically granting the President permission to act. This insight leads to the conclusion that the President has an implicit power to encumber the Treasury in the name of carrying out the responsibilities assigned to him by the plain text of article II.

3. All your authors are wrong – unitary executive is key to check the power of Congress and maintain SOP

Ginsburg and Menashi 10 (Douglas H Ginsburg, U.S. Court of Appeals for the District of Columbia, and Steven Menashi, Georgetown University Law Center, Kirkland and Ellis LLP, Universtity of Pennsylvania Journal of Constitutional Law, Vol. 12, No. 2, p. 251, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1567819)

No reader of this Journal will be surprised to hear that Dick Cheney did not originate the idea that the executive power should be united under presidential control. That was part of the original constitutional design. In fact, **the provision of a unitary executive was a response to the fear, seldom heard today, that the Congress would become tyrannical**. Indeed, for all the contemporary hysteria over the unitary executive, few seemed to recognize, until Professors Calabresi and Yoo began to publish their research on the subject,11 how important the idea has been in American history. A necessary corollary of the theory of the unitary executive, then, finds expression in the nondelegation doctrine—the idea that the Congress cannot delegate its lawmaking powers to the executive or the judiciary. It is the demise of that doctrine that has allowed the Congress both to augment and to fragment the executive branch by establishing

federal agencies within the executive tasked with making policy pursuant to broad mandates from the Congress, agencies that effectively exercise legislative power through rulemaking**. The nondelegation doctrine was once recognized as a foundational principle of the separation of powers**.19 Its roots go back to John Locke, who put it this way:

4. Turn - Presidential spending power to enforce international obligations is essential effective separation of powers, unitary executive, and protection of liberty

Sidak 89 (J. GREGORY SIDAK, Covington & Burling, Washington, D.C. A.B. 1977, A.M., J.D. Stanford University, 1989 "THE PRESIDENT'S POWER OF THE PURSE.", 1989 Duke L.J. 1162, *)

No principle is more elemental to the logic of the Constitution than the separation of powers. 405 However, much constitutional scholarship since Watergate has been predicated on the belief that a metamorphosis from a **unitary Executive to a plural Executive would be salutary**. 406 The Framers did not start from that premise. Such a metamorphosis is plainly contrary to the history, text, and structure of the Constitution. "The accretion of dangerous power does not come in a day," wrote Justice Frankfurter in Youngstown. 407 "It does come, however slowly, from [*1253] the generative force of unchecked disregard of the restrictions that fence in even the most disinterested assertion of authority." 408 Behind the pretext of protecting taxpayers from a spendthift President, Professor Stith's Principle of Appropriations Control would have Congress control decisions that the Constitution said should be made by a unitary Executive. In its extremity, Professor Stith's theory would go so far as to tell the President that he cannot protect the constitutional rights of citizens if Congress should withhold the money necessary for him to take such action. I do not claim that mine is the last word on the appropriations clause. In particular, more thought is needed on the question of a feasible limiting principle for unappropriated spending by the President. The one clear lesson that scrutiny of this provision affords is that its text is one of the "great silences" 409 in the Constitution. Particularly because the clause can generate conflicts over the separation of powers, its probable meaning must be evaluated in light of the history and structure of the Constitution and in light of whether a particular interpretation of the clause (such as Professor Stith's Principle of Appropriations Control) would produce implausible results at odds with other portions of the Constitution. I have attempted to show that the conventional understanding of Congress's "power of the purse**" has virtually no support in the historical records of the Constitutional Convention** of 1787, the Federalist Papers, or other contemporaneous writings of the Framers. Unlike Professor Stith, I consider Congress's misuse of the appropriations power to be a grave constitutional problem. The Framers would not have assigned to the President such responsibilities as the making of treaties, the commanding of the armed forces, and the faithful execution of laws if they expected that Congress could selectively veto the execution of these functions by defunding them. There must exist an implied power for the President to obligate the Treasury, at least for the minimum amount necessary for him to perform the duties and exercise the prerogatives that article II imposes on his office. To conclude otherwise would require embracing the unlikely proposition that thrift was an object more precious to the Framers than was the perfection of a Constitution that "diffuses power the better to secure liberty." 410

AT: Totalitarian

1. Non Unique – thousands of XOs have been passed without triggering the Link

2. There's no risk of totalitarianism – Our Warrants subsume yours – there's empirical proof, and post midterm backlash prevents escalating power

Calabresi and Lindgren 6 (STEVEN G. CALABRESI AND JAMES LINDGREN. Professors of Law, Northwestern University.2006. THE MOST DANGEROUS BRANCH? MAYORS, GOVERNORS, PRESIDENTS, AND THE RULE OF LAW: A SYMPOSIUM ON EXECUTIVE POWER: COMMENTARY: The President: Lightning Rod or King? Copyright (c) 2006 The Yale Law Journal Company115 Yale L.J. 2611] |Kumar|)

THE POWERS OF A KING? There is an idea current in the land today that presidential power has grown to the point where it is a threat to democracy**.** The New York Times editorial page writers and leading Democrats regularly accuse President George W. Bush of acting like a king or seeking kingly powers. n1 In the academic community, Professor Bruce Ackerman has written powerfully about what he sees as the danger that presidential power poses to democracy itself. n2 In this Symposium Issue, Professors Bill Marshall n3 and Jenny Martinez n4 argue that the presidency has become too powerful. Marshall goes so far as to argue for reducing presidential power by separately electing the Attorney General. In this Commentary, we suggest that when political power is examined more broadly**,** Presidents and their parties generally have less power in the [*2612] United States than commentators recognize. We believe the President today is less of a king than a lightning rod. Indeed, the constitutional and practical weakness of the presidency is, if not a threat to American democracy, at least a worrisome limitation on it. The reason for this is that midterm and off-year elections show a strong backlash against members of the President's party. Political scientists have put forward two theories to explain midterm elections, both of which underestimate this backlash. The first theory of surge and decline holds that presidential midterm losses are explained mostly by the absence in those years of presidential coattails. n5 The second theory of midterm elections is that they are mostly a referendum on how well the President and the economy are doing. n6 These approaches tend to look too narrowly at federal elections when much of the reaction to winning the White House occurs in the states. Our backlash theory holds that midterm elections almost always punish the President's party so that it actually loses as much or more power in state and federal elections as the party gained by winning the White House. In essence, this pattern is one step forward in presidential election years and several steps back over the succeeding three years. In midterm elections, it is not merely that, without the President at the top of the ticket, his party loses some of its gains from the presidential election years (the surge and decline theory). Nor are the losses confined to the federal government or to years with unpopular Presidents or poor economies, as the referendum theory might imply. Indeed, when a party wins the White House, it gains on average only one governor's seat, while over the next three years the President's party loses on average four governorships, leaving it worse off than before it won the presidency. Winning the White House leads to losing a lot of important statehouses, which in turn are key to influencing domestic policy. Given this pattern, recent fears about growing presidential power with respect to domestic affairs may be overblown.

3. XOs don't cause dictatorship – CONSPIRACY THEORISTS ARE WRONG

Poupard 12 (L. Vincent Poupard, political/business consultant and contributor to yahoo news, March 20, 2012, "Obama's NDRP Executive Order a Strong Move," http://news.yahoo.com/obamas-ndrp-executive-order-strong-move-175500534.html)

Questions about martial law and government takeovers have been around for decades. The concern is often spread by conspiracy theory groups but is nothing more than a push to make people paranoid about the power held in the government. 9/11 was the closest we ever came to a national security state of emergency and we did not enter a state of martial law. The executive order is an easy target for conspiracy theorists who flip out whenever they hear anything about emergency powers. If they sat down to think they might realize it is best for the government to have plans in place in case of emergency. Orders like this help to ensure our prosperity, not take it away.

4. Congressional and Judicial oversight prevent tyrannical power

Wetzel '7 [Alissa C., Juris Doctor and Master of Science in international commerce and policy degrees May 17 from Valparaiso University, The School of Law, 2007 Valparaiso University Law Review. 42 Val. U.L. Rev. 385. Beyond the Zone of Twilight: How Congress and the Court Can Minimize the Dangers and Maximize the Benefits of Executive Orders. Lexis. Accessed 6/13/09]

As this Part has shown, though executive orders may seem to leave open the possibility of Presidential abuse, in practice, the system, though not perfect, creates appropriate blocks to executive tyranny. n165 First, executive orders allow the President to issue bold prerogatives on [*425] politically sensitive issues. n166 Second, Congress is able to appropriately check any potential for Presidential abuse, though it does not often do so. n167 Finally, the Court's test for the validity of executive orders is proper, though it is improperly applied to intelligence and classification. n168 In short, the Constitutional dialogue on executive orders has been a productive one, producing a test that, if applied correctly, can guard against executive tyranny and abuse. However, Congressional oversight has not been sufficiently effective and the Court's application of the Jackson test is flawed in the area of intelligence and classification. n169 Now, it is up to Congress to take a bolder stance on such issues in order for the Court to apply the test correctly. n170 V. CONCLUSION For two centuries, executive orders have allowed Presidents to exercise enormous power. At times, that power has been used to implement important measures to advance the country. At other times, executive orders have bred scandal and national shame. Upon closer examination of 200 years of Constitutional dialogue among the three branches of government concerning how much unilateral power a President ought to have, however, it becomes clear that although executive orders may appear tyrannical based on the broad power they afford Presidents, in practice executive orders are useful tools of the Presidency, able to be checked by Congressional oversight and controlled by the Court. If correctly wielded, such Congressional and judicial oversight can guarantee that executive orders will not allow Presidents to become the despots so feared by the founding generation. Instead, by moving out of the zone of twilight and exercising proper oversight Congress and the Court can ensure that the President is able to [*430] administer the executive branch effectively, pass measures quickly, and occasionally rise above political divisions and do the right thing.

5. Turn – Unitary Executive Power is key to prevent congressional totalitarianism

Ginsburg and Menashi 10 (Douglas H Ginsburg, U.S. Court of Appeals for the District of Columbia, and Steven Menashi, Georgetown University Law Center, Kirkland and Ellis LLP, Universtity of Pennsylvania Journal of Constitutional Law, Vol. 12, No. 2, p. 251, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1567819)

In fact, the theory of a unitary executive has nothing to do with the extent of presidential power but only with who is to exercise those powers, however broad, allocated to the executive. Its proponents seek not to evade the limitations of separated powers, but rather insist— especially when dealing with the other branches— that the President alone is responsible for the actions of the executive branch. The idea seems ominous today because so many functions have been allocated to the now-fragmented executive branch that reuniting it under presidential leadership seems to the present generation both to enhance presidential authority unimaginably and to create an unmanageable administrative structure. We suggest the "**unitary executive" has fallen into ill repute and apparent obsolescence not because of an executive bent upon autocracy but because of a legislature freed from the constraints of the separation of powers.** In Part I we introduce the nondelegation doctrine as a necessary corollary of the unitary executive and examine the failure of the Supreme Court to enforce that doctrine. In Part II we examine the similar failure of the President to resist encroachments by the Congress. In Part III we explore the implications of these failures.

6. History proves Executive Orders are Constitutional and that they can be controlled

Wetzel '7[Alissa C., Juris Doctor and Master of Science in international commerce and policy degrees May 17 from Valparaiso University, The School of Law, 2007 Valparaiso University Law Review. 42 Val. U.L. Rev. 385. Beyond the Zone of Twilight: How Congress and the Court Can Minimize the Dangers and Maximize the Benefits of Executive Orders. Lexis. Accessed 6/13/09]

II. BACKGROUND Like all executive power, the ability of Presidents to issue executive orders has developed through past practice and judicial decisions. n13 Indeed, Supreme Court jurisprudence in the area of executive orders has been called a "constitutional dialogue" between the executive and judicial branches. n14 Moreover, an examination of the long history of executive orders reveals the measures that Congress and the courts can take today to minimize the danger of absolute Presidential power, while preserving the positive attributes of executive orders. n15 [*388] Thus, this Part will cover over 200 years of constitutional dialogue, tracing the rise of the modern presidency and encompassing some of the great political debates and judicial decisions of the past. n16 First, this Part examines the early history of this dialogue, from its Constitutional roots to early executive orders and judicial challenges. n17 Second, this Part considers the manner in which executive orders and court challenges were affected by the Civil War and Gilded Age that followed. n18 Next, this Part focuses on how the dialogue changed with the advent of the modern presidency at the turn of the twentieth century through the duel crises of the Great Depression and World War II. n19 Finally, this Part discusses how contemporary Presidents have used executive orders and how the Supreme Court has developed the modern judicial hurdle of challenging an executive order. n20 A. Executive Orders from Constitutional Roots Through the Dawn of the Civil War: Congress Ignores Early Orders While the Court Firmly Establishes Statutory Supremacy In 1789, the framers drafted the United States Constitution and created an innovative institution: the American Presidency. n21 Though wary of creating too strong an executive figure, the framers drafted the Constitution such that the President possesses both express and implied [*389] powers. n22 The authority to issue executive orders is an implied power that has been used by Presidents dating back to George Washington. n23 Executive orders have allowed Presidents to do that which even the King of England could not: bypass the legislative process by issuing orders that carry the force of law. n24 [*390] Though executive orders did not receive their name until well into

the nineteenth century, most authorities agree that the first such order was an administrative order issued by George Washington in June of 1789. n25 However, President Washington's most divisive order did not come until 1793 in the form of a Neutrality Proclamation, declaring that the United States would not get involved in the war between France and Britain. n26 Significantly, though highly controversial, Congress never [*391] overturned the Neutrality Proclamation. n27 However, as history would soon illustrate, Congress was not the only check on Presidential power. n28 In 1804, the Supreme Court first weighed in on Presidential proclamations in Little v. Barreme. n29 The executive order at issue in Little, a naval order that was issued pursuant to a Congressional grant of Presidential authority, conflicted with a statute. n30 Firmly establishing the [*392] supremacy of statutes over executive orders, the Court held that the statute controlled and that the executive order was thus invalid. n31 The years that followed Little saw numerous executive orders unchallenged by Congress, most dealing with civil service issues and the disposition of public lands. n32 Still, two important executive orders were issued prior to the Civil War. n33 First, though seldom classified as such, President Thomas Jefferson's Louisiana Purchase had all the markings of an executive order, since it was done unilaterally by Presidential order without direct statutory or Constitutional authority. n34 Significantly, neither Congress nor the public challenged the Louisiana Purchase on [*393] the grounds that it was issued without Congressional authority. n35 Second, President John Tyler began the tradition of establishing controversial independent Presidential commissions with executive orders when he issued an 1842 order calling for a commission to investigate corruption in the New York City Customshouse. n36 Thus, by the beginning of the Civil War, the practice of issuing executive orders was firmly established in American politics, and, although the Court had established the supremacy of statutes over executive orders, Congress was seldom willing to override an order. n37 In the mid-1800s, as with modern executive orders, the Court had developed a framework for assessing the legality of executive orders; however, in order for the Court to effectively check Presidential power, Congress had to be proactive as well. n38

7. There's no risk of totalitarianism – The real problem is that people don't vote correctly

Calabresi and Lindgren 6 (STEVEN G. CALABRESI AND JAMES LINDGREN. Professors of Law, Northwestern University.2006. THE MOST DANGEROUS BRANCH? MAYORS, GOVERNORS, PRESIDENTS, AND THE RULE OF LAW: A SYMPOSIUM ON EXECUTIVE POWER: COMMENTARY: The President: Lightning Rod or King? Copyright (c) 2006 The Yale Law Journal Company115 Yale L.J. 2611]|Kumar|)

The American political landscape changes not just every four years, but every two years as well. What has not been adequately recognized in the scholarly literature is that the changes in control in the gubernatorial off-year elections are indeed larger than any coattail effect in the presidential election year, largely because only eleven small states elect their governors at the same time as they vote for President. The net effect is that by the time a President is up for reelection, his party controls fewer governorships than before he won the election. Winning the presidency seems to lead very shortly to losing power, not only in Congress, but in state governorships as well. When one adds this perverse effect to the constitutional weakness of the presidency, the extraordinary emphasis on the presidential election every four years seems misplaced. No American President has ever seriously threatened our democratic system of government, but democracy may be undermined when people regularly mobilize for and participate in a presidential election that is likely to produce on balance the exact opposite policy consequences from those for which the people have voted. Rather than worrying about imaginary threats of dictatorship, we ought to be worried today about an electoral system that may regularly be frustrating the popular will.

AT: Delay

1. FIAT solves any delay – If the Aff gets FIAT its only fair the CP would too

Executive fiat is faster than congressional and avoids separation of powers Endelman & Mehta 9

(Gary Endelman obtained a BA. History, University of Virginia, PhD in U.S. History, University of Delaware (1978), J.D., University of Houston (1984). He has practiced immigration and nationality law in Houston in private practice (1985-1995) and as the in-house immigration counsel for BP America Inc. & Cyrus D. Mehta a graduate of Cambridge University and Columbia Law School, is the Managing Member of Cyrus D. Mehta & Associates, PLLC in New York City. The firm represents corporations and individuals from around the world in a variety of areas such as business and employment immigration, family immigration, consular matters, naturalization, federal court litigation and asylum.) ["The Path Less Taken: Is There An Alternative To Waiting For Comprehensive Immigration Reform?" online @ http://www.ilw.com/articles/2009,0225-endelman.shtm, loghry]

Dinesh Shenoy made a huge first step but it was only a first step. Is action by Congress the only, or even the best, way to break the priority date stranglehold on US immigration policy? The authors do not think so. Amendment of INA Section 245 is unlikely since action by Congress, even in the best of times, takes time. When Congress finds such time, legalization and other priority items (like recapture of unused visas) will absorb it. Beyond this, is it necessary to relax the rules on adjustment of status? What do potential immigrants really want for themselves and their spouses? The ability to work in the United States on a long-term basis and travel back home for vacation and/or family emergency. Can they only do that as adjustment applicants? Is there another way? The authors think there is. While INA Section 245 conditions adjustment of status on having a current priority date and meeting various conditions,9 there would be prohibition anywhere that would bar USCIS from allowing the beneficiary of an approved I-140 or I-130 petition to apply for an employment authorization document (EAD) and advance parole. No action by Congress would be required; executive fiat suffices. For those who want some comfort in finding a statutory basis, the government could rely on its parole authority under INA Section 212(d)(5) to grant such interim benefits either for "urgent humanitarian reasons" or "significant public benefit.10 There is nothing in 8 CFR Section 212.5 that would prohibit the DHS from granting parole for this reason on the grounds that the continued presence of I-140 or I-130 beneficiaries provide a significant public benefit. Since such parole is not a legal admission,11 there is no separation of powers argument since the Executive is not trying to change existing grounds of admission or create any new ones. Moreover, Congress appears to have provided the government with broad authority to provide work authorization to just about any non-citizen.12

2. XOs are quicker than congressional action

Rottinghaus and Belco 12 (Brandon Rottinghaus, phd Canidate at University of Houston, and Michelle Helene Belco, phd Canidate at University of Houston , "In Lieu of Legislation: Presidential Preemption of the Legislative Process Through Unilateral Order," Social Science Research Center, 2011, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1900804)

In this section, we formalize our expectations about which factors influence the president‟s decision to issue a unilateral order in lieu of legislation. In our first hypothesis we consider the presidency-centered conditions that may influence decision-making with regard to "preempting" Congress in the legislative arena (as described in the previous section). Our expectations are drawn from the "strategic model" (or "evasion hypothesis") (Martin 1999). Specifically, when political circumstances engender the need for expediently enacting the president‟s agenda into law, we expect that presidents in the later stages of the administration, in election years and those with greater discretion should be more likely to act against Congress. For instance, this is prominent when the president is in a position where he needs to act efficiently to create new laws or to foster his legislative agenda. First, Mayer (2001) suggests that the later the "stage of his term," the more likely presidents are to issue an executive order (102). Moments where the president is in the second half of his term or his second term should give rise to presidents issuing more orders acting against Congress. Second, presidents are more likely to issue a preemptive order when the issue is on their political or electoral agenda. The rise of the "permanent campaign" has hastened the need to act quickly for legislative and political victories (Cook 2002) and the growth of the public presidency has exponentially magnified the need for presidents to keep their promises (Light 1999). Presidents often use this tactic to make progress on a legislative agenda item (Rudalevige 2005), especially using executive orders (Mayer 2001, 97).

3. XOs are quick and avoid cumbersome congress – only the plan would get delayed by procedural requirements

Cooper 2 [Phillip, Professor of Public Administration @ Portland State University, *By Order of the President: The Use and Abuse of Executive Direct Action"*]

Executive orders are often used because they are quick, convenient, and relatively easy mechanisms for moving significant policy initiatives. Though it is certainly true that executive orders are employed for symbolic purposes, enough has been said by now to demonstrate that they are also used for serious policymaking or to lay the basis for important actions to be taken by executive branch agencies under the authority of the orders. Unfortunately, as is true of legislation, it is not always possible to know from the title of orders which are significant and which are not, particularly since presidents will often use an existing order as a base for action and then change it in ways that make it far more significant than its predecessors. The relative ease of the use of an order does not merely arise from the fact that presidents may employ one to avoid the cumbersome and time consuming legislative process. They may also use this device to avoid sometimes equally time consuming administrative procedures, particularly the rulemaking processes require by the Administrative Procedure Act. Because those procedural requirements do not apply to the president, it is tempting for the executive branch agencies to seek assistance from the White House to enact by executive order that which might be difficult for the agency itself to more through the process. Moreover, there is the added plus from the agency's perspective that it can be considerably more difficult for potential adversaries to obtain standing to launch a legal challenge to the president's order than it is to move an agency to judicial review. There is

nothing new about the practice of generating executive orders outside the White House. President Kennedy's executive order on that process specifically provides orders generated elsewhere.

4. Congressional programs are fragmented – it is much quicker for Obama to pass orders himself – orders on abortion funding prove

Edwards and Wayne 9 (By George C. Edwards, III, Distinguished Professor of Political Science at Texas A&M University. holds the Jordan Chair in Presidential Studies and has served as the Olin Professor of American Government at Oxford and the John Adams Fellow at the University of London, has held senior visiting appointments at Sciences Po-Paris, Peking University, Hebrew University of Jerusalem, and the U.S. Military Academy at West Point, the founder and from 1991-2001 the director of The Center for Presidential Studies, Stephen J. Wayne, served as President of the Presidency Research Group and The National Capital Area Political Science Association, regularly lectures to international visitors, senior federal executives, and college students in the United States and abroad on the presidency and electoral politics, has testified before Congress, advised both the Republican and Democratic National Committees on the presidential nomination process, Presidential Leadership: Politics and Policy Making, p. 521, published by Cengage Learning, July 15, 2009 http://books.google.com/books?hl=en&lr=&id=J5U5OOSC3RAC&oi=fnd&pg=PR7&ots=Ccit2eWhB6&sig=t2MtZVMSz2KhroGK_tB2BOAF7RA#v=onepage&q=executive%20order&f=false)

The bottom line is that although Congress and the judiciary can limit the unilateral power of the president, they rarely do so in practice. Thus, the absence of congressional and judicial actions implicitly encourages presidents to turn to their executive authority to achieve their policy objectives when they cannot do so by other means or **when time is of the essence**.

AT: Inter-branch conflict

1. Strong Executive doesn't mean the Legislative has less power – cooperation more likely than competition

Cheibub and Limongi 10 (José Antonio Cheibub, University of Illinois, and Fernando Limongi, Universidade de São Paulo and CEBRAP, "From Conflict to Coordination:

Perspectives on the Study of Executive-Legislative Relations," http://scholar.googleusercontent.com/scholar?q=cache:cX5HZuddXJwJ:scholar.google.com/&hl=en&as_sdt=0,22&as_ylo=2008)

In the traditional model of legislative-executive relations, a strong government, that is, one endowed with a large array of legislative powers, will use these powers against the legislature. The greater the conflict between the two branches of government, the greater the incentives the executive will have to use these powers in order to see its will prevail over the recalcitrant legislature. This view has been challenged and the seminal work doing so is Huber's (1996) study of policy making under the 1958 French constitution. Specifically, in his book Huber focuses on the role of the package vote and the confidence vote procedure – two features of the 1958 constitution that strengthen the government's legislative powers8 –in shaping how the executive and the legislature interact. Using an adapted version of the classical agenda setter model (Rommer and Rosenthal1978) and drawing heavily on models developed to understand the relations between the floor and committees in the US Congress, Huber accomplishes a series of tasks that re-direct the way one should think about the use of restrictive legislative procedures by the executive. In the first place, he demonstrates theoretically and empirically that, contrary to the prevailing perception of students of French politics, the use of restrictive procedures is not related to the degree of policy conflict between the government and the parliament. The government does not use restrictive procedures as a way to guarantee that its preferences prevail when these preferences are at odds with those of the legislature.9Second, Huber shows that not all restrictive procedures are the same. He demonstrates that the package vote is a mechanism used by the government to protect the outcome of bargaining in a multidimensional policy space among parties within the governing coalition, or between the government and the opposition. By halting legislative debate and forcing an up-or-down vote on a bill that contains only the amendments the government chooses to retain, the package vote compels legislators to choose between a specific policy package and the status quo. Since the legislature is the last one to act –it has the last word – it will approve the bill only if it is preferred to the status quo. In this sense, the government does not impose its will; rather, it forces a choice between the status quo and policy change.8 The package vote (article 44.3), allows the government to close debate on a bill and force an up or down vote on a proposal containing only the amendments proposed or accepted by the government; the confidence vote procedure (article 49.3), when invoked by the government, stops debate on a bill and, if no motion of censure is introduced and adopted, implies approval of the bill shaped by the government.9 Huber's argument is analogous to the one developed by Shepsle (1979), Shepsle and Weingast(1987a and 1987b) and Krehbiel (1987a 1987b) to the effect that congressional committees in the US cannot legislate against the will of the floor. Finally, Huber shows that the confidence vote plays a different role than the package vote in the legislative process. While it can also serve as a mechanism for protecting policy bargains in

multidimensional spaces – it allows coalition members to implement a given policy while criticizing it in the parliament – its primary role is to allow parties in the majority to compete for votes at the same time that they cooperate to pass legislation. Thus, members of the majority can make sincere, position-taking proposals in the legislature in order to communicate their policy positions to their voters, force the government to use the confidence vote and, given that now the vote is no longer on the policy issue alone but on the very survival of the government, refrain from supporting the censure motion and allow the policy to be enacted. This policy, however, like with the package vote, is not unrelated to the preferences of the majority. Although the prime minister will explore the first mover advantage of proposing a specific policy, his or her choice will be constrained by the preferences of the majority. That is to say, the PM will propose a policy that is closest to his or her ideal point within the set of policies the majority prefers over the status quo. In this sense, while they give some leeway to the government to pick a policy it likes, neither the vote of confidence nor the package vote can be used against the majority. The implications of this analysis are profound when it comes to analyzing executive-legislative relations. To begin with, the analytical focus shifts from outside forces – the way legislators and governments get and retain their mandates – to the specific rules regulating executive-legislative relations. As with Strom, and perhaps even more forcefully than he, the relevant variables for understanding policy making are located inside rather than outside the legislature. Second, not all parliaments are rationalized in the sense used by Huber (see alsoLauvaux 1988), that is, not all parliaments contain provisions that allow the government to control the flow of legislation. In this sense, government control over the legislative agenda is not intrinsic to or follows from the principle that defines parliamentarism. That is to say, the strong cabinet control of the legislative process and the near irrelevance of individual members of parliament in this process, which characterizes England, are not inherent to parliamentary governments, as the cases of Italy after 1945and France in the Third and Fourth Republics well illustrate. In both cases, the government had no control over the definition of the legislative agenda, committees had considerable power, and the rights of individual legislators were not“expropriated.”10 Similarly, and by extension, there is nothing in presidentialism that10 In France, until 1911, it was the Chamber presidents who defined the legislative agenda. As Andrews (1978:471) reports, despite several incremental reforms, the government did not have firm control over the definition of the legislative agenda and no-confidence votes were easy to be introduced, leading to the fall of the government. Moreover, committees could veto policy since a report from the committee was necessary for consideration of a bill by the floor. The government could expedite the committee report but could not avoid it. Therefore, committees could respond to government pressure with an unsatisfactory report. Besides, **according to requires that a well-functioning system be one in which a weak president faces a strong congress. Although this describes the allocation of powers across branches in the U.S. system, and the U.S. is the only presidential democracy that has lasted for a long time, it does not follow that the success of the U.S. system can be attributed to the specific way powers are allocated across the presidential and the legislative branches.11This characterization sheds new light on the mechanisms that produce party discipline inside the legislature. The threat of dissolution and early elections is not a sufficient condition to hold party members in line, as the frequent fall of the French and Italian governments demonstrate. Neither is it a necessary condition, since party discipline does occur under presidentialism, nor, it should be noted, can it be inferred from characteristics of the electoral laws since disciplined parties are observed in countries that adopt candidate-centered rules, such as Finland, Brazil, and Chile among others. Discipline is rather a function of restrictive procedures, of denying the rank-and-file members the space for opportunistic**

behavior. In other words, party discipline is less a product of punishing free riders than of preempting the opportunities for free-riding. The expropriation of the rank-and-file legislative rights implied by the concentration of agenda powers in the hands of the executive renders the individual and independent action of legislators futile. For these legislators, the rational course of action when it comes to voting in the assembly is to follow their parties' directives. This is the only way they will be able to influence public policies and send signals to voters (see Limongi andFigueiredo 1998).

2. Nope, Other branches usually support presidential action

Julian **Ku* and** John **Yoo**, Associate Professor of Law, Hofstra University School of Law; Visiting Associate Professor of Law, William & Mary Marshall-Wythe School of Law. And Professor of Law, University of California at Berkeley School of Law (Boalt Hall); Visiting Scholar, American Enterprise Institute. Summer, **2006** THE FUNCTIONAL CASE FOR FOREIGN AFFAIRS DEFERENCE TO THE EXECUTIVE BRANCH 23 Const. Commentary 179Copyright (c) 2006 Constitutional Commentary. Lexis |Kumar|

But one need not take sides in the war powers debate between the President and Congress to see that the Court has unnecessarily interfered in the political branches' management of war. Constitutional practice shows that there has been a substantial history of inter-branch interaction and cooperation on the subject of military commissions. Rather than a story of unilateral executive branch action, Congress has supported presidential use of them in at least three different ways: a) Section 821 of the UCMJ, which recognizes military commissions; b) the Authorization to Use Military Force enacted on September 18, 2001, which authorized the President to use all necessary and appropriate force against those responsible for the September 11 attacks; and c) the Detainee Treatment Act of 2005, which created a carefully crafted review process for military commission verdicts**.** This is not to say that President Bush could not use military commissions on his own authority once war broke out; several Presidents had employed them as a wartime measure without any specific congressional authorization. But it was unnecessary for the Court to reach the issue of the President's constitutional powers since Congress was on record as supporting military commissions. Indeed, Congress's swift action to largely reinstate the pre-Hamdan military commissions simply confirms that there was no real conflict between executive and legislative policy in the use of military commissions.

3. The struggle for inter-branch power is inevitable

Moe and Howell 99 (Terry M and William G., senior fellow at the Hoover Institution and Associate Professor in the Government Department at Harvard University, “Unilateral Action and Presidential Power: A theory”, *Presidential Studies Quarterly* 29.4, December)

It was also inevitable, however, that there would be a struggle for power over the framework itself. The Constitution sets out the entire design of American government in just a few brief pages and is almost entirely lacking in detail. It does not define its terms. It does not elaborate. It does not clarify. While some of the powers it allocates are straightforward--the president's power to veto legislation, for instance--many of the others, including powers that are quite fundamental, are left wholly

ambiguous. The actual powers of the three branches, then, both in an absolute sense and relative to one another, cannot be determined from the Constitution alone. They must, of necessity, be determined in the ongoing practice of politics. And this ensures that the branches will do more than struggle over day-to-day policy making. They will also engage in a higher order struggle over the allocation of power and the practical rights to exercise it. Throughout the course of American history, this higher order struggle has been reasonably well contained. No single actor has dominated, decisions have been made for the nation, and the same formal Constitution has prevailed. Nonetheless, the reality of the governing structure has changed substantially over the years, to the point that the Founders would barely recognize the system that now governs our nation. Who has power, and how that power gets exercised, looks dramatically different today than it did two hundred years ago. The struggle has transformed it.

4. Non Unique – Thousands of XOs have been passed, the CP is no different

5. Even if the executive order is controversial would not lead to inter-branch conflict

Moe and Howell 99 [Terry, prof of political science @ Stanford, and William, Associate Prof @ Harvard, Presidential Studies Quarterly, December 1999, http://www.blackwell-synergy.com/doi/pdf/10.1111/1741-5705.00070]

What is likely to happen in Congress, then, when presidents take unilateral action by issuing executive orders that shift the policy status quo? The answer is that legislative responses (if there are any) will be rooted in constituency. An executive order that promotes civil rights, for example, will tend to be supported by legislators from urban or liberal constituencies, because it shifts the status quo in their preferred direction, while members from conservative constituencies will tend to oppose it. The fact that this executive order might well be seen as usurping Congress's lawmaking powers, or that it has the effect of expanding presidential power, will for most legislators be quite beside the point. Thus, if Congress tries to take any action at all in responding to the executive order, the battle lines will be determined by the order's effects on legislative constituencies, not by its effects on Congress's power vis-à-vis the president. Even when presidents are clearly taking action to push out the boundaries of their power, therefore, Congress will not tend to vote or respond on that basis and will not, as a result, be able to defend or promote its institutional power very effectively.

AT: Funding

1. Executive Branch –specifically presidential review – controls ESF funding

Humphage 8 (Owen F. Humpage, senior economic advisior at the research department of the federal reserve bank of cleveland, "A New Role for the Exchange Stabilization Fund," Federal Reserve Bank of Cleveland, 8/15/08, http://www.clevelandfed.org/research/commentary/2008/0808.cfm)

Congress allowed the ESF to be self-financing and to exist outside of the annual appropriations process. Doing so guarded the agency's secrecy, a precious commodity when charged with fending off currency speculators. In a like vein, Congress gave the secretary of the treasury full control over ESF operations. Responding quickly is also essential for successful foreign-exchange operations. Aside from the president, no other officer of the U.S. government has authority to review the Treasury's decisions regarding ESF operations. Since the late 1970s, Congress has imposed some oversight on operations and on the financing of the ESF, but these are largely after-the-fact reporting requirements. Fund operations remain squarely within the purview of the Treasury.

2. ESF can solve – Over 100 billion in reserve

US Department of Treasury, 8/31 (http://www.treasury.gov/resource-center/international/ESF/Documents/Trunc%20+%20Notes.pdf)

ASSETS Fund Balance with Treasury - Special Drawing Rights Special Drawing Rights Holdings 57,583,454,876.90 Accrued interest receivable on Special Drawing Rights holdings 21,077,123.25 Total Special Drawing Rights 57,604,532,000.15 US Government Securities Investments in US Government Securities 22,725,152,822.12 Accrued interest receivable on U.S. Gov't Securities - Total US Government Securities 22,725,152,822.12 European Euros (Note 1) Deposits with Official Institutions 7,629,868,019.92 Securities: Held outright 4,912,277,623.35 Held under repurchase agreements 2,681,724,835.42 Accrued interest receivable on Euro investments 100,225,520.45 Total European Euros 15,324,095,999.14 Japanese Yen (Note 1) Deposits with official institutions 4,005,466,624.34 Securities 8,112,728,753.66 Accrued interest on Yen investments 11,907,325.69 Total Japanese Yen 12,130,102,703.69 **TOTAL ASSETS** (Note 3) **$ 107,783,883,525.10**

3. The President can directly spend money from the Treasury – Congressional appropriation isn't needed

Sidak 89 (J. GREGORY SIDAK, Covington & Burling, Washington, D.C. A.B. 1977, A.M., J.D. Stanford University, 1989 "THE PRESIDENT'S POWER OF THE PURSE.", 1989 Duke L.J. 1162, *)

In the first category are the duties that article II explicitly imposes on the President. In the second category are the President's prerogatives, also enumerated in article II. This Part argues that the President has the right under the Constitution to perform these explicit duties and exercise these explicit prerogatives even if Congress has not appropriated funds for him to do so. The Constitution commands the President to act with respect to the subjects listed in article II -- even if, as in the case of the President's prerogatives, the command is to exercise discretion. The Constitution does not condition its commands in article II on Congress periodically granting the President permission to act. This insight leads to the conclusion that the President has an implicit power to encumber the Treasury in the name of carrying out the responsibilities assigned to him by the plain text of article II.

4. President has discretionary spending power within agencies

Pika et al 5 [Joseph, Professor of Political Science and International Relations @ University of Delaware + John Maltese, Associate Professor of Political Science @ University of Georgia + Norman Thomas, department of Political Science @ University of Cincinnati The Politics of the Presidency5th Edition, pg. 233]

In addition to budgeting, presidents have certain discretionary spending powers that increase their leverage over the bureaucracy. They have substantial non statutory authority, based on understandings with congressional appropriations committees, to transfer finds within an appropriation and from one program to another. The committees expect to be kept informed of such “reprogramming” actions. **Fund transfer authority is essential to sound financial management, but it can be abused to circumvent congressional decisions**. In 1970, for example, Nixon transferred funds to support an extensive unauthorized covert military operation in Cambodia. Nevertheless, Congress has given presidents and certain agencies the authority to spend substantial amounts of money on a confidential basis, the largest and most controversial of which are for intelligence activities.

5. Discretionary budgets gives the president the ability to fund things even if congress opposes

Howell 5 [William, Associate Prof @ Harvard, “Unilateral Powers: A Brief Overview”, September 2005, Presidential Quarterly, http://www.blackwell-synergy.com/doi/full/10.1111/j.1741-5705.2005.00258.x]

Third, and finally**,** given the size of the overall budget and the availability of discretionary funds, presidents occasionally find ways to secure funding for agencies and programs that even a majority of members of Congress oppose. Presidents may request moneys for popular initiatives and then, once secured, siphon off portions to more controversial programs and agencies that were unilaterally created. They can reprogram funds within budgetary accounts or, when Congress assents, they may even transfer funds between accounts. And they can draw from contingency accounts, set-asides for unforeseen disasters, and the like, in order to launch the operations of certain agencies that face

considerable opposition within Congress. By Louis Fisher's account, "The opportunity for mischief is substantial" (1975, 88). While discretion is far from absolute, the president does have more flexibility in deciding how funds are spent than a strict understanding of Congress's appropriations powers might suggest.

6. Presidents can garner funding regardless of congress

Howell 5 [William, Associate Prof @ Harvard, "Unilateral Powers: A Brief Overview", September 2005, Presidential Quarterly, http://www.blackwell-synergy.com/doi/full/10.1111/j.1741-5705.2005.00258.x]

Second, the appropriations process is considerably more streamlined, and hence easier to navigate, than the legislative process**.** It has to be, for Congress must pass a continually expanding federal budget every year, something not possible were the support of supermajorities required. But by lowering the bar to clear appropriations, Congress relaxes the check it places on the president's unilateral powers. There are a range of programs and agencies that lack the support of supermajorities that are required to create them, but that have the support of the majorities needed to fund them. Just because the president cannot convince Congress to enact a program or agency does not mean that he cannot build the coalitions required to fund them.

7. The president can use the ESF to control spending even if congress disagrees

Desltler 10 (I.M. (Mac) Destler, Professor at the School of Public Policy @ University of Maryland, Director, Program on International Security and Economic Policy, Visiting Fellow at Peterson Institute for International Economics September 2010, "THE FOREIGN ECONOMIC BUREAUCRACY," http://scholar.googleusercontent.com/scholar?q=cache:sntSnvRxc2EJ:scholar.google.com/+presidential+slush+fund+exchange+stabilities+fund&hl=en&as_sdt=0,22&as_ylo=2008)

Treasury dominance has been almost as great on matters of LDC debt. The Mexican crisis caught Robert Rubin in transition from the position of NEC director to that of Treasury Secretary, but he quickly dominated decision making on the US response, working with his Deputy Secretary, Larry Summers. **After encountering Congressional resistance, they were able to act independently by use of a Treasury-controlled institution, the Exchange Stabilization Fund**. (Henning 1999)Rubin and Summers also dominated the US response to the East Asian financial crisis of 1997, and their failure to come to Thailand's aid generated criticism that they had given short shrift to US geopolitical interests. **And when a full-blown American financial crisis emerged in 2008, and spread to other advanced nations, the international response was determined by Bush's Treasury Secretary, Henry Paulson, working again in tandem with Ben Bernanke and Timothy Geithner of the Fed**. They were, inevitably, the point persons in measures to keep the Great Recession from becoming a second Great Depression, particularly because banks and "non-bank" financial institutions were at the center of the crisis. This lead

department role continued into the Obama administration, with Geithner becoming Treasury Secretary and (together with Obama) leading the US at a series of Group of 20 international economic summits.

AT: ESF not enough $

Warehousing solves for lack of ESF funding

Humphage 8 (Owen F. Humpage, senior economic advisior at the research department of the federal reserve bank of cleveland, "A New Role for the Exchange Stabilization Fund," Federal Reserve Bank of Cleveland, 8/15/08, http://www.clevelandfed.org/research/commentary/2008/0808.cfm)

The ESF can also obtain dollars by warehousing foreign exchange with the Federal Reserve. Warehousing is a currency swap in which the Federal Reserve buys foreign currency from the ESF in a spot transaction and sells it back to the ESF in a forward transaction. The duration typically has been 12 months, but some have unwound early and some have rolled over. Because the Federal Reserve undertakes the spot and forward portions of these swaps at the same exchange rate, unanticipated exchange-rate movements have no financial consequences for the Fed. The Fed earns interest from any foreign-currency denominated assets that it holds as a consequence of the swap, but loses interest on the Treasury securities that it might have to sell to offset any monetary impacts from the ESF's dollar sales. Many FOMC participants have viewed warehousing as a temporary loan from the Federal Reserve to the ESF, collateralized with foreign exchange. The Federal Reserve Act does not include such lending authority, and the Banking Act of 1935 prohibits the Federal Reserve from purchasing U.S. government obligations, except in the open (or secondary) market. The U.S. Congress granted the Federal Reserve authority to lend up to $5 billion to the Treasury for short durations in 1942, but this authority expired in 1981. Opponents of warehousing argue that in the absence of clear ongoing lending authority, the Fed should not warehouse currencies for the ESF, especially given the foreign-policy nature of many ESF stabilization loans**. Proponents view warehousing as a temporary exchange of assets—not as a loan**. Moreover, because the Treasury does not issue German marks or Japanese yen—as it does U.S. government securities—the Treasury constitutes part of the open market for foreign exchange. They sometimes point to parallels between warehousing and the acceptance of SDR certificates. Hence, proponents contend warehousing foreign exchange is wholly acceptable. The FOMC currently authorizes the Fed to warehouse up to $5 billion in foreign exchange for the ESF. During the Mexican peso crisis of 1995, the limit was increased to $20 billion. However, no funds have been warehoused since 1992.

ESF can solve – Over 100 billion in reserve

The ESF can draw on mysterious hidden gold - it secretly controls 87% of the US gold supply

Gold Anti-Trust Action Committee 1 (http://www.gata.org/gold_reserves.html, 8/15/01)

"The ESF by law cannot issue more SDR certificates than it has SDR's. The largest amount of SDR certificates outstanding was 10,168 million in December 1995, a significant date, because I have contended all along that government actions that have depressed the gold price began in 1996, which is the same year that the SDR certificates began to decline. From this peak to the present, the SDR certificates have been reduced by 7,968 million. Given that there are 35 SDR's per ounce of gold, this reduction in the SDR certificate account equates to 227.7 million ounces, or 87 percent of the U.S. Gold Reserve...." "Everything is fitting into place," Murphy says. "It appears that the SDR certificates **are being used by the ESF to hide its gold transactions** from the American public." GATA has long claimed that central bank gold loans are two to three times the commonly accepted 5,000 tonnes cited by the gold industry. "Eighty-seven percent of the U.S. gold reserves is very close to 7,000 tonnes, which would increase to 12,000 tonnes the official sector gold out on loan in some way," Murphy notes. "No wonder former Treasury Secretaries Robert Rubin and Lawrence Summers and current Secretary Paul O'Neill have refused to directly answer members of Congress regarding their gold market queries," Murphy goes on. "**The ESF reports only to the president** of the United States and the treasury secretary, which means that these men are very aware of the mechanics of manipulating the gold price."

The ESF can use warehousing to replenish itself and the Fed's open market operations will check any adverse consequences

Henning 99 (C. Randall Henning , Institute for International Economics, September 1999 http://www.iie.com/publications/pb/pb99-8.htm)

Warehousing is the spot sale of foreign currency from the ESF to the Federal Reserve along with a parallel repurchase at some specified date in the future. **It is designed to replenish dollars in the ESF** when they have been sold or swapped for foreign currency. The treasury last availed itself of this facility in 1989 and 1990. When warehousing was first instituted in the early 1960s, the General Counsel of the Federal Reserve issued an opinion articulating its legal basis. Congress authorized the Federal Reserve in 1980 to purchase foreign securities, an affirmative action meant to facilitate the Fed's holding of foreign exchange. The counsel opinion, the 1980 law, and 35 years of practice disclosed to the Congress, would seem to consolidate the legal basis for warehousing. Should the issuance of dollars to the ESF cause an undesired expansion of the money supply, the Federal Reserve can easily offset the liquidity effect through standard open market operations. Moreover, the Federal Open Market Committee decides on matters related to warehousing, such as the limits to be set on the facility. In the event that warehousing became so large as to complicate sterilization, the FOMC could refuse further drawings.3 It is therefore difficult to foresee any realistic scenario under which warehousing could undermine the independence of the Federal Reserve or domestic price stability.

AT: Treasury Controls ESF

Nope, Prez controls treasury through appointees

Desltler 10 (I.M. (Mac) Destler, Professor at the School of Public Policy @ University of Maryland, Director, Program on International Security and Economic Policy, Visiting Fellow at Peterson Institute for International Economics September 2010, "THE FOREIGN ECONOMIC BUREAUCRACY," http://scholar.googleusercontent.com/scholar?q=cache:sntSnvRxc2EJ:scholar.google.com/+presidential+slush+fund+exchange+stabilities+fund&hl=en&as_sdt=0,22&as_ylo=2008)

Both Treasury's stances on international issues and its credibility in addressing them are shaped by its domestic policy base. Until the late 1980s, this relationship was embodied in the position of Under Secretary for Monetary Affairs, held prominently in the early seventies by Paul Volcker. Today, that job is split between domestic and international finance, and **Treasury has three presidential appointees** with specifically international responsibilities—the Under Secretary for International Affairs, an Assistant Secretary for International Finance, and an Assistant Secretary for International Markets and Development

AT: Congress Rollback

1. The CP FIATS it will not be rolled back, If the AFF gets FIAT the neg should too, otherwise the AFF can be roll backed

2. Their evidence never says the XO will be roll backed only that It can, probability is slim to none

3. Executive orders are nearly impossible to overturn – Supermajority and political criticism

Kraljic 11 (Dave Kraljic Co-Founder Votetocracy.com and government researcher, May 7, http://www.votetocracy.com/blog/detail/understanding-executive-orders-and-the-powers-they-grant.html

Executive orders can be overturned by either of the other two branches: the Supreme Court can do so through a case that is brought in front of them and Congress can do so by passing legislation that would conflict with the order or by refusing to approve funding to enforce it. The president still has the right to veto a decision from Congress, which Congress can override as always with a two-thirds majority that would end the executive order. **However, this is nearly impossible** because of the supermajority vote that is required as well as the fact that individual lawmakers can be left very vulnerable to political criticism. **To date, two executive orders have been overturned by other branches.** This includes the previously mentioned Truman order as well as a 1996 Clinton order that attempted to prevent the US government from contracting with organizations that had strike-breakers on the payroll. Executive orders can also be overturned by future presidents.

4. Courts and the Congress won't rollback XOs even if they have the power to

Edwards and Wayne 9 (By George C. Edwards, III, Distinguished Professor of Political Science at Texas A&M University. holds the Jordan Chair in Presidential Studies and has served as the Olin Professor of American Government at Oxford and the John Adams Fellow at the University of London, has held senior visiting appointments at Sciences Po-Paris, Peking University, Hebrew University of Jerusalem, and the U.S. Military Academy at West Point, the founder and from 1991-2001 the director of The Center for Presidential Studies, Stephen J. Wayne, served as President of the Presidency Research Group and The National Capital Area Political Science Association, regularly lectures to international visitors, senior federal executives, and college students in the United States and abroad on the presidency and electoral politics, has testified before Congress, advised both the Republican and Democratic National Committees on the presidential nomination process, Presidential Leadership: Politics and Policy Making, p. 521, published by Cengage Learning, July 15, 2009 http://books.google.com/books?hl=en&lr=&id=J5U5OOSC3RAC&oi=fnd&pg=PR7&ots=Ccit2eWhB6&sig=t2MtZVMSz2KhroGK_tB2BOAF7RA#v=onepage&q=executive%20order&f=false)

The judiciary for its part has also given the president considerable latitude in the issuance of executive orders. Courts do not wish to create institutional conflict, particularly conflict that may damage their reputation as a nonpartisan body or their stature as the final constitutional interpreter. Moreover, the judiciary does not have a mechanism to enforce its judgements; it is dependent on the executive branch to do so. **In the few instances in which the courts have reversed a presidential order, they have done so on the gournds that the order exceeded the president's constitutional or statutory authority**. In Truman's seizure of the steel mills, for example, the Supreme Court ruled in the case of Youngstown v. Sawyer, 353 U.S. 579 (1952), that the president had violated the Taft-Hartley Act because in its deliberations on this legislation, Congress specifically rejected a provision that would have allowed the president to intervene directly in labor-management disputes. Instead, the law provided for a "cooling off period" during which federal mediators would try to negotiate a settlement. But the Court's decision in the steel seizure case stands out as an exception to the rule that presidents tend to get their way when they issue an executive order. Howell examined eighty-three court cases in which a total of forty-five executive orders were challenged, some several times. Of these cases**, the courts decided in favor of the president 83 percent of the time**. Moreover, Howell notes, "[**I]n the vast majority of challenges to executive orders, the courts not only supported president's actions, but also provided…rationales for future presidents to further expand their base of power**." The bottom line is that **although Congress and the judiciary can limit the unilateral power of the president, they rarely do so in practice. Thus, the absence of congressional and judicial actions implicitly encourages presidents to turn to their executive authority to achieve their policy objectives when they cannot do so by other means or when time is of the essence.**

5. There is no risk of an overturn – congress will allow executive orders to avoid the burdensome overturn process

Krause and Cohen 2000 [George and David, Professors of Political Science @ South Carolina, "Opportunity, Constraints, and the Development of the Institutional Presidency: The Issuance of Executive Orders" THE JOURNAL OF POLITICS, Vol. 62, No. 1, February 2000]

We use the annual number of executive orders issued by presidents from 1939 to 1996 to test our hypotheses. Executive orders possess a number of properties that make them appropriate for our purposes. First, the series of executive orders is long, and we can cover the entirety of the institutionalizing and institutional-ized eras to date.6 Second, unlike research on presidential vetoes (Shields and Huang 1997) and public activities (Hager and Sullivan 1994), which have found support for presidency-centered variables but not president-centered factors, ex-ecutive orders offer a stronger possibility that the latter set of factors will be more prominent in explaining their use. One, they are more highly discretionary than vetoes.7 More critically, presidents take action first and unilaterally. In ad-dition, Congress has tended to allow executive orders to stand due to its own collective action problems and the cumbersomeness of using the legislative pro-cess to reverse or stop such presidential actions**.** Moe and Howell (1998) report that between 1973 and 1997, Congress challenged only 36 of more than 1,000 executive orders issued. And only two of these 36 challenges led to overturning the

president's executive order. Therefore, presidents are likely to be very suc-cessful in implementing their own **agendas through such actions**. In fact, the nature of executive orders leads one to surmise that idiopathic factors will be relatively more important than presidency-centered variables in explaining this form of presidential action. Finally, executive orders have rarely been studied quantitatively (see Gleiber and Shull 1992; Gomez and Shull 1995; Krause and Cohen 1997)8, so a description of the factors motivating their use is worth-while.9 Such a description will allow us to determine the relative efficacy of these competing perspectives on presidential behavior.10

Thus, the absence of congressional and judicial actions implicitly encourages presidents to turn to their executive authority to achieve their policy objectives when they cannot do so by other means or when time is of the essence.**

4. Executive orders are nearly impossible to overturn – Supermajority and political criticism

Kraljic 11 (Dave Kraljic Co-Founder Votetocracy.com and government researcher, May 7, http://www.votetocracy.com/blog/detail/understanding-executive-orders-and-the-powers-they-grant.html

Executive orders can be overturned by either of the other two branches: the Supreme Court can do so through a case that is brought in front of them and Congress can do so by passing legislation that would conflict with the order or by refusing to approve funding to enforce it. The president still has the right to veto a decision from Congress, which Congress can override as always with a two-thirds majority that would end the executive order. **However, this is nearly impossible** because of the supermajority vote that is required as well as the fact that individual lawmakers can be left very vulnerable to political criticism**. To date, two executive orders have been overturned by other branches.** This includes the previously mentioned Truman order as well as a 1996 Clinton order that attempted to prevent the US government from contracting with organizations that had strike-breakers on the payroll. Executive orders can also be overturned by future presidents.

5. It is very difficult to overturn executive orders

Their author Cooper 97 [Phillip, Prof of Public Administration @ Portland State, Nov 97, "Power tools for an effective and responsible presidency" Administration and Society, Vol. 29]

If Congress does challenge an executive order, then the president must either demonstrate that he properly interpreted the statute in question or that the action can be independently justified from executive powers delegated by the Constitution. However, it can, for a variety of reasons, be very difficult to get a legal challenge into court, and even if such a case does reach a judicial assessment, the broad kinds of grounds that can be asserted by the president can make it extremely difficult to challenge a presidential action. It has been done but it is not a simple matter (Note, 1987a).

6. Courts refuse to overturn executive orders

Mayer 99 (Kenneth R., Associate Professor of Political Science at University of Wisconsin-Madison, May 1999 "Executive Orders and Presidential Power," Journal of Politics)

Executive orders have legal force only when they are based on the president's constitutional or statutory authority (Fisher 1991, 109). Yet, presidents take an expansive view of their own power when it suits them, and use executive orders to expand the boundaries of their authority. **The courts typically stay out of the president's way, upholding executive orders even when the they are "of -- at best --dubious constitutional authority** ... [or] issued without specific statutory authority" (Fleishman and Aufses 1976, 5). Between 1789 and 1956, state and federal courts overturned only 16 executive orders (Schubert 1957, 361-65); Youngstown Sheet and Tube v. Sawyer (343 U.S. 579, 1951), which overturned Truman's seizure of the nation's steel mills, is undoubtedly the most famous. More recently, the federal courts overturned a 1995 Clinton executive order barfing federal contractors from hiring permanent replacements for striking workers, in Chamber of Commerce v. Reich (74 F. 3d 1322, 1996). This is the exception, though, and in practice presidents have wide latitude in issuing orders.

AT: Future Prez Rollback

1. The CP FIATS it will not be rolled back, If the AFF gets FIAT the neg should too, otherwise the AFF can be roll backed

2. Their evidence never says the XO will be roll backed only that It can, probability is slim to none

3. This argument may have made sense in the context of space exploration but not for transportation – once infrastructure is being built no one can just magically make it go away – not even a future president with another executive order

4. Political barriers check – new, stronger constituencies

Branum 2 [Tara L, Associate, Fulbright & Jaworski L.L.P, "President or King? The Use and Abuse of Executive Orders in Modern Day America" Journal of Legislation]

Congressmen and private citizens besiege the President with demands [*58] that action be taken on various issues. [n273] To make matters worse, once a president has signed an executive order, he often makes it impossible for a subsequent administration to undo his action without enduring the political fallout of such a reversal. For instance, President Clinton issued a slew of executive orders on environmental issues in the weeks before he left office. n274 Many were controversial and the need for the policies he instituted was debatable. [n275] Nevertheless, President Bush found himself unable to reverse the orders without invoking the ire of environmentalists across the country. [n276] A policy became law by the action of one man without the healthy debate and discussion in Congress intended by the Framers. Subsequent presidents undo this policy and send the matter to Congress for such debate only at their own peril. This is not the way it is supposed to be.

AT: Can't Solve – Signal/Perception

1. Executive orders spark national dialogue and are empirically best for social change – proven by the civil rights movement.

Kenneth R. **Mayer,** Professor of Political Science @ U of Wisconsin-Madison, 20**01** (With the Stroke of a Pen: Executive Orders

and Presidential Power) p. 216-217

Presidents used executive orders to prod and drag Congress when the legislature refused to enact significant new protections, and to steer a middle course that would not prove excessively antagonizing to the South. By relying on executive orders to embark on such a difficult course, "presidents began to pick their way warily through the minefield" of racial politics.**165 Presidential involvement was crucial, in that it established the federal government's role in civil rights** enforcement: scarcely a decade after Roosevelt's 1941 establishment of the Fair Employment Practices Committee in 1941 (an important but ultimately ineffective organization), the validity of presidential nondiscrimination efforts was "assumed,"' and White House officials recognized that efforts to back away from the precedent of nondiscrimination in federal activities world provoke sharp opposition."' The use of executive orders in civil rights demonstrates in one sense the limits of executive power to foster broad and enduring social change. In this regard civil rights falls into the theoretical predictions of the "politics of structure" model I employed in chapters four and five to analyze the use of executive orders to expand the president's control over government institutions and processes. The expectation is that the farther an executive action reaches beyond the government in requiring changes in private behavior, the greater the controversy about the legitimacy and authority of the action. Executive action can serve as a spark to ignite a broader dialogue by placing an issue on the national agenda and extending the envelope of acceptable social policies. It can establish an anchor point for political debate, and can help draw Congress and the courts along. By itself, though, it cannot create consensus where the middle ground does not otherwise exist; the persistence of the affirmative action controversy nearly four decades after Executive Orders 10925 and 11246, and more than thirty years after the Philadelphia Plan established the baseline for "goals and timetables," attests to the limits of the president's ability to force a policy on a skeptical public. The discretion and flexibility of executive action as opposed to legislation can, to use Graham's language, help presidents "pick their way" carefully through complicated policies, but on sonic issues the trail is so narrow and convoluted that no path is clear of mines.

2. Executive action is best for governmental resolve – it shows determination to pursue policy, unlike the cumbersome legislative process which sends mixed signals.

Phillip J. **Cooper. 2002**. "By Order of the President: The Use and Abuse of Executive Direct Action" p. 65

Executive orders can also be used to hit quickly with policies aimed at important problems, providing a strong and immediate sense of momentum for a new administration. **These messages are sent to reassure an administration's supporters that the issue positions for**

which they campaigned are going to be acted upon in the case of symbolic orders, which are often use for this purpose, **the reward can be given to allies without a serious commitment of political resources** in Congress, legal resources in administrative rulemaking, or financial resources associated with building really, substantive programs. **They also serve to send a message to potential adversaries that the administration is truly in charge and moving. Those seeking to mobilize opposition in such conditions find themselves reactive and defensive.**

AT: Prez Can't Repeal Laws

Other precedents don't apply in the realm of foreign affairs – the President can unilaterally repeal law

Roy E. **Brownell** II, Former Editor-in-Chief of the American University Law Review, Congressional Liaison Office for USAID, and Attorney @ the Washington, D.C. firm of Muldoon, Murphy, and Faucette, LLP , **June 1998** (47 Am. U.L. Rev. 1273)

Consequently, the Court in Dames & Moore upheld the President's actions absent congressional approval, effectively placing it within Justice Jackson's second category. From Supreme Court precedent, it therefore follows that the President, whether acting with or without congressional approval, has exceptional discretion in national security affairs. In fact, as will be discussed further, when acting absent congressional authority, the President's national security power at times extends both to positive lawmaking and to unilateral repeal of existing law. Such presidential power in national security thus would appear to carve out an exception to Chadha's and City of New York's seemingly airtight holdings. Put simply, national security lawmaking has different lawmaking requirements. As a result, if the Chadha and City of New York decisions do not apply solely to domestic spending bills, then they at least apply in a different manner to national security spending, thus paving the way for recognition of National Security Rescission.

Past court precedents give the President the power to unilaterally change Congressional law

Roy E. **Brownell** II, Former Editor-in-Chief of the American University Law Review, Congressional Liaison Office for USAID, and Attorney @ the Washington, D.C. firm of Muldoon, Murphy, and Faucette, LLP , **June 1998** (47 Am. U.L. Rev. 1273)

The effect of much Supreme Court precedent on the President's unilateral national security power has been to legitimize the "coordinate construction" <=240> n239 given the Constitution by the political branches. The Court's refusal to decide Goldwater v. Carter <=241> n240 on the merits allowed the President to abrogate an existing treaty. <=242> n241 In [*1324] Goldwater, several Senators sued for declaratory and injunctive relief against President Carter, who was planning to end the nation's mutual defense treaty with Taiwan. The Court held that the case was nonjusticiable because it involved the "authority of the President in the conduct of our country's foreign relations." <=243> n242 This was because the Court reasoned, "the effect of this action, as far as we can tell is entirely external to the United States, and [falls] within the category of foreign affairs." <=244> n243

In effect, the decision gave the President a free hand to terminate existing treaties which had required not merely a majority vote in the Senate, as normal legislation would demand, but a supermajority of two thirds. Because treaties define legal relationships between the peoples of different nations and are recognized as the "law of the land" - essentially on par with that of statutes <=245> n244 - the President is in effect unilaterally redefining the law. **The President, therefore, has the power to unilaterally change the law despite prior congressional action to the contrary**: an action that likely falls within Justice Jackson's third category.

AT: XOs Aren't Law

Executive orders do constitute "law"

Kenneth R. **Mayer**, Professor of Political Science at the University of Wisconsin-Madison. **4/12/01** (http://pup.princeton.edu/chapters/s7095.html,

Even within the confines of their executive powers, presidents have been able to "legislate" in the sense of making policy that goes well beyond simple administrative activity. Yale Law School professor E. Donald Elliot has argued that many of the thousands of executive orders **"plainly 'make law' in every sense,"7**

AT: CMR

1. Turn: Congressional attempts to change military policy destroy CMR since it passes contradictory policies which dispute military leadership. Presidential action solves CMR best

Gaziano Et Al 7 Todd F. Gaziano, Attorney General Edwin Meese at The Heritage Foundation, Chief Counsel to the House Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs, served in the Office of Legal Counsel in the U.S. Justice Department, judicial law clerk to the Honorable Edith H. Jones, United States Judge for the Fifth Circuit Court of Appeals, J.D. from Chicago, Steven Groves, responsible for developing and running the Thatcher Center's "Freedom Project", senior Counsel to the U.S. Senate Permanent Subcommittee on Investigations, Assistant Attorney General for the State of Florida, He holds a law degree from Ohio Northern University College of Law, and Brian Walsh, Senior Legal Research Fellow in The Heritage Foundation's Center for Legal and Judicial Studies, 2/6/07, "Congress's Iraq Resolutions: Without Resolve or Constitutional Purpose" http://www.heritage.org/Research/MiddleEast/wm1347.cfm

Although policymakers are not at liberty to tinker with the constitutional design except by amendment, history has vindicated the choices made by the Framers. Those choices allow a determined Congress to end a war (if it uses its own powers), **and it grants the President independence of action and ultimate responsibility for prosecuting any war** Congress funds. The Framers knew that successful war efforts require decisiveness, fixed will, and determined leadership that does not vacillate in the face of adversity and setbacks. **Timidity, equivocation, and hand-wringing compromises almost always result in defeat**. The Framers of our Constitution understood that war-making powers are best vested in a single Executive. They rejected a proposal for the executive power to be shared by a committee or privy council, even one wholly within the executive branch.[10] In contrast to the "energy" and "responsibility" they intended the President to have, they sought to make congressional action more cumbersome, as befitting "the most dangerous branch." Thus **by design**, **Congress's decision-making process is often tedious and inconclusive**. The ultimate **decisions of Congress are**, invariably, **political compromises**. The Framers sought to ensure such deliberations and internal checks as they related to the government's domestic actions, but they **expressly rejected this result for "external threats**." For external threats, they wanted to ensure presidential secrecy, dispatch, and decisiveness. Congressional deliberation is perfectly appropriate for passing legislation, particularly regarding domestic concerns, but not for prosecuting--**much less micromanaging**--a war. Whether the President's war plans are flawed or not, Congress has not yet devised--and does not even propose to devise--a single set of comprehensive recommendations for the war in Iraq on which it can agree. The recent hearings and debate to confirm General David Patreaus to command U.S. forces in Iraq are indicative of why Congress is unfit to prosecute a war. The Senate unanimously confirmed General Petraeus--a proponent of the "surge" strategy.[11] That the Senate would confirm General Petraeus so easily and subsequently pass a resolution **disputing the strategy he believes is necessary for victory is an unjustifiable inconsistency**.

2. Congressional inaction solidifies presidential authority over the armed forces. Congressional micromanaging shatters presidential powers and puts the entirety of the institution at risk.

Chen 7 (Michelle Chen, Staff Writer for the New Standard, 1/16/07, http://newstandardnews.net/content/index.cfm/items/4116)

Jan. 16 – With the Pentagon already implementing President Bush's broadly opposed plan to expand the US fighting force in Iraq, critics are calling on Congress to stop the escalation. But Democratic lawmakers are divided on whether to wield their "power of the purse" and curb or cut the war budget, leaving some to downplay Congress's ability to take concrete action. Representative John Murtha (D–Pennsylvania), a member of the House Appropriations Committee who voted to authorize the Iraq war in 2002, said he plans to try placing restrictions on military expansion in upcoming "emergency" military-funding bills. Federal allocations related to the Iraq and Afghanistan conflicts have already exceeded $500 billion. Senator Ted Kennedy (D–Massachusetts), who voted against the authorization, has already introduced legislation that would bar the president from spending money to escalate troop levels "unless and until Congress approves the president's plan." Neither Kennedy's nor Murtha's proposal would alter funding for the existing deployment in Iraq. But even such efforts to prevent the occupation from intensifying have met resistance within the Democratic Party and raised public doubts about their commitment to ending the war. Efforts to prevent the occupation from intensifying have met resistance within the Democratic Party – and raised public doubts about their commitment to ending the war. Various political snags await the proposed strictures. The most-direct threat is a veto from the White House, which has already indicated that it has no plans to heed congressional dissent. To override a presidential objection, the House and Senate would each need to muster a two-thirds majority. Nothing is stopping the president from jumping ahead of Congress and boosting the Iraq force using funds previously allocated for the war, said Lawrence Korb, a senior fellow with the liberal think tank Center for American Progress and senior advisor to the Center for Defense Information. By the time you vote on the money bill," Korb told The NewStanard, "a lot of the troops will already be there." The Bush administration says Congress does not have the power to steer the conduct of military operations. In an interview on Fox News Sunday, Vice President Dick Cheney said of the president, "He's the guy who's got to decide how to use the force and where to deploy the force." He added that while Congress serves as the military's financer, "you also cannot run a war by committee." But according to some policy experts critical of the war, within the constitutional separation of powers, Congress has both the authority and a responsibility to redirect national resources away from an unpopular war. Anthony Arend, director of the Institute for International Law and Politics at Georgetown University, argued that Congress may lack the power to "micromanage an ongoing conflict" with detailed mandates for deploying forces. However, Arend told TNS, lawmakers could rein in war spending so that the White House "would have no choice but to reduce troops in accordance with that funding reduction." "Congress, of course, being cowards, are going to hold off on cutting funds in any obvious or dramatic way… because they think they might be blamed [for defunding military forces] and not reelected." -- Lt. Col. Piers Wood, Military InsightsTaking a historical view of congressional powers in practice, a recent policy paper by the Center for American Progress lists ways lawmakers have previously used budgetary, legislative and political leverage to cap troop levels, influence the conditions and timing of missions, and bar funds for forces either before or after they are deployed. For instance, toward the end of the Vietnam War, Congress cut funding for military efforts in Southeast Asia. Though outcry against the war had already engulfed the country by then, the budget restrictions solidified the opposition and, combined with public pressure, helped compel the executive branch to withdraw US forces. Winslow Wheeler with the policy-analysis group

Center for Defense Information, who previously worked as a congressional staffer and researcher with the Government Accountability Office, said the US Constitution gives Congress "complete, utter control over how every single penny of appropriations is spent." But he added that so far, Congress has only deepened the Iraq conflict by handing the president ample war funds with minimal strings attached. Some analysts opposed to the war say that although constitutional issues and White House resistance may pose some difficulty, much of the Democrats' reluctance to seize the Iraq war's purse strings stems from political timidity. Critics suspect lawmakers are hesitant to cut military funding because they fear giving the impression that they are "abandoning" American troops. In recent statements to the press, several Democrats in Congress have emphasized that they will steer clear of withholding funds for forces in the field. Critics say the Democrats' reluctance to seize the Iraq war's purse strings stems from political timidity.Jim Manley, a spokesperson for Senate Majority Leader Harry Reid (D–Nevada), told TNS that while the Senator would scrutinize the upcoming funding requests, Reid "intends to make sure that the troops get everything they need." For now, Manley said that Reid, who initially supported the war, is promoting a conciliatory approach: a non-binding resolution criticizing Bush's troop increase, aimed at winning Republican backing to show bipartisan opposition. That resolution, Reid's office says, is still being finalized and has not been publicly released. But retired Lieutenant Colonel Piers Wood, who heads the think tank Military Insights, said de-escalating the war would not necessarily put the troops at further risk. By enacting surgical budget cuts, he said, Congress "could constrain offensive operations" but maintain funds to cover troops' basic needs. He nonetheless predicted, "Congress, of course, being cowards, are going to hold off on cutting funds in any obvious or dramatic way… because they think they might be blamed [for defunding military forces] and not reelected." Representative José Serrano (D–New York), who voted against the war authorization and has called for an immediate pullout from Iraq, said that while he understands his colleagues' concerns on the issue of neglecting the troops, he sees a straightforward way to keep soldiers safe. "My plan not to jeopardize the troops is to take them out immediately," Serrano told TNS. According to analysts interviewed by for this story, Congress could express definitive opposition to the occupation by repealing its original authorization for the Iraq war. Representative Sam Farr, for example, recently introduced a bill to rescind the war resolution, which he voted against in 2002. The initiative would pit congressional authority in wartime squarely against executive control of the military. **Some political observers say a standoff** over withdrawal **might trigger a governmental clash and national debate over the war's legality, possibly testing the scope of executive power under the Constitution and the War Powers Act that emerged from the Vietnam Era**

3. Congressional meddling with the army usurps presidential powers

Gaziano Et Al 7

Todd F. Gaziano, Attorney General Edwin Meese at The Heritage Foundation, Chief Counsel to the House Subcommittee on National Economic Growth, Natural Resources, and Regulatory Affairs, served in the Office of Legal Counsel in the U.S. Justice Department, judicial law clerk to the Honorable Edith H. Jones, United States Judge for the Fifth Circuit Court of Appeals, J.D. from Chicago, Steven Groves, responsible for developing and running the Thatcher Center's "Freedom Project", senior Counsel to the U.S. Senate Permanent Subcommittee on Investigations, Assistant Attorney General for the State of Florida, He holds a law degree from Ohio Northern University College of Law, and Brian Walsh, Senior Legal Research Fellow in The Heritage Foundation's Center for Legal and Judicial Studies, 2/6/07, "Congress's

Iraq Resolutions: Without Resolve or Constitutional Purpose"
http://www.heritage.org/Research/MiddleEast/wm1347.cfm

Congress may soon consider one or more non-binding resolutions expressing its "disagreement" with President Bush's plan to augment American forces in Iraq by 21,500 troops.[1] Such resolutions condemning the Commander in Chief's considered strategy to achieve victory and promote peace and stability in Iraq may play well on the campaign trail, but they are an abuse of Congress's authority and an unreasonable interference with the President's exclusive constitutional authority to make strategic military decisions during wartime. Congressional second-guessing of executive responsibilities has become sadly common, and few are willing to speak up to defend any policy that seems unpopular. But no degree of supposed unpopularity[2] can render constitutional actions unconstitutional--notwithstanding the confusion on such matters by the mainstream media and misstatements by academics or others with ideological axes to grind. As most Members of Congress know, their control over the troops available to the President during a war or other conflict is limited to the number of commissioned officers Congress authorizes and the Senate confirms and the overall number of non-commissioned soldiers Congress authorizes and appropriates money for. The President's constitutional authority as Commander in Chief to commit any number of these soldiers to battle, including his authority to augment the forces in Iraq, is almost absolute, with minor exceptions that are not relevant to the pending resolutions.[3] Congress expressly authorized the President to prosecute the war in Iraq in any manner that he determines necessary and appropriate, but even a revocation of that authorization would not change the President's constitutional duty to use any and all military forces Congress funds to defeat enemy soldiers bent on America's destruction. Congress does have sufficient power to starve the President of the funds necessary to win the war, but it cannot usurp the President's strategic command over troops that are funded. Given the important but distinct powers each branch possesses, it is, at best, irresponsible meddling for Congress to publicly disparage the President's command decisions. At worst, it is an attempted interference with his military command that is inconsistent with our constitutional design.

DA Thumper

Presidents have been using XO's for decades – The link is non Unique

Kelly 7 (Christopher S. Kelley Assistant Professor Department of Political Science Miami University. 2007 writing for Presidential Studies Quarterly [37 no1 169-70 Mr 2007]Northwestern Library |Kumar|)

The presidency of George W. Bush has proved a boon for presidency scholars who are interested in the area of presidential unilateralism--the idea of obtaining political objectives without the reliance upon external actors, such as Congress. Recently, in the case of the current Bush presidency, some have confused this with presidential imperialism, but as Adam Warber explains, this process of unilateralism did not start with George W. Bush and in all likelihood will not end with him or his presidency. In Executive Orders and the Modern Presidency, Warber has produced a well-written, solidly argued piece of research that is suitable for undergraduate and graduate courses on the U.S. presidency. Further, he moves presidency scholars toward developing and refining theory to explain the connections between unilateral action and presidential power.In the first chapter (of five), Warber lays out an explanation for the use of executive orders by modern presidents (his time period covers 1936-2001) that builds upon the earlier work of Terry Moe and William Howell, who used rational actor modeling to explain why presidents choose to go solo (p. 4). The rational actor approach is used, as Warber explains, "because it [weighs] political costs and benefits when deciding how to achieve policy in order to cope with an uncertain political environment" (p. 8). Warber then lists a number of assumptions that describe how unilateralism benefits from the rational actor approach. In sum, the assumptions stipulate that, because presidents are rational, they will be able to ascertain in what areas unilateralism will enable them to push their agendas while being wary of the costs involved (p. 13). In the remaining chapters, Warber fills in the gaps overlooked by other scholars interested in the executive order. He uses content analysis, rather than simply counting executive orders by president or sampling from different presidencies, to separate executive orders by type: symbolic, routine, and policy-making directives. Warber then tests what effect such independent variables as the party of the president, divided/unified government, scandal, and year in office (election or lame duck) have on the use of executive orders. He finds that political party matters--Democratic presidents are more likely than Republican presidents to use the executive order to push social policy (p. 45), and divided government sees less executive order activity than unified government (pp. 65-66). At the same time, the presence of scandal, albeit in an examination of just the Nixon and Clinton presidencies, does not appear to affect the use of executive orders (pp. 67-70); the presence of an election decreased the number of policy-making orders, while the president's final year in office saw an increase in executive orders of all types when compared with previous years of a president's term in office (pp. 71-76). Warber wraps up Executive Orders and the Modern Presidency with a look at the current Bush administration and a discussion of the directions that his own research on the executive order should go in the future. Warber tempers the flurry of discussion about the Bush administration's penchant for exercising unilateral powers in order to achieve goals not met in the course of the normal legislative process. He finds that President George W. Bush has used the executive order in a way that is not distinguishable from his predecessors--either in type or in quantity. Where President Bush has differed is his tendency to revoke or amend the executive orders of his predecessors (pp. 124-25). Warber concludes that in the future scholars may wish to study how certain executive branch officials, such as those serving in the Office of Legal Counsel, set about the task of crafting the language in an executive order to escape detection by such outside political actors as Congress or the courts. In addition to those he lists, I would encourage him and others interested in unilateralism to study how unilateral devices are used in tandem to achieve political objectives. For instance, Warber provides cursory examination of three important executive orders, 12291 and 12498 in the Reagan administration and 12866 in the Clinton administration, used to give the president greater control over regulatory process. These three executive orders also were important in the development of the signing statement as a means to influence administrative discretion.

Turns

1NC Circumvention

The executive branch does whatever it think is necessary despite any legislation – FISA secret interpretations prove

Bendix and Quirk 15 -- assistant professor of political science at Keene State College and Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia, former research associate at Brookings Institution, respectively (William Bendix and Paul J. Quirk, March 28, "Secrecy and negligence: How Congress lost control of domestic surveillance," Issues in Governance Studies Number 68, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf. P. 5-6), acui

Concerned about the possibility of investigative abuse, however, lawmakers set the business records provision to expire in December 2005. Congress reviewed the use of records requests before the legislative sunset took effect and decided, in early 2006, to renew the business-records provision but with a higher evidentiary standard. Under the new law, FISA applications now needed to include a "statement of facts" demonstrating that the items sought were somehow connected to a suspected foreign agent, raising the evidentiary standard close to the 1998 version.10 In addition, Congress placed a new four-year sunset on the business-records provision to ensure another review of the measure in 2009. Although the shifting evidentiary standards for records requests created a complex body of law, two points stand out. First, in all versions of the business-records provision, Congress made clear that orders were to be used against a specific individual in a particular ongoing investigation. Legislators never contemplated bulk-collection orders that lacked named targets and that permitted the capture of records for cases yet to be launched. Second, in both the PATRIOT Act and its 2006 reauthorization, Congress specified that business-records orders were to be used by the FBI. Neither bill mentioned the NSA. As we discuss next, **secret interpretations of the PATRIOT Act authorizing dragnet collection of metadata overlooked the statutory restrictions**.11 Executive action and the metadata programs In the decade between the PATRIOT Act's passage and Snowden's first leaks, Congress played no part in developing or modifying the NSA's domestic programs. In fact, aside from the limited involvement of two FISA Court judges, the Bush and Obama administrations made all decisions over blanket-collection procedures. But Congress did not opt out of deliberations and policy formulation. **The executive simply ignored surveillance restrictions included in the PATRIOT Act and decided to keep nearly all legislators, except for congressional leaders and four members on the Intelligence committees, in the dark.12**

2NC Circumvention – Self-Sabotage

It is impossible for Congress to enact good legislation – no one knows or case what is happening and those who do prevent others from finding out

Bendix and Quirk 15 -- assistant professor of political science at Keene State College and Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia, former research associate at Brookings Institution, respectively (William Bendix and Paul J. Quirk, March 28, "Secrecy and negligence: How Congress lost control of domestic surveillance," Issues in Governance Studies Number 68, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf. P. 12-13), acui

In addition to concealing classified information, Republican House leaders omitted hearings¶ and markups and restricted floor debate to rush passage of the business-records extensions.¶ Rep. Jim Sensenbrenner (R-Wis.), one of the authors of the original PATRIOT Act, defended the truncated process, arguing that Congress had debated FISA Court orders at length in previous years. "The time for multiple temporary extensions is over," he declared, calling for a permanent reauthorization.39 He dismissed Tea Party resistance to the bills as uninformed "scare-mongering."40¶ At the same time, Intelligence Chairman Rogers and Judiciary Chairman Lamar Smith (R-Texas) made the false assertion that the extensions merely continued to provide antiterrorism agents with the same tools that criminal investigators had. Business-records orders, they claimed, were used to seize the very same documents as grand jury subpoenas.41 What they omitted from their explanation was that authorities used FISA Court orders to seize data on millions of calls per day—something that investigators could never do with subpoenas. Following Republican leaders in the House, Democratic leaders in the Senate scheduled no hearings or markups on the reauthorization bills and used procedural tricks to limit floor discussion on the four-year extension. Leahy pushed to raise the evidentiary standard for business-records orders, while Senators Ron Wyden (D-Ore.) and Mark Udall (D-Colo.) offered an amendment designed to declassify the phone metadata program. But Majority Leader Harry Reid (D-N.V.) filled the amendment tree to block these proposals from the floor. With no way to modify the bill, Wyden and Udall nonetheless spoke at length against surveillance policy during debate over the four-year extension. Before the final vote on the reauthorization, Wyden gave a 23-minute floor speech that included stark warnings about the secret interpretation of the law and chastised the Senate for the members' ignorance:¶ When the American people find out how their government has secretly interpreted the PATRIOT Act, they are going to be stunned and they are going to be angry. They are going to ask senators: Did you know what this law actually permits? Why didn't you know before you voted on it?....[M]any members of Congress have no idea how the law is being secretly interpreted by the executive branch.... It is almost as if there are two PATRIOT Acts, and many members of Congress have not read the one that matters.42¶ Disregarding these warnings, Congress extended the business-records provision until June 1, 2015.43¶ Overall, ignorance and misinformation marred congressional deliberations on the renewal of the business-records provision. Prominent members, including committee chairs, made specious claims to suggest that records requests had a limited scope, much like subpoenas in criminal probes. These comparisons reinforced the general view that agents only used FISA Court orders in traditional¶ types of investigations where only one or a few suspects were targeted. Opponents could not refute these inaccurate statements without exposing the classified metadata program, and thus they faced an insurmountable deliberative challenge: to persuade colleagues of privacy violations without identifying the nature of the violations or providing any evidence of them. Wyden's speech presented the sharpest, most detailed rebuttal. But the many members who had not attended classified briefings lacked a basis for evaluating Wyden's claims against the many assurances from committee chairs that the PATRIOT Act authorized only modest, uncontroversial surveillance tools. Two years later, the Snowden leaks demonstrated the breadth and depth of Congress's ignorance during the 2011 debates. Among members who did not sit on the regularly briefed committees, many expressed shock and outrage over the revelations. They readily admitted that they had not attended¶ classified briefings offered by the Obama administration.44

Worse, members on the Intelligence¶ and Judiciary panels acknowledged that they had lacked understanding of the metadata program. They found the briefings overly technical, frequently evasive, and loaded with undocumented claims about the successes of bulk collection.45 As Rep. Jan Schakowsky (D-Ill.), a member of the House Intelligence Committee, confessed after the leaks, "In terms of the oversight function, I feel inadequate most of the time."46 In an egregious case of legislative malfeasance, a senior House Judiciary Committee Republican, Jim Sensenbrenner, who had helped lead the push for permanent authorization, claimed that he had attended no classified briefings and had had no knowledge of the metadata program prior to the leaks.47

2NC Circumvention – Passivity

Congress cannot enact effective legislation – most members haven't attending classified briefings, the ones who have can't share classified info – means they can't target the specifics of surveillance policy

Bendix and Quirk 15 -- assistant professor of political science at Keene State College and Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia, former research associate at Brookings Institution, respectively (William Bendix and Paul J. Quirk, March 28, "Secrecy and negligence: How Congress lost control of domestic surveillance," Issues in Governance Studies Number 68, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf. P. 8-9), acui

In all the discussions on bulk collection between the White House and the FISA Court, Congress was absent. This absence resulted initially from the Bush administration's overt decision to exclude legislators. But once legislators gained opportunity to learn about and shape surveillance policy, a combination of indifference and deception in Congress ensured that most members remained absent from the debate. The congressional response: Deference and avoidance By the time the PATRIOT Act came up for its second renewal in 2009, the executive branch had abandoned the strategy of secrecy and unilateralism on the metadata programs. Starting in 2007, after the dragnets had received court approval, the Bush administration provided full and regular disclosures to the Intelligence and Judiciary committees.27 Going further, the Obama administration made repeated efforts to provide all members of Congress, through secret briefings, with the essential information on the metadata programs.28 The reauthorization thus gave Congress the opportunity to respond to the vast executive branch expansion of phone and email surveillance. But Congress neither sought to reassert the privacy protections of the existing business-records provisions— forcing an end to the dragnet programs—nor attempted to establish legislative standards to regulate the collection and use of metadata. In effect, Congress surrendered control to the executive branch. Congress's passivity partly reflected the incentives of individual members to defer to the executive and avoid the security and political risks of imposing constraints on investigatory methods. But the restricted flow of information on secret intelligence capabilities and practices also contributed heavily. Most legislators did not attend classified briefings—some because they lacked interest in surveillance policy, others because they were intentionally excluded from meetings by congressional leaders. A few highly engaged members, mostly Democrats, made use of the executive briefings to become well informed. But these members could not speak publicly about the actual practice of bulk collection and, as a result, could not make an effective case for policy change. Meanwhile, leading members who wanted to protect the metadata program from legislative interference took advantage of the widespread ignorance to misrepresent business-records orders as narrowly-focused investigative tools. As the later reaction to the Snowden leaks made clear, most members remained serenely clueless about metadata collection. Congress in the end opted for two short-term extensions before reauthorizing the business-records provision, without change, until June 2015. The debates over renewal stretched over three years, from 2009 to 2011, giving the appearance of thorough deliberation. But that appearance was utterly false. While maintaining the secrecy of the metadata program, Congress failed to assess the security value of mass records seizures,

to weigh the resulting harm to privacy interests, or to impose standards or requirements to minimize that harm.

1NC Credibility

Executive action is the most effective and increases credibility

Macey 6 -- Sam Harris Professor of Corporate Law, Securities Law, and Corporate Finance at

Yale Law School (Jonathan Macey, 2006, "Executive Branch Usurpation of Power: Corporations and Capital Markets," The Yale Law Journal, p.2416, http://www.yalelawjournal.org/pdf/110_wddcsum3.pdf), acui

Abstract. Agencies in the executive branch are better situated than other political¶ institutions to take advantage of opportunities to expand their power base by responding quickly and decisively to real or imagined crises. The executive has structural advantages over the other branches because it can respond faster to perceived emergencies. Congress is hampered more than the executive by gridlock caused by special-interest group pressures when it tries to act quickly. The legislative process is also inherently slower than the executive process because the executive can launch into unilateral action, as by filing a lawsuit. The executive's structural advantage over the judiciary is even more complete than its advantage over Congress because the judiciary has no power to initiate action. Executive action, particularly that of agencies, determines the course of law. This Essay argues that the ascendancy of the executive branch in policymaking is an unintended consequence of the modern administrative state. The emergence of the executive as the fulcrum of power within the administrative state upsets the traditional balance of powers among the three branches of government. This imbalance can be counteracted only by a concerted effort by the federal judiciary to rein in executive power that improperly usurps Congress's authority to make law.

Internal Net Benefits

XO – Soft Power

Obama key to set international precedent on surveillance policy, increases soft power and shields the link to prez powers

Singer and Wright 13 – Strategist and Senior Fellow at the New America Foundation, former director of the Center for 21st Century Security and Intelligence, senior fellow in Foreign Policy at Brookings and senior fellow at Brookings, respectively (Peter W. Singer and Thomas Wright, February 17, 2013, "Obama, own your secret wars," http://www.nydailynews.com/opinion/obama-secret-wars-article-1.1265620), acui

Obama has a unique opportunity — in fact, an urgent obligation — to create a new doctrine, unveiled in a major presidential speech, for the use and deployment of these new tools of war.¶ While the Republicans tried to paint the President as weak on security issues in the 2012 elections, history will record instead that his administration pushed into new frontiers of war, most especially in the new class of technologies that move the human role both geographically and chronologically further from the point of action on the battlefield.¶ The U.S. military's unmanned systems, popularly known as "drones," now number more than 8,000 in the air and 12,000 on the ground. And in a parallel development, the U.S. Cyber Command, which became operational in 2010, has added an array of new (and controversial) responsibilities — and is set to quintuple in size.¶ This is not just a military matter. American intelligence agencies are increasingly using these technologies as the tips of the spear in a series of so-called "shadow wars." These include not only the more than 400 drone strikes that have taken place from Pakistan to Yemen, but also the deployment of the Stuxnet computer virus to sabotage Iranian nuclear development, the world's first known use of a specially designed cyber weapon.¶ Throughout this period, the administration has tried to have it both ways — leaking out success stories of our growing use of these new technologies but not tying its hands with official statements and set policies.¶ This made great sense at first, when much of what was happening was ad hoc and being fleshed out as it went along.¶ But that position has become unsustainable. The less the U.S. government now says about our policies, the more that vacuum is becoming filled by others, in harmful ways.¶ By acting but barely explaining our actions, we're creating precedents for other states to exploit. More than 75 countries now have military robotics programs, while another 20 have advanced cyber war capacities. Rest assured that nations like Iran, Russia and China will use these technologies in far more crude and indiscriminate ways — yet will do so while claiming to be merely following U.S. footsteps.¶ In turn, international organizations — the UN among them — are pushing ahead with special investigations into potential war crimes and proposing new treaties.¶ Our leaders, meanwhile, stay mum, which isolates the U.S. and drains its soft power. The current policy also makes it harder to respond to growing concerns over civilian casualties. Indeed, Pew polling found 96% levels of opposition to U.S. drones in the key battleground state of Pakistan, a bellwether of the entire region. It is indisputable than many civilians have been harmed over the course of hundreds of strikes. And yet it is also indisputable that various groups have incentives to magnify such claims.¶ Yet so far, U.S. officials have painted themselves into a corner — either denying that any collateral losses have occurred, which no one believes, or reverting to the argument that we cannot confirm or deny our involvement, which no one believes, either.¶ Finally, the domestic support and legitimacy needed for the use of these weapons is in transition. Polling has found general public support for drone strikes, but only to a point, with growing numbers in the "not sure" category and growing worries around cases of targeting U.S. citizens abroad who are suspected of being terrorists.¶ The administration is so boxed in that, even when it recently won a court case to maintain the veil of semi-silence that surrounds the drone strike program, the judge described the current policy as having an "Alice in Wonderland" feel.¶ The White House seems to be finally starting to realize the problems caused by this disconnect of action but no explanation. After years of silence, occasional statements by senior aides are acknowledging the use of drones, while lesser-noticed working level documents have been created to formalize strike policies and even to explore what to do about the next, far more autonomous generation of weapons.¶ These efforts have been good starts, but they have been disjointed and partial. Most important, they are missing the much-needed stamp of the President's voice and authority, which is essential to turn tentative first steps into established policy.¶ Much remains to be done — and said — out in the open.¶ This is why it's time for Obama's voice to ring loud and clear. Much as Presidents Harry Truman and Dwight Eisenhower were able keep secret aspects of the development of nuclear weapons, even as they articulated how and when we would use them, Obama should publicly lay out criteria by which the United States will develop, deploy and use these new weapons.¶ The President has a strong

case to make — if only he would finally make it. After all, the new weapons have worked. They have offered new options for military action that are more accurate and proportionate and less risky than previously available methods.¶ But they have also posed many new complications. Explaining our position is about embracing both the good and the bad. It is about acknowledging the harms that come with war regardless of what technology is being used and making clear what structures of accountability are in place to respond.¶ It's also about finally defining where America truly stands on some of the most controversial questions. These include the tactics of "signature" strikes, where the identity is not firmly identified, and "double tap" strikes, where rescuers aiding victims of a first attack are also brought under fire. These have been reported as occurring and yet seem to run counter to the principles under which the programs have been defended so far.¶ The role of the President is not to conduct some kind of retrospective of what we have done and why, but to lay out a course of the future. What are the key strategic goals and ethical guidelines that should drive the development and use of these new technologies? Is current U.S. and international law sufficient to cover them?¶ There are also crucial executive management questions, like where to draw the dividing line between military and civilian intelligence agency use of such technologies, and how to keep a growing range of covert actions from morphing into undeclared and undebated wars.¶ And, finally, the President must help resolve growing tensions between the executive branch and an increasingly restive Congress, including how to handle situations where we create the effect of war but no U.S. personnel are ever sent in harm's way.¶ Given the sprawling complexity of these matters, only the President can deliver an official statement on where we stand. If only we somehow had a commander in chief who was simultaneously a law professor and Nobel Peace Prize winner!¶ The President's voice on these issues won't be a cure-all. But it will lay down a powerful marker, shaping not just the next four years but the actions of future administrations.

XO - Credibility

Transparent XO generates credibility

Posner and Vermeule 11 – Kirkland & Ellis Distinguished Service Professor of Law & Arthur and Esther Kane Research Chair at University of Chicago and John H. Watson Professor of Law at Harvard, respectively (Eric A. Posner and Adrian Vermeule, February 16, 2011, "The Executive Unbound: After the Madisonian Republic," p. 145, https://books.google.com/books?id=yaWuHE_PrJ4C&printsec=frontcover&source=gbs_atb#v=onepage&q&f=false), acui

The well-motivated executive might commit to transparency, as a way to reduce the costs to outsiders of monitoring his actions.80 FDR's strategy of inviting potential whistleblowers from the opposite party into government is a special case of this; the implicit threat is that the whistleblower will make public any evidence of partisan motivations. The more ambitious case involves actually exposing the executive's decision-making processes to observation. To the extent that an ill-motivated executive cannot publicly acknowledge his motivations or publically instruct subordinates to take them into account in decision-making process. The public will know that only a well-motivated executive would promise transparency in the first place, and the public can therefore draw an inference as to credibility.

AT: Separation of Powers

No overstep and no risk of executive dominance – laundry list of factors check and presidential lead is key -- their ev is Republican fearmongering

Posner 14 -- Kirkland and Ellis Distinguished Service Professor of Law and Arthur and Esther Kane Research Chair at University of Chicago Law School (Eric A. Posner, February 3, 2014, "The Presidency Comes With Executive Power. Deal With It.," http://www.newrepublic.com/article/116450/obama-use-executive-power-unexceptional), acui

In his State of the Union address, President Barack Obama vowed to act on his own if Congress did not do its part. Republicans duly took the bait. "We don't have a monarchy in this country," said Representative Steve Scalise of Louisiana. "The abuse of power by the administration has only become more brazen," said Senator Ted Cruz.¶ Obama has unsheathed the sword of executive power, and yet rather than use it to smite his foes, he seems intent on clipping hedges. He says he will raise the minimum wage for a few thousand employees of federal contractors, tinker with the pension system, trim red tape, cajole business leaders to fund pre-kindergarten education, and do something unspecified to help stop gun violence.¶ Obama begged Congress for help far more often than he vowed to go it alone. Obama's significant acts of executive power—the Libya intervention, the refusal to defend DOMA before the Supreme Court, non-enforcement of the immigration law against certain groups, climate regulation, NSA surveillance, recess appointments, executive privilege, and so on—lie in the past.¶ So we have a paradox. In his first term, Obama humbly beseeched Congress for help and sang the virtues of bipartisanship while resorting to unilateral action whenever he needed to. Today, he announces his defiance of Congress yet seems uninterested in using his newly acknowledged executive powers to, for example, shut Guantanamo Bay or raise the debt ceiling on his own.¶ Be that as it may, it is worth understanding what is at stake in these debates. We all learned in school that the founders feared executive power and so gave policy-making authority to Congress. In fact, the founders feared a too-powerful Congress as well, and they sought to create a strong executive. But the idea that Congress makes law and the president executes it—and any deviation from this pattern is tyranny—is burned into our political culture.¶ This system of separation of powers was cumbersome from the start. The country did well in its first few decades probably because state governments led the way, and state government structure was far less rigid than federal structure, which finally collapsed with the Civil War. When the communications and transportation revolutions created national markets and new opportunities and threats in foreign relations, it was finally clear that the federal separation-of-powers system could not manage policy at a national level.¶ The problem was that Congress was an enormously clumsy institution. Its numerous members fiercely advanced their deeply parochial interests. Policies of great importance for one section of the country, or one group of people, could not be embodied in legislation unless logrolling could be arranged, which was slow, difficult, and vulnerable to corruption. **As a public, deliberative body, Congress could not react swiftly to changing events, nor act secretly when secrecy was called for**. ¶ No one held a constitutional convention to replace the eighteenth-century constitution with a twentieth-century one. Instead, political elites acting through the party system adjusted the government structure on their own. Congress created gigantic regulatory agencies and tasked the president to lead them. Congress also acquiesced as presidents asserted authority over foreign policy. The Supreme Court initially balked at the legislative delegations but eventually was bullied into

submission; it hardly ever objected to the president's dominance over foreign affairs. ¶ This was not a smooth process. The rise of executive power sometimes hurt important interests and always rubbed against the republican sensibilities that Americans inherited from the founders. From time to time, Congress reaped political benefits from thwarting the president. But today Congress reacts rather than leads. It investigates allegations of corruption in the executive branch. It holds hearings to torment executive officials. It certainly doesn't give the executive the budget he always wants, or pass every new law that he believes that he needs. But existing laws and customs almost always give the president the power he needs to govern. And when they don't, Congress will sooner or later give him the power he wants. Witness the Dodd-Frank Act and the Affordable Care Act—two massive expansions of executive power.¶ In monarchies, the official position was that the king made policy but everyone understood that his ministers did. In our system, the official story is that Congress makes policy and the president implements it—such is the inertia of history. But the reality is that the president both makes policy and implements it, subject to vague parameters set down by Congress and to its carping from the sidelines. Presidents can defy the official story and assert the reality if they want. That is what the George W. Bush administration did, to its eventual sorrow. In hindsight, the broad assertions of executive power by Bush administration lawyers in signing statements, executive orders, and secret memos were naïve. They described, with only some exaggeration, the actual workings of the government, but their account conflicted with the official narrative and thus played into the hands of critics, who could invoke tyranny, dictatorship, and that old standby, the "imperial presidency."¶ Democratic presidents have been shrewder. Bill Clinton and Obama have been just as muscular in their use of executive power as Ronald Reagan and Bush, but they resisted the temptation to brandish the orb and scepter. Whereas Republican presidents cite their constitutional powers as often as they can, Democratic presidents avoid doing so except as a last resort, preferring instead to rely on statutes, torturing them when necessary to extract the needed interpretation. Thus did Obama's lawyers claim that the military intervention in Libya did not violate the War Powers Act because the U.S. bombing campaign did not amount to "hostilities" (the word in the statute). A more honest legal theory—one that does not require such a strained interpretation of a word—is that the War Powers Act infringes on the president's military powers, but a theory like that would have provoked howls of protest. ¶ In most cases, lawyers do not need to resort to such measures because Congress has already granted authority. The president's power to raise the minimum wage comes from the Federal Property and Administrative Services Act of 1949, which, in typically broad language, permits the president to set contract terms with federal contractors so as to promote "efficiency." Far from being a bold assertion of executive power, this is the type of humdrum presidential action that takes place every day.¶ Congress gave the president the power to determine contract terms because Congress did not want to—practically speaking could not—negotiate those terms itself every time the U.S. government entered a contract. This principle explains why Congress gives the executive branch enormous discretion to determine health, education, environmental, and financial policy. Congress directed the financial regulators to implement the Volcker Rule, but it would be entirely up to those regulators to make the rule meaningful or toothless. Nor can Congress block Obama's decision to effectively implement the Dream Act—which was not passed by Congress—by not enforcing immigration laws against those who would have benefited from the act.¶ Meanwhile, the founders' anxieties about executive tyranny have proven erroneous. The president is kept in check by elections, the party system, the press, popular opinion, courts, a political culture that is deeply suspicious of his motives, term limits, and the sheer vastness of the bureaucracy which he can only barely control. He does not always do the right thing, of course, but presidents generally govern from

the middle of the political spectrum. ¶ Obama's assertion of unilateral executive authority is just routine stuff. He follows in the footsteps of his predecessors on a path set out by Congress. And well should he. If you want a functioning government—one that protects citizens from criminals, terrorists, the climatic effects of greenhouse gas emissions, poor health, financial manias, and the like—then you want a government led by the president.

Their evidence is all fear-mongering – hard studies prove no risk of separation of powers fracture – the system is strong – accounts for fluctuations

Hamon and Knott 96 -- Professor in the Department of Political Science at Michigan State University and dean of the USC Sol Price School of Public Policy, respectively (Thomas H. Hammond and Jack H. Knott, 1996, "Who Controls the Bureaucracy?: Presidential Power, Congressional Dominance, Legal Constraints, and Bureaucratic Autonomy in a Model of Multi-Institutional Policy-Making," p. 162-3, http://jleo.oxfordjournals.org/content/12/1/119.full.pdf+html), acui

12. Conclusion In a 1993 review of historical evidence on the struggle between the president and Congress for control of the bureaucracy, Francis E. Rourke (1993: 690) observed: These recent attempts of the White House to establish unilateral control over executive agencies bear a strong resemblance to the congressional effort to achieve total legislative dominance over bureaucracy in the aftermath of the Civil War. **The failure of both these efforts suggests that joint custody over bureaucracy represents a point of equilibrium from which the President and Congress may sometimes depart, but to which they invariably return**. For both institutions the idea of total control lies in a field of dreams.¶ Our own answer to the question "Who, if anyone, controls the bureaucracy?" parallels Rourke's answer to a considerable degree. In our view, control of the bureaucracy is a function of the interactions of the president and Congress (and, in a broader perspective, the courts). For some agencies, these interactions lead to great autonomy; for other agencies these interactions lead to little autonomy. Autonomy, in other words, is a contingent matter, and there is no reason to expect all agencies to be constrained to the same degree. However, whatever the extent of constraints on an agency, one cannot single out any one institution as primarily responsible for these constraints. Instead, control of the bureaucracy must be seen as a systemic matter: the president, House, and Senate collectively control the bureaucracy. It is, to use Rourke's phrase, a matter of joint custody, and this means that no one institution will necessarily like the bureaucratic autonomy, or the bureaucratic policies, that may result. But in the nature of our separation-of-powers system of government, no one institution may be able to do much about it.¶

Competition

1NC Competition

A. The federal government includes all three branches -- prefer a definition from legal code

US Code no date ("United States Federal Government Law & Legal Definition," http://definitions.uslegal.com/u/united-states-federal-government/)

The United States Federal Government is established by the US Constitution. The Federal Government shares sovereignty over the United Sates with the individual governments of the States of US. The Federal government has three branches: i) the legislature, which is the US Congress, ii) Executive, comprised of the President and Vice president of the US **and** iii) Judiciary.

B. Resolutional – Resolved means legislative action

Lousiana House of Representatives 5 (http://house.louisiana.gov/house-glossary.htm)

Resolution A legislative instrument that generally is used for making declarations, stating policies, and making decisions where some other form is not required. A bill includes the constitutionally required enacting clause; a resolution uses the term "resolved". Not subject to a time limit for introduction nor to governor's veto. (Const. Art. III, §17(B) and House Rules 8.11 , 13.1 , 6.8 , and 7.4)

1NC—Shields Ptx Link

Executive orders shield politics the president acts without using up capital

Howell, 2005, [William G., Presidential Studies Quarterly, Ph.D., university of Chicago, "Unitlateral Power: a Brief Overview", http://goliath.ecnext.com/coms2/gi_0199-5050927/Unilateral-powers-a-brief-overview.html]

The actions that Bush and his modern predecessors have taken by fiat do not fit easily within a theoretical framework of executive power that emphasizes weakness and dependence, and offers as recourse only persuasion. For at least two reasons, the ability to act unilaterally is conceptually distinct from the array of powers presidents rely upon within a bargaining framework. First, when presidents act unilaterally, they move policy first and thereby place upon Congress and the courts the burden of revising a new political landscape. If they choose not to retaliate, either by passing a law or ruling against the president, then the president's order stands. Only by taking (or credibly threatening to take) positive action can either adjoining institution limit the president's unilateral powers. Second, when the president acts unilaterally, he acts alone. Now of course, he relies upon numerous advisers to formulate the policy, to devise ways of protecting it against congressional or judicial encroachment, and to oversee its implementation (more on this below). But in order to issue the actual policy, the president need not rally majorities, compromise with adversaries, or wait for some interest group to bring a case to court. The president, instead, can strike out on his own. Doing so, the modern president is in a unique position to lead, to break through the stasis that pervades the federal government, and to impose his will in new areas of governance. sThe ability to move first and act alone, then, distinguishes unilateral actions from other sources of influence. Indeed, the central precepts of Neustadt's argument are turned upside down, for unilateral action is the virtual antithesis of persuasion. Here, presidents just act; their power does not hinge upon their capacity to "convince [political actors] that what the White House wants of them is what they ought to do for their sake and for their authority" (Neustadt 1990, 30). To make policy, presidents need not secure the formal consent of Congress. Instead, presidents simply set public policy and dare others to counter. And as long as Congress lacks the votes (usually two thirds of both chambers) to overturn him, the president can be confident that his policy will stand.

1NC—Prez Powers Module

XOS Shape American Policy – they are key to prez powers

McCormick 10 (James M. McCormick, , "American Foreign Policy and Process," http://books.google.com/books?hl=en&lr=&id=m_MOrBfBEmYC&oi=fnd&pg=PR5&dq=executive+orders+quick+process&ots=HTAhZJp2qW&sig=7FfCHf0qgQRvKqDAEbGC_c-Dmw0#v=onepage&q=eecutive%20order&f=false)

Other executive orders in the past sent American foreign policy in a new direction. Most notably, perhaps, was President Ford's 1976 executive order outlawing the use of political assassination by the United States. A few years later, President Reagan issued an executive order defining and setting limits on America's "special activities," or covert actions, abroad that remains in effect today**. Executive orders clearly deal with significant foreign policy matters.** Political scientists Kenneth Mayer and Kevin Price's analysis of such orders from 1936 through 1999 demonstrates their importance. Based on stringent criteria, they found that 149 out of the 1,028 executive orders sampled were "significant" in their effect on policy and society. Of those 149, moreover, we estimated that 58(or 39 percent) dealt with foreign policy. Importantly, then, executive orders afford presidents yet another avenue of influence on foreign affairs.

2NC—XT Shields Ptx

Avoids public scrutiny and has the full force of law – XO 12333 Proves

Newland 15 -- J.D. Candidate at Yale Law School (Erica Newland, April 2015, "Executive Orders in Court," http://www.yalelawjournal.org/note/executive-orders-in-court), acui

Yet a different law—one that has long served as a linchpin of surveillance programs and that reportedly authorizes many of the NSA's most controversial activities4—has largely escaped public5 and congressional6 scrutiny. This law is not a statute but rather an executive order that dates back to 1981.7¶ Known as E.O. 12,333 (twelve-triple-three), the surveillance executive order creates a framework for intelligence programs that target "the activities, capabilities, plans, and intentions of foreign powers, organizations, and persons and their agents."8 Its sweep is extensive, and its first principles are explicit: "All reasonable and lawful means must be used to ensure that the United States will receive the best intelligence available."9¶ The relative scarcity of attention to E.O. 12,333 is all the more surprising because the Order, according to some reports, is the authority behind "most of [the] NSA's data collection."10 Despite text that imposes limitations on surveillance of U.S. persons,11 press reports have suggested that significant numbers of U.S. persons are caught in the Order's web.12 And compared to activities authorized by the Order's statutory counterparts, E.O. 12,333 programs are less likely to be briefed to the congressional intelligence committees.13 These programs also fall outside the jurisdiction of the Foreign Intelligence Surveillance Court (FISC).14¶ While it has never been put to a congressional vote, E.O. 12,333 nonetheless has the force and effect of law: executive orders, which can derive their power from congressional delegations of authority to the President (explicit, implicit, or anticipated),15 from the President's independent authority under Article II of the Constitution,16 or from some vague combination of the two,17 are generally enforceable by courts against private citizens.18 E.O. 12,333's authority purportedly derives from both constitutional and statutory sources. President Reagan captured this lineage in the opening lines of the Order, averring that it was issued "by virtue of the authority vested in me by the Constitution and the laws of the United States of America, including the National Security Act of 1947 . . . and as President of the United States of America."19¶ Presidents may issue executive orders in order to plant a flag in a particular policy sphere, to reorganize the structure of the executive branch, or to provide policy leadership when Congress is stuck in the mud.20 Executive orders, like E.O. 12,333, are formidable instruments of power21 in large part because they are not immediately constrained by the "finely wrought and exhaustively considered" process of bicameralism and presentment,22 nor are they subject to the hoops and constraints of the Administrative Procedure Act.23As Kevin Stack has written:¶ In contrast to legislation or agency regulation, there are almost no legally enforceable procedural requirements that the president must satisfy before issuing (or repealing) an executive order or other presidential directive. That, no doubt, is central to their appeal to presidents. They rid the president of the need to assemble majorities in both houses of Congress, or to wait through administrative processes, such as notice-and-comment rulemaking, to initiate policy.24

XO avoids PC drain and solves perception

Tenpas 3 -- Nonresident Senior Fellow in Governance Studies at Brookings (Kathryn Dunn Tenpas, April 2003, "Campaigning to Govern: Presidents Seeking Reelection," http://www.brookings.edu/~/media/research/files/articles/2003/4/elections-tenpas/200305.pdf), acui

Similarly, the number of executive orders decreased from the third to the fourth year of the term for all presidents since Nixon with the exception of President Clinton. The Clinton numbers can be explained by the presence of campaign consultant Dick Morris and his deliberate efforts to showcase the president's promotion of a number of small issues (e.g., school uniforms, the V chip). The executive order approach was far more attractive than taking on the Republican Congress, risking defeat and expending precious

political capital. “Clinton often issued executive orders on small-bore issues to show he was taking action rather than calling on Congress to do something” (Allen 2002, A2). The decline in policymaking is real, and according to one staff member, “During the campaign, things change dramatically because every political story has a reelection dimension and therefore everything you work on has that potential.”17 Decisions or pronouncements that may have been advantageous, but potentially risky, in year two or three are completely avoided.

2NC--AT Aff no defend Resolved

Nope, the words after the colon just specifies what came before

UOB no date (University of Bristol, Faculty of Arts, “Improve Your Writing,” “The colon.”)

The colon has two main uses. Firstly it is used to introduce an idea that is an explanation or continuation of the one that comes before the colon. The colon can be considered as a gateway inviting the reader to go on. Have a look at these examples:

Grammar dictates words after the colon just clarify those before it

Fogarty 10 (Mignon Fogarty creator of Grammar Girl, the founder and managing director of Quick and Dirty Tips, magazine writer, technical writer, and entrepreneur, has served as a senior editor and producer at a number of health and science web sites. B.A. in English from the University of Washington in Seattle and an M.S. in biology from Stanford University, 9/23/10, “Colons,” Grammar Girl Episode 241, http://grammar.quickanddirtytips.com/colon-grammar.aspx)

Notice how the items after the colon expand on or clarify what came before the colon. I referred to my favorite hobbies before the colon and then specifically named them after the colon. A quick and dirty way to decide whether a colon is acceptable is to test whether you can replace it with the word namely. For example, you could say, "Grammar Girl has two favorite hobbies, namely, watching clouds and seeing how long she can stand on one foot." Most of the time, if you can replace a colon with the word namely, then the colon is the right choice.

2NC--Ext. The = All Parts

Federal Government means all three branches
Blacks Law Dictionary 1990

In the United States, government consists of the executive, legislative, and judicial branches in addition to the administrative agencies. In a broader sense, includes the federal government and all its agencies and bureaus, state and country governments, and city and township governments.

A. Definitional: "The" means all parts – they're definitionally bound to defending all branches

Merriam-Webster's No Date Online Collegiate Dictionary, No Date,

http://www.m-w.com/cgi-bin/dictionary

used as a function word before a noun or a substantivized adjective to indicate reference to a group as a whole <the elite>

2NC--Ext. Resolved

Resolved means a determination reached by voting

Webster's 98 (Webster's Revised Unabridged, dictionary.com)

Resolved: 5. To express, as an opinion or determination, by resolution and vote; to declare or decide by a formal vote; -- followed by a clause; as, the house resolved (or, it was resolved by the house) that no money should be appropriated (or, to appropriate no money).

'Resolved' means to settle formally by voting

Webster's Law 96 ("resolved." Merriam-Webster's Dictionary of Law. Merriam-Webster, Inc. 01 Jul. 2007. <Dictionary.com http://dictionary.reference.com/browse/resolved>.)

resolve transitive verb 1 : to deal with successfully : clear up <resolve a dispute> 2 a : to declare or decide by formal resolution and vote b : to change by resolution or formal vote <the house resolved itself into a committee> intransitive verb : to form a resolution

2NC--AT: Perm Do Both

Perm guts credibility

Belia 2 – Notre Dame Law School (Patricia L. Bellia, 2002, "Executive Power in Youngstown's Shadows," p. 149 – 151, http://scholarship.law.nd.edu/cgi/viewcontent.cgi?article=1089&context=law_faculty_scholarship), acui

Consider second the fact that the combination of congressional¶ silence and judicial abstention will create power where the¶ Constitution does not. If presidential powers are legitimate, they¶ must stem from some source -statutory or constitutional. In this¶ sense, the notion that presidential powers "fluctuate" is misleading.¶ The Constitution either grants the President power or it¶ does not. It is true that Congress may, through the exercise of its¶ own constitutionally granted authority, limit some presidential¶ conduct, but its failure to do so does not create presidential¶ power. At most, congressional silence despite awareness that the¶ executive is engaging in certain conduct provides, as Justice¶ Frankfurter suggested, a "gloss" on the President's constitutional¶ powers. In other words, congressional silence may indicate¶ something about Congress's understanding of the scope of the¶ President's constitutional powers, but it does not create a presidential¶ power independent of the Constitution. For this reason,¶ it is somewhat surprising that many congressional primacy scholars¶ recognize that the President possesses certain "initiating" 283¶ or "concurrent" 284 powers, the exercise of which is contingently¶ constitutional.285 Since these powers are not enumerated in the¶ constitutional text, to recognize their existence is to recognize¶ that some of the President's foreign affairs powers are nontextual-that¶ they must be inferred from the constitutional text and¶ the structure the Constitution creates. If this is the case, then any¶ justification for courts' posture of deference to executive action¶ and congressional silence evaporates. Whatever the scope of the¶ political question doctrine might be, it does not apply when the¶ question presented concerns only the constitutional division of¶ authority between Congress and the President. The fact that a¶ resolution of the question demands interstitial rather than textual¶ analysis does not make the question a political one.286 Congress¶ is in the best position to decide whether it concurs in a policy¶ the Executive develops, but it is in no better position than a court to determine whether the Executive has authority to develop¶ that policy.¶ To see the problems in giving dispositive weight to inferences¶ from congressional action (or inaction), we need only examine¶ the similarities between courts' approach to executive¶ power questions and courts' approach to federal-state preemption¶ questions. If a state law conflicts with a specific federal en-287actment, or if Congress displaces the state law by occupying¶ the field,"'8 a court cannot give the state law effect. Similarly, if¶ executive action conflicts with a specific congressional policy (reflected¶ in a statute or, as Youngstown suggests, legislative history),¶ or if Congress passes related measures not authorizing the¶ presidential conduct, courts cannot give the executive action effect.289¶ When Congress is silent, however, the state law will¶ stand; when Congress is silent, the executive action will stand.¶ This analysis makes much sense with respect to state governments¶ with reserved powers, but it makes little sense with respect¶ to an Executive Branch lacking such powers. The combination¶ of congressional silence and judicial inaction has the¶ practical effect of creating power.¶ Courts' reluctance to face questions about the scope of the¶ President's constitutional powers-express and implied-creates¶ three other problems. First, the implied presidential power given¶ effect by virtue of congressional silence and judicial inaction can¶ solidify into a broader claim. When the Executive exercises an¶ "initiating" or "concurrent" power, it will tie that power to a textual¶ provision or to a claim about the structure of the Constitution.¶ Congress's silence as a practical matter tends to validate the¶ executive rationale, and the Executive Branch may then claim a¶ power not only to exercise the disputed authority in the face of¶ congressional silence, but also to exercise the disputed authority¶ in the face of congressional opposition. In other words, a power¶ that the Executive Branch claims is "implied" in the Constitution¶ may soon become an "implied" and "plenary" one. Questions¶ about presidential power to terminate treaties provide a ready example. The Executive's claim that the President has the¶ power to terminate a treaty-the power in controversy in Goldwater¶ v. Carter, where Congress was silent-now takes a stronger¶ form: that congressional efforts to curb the power are themselves¶ unconstitutional.29

A. Parallel Action – The perm destroys prez powers – makes Obama look weak

Davis 09 (Chelyen, interviewing veteran television journalist Sam Donaldson that has covered president's since Kennedy, 3/25, http://fredericksburg.com/News/FLS/2009/032009/03252009/454697)

Veteran television journalist Sam Donaldson said an important test for President Barack Obama is whether he learns--**quickly**--to wield his presidential power effectively, especially over Congress. Speaking at the University of Mary Washington's Fredericksburg Forum, Donaldson--who has covered presidents since John F. Kennedy--said **if Obama lets Congressional Democrats take charge, he won't be seen as a strong leader**. Case in point, Donaldson said, was the stimulus bill, which Obama let Democrats in Congress write. "Next time, if he has to send up another stimulus bill, I want to see him write it," Donaldson said. One way Obama's fledgling administration could endanger itself, Donaldson said, is trying to do too much. Successful presidents pick two or three big issues and work on those, he said, whereas Obama has already promised health care reform, energy policy changes, Social Security reform and economic improvements. "You mass your forces. You bring great power," Donaldson said. "If he tries to do it all, he gets picked off here, there he's going to have a problem with his own party." If those policies turn out to be successful, of course, Donaldson said it won't matter--Obama will become a success, and any early missteps will be forgotten.

B. Turns the case---using multiple actors kills focus and coordination- turning the case since the plan gets juggled around by executive agencies

Steve **Radelet**, Senior Fellow Center for Global Development, 6/12/**07** (*CQ Testimony*)

Nevertheless, there is wide agreement that our programs can be significantly strengthened. U.S. foreign assistance programs continue to be a hodge-podge of uncoordinated initiatives from **multiple institutions without a coherent guiding strategy**. Many of the structures and guiding principles of our programs have their roots in the Cold War, and they are not well-suited to meet today's global challenges. Programs are highly fragmented with little coordination across the **20 or so executive branch agencies** that administer foreign aid programs. Sometimes these agencies work at cross purposes with each other with different objectives and techniques.

C. Perm renders the executive order useless and destroys presidential power.

Ivey '03 (Lisa, Cumberland Law Review, 33 Cumb. L. Rev. 107, lexis)

The third "zone" of presidential power occurs when the President's actions are "incompatible with the [express] or implied will of Congress." In the Youngstown Sheet & Tube Co. case itself, Jackson found President Truman's actions in seizing steel mills was incompatible with Congressional will because Congress had not been silent on the subject of seizure of private property. Thus, there was no "open field" in which the President could operate. Similarly, in enacting the Executive Order establishing military tribunals, the President is probably operating in the third "zone." Congress has specifically indicated its intention to exercise its constitutional powers and enact anti-terrorist legislation. Where Congress has indicated an intention to occupy the field of legislation and exercise its full power, none is

left over for the President. In the case of the Executive Order, Congress has already covered the playing field, and the President's power is at its lowest ebb.

D. Disad to the perm – Congressional action is like a Mack Truck – it devastates presidential flexibility and dooms effective foreign policy killing Hegemony

Brent **Scowcroft**, National Security Adviser Under Bush I and Ford, **and** Arnold **Kanter**, Undersecretary of State for Political Affairs in Bush I, **10/20/1993** (The Washington Post)

Maneuvering in the complex environment of a Somalia -- or of a Haiti, Bosnia or the other crises that loom on and just over the horizon -- requires the **agility of a ballet dancer, not the Mack truck of legislation**. In a world that increasingly places a premium on a **rapidly adaptable foreign policy**, codifying highly detailed requirements in a public law is a recipe for ineffectiveness. It undermines the president's ability to threaten, cajole and pressure our adversaries by publicizing the costs we will and won't pay and by broadcasting the conditions and constraints under which our forces will operate. At the same time, it leaves our friends and allies, whose cooperation we seek, to wonder whether Congress will permit the president to follow through on his promises and commitments. Finally, **it stays on the books, continuing to tie the president's hands** as circumstances change and Congress's attention shifts to other priorities. Now more than ever, trying to legislate foreign policy is simply a bad idea.

AT Executive CP

No Solvency--Executive Self-Restraint

Obama is not interested in stopping metadata collection – means self-restrain is a lie -- the burden is on Congress

Carpenter 14 -- Assistant Washington Editor for The Nation (Zoë Carpenter, January 17, 2014, "What Obama Didn't Say in His Speech on NSA Spying," http://www.thenation.com/article/what-obama-didnt-say-his-speech-nsa-spying/), acui

The really significant parts of Obama's speech were the things he did not mention. He did not call for a full stop to the bulk collection of communication records, only a transfer of ownership. Instead, he endorsed the idea that data about millions of Americans should be stored and made available to intelligence analysts. Tellingly, Senator Dianne Feinstein and Representative Mike Rogers, the NSA's most ardent and prominent supporters in the Capitol, applauded the president for affirming that using metadata "is a capability that is 'critical' and must be 'preserved.'"¶ Even given the new hurdles the government will face in querying the data, its collection alone poses serious privacy questions, as civil liberties advocates have been quick to point out. "The president's decision not to end bulk collection and retention of all Americans' data remains highly troubling," the ACLU said in a statement. "The president should end—not mend—the government's collection and retention of all law-abiding Americans' data. When the government collects and stores every American's phone call data, it is engaging in a textbook example of an 'unreasonable search' that violates the Constitution."¶ The president did not articulate a specific reason why this information needs to be collected and stored. His own intelligence review panel found that it serves no essential counterterrorism purpose. On the other hand, the same panel (among others) emphasized the intrusiveness of bulk data collection. Quoting Supreme Court Justice Sonia Sotomayor the panel explained, "telephone data can reveal 'a wealth of detail' about an individual's 'familial, political, professional, religious, and sexual associations.'"¶ Obama omitted much in the historical justifications he offered up, too. Explaining the genesis of the telephone metadata program, Obama said:¶ The program grew out of a desire to address a gap identified after 9/11. One of the 9/11 hijackers—Khalid al-Mihdhar—made a phone call from San Diego to a known al Qaeda safe-house in Yemen. NSA saw that call, but could not see that it was coming from an individual already in the United States. The telephone metadata program under Section 215 was designed to map the communications of terrorists, so we can see who they may be in contact with as quickly as possible.¶ In fact, we know that al-Mihdar could have been located well before 9/11. The problem wasn't a lack of information—it was the fact that intelligence agencies failed to share information with one another.¶ Still, the phone records program is only one of the many disclosed by Edward Snowden. The president failed to say anything about other types of data collection carried out under Executive Order 12333, which the NSA uses to vacuum up data flowing from Internet servers and information from Americans' digital address books. He did not address the NSA's attempts to weaken encryption technologies, a practice that has deeply alarmed US Internet companies. Nor did the president announce substantive changes to dragnet surveillance programs conducted under section 702 of the FISA Amendments Act, which contains a loophole allowing the NSA to search for information about US citizens through their international communications. There was no mention of Dishfire, the latest NSA program to be disclosed, which sweeps up "pretty much everything it can."¶ Obama made a few important acknowledgements of the potential for abuse inherent in surveillance programs, but he painted a seriously misleading picture of the NSA's recent history when he said that he's learned nothing that "indicated that our intelligence community has sought to violate the law or is cavalier about the civil liberties of their fellow citizens." In 2009, the FISA court argued that the privacy protocols set for the phone records program had been "so frequently and systematically violated that it can fairly be said that this critical element of the overall…regime has never functioned effectively." In 2011, the chief judge of the FISA court found that the NSA had, for three years, operated in violation of the Constitution by gathering and searching the contents of tens of thousands of Internet communications sent by Americans, and had repeatedly misled the court about its activities. NSA employees have used surveillance programs to spy on their spouses and exes.¶ It is not surprising that the president chose to defend rather than challenge the intelligence establishment. He has done so consistently since the first of the Snowden documents came out. Much of what he outlined today are not specific reforms, and instead directives for transparency; assurances to foreigners that they will not be spied on; and further reviews, notably a broad consideration of big data and privacy to be led by adviser John Podesta.¶ Obama did do something of potentially great significance today: open the door for others to make the

big changes that he won't.¶ **That task now rests with Congress**. Obama requested that lawmakers engage on several fronts, most critically in creating an independent panel of privacy and technology experts to inform decisions made by the FISA court, and to consider whether there should be judicial review before the FBI can issue National Security Letters to obtain communication and financial records from business. And many of the most vocal privacy advocates from both parties in Congress have made it clear that they will not stop there.

Executive self-restraint kills separation of powers

Johnsen 8 -- Walter W. Foskett Professor of Law at Indiana University Maurer School of Law, J.D. at Yale Law School (Dawn E. Johnsen, 2008, "WHAT'S A PRESIDENT TO DO? INTERPRETING THE CONSTITUTION IN THE WAKE OF BUSH ADMINISTRATION ABUSES," p. 413-4, https://www.bu.edu/law/central/jd/organizations/journals/bulr/documents/JOHNSEN.pdf), acui

Second, the President must respect the constitutional functions of the other branches of government. In considering whether and how to promote distinctive constitutional views, the President must not impermissibly infringe upon the Supreme Court's judicial power or Congress's legislative power.74 For example, if Presidents were to refuse to comply with a court order whenever they disagreed with the court's constitutional analysis, the judiciary's core function would be gravely impaired. Longstanding practice and academic commentary almost universally condemn presidential defiance of a court order, even when the President's constitutional disagreement is principled and sincere.75 Although not quite as likely to be unsupportable as the violation of a court order, a presidential refusal to enforce a federal statute is highly suspect. The Constitution sets forth a detailed process for lawmaking, a "single, finely wrought and exhaustively considered, procedure," that contemplates presidential involvement prior to enactment to ensure the constitutionality of legislation.76 Presidents should work with Congress to correct constitutional problems in draft legislation, veto unconstitutional bills whenever possible, and also work with Congress to repeal and correct unconstitutional provisions. If, instead, Presidents were routinely to disregard laws they found constitutionally objectionable, they would circumvent this legislative process and threaten Congress's core legislative authority.

Discussions of separation of power key – the NSA will never stop and Obama is on their side

Wheeler 14 -- independent journalist writing about national security and civil liberties, PhD from the University of Michigan (Marcy Wheeler, January 24, 2014, "The Impasse on Executive Spying," https://www.emptywheel.net/tag/eo-12333/), acui

When NSA chose to avoid First Amendment review on the 3,000 US persons it had been watch-listing by simply moving them onto a new list, when it refused to tell John Bates how much US person content it collects domestically off telecom switches, when it had GCHQ break into Google's cables to get content it ought to be able to obtain through FISA 702, when it rolled out an Internet dragnet contact-chaining program overseas in part because it gave access to US person data it couldn't legally have here, NSA made it clear it will only fulfill its side of the compromise so long as no one dares to limit what it can do.¶ That is, Snowden has made it clear that the "compromise" never was one. It was just a facade to make Congress and the Courts believe they had salvaged some scrap of separation of powers.¶ NSA has made it clear it doesn't much care what its overseers in Congress or the Court think. It'll do what it wants, whether it's in the FISC or at a telecom switch just off the US shore. And thus far, Obama seems to agree with them.¶ Which means we're going to have to start talking about whether this country believes the Executive Branch should have relatively unfettered ability to spy on Americans. We're going to have to take a step back and talk about separation of powers again.

Separation of powers key to liberty

*we don't endorse gendered lang of the card

Kesler 7 -- professor of Government/Political Science at Claremont McKenna College and Claremont Graduate University, Ph.D in Government from Harvard University (Charles R. Kesler, December 17, 2007, "What Separation of Powers Means for Constitutional Government," http://www.heritage.org/research/reports/2007/12/what-separation-of-powers-means-for-constitutional-government), acui

The argument from liberty holds that separation is needed in order to prevent tyranny. According to Publius's famous definition, "The accumulation of all powers legislative, executive, and judiciary, in the same hands, whether of one, a few, or many, and whether hereditary, self-appointed, or elective, may justly be pronounced the very definition of tyranny."[3] Tyranny is a danger because ~~man's~~ [people's] passions and reason are not perfectly harmonious; ~~his~~ [their] reason may be distorted by desire. Although each ~~man~~ [person] has by nature the rights to life, liberty, and the pursuit of happiness, ~~he~~ [they] cannot secure these rights without joining together with other ~~men~~ [people] to form a civil society, a people. Despite the legal unity of this people, it is composed of individuals whose impassioned opinions and interests divide them into majorities and minorities. As a precaution against injustice, therefore, the powers of government must be so divided that no ~~man~~ [person] or group of ~~men~~ [people] may wield all of them at once. This precaution would not be necessary if reason and passion were utterly harmonious, and if the whole comprising such reason and passion were a priori unitary rather than synthetic. These conditions, however, are unique to God, who alone justly unites the legislative, judicial, and executive powers in the same hands. The Declaration of Independence affirms this by appealing at once to "the laws of Nature and of Nature's God," "the Supreme Judge of the world," and "the Protection of Divine Providence."[4]

No Solvency--XO

Real reforms require congressional approval

Gerstein 1/13 -- White House reporter for POLITICO specializing in legal and national security issues (Josh Gerstein, January 13, 2014, "The limits of President Obama's power on NSA reform," http://www.politico.com/story/2014/01/nsa-surveillance-limits-102081.html), acui

President Barack Obama on Friday will try to put the ongoing surveillance controversy behind him, laying out reforms to U.S. intelligence-gathering activities aimed at reassuring Americans that his administration will right the balance between civil liberties and national security.¶ But Obama's powers have significant limits.¶ Many of the key reforms he's expected to endorse — including changes to the National Security Agency's practice of gathering information on telephone calls made to, from or within the U.S. — will require congressional action. Like the public — and seemingly the president himself — lawmakers on both sides of the aisle are divided on what needs fixing and how to do it.¶

XO can't curtail programs that have congressional approval, Congress is key

Bhalla 13 -- consultant and policy adviser at the World Bank, U.S. Department of the Treasury, U.S. Department of Health and Human Services, and National Archives and Records Administration (Asheesh Bhalla, June 20, 2013, "NSA Surveillance Program: Obama Can't Stop What Bush and Congress Started," http://mic.com/articles/49125/nsa-surveillance-program-obama-can-t-stop-what-bush-and-congress-started), acui

A new president takes over an establishment of over 14 million people. Many civil servants have had careers in government spanning decades and administrations from both parties. Executive orders provide the president the ability to reform policies and procedures of federal agencies where these orders do not conflict with federal statutes or the Constitution. Contrary to the assertion of former presidential hopeful Governor Mitt Romney, he would not have been able to overturn the Affordable Care Act with a simple executive order.¶ President Obama is not simply able to stop the operation of congressionally legislated and funded programs that conduct warrantless wiretapping under the PATRIOT Act. And in a move out of step with his liberal constitutional-scholar background, he has actually overseen the expansion of government acts that violate civil liberties by authorizing a drone strike on an American citizen without a modicum of due process. The attorney general claims that executive due process was applied in the decision, but due process by any legitimate legal definition includes the right to notice and the opportunity to be heard underscored by the principle of "innocent until proven guilty." Anwar Al-Awlaki, no matter how deplorable his actions, was an American citizen with the right to notice and the opportunity to be heard in court before his government ordered his execution. Reports indicate that in 2006 he was arrested in Yemen and detained until December 2007, giving doubt to the claim that he could not have been captured and detained. President Obama has publicly asked Congress to reduce the ability of a future president to conduct such strikes by repealing the Authorization for Use of Military Force (AUMF), but that still does not negate the previous violation of due process by drone execution.¶ According to recent reports, the NSA surveillance program has stopped terrorist plots in 20 nations. The program arguably has significant security benefits that may outweigh concerns about personal privacy for some people. The program has been authorized and re-authorized by the Congress and the president numerous times, but it is the continuation of a program established under the Bush administration with congressional approval. President Obama would require significantly more political leverage to ask the intelligence community to not operate it.¶ **A president can only make meaningful reform to the protections of civil liberties where he has the buy-in of Congress.** President Bush initiated the NSA surveillance program with the consent of Congress, but tried to pass a guest-worker immigration legislation and was stonewalled. President Obama has supported constitutional challenges to the Defense of Marriage Act thereby supporting fundamental rights for couples in same-sex marriages, and he may sign into law legislation that increases protections of civil liberties for undocumented immigrants. Both presidents tried to protect

civil liberties and national security in a way they thought was balanced. But these agency programs are largely governed by policies established by congressional legislation.

PPD-28 proves executive action is only cosmetic – they just want to keep doing what they are doing

Goitein 4/7 -- co-director of the Brennan Center for Justice's Liberty and National Security Program (Elizabeth Goitein, April 7, 2015, "Obama's Surveillance Reform Promises, One Year Later," http://www.truth-out.org/news/item/30074-obama-s-surveillance-reform-promises-one-year-later), acui

The report makes clear that the big picture has not changed. One year after President Obama promised to end the bulk collection of Americans' phone records, the administration continues to apply for a FISA court order every three months directing American phone companies to turn all of their phone records over to the NSA. It also continues to exploit a surveillance program nominally targeted at foreigners to listen to Americans' phone calls and read their e-mails without a warrant. Overseas, the administration collects communications that involve Americans on a truly massive scale with no judicial oversight or legislative restrictions. **These activities constitute an existential threat to civil liberties that cannot be addressed by procedural tweaks**.¶ It is tempting to cheer the administration's changes simply because they happened – and because they improve the status quo, however incrementally. Context matters here: in the short period of time since 9/11, technological changes have exponentially increased the amount of personal information the government can collect, while the longstanding laws that would restrict such collection have been systematically gutted or tossed aside. Given this dizzying trajectory, any tap on the brakes is in some sense a major accomplishment.¶ But the surveillance explosion also means that small changes are not enough. **Ultimately, we must measure the administration's efforts against where we need to be, not where we have been going. By that measure, the administration's reforms fall distressingly far from the mark.**¶ • • •¶ For nearly fifteen years, the NSA has collected Americans' telephone records in bulk. Originally, the Bush administration collected the records secretly and without seeking any court approval. Starting in 2006, the administration persuaded the FISA Court to endorse the program under a provision of the Patriot Act—Section 215—that allows the Justice Department to obtain a court order requiring companies to turn over business records that are "relevant" to an investigation. The FISA Court prohibited officials from searching the collected records without reasonable suspicion of a terrorist link. However, the Court allowed officials to make this determination, and to extend the search out three hops from the suspect—i.e., officials could search the suspects' records, the records of those in contact with the suspects, and the records of those in contact with the suspect's contacts. The legal justification for these activities was flimsy and the program remained secret until Snowden revealed it in 2013.¶ Since then, two independent review panels have concluded that bulk collection adds little or no counterterrorism value. The administration nevertheless refuses to simply end it, preferring for Congress to create a substitute program that is less intrusive while still permitting broader collection than a sensible reading of Section 215 would allow. In the meantime, the NSA continues to collect phone records in bulk. The most significant reform to the program in the past year is that the administration asked the FISA Court to pre-approve searches of the data and to limit the searches to two hops.¶ As the program stands, the potential for abuse remains enormous. Initial government claims that phone metadata is no more revealing than numbers in a phone book were swiftly debunked. Sophisticated computer programs can parse this data to create intimate, detailed portraits of a person's private life, including political and religious beliefs, associations, hobbies, and more. Because the NSA collects and holds this data, any limitations on how the data are searched or used necessarily rely on self-policing. A series of FISA Court opinions shows that the NSA inadvertently but routinely violated court orders, and this shocking level of non-compliance went undetected and unreported for years. Imagine, then, how long it would take to uncover violations the NSA was actively trying to hide.¶ • • •¶ The DNI's recent report also addresses the NSA's collection of communications content. Beginning in 1978, if the government, acting inside the United States, wanted to eavesdrop on phone calls between foreign targets and Americans, it had to obtain an order from the FISA Court based on probable cause that the target was a foreign power (which includes terrorist groups) or its agent. Then the Bush administration's warrantless wiretapping program was exposed, and rather than shutting down the program, Congress amended the law to legalize it.¶ Under the FISA Amendments Act of 2008 (FAA), the government needs no individualized court order to collect the communications of foreigners overseas, even if there is an American on the other end. The government must certify, however, that its interest lies in the foreigner, not in any American whose communications are "incidentally" swept up. It also must adopt procedures to "minimize" the retention and use of Americans' information—basically, masking or deleting Americans' digital data upon recognition.¶ Both the executive branch and the FISA Court originally interpreted the "minimization" requirement as prohibiting government officials from sifting through the collected communications for Americans' information (so-called "U.S. person searches"). In 2011, however, the FISA Court allowed the government to drop this prohibition. In 2013, the NSA and CIA conducted nearly 2,000 U.S. person searches. The FBI makes no effort to count these searches, but the Privacy and Civil Liberties Oversight Board, an independent panel charged by Congress with overseeing counterterrorism policies, reported that the FBI searches FAA data every time it opens an investigation or "assessment"—a type of investigation that occurs when the FBI lacks any factual basis to suspect criminal activity.¶ These "backdoor" searches—as Senator Ron Wyden labeled them—constitute a bald-faced end run around the Fourth Amendment. The law is clear: if government officials want access to Americans' communications, they must obtain a warrant, or, if they are seeking foreign intelligence, an individualized order from the FISA Court. The legality of proceeding without such judicial authorization rests entirely on the government's promise to target only foreigners overseas, and to redact or discard Americans' information. Instead, the FBI routinely listens to Americans' calls and reads their e-mails without even a factual basis to suspect wrongdoing, let alone probable cause of criminal activity.¶ The DNI's report unveils two new reforms related to U.S. person searches. First, the NSA and CIA, when conducting U.S. person searches, will now be required to provide written statements showing that

the search is reasonably likely to return "foreign intelligence information," a term that is broadly defined under the law. Of course, internally documenting that a search is likely to yield information about foreign matters is a far cry from proving to a court that there is probable cause of a crime. More to the point, the new changes do not require the FBI to do either: the most prolific user of backdoor searches is exempt from this new limitation.¶ Second, going forward, information acquired under the FAA may be used as evidence against an American in a criminal case only if the case has national security implications or involves a serious crime. This reform could indeed reduce the damage that flows from using warrantless surveillance to prosecute Americans. But the fact remains: the Fourth Amendment contains no exception for Americans suspected of "serious crimes." If anything, the prospect of lengthy sentences or even capital punishment raises the constitutional stakes.¶ • • •¶ The largest, least regulated, and least transparent set of surveillance activities operates under Executive Order 12333, which governs surveillance of foreign targets that takes place overseas. In theory, searches of foreigners conducted overseas do not implicate the Fourth Amendment. Accordingly, no courts oversee these activities, Congress has not constrained them, and—until Snowden—the executive branch saw little reason to make any information about them public.¶ In light of today's communications technologies, the notion that overseas surveillance of foreigners' communications does not implicate Americans' privacy rights is pure fiction. Americans' communications travel through fiber-optic cables overseas and reside on servers in other countries. By its own admission, the NSA could not filter out all of this traffic if it wanted to. Americans also routinely communicate with foreigners, and these communications are captured in massive numbers. Under one program code named "MYSTIC," the U.S. has engaged in the bulk collection of every phone call transiting in or out of particular countries—including every phone call to or from the United States.¶ In any event, the right to privacy is not limited to Americans. Under treaties signed by the United States, privacy is recognized as a fundamental human right. The United States has largely disregarded this legal constraint, but before the digital age, limits on data storage and analytical capacity served as a practical constraint, forcing the government to narrow its focus. Today, as programs like MYSTIC illustrate, there is little to stop the United States from sweeping up the data of ordinary private citizens across the globe and subjecting that data to computer analysis.¶ In January 2014, President Obama issued an order (Presidential Policy Directive 28, or "PPD-28") requiring agencies to adopt new limits on electronic surveillance of foreign targets overseas. Most notably, agencies may retain or disseminate information about foreigners only if Executive Order 12333 would permit the retention or dissemination of "comparable information" about Americans.¶ There is tremendous symbolic importance in articulating the principle that foreigners have privacy rights and in requiring their data to be treated similarly to Americans' data. Unfortunately, the retention and dissemination limitations that now apply to both Americans and foreigners offer little protection in practice.¶ In general, information about Americans may be retained for five years, and may not be disseminated, unless it constitutes "foreign intelligence information" or falls under a long list of other exceptions. The definition of "foreign intelligence information" in Executive Order 12333, however, encompasses almost any information about any foreign person, rendering the retention and dissemination limitations meaningless when applied to foreigners. Recognizing this issue, the DNI in July 2014 pledged that information would not be kept or shared "solely because of [a] person's non-U.S. person status." But the standards that will be used instead are classified. Moreover, any limits on retention may be waived if the DNI determines that "continued retention is in the national security interests of the United States." It is easy to see how this exception might swallow the rule—indeed, it is difficult to see how it would not.¶ PPD-28 contains another notable limitation: when the government collects data in bulk, it may only use this data for six enumerated purposes. Whether these restrictions will have a significant effect on operations depends on how they are interpreted and applied, and history strongly suggests this will happen in secret. One of the permissible uses, for instance, is "detecting and countering . . . threats to the United States and its interests" from foreign powers or from terrorism. What will be the bar for considering something or someone a "threat to U.S. interests"—and how will we know?¶ • • •¶ Assessing the privacy impact of surveillance activities depends on knowing what those activities are. In the so-called "information age," intelligence agencies, backed by presidents and even congressional overseers, have been remarkably successful at keeping this information out of the public's hands. Despite President Obama's pledge to preside over the most transparent administration in history, his administration was, for several years, nearly as secretive as the previous one when it came to national security policy.¶ Snowden's disclosures forced a change in this approach. To manage public opinion on particular programs and to win back the public's trust and approval, the administration had to make disclosures of its own. The DNI thus created the website, "IC on the Record," on which information about intelligence activities ranging from the DNI's public speeches to declassified decisions of the FISA court are regularly posted. Although some disclosures were compelled by Freedom of Information Act litigation, the declassification and public posting of more than 4,500 pages over an 18-month time span is unprecedented.¶ Unfortunately, the disclosed documents are the tip of a massive iceberg of secret information. The unnecessary classification of information, or "overclassification," is a universally recognized problem. There were 80 million decisions to classify information in 2013, and former national security officials have estimated that between 50 and 90 percent of classified information could safely be released. There is simply no way to assess how much of the relevant information the DNI has chosen to disclose, and how much remains locked away on a classified network.¶ What is certain is that the administration's commitment to openness breaks down when transparency threatens to yield legal accountability. Despite having posted documents about the NSA's so-called "upstream collection" program on the DNI's website, the administration recently convinced a court to dismiss a legal challenge to this same program on the ground that the lawsuit would reveal "state secrets." In another case alleging unlawful surveillance, the Justice Department accidentally sent the plaintiffs a classified document showing that the government had captured their data; demanded and obtained the document's return; and then argued in court that the plaintiffs had no right to sue because they could not prove they had been surveilled. The

administration has invoked such claims of secrecy in every civil lawsuit challenging unlawful surveillance.¶ Given the intense secrecy that permeates intelligence agencies, one of the only ways in which private citizens learn about surveillance activities that affect their rights is through whistleblowers like Edward Snowden. The DNI report notes that both the administration and Congress have extended protections to intelligence employees who disclose fraud, waste, or abuse through approved channels within government. These protections are helpful if an employee wishes to call attention to the rogue misdeeds of a supervisor. They are useless, however, if the activities the whistleblower seeks to disclose constitute the agency's official policy and were most likely approved by the very people authorized to hear the whistleblower's complaint.¶ When whistleblowers have found it necessary to go to the media, the Obama administration has come down on them with unprecedented ferocity. Under Attorney General Eric Holder, the Justice Department has used the Espionage Act – a criminal statute meant for spies and traitors—three times as often as all previous administrations combined to prosecute disclosures of information to the media. Many of these cases involved the disclosure of government wrongdoing; all involved information of significant public interest. In no case did the defendant display any intent to harm national security, nor was any harm to national security alleged. Indeed, the Justice Department was forced to argue that neither the intent nor the effect of the disclosures had any relevance. Regardless of whether this is a sound reading of the law, it begs the question: why is this administration so intent on jailing well-intentioned individuals whose disclosures caused no provable harm, but only embarrassment to government officials?¶ • • •¶ Ultimately, the most important piece of information to keep in mind when reading the DNI's report is its author. No one who holds the office of DNI, and no one who heads any of the 17 intelligence agencies the DNI oversees, considers openness and the preservation of privacy to be among the agencies' core missions. (Indeed, the current director defended giving false testimony before the Senate intelligence committee on the ground that it was "the least untruthful" answer he could give.) Their job is to gather intelligence, an undertaking that is by nature secretive and invasive of privacy. This goal shapes the ethos that pervades the intelligence establishment.¶ The job of tempering the intelligence establishment's "collect it all" instinct falls to other governmental entities: the Privacy and Civil Liberties Oversight Board, the agencies' Inspectors General, the congressional intelligence committees. All of these entities are handicapped by the fact that they rely on the intelligence agencies to keep them informed, and they don't know what they don't know. Moreover, they are simply outgunned. The intelligence establishment includes seventeen agencies, some of which employ tens of thousands of people, and a declared budget of 70 billion dollars. The Privacy and Civil Liberties Oversight Board—the only independent government body whose sole mission is to ensure that counterterrorism policies respect privacy and civil liberties – has five members, thirteen staffers, and a budget of under $8 million.¶ The DNI and the agencies he oversees are thus left to focus on their mission, and they, of course, see no problem with this. The "nothing to see here" tone of the DNI's report is not an act; he is not concerned about our civil liberties. That is why we should be.

No solvency – the president has already decided he is not going to curtail surveillance, means all changes are just to appease the media

Frasse 14 -- Co-founder, partner, and editorial director (Michael Frasse, February 20, 2014, “Obama’s Orwellian surveillance reform,” http://www.farces.com/obamas-orwellian-surveillance-reform/), acui

Last Friday, President Barack Obama announced “reforms” for the US National Security Agency’s (NSA) surveillance programs that are little more than lipstick on a pig. Like putting Bondo on a car’s door panel so it can be painted up and look good but remain as structurally unsound as ever.¶ All of the usual corporate media sources seem to have conveniently “forgotten” that the Privacy and Civil Liberties Oversight Board (PCLOB) will publish its report into the NSA’s surveillance activities on 23 January 2014. That’s right friends and neighbors, that’d be after President Obama’s “reform” announcement. What’s especially interesting about the PCLOB recommendations is its considerable focus on the most controversial aspects of the NSA’s surveillance operations: Section 215 of the USA PATRIOT Act, Section 702 (.pdf; 1.4MB) of the Foreign Intelligence Surveillance Act (FISA) Amendments Act, and the Foreign Intelligence Surveillance Court (FISC).¶ But never mind, the president has already made his decisions.¶ And just what are those decisions?¶ 1. The NSA loses control of its telephone conversation metadata database¶ 2. US intelligence agencies are required to obtain court orders — except in cases of “true emergency” — to access the telephone conversation metadata and those database queries will be limited to two degrees of separation or hops¶ 3. Appointment of “outside panel of experts” to serve as public advocates in FISC cases¶ 4. Time limits on gag orders associated with national security letters¶ 5. Some rights extended to foreign citizens¶ 6. No more surveilling allied governments except in cases of “compelling national security interest”¶ After all of the revelations resulting from the secret documents leaked by Edward Snowden, that’s it? Five hand-waves, and a passing acknowledgement that legal surveillance might possibly maybe sometimes require a court order. Not a word — not one breath — about the most disturbing aspects of the US surveillance state:¶ 1. The NSA’s actions to weaken, break, and circumvent encryption¶ 2. The many other flavors of bulk surveillance than telephone conversation metadata¶ 3. The government’s resistance to purging stored information about US citizens¶ 4. Amnesty

for Snowden¶ 5. The lack of prior judicial review of national security letters¶ 6. Limiting the scope of national security letters¶ 7. And others¶ Here, see for yourself; speeches are speeches, presidential directives are executive orders equivalent to non-congressionally-vetted laws:

No solvency – some XOs can be secret allowing the president to stop following the executive order at any time

Newland 15 -- J.D. Candidate at Yale Law School (Erica Newland, April 2015, "Executive Orders in Court," http://www.yalelawjournal.org/note/executive-orders-in-court), acui

Part IV.A discussed how justiciability doctrine deprives the public of access to the courts to vindicate any interest in executive compliance with executive orders. This Part suggests that, in practice, executive orders subvert even the public's basic reliance interest in knowing the content of its government's laws. This is because the non-justiciability of many orders makes it possible for presidents to regularly waive,230 or even secretly modify, executive orders when such orders prove uncooperative.¶ For example, according to Senators Russ Feingold and Sheldon Whitehouse, an OLC memo issued under the George W. Bush Administration held that a President may "depart from the terms of a previous executive order" whenever he so desires because "an executive order cannot limit a President"231 —and this despite the fact that presidents are required, by statute, to publish executive orders in the Federal Register.232 Moreover, as Senators Feingold and Whitehouse explained, under OLC's interpretation, the President need not "change the executive order, or give notice that he's violating it, because by 'depart[ing] from the executive order,' the President 'has instead modified or waived it.'"233¶ As the Senators observed:¶ Now, no one disputes that a President can withdraw or revise an Executive Order at any time; that is every President's prerogative. But abrogating a published Executive order without any public notice works a secret change in the law. Worse, because the published Order stays on the books, it actively misleads Congress and the public as to what the law is.234 ¶

Links to Politics

Links to politics – everyone looks to the president and Congress deflects blame

Macey 6 -- Sam Harris Professor of Corporate Law, Securities Law, and Corporate Finance at

Yale Law School (Jonathan Macey, 2006, "Executive Branch Usurpation of Power: Corporations and Capital Markets," The Yale Law Journal, p.2442-3, http://www.yalelawjournal.org/pdf/110_wddcsum3.pdf), acui

This analysis sheds new light on Professor William Riker's seminal¶ observation that Congress's willingness to create administrative agencies and¶ the consequent rise of the administrative state can be explained by the fact that¶ the creation of such agencies enables Congress to deflect blame from itself for¶ bad or politically unpopular outcomes.119 When Congress acts directly, it must¶ accept the blame for its actions. When administrative agencies are created,¶ Congress can not only take the credit for acting decisively to address the issues¶ for which the agency is responsible, but can also deflect the blame if, later on,¶ the agency makes decisions and promulgates policies that prove to be¶ unpopular.¶ Presidents, however, tend to be blamed for administrative agency decisions¶ because such agencies are viewed as vehicles for diffusing presidential power to¶ a particularized level. It is widely known that Presidents are increasingly held¶ responsible for a wide variety of issues, from the state of the economy,120 to casualty rates in war,121 to the fallout from natural disasters like Hurricane¶ Katrina. It seems clear that, just as the executive has demonstrated a relentless¶ ability to act unilaterally, so too has the public demonstrated a concomitant¶ tendency to hold the President primarily responsible for all sorts of problems¶ that may not, in fact, really be within the President's control. This fact¶ probably provides an added incentive (if any was needed) for Presidents to¶ attempt to amass power. It stands to reason that if the President is being held¶ responsible for outcomes, he should at least have the power to influence those¶ outcomes.

Congress pushback against independent executive action

Weigel 14 – reporter for Bloomberg Politics (David Weigel, January 29, 2014, "The Tyranny of Barack Obama,"The Tyranny of Barack Obama," http://www.slate.com/articles/news_and_politics/politics/2014/01/republican_party_s_response_to_obama_state_of_the_union_gop_leaders_are.html), acui

More resonant warnings followed, from Republicans who had been characterizing all of Obama's actions—delays to the health care law, EPA rules, deferred action on certain deportations—as petty tyranny. "Dictatorships are often characterized by an abundance of laws," wrote Texas Sen. Ted Cruz in the Wall Street Journal. "When a president can pick and choose which laws to follow and which to ignore, he is no longer a president."¶ Kentucky Sen. Rand Paul weighed in, too, though his dark cloud concealed a rainbow. "I think it's disturbing," he said, "and I think the Supreme Court is going to rebuke him, in the near future, on the idea that he can go around Congress and decide when we're in session for recess appointments. I hope that that would chasten him, not embolden him."¶ A State of the Union isn't really an occasion for chastening, but the White House didn't go as far as conservatives feared. The president announced, for the second time in a day, an executive order that would raise the minimum wage for future federal contractors. "I intend to lead by example," he said. He planned to "direct the Treasury to create a new way for working Americans to start their own retirement savings" and "use my authority to protect more of our pristine federal lands." Twice, he sketched out a reform and said that it would work best "if Congress wants to help."¶ That was it, really, but it raised all the expected hackles. South Carolina Rep. Joe Wilson, who became famous when he yelped "you lie" during Obama's 2009 address, left the House chamber shaking his head. "I think it's just wrong," he said. "He calls on us to work together, then he threatens to act unilaterally? It just doesn't fit."¶

Perm

Perm increases solvency and key to future executive power

Johnsen 8 -- Walter W. Foskett Professor of Law at Indiana University Maurer School of Law, J.D. at Yale Law School (Dawn E. Johnsen, 2008, "WHAT'S A PRESIDENT TO DO? INTERPRETING THE CONSTITUTION IN THE WAKE OF BUSH ADMINISTRATION ABUSES," p. 396-7, https://www.bu.edu/law/central/jd/organizations/journals/bulr/documents/JOHNSEN.pdf), acui

Prominent commentators have speculated with some disagreement about the likely effects of the Bush presidency on the future strength of executive power. Their assessments underscore what is at stake. Professor Jack Goldsmith, who served as a high-ranking official in President Bush's Department of Justice, has written a valuable insider's account.3 Goldsmith concludes that the "harmful suspicion and mistrust" engendered by President Bush's unnecessary unilateralism – his attempts to exclude Congress and the courts – can be expected to diminish executive power.4 Goldsmith notes the irony of this prospect, given the administration's overriding goal of expanding presidential authority: It was said hundreds of times in the White House that the President and Vice President wanted to leave the presidency stronger than they found it. In fact they seemed to have achieved the opposite. They borrowed against the power of future presidencies – presidencies that, at least until the next attack, and probably even following one, will be viewed by Congress and the courts, whose assistance they need, with a harmful suspicion and mistrust because of the unnecessary unilateralism of the Bush years.5 Due to his support of both a relatively strong presidency and many of President Bush's policy objectives,6 Goldsmith laments the potential loss of some executive power even as he criticizes the Bush administration for egregious power grabs. Goldsmith maintains that President Bush would have been more successful and presidential authority more secure if, rather than repeatedly seeking to go-it-alone in secret, he had sought congressional support more often.7 To support this assessment, Goldsmith cites the Supreme Court's aggressive review of the administration's unilateral policies8 and Congress's general willingness to support those policies.9

Congress CP

Text: Congress should <plan>

Congress crucial to reform surveillance programs

Serwer 14 (Adam—reporter at msnbc, 1/30/14, "Surveillance reform is up to Congress", msnbc,

http://www.msnbc.com/msnbc/nsa-reform-congress-obama)

Republican lawmakers were less effusive. Michigan Republican Rep. Justin Amash, whose proposal to end the NSA's bulk collection program came within a handful of votes of passing the House last summer, said Obama had refused to "end the unconstitutional violation of Americans' privacy, stop the suspicionless surveillance of our people, and close the era of secret law," and he called on Congress to act. Congress was always going to be it with changes, or whether to reauthorize it at all," said Stephen Vladeck, a law professor at American University. "In that regard, the biggest takeaway from the speech is how little of a thumb the president is the most important player here. "Congress is going to have to decide whether to reauthorize [Section 215] in its current form, whether to reauthorize placing on that particular scale." Sensenbrenner, in his reaction to the speech, praised Obama's "good intentions" but emphasized that Congress must make significant changes–and not just to the metadata program, or but other significant surveillance authorities that the president's speech didn't address. "The bottom line is real reform cannot be done by presidential fiat," Sensenbrenner said in his statement. Democratic California Rep. Adam Schiff, who has also proposed legislation curtailing some of the NSA's powers, said it was "up to Congress to implement many of these changes, as well as others, and to ensure that they are durable across future Administrations."

Solvency—General—Filling in

Congress needed to steer surveillance programs—president inadequacy

James 14 (Frank, 1/17/14, “Congress Vows To Step Up To Surveillance Policy Challenge”, npr,

http://www.npr.org/sections/itsallpolitics/2014/01/17/263497478/congress-vows-to-step-up-to-surveillance-policy-challenge)

If there was a consensus emanating from Congress Friday after President Obama's NSA reform speech, it was — not surprisingly — that Congress itself has a major role to play in the ultimate fix. Whether from strong NSA supporters or agency critics, the reactions sounded similar: Congress intends to do much of the steering in the drive to overhaul the NSA's gathering of certain non-public information, especially consumer phone records, in the nation's counterterrorism efforts. Even so, if you listened closely, you could hear the sound of politics in some of the reaction. For instance, Speaker John Boehner issued a statement suggesting that much of the controversy over former NSA contractor Edward Snowden's revelations of the agency's spying practices was due to Obama's failures as a communicator. The Speaker warned the president against letting politics trump national security. "Because the president has failed to adequately explain the necessity of these programs, the privacy concerns of some Americans are understandable," Boehner's statement said. "When considering any reforms, however, keeping Americans safe must remain our top priority. When lives are stake, the president must not allow politics to cloud his judgment." Then there was Sen. Rand Paul, R-Ky., a fierce libertarian opponent of the NSA's current efforts. With a nod toward Obama's broken health care promise, he skewered the president on CNN immediately after the speech. "Well, what I think I heard was that if you like your privacy, you can keep it. But in the meantime, we're going to keep collecting your phone records, your emails, your text messages and likely, your credit card information." Much of the congressional reaction, however, lacked any noticeable partisan jabs. New York GOP Rep. Pete King, a member of the House Intelligence Committee and a national security hawk, tweeted after the speech: "Pres Obama NSA speech better than expected. Most programs left intact. But concerned about extending US citizen privacy rights to foreigners." What was clear was that some lawmakers expected that they — not the president — would ultimately have to resolve the NSA's controversial practices. "Essentially, the president was stronger on principle than he was on prescription," said Sen. Richard Blumenthal, D-Conn., in an interview with All Things Considered co-host Audie Cornish. "But Congress is going to have to fill in a lot of the blanks. Congress is going to have to resolve the question of whether this collection should continue and who is going to keep the data and resolve these issues and try to strike a balance, obviously."

Congress will continue to limit surveillance—evades the link to the terror DA
Cleveland 13 (8/6/13, "Congress can limit the scope of NSA domestic surveillance without impeding the agency's ability to keep listening to al-Qaida and its terrorist", Cleveland,
http://www.cleveland.com/opinion/index.ssf/2013/08/congress_can_limit_the_scope_o.html)

The revelation that high-level intercepts between the head of al-Qaida and a top lieutenant lay behind the U.S. decision to close nearly two dozen embassies underscores the critical importance of signals intelligence in keeping Americans safe. It was highly unusual to pick up such top-level communications but even more striking was the specificity, pointing to attacks on Sunday, and large scale of the plot, authorities said. Some officials characterized it as one of the most serious potential terrorist strikes since 9/11. Other Western countries also closed embassies. Still, however devastating this plot might have been, it was uncovered through foreign intelligence intercepts, not domestic vacuuming-up of metadata. Congress should not back off its attempts to limit such indiscriminate and poorly overseen domestic spying. A secret intelligence court should not be able to approve the widespread sweeping-up of telephone calls and other communications among ordinary Americans. Quite the contrary. The secret collection of such metadata without any apparent terrorist tie-in and without the ability of average Americans to learn of the data-gathering or to object to it is clearly beyond the intended powers of the Foreign Intelligence Surveillance Act court. U.S. Rep. Jim Sensenbrenner, a Wisconsin Republican who oversaw the drafting of the 2002 Patriot Act that set the stage for a widened FISA court role in intelligence gathering after 9/11, has said he will have legislation ready to rein in the court after Congress' August recess. Lawmakers should act on his bill swiftly. Limited, common-sense restrictions make sense and would not impede the critical intercepts that enabled authorities to unmask what appeared to be a serious plot against Western interests.

Solvency—General—Past bills

Congress shifting towards surveillance reforms—Freedom Act

Molinari 15—vice president for public policy at Google, was member of the US House of Representatives (Susan, 6/2/15, "Congress takes a significant step to reform government surveillance", Google Public Policy Blog,
http://googlepublicpolicy.blogspot.com/2015/06/congress-takes-significant-step-to.html)

In passing the USA Freedom Act, Congress has made a significant down payment on broader surveillance reform. Today marks the first time since its enactment in 1978 that the Foreign Intelligence Surveillance Act (FISA) has been amended in a way that reflects privacy rights enshrined in our history, tradition, and Constitution. While most of the focus has been on ending the bulk telephony metadata program under Section 215 of the PATRIOT Act, there are other meaningful reforms in the bill for Internet users. The USA Freedom Act shuts the door to the bulk collection of Internet metadata under a separate legal authority that the government relied upon in the past to collect Internet metadata in bulk. The USA Freedom Act additionally prevents bulk collection of Internet metadata through the issuance of National Security Letters. Not all of these legal authorities expired on June 1, and we are pleased that Congress took the initiative to prevent the bulk collection of Internet metadata under these legal authorities. Today's vote represents a critical first step toward restoring trust in the Internet, but it is only a first step. We look forward to working with Congress on further reforms in the near future.

Congress moving towards reforms—past bills and attitudes

Zeller 15—senior writer for CQ Weekly(Shawn, 4/14/15, "Congress' Surveillance Views Have Changed", Roll Call,
http://www.rollcall.com/news/congress_surveillance_views_have_changed-241173-1.html)

When Congress last reauthorized the Patriot Act in 2011, it went fairly easily. A majority of House Democrats objected, but support was strong among House Republicans and in both parties in the Senate. But lawmakers began to have second thoughts last year. First, in May, the House passed the USA Freedom Act with the aim of restricting the National Security Agency's collection of phone records. Last-minute changes, negotiated with the Obama administration, opened loopholes that caused privacy advocates, and many of the bill's co-sponsors, to balk. Still, the measure, sponsored by one of the principal authors of the Patriot Act, Republican Rep. Jim Sensenbrenner of Wisconsin, passed overwhelmingly and showed that attitudes about government surveillance have changed substantially in the Capitol. When the Senate considered a similar measure later in the year, it came two votes shy of cloture. But lawmakers approved an amendment to the annual House defense appropriations bill by Republican Thomas Massie of Kentucky and Democrat Zoe Lofgren of California that would have barred the NSA from sweeping up Americans' emails, Web-browsing data and online chats without a warrant. It was later removed when House leaders incorporated defense spending into the year-end omnibus

spending law. Massie last month introduced legislation with Democrat Mark Pocan of Wisconsin to repeal the Patriot Act.

Solvency—TSA

Congress has authority to reform and improve the TSA process

HST 14 (Homeland Security Today, "Legislation To Improve TSA Acquisition, Stakeholder Engagement Goes To Obama", December 10 2014, http://www.hstoday.us/briefings/grants-funding/single-article/legislation-to-improve-tsa-acquisition-stakeholder-engagement-goes-to-obama/8d5813ab8610974b252c9062f5301308.html))

The House Wednesday "overwhelmingly" passed Senate amendments to HR 2719 and HR 1204, bipartisan legislation to reform the Transportation Security Administration's (TSA) technology purchasing process and to improve stakeholder engagement with TSA. The House concurred with the Senate amendment to HR 2719, the Transportation Security Acquisition Reform Act, which was introduced by House Committee on Homeland Security Subcommittee on Transportation Security Chairman Richard Hudson (R-NC). The bill requires TSA to implement best practices and improve transparency with regard to technology acquisition programs. The House also concurred with the Senate amendment to HR 1204, the Aviation Security Stakeholder Participation Act, which was introduced by ranking House Homeland Security Committee member Bennie Thompson (D-Miss.). The bill ensures TSA maintains open lines of communication with relevant stakeholder groups through the Aviation Security Advisory Committee (ASAC). This legislation authorizes ASAC in law to ensure stakeholders are consulted and included in TSA's aviation security policy efforts, particularly when there are plans to change how aviation security is conducted," Thompson's office explained. "This bipartisan legislation ensures that all aviation security stakeholders, including labor organizations, airports, small business operators at airports and airlines have a permanent seat at the table when TSA is developing policies and procedures that directly impact their work and businesses," Thompson said. "I look forward to working with TSA to implementing this legislation once the President signs it." "These common sense bills will improve the way TSA spends taxpayer dollars and makes major policy decisions," said full committee chairman Michael McCaul (R-Texas). "By ensuring that private industry has a seat at the table and that TSA does not purchase new technologies without proper planning, oversight and accountability, we can better safeguard our critical aviation sector, which remains a prime target for terrorists." "These important bills are common sense steps to increase transparency and accountability at TSA while keeping travelers safe and saving taxpayer dollars," Hudson added, saying, "Despite Washington's gridlock, the bipartisan passage of today's bills show that Republicans and Democrats can work together to solve problems for the common good."

Solvency—Sox

Congress should repeal the Sarbanes-Oxley Act

Niskanen 6—economist and Cato Institute chairman (William A., 8/2/06, "Congress Should Repeal the Sarbanes-Oxley Act", Cato Institute,

http://www.cato.org/publications/commentary/congress-should-repeal-sarbanesoxley-act)

All too often, as with the hurried passage of the Sarbanes-Oxley Act of 2002 (SOA), it seems more important for government officials to be seen to address some problem of popular concern than to be held responsible over time for resolving the problem. As if to demonstrate this point, Senator Paul Sarbanes (D-MD) and Representative Michael Oxley (R-OH) have announced their resignation from Congress at the end of this term. In the concluding chapter of After Enron: Lessons for Public Policy, I wrote (in 2004) that "The SOA was the most important political response to the collapse of Enron and several other large corporations. My own evaluation of this act is much like that of (a colleague), who described the SOA as "unnecessary, harmful, and inadequate." Unnecessary – because the stock exchanges had already implemented most of the SOA changes in the rules of corporate governance in their new listing standards; the Securities and Exchange Commission (SEC) had full authority to approve and enforce accounting standards, the requirement that CEOs certify the financial statements of their firms, and the rules for corporate disclosure; and the Department of Justice had ample authority to prosecute executives for securities fraud. The expensive new Public Company Accounting Oversight Board (PCAOB) is especially unnecessary. Its role is to regulate the few remaining independent public auditors, but it has no regulatory authority beyond that already granted to the SEC. Moreover, the audit firms still have a potential conflict of interest, because they are selected by and paid by the public corporations that they audit … The PCAOB may also be unconstitutional, because it is a private monopoly that has been granted both regulatory and taxing authority. Harmful – because the SOA substantially increases the risks of serving as a corporate officer or director, the premiums for directors and officers liability insurance, and the incentives, primarily for foreign and small firms, not to list their stock on an American exchange. The ban on loans to corporate officers eliminates one of the most efficient instruments of executive compensation. And the SOA may also reduce the incentive of corporate executives and directors to seek legal advice. Inadequate – because the SOA failed to identify and correct the major problems of accounting, auditing, taxation, and corporate governance that have invited corporate malfeasance and increased the probability of bankruptcy. What to do? At a minimum, Congress should clarify that the criminal penalties in the SOA require proof of malign intent and personal responsibility for some illegal act … Any potential SOA cleanup legislation should address the potential problems of delisting by foreign and small firms from the American stock exchanges, maybe by exempting such firms from the regulatory requirements … A wise Congress would also eliminate the expensive new and wholly unnecessary PCAOB, preferably before it establishes new precedents and creates some new special interest … A Congress that is both wise and brave would repeal the SOA – lock, stock, and barrel. The SOA adds no necessary authority to those previously granted, creates the potential for substantial harm, and does not address the major policies that lead to problems in the U.S. corporate economy."

AT: Gridlock

Congress can overcome gridlock—common policy negotiating ground
Curry 13—assistant professor in the Department of Political Science at the University of Utah(James M., 2013, "BRINKMANSHIP POLITICS IN CONGRESS: OVERCOMING GRIDLOCK IN TIMES OF POLARIZED PARTIES", University of Utah,
http://poseidon01.ssrn.com/delivery.php?ID=318115065115116123004070069006031087017069064045069066075089114069073013022121124018022103030104056120001029117083081003115081117022094008013004030019103125112001112065073085001075009016002119011094087089107070097090015109116107126030019104029090066&EXT=pdf&TYPE=2)

These studies differ in their approaches to the legislative process, but their conclusions are in a similar vein. Taken together they suggest that, first, because the design of our political system requires agreement across legislative chambers and governmental branches, and because rules of the Senate require a supermajority to overcome minority obstructionism, policy change usually requires large, bipartisan coalitions of support. Second, and relating to the first conclusion, party polarization makes the formation of these large coalitions more difficult because there will be fewer policies on which the parties are in agreement. The conclusions these studies draw are important to our systematic understanding legislative productivity, but they have limitations. For one, these theories cannot explain why the parties sometimes do compromise when they are polarized and sharply divided on an issue. The theories referenced above largely imply that it will take a change in congressional membership, through an election, to alter the distribution of policy preferences and create opportunities for action. But Congress sometimes does reach compromises when previously deadlocked. For example, after months of deadlock over raising the Federal debt ceiling in 2011, Congress agreed in bipartisan fashion to raise the debt ceiling while reducing Federal deficits by $917 billion—a deal that could not have been predicted just months earlier. Additionally, the studies above are limited by their presentation of political compromise on ideological terms. From this perspective, gridlock is overcome when negotiators can locate the policy space that will attract the support of enough lawmakers to obtain passage. But compromise is not solely about proposing legislation with the right ideological balance. Other factors, including partisan and political considerations, can influence lawmakers' decisions. For example, the behavior of lawmakers is influenced by the collective party interests, as lawmakers work to improve their party's image with the public, and denigrate the image of the other party (Lee 2009; Cox and McCubbins 2005). Party leaders can further encourage partisanship, even in the face of conflicting ideological or electoral interests, by rewarding party loyalty (and punishing disloyalty) with the distribution of select incentives (Cann 2008; Rohde 1991, 77-78; Cann and Sidman 2011), or by extracting promises from lawmakers to support specific policy proposals (King and Zeckhauser 2003). Consequently, lawmakers sometimes support a policy they might otherwise oppose to avoid causing their party a defeat on the floor. Generally, lawmakers are influenced by more than their policy preferences.

AT: 3 branches Key

All 3 branches prevent real reform—flawed system

Greenwald 13 (Glenn, 11/19/14, "CONGRESS IS IRRELEVANT ON MASS SURVEILLANCE. HERE'S WHAT MATTERS INSTEAD", The Intercept,

https://firstlook.org/theintercept/2014/11/19/irrelevance-u-s-congress-stopping-nsas-mass-surveillance/)

All of that illustrates what is, to me, the most important point from all of this: the last place one should look to impose limits on the powers of the U.S. government is . . . the U.S. government. Governments don't walk around trying to figure out how to limit their own power, and that's particularly true of empires. The entire system in D.C. is designed at its core to prevent real reform. This Congress is not going to enact anything resembling fundamental limits on the NSA's powers of mass surveillance. Even if it somehow did, this White House would never sign it. Even if all that miraculously happened, the fact that the U.S. intelligence community and National Security State operates with no limits and no oversight means they'd easily co-opt the entire reform process. That's what happened after the eavesdropping scandals of the mid-1970s led to the establishment of congressional intelligence committees and a special FISA "oversight" court—the committees were instantly captured by putting in charge supreme servants of the intelligence community like Senators Dianne Feinstein and Chambliss, and Congressmen Mike Rogers and "Dutch" Ruppersberger, while the court quickly became a rubber stamp with subservient judges who operate in total secrecy.

AT: Congress CP

Fails—General

Congress fails—laundry list

Bedix and Quirk 15—assistant professor of political science at Keene State College, Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia(William and Paul, Mar 2015, "Secrecy and negligence: How Congress lost control of domestic surveillance", Governance Studies,

http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf)

After the relatively balanced and cautious provisions of the 2001 PATRIOT Act, Congress virtually absented itself from substantive decision making on surveillance. It failed to conduct serious oversight of intelligence agencies, ignored government violations of law, and worked harder to preserve the secrecy of surveillance practices than to control them. Even after the Obama administration made the essential facts about phone and email surveillance available in classified briefings to all members, Congress mostly ignored the information and debated the reauthorizations on the basis of demonstrably false factual premises. Until the Snowden revelations, only a handful of well-briefed and conscientious legislators—too few to be effective in the legislative process—understood the full extent of domestic intelligence gathering. We describe and explain Congress's deliberative failure on phone and Internet surveillance policy. We show that along with a lack of consistent public concern for privacy, and the increasing tendency toward partisan gridlock, Congress's institutional methods for dealing with secret surveillance programs have undermined its capacity to deliberate and act effectively with respect to those programs. Although the current political environment is hardly conducive to addressing such problems, we discuss long-term goals for institutional reform to enhance this capacity. We see no easy or decisive institutional fix. But without some structural change, the prospects look dim for maintaining significant limitations on investigatory intrusion in an era of overwhelming concern for security.

Fails—Regulations

Congress won't make metadata regulatory policies—risks, lack of interest, exclusion

Bendix and Quirk 15 --assistant professor of political science at Keene State College, Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia (William, Paul, "Secrecy and negligence: How Congress lost control of domestic surveillance", Brookings Institute, March 2015, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pd)

By the time the PATRIOT Act came up for its second renewal in 2009, the executive branch had abandoned the strategy of secrecy and unilateralism on the metadata programs. Starting in 2007, after the dragnets had received court approval, the Bush administration provided full and regular disclosures to the Intelligence and Judiciary committees.27 Going further, the Obama administration made repeated efforts to provide all members of Congress, through secret briefings, with the essential information on the metadata programs.28 The reauthorization thus gave Congress the opportunity to respond to the vast executive branch expansion of phone and email surveillance. But Congress neither sought to reassert the privacy protections of the existing business-records provisions— forcing an end to the dragnet programs—nor attempted to establish legislative standards to regulate the collection and use of metadata. In effect, Congress surrendered control to the executive branch. Congress's passivity partly reflected the incentives of individual members to defer to the executive and avoid the security and political risks of imposing constraints on investigatory methods. But the restricted flow of information on secret intelligence capabilities and practices also contributed heavily. Most legislators did not attend classified briefings—some because they lacked interest in surveillance policy, others because they were intentionally excluded from meetings by congressional leaders. A few highly engaged members, mostly Democrats, made use of the executive briefings to become well informed. But these members could not speak publicly about the actual practice of bulk collection and, as a result, could not make an effective case for policy change. Meanwhile, leading members who wanted to protect the metadata program from legislative interference took advantage of the widespread ignorance to misrepresent business-records orders as narrowly-focused investigative tools. As the later reaction to the Snowden leaks made clear, most members remained serenely clueless about metadata collection. Congress in the end opted for two short-term extensions before reauthorizing the business-records provision, without change, until June 2015. The debates over renewal stretched over three years, from 2009 to 2011, giving the appearance of thorough deliberation. But that appearance was utterly false. While maintaining the secrecy of the metadata program, Congress failed to assess the security value of mass records seizures, to weigh the resulting harm to privacy interests, or to impose standards or requirements to minimize that harm.

No bills will go through congress—keeping of traditional surveillance methods

Siddiqui 13 (Sabrina, 6/28/13, "NSA Surveillance Prompts Several Bills But Little Action In Congress", Huffington Post, http://www.huffingtonpost.com/2013/06/28/nsa-bills_n_3516928.html)

Senate Majority Leader Harry Reid (D-Nev.) told reporters earlier this month that any legislation in response to the NSA surveillance must go through the Judiciary committee. Leahy's office was unable to provide information on if and when the bill might be marked up. Even then, Senate Majority Whip Dick

Durbin (D-Ill.) predicted the FISA declassification bill would be unlikely to pass Congress and even more unlikely to be signed into law by President Barack Obama. "I encourage this, though I think it is going to be ill-fated," Durbin said of the bill after its introduction. "I just don't see a freight train coming down the track." Part of the problem is that most members of Congress have shown little appetite to change the nature the surveillance methods. In an era of extreme partisanship that earned the legislative body its "Do-Nothing" label, the one issue bipartisan majorities seem to agree on is that the federal government can employ far-reaching measures in the name of national security. "It's not an issue of whether anyone cares or not," said Jim Manley, Reid's former top spokesman. "I think that the fact is, based on the intelligence briefings that they have received, that many members support the NSA programs because they honestly believe that the country faces some very real threats from individuals and organizations that want to do real damage to this country." The other roadblock to an NSA legislative fix is a combination of timing and the public's short attention span. The revelations preceded monumental Supreme Court rulings on gay marriage and the Voting Rights Act, and the passage of comprehensive immigration reform in the Senate. With formal federal charges issued against Snowden, discussions around the NSA are now focused on whether the contractor will be extradited or granted asylum by a sympathetic government.

Congress won't pass SSRA—Freedom Act

Washington Newsletter 13(11/23/13, "ACTION ALERT: Four Steps Congress Can Take to End the Endless Wars", Environmentalists Against War,

http://www.envirosagainstwar.org/know/read.php?Itemid=14291)

The Surveillance State Repeal Act was one of the earliest reform bills introduced after the Guardian revealed the NSA's mass collection of Americans' calling records in June 2013. The bill, put forth by Rep. Rush Holt, would completely repeal Section 215 of the Patriot Act (used to collect all of your calling records) and Section 702 of the FISA Amendments Act (used to collect content of Internet and phone communications on a massive scale). The bill had little prospect of being passed when first introduced, and will not be passed due to the House's vote on the altered USA Freedom Act.

Craig **TImberg** 6/25/**14** (worked for The Valley News and Concord Monitor, both in New Hampshire, before joining The Baltimore Sun in 1996 and the Post in 1998. He spent three years in Richmond covering Virginia politics and two years in D.C., covering the mayor and city council, before joining the Foreign Staff in 2004. After a stint as Johannesburg Bureau Chief, he became education editor in 2009 and deputy national security editor in 2011Supreme Court cellphone ruling hints at broader curbs on surveillance http://www.washingtonpost.com/business/technology/supreme-court-cellphone-ruling-hints-at-broader-curbs-on-surveillance/2014/06/25/2732b532-fc9b-11e3-8176-f2c941cf35f1_story.html BP)

The words "National Security Agency" appear nowhere in the Supreme Court's opinion Wednesday prohibiting cellphone searches without a warrant. But **the unanimous ruling makes clear that the nation's most important jurists are tuned in to the roiling debate about high-tech surveillance and concerned about government officials going too far.** In broad, passionate language — spiked with the occasional joke — the ruling by Chief Justice John G. Roberts Jr. asserts that the vast troves of information police can find in modern cellphones are no less worthy of constitutional protection than the private papers that Founding Fathers once kept locked in wooden file cabinets inside their homes. Roberts even chides the government for arguing that searching a cellphone is "materially indistinguishable" from searches of other items that can be seized at the scene of an arrest, such as a pack of cigarettes or a handwritten note. "That is like saying a ride on horseback is materially indistinguishable from a flight to the moon. Both are ways of getting from point A to point B, but little else justifies lumping them together," he wrote. **Such declarations, experts said, suggest a willingness to reconsider legal rulings long used to justify modern surveillance tools. That includes some spying technologies that were unimaginable when courts first articulated those arguments but that now are routinely used by a range of government agencies, including the NSA, the FBI and many state and local police forces**. A footnote in Wednesday's ruling cautions against assuming too much about the court's views on data collection "under other circumstances." **But legal experts on both sides of the privacy debate took notice of the unanimity of the ruling and the uncommonly strong language Roberts used when describing the privacy risks in modern technologies. "It's just a big, forceful, bold decision," said Orin S. Kerr, a George Washington University law professor and former Justice Department lawyer specializing in technology issues. "If you're at the [American Civil Liberties Union], you're popping a champagne bottle. If you're at the FBI, you're scratching your head and thinking of what you're going to do next." Many observers date the Supreme Court's reconsideration of high-tech surveillance to the United States v. Jones decision in 2012, which ruled that police had trespassed**

when placing an electronic tracking device on a suspect's car. In applying a traditional constitutional protection to new technology, the court expressed concerns about the need to update the Fourth Amendment for the modern world. The ruling on cellphone searches, experts said, suggested that the court's consensus has grown on such issues over the past two years, a period in which the revelations made by former NSA contractor Edward Snowden have sparked international controversy over the privacy implications of high-tech government spying.

The Supreme Court controls public perception and the direction of the politics link—this is the best comparative evidence

Katerina LInos and Kimberly Twist 10/15/14 (Linos, Professor. UC Berkeley School of Law Twist, Ph.D. from the Travers Department of Political Science at the University of California, Berkeley "The Supreme Court, the Media, and Public Opinion: Comparing Experimental and Observational Methods" https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CB8QFjAA&url=http%3A%2F%2Fwww.law.uchicago.edu%2Ffiles%2Ffiles accessed 7/6/15 BP)

In turn**, public responses depend heavily on the interaction of the choices of the Court** and the media. **The Court can often avoid shifting national opinion by refusing to engage with a controversial case, and thus reduce the likelihood that most Americans will hear about the issue.** The media can also prevent a shift in opinion by giving their audiences both the Court majority's frame and powerful competing frames. **National opinion changes only when the Court and the media act in concert: when the Court rules on a controversial case, and the media decide to present their audiences with one-sided coverage of the decision**. Three research design innovations allow us to test our theory, and to build the literature on public opinion formation more generally. First, we surveyed a nationally representative sample of Americans shortly before and shortly after two major and surprising Court decisions on health care and immigration. **Prior studies of Court decisions in real-life settings have been based on survey questions fielded for other purposes, such as the General Social Survey. They thus share a major limitation: There is a very long time gap, often one or more years, between the "before" and the "after" sample, and events other than the Court decision could influence opinion in this interval** (Hoekstra 1995, 112).The scarcity of real-life data shortly before and shortly after major events is a more general limitation of public opinion research, because researchers cannot anticipate occurrences such as terrorist attacks, political scandals or natural disasters. The most extensive before-and-after research to date surrounds election campaigns, but often these studies report limited opinion move- meant, as surprising events may not occur in the intervals studied. **By combining our data with other poll data, we show both that an opinion shift occurred immediately after the Court decision, and that this shift persisted for many months, as no other actor or event was able to draw as much media attention to the issues as did the Court. Second, we combine public opinion data with detailed media coverage data, and connect individuals' opinion shifts with the content of television programs they watched. "Most published work on media effects does not include measures of media content**" (Barabas and

Jerit 2009, 74) and “most researchers fail to ascertain, let alone content-analyze, the media information that, they assume, their subjects encountered” (Graber 2004, 516). As a result, major propositions of public opinion theory, such as the claim that different frames lead to dfferent opinion shifts, have**. In turn, public responses depend heavily on the interaction of the choices of the Court and the media. The Court can often avoid shifting national opinion by refusing to engage with a controversial case, and thus reduce the likelihood that most Americans will hear about the issue. The media can also prevent a shift in opinion by giving their audiences both the Court majority’s frame and powerful competing frames. National opinion changes only when the Court and the media act in concert: when the Court rules on a controversial case, and the media decide to present their audiences with one-sided coverage of the decision**

(note if they ask about media involvement in this card in cx talk about how the court can shift the way it rules or on what grounds it rules to spur more or less media attention)

Generic Solvency

Surveillance curtailment can only occur outside of executive branch –(retag possible tyranny/separation of powers net ben along with circumvention arg)

Glenn Harlan **Reynolds** 2/10/**14** (is professor of law at the University of Tennessee and the author of The New School: How the Information Age Will Save American Education from Itself. "NSA spying undermines separation of powers: Column" http://www.usatoday.com/story/opinion/2014/02/10/nsa-spying-surveillance-congress-column/5340281/ accessed 7/1/15 BP)

As the Framers conceived it, our system of government is divided into three branches -- the executive, legislative and judicial -- **each of which is designed to serve as a check on the others**. If the president gets out of control, Congress can defund his efforts, or impeach him, and the judiciary can declare his acts unconstitutional. If Congress passes unconstitutional laws, the president can veto them, or refuse to enforce them, and the judiciary, again, can declare them invalid. If the judiciary gets carried away, the president can appoint new judges, and Congress can change the laws, or even impeach. **But if the federal government has broad domestic-spying powers, and if those are controlled by the executive branch without significant oversight, then the president has the power to snoop on political enemies, getting an advantage in countering their plans, and gathering material that can be used to blackmail or destroy them. With such power in the executive, the traditional role of the other branches as checks would be seriously undermined, and our system of government would veer toward** what James Madison in The Federalist No. 47 called "**the very definition of tyranny**," that is, "the accumulation of all powers, legislative, executive, and judiciary, in the same hands." That such widespread spying power exists, of course, doesn't prove that it has actually been abused. But **the temptation to make use of such a power for self-serving political ends is likely to be very great. And, given the secrecy surrounding such programs, outsiders might never know. In fact, given the compartmentalization that goes on in the intelligence world, almost everyone at the NSA might be acting properly, completely unaware that one small section is devoted to gather political intelligence.** We can hope, of course, that such abuses would leak out, but they might not. Rather than counting on leakers to protect us, we need strong structural controls that don't depend on people being heroically honest or unusually immune to political temptation, two characteristics not in oversupply among our political class. That means that the government shouldn't be able to spy on Americans without a warrant — a warrant that comes from a different branch of government, and requires probable cause. The government should also have to keep a clear record of who was spied on, and why, and of exactly who had access to the information once it was gathered. We need the kind of extensive audit trails for access to information that, as the Edward Snowden experience clearly illustrates, don't currently exist

Courts Solve surveillance—new legal precedent from gps and cellphones

Steven **Nelson** 7/3/**14** (reporter at U.S. News & World Report "Supreme Court Cellphone Ruling May Tilt NSA Fight" http://www.usnews.com/news/articles/2014/07/03/supreme-court-cellphone-ruling-may-tilt-nsa-fight accessed 7/1/15 BP)

The cellphone ruling referenced the court's 2012 U.S. v Jones decision, which prohibited warrantless GPS tracking. Surveillance foes hope the Jones ruling will guide a rebuke to the NSA's warehousing of

billions of phone records. “Historic location information is a standard feature on many smartphones and can reconstruct someone’s specific movements down to the minute, not only around town but also within a particular building,” Roberts wrote, quoting Justice Sonia Sotomayor’s concurring opinion in Jones that “GPS monitoring generates a precise, comprehensive record of a person’s public movements that reflects a wealth of detail about her familial, political, professional, religious and sexual associations.” Roberts also noted it’s not always clear if content is stored on the phone itself or on the digital cloud. Searching phone content that’s stored on remote servers is “like finding a key in a suspect’s pocket and arguing that it allowed law enforcement to unlock and search a house,” he wrote. Even low-tech flip-phones, he wrote, are protected from warrantless searches because such searches might identify information such as a suspect’s home address. [ALSO: White House Ignores Snowden Petition for Full Year] The NSA’s bulk collection of U.S. phone records – including numbers dialed, the duration and time of calls and location data – isn’t precisely analogous to the cellphone searches proscribed by the court. But Larry Klayman, a conservative legal activist challenging the NSA phone record collection, says the writing is on the wall. “It pretty much cements victory in our case,” he says. **Attorneys defending the NSA phone program lean heavily on the Supreme Court’s 1979 decision in Smith v. Maryland, which allows the warrantless acquisition of third-party-held phone metadata, over which that decision says phone customers lack a reasonable expectation of privacy. “Smith no longer applies, Smith was basically trashed,” Klayman says. “All of the government’s briefs are now null and void.” He expects that claim to be validated in future court rulings**. [MORE: New NSA Restrictions Pass House by Large Margin] Orin Kerr, a George Washington University law professor who specializes in the Fourth Amendment, disagrees with Klayman. “That's hilarious,” Kerr says. “No, Riley does not invalidate Smith. It has nothing to do with Smith.” Kerr says the cellphone ruling applies to different aspects of Fourth Amendment law than pending NSA cases, and that its possible impact is difficult to determine. Kurt Opsahl, an attorney who works on the Electronic Frontier Foundation's lawsuits against the NSA program, has a more nuanced, albeit upbeat, perspective. [READ: Intel Committee Senator Says 'Eric Schnowden' Is NSA Leaker] "**The Riley decision is good news for challenges to the phone record spying program," he says. "It rejected the government's expansive interpretation of Smith v. Maryland and the third-party doctrine, opens the door to ratcheting back the doctrine and shows that the court is deeply concerned with government intrusion into people's private lives, even if that information is outside the home**." Editorial cartoon on national security SEE PHOTOS Editorial Cartoons on the NSA Sen. Rand Paul, R-Ky., is also suing to end the program and released a statement after the cellphone ruling, saying: “**This decision has a direct bearing on what the NSA is doing. As our technology evolves, our Constitution endures.” Klayman won the first – and thus far only – federal court victory against the NSA program in December. District Judge Richard Leon found the “almost Orwellian” program “almost certainly” violates Americans’ Fourth Amendment rights. “When I read the [Riley] decision I was elated – it rubber stamps what Leon wrote,” Klayman says. “Their decision is pretty easy to write now, they are locked in by Riley.”**

Supreme Court decisions on electronic surveillance coming now –GPS and Cellphone searches mean new solvency

Andy Greenberg 7/1/14 (Andy Greenberg is a senior writer for WIRED, covering security, privacy, information freedom, and hacker culture “Why the Supreme Court May Finally Protect Your Privacy in the Cloud” http://www.wired.com/2014/06/why-the-supreme-court-may-finally-protect-your-privacy-in-the-cloud/ accessed 7/5/15) BP

When the **SUPREME COURT RULED yesterday in the case of Riley v. California , it definitively told the government to keep its warrantless fingers off your cell phone**. But as t**he full impact of that opinion has rippled through the privacy community, some SCOTUS-watchers say it could also signal a shift in how the Court sees the privacy of data in general**—not just when it's stored on your physical handset, but also when it's kept somewhere far more vulnerable: in the servers of faraway Internet and phone companies. In the Riley decision, which dealt with the post-arrest searches of an accused drug dealer in Boston and an alleged gang member in California, the court unanimously ruled that police need a warrant to search a suspect's phone. The 28-page opinion penned by Chief Justice John Roberts explicitly avoids addressing a larger question about what's known as the "third-party doctrine," the notion that any data kept by a third party such as Verizon, AT&T, Google or Microsoft is fair game for a warrantless search. But even so**, legal analysts reading between the opinion's lines say they see evidence that the court is shifting its view on that long-stewing issue for online privacy**. **The results, if they're right, could be future rulings from America's highest court that seriously restrict both law enforcement's and even the NSA's abilities to siphons Americans' data from the cloud. Digital Is Different The key realization in Roberts' ruling**, according to Open Technology Institute attorney Kevin Bankston, can be summarized as "digital is different." Modern phones generate a volume of private data that means they require greater protection than other non-digital sources of personal information. "Easy analogies of digital to traditional analog surveillance won't cut it," Bankston says.1 Daniel Solove, a law professor at George Washington Law School, echoes that sentiment in a blog post and points to this passage in the opinion: First, a cell phone collects in one place many distinct types of information—an address, a note, a prescription, a bank statement, a video—that reveal much more in combination than any isolated record. Second, a cell phone's capacity allows even just one type of information to convey far more than previously possible. The sum of an individual's private life can be reconstructed through a thousand photographs labeled with dates, locations, and descriptions. **That argument about the nature of digital collections of personal data seems to apply just as much to information held by a third party company** as it does to information held in the palm of an arrested person's hand. And Solove argues that could spell trouble for the third-party doctrine when it next comes before the Court. "The Court's reasoning in Riley suggests that perhaps the Court is finally recognizing that old physical considerations—location, size, etc.—are no longer as relevant in light of modern technology. What matters is the data involved and how much it reveals about a person's private life," he writes. "**If this is the larger principle the Court is recognizing today, then it strongly undermines some of the reasoning behind the third party doctrine**. The Court's opinion was careful not to make any overt reference to the third-party doctrine. In fact, it includes a tersely-worded footnote cautioning that the ruling's arguments about physical search of phones "do not implicate the question whether the collection or inspection of aggregated digital information amounts to a search under other circumstances." But **despite the Court's caveat, its central argument—that the notions of privacy applied to analog data are no longer sufficient to protect digital data from warrantless searches—doesn't limit itself to physical access to devices**. And the opinion seems to hint at the Court's thoughts on protecting one sort of remotely-stored phone data in particular: location data. The Logic of Location Data The Riley ruling cites an opinion written by Justice Sonia Sotomayor in the case of US vs. Jones, another landmark Supreme Court decision in 2012 that ended warrantless use of GPS devices to track criminal suspects' cars. GPS devices, Sotomayor wrote at the time, create "a precise, comprehensive record of a person's public movements that reflects a wealth of detail about her familial, political, professional, religious, and sexual associations." Roberts' reference to that opinion in Tuesday's ruling seems to acknowledge that the

sensitivity of GPS device data extends to phone location data too. And there's little logical reason to believe that phone data becomes less sensitive when it's stored by AT&T instead of in an iPhone's flash memory. **With Riley and Jones, "we've now seen two indications that the Supreme Court is rethinking privacy for stored data**," says Alex Abdo, a staff attorney at the American Civil Liberties Union. "Neither raises the question directly, but they both contain clues into the mindset of the court, and they both suggest that there's another victory for privacy in the waiting." "If I were to guess," Abdo adds, "I would predict that the Supreme Court will make good on its suggestion that the third-party doctrine doesn't make sense in the context of cloud storage." The ripples from Riley may extend to the NSA's surveillance practices, too. The ripples from Riley may extend to the NSA's surveillance practices, too, says Jennifer Granick, director of Civil Liberties at Stanford Law School's Center for Internet and Society. She points out that the NSA has used the same third-party doctrine arguments to justify its collection of Americans' phone data under section 215 of the Patriot Act. "What will this mean for the NSA's bulk collection of call detail records and other so-called 'metadata'?" she asks in a blog post. "The opinion suggests that when the Court has that question before it, the government's approach may not win the day.

SOX specific

***DON'T USE THE OTHER ONE**

Potential CP text : The United States Supreme should reverse the decision in Free Enterprise Fund and Beckstead and Watts v. PCAOB ruling that the Sarbanes-Oxley Act is unconstitutional

CP solves- theres legal precedent

Troutman Sanders 7/10/10 (is an international law firm with more than 600 attorneys located in North America and Asia. The firm is organized into over forty areas of legal practice within five sections: Business Law, Energy and Industry Regulation, Finance, Litigation and Real Estate "Supreme Court Upholds Constitutionality of the Sarbanes-Oxley Act of 2002" http://www.troutmansanders.com/supreme-court-upholds-constitutionality-of-the-sarbanes-oxley-act-of-2002-07-07-2010/ accessed 7/1/15 BP

On June 28, 2010, **the United State Supreme Court issued a 5-4 decision in Free Enterprise Fund and Beckstead and Watts, LLP v. Public Company Accounting Oversight Board and United States of America**. The Supreme Court held that a provision in the Sarbanes-Oxley Act of 2002 (the "Sarbanes-Oxley Act") requiring the Securities and Exchange Commission (the "SEC") to remove board members of the Public Company Accounting Oversight Board (the "PCAOB") only for "good cause" is unconstitutional and, as a result, invalid. **The Supreme Court, however, further held that this unconstitutional "for-cause" removal provision of the Sarbanes-Oxley Act is severable from its other provisions and, as a result, the remainder of the Sarbanes-Oxley Act remains in effect. The much anticipated ruling therefore did not result in the dramatic invalidation of the entire Sarbanes-Oxley Act, as some commentators had speculated might occur. Companies' obligations under the Sarbanes-Oxley Act instead remain unchanged**. The PCAOB is a private-sector, nonprofit corporation created by the Sarbanes-Oxley Act to oversee accounting professionals who provide audit reports for publicly traded companies. The PCAOB is composed of five board members appointed by the SEC. PCAOB board members may only be removed by the SEC before the end of a five-year term "for good cause shown," "in accordance with certain procedures." SEC Commissioners, in turn, may be removed by the President of the United States for "inefficiency, neglect of duty, or malfeasance in office." **The Supreme Court held that these dual "for-cause" removal restrictions violated the separation of powers principle of the United States Constitution**. In the past where **the Supreme Court has upheld limited removal restrictions on the President's removal power**, only one level of protected tenure separated the President from an officer exercising executive power. In such cases, the President, or an at-will subordinate of the President, would decide whether to remove the officer for cause. The unconstitutional "for-cause" removal provision in the Sarbanes-Oxley Act protects PCAOB board members from removal except for good cause, but also removes the President from all decisions on whether that good cause exists. The decision relating to whether good cause exists is made by SEC Commissioners who are not subject to the President's direct control. The effect of this dual "for-cause" removal regime is that the President "cannot hold the [SEC] fully accountable for the [PCAOB]'s conduct, to the same extent that he may hold the [SEC] accountable for everything else that it does." **The Supreme Court further held that the unconstitutional "for-cause" removal provision of the Sarbanes-Oxley Act is severable from the remainder of the statute. As a result, other than the unconstitutional**

"for-cause" removal provision, the Sarbanes-Oxley Act remains "fully operative as a law." The removal of this provision leaves PCAOB board members removable at will by the SEC Commissioners and the President is separated from PCAOB board members "by only a single level of good-cause tenure." While the case has garnered attention as a result of the conjecture that the entire Sarbanes-Oxley Act would be invalidated by the Supreme Court, this decision ensures that the remainder of the Sarbanes-Oxley Act remains intact. Companies, therefore, are not relieved of their obligations under the Sarbanes-Oxley Act and the PCAOB continues as well

The Supreme court can curtail Sarbanes Oxley- empirics prove

Brent Kendall 2/25/15 (Kendall is a legal affairs reporter in the Washington bureau of The Wall Street Journal, where he covers the Justice Department, the Federal Trade Commission and the federal courts, including the Supreme Court. "Supreme Court Faults Use of Sarbanes-Oxley in Fisherman Case" http://www.wsj.com/articles/supreme-court-faults-use-of-sarbanes-oxley-law-in-fisherman-case-1424880168 accessed 7/7/15

WASHINGTON—**A divided U.S. Supreme Court on Wednesday curtailed the use of the Sarbanes-Oxley corporate governance law in cases** that aren't about corporate fraud, ruling it couldn't be used to prosecute a fisherman for destroying evidence he illegally harvested fish. **The decision is a setback for the government because the Justice Department increasingly has sought to use a Sarbanes-Oxley prohibition on evidence destruction in cases outside the corporate realm.** The ruling, for example, could have an immediate effect on the high-profile cases of two men charged with obstructing the investigation into alleged Boston Marathon bomber Dzhokhar Tsarnaev. A judge had postponed their sentencing until the Supreme Court ruled in the fisherman case. Arkady Bukh, a lawyer for Boston defendant Azamat Tazhayakov, said he was still studying the fisherman decision but likely would ask a judge to exonerate his client in light of the high court's ruling. A jury convicted Mr. Tazhayakov last year of a Sarbanes-Oxley violation for removing a backpack and other materials from Mr. Tsarnaev's College dorm room that were being sought by federal authorities. **A spokeswoman for the U.S. attorney's office in Massachusetts said prosecutors were studying the ruling and had no further comment**. MORE High Court Appears Ready to Allow Felon to Sell Gun Collection Supreme Court Receptive to Investors in 401(k) Case Supreme Court Faults Use of Sarbanes-Oxley Law in Fisherman Case No Second Chance for Supreme Court Litigant Who Disappeared Prosecutors in the fisherman case had charged John Yates with a Sarbanes-Oxley violation after a fish-and-wildlife officer boarded the fisherman's boat in 2007 and found Mr. Yates had kept 72 grouper that were under the minimum size limit for catch. He issued the Florida fisherman a civil citation and told Mr. Yates to bring the undersized fish back to port for further inspection. Prosecutors alleged Mr. Yates instead told his crew to throw the fish overboard and replace them with bigger fish. He was convicted in 2011 and sentenced to 30 days in jail. Wednesday's Supreme Court ruling splintered the justices and scrambled their traditional ideological lines. Four **justices, in an opinion by Justice Ruth Bader Ginsburg, said the 2002 Sarbanes-Oxley law, passed in the wake of accounting scandals at publicly traded companies, such as Enron Corp., bars the destruction of evidence, including business documents and records. It doesn't apply to a fisherman's alleged destruction of his catch, those justices said. Congress in Sarbanes-Oxley made it a crime to knowingly destroy or cover up "any record, document or tangible object**" with the intent to obstruct an investigation, with a maximum 20-year prison sentence. Justice Ginsburg conceded a fish is a tangible object, but she said reading the corporate law that broadly would be to cut it loose "from its financial-

fraud mooring." If the nation needs a broader "coverall" statute to prohibit evidence destruction, that is a decision best left to Congress, Justice Ginsburg wrote. Justice Samuel Alito didn't join that holding but provided a fifth vote, based on somewhat different legal reasoning, to toss Mr. Yates's Sarbanes-Oxley conviction. Chief Justice John Roberts and Justices Stephen Breyer and Sonia Sotomayor joined the opinion by Justice Ginsburg. A Justice Department spokesman in Washington didn't respond to requests for comment. The department had argued the Sarbanes-Oxley provision was an important tool for prosecutors because it closed loopholes in federal law on destruction of evidence. It said it had used the provision in cases prosecuting everything from the destruction of cocaine to the burning of a man killed by a police officer after Hurricane Katrina. Mr. Yates's lawyer, John Badalamenti, welcomed the ruling, saying the **Supreme Court made clear Sarbanes-Oxley is "intended to target big corporate white-collar coverups," not the destruction of any and all physical objects. Four justices— Elena Kagan, Antonin Scalia, Anthony Kennedy and Clarence Thomas—dissented from the ruling. They would have read the Sarbanes-Oxley evidence destruction provision more broadly to punish people who destroy any physical evidence to thwart a federal investigation.**

Drones

Supreme Court Solves Drones—Legal Precedent and Solvency Advocate
EPIC no date (EPIC is an independent non-profit research center in Washington, DC. EPIC works to protect privacy, freedom of expression, democratic values, and to promote the Public Voice in decisions concerning the future of the Internet. EPIC pursues a wide range of program activities including public education, litigation, and advocacy. EPIC routinely files amicus briefs in federal courts, pursues open government cases, defends consumer privacy, organizes conferences for NGOs, and speaks before Congress and judicial organizations about emerging privacy and civil liberties issues. EPIC works closely with a distinguished advisory board, with expertise in law, technology and public policy "State v. Davis" https://epic.org/amicus/drones/new-mexico/davis/default.html# accessed 7/1/15

The New Mexico Supreme Court has agreed to review a decision by the Court of Appeals in State v. Davis concerning the constitutionality of warrantless aerial surveillance. In Davis, the lower court reversed a denial of the defendant's motion to suppress evidence gathered after an Army National Guard helicopter was used to spot "vegetation" in his backyard and greenhouse. Specifically, the lower court held that the New Mexico Constitution does not permit warrantless aerial surveillance of an individual's home and curtilage.. EPIC seeks to preserve Fourth Amendment privacy protections **in light of the use of advanced surveillance technologies. State v. Davis** is especially significant and relevant to EPIC's mission **because of its potential impact on the use of increasingly sophisticated unmanned aerial surveillance technologies. As an expert on both constitutional privacy rights and advanced surveillance technologies**, EPIC is uniquely qualified to support the argument for aerial privacy protections. This case is also related to EPIC's prior work. EPIC frequently files amicus briefs in state and federal courts on important Fourth Amendment issues related to new technologies. Most recently, EPIC filed an amicus brief in Riley v. California, which was cited in the Court's majority opinion. EPIC argued in its brief that: (1) U.S. consumers are dependent on modern cell phones for a wide range of personal and business activity; (2) modern communications providers store sensitive personal information on remote servers, accessible to authorized users with cell phones, tablets, and other devices; and (3) law enforcement can easily mitigate the risk of cell phone data loss pending a judicial determination of probable cause. **The Supreme Court held in a unanimous decision that police must obtain a warrant to search a cell phone that is seized pursuant to a lawful arrest. The Court's decision in Riley emphasized the impact of new technologies on individual privacy interests**. EPIC also filed an amicus brief in Florida v. Harris, arguing that the use of advanced investigative techniques raises important new privacy considerations that should inform the Court's Fourth Amendment analysis. Specifically, EPIC's brief argued (1) that the government's burden of reliably establishing probable cause is essential to the preservation of electronic privacy; (2) that a probable cause finding under the Fourth Amendment should be based on reliable evidence; and (3) new investigative techniques should be used based on research, testing, and data indicating reliability. EPIC has also advocated strongly in favor of comprehensive privacy protections for the use of drones or unmanned aerial vehicles ("UAVs "). EPIC recently issued a new Spotlight on Surveillance report**, exploring the privacy and civil liberties**

implications of domestic drone use. Domestic use of drones by the government and private citizens has increased substantially over the past several years, yet it remains largely unregulated with not privacy restrictions at the federal level and only a patchwork of laws at the state and local levels. EPIC notes that while the capacity to perform aerial surveillance is not new, the economics of aerial surveillance have changed dramatically. Low-cost drones, coupled with leaps in camera technology and cheap data storage, create the capacity for pervasive and indiscriminate surveillance. EPIC made a number of recommendations to further the goal of protection of privacy:

More Drones ev.

EPIC 5/25/15 (EPIC is an independent non-profit research center in Washington, DC. EPIC works to protect privacy, freedom of expression, democratic values, and to promote the Public Voice in decisions concerning the future of the Internet. The **US Supreme Court has held that individuals do not generally have Fourth Amendment rights with respect to aerial surveillance because of the ability that anyone might have to observe what could be viewed from the air**. Of course, **individuals do not operate drone vehicles with the capabilities of the US government. Also, some state courts have reached different conclusions about the privacy issues associated with aerial surveillance. In other cases where advanced technologies have allowed increasingly intrusive Government surveillance, courts have adjusted Fourth Amendment doctrine to account for the effect of technological change on the reasonable expectation of privacy**. In 2001, the Supreme Court ruled in Kyllo v. US that the use of a device that is not in "general public use" is a search even if it does not physically invade the home. In 2010, the D.C. Circuit Court required the Department of Homeland Security to undertake a new APA rulemaking when the Agency sought to implement Whole Body Imaging technology in the place of metal detectors as primary screening tools at U.S. airports. In 2012, the Supreme Court ruled in US v. Jones that the attachment of a GPS device to a car with the intent of gathering information was a "search" under the Fourth Amendment. The Jones decision marks a significant change from the previous doctrine, based on US v. Knotts, that an individual has no reasonable expectation of privacy in their location on public roads. **Drone surveillance also implicates public safety issues as the drones operate in airspace that may also be used by commercial and private aircraft**. For this reason**, federal agencies should regulate and control the proliferation of drone surveillance**

EPIC works closely with a distinguished advisory board, with expertise in law, technology and public policy "Clapper v. Amnesty Int'l USA" https://epic.org/amicus/fisa/clapper/ BP)

The question before the Supreme Court, whether the plaintiffs can establish standing to challenge a mass surveillance program, is critically important to protecting Fourth Amendment privacy rights. The government's foreign intelligence activities necessarily involve a great deal of secrecy, and mass surveillance under the FAA is not a transparent process. A failure to recognize plaintiff's legitimate fears that their communications are being intercepted, especially where plaintiffs regularly communicate with international clients and confidential sources, would effectively bar judicial review of FISA-authorized surveillance programs. **Proceedings in the FISA Court of Review are not adversarial, and it is nearly impossible to challenge its decisions. Notably, in In re Directives, the FISA Court of Review recognized a foreign intelligence surveillance exception to the Fourth Amendment. Without an individual's right to challenge unlawful government action in Article III courts, important civil and constitutional rights may never be vindicated. The Supreme Court's Decision The Supreme Court ruled on February 26, 2013 that a constitutional challenge to the Foreign Intelligence Surveillance Act cannot go forward. The Court stated that the Respondents had not presented sufficient proof to establish standing to sue the federal government. In a divided 5-4 decision**, Justice Alito wrote that the group's alleged injuries were too speculative to be considered. The majority said that the group could not prove, with "certainly impending" likelihood, that the government has intercepted or would intercept their communications. The Court said that the group's expenditures and attempts to avoid government surveillance are also not sufficient to get their case heard in court. Chief Justice Roberts and Justices Scalia, Kennedy, and Thomas also signed on to the majority opinion.

Privacy

The Courts are the best at defending rights to privacy.

Doug Linder 2015 (Professor Linder is a recipient of the Elmer P. Pierson Teaching Award (twice, most recently in 2003) for his teaching at umkc law school, received his J.D. from Stanford Law School.
http://law2.umkc.edu/faculty/projects/ftrials/conlaw/rightofprivacy.html accessed 7/7/15 BP

The U. S. Constitution contains no express right to privacy. **The Bill of Rights, however, reflects the concern of James Madison and other framers for protecting specific aspects of privacy**, such as the privacy of beliefs **(1st** Amendment), privacy of the home against demands that it be used to house soldiers (**3rd** Amendment), privacy of the person and possessions as against unreasonable searches (**4th** Amendment), and the **5th** Amendment's privilege against self-incrimination, which provides protection for the privacy of personal information. In addition, the Ninth Amendment states that the "enumeration of certain rights" in the Bill of Rights "shall not be construed to deny or disparage other rights retained by the people." The meaning of the Ninth Amendment is elusive, but some persons (including Justice Goldberg in his Griswold concurrence) have interpreted the **Ninth Amendment as justification for broadly reading the Bill of Rights to protect privacy** in ways not specifically provided in the first eight amendments. The question of whether the Constitution protects privacy in ways not expressly provided in the Bill of Rights is controversial. Many originalists, including most famously Judge Robert Bork in his ill-fated Supreme Court confirmation hearings, have argued that no such general right of privacy exists. **The Supreme Court, however, beginning as early as 1923 and continuing through its recent decisions, has broadly read the "liberty" guarantee of the Fourteenth Amendment to guarantee a fairly broad right of privacy that has come to encompass decisions about child rearing, procreation, marriage**, and termination of medical treatment. Polls show most Americans support this broader reading of the Constitution. The Supreme Court, in two decisions in the 1920s, read the Fourteenth Amendment's liberty clause to prohibit states from interfering with the private decisions of educators and parents to shape the education of children. In **Meyer v Nebraska** (1923), the Supreme Court struck down a state law that prohibited the teaching of German and other foreign languages to children until the ninth grade. The state argued that foreign languages could lead to inculcating in students "ideas and sentiments foreign to the best interests of this country." The Court, however, in a 7 to 2 decision written by Justice McReynolds concluded that the state failed to show a compelling need to infringe upon the rights of parents and teachers to decide what course of education is best for young students. Justice McReynolds wrote: "While this court has not attempted to define with exactness the liberty thus guaranteed, the term has received much consideration and some of the included things have been definitely stated. Without doubt, it denotes not merely freedom from bodily restraint but also the right of the individual to contract, to engage in any of the common occupations of life, to acquire useful knowledge, to marry, establish a home and bring up children, to worship God according to the dictates of his own conscience, and generally to enjoy those privileges long recognized at common law as essential to the orderly pursuit of happiness by free men." Two years late, in **Pierce v Society of Sisters**, the Court applied the principles of Meyer to strike down an Oregon law that **compelled all children to attend public schools, a law that would have effectively closed all parochial schools in the state**. **The**

privacy doctrine of the 1920s gained renewed life in the Warren Court of the 1960s when, in Griswold v Connecticut (1965), the Court struck down a state law prohibiting the possession, sale, and distribution of contraceptives to married couples. Different justifications were offered for the conclusion, ranging from Court's opinion **by Justice Douglas that saw the "penumbras" and "emanations" of various Bill of Rights guarantees as creating "a zone of privacy," to Justice Goldberg's partial reliance on the Ninth Amendment's reference to "other rights retained by the people," to Justice Harlan's decision arguing that the Fourteenth Amendment's liberty clause forbade the state from engaging in conduct** (such as search of marital bedrooms for evidence of illicit contraceptives) that was inconsistent with a government based "on the concept of ordered liberty." In 1969, **the Court unanimously concluded that the right of privacy protected an individual's right to possess and view pornography** (including pornography that might be the basis for a criminal prosecution against its manufacturer or distributor) in his own home. Drawing support for the Court's decision from both the First and Fourth Amendments, Justice Marshall wrote **in Stanley v Georgia**: "Whatever may be the justifications for other statutes regulating obscenity, we do not think they reach into the privacy of one's own home. If the First Amendment means anything, it means that a State has no business telling a man, sitting alone in his own house, what books he may read or what films he may watch. Our whole constitutional heritage rebels at the thought of giving government the power to control men's minds." **The Burger Court extended the right of privacy to include a woman's right to have an abortion in Roe v Wade** (1972), but thereafter resisted several invitations to expand the right. Kelley v Johnson (1976), in which the Court upheld a grooming regulation for police officers, illustrates the trend toward limiting the scope of the "zone of privacy." (The Court left open, however, the question of whether government could apply a grooming law to members of the general public, who it assumed would have some sort of liberty interest in matters of personal appearance.) Some state courts, however, were not so reluctant about pushing the zone of privacy to new frontiers. The Alaska Supreme Court went as far in the direction of protecting privacy rights as any state. In Ravin v State (1975), drawing on cases such as Stanley and Griswold but also basing its decision on the more generous protection of the Alaska Constitution's privacy protections, the Alaska Supreme Court found constitutional protection for the right of a citizen to possess and use small quantities of marijuana in his own home. The Supreme Court said in the 1977 case of **Moore v. East Cleveland** that "the Constitution protects the sanctity of the family precisely because the institution of the family is deeply rooted in the Nation's history and tradition." **Moore found privacy protection** for an extended family's choice of living arrangements, striking down a housing ordinance that prohibited a grandmother from living together with her two grandsons. Writing for the Court, Justice Powell said, "The choice of relatives in this degree of kinship to live together may not lightly be denied by the state." In more recent decades, the Court recognized in **Cruzan v Missouri Department of Health** (1990) that individuals have a liberty interest that includes the right to make decisions to terminate life-prolonging medical treatments (although the Court accepted that states can impose certain conditions on the exercise of that right). In 2003, in **Lawrence v Texas, the Supreme Court**, overruling an earlier decision, found that **Texas violated the liberty clause of two gay men when it enforced against them a state law prohibiting homosexual sodomy**. Writing for the Court in Lawrence, Justice Kennedy reaffirmed in broad terms the Constitution's protection for privacy: "**These matters, involving the most intimate and personal choices a person may make in a lifetime, choices central to personal dignity and autonomy, are central to the liberty protected by the Fourteenth Amendment**. At the heart of liberty is the right to define one's own concept of existence, of meaning, of the universe, and of the mystery of human life....The petitioners are entitled to respect for

their private lives. The State cannot demean their existence or control their destiny by making their private sexual conduct a crime. Their right to liberty under the Due Process Clause gives them the full right to engage in their conduct without intervention of the government. 'It is a promise of the Constitution that there is a realm of personal liberty which the government may not enter.'" One question that the Court has wrestled with through its privacy decisions is how strong of an interest states must demonstrate to overcome claims by individuals that they have invaded a protected liberty interest. Earlier decisions such as **Griswold and Roe suggested that states must show a compelling interest and narrowly tailored means when they have burdened fundamental privacy rights, but later cases such as Cruzan and Lawrence have suggested the burden on states is not so high. The future of privacy protection remains an open question.** Justices Scalia and Thomas, for example, are not inclined to protect privacy beyond those cases raising claims based on specific Bill of Rights guarantees. The public, however, wants a Constitution that fills privacy gaps and prevents an overreaching Congress from telling the American people who they must marry, how many children they can have, or when they must go to bed. **The best bet is that the Court will continue to recognize protection for a general right of privacy.**

The Supreme Court solves Snowden proves theres precedent.

DJ Pangburn 12/27/**13** (Editor, Death and Taxes, and contributor at VICE "After Federal Judge Ruled NSA Surveillance Legal, Will the Supreme Court Follow Suit?" http://motherboard.vice.com/blog/a-federal-judge-ruled-nsa-surveillance-legal-will-the-supreme-court-follow-suit BP)

this morning, **US District Judge Willaum Pauley ruled that the National Security Agency's dragnet phone surveillance is legal—just weeks after US District Court Judge Richard Leon ruled the NSA program was unconstitutional**. According to the Associated Press, Judge Pauley determined the September 11 terrorist attacks might have been prevented if bulk telephone data mining had been in place. In ruling that mass surveillance is legal, **Pauley dismissed an ACLU lawsuit that argued the government's interpretation of the Patriot Act's powers was far too broad to justify the mass data mining of Americans' electronic communications**. "The government learned from its mistake and adapted to confront a new enemy: a terror network capable of orchestrating attacks across the world," wrote Pauley. "It launched a number of counter-measures, including a bulk telephony metadata collection program—a wide net that could find and isolate gossamer contacts among suspected terrorists in an ocean of seemingly disconnected data." **Could this be a preview of how the Supreme Court might rule on the surveillance question? Judge Leon's decision, while encouraging to many observers, feels like a judicial anomaly. More often than not, courts favor the US intelligence complex. There is little reason to believe the Supreme Court's ideologically conservative majority would suddenly reverse course on surveillance**.

Patriot Act/SSRA

CP text: the SCOTUS should reverse the decision in Holder v. Humanitarian law on the grounds that the patriot act is unconstitutional

CP solves the Court has authority over the patriot act

Warren Richey 6/21/10 (Staff writer for the Christian Science Monitor, " Supreme Court upholds controversial part of Patriot Act" http://www.csmonitor.com/USA/Justice/2010/0621/Supreme-Court-upholds-controversial-part-of-Patriot-Act accessed 7/6/15 BP)

WASHINGTON — **The US Supreme Court on Monday upheld the constitutionality of a federal law that makes it illegal to teach members of a foreign terrorist group how to use peaceful means to pursue political goals. The statute, outlawing the provision of "material support" to designated terrorist organizations, does not violate free-speech and free-association protections of the First Amendment, and it is not unconstitutionally vague, the majority justices declared. In a 6-to-3 decision, the high court said the law – part of the USA Patriot Act – is specific enough to provide would-be violators fair notice of when their conduct crosses the line into illegality**. The majority opinion, written by Chief Justice John Roberts, says that Congress intentionally wrote the statute with a broad sweep to outlaw material support to terror groups in any form, including assistance or expertise that might help nudge the group toward nonviolence. Chief Justice Roberts quoted a congressional finding in support of his broad reading of the statute: "[F]oreign organizations that engage in terrorist activity are so tainted by their criminal conduct that any contribution to such an organization facilitates that conduct." In a dissent, Justice Stephen Breyer said that the majority's broad reading of the statute raises "grave" doubt about its constitutionality. "... I would read the statute as criminalizing First-Amendment-protected pure speech and association only when the defendant knows or intends that those activities will assist the organization's unlawful terrorist actions," Justice Breyer wrote. For example, if an aviation expert gave advice that facilitated a hijacking, the expert could be prosecuted for his role in facilitating the hijacking, he said. But teaching leaders of a terror group how to petition the United Nations would not. Roberts said Congress and the executive branch have rejected this view. Support is fungible, he said: "Such support frees up other resources within the organization that may be put to violent ends." He added that diplomatic and legal assistance might help bolster the international image of a terror group that the US considers an enemy. "In the dissent's world, such training is all to the good. Congress and the Executive, however, have concluded that we live in a different world," Roberts said. The material-support law has been one of the most effective tools in the

government's effort to fight international terrorism. It is designed to isolate extremist groups that use wanton violence for political ends by cutting them off from all potential supporters. It is also designed to enable prosecutors to act preemptively to disrupt terror plots in the planning stages. **The law, broadly interpreted, will make it easier for prosecutors to win convictions against those suspected of helping international terror groups**. **Critics have attacked the statute as being so broadly worded that it renders illegal any assistance to a designated terror group – including independent statements of support of a particular group.** The majority opinion says that the First Amendment protects the right of individuals to publicly support – and even join – terror groups. But statements of support must be free of any coordination with terror-group members, the court said. The decision in Holder v. Humanitarian Law Project stems from a lawsuit filed on behalf of human rights activists who were working with members of the Kurdistan Workers' Party (PKK) and the Liberation Tigers of Tamil Eelam (LTTE). The PKK is an underground group seeking to establish an independent Kurdish state in southeastern Turkey. The LTTE wants to establish Tamil independence in Sri Lanka. Both groups have carried out terrorist attacks in support of their goals, and both have been designated as terrorist organizations on a US State Department list.

The Supreme court has the ultimate authority to rule the Patriot act is unconstituitonal

Andaleeb Khalil 2005 (Writing a Senior honors thesis at EMU "The Patriot Act and Its Infringment on Civil Liberties"
http://commons.emich.edu/cgi/viewcontent.cgi?article=1043&context=honors&sei-redir=1&referer=http%3A%2F%2Fwww.google.com%2Fcse%3Fcx%3D010627838012573663791%3Ako94ry4bv4s%26cof%3DFORID%3A1%26q%3D%2522Supreme%2BCourt%2522%2BAND%2B%2522SSRA%2522%26sa%3DSearch#search=%22Supreme%20Court%20SSRA%22 accessed 7/5/15 BP)

The Judicial Branch of Government and the Patriot Act 20 **The judicial branch of government doesn't really like to take cases they think to be as too controversial or political**. There are many cases in history that the Supreme Court didn't want to review but knew that if they didn't they would receive much negative reply from the other branches of government and from the people. However, **the Supreme Court is the most powerful in the Court system not only because they are the last court that people can petition to but also because they have discretionary jurisdiction**. The Supreme Court does not have to take all the cases that come to them. To get a case to the Supreme Court a person must simply apply for a writ of cert. and the writ must be granted by at least four justices on the Supreme Court (rule of four). On the same token however, the Court can't go out and pick and choose the cases that they want to review. The case does have to come to them. The Supreme Court sometimes decides not to review cases that they simply don't think it is in their

arena to review. I think this is the reason that there are barely any cases that have worked its way up to the Supreme Court that deals with the Patriot Act. The only cases that I seemed to come across that has to deal with the Patriot Act and the Supreme Court reviewing is cases that have to do with U.S. citizens (of Muslim or Arab descent) being tried in a military tribunal as an enemy combatant. An example of such is a case is Hamdi v. Rumsfeld which I've talked about earlier. **Final Evaluation Even if the Patriot Act was formulated to serve as a tool to prevent future terrorist activities, there are major sections in the Act that seem to infringe immensely on 21 the rights of individuals**. Evaluating major parts of the Act, I have shown that substantive rights under the Constitution seemed have been disregarded because of the cry of terrorism. When looking at such a complex issue one needs to simply conduct a balancing test to weigh out the costs and benefits of such an act. The benefits that the government seem to give for the Patriot Act is that it will act as a deterrent for terrorists who plan to plot another terrorist attack against the American people. This is when the costs start to play in. The more the government seeks to protect the American people, the more they seem to take away from our liberty. A core democratic value that America lives by is freedom and liberty. The Bill of Rights is specifically planted in the first part of the Constitution to prove that the rights of the people and freedom are what make a democracy. The government has previously intruded on the rights of Americans in other times of crises. Still however, there are parts in the Patriot Act that allows the government to do things that they never before have done. As the reporter that I quoted earlier said there are things that the government was doing that was unprecedented. More costs to the Patriot Act include the direct violations of the Constitution. Many sections of the Patriot Act go against numerous amendments. Also, something that isn't explicitly in the Constitution is the right to privacy. The Patriot Act shuts this down though as well. **Even though the Supreme Court in Griswald, determined that the right to privacy does exist in the Constitution, the Patriot Act completely disregards this**. Another major cost to the Patriot Act is that it undermines the notion of checks and balances. When one branch of 22 government is given immense power over the other, the threat of tyranny is taken into account. **The Patriot Act allows for the Executive to snoop in documents that they would normally not allow them to do without the check of the other branches of government. The checks and balances principle is another principle that makes the American government so distinct from others. With the Patriot Act threatening this all for the possible prevention of terrorism doesn't seem to be that much of a benefit to the people**. Of the cases I have discussed and read about, they barely have even cracked down on these terrorists that might plan out another attack. For ever person that is being caught as being a threat to our safety who actually turns out to be terrorists, millions of Americans rights are being infringed upon. The costs do outweigh the benefits with the Patriot Act. To me and to a number of other Americans who seem to agree that parts of

the Patriot Act is unconstitutional, the potential security of the government with the exchange of the people's privacy being gone, doesn't seem to be a good enough trade off**. It is the job of the Supreme Court and the judicial branch of government to ensure that the other branches of government are acting with accordance to the U.S. Constitution. The Supreme Court however doesn't seem to want to tackle this issue probably for political reasons**. They barely have granted writs of certs. to cases that involve the Patriot Act. How else could we amend such a statue that seems to trample all over our rights? I guess the American people need to elect better members of Congress so they might do away with such an act.

Courts Solve Cloud Computing

EPIC 1/28/**11** (EPIC is an independent non-profit research center in Washington, DC. EPIC works to protect privacy, freedom of expression, democratic values, and to promote the Public Voice in decisions concerning the future of the Internet. EPIC pursues a wide range of program activities including public education, litigation, and advocacy. EPIC routinely files amicus briefs in federal courts, pursues open government cases, defends consumer privacy, organizes conferences for NGOs, and speaks before Congress and judicial organizations about emerging privacy and civil liberties issues. EPIC works closely with a distinguished advisory board, with expertise in law, technology and public policy "Cloud Computing" https://epic.org/privacy/cloudcomputing/ accessed 7/2/15 BP

One of the biggest risks of storing data in the cloud is the possibility that this data will be accessed by unwanted third parties. While some cloud computing services encrypt user data when it is stored, others store data in clear text, leaving it especially vulnerable to a security breach. Data stored in the cloud might also be provided to marketers. For example, many email providers allow secondary advertising uses for e-mail communications. In recent studies, an overwhelming majority of Cloud Computing Services users expressed serious concern regarding the possibility that a Cloud Computing Services provider would disclose their data to others. According to a report by the Pew Internet and American Life Project, 90% of cloud application users say they would be very concerned if the company storing their data sold it to a third party. 80% of users say they would be very concerned if companies used their photos or other data in marketing campaigns and 68% say they would be very concerned if companies who provided these services analyzed their information and then displayed ads to them based on their actions. **Legal rights and regulatory authority for the protection of the privacy of cloud computing users are not well defined. Data stored in the cloud may be subject to less stringent legal protection than data stored on a personal computer. Under the Electronic Communications Privacy Act, data stored in the cloud may be subject to a lesser standard for law enforcement to gain access to it than if the data were stored on a personal computer. Moreover, the terms of service for cloud computing services often make clear that they will preserve and disclose information to law enforcement when served with legal process. Health information services that store user medical information may not be subject to the privacy protections of the Health Insurance Portability Protection Act. Even where it is clear that user data is protected, cloud computer service providers often limit their liability to the user as a condition of providing the service, leaving users with limited**

recourse should their data be exposed or lost. Storing data in the cloud means that access to that data is subject to the cloud computing service provider's terms. Often the terms of service allow the cloud computing service provider to terminate the service at any time. On the other hand, depending on the terms of service, deleting an account may not actually remove the stored data from the provider's servers. One might also imagine a data hostage scenario where it is vital that a user gain access to online information, but the data holder refuses that access without first receiving a payment or other compensation. In addition, there are serious concerns about the reliability of cloud computing services. As mentioned earlier, if the cloud computing service goes down or loses data, the users would have little legal recourse.

EPIC pursues a wide range of program activities including public education, litigation, and advocacy. EPIC routinely files amicus briefs in federal courts, pursues open government cases, defends consumer privacy, organizes conferences for NGOs, and speaks before Congress and judicial organizations about emerging privacy and civil liberties issues. EPIC works closely with a distinguished advisory board, with expertise in law, technology and public policy "Whole Body Imaging Technology and Body Scanners ("Backscatter" X-Ray and Millimeter Wave Screening)" https://epic.org/privacy/airtravel/backscatter/ accessed 7/2/15 BP

Public Opposes TSA Nude Body Scanners: **Following a court mandate that the Transportation Security Administration receive public comment on airport body scanners, the public overwhelmingly opposes invasive nude body scanners. The court mandate was in response to EPIC's lawsuit in EPIC v. DHS, where EPIC successfully challenged the TSA's unlawful deployment of airport body scanners**. The TSA will accept comments until June 24, 2013. The public has submitted almost 2,000 comments noting various problems with the scanners, including privacy violations, potential health risks, and the machine's inability to accurately detect threats. For more information, see EPIC: Comment on the TSA Nude Body Scanner Proposal, EPIC: Radiation Risks lawsuit, and EPIC: ATR lawsuit. (Apr. 23, 2013) EPIC Appeals FOIA Decisions Concerning Body Scanner Information**: EPIC has filed appeals in two Freedom of Information Act cases seeking documents related to airport body scanners from the Department of Homeland Security and the Transportation Security Administration. EPIC filed FOIA requests with the agencies seeking records related to radiation risks from body scanners and the threat detection software the machines use. The TSA is currently developing formal rules for the use of body scanners in response to a court order in one of EPIC's previous cases**. Body scanners allow routine digital strip searches of individuals who are not suspected of any crime. For more information, see EPIC: Radiation Risks lawsuit and EPIC: ATR lawsuit, and EPIC: Suspension of Body Scanner Program. (Apr. 16, 2013) TSA Broadens Use of 'Backscatter X-Ray' Machines That Conduct 'Virtual Strip Searches': **The Transportation Security Administration is expanding the use of "backscatter X-ray" systems for passenger screening. The $100,000 refrigerator-size machines use "backscatter" technology, which bounces low-radiation X-rays off of a passenger to produce photo-quality images of travelers as if they were undressed. Computer processing partially obscures the image that is available to operators. TSA states that the agency will delete the raw images, but there is no law or regulation that prevents the agency from saving the original, detailed images. Until there is such a prohibition, EPIC believes funding for the program should be suspended**. See EPIC's Spotlight on Surveillance and page on Backscatter X-ray. (October 11, 2007) Field Tests Begin in Arizona on Backscatter X-Ray Machines: An X-ray machine aimed at detecting weapons and explosives hidden on passengers is scheduled to make its debut Friday at Phoenix's Sky Harbor International Airport. The "backscatter" will be in operation at Security Checkpoint

B in Terminal 4. While any Terminal 4 ticketed passenger can pass through any checkpoint, the B concourse is primarily used by travelers on Tempe-based US Airways. (February 21, 2007) Phoenix Airport to Use 'Backscatter' X-Ray on Travelers: Sky Harbor International Airport here will test a new federal screening system that takes X-rays of passenger's bodies to detect concealed explosives and other weapons. The technology, called backscatter, has been around for several years but has not been widely used in the U.S. as an anti-terrorism tool because of privacy concerns. (December 1, 2006)

Courts Solve bodyscanners

David Kravits 7/15/11 (David Kravets is a WIRED senior staff writer "Court OKs Airport Body Scanners, Rejects Constitutional Challenge" http://www.wired.com/2011/07/court-approves-body-scanners/ accessed 7/7/15 BP)

A federal appeals court on Friday unanimously declined to block the government from using intrusive body scanners across airports nationwide, saying it is "not persuaded by any of the statutory or constitutional arguments" against them. **The U.S. Court of Appeals for the District of Columbia Circuit was deciding a constitutional and procedural challenge to the Advanced Imaging Technology "nude" body scanner**s, which began rolling out in 2007 and are deployed to at least 78 airports nationwide. **The E**lectronic **P**rivacy **I**nformation **C**enter **asked the court to block usage of the devices** — of which 500 more are to be rolled out this year — **on grounds that they are an unconstitutional privacy invasion**, ineffective and unhealthy to airline passengers. "The petitioners argue that using AIT for primary screening violates the Fourth Amendment because it is more invasive than is necessary to detect weapons or explosives," the appeals court noted. "As other circuits have held, and as **the Supreme Court has strongly suggested, screening passengers at an airport is an 'administrative search'** because the primary goal is not to determine whether any passenger has committed a crime but rather to protect the public from a terrorist attack." The court said that, whether an administrative search is unreasonable, is a balancing test on how much it intrudes upon an individual's privacy, and how much that intrusion is needed for the promotion of "legitimate" government interests. "That balance clearly favors the government here," the court ruled 3-0. The court added that an "AIT scanner, unlike a magnetometer, is capable of detecting, and therefore of deterring, attempts to carry aboard explosives in liquid powder form." The three-judge appellate panel did not address limited research suggesting that the machines might not detect explosives or even guns taped to a person's body. **However, the appellate court**, which is one stop from the Supreme Court**, said that the Transportation Security Administration breached federal law in 2009 when it formally adopted the airport scanners as the "primary" method of screening.** The judges said the TSA violated the Administrative Procedures Act for failing to have a 90-day public comment period, and ordered the agency to undertake one. Generally, under the APA, agency decisions must go through what is often termed a "notice and comment" period if their new rules would substantially affect the rights of the public — in this case air passengers. The Environmental Protection Agency often undertakes "notice and comment" periods for proposed pollution regulations. **The court did not penalize the TSA for its shortcomings. The TSA argued to the court in March that a public comment period would thwart the government's ability to respond to "ever-evolving threats.**"

AT: CP Links to Politics

SCOTUS takes flack for politically devicive issues –obamacare proves

Scott Greer 7/2/15 (Associate Director at the Daily Caller "The Supreme Court's Insufferable Weathervane" http://dailycaller.com/2015/07/02/anthony-kennedy-the-insufferable-weathervane/ accessed 7/6/15 BP)

Poor John Roberts: He just can't catch a break from conservatives. After voting to uphold Obamacare for the second time during his tenure last week, Roberts caught a lot of flak from the right. The chief justice even caught hell from the right on his bench, with Antonin Scalia opining that Roberts had made the health care initiative "SCOTUScare." Oddly enough, **all this rage at Roberts for Obamacare has seemingly distracted conservatives** from the supposed "swing vote" on the court — Anthony **Kennedy. In addition to joining Roberts in saving Obamacare, the supposedly conservative Kennedy authored two decisions — on same-sex marriage and housing discrimination claims respectively — that imposed the will of elite opinion on the rest of the countr**y. Maybe Roberts is getting the hate because he was sold as a true-blue conservative. But Kennedy was also sold that way when he was placed on the court in 1988 after the nomination of arch-conservative Robert Bork failed to pass the Senate in 1987. The Reagan appointee looked poised to bring judicial restraint and a respect for liberty when he was confirmed. However, for most of his career Kennedy has failed to do as promised, and he proved last week that he's the worst Supreme Court justice on the bench right now. Yes, the worst. **The out-and-out liberal justices like Ruth Bader Ginsburg and Stephen Breyer are not nearly as bad as Kennedy simply because they make decisions based on their own principles. On the other hand, Kennedy appears to be making decisions based more on the supposed popular consensus** — which happens to now align with the liberal jurisprudence of Ginsburg and Breyer. Not only that, but the legal weathervane tries to look like an intellectual heavyweight when his latest opinions are gooey, feel-good nonsense draped in the dour decor of legalese. Simply put, Kennedy has abandoned any pretense of principle in favor of etching his name on the so-called right side of history. Take his opinion on the case that legalized gay marriage in all 50 states. Kennedy argued that marriage is a "fundamental right" and, thus, he said it is necessary to grant an undefined "dignity" to gay individuals seeking the arrangement.

Supreme Court turns the direction of the link determines public perception on controversial issues—empircs prove

Joseph Ura 2/20/**14** (an Associate Professor, the Director of Undergraduate Studies, and Director of the American Politics Program in the Department of Political Science at Texas A&M, "In the long run, the Supreme Court leads public opinion on controversial issues" http://blogs.lse.ac.uk/usappblog/2014/02/20/in-the-long-run-the-supreme-court-leads-public-opinion-on-controversial-issues/ accessed 7/6/15 BP)

This perspective rests on the idea that **the Supreme Court can lead public opinion—an ideal with special appeal for mid-twentieth century progressives who hoped that the judicial action might catalyze broad social change.** These scholars envisioned the Court as a "republican schoolmaster" that could "transfer to the minds of the citizens the modes of thought lying behind legal language and the notions of right fundamental to the regime" or an "educational body" leading "a vital national seminar." **They argued that the moral force of the Supreme Court and American's deep loyalty to the Court and the Constitution for which it presumed to speak might "appeal to men's better natures" and remind them of their fundamental commitments to equality and equity "**which may have been forgotten in the moment's hue and cry." Despite these expectations, though, evidence of the Supreme Court's ability to shape Americans' political attitudes has been mixed. Franklin and Kosaki's seminal study of public responses to Roe v. Wade (1973), for example, found that public support for access to legal abortion to protect a mother's life and in cases of rape or probable birth defects increased from 1972 (prior to Roe) to 1973 (after the Court's abortion decision) while there was no significant change in the level of public support from 1972 to 1973 for legal abortion due to families' economic circumstances, a mother's marital status, or parents' desire to have no more children. **Subsequent studies examining year-over-year changes in attitudes about the death penalty and gay rights have similarly found uneven support for the idea that the Court pulls public opinion toward its position.** More broadly, in two separate studies, Marshall compares a total of forty-six pre-decision and post-decision polls (eighteen in the 1989 study and another twenty-eight in the 2008 study) asked in similar forms, though at substantially variable intervals, investigating public attitudes on issues before **the Court, finding that "poll shifts'" away from positions adopted by the Court happen as often as shifts toward the Court's positions. Despite its development over the last three decades, though, the literature on public responses to Supreme Court decisions is limited in two important ways. First, these prior studies tend to focus on the effects of individual cases on public attitudes. This approach prevents scholars from identifying effects associated with the accumulated influence of Supreme Court decisions**— either within or across issues. Second, **the literature emphasizes comparisons of public opinion shortly before and shortly after Supreme Court decisions**. This methodological choice has prevented scholars from identifying long-term dynamics that might follow from Supreme Court decisions. To overcome these obstacles and reconsider the Supreme Court's ability to influence American's hearts and minds, I borrow from research examining American's aggregate responses to policymaking in the elected branches of government and national economic conditions. I use data on the overall level of liberalism or conservatism in American public opinion since the mid-1950s developed by Jim Stimson at the University of North Carolina at Chapel Hill. This "**policy mood" data collapses scores of national survey questions into a single measure of the country's overall demand for greater or lesser policy liberalism. I use these data to estimate a model of the cumulative influence of Supreme Court decisions** on Americans' overall levels of

liberalism or conservatism. The particular statistical model I utilize also allows me to identify whether the Court influence public opinion in the short-run, the long-run, or both. The data show that public responses to important Supreme Court decisions are generally marked by a backlash in public opinion in the short-term that decays and is replaced by a long-run movement in public opinion toward the positions adopted by the Court. In other words, on average, there is negative reaction in public opinion against important decisions of the Supreme Court. However, these negative responses are relatively short lived. Over the long run, backlash against the Court's decisions tends to be replaced by significant movement toward positions taken by the Supreme Court. The key result of the study is that the Supreme Court generally leads public opinion in an important way—even if there is typically some initial pushback against its decisions in public opinion.

The public is overwhelmingly uniformed about the Supreme court

Meredith Dost 5/14/15 (Research Assistant at Pew Research Center for the People & the Press "Dim public awareness of Supreme Court as major rulings loom" http://www.pewresearch.org/fact-tank/2015/05/14/dim-public-awareness-of-supreme-court-as-major-rulings-loom/ accessed 7/3/15 BP)

In the next few weeks, the U.S. Supreme Court is expected to issue rulings that could potentially affect same-sex marriage, health care and capital punishment in the United States. Yet it remains an institution whose members – and even the facts about some of its most important decisions – are a mystery to many Americans. In Pew Research Center's most recent knowledge quiz, just 33% knew that there are three women on the Supreme Court – Justices Ruth Bader Ginsburg, Elena Kagan and Sonia Sotomayor. A higher percentage (39%) said that there are two women on the high court, while 14% said there is one and 4% said four. It was by far the lowest correct response percentage for any of the 12 questions in the quiz. **But lack of awareness about the Supreme Court's members is nothing new. In fact, Americans have fared no better when asked other questions about the court's members in recent years. An August 2013 survey included the names and photos of four justices – Ginsburg, Antonin Scalia, Anthony Kennedy and Clarence Thomas – and asked which one had most often been the court's "swing vote." Despite the fact that there had been several closely divided Supreme Court cases during the 2012-2013 term in which Kennedy's votes were often decisive, just 28% correctly identified him as the swing vote. Chief Justice John Roberts is also not well-known. In July 2012, shortly after Roberts cast the deciding vote upholding most of the Affordable Care Act, just 34% identified Roberts as chief justice from a list that included Stephen Breyer, Harry Reid and William Rehnquist. That was not much better than the 28% who identified Roberts from a similar list in 2010.**J

AT: Judicial Activism

Judicial Activism theory is false and inconsistent

Clark Neily and Dick M. Carpenter II 2011 (Clark Neily joined the Institute for Justice as a senior attorney in 2000. He litigates economic liberty, property rights, school choice; Dick M. Carpenter II, Ph.D. Director of Strategic Research at the intituite for justice "Government Unchecked: The False Problem of "Judicial Activism" and the Need for Judicial Engagement" http://www.ij.org/government-unchecked09/11 accessed 7/7/15 BP)

The past five decades have seen a relentless expansion in the size of government and a sharp increase in the num-ber of liberty-stifling laws and regulations at every level. Despite this explosion of political power, commentators and scholars of all ideological stripes appear to worry more about the supposed growth of judicial power. Those who decry so-called "judicial activism" complain that the Supreme Court too frequently strikes down the acts of elected rep-resentatives, infringes on the prerogatives of the executive branch or upends settled law by overturning its own precedents. This report puts those claims to the test with empirical data and concludes that we suffer not from rampant judicial activism, but rather from too little judicial engagement**. The Supreme Court rarely strikes down government enactments or overturns its own precedents—and this is consistently true over the past 50-plus years. The years examined in this report saw more than a million federal and state laws passed and more than 20,000 regulations adopted. Many of these restrain liberty in significant ways. Decades of the Supreme Court's abdicating its duty to enforce the Constitution have made this growth in the size and scope of government possible. More judicial "restraint" is not the answer. Judges engaging in meaningful review of constitutional claims and the facts behind them is the answer**.

Theories of Judicial Activism are tainted by right wing hypocrisy Their authors are from heritage and CATO

Carlos A. Ball 12/14/10 (Professor of Law, Rutgers University "Right-Wing Hypocrisy on "Judicial Activism" http://www.huffingtonpost.com/carlos-a-ball/rightwing-hypocrisy-on-ju_b_796344.html accessed 7/8/15 BP

Conservative politicians and commentators are celebrating the decision by a federal judge in Virginia striking down the recently enacted health insurance legislation. This means that in the next few days we will hear repeatedly from conservatives how a federal court has agreed with the law's critics that it constitutes an unwarranted federal takeover of health care in this country. **The one thing we will not hear from the ruling's supporters is the charge of "judicial activism." This is because conservatives only complain about judges striking down laws enacted by democratically elected representatives when those rulings are inconsistent with right-wing ideology**. It is possible to take issue with a judicial opinion interpreting the Constitution in two different ways. The first is to disagree with the legal reasoning adopted by the court. The main question in the cases challenging the health legislation is whether the Constitution authorizes congressional regulation of individuals who choose not to purchase health insurance. Although I believe that the Constitution does grant Congress the power to do so, I

recognize that reasonable people disagree on the correct answer to that legal question. The second way in which it is possible to take issue with a constitutional ruling is not to question its legal reasoning, but to argue instead that courts should not be involved in deciding the issue to begin with. At the heart of this second critique is the notion that it is illegitimate for unelected judges to decide matters that are best left to democratically elected officials. It is rare these days for liberals to question the legitimacy of courts deciding constitutional questions, though they (like others) frequently take issue with the reasoning behind particular judicial decisions. In stark contrast, **conservatives for the last several decades have astutely deployed the "judicial activism" charge to great political effect as a way of undermining the legitimacy of judicial rulings with which they disagree. That they have done so is ironic because recent studies show that it is conservative members of the Supreme Court who are more likely to strike down laws enacted by Congress than liberal ones**. Indeed**, there is no better example of judicial activism in recent memory than the ruling in Bush v. Gore**, the decision that handed the presidency to George W. Bush. It is very difficult for a lawyer, much less for someone who is not an attorney, to articulate the constitutional grounds relied upon by the five Supreme Court justices (all appointed by Republican Presidents) who ordered that Florida stop counting votes during the contested 2000 presidential election. And yet, to my knowledge, **no prominent conservative politician or commentator has ever criticized the Court for its interference with the democratic process in that case**. But when it comes to an issue such as same-sex marriage, for example, it is common for right-wingers to proclaim, usually with much indignation, that courts have no business interfering with the wishes of a majority of voters or of elected representatives. The difference between liberals and conservatives on the role of the courts, then, is not that only one side frequently seeks the help of judges in trying to render unenforceable laws approved through the democratic process. Instead, the difference is that **only right-wingers criticize their political opponents for doing so. A case such as the recent ruling by the federal court in Virginia on the health insurance legislation, whatever its constitutional merits, helps to expose right-wing hypocrisy on the issue of judicial activism**. Most right-wingers are not truly troubled by "judicial activism," so long as it is an activism aimed at promoting conservative ideology.

Judicial activism theory is wrong any court decision can be seen activist bringing this up in debate is what undermines the court This is a rhetoric DA to the affirmative

Thelton Henderson 2003 (Thelton Eugene Henderson is currently a federal judge in the Northern District of California. He has played an important role in the field of civil rights as a lawyer, educator, and jurist "Social Change, Judicial Activism, and the Public Interest Lawyer"
http://openscholarship.wustl.edu/cgi/viewcontent.cgi?article=1308&context=law_journal_law_policy&sei-redir=1&referer=http%3A%2F%2Fwww.google.com%2Fcse%3Fcx%3D010627838012573663791%3Ako94ry4bv4s%26cof%3DFORID%3A1%26q%3D%2522surveillance%2522%2BAND%2B%2522judicial%2Bactivism%2522%26sa%3DSearch#search=%22surveillance%20judicial%20activism%22 accessed 7/8/15 BP)

We need not debate the soundness or the wisdom of this jurisprudential trend to expand states' rights in order to understand the concerns of the civil rights community where, historically speaking, the term "states' rights" has been considered synonymous with racial segregation and Jim Crow laws that perpetuated second class citizenship for blacks in our southern states. **Further compounding this effect is the growing trend to label decisions upholding or expanding civil rights as the product of judicial activism**, with the pejorative implication that **such decisions represent an attempt by judges to improperly disregard legal precedent or to thwart "the will of the legislature" or "the will of the people**." Conversely, decisions that are consistent with a more politically conservative outlook are typically portrayed as products of judicial restraint. It seems to me, however, that the term 'judicial activism' ultimately depends upon whose ox is being gored, and not upon judicial, political, or social persuasion. **The truth is that the term 'judicial activism' is not a particularly coherent concept to begin with**. All judges are required to act in every case, **and every form of judicial action bears some social consequences, if only for the parties involved**. Thus, the claim that a judge who maintains the status quo is quiescent whereas a judge whose decisions modify the status quo is active seems to me to be a distinction without a difference. In reality, there are plenty of issues on a conservative agenda that would require active judging to implement, just as there are a host of liberal issues that will only hold firm if judges are restrained in approaching them. Indeed, the misleading nature of the judicial activism debate is made even more evident when one considers that it seems to be only invoked to describe decisions perceived as having a liberal bent. Washingt5. Alden sv. Maine, c527 rU.S. 706 (1999); College Sav. Bank v. Florida Prepaid PostseocnonUdnairvyeEr dituyc.O, 5p2e7n US .Sh.o6la66sh(i1p999); United States v. Morrison, 529 U.S. 598 (2000). **The true nature of the judicial activism debate can**, in my view, **be fairly easily and obviously exposed**, as was recently done by Professor William P. Marshall of the University of North Carolina.6 After comprehensively analyzing the decisions of the Supreme Court since 1995, Professor Marshall concluded that the current court is actually the most "activist" in our history.7 Among other things, he found that it has invalidated over twenty-six federal laws in the last six years.8 In striking contrast, he tells us that during the entire first 200 years following ratification of the constitution, the Supreme Court only struck down a grand total of 127 federal laws, an average of a little more than one law every two years.9 It has also been frequently observed that the recent line of Eleventh Amendment cases that I mentioned earlier10 represents one of the most dramatic departures from precedent in Supreme Court history. Indeed, Judge John T. Noonan, a former Boalt Hall Law School professor, and now a highly regarded member of the Ninth Circuit Court of Appeals, who also happens to be a Reagan appointee and who is usually considered a judicial conservative, made this point quite passionately in his recent book.11 In his extraordinary critique of the Supreme Court, Judge Noonan contends that the Supreme Court's recent expansion of the states' immunity from the reach of federal law is untethered from the Constitutional design, and "without justification of any kind,"12 thus threatening "intolerable injury to the enforcement of federal standards"13 and presenting a "danger to the exercise of democratic government."14 This is strong language indeed, especially from a federal judge who is supposed to take his marching orders from the Supreme Court. What reform or 6. William P. Marshall, Conservatives and the Seven Sins of Judicial Activism, 73 U. COLO. L. REV. 1217 (2002). 7. Id. at 1223. 8. Id. (citing Seth P. Waxman, Defending Congress, 79 N.C. L. REV. 1073, 1074 (2001)). 9. Id. 10. See supra note 5 and accompanying text. 11. JOHN T. NOONAN, NARROWING THE NATION'S POWER: THE SUPREME COURT SIDES WITH THE STATES (2002). 12. Id. at 154. 13. Id. at 155. 14. Id. at 140. improvement is more evidently needed than light on decisions that fail to carry out purposes set out by the Constitution itself. Unfortunately, however, **the persistent drumbeat of judicial activism may take a**

toll. While I would not expect that it would affect the outcome of any particular case, the persistent campaign against judicial activism inevitably contributes to the politicalization of the judiciary, especially at the federal level, which can only serve to undermine the overall independence of the judiciary and, in turn, the legitimacy and effectiveness of our courts as an institution. This, in turn, necessarily increases the challenge for the public interest lawyer who must rely upon a strong and independent judiciary to vindicate civil rights and implement its judgments. Of course, no discussion of the challenges facing public interest lawyers would be complete without addressing the very real obstacles to effectuating social change through civil rights litigation, obstacles that have been revealed all too clearly by the last 25 years of civil rights history in this country.

Judicial Activism DA

The Courts cannot access social change, Hobby Lobby proves.

Elias Isquith 7/5/14 (Elias Isquith is a staff writer at Salon, focusing on politics ""Something the Supreme Court is not supposed to do": Are Christians getting preferential treatment"
http://www.salon.com/2014/07/05/something_the_supreme_court_is_not_supposed_to_do_are_christians_getting_preferential_treatment/ accessed 7/7/15 BP)

yet **despite the Court's modern reputation as a bulwark against government overreach and a protector of civil rights** — a reputation earned largely due to the historic and epoch-defining work of the Warren Court — **there's an argument to be made that the reactionary rulings handed down by the Court on Monday were, in truth, quite in keeping with its historical role in American politics**. (During his heyday, for example, Thomas Jefferson was generally seen as a leader of those in American politics who we'd today call progressives; and he hated the idea of judicial review.) Hoping to further explore the Court's historically complicated relationship with social change and progress, Salon called up University of Pennsylvania Law School professor Kermit Roosevelt, author of "The Myth of Judicial Activism," to discuss Monday's rulings and the "inherently conservative" nature of the Court. Our conversation can be found below, and has been edited for clarity and length. First off, did anything about Monday's decisions surprise you? I would say disappointed more than surprised. I sort of saw them coming; I think a lot of people did. **You know, this is a pretty conservative Supreme Court and we're getting conservative decisions. Some folks who oppose the Hobby Lobby ruling have argued that it's a form of right-wing judicial activism**. Do you think that's a fair description? It depends on what you mean by "judicial activism." **So, if by judicial activism people mean designing cases based on political preferences rather than the law or the Constitution, I think that's not typically a helpful way to frame the issue because in a lot of these cases, the law really isn't clear and it's possible to have disagreements. And sometimes — probably most of the time — which position you take will depend on a broader judicial philosophy or a broader conception of the appropriate nature and relation of the state and the federal government or the federal government and the people or something like that. And that's just legitimate Constitutional interpretation**. Occasionally, you'll find justices taking positions that seem to advance a partisan preference and that are contrary to everything they've said about broader Constitutional issues and that really does look like a politically motivated decision. Bush v. Gore is a great example of that. There aren't really any other such striking examples. In Bush v. Gore, the conservative justices were suddenly very aggressive in enforcing an equal-protection claim — and that's what the case was based on — against the state, which is totally at odds with what they usually do in equal-protection cases. And the liberals were advocating restraint and respect for the states, which is also not what they typically do in equal-protection cases. So there it looks like that decision was driven by

partisan politics. Most of the time, I think, decisions can be understood in less partisan terms and it's better to try and understand them that way

Using the courts to activate change is bad- it undermines the court itself
Eilzabeth Slattery 6/13/13 (Elizabeth Slattery is a legal fellow in the Heritage Foundation's Edwin Meese III Center for Legal and Judicial Studies. She researches a variety of issues such as the rule of law "How to Spot Judicial Activism: Three Recent Examples" http://www.heritage.org/research/reports/2013/06/how-to-spot-judicial-activism-three-recent-examples accessed 7/7/15 BP)

Since the late 1930s, **the courts have gradually abandoned their proper and essential role under the Constitution to police the structural limits on government and neutrally interpret the laws and constitutional provisions without personal bias**. Many judges refuse to interpret the Constitution and statutes according to their original public meaning (or perhaps lack the understanding of how to do so).[2] Instead, they seek to impose their personal preferences. But a judge who looks beyond the text of the Constitution "looks inside himself and nowhere else."[3] While **the Supreme Court of the United States should interpret the laws and constitutional provisions according to their original public meaning**, the lower courts—and state courts when dealing with federal constitutional rights—are bound by the precedents of the Supreme Court. To the extent that a case presents an unresolved question, lower courts should likewise give effect to the original public meaning of the text before them. Although attempts to define "judicial activism" are often criticized as too broad, too partisan, or simply "devoid of content,"[4] a simple working definition is that judicial activism occurs when judges fail to apply the Constitution or laws impartially according to their original public meaning, regardless of the outcome, or do not follow binding precedent of a higher court and instead decide the case based on personal preference. The proper measure is not whether a judge votes to uphold or strike down a statute in any given case. Adhering to an original understanding of the law is the only way to consistently "minimize or eliminate the judge's biases."[5] At times, this means that judges must strike down laws that offend the Constitution. Some scholars mistakenly argue that judges engage in judicial activism whenever they strike down a law,[6] but judges' subjective policy preferences could just as easily lead them to uphold unconstitutional laws that they favor as to strike down ones that they oppose. In either situation, **judges abdicate their duty of fidelity to the law. Judicial activism is therefore not in the eye of the beholder. In applying the law as it is written, judges may reach conclusions that are** (or may be perceived to be) **bad policy** but are nonetheless correctly decided. Judges are charged not with deciding whether a law leads to good or bad results, but with whether it violates the Constitution and, if not, how it is properly construed and applied in a given case.[7] Labeling as "activist" a decision that fails to meet this standard expresses

not policy disagreement with the outcome of a case, but disagreement with the judge's conception of his or her role in our constitutional system. Judicial activism can take a number of different forms. These include importing foreign law to interpret **the U.S. Constitution, elevating policy considerations above the requirements of law, discovering new "rights" not found in the text, and bending the text of the Constitution or a law to comport with the judge's own sensibilities, to name just a few.[8] Rather than succumb to these temptations, judges should strive to put aside their personal views and policy preferences in order to maintain impartiality and render sound judgments according to the laws as written.**

Surveillance rulings uniquely link to the DA

Paul Mirengoff 12/17/13 (Paul Mirengoff is a retired attorney in Washington, D.C. He is a 1971 graduate of Dartmouth College and a 1974 graduate of Stanford Law School "The NSA, Privacy, and Judicial Activism" http://www.powerlineblog.com/archives/2013/12/the-nsa-privacy-and-judicial-activism.php accessed 7/8/15)

J**udge Leon's response to Smith is, in essence, that things have changed considerably since 1979** when that case was decided. **He cites the vast increase in the government's surveillance capacity and changes in people's phone usage** habits. But these changes provide no sound basis for distinguishing Smith. That case rests on the view that, because of the nature of metadata, its collection by the government without a warrant isn't constitutionally problematic. This true no matter the quantity of metadata the government collects. It's possible that the Supreme Court would decide that changed circumstances warrant limiting the holding of Smith. **The Court has seen fit to limit or dispense with other old decisions in the name of striking down certain government policies intended to protect the nation from terrorism. But this isn't something that district courts or courts of appeals are supposed to do**. John Yoo and Max Boot are right to condemn Judge Leon's decision on this basis**. It is an egregious example of judicial activism**. I also agree with Yoo that even the Supreme Court shouldn't reconceive the rules of search and seizure in light of new Internet technologies. As Yoo explains: [T]hat is **the responsibility of our elected representatives. Only they can determine what society's "reasonable expectation of privacy" is in Internet and telephone communications. Judges are the last people to fairly claim they have their fingers on the pulse of the American people**. **Only our elected representatives can properly balance existing privacy rights (if any), against the need for information to protect the nation from terrorist attack. Judges are far too insulated and lack the expertise to make effective judgments on national-security and foreign affairs. Unfortunately, judges — even district court judges — are too immodest and/or too power hungry to recognize this reality.**

Judicial restraint not activism is key to liberties means they cant solve Activism means a zero sum tradeoff with congressional powers

Sandhya Bathija 2/7/14 (campaign manager of Legal Progress at the Center for American Progress. Previously, she worked in the national communications department of the American Civil Liberties Union, where she led media and communications campaigns on the organization's federal policy work, with a specific focus on immigrant rights, voting rights, racial justice, and criminal justice. "Why Judicial Restraint Best Protects Our Rights"

T**he federal government's powers are divided among Congress, the president, and the judiciary**. None is superior to any other. **Whenever the U.S. Supreme Court rules a legislative act is beyond Congress's inherent powers, it second-guesses a constitutional determination made by Congress and expands the Court's power at Congress's expense. Not only does this assert judicial supremacy, it also discounts the fact that Congress is better-suited than the courts for protecting (and expanding) our rights.**[5] Consider that throughout history most victories protecting our liberties have been secured through the political process. During Reconstruction, **Congress passed the Thirteenth, Fourteenth, and Fifteenth Amendments** to abolish slavery and provide ongoing equal rights protections. In the 1930s, Congress passed New Deal legislation such as the Wagner Act, which created a right by statute for workers to organize into a union and engage in collective bargaining. It also passed the Fair Labor Standards Act, which included the right to earn a minimum wage. In the 1960s, **Congress passed the Civil Rights Act** of 1964 and the Voting Rights Act of 1965. Also in the 1960s, **Congress passed anti-poverty laws** such as Medicaid and Medicare. And most recently, **Congress passed the Affordable Care Act** and the Lilly Ledbetter Equal Pay Act. **The Court's proper role in a system of checks and balances isn't to strip Congress of its ability to pass laws that protect our rights and the public welfare. Rather, the role of the Court is to allow Congress the autonomy to do so. Otherwise, Congress, which has traditionally upheld our rights and expanded opportunity for all, will cease to be able to do so**. Democracy Informs Our Liberty Rights Sandefur defends his judicial philosophy by arguing that liberty, not democracy, is the "central constitutional value." **To argue that democracy and liberty are in tension discredits the fact that advocacy by the people, not through the courts, has led to the expansion of equal rights and liberty protections. The truth is, the will of the people impacts our definition of liberty, which is then interpreted and applied by the courts**. Therefore, liberty and democracy are not at odds; they are congruent. For example, scholars often argue that the Warren Court's "activist" decisions in protecting civil rights and civil liberties weren't activist at all, but rather followed the politics of the era.[6] The courts, just like the other two branches of government, are "influencing and influenced by American politics and its cultural and intellectual currents."[7] As the will of the people changes, so do our definitions of liberty, for better or worse.

(This is the only good card in the DA ^^)

Judicial activism undermines the law, destroys separation of powers, causes war
Robert H. Bork 2/24/10 (Bork served as a Yale Law School professor, Solicitor General, Acting Attorney General, and a judge of the United States Court of Appeals for the District of Columbia Circuit. "Keeping a Republic: Overcoming the Corrupted Judiciary" http://www.heritage.org/research/lecture/keeping-a-republic-overcoming-the-corrupted-judiciary accessed 7/8/15 BP)

The Court's performance strikes at the heart of the concept of a republic. **Without any warrant in law, nine lawyers split five to four, and the judgments of Congress, the President, state legislatures, governors, other federal judges, and the judges of all 50 states all are made instantly irrelevant**. **Whatever else it is, that is not democracy or a republican form of government. It is a robed oligarchy**. **So far, all attempts to tame it, to bring it back to democratic legitimacy, have failed**. So contemptuous of the electorate has the Court majority become that it routinely publishes opinions notable for their

incoherence and remains unperturbed by the most devastating criticisms. The best known, but hardly unique, example is Roe v. Wade, which invented a wholly fictitious right to abortion. Though they have tried desperately, nobody, not the most ingenious academic lawyers nor judges, in the 36 years since it was decided has ever managed to construct a plausible legal rationale for Roe, and it is safe to say nobody ever will. Roe is the premier example of what we now call judicial activism. You will hear it argued that to apply the term "activism" means no more than that you don't like a case's outcome. That is not true, and people who talk that way are, whether they realize it or not, implicitly saying that there are no criteria for judging the goodness or badness of a case other than personal or political sympathy. "Activism" has a real meaning, and it is an indispensable term in our debates. A judge is an activist when he reaches results or announces principles that cannot plausibly be derived from the actual historic Constitution. The historic Constitution is the set of principles that the ratifiers, who made the Constitution law, understood themselves to be enacting--the original understanding. **That approach is now called "originalism," and under no other approach can we have any semblance of the rule of law, which means in turn that no other approach is compatible with a republican form of government**. Activism means lawlessness, and it is rife among many judges and most professors of constitutional law. The rule of law requires that the principles announced and relied upon by judges be neutral in their application. Neutrality requires that a principle, once chosen, be applied according to its terms to all relevant cases without regard to the judge's personal views of the parties or issues before him. That is a powerful discipline, for in deciding Case A he must realize that he has committed himself to decisions in future cases that fall within the principle but whose particulars are at the moment unknown to him. That counsels great care in choosing and articulating the principle which he advances as dispositive in Case A. Should the principle prove unsatisfactory in Case B, the judge's only recourse is to reformulate it with a full explanation of his reasons. It is not sufficient, of course, that a principle be neutrally applied. That requirement would be met if the judge chose the principle that a labor union always loses and applied it neutrally, no matter the merits of a particular case. The principle chosen must also be neutrally derived, chosen without regard to the judge's individual preferences. The only source for principles that minimize or eliminate the judge's biases is the Framers' original understanding of the principles they were making into law. The morality and the policy enforced come from outside the judge. The judge who looks outside the historic Constitution looks inside himself and nowhere else. No judge can possibly avoid seeing a case without his own worldview coloring his vision. But **there is a chasm between a judge who knows that and consciously strives for objectivity and a judge who knowingly undertakes to impose his vision of justice** upon the parties before him and upon the society. Professor Lino Graglia of the University of Texas Law School summarizes what the Court has done in recent years to domestic policy, moving the nation to the cultural left: Virtually every one of the Court's rulings of unconstitutionality over the past 50 years--on abortion, capital punishment, criminal procedure, [school busing], prayer in the schools,...public display of religious symbols, pornography,...discrimination on the basis of sex, illegitimacy, alien status,...flag burning...have reflected the views of the elite. **In every case, the Court has invalidated the policy choice made in the ordinary political process, substituting a choice further to the political Lef**t.... Graglia observes that the thought that the making of policy should fall into the hands of the American people is the intellectual's nightmare. Maintaining a liberal activist judiciary is the only means of preventing that. Even more egregiously, the Court has forced itself into the conduct of our war against Islamic terrorists. Professor Gregory Maggs, of George Washington University Law School, points out that our current Supreme Court has overruled every precedent established in World War II, **and it has done so in defiance of the**

foreign affairs powers the Constitution entrusts to Congress and the President, as well as the President's role as commander in chief of the armed forces. The Court's incursions into areas best governed by the political branches are unprecedented as well as far beyond its competence. Detained enemy combatants, even those held abroad, are now for the first time in our history entitled to challenge their detention by claiming due process rights formerly available only to American citizens and lawful residents. The alternative system of justice, trial by military commissions, which goes back at least to George Washington and was ratified as recently as World War II by Franklin Roosevelt, has been made subject to new rules that seriously impair the effectiveness of the commissions. **Judges have interfered with the collection of intelligence about terrorists by electronic means even where there is no conceivable threat to any citizen's privacy. The threat to American lives and war aims by the American judiciary is real and serious.** Professor Jack Goldsmith warns **that our capacity to wage war "has been strangled by law"--the war has been "judicialized." So accustomed are Americans becoming to control by judges and legal processes that we are introducing law into areas where it is incapable of performing well and instead debilitates other vital national functions. Lawyers now oversee the conduct of war, often down to tactical levels**.

Exports

Exports China Mil Addendum

Link—ECR Helps China militarize

The economic-competitiveness exemption creates a civilian-end use exception that helps China militarize

Goodman 14 (Colby, Senior Research Associate for the Security Assistance Monitor where he leads research and analysis on U.S. foreign security assistance around the world, "U.S. Export Reform May Increase Military Exports to China", January 26 2015, http://securityassistance.org/east-asia-and-pacific/blog/us-export-reform-may-increase-military-exports-china)

A central component of the ongoing Export Control Reform Initiative has been the regrouping of tens of thousands of arms and military items from the State Department's more strictly controlled U.S. Munitions List (USML) to the Commerce Department's more loosely controlled Commerce Control List (CCL). According to the administration, these ongoing regulatory changes will allow the U.S. government to better control sensitive military items and reduce some burden on the U.S. defense industry for the less sensitive items. Although the administration has taken steps to require U.S. government review of most of the arms and military items moving to the CCL for export to China, CCL controls are not as strong as those on the USML. Based on a review of U.S. regulations by this author, for instance, the CCL Control Policy states that there is a general policy of approval for companies seeking to export certain military items on the CCL to China intended for civilian-end uses, but not for military-end-uses. This civilian-end use exception does not apply to items on the USML and could continue to be used acquire U.S. military items to support its military modernization. In connection with ECRI, the U.S. government is also transferring many items formerly considered "specially designed" for military purposes or otherwise formerly deemed important to control off both the State Department and Commerce Department control lists. Once off both of these control lists, companies are now able to export or provide these items, such as nuts and bolts for military vehicles or potentially larger items for military aircraft, to China **without U.S. government review**. As China continues to seek Western equipment and technology to address problems it has in developing "naval propulsion, aircraft engines and new materials," and the United States remains concerned about China's military actions in the Pacific region, the SIPRI report encourages countries to communicate more about the goals of their embargoes and be more transparent about exports to China. Although it's too early to tell exactly how U.S. export reforms may effect U.S. exports to China or U.S. diplomatic pressure on European countries, it is clear that ECRI has raised EU concerns about a potential U.S. double standard.

"Dual-use" Items can be used militarily—it's just a term to paper over opposition to control reforms

Goodman 14 (Colby, Senior Research Associate for the Security Assistance Monitor where he leads research and analysis on U.S. foreign security assistance around the world, "More than F-16 Bolts: A Problematic Ruse on Export Reform", June 6 2014, http://www.pogo.org/blog/2014/06/more-than-f-16-bolts-a-problematic-ruse-on-export-reform.html?referrer=https://www.google.com/)

Attempting to support this mass move of war materials and military technology to Commerce Department controls, Administration representatives have also frequently said that many of these military items are essentially **dual-use items** or are widely or **predominantly used in civilian systems**.

Although it is true that some military items formerly controlled by the State Department have been used in civilian applications or systems, absolutely none of them have been used widely or predominately in civilian applications. If they had been, they would have already been moved to Commerce Department controls as required by the Export Administration Act. Numerous Justice Department public releases also show that Chinese, Iranian, Russian, and other foreign military procurement networks often focus on acquiring the same parts and components the Administration has regrouped onto the Commerce Department control list. In recent years, for instance, it is clear that the Chinese government is aggressively seeking U.S. made radiation-hardened microchips, which are critical components in the operation of missiles and satellite systems and now on the CCL. The Iranians also continue to attempt to acquire many military aircraft parts recently moved to the CCL that are key to maintaining their aging fighter jets and military helicopters. For such reasons, the State Department has previously said exports of helicopter spare parts can be just as dangerous as attack aircraft or missiles. Many of the military items moving to Commerce Department control such as military body armor, military detonators and explosives, smoke grenades, certain control electronics for UAVs and drones, and diesel engines for tanks and armored vehicles also clearly contribute to military capabilities. In 2006, for instance, Amnesty International published a report showing that less advanced dual-use U.S. designed diesel engines controlled by Commerce ended up in Chinese military trucks delivered to the Sudanese government for likely use by the Sudanese military and Janjawid in Darfur. Although the Administration has yet to finalize its regulations on many other types of military categories, it has also indicated it would transfer most types of firearms and some night vision devices to the Commerce Control list, which can significantly improve a terrorist or insurgent group's military capabilities.

AT: Illegal Exports Now

Effective export controls now

BIS 15 (US Department of Commerce, Bureau of Industry and Security, "2015 REPORT OX FOREIGN POLICY-BASED EXPORT CONTROLS")

5. Effective Enforcement of Controls. The Secretary has determined that the United States has the ability to effectively enforce these controls. Controls on exports to embargoed and sanctioned countries and persons, including those discussed in this Chapter, raise a number of challenges. These include the need to concentrate limited resources on priority areas, develop new strategies to limit re-export violations, strengthen the cooperative relationship with other law enforcement agencies in the United States and overseas, and maintain a consistent outreach effort to help limit U.S. business vulnerability. Overall, the sanctions are generally understood and supported by the U.S. public. Voluntary cooperation from most U.S. exporters is common. BIS gathers leads on activities of concern and conducts end-use checks, primarily through its Export Control Officer and Sentinel programs, to verify the end use and end-users of U.S.-origin items. End-use checks involve the assessment of bona fides (i.e.. legitimacy and reliability) of foreign end users that receive U.S.-origin items and prospective end-users on pending license applications for diversion risk, as well as educational outreach to foreign trade groups. The Department conducted a number of enforcement actions regarding noncompliance with these export controls, including: Lev Steinberg Riflescopes to Russia On February 25. 2014. Lev Steinberg was sentenced in the U.S. District Court for the Southern District of New York to one year of probation and a S4.000 criminal fine. On September 16. 2009. Steinberg, a resident of Brooklyn. NY. pled guilty to violating the International Emergency Economic Powers Act in connection with an unlicensed export of riflescopes as well as to a violation of the Foreign Corrupt Practices Act. Steinberg was arrested in March 2009 for exporting riflescopes controlled for crime control reasons to Russia without the required license from the U.S. Department of Commerce. This was a joint investigation involving the Office of Export Enforcement. U.S. Immigration and Customs Enforcement, and the Defense Criminal Investigative Service. C. Consultation with Industry In a September 4. 2014 Federal Register notice (79 FR 52630) the Department of Commerce solicited comments from industry and the public on the effectiveness of U.S. foreign policy- based export controls. In addition, comments were solicited from the public via the BIS website. The comment period closed on October 6. 2014. A detailed review of all public comments received can be found in Appendix I. The Department of Commerce consults with the Regulations and Procedures Technical Advisory Committee, one of seven technical advisory committees that advise BIS. in preparation for publication of major regulatory changes affecting crime controls. Li addition, the Department of Commerce has consulted with exporters of crime control items and with human rights groups concerned about the potential for misuse of such items in various parts of the world. BIS has frequent consultations with exporters about specific items proposed for export to specific end users and for specific end uses. D. Consultation with Other Countries Most other countries that supply crime control and detection items have not imposed similar export controls. The United Kingdom and Canada maintain controls similar to U.S. controls on certain crime control commodities. Certain European Union member states prohibit or impose a license requirement on the export of dual-use items not covered by the multilateral export control regimes for reasons of public security or human rights considerations. E. Alternative Means Section 6(n) of the EAA requires the Department of Commerce to maintain export controls on crime control and detection items. Attempting to achieve the purposes of the crime control restrictions through negotiations or other alternative means would not meet this requirement. The U.S.

Government does, however, use diplomatic efforts, sanctions, and other means to convey its concerns about the human rights situation in various countries.

Cross-agency and private-public cooperation solves

Mueller III 12 (John S, Director Federal Bureau of Investigation, "U.S. Department of Commerce, Bureau of Industry and Security Annual Update Conference on Export Controls and Policy Washington, D.C.", July 18 2012, https://www.fbi.gov/news/speeches/preventing-illegal-exports-and-protecting-national-security-in-todays-global-marketplace)

In addition to our resources dedicated to countering espionage and insider threats, one year ago we established the Counterproliferation Center at FBI Headquarters. This center brings together the expertise of our Weapons of Mass Destruction and Counterintelligence Divisions to prevent the illegal export of protected United States goods. And we are making progress. We now have more than 1,500 pending cases, and in the past year, we made several high-value arrests and **witnessed a significant increase in disruptions**. One recent case, called Wintry Blast, was opened when our Minneapolis Field Office uncovered a major Iranian procurement network operating through front companies in Asia. The network was seeking export-controlled U.S. technology for the Iranian military and for Iran's ballistic missile programs. In September 2010, five individuals and four of their companies were indicted for participating in the illegal export of military-grade restricted antennas and 6,000 radio frequency modules. Sixteen of those modules were found in unexploded bombs and in weapons caches in Iraq. Last October, officials in Singapore arrested four of the five defendants—all citizens of Singapore. We continue to seek their extradition to the United States. The fifth defendant—an Iranian national—remains at large. We would not have been successful without our strong partnership with the Departments of Commerce and Homeland Security and our counterparts in Singapore. But just as we develop sophisticated tradecraft, so, too, do those individuals who seek our protected technology. To stay ahead of our adversaries, we must continue to work with partners at home and abroad. And we must constantly improve our efforts to counter the threat, always remaining within the limits of the Constitution and the rule of law. Turning to the importance of private sector partnerships… Close working relationships with our federal and international partners are but one aspect of our efforts to prevent illegal exports. Our partnerships with those of you in the private sector are equally important. Proliferation networks are sophisticated and far-reaching. They use deceptive practices and they frequently work in concert with a web of associates to disguise their true activities. We are working hard to disrupt, neutralize, and eliminate these networks, and we need your help. Through the FBI's InfraGard program, individuals in law enforcement, government, and the private sector, as well as academia, meet to talk about how best to protect our country's critical infrastructure and key resources. Since its inception in 1996, InfraGard has grown from a single chapter in the Cleveland Field Office to 88 chapters around the country, with more than 51,000 members. Members have access to an FBI secure communications network through which we disseminate threat alerts, advisories, and intelligence products. There are also several special interest groups within InfraGard, including one that is focused on research and technology protection. This group works to share relevant information with members so that we can better protect our collective research and technology. Beyond InfraGard, our Counterintelligence and Weapons of Mass Destruction Divisions run a number of partnership initiatives. We have a partnership coordinator in each of our 56 field offices to inform you about foreign

intelligence threats to your research, your products, and your personnel. Another such initiative addresses the synthetic biology sector. We are working with biology companies to protect the new technology that enables the synthetic generation of DNA sequences. Together, we have developed procedures to screen unusual purchases…and we have created a reporting mechanism for suspicious orders that may pose a threat.

Exports Case Defense

1NC—Squo solves

Squo STA exemption solves

Fergusson and Kerr 14 (Ian F, Specialist in International Trade and Finance, Paul, Analyst in Non-Proliferation, "The U.S. Export Control System and the President's Reform Initiative", January 13 2014, https://www.fas.org/sgp/crs/natsec/R41916.pdf)

In 2011, the Administration devised a new license exception known as the Strategic Trade Authorization (STA), which is designed to facilitate transfers to low risk countries and to promote interoperability to allies in the field.37 To be eligible, exporters have to provide notification to BIS of the transaction and a destination control statement notifying the foreign consignee of the terms of the exception's safeguard requirements, and they must obtain from the foreign consignee a statement acknowledging its understanding and willingness to comply with the requirements of the license exception. Under the final rulemaking, STA is available in various degrees **to 44 countries**. To a group of 36 countries made up of NATO partners and members of all 4 multilateral non-proliferation control regimes, dual-use items controlled for national security (NS), chemical or biological weapons, nuclear non-proliferation, regional stability, crime control, or significant items (hot section jet technology) are eligible for an STA. This includes **almost all items on the CCL** that are not controlled for statutory reasons. An additional eight countries are eligible for exports, reexports, or transfers controlled for NS-only and that are not designated as STA-excluded.38 Dual-use items controlled for missile technology (MT), chemical weapons (CW), short supply (SS), or surreptitiously listening (SL) are not be eligible for export under STA. Certain implements of execution and torture, pathogens and toxins, software and technology for "hotsections" of aero gas-turbine engines, and encryption have also been excluded from the STA. According to former Commerce Secretary Locke, the license exception will eliminate the need for licenses for over 3,000 yearly types of transactions, **affecting $1.4 billion in exports**.39

Streamlining the application process now

Fergusson and Kerr 14 (Ian F, Specialist in International Trade and Finance, Paul, Analyst in Non-Proliferation, "The U.S. Export Control System and the President's Reform Initiative", January 13 2014, https://www.fas.org/sgp/crs/natsec/R41916.pdf)

The fourth singularity is the creation of a single information technology system to be used to administer the export control system. The USXPORTS database, currently used by the Department of Defense to track license applications referred to it, is being expanded to State and Commerce. When completed, it will become the platform for a proposed single export license application form to be used by State, Commerce, and the Treasury's Office of Foreign Assets Control. It will also be used by the Department of Energy, Immigration and Customs Enforcement, and the Export Coordination Enforcement Center. DDTC reportedly has adopted the new system, but sequester-related budget constraints have held up final adoption by BIS.44 This reform is being proposed to streamline the interagency review process. Currently, the agencies' computer systems are not compatible and cannot seamlessly share licensing application information with referring agencies. Until recently, OFAC used a paper-based licensing system, but in April 2013 announced it had transitioned to an electronic filing system.45 BIS, in particular, has had difficulties in securing its system, which was hacked in late 2006. In response, BIS completed a replacement of all its computers in 2010—a step that will help prepare it for the adoption of the single IT system.46 The Administration's plan calls for the adoption of USXPORTS first for internal communications such as license referrals, while exporters would continue to use the existing SNAP-R and D-Trade electronic license filing

portals. Currently, a license submitted to BIS using the SNAP-R system must be converted to BIS's internal ECASS system for internal deliberation, and to be sent for referral, it must be converted to the USXPORTS system.47 The Administration has indicated that eventually it would like to facilitate interoperability between the license portals, the internal system, and Customs' Automated Export System (AES), the information system that tracks actual movement of goods. In conjunction with the single IT system, the Administration has developed a single license application form. To make this possible, the Administration has standardized certain definitions between the different regulations, such as the use of the term "technology" in the EAR as opposed to the term "technical data" used in the ITAR.48 To assist in compliance with U.S. export regulations, the Administration has also compiled a consolidated screening list of over 24,000 entities from existing Commerce, Treasury, and State Department screening lists. The list consolidates the BIS Denied Person List, Unverified List, and Entity List; the Department of State's Nonproliferation Sanctions List; the Directorate of Defense Trade Controls Debarred List; and the Office of Foreign Assets Control Specially Designated Nationals List.

1NC—Alt Cause to Offshoring

Alt Cause—uncertain tax policy creates uncertainty and is driving companies elsewhere

Master 12 (Jonathan, writes on issues related to national security and defense, and contributes to CFR's Renewing America initiative that focuses on the economic underpinnings of U.S. foreign policy, "Policy Initiative Spotlight: Checking the Innovation Box", May 4 2012, http://blogs.cfr.org/renewing-america/2012/05/04/policy-initiative-spotlight-checking-the-innovation-box/)

In the competition to attract and retain global corporate investment, tax policy is often seen as one of the most immediate and potent levers that legislators can pull. This is especially true given the ability of multinational companies to move business and capital across borders. These transnational flows often take with them the jobs, the R&D, and the innovations that drive and sustain long-term growth. Intellectual property (IP)—including copyrights, trademarks, and patents—is particularly mobile as an intangible asset. In April of next year, the United Kingdom will become the latest country to introduce a corporate tax incentive known as a "patent box," a policy that grants companies a significant tax break on profits attributed to IP. The policy's name refers to the box that is physically checked on the tax form. The UK patent box, which hopes to attract innovative industries and all their economic fruits, will allow corporations to apply a reduced 10 percent rate to income from patents- versus a headline rate of 23 percent. Patent box policies have also been deployed recently in Holland and Belgium (2007), as well as in Spain and Luxembourg (2008). The Dutch "innovation box" goes even further by including a broader class of IP and a lower rate of 5 percent. As other nations jockey for position, the United States has slipped well behind. The current U.S. corporate tax regime hasn't undergone a major facelift since 1986. And the current system is doubly flawed, combining the highest top tax rate in the world, at 35 percent, with a host of complex subsidies and loopholes that add to inefficiency. While both parties have acknowledged a need to cut the top rate and end many of the tax subsidies, one incentive that most policymakers—including President Obama and Mitt Romney—would like to preserve is the Research and Experiment (R&E, sometimes R&D) tax credit. Most economists agree that unlike many other corporate tax incentives, the R&D credit deserves special treatment because it provides a wellspring of growth and has social returns that are not captured by businesses—a market failure. But despite the **near consensus**, Washington has proved unable to make the R&D tax credit a permanent fixture of the U.S. code. It has expired and been renewed thirteen times (often retroactively) since 1981, sunsetting yet again last January. The impermanence of the credit in the U.S., as with many tax policies, has made it less effective as businesses are reluctant to change behavior given uncertainty. "What's happened traditionally every year is that in the fourth quarter or maybe even beyond the fourth quarter, the R&D credit is enacted and we have to then figure out the deduction for the whole year's credit," said Bruce Lassman, vice president of international tax at IBM. "So that's kind of a nerve-wracking thing. It's difficult to manage your affairs when you have a legislative situation like that." While there is broad consensus that the R&D tax credit should be made permanent, the idea of adding a patent box tax incentive has not been part of the debate in the United States. If adopted in concert with the R&D credit, a U.S. innovation box could supply a back-end incentive in the so-called innovation value chain. In other words, it would target the back end, the income from innovations, while the R&D credit incentivizes the front end, or the underlying research. While the latter is more important because the R&D provides spillover social benefits, the revenue incentive provided by an innovation box would likely sweeten the deal and encourage companies to maintain or expand IP-intensive activities in the United States.

2NC—Alt Cause

Other countries are changing tax policy to encourage innovation

Atkinson and Andes 11 (Robert D, president of the Information Technology and Innovation Foundation, a public policy think tank based in Washington, D.C., that promotes policies based on innovation economics, Scott, "Patent Boxes: Innovation in Tax Policy and Tax Policy for Innovatio", October 2011, http://www.itif.org/files/2011-patent-box-final.pdf)

Countries interested in winning the race for global innovation advantage need to shift the debate over domestic tax policy from one of revenue enhancement to one of global competitiveness. And most countries are doing just that. However, over the last quarter century the U.S. tax code has seen little change. More countries are entering the global race and others are running faster to keep the lead. If the United States' pace remains constant, we will slowly but surely fall further behind. Implementing a patent box is an opportunity for the United States to develop a tax code that more effectively drives innovation, competitiveness, and family-wage jobs. Many countries have patent boxes but most have significant shortcomings in design. The U.S. patent box wouldn't be the world's first, but it could be the world's best. By tying together R&D, high-tech manufacturing, and commercialization of U.S. IP, a well-formulated patent box would create a powerful incentive for firms to develop and produce innovation within the United States.

Can't solve—innovation isn't focused on commercialization now

However, commercialization has never been a major part of the U.S. innovation agenda. The R&D tax credit focuses on the inputs to innovation in the private sector, while only a small fraction of the budgets of innovation-driven agencies like NSF, NIST, and DOE's Office of Science are allocated to commercialization efforts.41 On the other hand, countries like Finland are taking the commercial side of innovation far more seriously. In the last two decades, Finland has transformed itself from a largely natural resource-dependent economy to a world leader in technology, with Tekes, Finland's National Agency for Technology and Innovation, playing a key role in the country's transformation. Affiliated with the Ministry of Employment and the Economy, Tekes funds many research projects in companies, multi-company partnerships, and business-university partnerships. With a

budget of $560 million (in a country of only 5.2 million people), Tekes works in partnership with business and academia to identify key technology and application areas that can drive the Finnish economy.

The United States needs a hybrid approach to innovation policy. European-style patent boxes that do not require domestic R&D or production will not induce enough R&D or high-tech manufacturing, while the U.S. R&D credit, useful as it is, does not go far enough to promote commercialization and domestic production. A patent box that reduces the corporate tax rate on revenue from qualifying IP to a significantly lower rate, coupled with an incentive for corresponding R&D and production to be located in the United States, would provide firms with a much stronger incentive to innovate and to produce in the United States.

2AC--AT: Tax Policy AC

Patent box does nothing—its unsustainable in the long term

Thornton 15 (Alexandra, Senior Director of Tax Policy on the Economic Policy team at American Progress, "Patent Tax Dodge: Why the Patent Box Does Not Answer America's Need for Tax Reform", June 1 2015, https://www.americanprogress.org/issues/economy/news/2015/06/01/114088/patent-tax-dodge-why-the-patent-box-does-not-answer-americas-need-for-tax-reform/)

Theoretically, under a U.S. patent box law, a U.S. multinational company would report all of its patent-related income worldwide on its U.S. tax return each year and pay U.S. tax on those earnings even if they were not repatriated. The key attraction of this for companies is that income in the patent box is subject to what is usually a much lower tax rate. The United Kingdom, which adopted a patent box structure in 2013, applies a 10 percent tax rate to that income, well below its top business tax rate of 20 percent. Proponents of a U.S. patent box argue that this is necessary to discourage companies from moving offshore, where foreign companies receive much more favorable treatment of their patent-related income. A recent study confirmed that there is a strong association between U.S. corporate expatriations and the growth in revenue from intangibles such as patents. The same study also found that corporate expatriations have generated excess returns of about 225 percent above market returns, suggesting the magnitude of the international tax avoidance problem.

From a budget perspective, however, a U.S. patent box is too good to be true. Rep. Dave Camp (R-MI) included an expansive version of a patent box in his Tax Reform Act of 2014. The Congressional Joint Committee on Taxation scored that measure, along with some related changes, as raising $115 billion in federal revenue within the 10-year budget window that lawmakers use to assess tax proposals' impact. Unfortunately, because it was included in a costly and much broader proposed reform of the taxation of foreign income, the estimate is not helpful in determining how much revenue, if any, a more typical patent box proposal would raise in the early years.

Nevertheless, it seems likely that a patent box provision would lose significant revenue in the long term, as earnings that would have been repatriated at a higher tax rate would instead be taxed at the much lower patent box rate. The majority chief tax counsel of the House Ways and Means Committee has implied that this would be the case, and as such, it would hamper later efforts to achieve a broader-based corporate tax rate cut. To be sure, the amount of revenue lost depends in part on whether the income would have been repatriated and on the specific tax rate lawmakers choose for the patent box income. But the long-term revenue loss could grow as companies find ways to include other income in the box, such as income related to a large product that includes one small patented part, a criticism raised over the U.K. patent box. Alternatively, companies could pressure policymakers to expand the definition of qualifying property to a wider range of patentable items. These could include computer programs and software, business methods, financial instruments, accounting systems or even tax strategies. Worse, lawmakers could expand the box to include unpatented forms of intellectual property, an approach referred to as an innovation box.

Conclusion

In the end, the patent box would reward many of the very companies that have taken the greatest advantage of this form of profit shifting to avoid paying their fair share of U.S. taxes. These companies already benefit from the strong legal protection the U.S. provides for patents. And many of them

undoubtedly benefited from the R&E tax credit when developing their patented products. The R&E credit arguably provides incentives for innovation when it matters most—before ideas become commercially valuable and regardless of whether they do. Patent boxes, however, reward only innovation that proves itself to be commercially successful.

In their effort to find revenue to support other federal priorities, lawmakers should ensure that U.S. multinational corporations pay their fair share of taxes. A patent box with a low tax rate could end up being just another tax loophole for U.S. multinationals, further reducing these corporations' tax bills while requiring others to endure higher taxes or program cuts to make up for it. Congress should avoid putting international patent income into such a budget sieve.

Doesn't do anything for R AND D

CTJ 15 (Citizens for Tax Justice, "A "Patent Box" Would Be a Huge Step Back for Corporate Tax Reform", June 4 2015, http://ctj.org/ctjreports/2015/06/a_patent_box_would_be_a_huge_step_back_for_corporate_tax_reform.php#.Vb0fIPlViko)

The 2012 fiscal cliff deal cut federally funded research by $26 billion in 2015 compared to its 2010 level.[12] If lawmakers want to boost research and innovation, the most straightforward way to do so would be to expand direct research funding by the federal government. This approach would avoid the problem of subsidies for "research" has little or nothing to do with real scientific advances. Federally funded research is typically much more beneficial than profit-driven corporate research because it allows companies to focus on broadly beneficial research that may take years or even decades to generate profits. While Congress has cut federal research funding in recent years to lower the deficit, corporations have not been asked to give up generous tax breaks to contribute to deficit reduction. Instead, corporations and their congressional allies continually cite the nation's 35 percent corporate tax rate as reason for "reform" and more tax breaks. But that is a ruse. U.S. corporate tax collections as a percent of GDP are already close to the lowest in the developed world,[13] and on average large, profitable corporations pay about half the statutory tax rate.[14] Congress should close loopholes and raise more revenue from corporations.[15] If Congress's priority is research and innovation, it could use the revenue raised from corporations to undo the cuts in federal research spending enacted in recent years.

Amendment CP

Plan: The United States should amend its national Constitution to _____ unconstitutional. The US Congress should initiate the process. The US Supreme Court should not review any cases concerning this amendment in the next two terms.

The Counterplan solves.

NCC Staff 13 [National Constitution center, June 17, 2013, The Next 10 Amendments: Do we need more laws to protect privacy? http://news.yahoo.com/constitutional-amendment-protect-privacy-133028314.html] Achal Patel

The furor in the past two weeks over government eavesdropping on the media and citizens has raised a lot of questions related to the First Amendment and the Fourth Amendment. Government actions to monitor the phone records of the Associated Press and track the activities of a Fox News reporter started a debate about the First Amendment. And last week's revelations about widespread government collection of phone call data—followed by broader claims about data collection involving the Internet—started a whole new argument about the Fourth Amendment. Those are just a few of the issues about privacy that have been debated over the past year. There's also the pesky issue of drones and other forms of technology that can do much good, but also cause massive privacy invasions in the wrong circumstances. And there's the issue of when and how police can enter your home. As for the government surveillance programs, the Obama administration and Congress members say the activities of the National Security Agency are approved and monitored by all three government branches, in accordance with the Constitution. In past court decisions, the Fourth Amendment has been applied to support privacy rights—to learn more about the evolution of privacy rights, National Constitution Center president Jeffrey Rosen suggests the five must-read books about privacy issues that are now all too contemporary.

Amendments best solve for rights.

Ehling 12 Matt Ehling | 10/04/12 Minnesotans need to better evaluate when (and why) to amend their constitution https://www.minnpost.com/community-voices/2012/10/minnesotans-need-better-evaluate-when-and-why-amend-their-constitution

Rights can either be granted by statute (through legislative action) or through a constitution's provisions. The former tend to be more specific in nature, and can change with social needs and desires. The latter tend to be broader philosophical statements that guarantee individual rights by permanently restraining governmental powers. There has been just one amendment made to the U.S. Constitution that has exclusively constrained individual conduct, and it was short-lived. The most durable and stable constitutional amendments have been those that have secured broad-based rights for the people. One can recognize this by looking to the earliest history of the U.S. Constitution. As originally written, the federal Constitution contained almost no guarantees of individual rights, save for the "privilege of the writ of habeas corpus." Because of this, a political struggle ensued, and the Constitution was ratified under the terms of a brokered deal that added 10 rights-based amendments to the original text. These amendments constituted the Bill of Rights a group of amendments that has survived for over 200 years because of its close correlation to our nation's guiding philosophy of securing individual liberty.

Amendments can overrule court decisions.

Schaffner, 05

(Associate Law Professor – GW, 54 Am. U.L. Rev. 1487)

Because the judicial branch has the ultimate authority over constitutional interpretation and construction, the **only "check**" on judicial power of constitutional interpretation is the constitutional amendment process. The amendment process should be used to overturn the Court only when it acts beyond its powers or inconsistently with constitutional principles. Otherwise, the careful balance of powers among the branches is compromised.

The history of amending the Constitution to overrule Supreme Court decisions is consistent with this view and is particularly relevant here. While the U.S. Supreme Court is not being overturned by the FMA, the Massachusetts Supreme Judicial Court's Goodridge decision is in jeopardy. Goodridge was the catalyst for the fervor behind the proposed marriage amendment. Moreover, the FMA will forever prevent the U.S. Supreme Court from addressing the issue.

Only four constitutional amendments have been adopted to overrule the Supreme Court. 186 They are: (1) the Eleventh Amendment, which overruled Chisolm v. Georgia; 187 (2) the Thirteenth Amendment and, most specifically, the first sentence of the [*1519] Fourteenth Amendment, 188 which overruled Dred Scott v. Sanford; 189 (3) the Sixteenth Amendment, which overruled Pollack v. Farmer's Loan & Trust Co.; 190 and (4) the Twenty-Sixth Amendment, which overruled Oregon v. Mitchell. 191 As we will see, each amendment was in harmony with the basic principles that underlie the Constitution - individual rights, separation of powers, and federalism. Moreover, in the cases where fundamental liberty interests were at stake, the amendment reestablished individual rights in light of the Court's limited interpretation of those rights. Without analyzing the propriety of the individual Supreme Court decisions, the following will demonstrate that, unlike the FMA, **the use of the amendment power to overrule these cases was proper and consistent with basic democratic principles.**

Mootness DA

2NC – Mootness DA

(A) The perm decides a moot legal question

Watson, Northwestern University Law Review, **1991**

(Corey C., "Mootness and the Constitution," Fall 1991, lexis)

A case becomes "moot" when "its factual or legal context changes in such a way that a justiciable question no longer is before the court." n32 [*147] Defining mootness as the absence of a justiciable issue, however, merely raises the question of what is meant by the term "justiciability." n33 The Supreme Court has distinguished a justiciable controversy "from one that is academic or moot." n34 Accordingly, a justiciable controversy is one that is "definite and concrete, touching the legal relations of parties having adverse legal interests." n35 The controversy must be "real and substantial[,] . . . admitting of specific relief through a decree of a conclusive character, as distinguished from an opinion advising **what the law would be upon a hypothetical state of facts**." n36 The rule that a court will not decide a moot case is recognized in virtually every American jurisdiction. n37 With the concepts of mootness and justiciability so loosely formulated, some scholars have attempted to understand mootness jurisprudence by cataloguing the various circumstances which render a case moot. n38 A case may become moot because the alleged wrong passes and cannot be expected to recur; n39 because a defendant pays money owed [*148] and no longer wishes to appeal; n40 because a criminal defendant dies while appealing his case; n41 because the law under which the suit was brought has since changed; n42 or because a party is no longer affected by the challenged statute. n43 Indeed, the Court has attempted to generalize the causes of mootness by declaring a case moot when it finds either (a) that the issues presented are no longer "live" or (b) that the "'parties lack a legally cognizable interest in the outcome.'" n44 These are commonly referred to as the "live issue" and "personal stake" requirements. n45 For a party to satisfy the live issue test, he must show more than abstract injury. n46 The plaintiff must demonstrate that he "'has sustained or is immediately in danger of sustaining some direct injury' as the result of the challenged official conduct and the injury or threat of injury must be both 'real and immediate,' not 'conjectural' or 'hypothetical.'" n47 Finally, the "personal stake" criterion requires a "logical nexus between the status asserted and the claim sought to be adjudicated" n48 and a sufficient degree of "contentiousness." n49

(b) Violates separation of powers

Watson, Northwestern University Law Review, **1991**

(Corey C., "Mootness and the Constitution," Fall 1991, lexis)

Public law model advocates explain that requiring a party's claim to implicate constitutional rights circumscribes judicial power. n156 This, however, recalls the problems encountered when trying to define the constitutional terms "case" and "controversy." n157 The public law model attacks those who pretend to objectively define constitutional terms. Yet, when a model purports to describe a case as that which implicates constitutional rights, one must ask how to define those rights. All legislative issues must necessarily implicate "constitutional" issues and rights since the legislative power is constitutionally created. Therefore, although the public law model theoretically accounts for a functionally enumerated judicial power, its fundamental principle of a judicial authority that can reach all issues which touch the Constitution runs afoul of another constitutional edict: separation of powers. n158 Hence, one is driven to the public law model's second line of defense in limiting judicial power, the prudential screen. To say that prudential factors beget the mootness doctrine, which begets

justiciability, which begets the case and controversy requirement, which begets judicial power is to say, in effect, that a judge defines his own jurisdiction. But this is precisely what the Constitution was intended to prevent: a government that defines its own powers. This recalls the problem of unrestricted judicial [*164] power encountered under the pure prudential model. The omnipotence of a judge under the public law model may be even more dangerous because here prudential decision-making is masquerading as a constitutional doctrine. At least the pure prudential model does not purport to be more than it is.

(c) equivalent of a nuclear war

Martin H. **Redish**, professor of law at Northwestern, **and** Elizabeth J. **Cisar**, Law Clerk to Chief Judge William Bauer, United States Court of Appeals, Seventh Circuit, December **1991**, Duke Law Journal, 41 Duke L.J. 449, p. 474

In summary, no defender of separation of powers can prove with certitude that, but for the existence of separation of powers, tyranny would be the inevitable outcome. But the question is whether we wish to take that risk, given the obvious severity of the harm that might result. Given both the relatively limited cost imposed by use of separation of powers and the great severity of the harm sought to be avoided, one should not demand a great showing of the likelihood that the feared harm would result. For just as in the case of the threat of nuclear war, no one wants to be forced into the position of saying, "I told you so."

Ruling on Moot Issue Destroys the Constitution

Violates and destroys the constitution

Watson, Northwestern University Law Review, **1991**

(Corey C., "Mootness and the Constitution," Fall 1991, lexis)

According to the textual constitutional model, the mootness doctrine inheres in a fundamental definition of a case and controversy n106 -- thatis, mootness doctrine is directly related to a court's jurisdiction over a case. n107 According to this model, the case or controversy clause of article III has an identifiable and immutable meaning that dictates the limits on judicial power. n108 This meaning is derived from a natural, intuitive [*157] understanding of the confines of a case, n109 an historical articulation of this understanding, n110 and a refinement of the definition through judicial precedent. Although the case and controversy clause may have fluctuated at its margins as it evolved, proponents maintain that article III has retained a core meaning that is somewhat analogous to the "traditional judicial business of the English courts." n111 Accordingly, article III "does not extend the judicial power to every violation of the constitution which may possibly take place, but to 'a case in law or equity,' in which a right, under such law, is asserted in a court of justice." n112 From this core meaning, according to the model, have sprung various interpretative doctrines which, when taken together, flesh out the meaning of the case and controversy clause. These doctrines are incorporated under the broad label of "justiciability." The doctrine of mootness, a species of justiciability, is umbilically attached to the case and controversy clause and is thus subservient to article III of the Constitution. n113 Hence, **the relationship between the mootness doctrine and the Constitution is symbiotic**: the Constitution gave birth to the doctrine of mootness while the doctrine itself illuminates the limitation of federal judicial power. Although courts are permitted to entertain prudential considerations when deciding questions of jurisdiction, n114 the model forbids courts from allowing prudential concerns to compromise the fundamental principles of article III. n115 Consequently, whether a case is justiciable is a threshold question throughout the judicial proceeding which must be answered affirmatively for a court to assume jurisdiction. n116 [*158] The textual constitutional model, therefore, contends that the language chosen to formulate the Constitution has particular significance. Attempts to manipulate this language by superimposing specific value systems n117 or by tossing prudential factors into the constitutional calculus n118 **dissolve the integrity of the Constitution itself**. The Constitution retains flexibility by establishing procedures for its amendment, and judicial or scholarly glosses which essentially rewrite the Constitution circumvent the amendment process. Such circumvention, the model asserts, is violent to democratic and representative ideals.

Reject all constitutional violations

Stephen L. **Carter**, professor of law at Yale University, **1987**, Brigham Young University Law Review, 1987 BYU L. Rev. 719, HeinOnline, p. 750-751

The problem with this use of our burgeoning public policy science, an inevitable one in an area of theory driven by instrumental rationality, is that the law itself is stripped of the aura of uniqueness which is assigned to it in liberal theory. The law becomes all too mutable, and is left as no more than one of the means that must be tested against its efficacy in achieving the desired end. The Constitution, which is after all a species of law, is thus quite naturally viewed as a political impediment to policy, a barrier that must be adjusted, through interpretation or amendment, more often than preservation of government under that Constitution is viewed as a desirable policy in itself. In this the modern student of policy is like the modern moral philosopher – and like a good number of constitutional theorists as well – in denigrating the value of preserving any particular process and exalting the desirable result. But constitutionalism assigns enormous importance to process, and consequently assigns costs, albeit perhaps intangible ones, to violating the constitutional process. For the constitutionalist, as for classical liberal democratic theory, the autonomy of the people themselves, not the achievement of some well-intentioned government policy, is the ultimate end for which the government exists. As a consequences, no violation of the means the people have approved

for pursuit of policy—here, the means embodied in the structural provisions of the Constitution, can be justified through reference to the policy itself as the end.

Answer To: “Mootness Doctrine Destroys Judicial Review”

No Link

Watson, Northwestern University Law Review, **1991**

(Corey C., “Mootness and the Constitution,” Fall 1991, lexis)

[*172] At first blush, cases of judicial review seem to collide with mootness doctrine as defined in the proposed model. In this context, pragmatic reasons exist for sustaining a case through the appellate levels even though the case may have become moot under traditional standards. If the legislation is unconstitutional, it seems not to matter that the particular parties to the dispute are no longer entitled to the remedy of repealing the law because, arguably, the law should not have existed in the first place. Hence, the broad effect of declaring a law unconstitutional seems to conflict with the narrow requirement of personal stake in the outcome of a case. Anyone, it seems, should be able to challenge the constitutionality of a law. Under the pure prudential model, or the flexible constitutional model, or the public law model, a court would probably proceed with the case because it seems a good investment of judicial resources to repeal an unconstitutional law. The remedy is, practically speaking, capable of judicial administration. The apparent conflict can be reconciled by recognizing that personal stake is not constitutionally required in cases of judicial review.

Constitutional Amendment CP - Wave 1 - GLAGG - NDI 15

1NC

1NC

Text: The appropriate number of the fifty states will invoke their power under Article V of the Constitution to call a limited constitutional convention for the purpose of [plan]. A sufficient number of the fifty states will ratify the amendment.

CP solves the AFF and avoids the DA

Vermeule 4 (Adrian – Professor of Law at the University of Chicago, "Constitutional Amendments and the Constitutional Common Law," University of Chicago Public Law & Legal Theory Working Paper No. 73, 2004, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=1072&context=public_law_and_legal_theory)

These points, however, capture only one side of the ledger. Precedent, and the constraint that new decisions be related analogically to old decisions, effect a partial transfer of authority from today's judges to yesterday's judges. As against claims of ancestral wisdom, Bentham emphasized that prior generations necessarily possess less information than current generations. If the problem is that changing circumstances make constitutional updating necessary, it is not obvious why it is good that current judges should be bound either by the specific holdings or by the intellectual premises and assumptions of the past. Weak theories of precedent may build in an escape hatch for changed circumstances, but **the escape hatch in turn weakens the whole structure**, diluting the decisionmaking benefits said to flow from precedent. Another cost of precedent is path dependence. Path dependence is an ambiguous term, but a simple interpretation in the judicial setting is that the order in which decisions arise is an important constraint on the decisions that may be made. Judges who would, acting on a blank slate, choose the constitutional rule that is best for the polity in the changed circumstances, may be barred from reaching the rule, even though they would have reached it had the cases arisen in a different order. Precedent has the effect of making some optimal rules inaccessible to current decisionmakers. When technological change threatened to render the rigid trimester framework of Roe v. Wade obsolete, the Supreme Court faced the prospect, in Pennsylvania v. Casey, that precedent would block a decision revising constitutional abortion law in appropriate ways, even though a decisive fraction of the Justices would have chosen the revised rule in a case of first impression.78 The joint opinion in Casey resorted to intellectual dishonesty, proclaiming adherence to precedent while discarding the trimester framework that previous cases has taken to be the core of Roe's holding.79 The lesson of Casey is sometimes taken to be that precedent imposes no real constraint, but absent precedent the Justices would have had no need to write a mendacious, and widely ridiculed, opinion. The institutions that participate in the process of formal amendment, principally federal and state legislatures, are not subject to these pathologies. The drafters of constitutional amendments may write on a blank slate, drawing upon society's best current information and deliberation about values, while ignoring precedent constraints that prevent courts from implementing current learning even if they possess it. The contrast is overdrawn, because legislatures deliberating about constitutional amendments use precedent in an informal way. But precisely because the practice of legislative precedent is relatively less formalized than the practice of judicial precedent, legislative practice may capture most of the decisional benefits of formal precedent while minimizing its costs. Legislatures may draw upon their past decisions purely to conserve on decisionmaking costs, while shrugging off precedential constraints whenever legislators' best current information clearly suggests that the constitutional rules should be changed.

Constitutional amendment is necessary to curtail domestic surveillance.

Jurist 15 (Eric – writer with an interest in Constitutional history, "The Case for an Article v, Convention of States, Amending Convention - Part 2 - Surveillance State," published January 12, 2015, https://www.scribd.com/doc/251693629/The-Case-for-an-Article-v-Convention-of-States-Amending-Convention-Part-2-Surveillance-State-Plus-Solution)

The problem we face is daunting and multifaceted, but, in short, it is: a concentration of power by some branches of Government and the abdication of authority by others such that we, as individuals, are left feeling isolated, helpless, and hopeless. Know that none of those things is true, for the ties that bind us as unique, individual Americans, rooted in Natural Law, can never truly be broken so long as we continue, as our Founders (and subsequent generations of Americans), to hold that, with the "firm reliance on the protection of divine Providence," we can unleash a power the likes of which Washington, heretofore, has never seen. The Framers left us with just such power, and it is codified in our Constitution (Article V - an Amending Convention). The Sheer Breadth of the Problem (a few intertwined examples --- all hat tips (h/t) are at the very end): The Surveillance State: The power and scope of these Federal Agencies'

authority is not only astonishing, it is downright frightening, for they continue, unabated, to seize more (for more read Part 1). It is now well known that the **N**ational **S**ecurity **A**gency (NSA) continues to collect not only meta-data, which is concerning as German politician Malte Spitz shows, but it is also collecting email address books, buddy lists, texts, phone records, and audio calls of Americans (even burner phones are not safe as Edward Snowden revealed in his interview with Brian Williams - transcript & audio @3:18). That is most certainly the tip of the iceberg. The vast amount of data collected and stored by the NSA is estimated to reach "966 Exabytes (0.966x10^12 Gigabytes or almost 200 times greater than Eric Schmidt's, former Google CEO, estimated sum of all human knowledge up to 2003 - 5 Exabytes) a year by 2015 (RT interview with NSA whistleblower William Binney, July 2014)." Now, it is incontestable, even at an innate level, that the NSA's (among others) collection of information of Americans violates our most fundamental rights; and none other than James Otis made a better case against such arbitrary abuse of power when arguing in defense of merchants in Salam & Boston, MA in 1761 against General Writs of Assistance (General Warrants issued by officers or their deputies) against the Crown, and in his spirited defense, as notated by John Adams, he states: "I was desired by one of the Court to look into the books, and consider the question now before them concerning the Writs of Assistance…It appears to me the worst instrument of arbitrary power, the most destructive of English liberty and the fundamental principles of law, that ever was found in an English law book… Your Honours will find in the old books concerning the office of a Justice of the Peace, precedents of general warrants to search suspected houses. But in more modern books, you will find only special warrants to search such and such houses, specially named, in which the complainant has before sworn that he suspects his goods are concealed; and will find it adjudged that special warrants only are legal. In the same manner I rely on it, that the writ prayed for in this petition, being general is illegal. It is a power that places the liberty of every man in the hands of every petty officer. I say I admit that special writs of assistance, to search special places, may be granted to certain persons on oath; but I deny that the writ now prayed for can be granted, for I beg leave to make some observations on the writ itself…In the first place, the writ is universal, being directed 'to all and singular Justices, Sheriffs, Constables, and all other officers and subjects;' so that, in short, it is directed to every subject in the King's dominions. Every one with this writ may be a tyrant in a legal manner, also may control, imprison, or murder any one within the realm. In the next place, it is perpetual, there is no return. A man is accountable to no person for his doings. Every man may reign secure in his petty tyranny, and spread terror and desolation around him, until the trump of the archangel shall excite different emotions in his soul. In the third place, a person with this writ, in the day time, may enter all houses, shops, &c. [etc.] at will, and command all to assist him. Fourthly, by this writ, not only deputies, &c. but even their menial servants, are allowed to lord it over us. What is this but to have the curse of Canaan with a witness on us; to be the servant of servants, the most despicable of God's creation? Now one of the most essential branches of English liberty is the freedom of one's house. A man's house is his castle; and whilst he is quiet, he is as well guarded as a prince in his castle. This writ, if it should be declared legal, would totally annihilate this privilege. Custom-house officers may enter our houses when they please; we are commanded to permit their entry. Their menial servants may enter, may break locks, bars, and every thing in their way; and whether they break through malice or revenge, no man, no court, can inquire. Bare suspicion without oath is sufficient. This wanton exercise of this power is not a chimerical suggestion of a heated brain. I will mention some facts." Presently, the NSA is a **tyrant in a legal manner**, as so sanctioned by the Foreign Intelligence Surveillance (FISA) Court. According to NSA whistleblower Russ Tice they are not indiscriminate in the individuals they target: from high-ranking military officials to members of Congress (especially those on intelligence or armed services committees), to judges and so forth. A similar organization, the Central Intelligence Agency (CIA) revealed, on July 31st, 2014 that it did spy on the Senate Intelligence Committee. It is not so farfetched to suggest that the NSA would also conduct such surveillance as well and lord it over us. The surveillance and data collection does not end there: In May 2013, it was learned that the Department of Justice (DOJ) "secretly obtained two months' worth of telephone records of journalists working for the Associated Press." Following the heels of that story, it was learned that the DOJ also "obtained a portfolio of information about a Fox News correspondent's conversations and visits (DOJ Targets Fox News, Accuses Reporter of a Crime.., May 2013). And, in October 2013 a journalist's home was raided and "agents had taken her private documents – documents that were not listed on the search warrant." In August 2013, Reuters learned that the Drug Enforcement Administration (DEA) Special Operations Division (SOD), which is made up of "two dozen partner agencies…including the FBI, CIA, NSA, Internal Revenue Service and the Department of Homeland Security," "is funneling information from intelligence intercepts, wiretaps, informants and a massive database of telephone records to authorities across the nation to help them launch criminal investigations of Americans." In January 2014, it was revealed that the, relatively, newly created Consumer Financial Protection Bureau (CFPB) is "conducting a massive, NSA-esque data-mining project collecting account information on an estimated 991 million American credit card accounts….[and] that CFPB officials are working with the Federal Housing Finance Agency on a second data-mining effort, this one focused on the 53 million residential mortgages taken out by Americans since 1998." In August 2014 The Intercept obtained documents showing that the "NSA built its own secret Google" called ICREACH. "ICREACH has been accessible to more than 1,000 analysts at 23 U.S. government agencies that perform intelligence work, according to a 2010 memo. A planning document from 2007 lists the DEA, FBI, Central Intelligence Agency, and the Defense Intelligence Agency as core members. Information shared through ICREACH can be used to track people's movements, map out their networks of associates, help predict future actions, and potentially reveal religious affiliations or political beliefs." Couple all of the above with what Edward Snowden pointed out just in relation to innocuous Web searches and what the information allows an agency to conclude: "Are you doing something, are you someplace you shouldn't be, according to the government, which is arbitrary, you know — are you engaged in any kind of activities that we disapprove of, even if they aren't technically illegal? And all of these things can raise your level of scrutiny, even if it seems entirely innocent to you. Even if you have nothing to hide. Even if you're doing nothing wrong. These activities can be misconstrued, misinterpreted, and used to harm you as an individual, even without the government having any intent to do you wrong. The problem is that the capabilities themselves are unregulated, uncontrolled, and dangerous." Under such unreasonable surveillance and collection of data, how can an individual ever be secure in their person, house, papers, and effects? "It is impossible to devise a more outrageous and unlimited instrument of tyranny than this proposed writ: and it cannot be wondered at, that

such an alarm should have been created, when it is considered to what enormous abuses such a process might have led (Remarks about Otis' speech, as published by William Tudor in 1823, James Otis's speech on Writs of assistance, Parker P. Simmons, 1906, p.16)." The Solution: As James Otis asserted in his fiery arguments against Writs of Assistance (General Warrants), in 1761, "Every man, merely natural, was an independent sovereign, subject to no law, but the law written on his heart, and revealed to him by his Maker, in the constitution of his nature, and the inspiration of his understanding and his conscience. His right to his life, his liberty, no created being could rightfully contest. Nor was his right to his property less incontestible...He asserted that these rights were inherent and inalienable. That they never could be surrendered or alienated." However, tyranny abounds, attempting to separate, surrender, and alienate our inherent and inalienable rights; in the face of so much tyranny what can we do? **There is only one legitimate answer left**, and the Framers deliberately gave it to us in **Article V - an Amending Convention**. "The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress." Thus, all that is needed is for 34 States to pass an application (resolution) calling for an Amending Convention. In 2014, three States (GA, AK, & FL) successfully passed an application calling for an Amending Convention for the sole purpose of limiting the size, scope, and jurisdiction of the Federal Government. Now, we have this second mode of amending the Constitution, because two days prior to the end of the Constitutional Convention George Mason (from James Madison's notes): "thought the plan of amending the Constitution exceptionable & dangerous. As the proposing of amendments is in both the modes to depend, in the first immediately, and in the second, ultimately, on Congress, no amendments of the proper kind would ever be obtained by the people, if the Government should become oppressive, as he verily believed would be the case." And so, the adopted version of Article V included the method of using the State Legislatures to propose amendments, for a tyrannical government would never restrain its own power.

Net Benefits

Amendment avoids Legitimacy DA

Amendments save court legitimacy—court action uniquely undermines it

Vermule 2004(Adrian, Professor of Law at the University of Chicago, September, "Constitutional Amendments and the Constitutional Common Law", http://www.law.uchicago.edu/files/files/73-av-amendments.pdf)

There is another side to the ledger, however. Premise (i) holds that the lower the rate of amendment, the more updating that the Court must supply; and the need to update constitutional law can itself damage the Court' s public standing in straightforward ways. Overrulings, switches in time, creative and novel interpretation, all the tools that judges use to change the course of constitutional adjudication, them selves may draw down the Court's political capital by fracturing the legalistic façade of constitutional interpretation. An equally plausible causal hypothesis, then, is that increasing the rate of amendments might increase the Court's sociological legitimacy by reducing the need f o r judicial self - correction. In particular cases, legitimacy-granting publics might react poorly to judicial flip-flops, while viewing form al amendments that overturn judicial decisions as the proper legal channel for change—the very use of which assumes that the judges have done their job well, not poorly. This is rankly speculative, but the point is that (ii) is rankly speculative as well. It is hard to know about any of this in the abstract; but we cannot simply assume (ii), in the faith that a world without (nonjudicial) amendments is the best of all possible worlds to inhabit.

Legitimacy DA—Link

Court action undermines legitimacy

Lasser 1988(William, Professor of Political Science at Clemson, "The Limits of Judicial Power: The Supreme Court in American Politics", P. 246)

An institution apparently so weak and so dependent on conformity to the popular will had to move with great care and circumspection, at least in extreme cases. If the justices tried to impose their will on an unwilling public, they were doomed to failure or worse. "Surely the record teaches that no useful purpose is served when the justices seek the hottest political cauldrons of the moment and dive into the middle of them," McCloskey counseled. "Nor is there much to be said for the idea that a judicial policy of fiat and uncompromising negation will halt a truly dominant political impulse." Instead, the justices had to learn history's compelling lesson: "The Court's greatest successes have been achieved when it has operated near the margins rather than at the center of political controversy, when it has nudged and gently tugged the nation, instead of trying to rule it." After two hundred years of struggling to establish itself as a vital force in American politics, McCloskey concluded, "it would be a pity if the judges . . . should now once more forget the limits that its own history so compellingly prescribes."

Legitimacy DA—A2: CP Links

The counterplan doesn't link—its key to prevent legitimacy collapse

Carter 1986(Stephen, Professor of Law at Yale University, January 1, "The Morgan "Power" and the Forced Reconsideration of Constitutional Decisions", http://digitalcommons.law.yale.edu/cgi/viewcontent.cgi?article=3260&context=fss_papers)

If all of this is so, then the place of the Morgan power in the dialogue between the Court and its constituents should be plain. I earlier outlined the ideal of symbiotic progress, in which the Congress and the Supreme Court take turns leading the way toward a better future. An exercise of the Morgan power may fit into that progression in a special way, as the Congress's most effective tool for expressing its strong disapproval of a judicial decision accepting [*857] or rejecting a claim of fundamental right without risking the Court's legitimacy, hence the Constitution's, hence ultimately its own.

2NC/1NR

2NC Solvency-General

CP solves the case and no AFF offense applies

Rotunda and Safranek 96 (Ronald D. – Professor of Law at the University of Illinois College of Law, and Stephen J. – Associate Professor of Law, University of Detroit Mercy School of Law, "An Essay on Terms and Limits and A Constitutional Convention," 80 Marq. L. Rev. 227, http://scholarship.law.marquette.edu/cgi/viewcontent.cgi?article=1487&context=mulr)

Constitutional conventions, like constitutional amendments proposed by Congress, should not be taken lightly. However, the convention method does not threaten constitutional rights as feared by critics. The convention method is a necessary and integral part of the Constitution that must remain available to state legislators, and the people they serve, to ensure that Congress serves the people, rather than its own self-interest. As Abraham Lincoln noted in his first inaugural address: I will venture to add that, to me, the convention mode seems preferable, in that it allows amendments to originate with the people themselves, instead of only permitting them to take, or reject, propositions, originated by others, not especially chosen for the purpose, and which might not be precisely such, as they would wish to either accept or refuse. The convention method of amendment is a **critical component of the constitutional balance of power** because it acts as a safety valve for proposing amendments. Congress has proposed numerous constitutional amendments and some of these amendments have directly limited state power. However, none of the proposed amendments have directly limited congressional power. The framers of the Constitution anticipated that Congress would be reluctant to make proposals that would reduce its own powers. Thus, the framers created the convention method as an important safety valve to propose needed amendments when federal lawmakers impede reform. Indeed, history has shown that even the looming possibility of a convention can be enough to force Congress to act. Without this safety valve, the Seventeenth Amendment, providing for the direct popular election of Senators, might never have come to be.

Article V upholds Constitutional intention best, checking executive branch and Congressional overreach.

Denning 97 (Brannon P., Associate Professor of Law at the Cumberland School of Law at Samford University, "Means to Amend: Theories of Constitutional Change," 65 Tenn. L. Rev. 155, http://heinonline.org/HOL/Page?handle=hein.journals/tenn65&div=10&g_sent=1&collection=journals)

An obvious weakness of informal constitutional change, regardless of how impermanent, is that it effects a change in the constitutional order independent of Article V's rigors. Article V was meant to reinforce important principles of the Constitution: order, stability, legitimacy through consensus, and federalism. Change produced outside Article V runs the risk of producing disorder, instability, and dissensus. Further, the reliance on informal change can produce a constitutional culture in which people feel less and less bound by the words of the document which supposedly governs them. Worse, that culture may produce leaders who do not feel constrained by a document they take a pledge to uphold and defend. In the end it might be true, as John Vile has written, that an amendment to prohibit flag burning may do less damage to the Constitution in the long run than does a Supreme Court interpretation of the First Amendment allowing the same conduct. By the same token, it may do less harm to the country in the long run to redefine the war-making responsibilities of Congress and the President through a constitutional amendment than to have those powers claimed on an ad hoc basis by the President every time he exercises power as commander-in-chief.

2NC—Solvency-Surveillance

A radically different approach to addressing surveillance concerns is necessary given Washington's polarization

Wright 15 (Jazzy – Press Officer at the American Library Association, citing Alan S. Inouye – director of the American Library Association's (ALA) Office for Information Technology Policy (OITP), "It's time that we had a digital Constitutional Convention," in District Dispatch, 5-28-15, http://www.districtdispatch.org/2015/05/we-need-to-have-a-digital-constitutional-convention/)

Is it time to organize a digital **constitutional convention** on the future of the internet? In a thought-provoking op-ed published in The Hill, Alan S. Inouye, director of the American Library Association's (ALA) Office for Information Technology Policy (OITP) calls on the nation's leaders in government, philanthropy, and the not-for-profit sector to convene a digital constitutional convention for the future of the internet. Today we stand at the crossroads of **establishing digital society for generations to come**. By now, it is clear to everyone—not just network engineers and policy wonks—that the Internet is at the same time a huge mechanism for opportunity and for control. Though the advent of the Internet is propelling a true revolution in society, we're not ready for it. Not even close. For one thing, we are so **politically polarized** at the national level. The latest evidence: the net neutrality debate. Except it wasn't. For the most part, it was characterized by those who favor assertive regulatory change for net neutrality stating their position, restating their position, then yelling out their position. Those arguing for the status quo policy did likewise. As the battle lines were drawn, there was little room to **pragmatically consider a compromise advanced** by some stakeholders. The current state of digital privacy seems along these lines, as well. With copyright, it is even worse, as a decades-long "debate" has those favoring the strongest copyright protection possible dominating the discourse. Another problem, as the preceding discussion suggests, is that issues clearly related to each other—such as telecommunications, privacy, and copyright—are debated mostly in their own silos. We need a **radically different approach to address** these foundational concerns that will have ramifications for decades to come. We need something akin to the Constitutional Convention that took place 228 years ago. We need today's equivalents of George Washington, James Madison, and Benjamin Franklin to come together and apply their intellectual and political smarts—and work together for the good of all, to lay out the framework for many years to follow. Most people in the country are in the middle of the political spectrum. They (We) are reasonable people. We want to do as we please, but realize that we don't have the right to impinge on others' freedom unduly. We're Main Street USA. This sounds so simple and matter-of-fact, but we inside-the-beltway people understand how hard this is to achieve in national policy. We just look outside our windows and see the U.S. Capitol and White House to remind ourselves of the challenge of achieving common-sense compromise in a harsh political climate. Of course this is not easy. Some of us think of the challenge we need to address as access to information in the digital society, but really we're talking about the allocation of power—so the stakes are even higher than some may think. In a number of respects, power is more distributed in digital society. Obviously, laws, regulation, and related public policy remain important. Large traditional telecommunications and media companies remain influential. But now the national information industry includes Google, Apple, Facebook, Microsoft, and other major corporate players who also effectively make "public policy" through product decisions. Similarly, the continuing de facto devolvement from copyright law to a licensing regime (with the rapid growth of ebooks as the latest major casualty) also is shifting power from government to corporations. In some respects, individuals also have more power thanks to the proliferation of digital information and the internet that enable capabilities that previously only organizations could muster (e.g., publishing, national advocacy).

Amendments are the best way to advance constitutional law and check intelligence authority

Denning and Vile 2 (Brannon P. – Professor of Law at Samford University, John R. – Department Chair of Political Science at Middle Tennessee State University, "The Relevance of Constitutional Amendments: A Response to David Strauss," 77 Tul. L. Rev. 247, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=319702)

But let us concede, for the sake of argument, that informal channels for constitutional change would have developed. 28 We are then faced with another of Strauss's troubling assumptions: that constitutional change advances, uninterrupted, toward whatever progressive norms that we have heretofore relied on amendments to install in the Constitution - racial equality, full political participation for women and eighteen-year-olds, and the elimination of barriers to [*256] full enfranchisement for the poor and other minorities. 29 In

Strauss's world, there is no reaction, no backlash that forestalls future gains (perhaps placing them out of reach), and no backsliding by courts or legislatures. Again and again, he assures us that whatever gains were secured by amendment were already secured in large part or would have been in due time, amendment or not. 30 But often these assertions are made on his own authority, and he does not entertain the possibility that circumstances would have intervened that slowed change, or reversed its direction. Even in the case of a failed amendment, one might argue that by putting the change sought on the Nation's political agenda, the amendment's proponents acted as a catalyst for that change, which, in the absence of an amending mechanism, would not have otherwise progressed in the same way. 31 Strauss also ignores the inherently unstable nature of informal change. Congress may pass laws, but those laws are subject to repeal (or presidential veto). Executive orders may be rescinded. Court decisions may be overruled, distinguished, or ignored. And so on. Consider the New Deal. David Kyvig contrasts Reconstruction with the New Deal by noting the absence of any trace left by the latter in [*257] the text of the Constitution. 32 If Strauss's theory is correct, one would have expected that the Supreme Court's federalism decisions during the 1990s (and early 2000s) would have encountered more resistance from a public that had demanded substantial changes to the small-c-constitution effected after 1937. 33 Yet it is precisely because the New Deal did not enshrine its changes in the Constitution that change was provisional and subject to yet more change in the future. 34

2NC Solvency-Courts

Incremental judicial changes are surpassed by amendments.

Labunski 2k (Richard – Professor of Journalism at the University of Kentucky, "The Second Constitutional Convention: How American People Can Take their Government Back," p. 177-178)

For the judicial branch to serve its indispensable function within a complicated political and legal environment, it must be able to create certain standards that preserve its independence and legitimacy. Many of those standards permit judges to be creative in advancing the law and shaping it to reflect changing conditions. But many of the self-imposed rules and procedures — which have developed over a long period of time and which judges believe are necessary for the courts to function—significantly limit the scope and pace of constitutional change. The American people cannot wait while the courts make incremental modifications to the Constitution one case at a time over many years. They must take bolder and more comprehensive action by holding a second convention to recommend amendments that will help to restore democratic principles and make government more accountable.

Constitutional amendments are not influenced by petty political concerns.

Labunski 2k (Richard – Professor of Journalism at the University of Kentucky, "The Second Constitutional Convention: How American People Can Take their Government Back," p. 111)

Judges cannot, however, be the sole source of constitutional interpretation, aided by an occasional amendment. Because of political nature of the court system — especially the way cases come to and are decided by courts — judges cannot be expected to solve the problems created by an out-of-control campaign finance system and the other challenges that must be addressed by a second constitutional convention. The judicial branch plays an indispensable role in preserving civil liberties against encroachment by government, in striking down laws that violate the Constitution, in interpreting statutes, and by settling other legal disputes. But judges cannot do more than make incremental changes in **a system that cries out for more comprehensive reform**.

Extrajudicial interpretations of the Constitution have resolved multiple issues --- empirically solves

Whittington 2 (Keith – Professor of Politics at Princeton University, "Extrajudicial Constitutional Interpretation: Three Objections and Responses," North Carolina Law Review, Vol. 80, No. 3, 2002, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=293479)

If critics of extrajudicial constitutional interpretation overstate the stability of judicial interpretation, they also underestimate the stability of nonjudicial interpretation. Judicial supremacy is not necessary to settle constitutional understandings. Examples of extrajudicial settlement of constitutional disputes are **commonplace**. Britain has long relied on constitutional convention rather than constitutional law to provide such settlements, and analogous practices exist in the United States. n133 Policymakers were faced with constitutional indeterminacies early on in the nation's history and had little expectation that the judiciary either would or could clarify and stabilize the constitutional rules. Elected officials reached constitutional settlements of their own. Congress determined, for example, that the President could unilaterally remove executive officials. n134 The President successfully vetoed legislation

on policy grounds n135 and excluded the Senate from the negotiation of treaties. n136 Congress and the President agreed on procedures for acquiring new territory and admitting new states into the union. n137 The House and Senate established an understanding of impeachable offenses, and insisted that partisanship was inconsistent with judicial office. n138 George Washington set an enduring precedent of the two-term presidency, and Abraham Lincoln marshaled support for the view that states did not have a right to secede from the Union. The Senate understands that Presidents will generally nominate only members of [*805] their own party to serve in government offices, while the President understands the requirements of "senatorial courtesy." These settlements and others have endured through most of the nation's history with **little assistance from the judiciary**. Other political interpretations of the Constitution have structured government behavior for decades at a time. The Federalists established a broad interpretation of federal powers that embraced the incorporation of a national bank, and the Jacksonian Democrats replaced it with a narrow interpretation - John Marshall's formal endorsement of the broad interpretation notwithstanding. n139 The Federalists successfully claimed that the federal tariff power could be used to protect domestic manufacturers, and the Jacksonian Democrats forcefully abandoned that claim. n140 Presidents through most of American history claimed a power to impound appropriated funds, and in the 1970s Congress successfully established a framework for regulating the presidential spending power and clarifying the congressional power of the purse. n141 Congress regularly passes "framework legislation" and "statutes revolving in constitutional law orbits." n142 For much of the nineteenth century, legislatures were the primary institution for determining the scope of individual rights and were able to settle such disputes at least as effectively as the judiciary. n143 Extrajudicial constitutional settlements gain their stability from a variety of sources, despite the absence of a formal commitment to the authority of precedent. Not least among these supports for settlement is popular opinion. As Edward Corwin noted in outlining departmentalist theory, "finality of interpretation is hence the outcome - when indeed it exists - not of judicial application of the Constitution ... but of a continued harmony of views among the three [*806] departments. It rests, in other words, in the last analysis, on the voting power of public opinion." n144

2NC Judicial Review Key (Sullivan)

Only the counterplan solves – no one models an obsolete document-a strong Constitution is the basis for all of their court key arguments

Law and Versteeg 2012

David S., University of Washington St. Louis Professor of Law and PoliSci, and Mila, UVA Law Professor, The Declining Influence of the United States Constitution New York University Law Review, Vol. 87, 2012 http://whatthegovernmentcantdoforyou.com/wp-content/uploads/2012/02/ssrn-id1923556.pdf

It is equally plausible, however, that responsibility for the declining appeal of American constitutionalism lies with the idiosyncrasies of the Constitution itself rather than the proclivities of the Supreme Court. As the oldest formal constitution still in force, and one of the most rarely amended constitutions in the world,276 the U.S. Constitution contains relatively few of the rights that have become popular in recent decades,277 while some of the provisions that it does contain may appear increasingly problematic, unnecessary, or even undesirable with the benefit of two hundred years of hindsight.278 It should therefore come as little surprise if the U.S. Constitution strikes those in other countries—or, indeed, members of the U.S. Supreme Court279 –as out of date and out of line with global practice.280 Moreover, **even if the Court were committed to interpreting the Constitution in tune with global fashion,** it would still lack the power to update the actual text of the document. Indeed, efforts by the Court to update the Constitution via interpretation may actually reduce the likelihood of formal amendment by rendering such amendment unnecessary as a practical matter. 281 As a result, there is **only so much that the U.S. Supreme Court can do to** make the U.S. Constitution an attractive formal template for other countries. The obsolescence of the Constitution, in turn, may **undermine the appeal of American constitutional jurisprudence**: **foreign courts have little reason to follow the Supreme Court's lead on constitutional issues if the Supreme Court is saddled with the interpretation of an unusual and obsolete constitution**.282 **No amount of ingenuity or solicitude for foreign law on the part of the Court can entirely divert attention from the fact that the Constitution itself is an increasingly atypical document.**

Amendments cause judicial modeling

Marron '03 [Brian P. Editor in Chief of MARGINS Symposium @ Maryland Law, 3 Conn. Pub. Int. L.J. 157, ln]

Raskin explains that some of the solutions require the adoption of new Constitutional amendments such as the ones he has mentioned earlier. Congress lacks the power to effectively reverse the Supreme Court's (mis)interpretations of the Constitution that rejected democratic values. 129 In fact, a movement for democratic constitutional change itself can **influence the reasoning of the Court**. For instance, although the Equal Rights Amendment failed to pass, the Supreme Court apparently took notice of the movement's principles and began to apply "**heightened" scrutiny to** cases of **gender**-based **classifications.** 130

2NC CP doesn't do anything (Strauss)

Only amendments can solve in a national security crisis-the plan is meaningless

Goldstein 1988(Yonkel, J.D. from Stanford Law School, July, "The Failure of Constitutional Controls Over War Powers in the Nuclear Age: The Argument for a Constitutional Amendment", 40 Stan. L. Rev. 1543, Lexis)

None of the proposals to control nuclear weapons discussed above provide the kind of clarity and definitiveness which one would hope would characterize the rules governing the initiation and prosecution of a nuclear war. These proposals are grounded not in a line of clear precedent, but in a soggy morass of conflicting principles. Equally important, there is the perception, by people who regard themselves as hardened realists, that to adhere religiously to orthodox principles of congressional war declaration would be to render the entire nuclear defense deterrence system virtually worthless. [*1587] Because of these considerations, a constitutional amendment concerning the appropriate distribution of war powers should be adopted. More than any other legislative or rulemaking device, a constitutional amendment has a chance of commanding sufficient authority to be credible, **especially in time of crisis**. Because the constitutional problems associated with the control of nuclear weapons are so closely related to the war powers in general, the amendment must deal with war powers generally. Because technical capabilities of weapons and defense systems can change relatively rapidly, it is important that the amendment does not rigidly lock the nation into any specific procedure which is sure to become obsolete. Finally, the amendment ought to account for the recent congressional tendency to avoid taking stands on controversial issues until public opinion has clearly been discerned. Although the desire of members of Congress to see how their constituencies regard an issue is understandable, following massive public sentiment is not a viable option in many nuclear scenarios. Analogous to this congressional hesitancy is the Judiciary's reluctance to involve itself in questions of this kind. If my characterization of the problem is correct, namely that the Executive, aided by judicial acquiescence, has expanded its powers at the expense of congressional power, only one additional source of power on the federal level remains -- that is, of course, the people. The amendment proposed below attempts to take all of the above considerations into account.

Specificity ensures solvency (also in delay block)

Strauss 01 [David A., not David P. but Prof of Law @ Chicago, 114 Harv. L. Rev. 1457, ln]

Finally, for an amendment to matter, it must be unusually difficult to evade. An amendment that specifies a precise rule, for example, is more likely to have an effect than one that establishes only a relatively vague norm. If its text is at all imprecise, an amendment that is adopted at the high-water mark of public sentiment will be prone to narrow construction or outright evasion once public sentiment recedes, as the Fourteenth and Fifteenth Amendments were.

Strauss is wrong

Denning and Vile 02 [Brannon P., Prof of Law @ Samford, and John R., Dept. Chair of PoliSci @ MTSU, "The Relevance of Constitutional Amendments: A Response to David Strauss," 77 Tul. L. Rev. 247, ln]

But let us concede, for the sake of argument, that informal channels for constitutional change would have developed. 28 We are then faced with another of Strauss's **troubling assumptions**: that constitutional change advances, uninterrupted, toward whatever progressive norms that we have heretofore relied on amendments to install in the Constitution - racial equality, full political participation for women and eighteen-year-olds, and the elimination of barriers to [*256] full enfranchisement for the poor and other minorities.

29 In Strauss's world, there is no reaction, no backlash that forestalls future gains (perhaps placing them out of reach), and no backsliding by courts or legislatures. Again and again, he assures us that whatever gains were secured by amendment were already secured in large part or would have been in due time, amendment or not. 30 But often **these assertions are made on his own authority**, and he **does not entertain** the possibility that circumstances would have intervened that slowed change, or reversed its direction. Even in the case of a failed amendment, one might argue that **by putting** the **change sought on the Nation's political agenda**, the **amendment's proponents acted as a catalyst for** that **change, which**, in the absence of an amending mechanism, **would not have otherwise progressed** in the same way. 31 Strauss also **ignores** the **inherently unstable** nature of informal change. Congress may pass laws, but those laws are subject to repeal (or presidential veto). Executive orders may be rescinded. Court decisions may be overruled, distinguished, or ignored. And so on. Consider the New Deal. David Kyvig contrasts Reconstruction with the New Deal by noting the absence of any trace left by the latter in [*257] the text of the Constitution. 32 If Strauss's theory is correct, one would have expected that the Supreme Court's federalism decisions during the 1990s (and early 2000s) would have encountered more resistance from a public that had demanded substantial changes to the small-c-constitution effected after 1937. 33 Yet it is precisely because the New Deal did not enshrine its changes in the Constitution that change was **provisional** and subject to yet more change in the future. 34

2NC-Delay

---Fiat is immediate and reciprocal—ensures fair division of ground between the aff and neg, their interpretation means all counterplans would be delay, and the neg could never win.

---amendment process is not inherently slow

Jackson '01 (Jesse L. Jackson, Jr., 2001, U.S. Representative, "A More Perfect Union: Advancing New American Rights")

Some will say that amending the Constitution once, not to mention eight times, takes too long, requires too much energy, and costs too much money – that it's an inefficient stewardship of time and resources. The answer to the first argument is that the Constitution has been amended twenty-seven times, including seventeen times since the original Bill of Rights was passed. (The Bill of Rights itself required 811 days – from September 25, 1789, to December 15, 1791 – for ratification.) Following the initial, usually lengthy struggle to get an amendment through two-thirds of the House and Senate, there is no time limit for ratifying it – that is, no seven-year limitation on ratifying amendments, as many people believe. This schedule was arbitrarily placed on the Equal Rights Amendment (and later extended to ten years) and the D.C. Statehood Amendment. Once a state legislature votes for an amendment, that affirmation remains in place, unless a later body reverses it. How long it takes for my amendments to be passed by House and Senate, and ratified by three-quarters of the state legislatures, will be determined by a combination of political leadership and the will of the American people. If Americans have a strong desire for these rights – have a political fire burning in their bellies – such amendments can be shuttled through the House and Senate and ratified relatively quickly after a legitimate national debate on their substance and implications.

---Plan is slow-massive delay

Rosenberg, McClatchy Newspaper, 2011

(Carol, "How Congress helped thwart Obama's plan to close Guantanamo", 1-22, http://www.mcclatchydc.com/2011/01/22/107255/how-congress-helped-thwart-obamas.html, ldg)

Key among the factors, the cables suggest: Congress' refusal to allow any of the captives to be brought to the United States. In cable after cable sent to the State Department in Washington, American diplomats make it clear that the unwillingness of the United States to resettle a single detainee in this country — even from among 17 ethnic Muslim Uighurs considered enemies of China's communist government – **made other countries reluctant to take in detainees**. Europe balked and said the United States should go first. Yemen at one point proposed the United States move the detainees from Cuba to America's SuperMax prison in the Colorado Rockies. Saudi Arabia's king suggested the military plant micro-chips in Guantanamo captives before setting them free. A January 2009 cable from Paris is a case in point: France's chief diplomat on security matters insisted, the cable said, that, as a precondition of France's resettling Guantanamo captives the United States wants to let go, "the U.S. must agree to resettle some of these same LOW-RISK DETAINEES in the U.S." In the end, France took two. Closing the Guantanamo detention center had been a key promise of the Obama presidential campaign, and the new President Barack Obama moved quickly to fulfill it. Just two days after taking the oath of office, on Jan. 22, 2009, Obama signed an executive order instructing the military to close Guantanamo within a year. European countries were effusive in their praise. But as the second anniversary of that order passed Saturday, the prison camps remain open, and the prospects of their closure appear dim. Prosecutors are poised to ramp up the military trials that Obama once condemned, and the new Republican chairman of the House Armed Services Committee, Rep. Buck McKeon of California, last week said the U.S. should grow the population to perhaps 800 from the current 173. Many factors worked to thwart Obama's plans to close the camps — from a tangled bureaucracy to fears that released detainees would become terrorists. But Congress'

prohibition on resettling any of the detainees in the United States hamstrung the administration's global search for countries willing to take the captives in. The U.S. refusal to take in the captives "comes up all the time," acknowledged a senior Obama administration official of U.S. efforts to find homes for released detainees. "Were we willing to take a couple of detainees ourselves, it would've made the job of moving detainees out of Guantanamo significantly easier," said the official, who agreed to speak only anonymously because of the delicacy of the diplomacy.

An amendment that specifies a precise rule is immediate in effect.

Strauss 1 (David A. – Harry N. Wyatt Professor of Law at the University of Chicago, "The Irrelevance of Constitutional Amendments," 114 Harv. L. Rev. 1457, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2986&context=journal_articles)

Finally, **for an amendment to matter, it must be** unusually **difficult to evade**. **An amendment that specifies a precise rule**, for example, **is more likely to have an effect than one that establishes only a relatively vague norm**. If its text is at all imprecise, an amendment that is adopted at the high-water mark of public sentiment will be prone to narrow construction or outright evasion once public sentiment recedes, as the Fourteenth and Fifteenth Amendments were.

2NC—AT: Runaway

The CP solves --- a limited Constitutional convention solves.

Eidsmoe 92 (John – Senior Counsel and Resident Scholar at the Foundation for Moral Law, "New Constitutional Convention--Critical Look at Questions Answered, and Not Answered, by Article Five of the United States Constitution," 3 U.S. A.F. Acad. J. Legal Stud. 35, http://heinonline.org/HOL/Page?handle=hein.journals/usafa3&div=6&g_sent=1&collection=journals)

Concon proponents answer that these fears are totally unfounded. States may limit the convention to a single issue by calling for a convention for that limited purpose. Likewise, Congress, in calling the convention, may in its statutory call limit the convention's authority and purposes. The late Senator Everett Dirksen (R-Ill) believed a convention could be limited: I apprehend that when the applications are for a stated purpose or amendment... then in effect the state legislatures, which alone possess the initiative in convening a convention, have by their own action taken the first step toward limiting the scope of the convention. It would then remain for the Congress to implement this attempt to limit the convention by making appropriate provision in its call.' The late Senator Sam Ervin (D-NC), regarded as one of the leading constitutional experts ever to serve in the U.S. Senate, also believed the states and Congress can limit the scope of a convention." The American Bar Association conducted a detailed study of the issue and reached the same conclusion in 1973.

2NC—AT: Theory

CP provides unique education on surveillance and the separation of powers.

Forsythe and Presser 6 (Clarke D. – Director of the Project of Law and Bioethics at Americans United for Life, and Stephen B. – Professor of Legal History at Northwestern University School of Law, "RESTORING SELF-GOVERNMENT ON ABORTION: A FEDERALISM AMENDMENT," 10 Tex. Rev. Law & Pol. 301, http://www.trolp.org/main_pgs/issues/v10n2/Forsythe.pdf)

Our constitutional system provides only two ways to overturn a Supreme Court holding interpreting the Constitution: an overruling decision by the Court itself or a constitutional amendment. Obviously, constitutional amendments are among the most difficult political goals to achieve in our constitutional system. This article is unique in its explanation of the legal effect and implications of a federalism amendment on abortion. Because no previous legal analysis of this kind exists, this article is limited to evaluating the legal impact of a federalism [*341] amendment. It is beyond the scope of this article to evaluate fully the political obstacles or implications involved in the passage of such an amendment. For those who believe, as we do, that Roe has poisoned our political and judicial discourse, the political obstacles facing such an amendment ought to be weighed against the political obstacles to changing the Court's membership in the coming years to accomplish the same goal. Given that these political obstacles have resulted in a situation where there are only two publicly-declared Justices remaining on the Supreme Court who advocate the overturning of Roe thirty-three years after Roe, the obstacles to a constitutional amendment, while severe, may be less formidable than attempting to overrule Roe by changing the membership of the Court. Even if an amendment is impossible to accomplish, we do believe that legal and strategic dialogue and debate on abortion is healthy for its own sake. It is also possible that the arguments, public education, and political support involved in advocating a federalism amendment, even if Congress fails to consider an amendment, might move future Justices closer to the point of finally overturning this tragic decision.

---Don't get it twisted---the plan also does something that never happens i.e. the Court contradicting something when both branches agree it's a national security issue.

---Probability of amendment process isn't an argument

Castro 86—JD Candidate at UPenn

(A Constitutional Convention: Charting Article V's Undiscovered Country,

134 U. Pa. L. Rev. 939)

[*940] **The possibility of a convention is not here merely for the moment -- it is here to stay.** Convention requests have already been filed on a variety of issues; [6] this is the second time in the past twenty years that Congress has **almost been forced to call a constitutional convention**. [7] Unfortunately, the process of amendment via a constitutional convention has never been thoroughly worked out. [8] No one need elaborate on what may happen if Congress calls a convention while the convention process remains undefined; one need only reflect on the impact of the last convention on the Articles of Confederation to gain a sense of the magnitude of change that might occur.

---Topic Focus---this is a legal topic-process matters-their interpretation turns the topic into surveillance good/bad-the question of how executive authority should be constrained is obviously a core issue and a legitimate avenue for negative ground.

---Reciprocity isn't a reason to reject

A. Structural affirmative advantages offset. Speaking first and last, infinite prep time, and affirmative win percentages prove.

B. Arbitrary. Multi-actor fiat is not intrinsically more fiat than single-actor fiat. Increasing a controversial restriction on executive authority is reciprocal to the counterplan.

C. Undermines policy analysis and education. Issues like reciprocity are not absolute and should be balanced against attempts to find the best policy and developing arguments grounded in the literature.

---Optimal Policy-The purpose of policy debate is to find the best policy. The affirmative has unlimited time to devise the best plan it can. If it's proven not to be the best, it should be rejected.

2NC A2: Multi-Actor Fiat

--- Their interpretation is like a bad high school civics class-multiple actors is an intrinsic element in policymaking

GEYH 98 Georgetown Law Journal

http://www.findarticles.com/p/articles/mi_qa3805/is_199810/ai_n8809190

Despite the high school civics mantra that our government is comprised of three separate and independent branches, the paradoxical interdependence of these "independent" branches-brought about by a system of checks and balances in which each branch possesses the means to make the others miserable if they get out of line-is widely understood. Thus, we all know that legislators depend on judges to interpret the meaning of statutes and assess their constitutionality, while judges depend on legislators for the resources needed to perform their interpretive functions.

---Almost all plans require action by multiple agents. Acting through Congress implies the persuasion of over half of its 535 members. There's no difference between this and persuading actors in other government institutions.

2NC State Fiat

---Counter-interpretation. Domestic Actor Model. Fiat should be limited to domestic political actors in the United States. Debate is best understood as an adjunct to democratic decision making. This explains why we always select topics where we have at least some fractional impact on. This provides a fair limit on negative fiat as state or local action as an alternative to federal action is a recurrent issue in American politics.

---Search for best policy justifies. Net benefits checks abuse and is a warrant for voting negative. No rational decision-maker would reject the counterplan if it is a superior policy option to the affirmative.

---Uniform action isn't an argument. Policy realism is a double-edged sword for the affirmative since the status quo not restricting war power.This is a solvency argument at best that enforcement would be uneven not a reason to reject the counterplan.

---Reciprocity isn't an argument. First, the states are treated as a collective in the literature comparing state versus federal action. This checks against their infinite regression impact and proves the counterplan is reciprocal. Second, numerical standard is flawed since one state is clearly not equal to the federal government.

---Solvency advocate isn't an argument. First, all of our solvency evidence for the counterplan is a solvency advocate. Their interpretation is arbitrary. Second, At best this is a solvency argument. Their predictability argument is insane in the context of the damn states counterplan.

2NC Perm-Do Both

---Simultaneous adoption links to our net benefits---the permutation has the Court engage in Constitutional interpretation at the same time an amendment process is resolving the same issue-adopting the plan after the counterplan is an illegitimate time-frame permutation-Future fiat undermines negative ground. It eliminates all short term, time sensitive disadvantages. Without these arguments, debate would be incredibly skewed towards the affirmative

---Judicial involvement undermines the legitimacy of the amendment
Harvard Law Review, 19**90**

103 Harv. L. Rev. 1344 NOTE: CONSTITUTIONAL STARE DECISIS.

Judicial review does not as effectively guarantee widespread public support for the Constitution. 81 Rather than involving both Houses of Congress and each of the states, overruling decisions involve **only the federal courts**. Moreover, while amendments are valid because they follow the process mandated by the Constitution, a Supreme Court decision is acceptable only if its interpretation of the Constitution is convincing. Finally, judicial "amendments" contradict one of the purposes of article V. The amendment process affirms that sovereign power remains with the people and gives them a way to override the [*1357] judgment of the judiciary. 82 As a consequence, **judicial involvement in "amending" is inherently suspect**. 83

---And it links to our Court DA-The permutation bust the Political question doctrine
Castro 86—JD Candidate at UPenn

(A Constitutional Convention: Charting Article V's Undiscovered Country,

134 U. Pa. L. Rev. 939)

> Although there are a number of cases supporting a Supreme Court review of issues arising out of constitutional conventions, [75] it could be [*959] argued that the political question doctrine bars a fourteenth amendment challenge to a state's article V activities. In a nutshell, the problem is that the Court's review of constitutional convention activity must not threaten or undermine "either the *independence and integrity* of one of the branches or levels of government, or the ability of each to fulfill its mission in checking the others so as to preserve the *interdependence* without which independence can become domination." [76] Contrary to the contentions of some commentators, [77] however, the political question doctrine does not present an absolute bar to judicial review of article V activity. Thus, a plaintiff should be able to challenge a state's selection of delegates to a constitutional convention, for example, on the grounds that the selection process did not provide for the adequate representation of minorities.

2NC Perm-Do CP

Court rulings on an issue are distinct from upholding the amendment-Severance is illegitimate because if the 2AC could pick and choose what part of the plan to defend, no counterplan would compete.

Worthen 4 <Kevin J. (Professor of Law and Associate Dean, J. Reuben Clark Law School, Brigham Young University), *BYO Journal of Public Law*, "Same-Sex Marriage Symposium Issue: Who Decides and What Difference Does It Make?: Defining Marriage in "Our Democratic, Federal Republic," 18 BYU J. Pub. L. 273, 2004, lexis>

[*306] As a practical matter, recent experience has demonstrated that state court judicial review of state statutes can too easily lead to judicial resolution of the issue contrary to the will of the people and the legislature. n135 At least some state **court judges appear to be too eager to the resolve the issue for themselves**, without a careful consideration of their proper role in the system. The risk of tyranny of the judiciary is therefore somewhat high on such an impassioned issue. This, in turn, lessens the net benefit of a "double" judicial security. More importantly, as a theoretical matter, in our system, the ultimate sovereign who must remain responsible for whatever acts the government takes is the people. n136 While there are filters though which the people's judgment must pass before it is properly implemented in our system, in the long run, it is their judgment, not that of the judiciary, which should control. If a state constitutional amendment were adopted through the non-initiative process, the people's judgment would have passed through the requisite filters, and federal judicial review would be available to further ensure that other more process-oriented norms were not violated. Thus, while a proponent of "our democratic, federal, republican" form of government might be persuaded either way on the matter, this particular proponent concludes that the optimum form of resolution of the same-sex marriage issue is to specifically address the issue through a non-initiative generated state constitutional amendment.

---Severs judicial restriction-Judicial restrictions are initiated by the Judiciary and distinct from Congressional action

Sullivan-JD Candidate Baylor-4 56 Baylor L. Rev. 253, *

NOTE: The Grizzle Bear: Lingering Exculpatory Clause Problems Posed by Texas Commerce Bank, N.A. v. Grizzle

Exculpatory clauses are governed **not only by legislative requirements but also by judicial restrictions as well.** This Note next **explores the additional requirements imposed by the judiciary**. IV. Judicial Restrictions on Exculpatory Clauses Before the TTA, then under the TTA, and then under the TTC, **Texas courts supplemented statutory law with judicial restrictions on exculpatory clauses**. Texas courts thereby ensured additional protections against breaches committed with reckless indifference, in bad faith, or with intentional adversity to the beneficiary's interests. Courts, however, often employed imprecise language in attempting to constrain exculpation. This imprecise language created a trap for future unwary courts.

2NC—AT: Perm-vs Congress affirmatives

The plan is statutory law, the CP is constitutional law --- they sever normal means

Difference Between 13 ("Difference between Statutory Law and Constitutional Law," http://www.differencebetween.info/difference-between-statutory-law-and-constitutional-law)

Laws are an important part of society; they ensure peace and tranquility throughout the land. Imagine a world without laws, where everyone would be allowed to do as they wish. It would be chaos! Everyone would be free to steal, murder, do business as they please, etc. There would be no one to make sure everyone is treated fairly, business is being lawfully, people are being treated properly, etc. Hence, laws are very important to ensure that everyone is treated fairly and right. No one under the law is given extra power and everyone is treated the same. There are various different types of laws that are used to monitor different parts of the society and each law created monitors that specific part only. For people that are not well versed with the law and its studies can often become confused (with the language adding to the confusion). Statutory Law and Constitutional Law are two different types of law that are used to govern different aspects of the society. Statutory Laws are laws that have been written down and codified by the legislative branch of a country. The law has been set down by a legislature or legislator (if it is a monarchy) and codified by the government. These laws are also known as written law or session law. Statutory laws are often subordinate to the higher constitutional laws. The laws are written on a bill and must be passed by the legislative body of the government. Statutory laws originate from municipalities, state legislature or national legislature. The term 'codified' states that the law is organized by the subject matter. However, not all statutory laws are considered as 'codified'. The statues are often referred to as code. Codifying a law can also refer to taking a common law and putting it in statute or code form. Statues are prone to being over written or expiring, depending on the law that was passed. Many countries depend on a mixed law system to provide the proper justice. This is because statutory laws are often written in general language and may not govern every situation that may arise. In cases like these, the courts must interpret and determine the proper meaning of the statute that is most relevant to the case. Both statutory laws and common laws can be disputed and appealed in higher courts. Constitutional Law is the body of law that defines the relationship between different entities within a nation, most commonly the judiciary, the executive and the legislature bodies. Not all nations have a codified constitution, though all of them have some sort of document that states certain laws when the nation was established. These rules could state the basic human rights of the man and women of that state, including rights to own property, freedom of speech, etc. The main purpose of the constitutional law is to govern the law making bodies in the nation. It gives them set boundaries of the laws they cannot violate. For example, the law makers cannot violate the public's rights to do certain things such as freedom of speech, right to petition, freedom of assembly, etc. The constitutional law of a country can be changed if the government falls or changes. Additions can also be made to the constitution in form of amendments.

2NC Legitimacy-Shifts spotlight to convention (Schafly)

Their evidence is Phyllis Schlafly propaganda against the ERA-you should discount everything she says

Michel-Exildas **Galipeau** 9/6/**11**

http://rooferonfire.blogspot.com/2011/09/michele-bachmann-is-idiot-of-day.html

Phyllis Schlafly did stop the Equal Rights Amendment to the Constitution. She used popular **homophobia and sexism** under the guise of women's rights to **convert minds and prevent ratification of an amendment** that consisted of these sole points: Section 1. Equality of rights under the law shall not be denied or abridged by the United States or by any State on account of sex. Section 2. The Congress shall have the power to enforce, by appropriate legislation, the provisions of this article. Section 3. This amendment shall take effect two years after the date of ratification. Here are some smart kids spelling it out for you: Secondly, Mrs. Schlafly believes, to this day, that **women cannot be raped by their husbands**. In 2007, while giving a speech at Bates College, she uttered the following: "By getting married, the woman has consented to sex, and I don't think you can call it rape. She didn't back down from the statement, in fact, she affirmed it in 2008, when Washington University bestowed an honorary doctorate on her. In an interview with the student newspaper, she reiterated her prior statement. "I think that when you get married you have consented to sex. That's what marriage is all about, I don't know if maybe these girls missed sex ed." Phyllis Schlafly has all kinds of other crazy ideas too. From **blaming the Virginia Tech massacre on the English department** to calling for the impeachment of a Justice who voted to bar minors from receiving the death penalty, old Phyllis is the proud queen of the ultraconservative lobby. She also believes in men's supremacy, with a strong belief that men should avoid career women at all costs, and even the fact that women deserve less pay than men in order to encourage them to pursue their **Christ-approved position as wives and mothers** of many children: "we want a society in which the average man earns more than the average woman so that his earnings can fulfill his provider role in providing a home and support for his wife who is nurturing and mothering their children". She doesn't believe in women holding management positions, wage equality, or discrimination protection in the workplace for women because such protections might give women overtime work or promotions that interfere with her far more important domestic duties. To this day, the 87 year old Queen of Mean is at the forefront of movements against women's health care, gay rights, and fair divorce. Michele Bachmann desires to go to the White House with the teachings of her headmistress firmly at the forefront of her policies. Phyllis Schlafly is one of the meanest women in the public eye, and Bachmann wants to be a bigger, badder, louder version of her.

Commissions CP

1NC

Counterplan: The United States Congress should establish an independent commission empowered to submit to Congress recommendations regarding domestic federal government surveillance. Congress will allow 60 days to pass legislation overriding recommendations by a two-thirds majority. If Congress doesn't vote within the specified period, those recommendations will become law. The Commission should recommend to Congress that _____<insert the plan>_____

2NC O/V

Counterplan solves 100% of the case—Congress creates an independent commission comprised of experts to debate the merits of the plan, and the commission recommends to Congress that it passes the plan—Congress must pass legislation specifically blocking those recommendations within 60 days or the commission's recommendations become law

AND, that solves the AFF—commissions are empowered to debate Internet backdoors and submit recommendations—that's RWB

2NC Solvency

Empirics prove commissions solve
FT 10

(Andrews, Edmund. "Deficit Panel Faces Obstacles in Poisonous Political Atmosphere," Fiscal Times. 02-18-2010. http://www.thefiscaltimes.com/Articles/2010/02/18/Fiscal-Commission-Faces-Big-Obstacles?page=0%2C1//ghs-kw)

Supporters of a bipartisan deficit commission note that at least two previous presidential commissions succeeded at breaking through intractable political problems when Congress was paralyzed. The 1983 Greenspan commission, headed by Alan Greenspan, who later became chairman of the Federal Reserve, **reached an historic agreement to gradually raise Social Security taxes and gradually increase the minimum age at which workers qualify for Social Security retirement benefits. Those recommendations passed both the House and Senate, and averted a potentially catastrophic financial crisis with Social Security.**

2NC Solves Better

CP solves better—technical complexity

Glassman and Straus 15

(Glassman, Matthew E. and Straus, Jacob R. Analysts on Congress at the Congressional Research Service. "Congressional Commissions: Overview, Structure, and Legislative Considerations ," Congressional Research Service. 01-27-2015. http://fas.org/sgp/crs/misc/R40076.pdf//ghs-kw)

Obtaining Expertise Congress may choose to establish a commission when legislators and their staffs do not currently have sufficient knowledge or expertise in a complex policy area.22 By assembling experts with backgrounds in particular policy areas to focus on a specific mission, legislators might efficiently obtain insight into complex public policy problems.23

2NC Backdoors Solvency

Commission solves the plan

RWB 13

(Reporters Without Borders is a UNESCO and UN Consultant and a non-profit organization. "US congress urged to create commission to investigate mass snooping," RWB, 06-10-2013. https://en.rsf.org/united-states-us-congress-urged-to-create-10-06-2013,44748.html//ghs-kw)

Reporters Without Borders **calls on the US Congress to create a commission of enquiry into the links between US intelligence agencies and nine leading Internet sector companies that are alleged to have given them access to their servers.** The commission should also identify all the countries and organizations that have contributed to the mass digital surveillance machinery that – according to reports in the Washington Post and Guardian newspapers in the past few days – the US authorities have created. According to these reports, the telephone company Verizon hands over the details of the phone calls of millions of US and foreign citizens every day to the National Security Agency (NSA), while **nine Internet majors – including Microsoft, Yahoo, Facebook, Google and Apple – have given the FBI and NSA direct access to their users' data** under a secret programme called Prism. US intelligence agencies are reportedly able to access all of the emails, audio and video files, instant messaging conversations and connection data transiting through these companies' servers. According to The Guardian, Government Communication Headquarters (GCHQ), the NSA's British equivalent, also has access to data collected under Prism. The proposed congressional commission should evaluate the degree to which the collected data violates privacy and therefore also freedom of expression and information. The commission's findings must not be classified as defence secrets. These issues – protection of privacy and freedom of expression – **are matters of public interest.**

2NC Cybersecurity Solvency

Commissions are key—solves legitimacy and perception
Abrahams and Bryen 14

(Rebecca Abrahams and Dr. Stephen Bryen, CCO and Chairman of Ziklag Systems, respectively. "Investigating Heartbleed," Huffington Post. 04-11-2014. http://www.huffingtonpost.com/rebecca-abrahams/investigating-heartbleed_b_5134404.html//ghs-kw)

But who can investigate the matter? This is a non-trivial question because the government is no longer trustworthy. Congress could set up an independent commission to investigate compromises to computer security. It should be staffed by experts in cryptography and by national security specialists. The Commission, if empowered, should also make recommendations on a way forward for internet security. What is needed is a system that is accountable, where the participants are reliable, and where there is security from interference of any kind. Right now, no one can, or should, trust the Internet.

2NC Financial Dereg Solvency

Commissions solve financial deregulation
Tiberghien 7

(Tiberghien, Yves. Yves Tiberghien (Ph.D. Stanford University, 2002) is the Director of Institute for Asian Research (IAR) and an Associate Professor of Political Science at the University of British Columbia. He is also a Faculty Associate at the Center for Chinese Research, at the Center for Japanese Research, and at the Institute for European Studies at UBC, as well as a Research Associate at Science Po Paris and at the Asia Centre (Paris). Yves is a graduate from HEC Paris (Hautes Etudes Commerciales). He earned a Master of Science in Management from the Community of European Management Schools (CEMS) and a Master of International Policy Studies from Stanford University. Yves was an Academy Scholar at Harvard University in 2004-2006. He has also been a Japan Foundation Scholar at the Japanese Ministry of Finance, Keio University and GRIPS (Tokyo). In 2010-2011, he was a visiting professor at National Chengchi University of Taiwan, as well as an East Asian Institute Fellow at Peking University, Fudan University, Keio University, and Taiwan University. He specializes in comparative political economy and international political economy with an empirical focus on China, Japan, and Korea. At UBC, he teaches courses in international and comparative political economy (with a focus on Asian political economy and geopolitics), as well as the courses on Chinese Politics and Japanese Politics. "Entrepreneurial States: Reforming Corporate Governance in France, Japan, and Korea," Cornell University Press, 2007.
https://books.google.com/books?id=YjLfVYCUeTUC&pg=PA69&lpg=PA69&dq=(%22congressional+commission%22+OR+%22independent+commission%22)+AND+%22financial+deregulation%22&source=bl&ots=RPir7fo0de&sig=hezwFSnCJAWjwLQ_P-QtMQKJmVY&hl=en&sa=X&ved=0CEMQ6AEwBWoVChMIl_7N_IilxwIVgUo-Ch3FBADR#v=onepage&q&f=false//ghs-kw)

In January 1984, the government first passed a far-reaching banking act (first major banking reform since 1945), **which removed old divisions between investment and commercial banks and introduced new unified prudential rules for all financial institutions, under the leadership of an empowered independent commission**, the Comission Bancaire. 11 The government abandoned credit control in November 1984, then created new financial instruments such as money markets, commercial markets, and financial futures. The crowning step in the process of financial deregulation came on 1 July 1990 with the abolition of capital controls, a decision that came as part of EU-wide liberalization, as contained in the Single European Act of 1986. Another related and very important reform was the liberalization of inward foreign direct investments (FDI), with the removal in the late 1980s of the requirement that the prime minister personally approve any foreign investment proposal in France (autorisation préalable du Premier Ministre). 12

2NC Prisons Solvency

Commissions are key to accountability—Florida proves

Kennedy 15

(Kennedy, John. "Independent commission may oversee Florida's troubled prisons," Palm Beach Post. 2-16-2015. http://postonpolitics.blog.palmbeachpost.com/2015/02/16/independent-commission-may-oversee-floridas-troubled-prisons///ghs-kw)

Florida's troubled prison system would be guided by an independent oversight commission that could probe allegations of inmate abuse and poor health care, under legislation that sailed Monday through a Senate panel. The Criminal Justice Committee's 4-0 vote adds heft to a key recommendation made recently by a university panel that studied the nation's third largest prison system and found it horribly flawed. "This is a big step," said Allison DeFoor, chairman of the Project on Accountable Justice at Florida State University, whose November report called for the monitoring board. "Given the breadth of what the Senate committee is recommending, **people seem really serious about reform**," he added. Still, the measure (CS/SB 7020) has a long way to go. The House has only begun holding hearings on the Department of Corrections, plagued by months of media reports of suspicious inmate deaths, allegations of guards beating prisoners, staffing woes and shoddy medical treatment documented in a series of stories by the Palm Beach Post. Gov. Rick Scott and Department of Corrections Secretary Julie Jones – the governor's fourth prisons chief in as many years – also have shown little support for establishing an outside commission. But Sen. Rob Bradley, R-Fleming Island, said the proposed nine-member Florida Corrections Commission is needed. "We talk a lot in Tallahassee about accountability in things like health care and education and that's very important," Bradley said, adding, **"It also holds true for our criminal justice system…I think the people** of the state of Florida **expect nothing less."**

2NC Politics NB

No link to politics—commissions result in bipartisanship and bypass Congressional politics

Glassman and Straus 15

(Glassman, Matthew E. and Straus, Jacob R. Analysts on Congress at the Congressional Research Service. "Congressional Commissions: Overview, Structure, and Legislative Considerations ," Congressional Research Service. 01-27-2015. http://fas.org/sgp/crs/misc/R40076.pdf//ghs-kw)

Overcoming Political Complexity Complex policy issues may also create institutional problems because they do not fall neatly within the jurisdiction of any particular committee in Congress.26 By virtue of their ad hoc status, commissions may circumvent such issues. Similarly, a commission may allow particular legislation or policy solutions to bypass the traditional development process in Congress, potentially removing some of the impediments inherent in a decentralized legislature.27 Consensus Building Legislators seeking policy changes may be confronted by an array of political interests, some in favor of proposed changes and some against. When these interests clash, the resulting legislation may encounter gridlock in the highly structured political institution of the modern Congress.28 **By creating a commission, Congress can place policy debates in a potentially more flexible environment, where congressional and public attention can be developed over time**.29 Reducing Partisanship Solutions to policy problems produced within the normal legislative process may also suffer politically from charges of partisanship.30 Similar charges may be made against investigations conducted by Congress.31 **The non-partisan or bipartisan character of most congressional commissions may make their findings and recommendations less susceptible to such charges and more politically acceptable to diverse viewpoints**. **The bipartisan or nonpartisan arrangement can potentially give their recommendations strong credibility, both in Congress and among the public, even when dealing with divisive issues of public policy.**32 Commissions may also give political factions space to negotiate compromises in good faith, bypassing the short-term tactical political maneuvers that accompany public negotiations.33 Similarly, because commission members are not elected, they may be better suited to suggesting unpopular, but necessary, policy solutions.34 Solving Collective Action Problems A commission may allow legislators to solve collective action problems, situations in which all legislators individually seek to protect the interests of their own district, despite widespread agreement that the collective result of such interests is something none of them prefer. Legislators can use a commission to jointly "tie their hands" in such circumstances, allowing general consensus about a particular policy solution to avoid being impeded by individual concerns about the effect or implementation of the solution.35 For example, in 1988 Congress established the Base Closure and Realignment Commission (BRAC) as a politically and geographically neutral body to make independent decisions about closures of military bases.36 The list of bases slated for closure by the commission was required to be either accepted or rejected as a whole by Congress, **bypassing internal congressional politics** over which individual bases would be closed, **and protecting individual Members from political charges** that they didn't "save" their district's base.37

CP avoids the focus link to politics

Glassman and Straus 15

(Glassman, Matthew E. and Straus, Jacob R. Analysts on Congress at the Congressional Research Service. "Congressional Commissions: Overview, Structure, and Legislative Considerations ," Congressional Research Service. 01-27-2015. http://fas.org/sgp/crs/misc/R40076.pdf//ghs-kw)

Overcoming Issue Complexity Complex policy issues may cause time management challenges for Congress. Legislators often keep busy schedules and may not have time to deal with intricate or technical policy problems, particularly if the issues require consistent attention over a period of time.24 A commission can devote itself to a particular issue full-time, and can focus on an individual problem without distraction.25

No link to politics—commissions create bipartisan negotiations
Campbell 01

(Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. He received his Ph.D. from the University of California, Santa Barbara, and his B.A. and M.A. from California State University, Chico. Prior to joining the National War College, Dr. Campbell was a Legislative Aide to Representative Mike Thompson (CA-01), chair of the House Intelligence Committee's Subcommittee on Terrorism, Analysis and Counterintelligence, where he handled Appropriations, Defense and Trade matters for the congressman. Before that, he was an Analyst in American National Government at the Congressional Research Service, an Associate Professor of Political Science at Florida International University, and an American Political Science Association Congressional Fellow, where he served as a policy adviser to Senator Bob Graham of Florida. Dr. Campbell is the author, co-author, and co-editor of 11 books on Congress, most recently the Guide to Political Campaigns in America, and Impeaching Clinton: Partisan Strife on Capitol Hill. He has also written more than two dozen chapters and articles on the legislative process. Discharging Congress : Government by Commission. Westport, CT, USA: Greenwood Press, 2001. ProQuest ebrary. Web. 27 July 2015. Ghs-kw.)

The third major **reason for Congress to delegate to a commission is the strategy of distancing itself from a politically risky decision.** These instances generally occur when Congress faces redistributive policy problems, such as Social Security, military base closures, Medicare, and welfare. Such problems are the most difficult because legislators must take a clear policy position on something that has greater costs to their districts than benefits, or that shifts resources visibly from one group to another. Institutionally, Congress has to make national policy that has a collective benefit, but the self-interest of lawmakers often gets in the way. Members realize that their individual interests, based on constituents' demands, may be at odds with the national interest, and this can lead to possible electoral repercussions. 55 Even when pursuing policies that are in the interests of the country as a whole, legislators do not want to be blamed for causing losses to their constituents. In such an event, the split characteristics of the institution come into direct conflict. Many on Capitol Hill endorse a commission for effectively resolving a policy problem rather than the other machinery available to Congress. A commission finds remedies when the normal decision making process has stalled. A long-time Senate staff director said of the proposed Second National Blue Ribbon Commission to Eliminate Waste in Government: **"At their most effective, these panels allow Congress to realize purposes most members cannot find the confidence to do unless otherwise done behind the words of the commission."** 56 When an issue imposes concentrated costs on individual districts yet provides dispersed benefits to the nation, Congress responds by masking legislators' individual contributions and delegates responsibility to a commission for making unpleasant decisions. 57 Members avoid blame and promote good policy by saying something is out of their hands. This method allows legislators— especially those aiming for reelection— to vote for the general benefit of something without ever having to support a plan that directly imposes large and traceable geographic costs on their constituents. **The avoidance or share-the-blame route was much of the way Congress and the president finally dealt with the problem of financially shoring up Social Security in the late 1980s.** One senior staff assistant to a western Republican representative observed that the creation of the Social Security Commission was largely for avoidance: "There are sacred cows and then there is Social Security. Neither party or any politician wants to cut this. Regardless of what you say or do about it, in the end, you defer. Everyone backs away from this." Similarly, a legislative director to a southern Democratic representative summarized: "So many people are getting older and when you take a look at who turns out, who registers, people over sixty-five have the highest turnout and they vote like clockwork." The Commission on Executive, Legislative, and Judicial Salaries, later referred to as the Quadrennial Commission (1967), is another example. Lawmakers delegated to a commission the power to set pay for themselves and other top federal officials, whose pay they linked to their own, to help them avoid blame. Increasing their own pay is a decision few politicians willingly endorse. **Because the proposal made by the commission would take effect unless Congress voted to oppose it, the use of the commission helped insulate legislators from political hazards.** 58 That is, because it was the commission that granted pay raises, legislators could tell their constituents that they would have voted against the increase if given the chance. Members could get the pay raise and also the credit for

opposing it. Redistribution is the most visible public policy type because it involves the most conspicuous, long run allocations of values and resources. Most divisive socioeconomic issues— affirmative action, medical care for the aged, aid to depressed geographic areas, public housing, and the elimination of identifiable governmental actions— involve debates over equality or inequality and degrees of redistribution. These are "political hot potatoes, in which a commission is a good means of putting a fire wall between you [the lawmaker] and that hot potato," the chief of staff to a midwestern Democratic representative acknowledged. Base closing took on a redistributive character as federal expenditures outpaced revenues. It was marked not only by extreme conflict but also by techniques to mask or sugarcoat the redistributions or make them more palatable. The Base Closure Commission (1991) was created with an important provision that allowed for silent congressional approval of its recommendations. Congress required the commission to submit its reports of proposed closures to the secretary of defense. The president had fifteen days to approve or disapprove the list in its entirety. If approved, the list of recommended base closures became final unless both houses of Congress adopted a joint resolution of disapproval within forty-five days. Congress had to consider and vote on the recommendations en bloc rather than one by one, thereby giving the appearance of spreading the misery equally to affected clienteles. A former staff aide for the Senate Armed Services Committee who was active in the creation of the Base Closure Commission contended, "There was simply no political will by Congress. The then-secretary of defense started the process [base closing] with an in-house commission [within the Defense Department]. Eventually, however, Congress used the commission idea as a 'scheme' for a way out of a 'box.'" CONCLUSION Many congressional scholars attribute delegation principally to electoral considerations. 59 For example, in the delegation of legislative authority to standing committees, legislators, keen on maximizing their reelection prospects, request assignments to committees whose jurisdictions coincide with the interests of key groups in their districts. Delegation of legislative functions to the president, to nonelected officials in the federal bureaucracy, or to ad hoc commissions also grows out of electoral motives. Here, delegation fosters the avoidance of blame. 60 Mindful that most policies entail both costs and benefits, and apprehensive that those suffering the costs will hold them responsible, members of Congress often find that the most attractive option is to let someone else make the tough choices. Others see congressional delegation as unavoidable (and even desirable) in light of basic structural flaws in the design of Congress. 61 They argue that Congress is incapable of crafting policies that address the full complexity of modern-day problems. 62 Another charge is that congressional action can be stymied at several junctures in the legislative policymaking process. Congress is decentralized, having few mechanisms for integrating or coordinating its policy decisions; it is an institution of bargaining, consensus-seeking, and compromise. The logic of delegation is broad: to fashion solutions to tough problems, to broker disputes, to build consensus, and to keep fragile coalitions together. The commission co-opts the most publicly ideological and privately pragmatic, the liberal left and the conservative right. Leaders of both parties or their designated representatives can negotiate a deal without the media, the public, or interest groups present. When deliberations are private, parties can make offers without being denounced either by their opponents or by affected groups. Removing external contact reduces the opportunity to use an offer from the other side to curry favor with constituents.

2NC Commissions Popular

Commissions give political cover—result in compromise

Fiscal Seminar 9

(The Fiscal Seminar is a group of scholars who meet on a regular basis, under the auspices of The Brookings Institution and The Heritage Foundation, to discuss federal budget and fiscal policy issues. The members of the Fiscal Seminar acknowledge the contributions of Paul Cullinan, a former colleague and Brookings scholar, in the development of this paper, and the editorial assistance of Emily Monea. "THE POTENTIAL ROLE OF ENTITLEMENT OR BUDGET COMMISSIONS IN ADDRESSING LONG-TERM BUDGET PROBLEMS," The Fiscal Seminar. 06-2009. Ghs-kw)

In contrast, the Greenspan Commission provided a forum for developing a political compromise on a set of politically unsavory changes. In this case, the political parties shared a deep concern about the impending insolvency of the Social Security system but feared the exposure of promoting their own solutions. The commission created political cover for the serious background negotiations that resulted in the ultimate compromise. The structure of the commission reflected these concerns and was composed of fifteen members, with the President, the Senate Majority Leader, and the Speaker of the House each appointing five members to the panel.

2NC AT Perm do the CP

Permutation is severance:

1. **Severance: CP's mechanism is distinct—delegates to the commission and isn't Congressional action**
   Campbell 01

   (Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. He received his Ph.D. from the University of California, Santa Barbara, and his B.A. and M.A. from California State University, Chico. Prior to joining the National War College, Dr. Campbell was a Legislative Aide to Representative Mike Thompson (CA-01), chair of the House Intelligence Committee's Subcommittee on Terrorism, Analysis and Counterintelligence, where he handled Appropriations, Defense and Trade matters for the congressman. Before that, he was an Analyst in American National Government at the Congressional Research Service, an Associate Professor of Political Science at Florida International University, and an American Political Science Association Congressional Fellow, where he served as a policy adviser to Senator Bob Graham of Florida. Dr. Campbell is the author, co-author, and co-editor of 11 books on Congress, most recently the Guide to Political Campaigns in America, and Impeaching Clinton: Partisan Strife on Capitol Hill. He has also written more than two dozen chapters and articles on the legislative process. Discharging Congress : Government by Commission. Westport, CT, USA: Greenwood Press, 2001. ProQuest ebrary. Web. 27 July 2015. Ghs-kw.)

   So why and when does Congress formulate policy by commissions rather than by the normal legislative process? Lawmakers have historically **delegated authority to others who could accomplish ends they could not.** Does this form of congressional delegation thus reflect the particularities of an issue area? Or does it mirror deeper structural reasons such as legislative organization, time, or manageability? In the end, what is the impact on representation versus the effectiveness of delegating discretionary authority to temporary entities composed largely of unelected officials, or are both attainable together?

2. **Severs resolved: resolved means to enact by law—not the counterplan mandate**
   Words and Phrases 64 vol 37A

   Definition of the word "resolve," given by Webster is "to express an opinion or determination by resolution or vote; as 'it was resolved by the legislature;" It is of similar force to the word "enact," which is defined by Bouvier as meaning "to establish by law".

3. **Severs should: Should requires immediate action**
   Summers 94 (Justice – Oklahoma Supreme Court, "Kelsey v. Dollarsaver Food Warehouse of Durant", 1994 OK 123, 11-8, http://www.oscn.net/applications/oscn/DeliverDocument.asp?CiteID=20287#marker3fn13)

   ¶4 The legal question to be resolved by the court is whether the word "should"13 in the May 18 order connotes futurity or may be deemed a ruling *in praesenti*.14 The answer to this query is not to be divined from rules of grammar;15 it must be governed by the age-old practice culture of legal professionals and its immemorial language usage. To determine if the omission (from the critical May 18 entry) of the turgid phrase, "and the same hereby is", (1) makes it an in futuro ruling - i.e., an expression of what the judge will or would do at a later stage - or (2) constitutes an in in praesenti resolution of a disputed law issue, the trial judge's intent must be garnered from the four corners of the entire record.16 [CONTINUES – TO FOOTNOTE] 13 "*Should*" not only is used as a "present indicative" synonymous with *ought* but also is the past tense of "shall" with various shades of meaning not always easy to analyze. See 57 C.J. Shall § 9, Judgments § 121 (1932). O. JESPERSEN, GROWTH AND STRUCTURE OF THE ENGLISH LANGUAGE (1984); St. Louis & S.F.R. Co. v. Brown, 45 Okl. 143, 144 P. 1075, 1080-81 (1914). For a more detailed explanation, see the Partridge quotation infra note 15. Certain contexts mandate a construction of the term "should" as **more** than merely indicating preference or desirability. Brown, supra at 1080-81 (jury instructions stating that jurors "should" reduce the amount of damages in proportion to the amount of contributory negligence

of the plaintiff was held to imply an obligation and to be more than advisory); Carrigan v. California Horse Racing Board, 60 Wash. App. 79, 802 P.2d 813 (1990) (one of the Rules of Appellate Procedure requiring that a party "should devote a section of the brief to the request for the fee or expenses" was interpreted to mean that a party is under an obligation to include the requested segment); State v. Rack, 318 S.W.2d 211, 215 (Mo. 1958) ("should" would mean the same as "shall" or "must" when used in an instruction to the jury which tells the triers they "should disregard false testimony"). 14 *In praesenti* means literally "at the present time." BLACK'S LAW DICTIONARY 792 (6th Ed. 1990). In legal parlance the phrase denotes that which in law is *presently* or ***immediately effective***, as opposed to something that *will* or *would* become effective ***in the future*** *[in futurol*]. See Van Wyck v. Knevals, 106 U.S. 360, 365, 1 S.Ct. 336, 337, 27 L.Ed. 201 (1882).

4. **Severs should again: should is mandatory**

Summers 94 (Justice – Oklahoma Supreme Court, "Kelsey v. Dollarsaver Food Warehouse of Durant", 1994 OK 123, 11-8, http://www.oscn.net/applications/oscn/DeliverDocument.asp?CiteID=20287#marker3fn13)

2. **Time crunch—perm forces the plan now, doesn't give the commission time to generate political support and links to politics**
   Biggs 09

(Biggs, Andrews G. Andrew G. Biggs is a resident scholar at the American Enterprise Institute, where his work focuses on Social Security and pensions. From 2003 through 2008, he served at the Social Security Administration, as Associate Commissioner for Retirement Policy, Deputy Commissioner for Policy, and ultimately the principal Deputy Commissioner of the agency. During 2005, he worked at the White House National Economic Council on Social Security reform, and in 2001 was on the staff of the President's Commission to Strengthen Social Security. He blogs on Social Security-related issues at Notes on Social Security Reform. "Rumors Of Obama Social Security Reform Commission," Frum Forum. 02-17-2009. http://www.frumforum.com/rumors-of-obama-social-security-reform-commission///ghs-kw)

One problem with President Bush's 2001 Commission was that it didn't represent the reasonable spectrum of beliefs on Social Security reform. This didn't make it a dishonest commission; like President Roosevelt's Committee on Economic Security, it was designed to put flesh on the bones laid out by the President. In this case, the Commission was tasked with designing a reform plan that included personal accounts and excluded tax increases. That said, a commission only builds political capital toward enacting reform if it's seen as building a consensus through a process in which all views have been heard. In both the 2001 Commission and the later 2005 reform drive, Democrats didn't feel they were part of the process. They clearly will be a central part of the process this time, but the goal will now be to include Republicans. Just as Republicans shouldn't reflexively oppose any Obama administration reform plans for political reasons, so Democrats shouldn't seek to exclude Republicans from the process. Second, a reform task force should include a variety of different players, including members of government, both legislative and executive, representatives of outside interest groups, and experts who can provide technical advice and help ensure the integrity of the reforms decided upon. The 2001 Bush Commission didn't include any sitting Members of Congress and only a small fraction of commissioners had the technical expertise needed to make the plans the best they could be. A broader group would be helpful. Third, any task force or commission needs time. The 2001 Commission ran roughly from May through December of that year and had to conduct a number of public hearings. This was simply too much to do in too little time, and as a result the plans were fairly bare bones. There is plenty else on the policy agenda at the moment, so there's no reason not to give a working group a year or more to put things together.

2NC AT Theory

Counterinterp: process CPs are legitimate if we have a solvency advocate

AND, process CPs good:

1. **Key to neg ground—agent CPs are the only generics we have on this topic**
2. **Policy education—commissions are key to understanding the policy process**

Schwalbe, 03

(Steve,- PhD Public Policy from Auburn, former professor at the Air War College and Col. in the USAF "Independent Commissions: Their History, Utilization and Effectiveness")

FIFTH BRANCH Many analysts characterize commissions as an unofficial, separate branch of government, much like the news media. Campbell referred to commissions as the "**fifth arm of government**," after the media, the often-referred-to fourth arm.17 However, the media and independent commissions have as many similarities as differences. They are similar in that neither is mentioned in the Constitution. Both conduct oversight functions. Both serve to educate and inform the public. Both allow elites to participate in shaping government policy. On the other hand, the media and independent commissions are dissimilar in many ways. Where the news media responds to market forces, and hence will likely operate in perpetuity, independent commissions respond to a federal requirement to resolve a difficult problem. Therefore, they exist for a relatively short period of time, expiring once a final report is published and disseminated. Where the media's primary functions are reporting and analyzing the news, a commission's primary responsibilities can range from developing a recommended solution to a difficult problem to regulating an entire department of the executive branch. The media receives its funding primarily from advertisers, where commissions receive their funding from Congress, the President, or from private sources. The news media deal with issues foreign and domestic, while independent commissions generally focus on domestic issues. PURPOSE Commissions serve numerous purposes in the U.S. Government. Campbell cited three primary reasons for the establishment of federal independent commissions. First, they are established to provide expertise the Congress does not have among its own elected officials or their staffs. Next, he noted that the second most frequently cited reason by members of Congress for establishing a commission was to reduce the workload in Congress. Finally, they are formed to provide a convenient scapegoat to deflect the wrath of the electorate; i.e., "blame avoidance."18 Fisher found three advantages of regulatory commissions. First, commission members bring essential expert insights to a commission because the regulated industries are normally "complex and highly technical." Second, appointing commissioners for extended terms of full-time work allows commissioners to become very familiar with the technical aspects of an industry, through periodic contacts that Congress would not be able to accomplish. As a result of their tenure, varied membership, and shared responsibility, commissioners would be resistant to external pressures. Finally, regulatory commissions provide policy continuity essential to the stability of a regulated industry.19 What the taxpayers are primarily looking for from independent commissions are non- partisan solutions to current problems. A good example of establishing a commission to find non-partisan solutions is Congress regulating its own ethical behavior. University of Florida Professor Beth Rosenson researched this issue and concluded that authorizing an ethics commission may be "based on the fear of electoral retaliation if legislators do not take aggressive action to regulate their own ethics."20 Campbell noted that commissions perform several other functions besides providing recommendations to the President and Congress. The most common reason provided by analysts is that members of Congress generally want to avoid making difficult decisions that may adversely affect their chances for reelection. As he noted, "Incentives to avoid blame lead members of Congress to adopt a distinctive set of political strategies, such as 'passing the buck' or 'deflection'…."21 Another technique legislators use to avoid incurring the wrath of the voters is to schedule any controversial independent commissions for after the next election. Establish- ing a commission to research the issue and come up with recommendations after a preset period of time is an effective way to do that. The most clear-cut example demonstrating this technique is the timing of the BRAC commissions in the 1990s — all three made their base closure recommendations in non-election years (1991, 1993, and 1995). Even the next BRAC commission, established by the National Defense Authorization Act for Fiscal Year 2002, is not required to submit its base closure recommendations until 2005. Congress certainly is not the most efficient organization in the U.S.; hence, there are times when an independent commission is the more efficient and effective way to go. Law- makers are almost always short on time and information, which makes the option of delegating authority to a commission very appealing. Oftentimes, the expertise and necessary information is very costly for Congress to acquire. Commissions are generally the most inexpensive way for Congress to solve complex problems. From 1993-1997, Campbell found that 92 congressional offices introduced legislation that included proposals to establish ad hoc commissions.22 There are numerous other reasons for establishing independent commissions. They are created as a symbolic response to a crisis or to satisfy the electorate at home. They have served as trial balloons to test the political waters, or to make political gains with the voters. They can be created to gain public or political consensus. Often, when Congress has exhausted all its other options, a commission serves as an option of last resort.23 Commissions are a relatively impartial way to help resolve problems between the executive and legislative branches of government, especially during periods of congressional gridlock. Wolanin also noted that commissions are "particularly useful for problems and in circumstances marked by federal executive branch incapacity." Federal bureaucracies suffer from many of the same shortcomings attributed to Congress when considering commissions. They often lack the expertise, information, and time to conduct the research and make recommendations to resolve internal problems. They can be afflicted by groupthink, not being able to think outside the box, or by not being able to see the big picture. Commissions offer a non-partisan, neutral option to address bureaucratic policy problems.24 Defense Secretary Donald Rumsfeld has decided to implement the recommendations of the congressionally- chartered **Commission on Space**, which he chaired prior to being appointed Secretary of Defense!25 One of the more important functions of independent commissions is educating and persuading. Due to the high visibility of most appointed commissioners, a policy issue will automatically tend to gain public attention. According to Wolanin, the prestige and visibility of commissions give them the capability to focus attention on a problem, and to see that thinking about it permeates more rapidly. A recent example of a high-visibility commission chair appointment was Henry Kissinger, selected to chair the commission to look into the perceived intelligence failure regarding the September 11, 2001 terrorist attack on the U.S. .26 Wolanin cited four educational impacts of commissions: 1) educating the general public; 2) educating government officials; 3) serving as intellectual milestones; and, 4) educating the commission members themselves. Regarding education of the general public, he stated that, "Commissions have helped to place broad new issues on the national agenda, to elevate them to a level of legitimate and pressing matters about which government should take affirmative action." Regarding educating government officials, he noted that, "The educational impact of commissions within government…make it safer for congressmen and federal executives to openly discuss or advocate a proposal that has been sanctioned by such an 'august group'." Commission reports have often been so influential that they serve as milestones in affected fields. Such reports have become source material for analysts, commentators, and even students, particularly when commission reports are widely published and disseminated. Finally, by serving on a commission, members also learn much about the issue, and about the process of analyzing a problem and coming up with viable recommendations. Commissioners also learn from one another.27

3. **Predictability—commissions are widely used and predictable and solvency advocate checks**

Campbell 01

(Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. Web. 27 July 2015. Ghs-kw.)

Ad hoc commissions as instruments of government have a long history. They are used by almost all units and levels of government for almost every conceivable task. Ironically, the use which Congress makes of commissions— preparing the groundwork for legislation, bringing public issues into the spotlight, whipping legislation into shape, and giving priority to the consideration of complex, technical, and critical developments— receives relatively little attention from political scientists. As noted in earlier chapters, following the logic of rational choice theory, individual decisions to delegate are occasioned by imperfect information; legislators who want to develop effective policies, but who lack the necessary expertise, often delegate fact-finding and policy development. Others contend that some commissions are set up to shift blame in order to maximize benefits and minimize losses.

4. **At worse, reject the argument, not the team**

2NC AT Certainty

Counterplan solves your certainty args—expertise

Campbell 01

(Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. By delegating some of its policymaking authority to "expertise commissions," Congress creates institutions that reduce uncertainty. Tremendous gains accrue as a result of delegating tasks to other organizations with a comparative advantage in performing them. Commissions are especially adaptable devices for addressing problems that do not fall neatly within committees' jurisdictional boundaries. They can complement and supplement the regular committees. In the 1990s, it became apparent that committees were ailing— beset by mounting workloads, duplication and jurisdictional battles, and conflicts between program and funding panels. But relevant expertise can be mobilized by a commission that brings specialized information to its tasks, especially if commission members and staff are selected on the basis of education, their training, and their experience in the area which cross-cut the responsibilities of several standing committees.

2NC AT Commissions Bad

No disads—commissions are inevitable due to Congressional structure

Campbell 01

(Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. Others see congressional delegation as unavoidable (and even desirable) in light of basic structural flaws in the design of Congress. 61 They argue that Con**gress is incapable of crafting policies that address the full complexity of modern-day problems.** 62 Another charge is that congressional action can be stymied at several junctures in the legislative policymaking process. Congress is decentralized, having few mechanisms for integrating or coordinating its policy decisions; it is an institution of bargaining, consensus-seeking, and compromise. The logic of delegation is broad: to fashion solutions to tough problems, to broker disputes, to build consensus, and to keep fragile coalitions together. The commission co-opts the most publicly ideological and privately pragmatic, the liberal left and the conservative right. Leaders of both parties or their designated representatives can negotiate a deal without the media, the public, or interest groups present. When deliberations are private, parties can make offers without being denounced either by their opponents or by affected groups. Removing external contact reduces the opportunity to use an offer from the other side to curry favor with constituents.

2NC AT Congress Doesn't Pass Recommendations

Recommendations are passed—either bipartisan or perceived as non-partisan
Glassman and Straus 15

(Glassman, Matthew E. and Straus, Jacob R. Analysts on Congress at the Congressional Research Service. "Congressional Commissions: Overview, Structure, and Legislative Considerations ," Congressional Research Service. 01-27-2015. http://fas.org/sgp/crs/misc/R40076.pdf//ghs-kw)

Reducing Partisanship Solutions to policy problems produced within the normal legislative process may also suffer politically from charges of partisanship.30 Similar charges may be made against investigations conducted by Congress.31 **The non-partisan or bipartisan character of most congressional commissions may make their findings and recommendations less susceptible to such charges and more politically acceptable to diverse viewpoints. The bipartisan or nonpartisan arrangement can potentially give their recommendations strong credibility, both in Congress and among the public, even when dealing with divisive issues of public policy.**32 Commissions may also give political factions space to negotiate compromises in good faith, bypassing the short-term tactical political maneuvers that accompany public negotiations.33 Similarly, because commission members are not elected, they may be better suited to suggesting unpopular, but necessary, policy solutions.34

Recommendations are passed—BRAC Commission proves
Fiscal Seminar 9

(The Fiscal Seminar is a group of scholars who meet on a regular basis, under the auspices of The Brookings Institution and The Heritage Foundation, to discuss federal budget and fiscal policy issues. The members of the Fiscal Seminar acknowledge the contributions of Paul Cullinan, a former colleague and Brookings scholar, in the development of this paper, and the editorial assistance of Emily Monea. "THE POTENTIAL ROLE OF ENTITLEMENT OR BUDGET COMMISSIONS IN ADDRESSING LONG-TERM BUDGET PROBLEMS," The Fiscal Seminar. 06-2009.)

On the other hand, the success of BRAC seems to have resulted more from the defined structure and process of the commission.5 Under BRAC, a package of recommendations originated with the Department of Defense, was modified by the BRAC commission, and was then reviewed by the President. Congress then had to consider the package as a whole with no amendments allowed; if it failed to pass a resolution of disapproval, the recommendations would be implemented as if they had been enacted in law. Not one of the five sets of BRAC recommendations has been rejected by the Congress.6,

2NC AT No Authority

Commissions have broad authority

Campbell 01

(Campbell, Colton C. Dr. Colton Campbell is Professor of National Security Strategy. He received his Ph.D. from the University of California, Santa Barbara, and his B.A. and M.A. from California State University, Chico. Prior to joining the National War College, Dr. Campbell was a Legislative Aide to Representative Mike Thompson (CA-01), chair of the House Intelligence Committee's Subcommittee on Terrorism, Analysis and Counterintelligence, where he handled Appropriations, Defense and Trade matters for the congressman. Before that, he was an Analyst in American National Government at the Congressional Research Service, an Associate Professor of Political Science at Florida International University, and an American Political Science Association Congressional Fellow, where he served as a policy adviser to Senator Bob Graham of Florida. Dr. Campbell is the author, co-author, and co-editor of 11 books on Congress, most recently the Guide to Political Campaigns in America, and Impeaching Clinton: Partisan Strife on Capitol Hill. He has also written more than two dozen chapters and articles on the legislative process. Discharging Congress : Government by Commission. Westport, CT, USA: Greenwood Press, 2001. ProQuest ebrary. Web. 27 July 2015. Ghs-kw.)

Congressional commissions have reached the point where they can take over various fact-finding functions formerly performed by Congress itself. Once the facts have been found by a commission, it is possible for Congress to subject those facts to the scrutiny of cross-examination and debate. And if the findings stand up under such scrutiny, there remains for Congress the major task of determining the policy to be adopted with reference to the known factual situation. Once it was clear, for example, that the acquired immune deficiency syndrome (AIDS) yielded an extraordinary range of newfound political and practical difficulties, the need for legislative action was readily apparent. The question that remained was one of policy: how to prevent the spread of AIDS. Should it be by accelerated research? By public education? By facilitating housing support for people living with AIDS? Or by implementing a program of AIDS counseling and testing? The AIDS Commission could help Congress answer such questions.

2NC AT Perception

CP solves your perception arguments

Glassman and Straus 15

(Glassman, Matthew E. and Straus, Jacob R. Analysts on Congress at the Congressional Research Service. "Congressional Commissions: Overview, Structure, and Legislative Considerations ," Congressional Research Service. 01-27-2015. http://fas.org/sgp/crs/misc/R40076.pdf//ghs-kw)

Raising Visibility **By establishing a commission, Congress can often provide a highly visible forum for important issues that might otherwise receive scant attention** from the public.38 Commissions often are composed of notable public figures, allowing personal prestige to be transferred to policy solutions.39 **Meetings and press releases from a commission may receive significantly more attention in the media than corresponding information coming directly from members of congressional committees.** Upon completion of a commission's work product, public attention may be temporarily focused on a topic that otherwise would receive scant attention, thus increasing the probability of congressional action within the policy area.40

1NC—Oversight CP

Counterplan text: Congress should make the NSA Inspector General subject to Senate confirmation, require a NSA Civil Liberties & Privacy officer, change the jurisdiction of the PCLOB to include all intelligence activities, institutionalize privacy concerns in performance reviews, have the DNI annually report in a public forum on privacy and civil liberties matters, and create panels of cleared external reviewers for consultation by the DNI regarding new programs to encourage executive restraint in the area of [the plan.]

Rosenzweig 13 (Paul – Senior Legal Research Fellow in the Center for Legal and Judicial Studies at The Heritage Foundation, "The NSA Doesn't Need Wholesale Reform, Just Greater Oversight," in the New Republic, 10-29-13, http://www.newrepublic.com/article/115392/nsa-reform-not-essential-congressional-oversight)

What should we do about the NSA? Should we do anything at all? These question are on the forefront these days.

The right answer, of course, is **complex**. The **perception of illegality** at the NSA has **outrun the reality** by a fair bit. On the other hand, it seems quite clear that the NSA has often done things of which it is technically capable without considering whether or not they were wise in the context of a broader strategy. As Lisa Monaco the White Couse Counterterrorism advisor said the other day in USA Today: "Today's world is highly interconnected, and the flow of large amounts of data is unprecedented. That's why the president has directed us to review our surveillance capabilities, including with respect to our foreign partners. We want to ensure we are collecting information because we need it and not just because we can."

Last week, I was scheduled to give some testimony on the very subject to the House Permanent Select Committee on Intelligence (the hearing was cancelled and rescheduled). Those who want to can review the entire testimony for an explanation of the theory that underlies much of what I proposed and a consideration of many more proposals. But for the curious, here's a short summary, with footnote citations excised, of some of the reform proposals and their merits (or demerits, as the case may be):

Congress should probably provide for an in-house advocate before the Foreign Intelligence Surveillance Court, to be called called at the court's discretion. This would improve decision-making;

Data retention rules and distributed databases (that is the idea of asking the telecommunications companies to hold the data on behalf of the NSA) will be ineffective and no more privacy protective than current rules;

Post-collection judicial assessment of reasonable articulable suspicion is worth considering;

We should reject the assertion that the FISA court is somehow either a rubberstamp or a packed court;

The most effective reforms are likely structural rather than legislative; and

Finally, our current system of intelligence oversight generally works. It is incumbent on this Committee and those in Congress with knowledge of how our intelligence apparatus operates to defend that system as effective and appropriate.

Here's a deeper analysis:

First, we can't with one breath condemn government access to vast quantities of data about individuals as a return of "Big Brother," and at the same time criticize the government for its failure to "connect the dots" (as we did, for example, during the Christmas 2009 bomb plot attempted by Umar Farouk Abdulmutallab).

More to the point—large scale data analytical tools of the type the NSA is apparently using are of such great utility that governments will expand their use, as will the private sector. Old rules about collection and use limitations are no longer technologically relevant. If we value privacy at all, these ineffective protections must be replaced with new constructs. The goal then is the identification of a suitable legal and policy regime to regulate and manage the use of mass quantities of personal data.

We should therefore favor those reforms that create delegated or calibrated transparency (enough to enable oversight without eliminating essential capabilities) and respond to the new paradigm of data analytics and privacy (by controlling use rather than collection):

Adversarial Advocate: This proposal would create a standing team of attorneys to respond to and present a counter argument before the FISC to requests for permission to collect information against an individual or entity. Presumably, this team of attorneys would either be from within the government (such as the DNI's Civil Liberties and Privacy Officer) or a cadre of non-government attorney's with clearances.

There is much to be said in favor of this proposal. With regular criminal warrants the ex parte nature of the application for a warrant does not systematically create a lack of a check on overreaching because of the possibility for post-enforcement review during criminal prosecution with its adversarial process. By contrast, in intelligence investigations that post-execution checking function of adversarial contest is often missing—few if any intelligence collection cases wind up before the courts. As a result there is no systematic way of constraining the authority of the United States government in this context. Providing for an adversarial advocate would give us the general benefits of adversarial presentation and provide a useful checking function on the overarching broad effect of FISA law on the public.

To be sure, this would be a novel process. We don't typically do pre-enforcement review of investigative techniques. And if poorly implemented, this sort of process risks slowing down critical time sensitive investigations. Perhaps most importantly, many worry (not without justification) that the adversarial advocate will in the end have an agenda that may distort legal developments.

On balance, this seems to be a positive idea — but only if it is implemented in a limited way for novel or unique questions of law. It should be is limited to situations where the FISA court itself requests adversarial presentation. That would limit the number or circumstances where the process was used to those few where new or seminal interpretations of law were being made. The adversarial advocate should not appear routinely and should not appear on his or her own motion. The court is, in my view, capable (and likely) to define when it can benefit from adversarial argument quite well.

Phone Company Data Retention: Some have suggested that, instead of NSA collecting and retaining telephone call metadata, Congress should amend the law and impose a data retention requirement on phone companies and ISPs, requiring them to retain metadata for a fixed period of time, say five years. NSA and the FBI would, in turn, only be able to access this data set after a FISC court had passed on the validity of the request and determined that it met some evidentiary threshold, say, of relevance.

While the idea is attractive it is, in the end, more problematic than beneficial. To begin with, the FISC pre-access review would be more privacy protective–but it would achieve this protection in the old fashioned way of limiting access to the underlying data. More effective ways that focus on managing end uses rather than collection are to be preferred.

More to the point, this sort of system would be extremely cumbersome. Searching on multiple distributed databases is always more difficult than searching a single database. Worse, this arc hitecture would require the disclosure of classified threat information to private actors, on a regular basis–a structure that we ought to try and avoid. And, of course, though we might begin by limiting use of this database to counter-terrorism activities, I have nodoubt that political pressures will soon push us down the slippery slope to other attractive uses (e.g. combatting drug cartels or child pornography). In the end, we might fear that databases held by the private telecommunications companies would be the target of other legal process in the civil system.

Finally, at bottom, we cannot be sure that large commercial databases are actually more privacy protective than government ones. As Stewart Baker has said in assessing a comparable set of laws in Europe: "Not only does the 'data retention' requirement in European law cover more personal information, it comes with far fewer safeguards. In Europe, unlike the UnitedStates, the authorities need only ask for stored data; companies can and do "volunteer" their data without any court order or other legal process." We should be skeptical that any system we design for use here in American would not be subject to the same sorts of issues.

Non-NSA Determination of Reasonable Articulable Suspicion: One variant on the forgoing would break off a piece of the data retention proposal — namely the portion that requires external approval before NSA analysts access the Section 215 metadata database. Logically, this requirement could be implemented even if the database were housed in NSA rather than, as proposed above, in distributed databases at the telecommunications companies. In other words, Congress could add a requirement that every time the NSA determines that there is a reasonable articulable suspicion that a phone number is associated with terrorism, that the determination be promptly adjudicated before access is granted. The identity of "who" might adjudicate the reasonable articulable suspicion and "when" is capable of many variations–it might be the FISC, before access is granted; or it might be post-access review by the FISC. Or, it might even be pre-access review by some other portion of the Executive Branch, like DOJ's NSD.

In all its variants, this proposal has several positive aspects to it. First, by requiring external non-NSA approval, we enhance the credibility of the determination of reasonable articulable suspicion. Second, by invoking FISC jurisdiction or DOJ oversight we limit the likelihood that the database will be subject to mission creep and repurposed to non-counter-terrorism uses. Third, and most saliently from a theoretical viewpoint, this paradigm of review after collection and in a control of use is more consistent with what we see as the technological reality of data analytics today.

Regarding the modality of review, some argue that pre-use review by the FISC would be, in their judgment, too slow and cumbersome. This argument may not be persuasive—after all, many warrant applications are approved on an emergency basis. But if we were to reject pre-access judicial review the credibility of the section 215 program would be most enhanced by a combination of two other structures—pre-access approval outside of NSA within the Executive Branch (say at DOJ), followed by post-access approval by the FISC.

Reforming the FISA Court: A wide range of proposed reforms have been suggested for changing how the FISA court is staffed and operates. These include suggestions to add more FISC judges to the process (i.e. have decisions made by panels); mandating more diversity of views among judges; changing the appointment authority, and so on.

The grounds for these proposed reforms are a series of false and pernicious premises–ones that, regretfully, are fostered by our friends in the media. They suggest that the Chief Justice has been preferentially appointing pro-government judges to the FISC,and that the FISC is a rubber stamp for government action. While that Manichean view of justice is one that many liberal doubters of the court system espouse, it should be resisted with every fiber of our being.

In the first place, it simply isn't true. As anyone who has read the recent FISC opinions recognizes, the judges of that court have been vigilant (some critics even say too vigilant) in overseeing the NSA's activities, having called large scale programs into question on at least three occasions that are publicly known and having declared at least one aspect of one program unconstitutional. More to the point, we now know (and this is actually one of the few good results stemming from the Snowden disclosures)that the FISC requires substantive modification to roughly one-quarter of all FISA warrant applications. We don't know what the comparable figure. are for traditional criminal investigations (and I don't think they are collected) but my own experience as a prosecutor suggests that the rate of substantive amendment is far lower in that context.

And, of course, the premise of the entire argument is the ipse dixit that judges reflect their political views. As a society we must reject that premise, lest law become nothing more than politics by other means. It says everything you need to know about the validity of that premise that the original Section 215 order, authorizing metadata collection was (according to public reports–though it has not been declassified itself) issued in 2006 by Judge Colleen Kollar-Kotelly. Judge Kollar-Kotelly was appointed to the FISC by Chief Justice Rehnquist (i.e. before Chief Justice Roberts' tenure) and appointed to the bench by President Clinton. If the most controversial decision of which we are aware is a counter-factual to the general charge, we should doubt the charge itself.

Worse yet, the cure would be worse than the disease. Imagine, if you will, subjecting FISC appointments to Senate confirmation. Nothing would be more likely to politicize the proces. Likewise, attempting to democratize the proces by spreading it across the circuits would be impractical (since most FISC matters occur here in Washington) and would simply develve the criticism one step lower. The problem isn't with the FISC so much as its critics.

Structural Changes: Finally, most of the more effective possible changes lie not in significant legislative tinkering, but rather in interstitial structural and operational reforms that improve the audit and oversight process without fundamentally altering the capabilities of NSA or the IC organizations. Here are a few, listed just in bullet point form, that might be worth thinking about:

Make the NSA Inspector General, a presidential appointment, **with Senate confirmation**;

Require statutorily, the appointment of an NSA Civil Liberties & Privacy Officer;

Change the jurisdiction of the **P**rivacy and **C**ivil **L**iberties **O**versight **B**oard to include all intelligence activities, not just those with a counter-terrorism focus;

Create panels of cleared external reviewers for consultation by the DNI regarding new programs;

Institutionalize privacy and civil liberties concerns by making it a factor in performance reviews; and

Have the DNI annually report in a public forum on privacy and civil liberties matters.

Oversight solves --- empirics

Kriner 9 (Douglas – Assistant Professor of Political Science at Boston University, "CAN ENHANCED OVERSIGHT REPAIR "THE BROKEN BRANCH"?," in *SYMPOSIUM: THE MOST DISPARAGED BRANCH: THE ROLE OF CONGRESS IN THE TWENTY-FIRST CENTURY*, in 89 B.U.L. Rev. 765, http://www.bu.edu/law/central/jd/organizations/journals/bulr/volume89n2/documents/KRINER.pdf)

C. Failures of Oversight

Throughout American history, legislative oversight conducted by congressional committees has been **one of the most powerful tools** in Congress's arsenal to exercise a check on the executive branch and defend its institutional prerogatives. Particularly in times of national exigency - both military and economic - the need for Hamiltonian "energy" tilts the pendulum of power toward the executive branch. The very same **collective action dilemmas and cumbersome institutional machinery** that encourage such a shift to the executive also hinder Congress's capacity to police the executive branch and retain a check on delegated powers by acting legislatively. Instead, Congress has repeatedly turned to the oversight and investigative powers of its committees to police the executive branch. And, at least anecdotally, when Congress wields its oversight powers forcefully, **it can lead to genuine changes in public policy.** The War of 1812 and the accompanying expansion of presidential power strongly contributed to the initial evolution and growth of the standing committee system in the early-nineteenth century. 38 As the era of congressional dominance ended and presidential power grew in the early-twentieth century, Congress increasingly used its committee-based oversight powers to keep a watchful eye on the executive branch. For example, in the wake of the Spanish American War it fell to the executive to administer the nation's first major colonial acquisitions in the Philippines. The war undoubtedly bolstered presidential foreign policy power; yet, Congress retained some check on the exercise of this power through inquests into the conduct of the American occupation and continued oversight of its operations. In the aftermath of Teddy Roosevelt's bold assertions of unilateral presidential power, Congress struck back in the committee room with months of investigatory hearings into misconduct in the Interior Department and Forestry Bureau stemming from Roosevelt's proclamations and orders. Investigative oversight was also one of the primary means through which Congress pushed back at President Franklin Roosevelt's New Deal regime. The exponential growth in the size of government and its substantive scope fundamentally shifted the balance of power away from Capitol Hill and toward the other end of Pennsylvania Avenue. However, even in the midst of the Great Depression, Congress routinely used its investigative powers to exercise a check on the Administration's use of executive powers. Democratic Congresses launched sustained high profile investigations into the operation of many of Roosevelt's alphabet army of executive agencies including the National Recovery Administration, the Works Progress Administration and the Tennessee Valley Authority. 39 [*774] Even today in the post-World War II era, many of the **most potent symbols of congressional power** in our system of separated institutions sharing power have emerged not from the chamber floors, but **from Congress's committee rooms**. In a diverse range of cases from investigations of misconduct by executive agencies to Iran Contra, from Watergate to Whitewater, **Congress has used its bully pulpit** again and again to expose executive wrongdoing, challenge presidential policies and even to bring presidential administrations to the brink of political disaster. To be sure, the vast majority of congressional oversight is a far cry from such high profile publicity probes aimed at extreme allegations of executive misconduct. However, even more mundane oversight can play an important role in maintaining congressional influence over the implementation of public policy. Indeed, **even the anticipation of congressional oversight can be enough to keep an executive agency in line** and improve its adherence to legislative intent. 40 Yet despite its political importance, there are reasons to believe that, on the metric of conducting rigorous oversight, the contemporary Congress is again a broken branch. Interestingly, a principal recommendation of the 9/11 Commission regarding Congress emphasized the critical importance of augmented congressional oversight of anti-terrorism policy. 41 Rather than advocating a further transferal of power to the executive to meet the exigent threat posed by global terrorism, the Commission called for the strengthening of the intelligence committees and emphasized the importance of legislative oversight of antiterrorism policy across levels of government. 42 The Commission bemoaned the lack of oversight in the pre-9/11 era; 43 and there are strong reasons to worry that Congress has done little to improve its oversight capacity - in the realm of military policy and terrorism as well as in other policy arenas - in recent years. The level and quality of congressional oversight and changes in it over time are inherently difficult concepts to measure. In a leading quantitative study of the volume of congressional oversight over time, Joel Aberbach found that congressional oversight increased significantly in the early 1970s, even before the Watergate scandal rocked Washington, and remained strong into the [*775] 1990s. 44 More qualitative analyses, by contrast, have bemoaned a general decrease in quality oversight in recent years, a decline that reached its nadir during the first six years of the George W. Bush Administration. 45 However, what most sets trends in congressional oversight apart from the quality of legislative deliberation

and the nature of widespread delegation of legislative powers to the executive branch is that congressional oversight has not monotonically decreased or increased over time. Rather, when we examine the intensity with which Congress has dedicated itself to its oversight responsibilities, we see a pattern much like that of a swinging pendulum; at times, Congress appears to use its investigative powers aggressively to police the executive while at others it takes a decidedly passive role and fails to meet normative standards of a responsible independent legislature. Perhaps nowhere is this variable nature more readily apparent than in the fluctuations in oversight of the war in Iraq over the preceding five years. The next Part examines these sharp temporal fluctuations in detail. However, the fact that Congress does, **in certain political contexts,** continue to use its oversight tools to check the executive branch and influence the scope and conduct of public policy raises the hope that Congress might be able to reform itself and bolster its institutional capacity for sustained oversight. The Essay returns to such reforms in the Conclusion.

1NC—Appropriations CP

Counterplan text: The Congress of the United States should deny any and all appropriated funds for [program].

Appropriations enforce executive and agency change efficiently and without backlash.

Stith 98 (Kate – Professor of Law at Yale Law School, "ARTICLE: Congress' Power of the Purse," 97 Yale L.J. 1343, http://digitalcommons.law.yale.edu/cgi/viewcontent.cgi?article=2282&context=fss_papers)

E. The Power To Deny Appropriations The genius of regulating executive branch activities by limitations on appropriations is that these limitations can be bureaucratically 79 and contemporaneously enforced **without the need for litigation or after-the-fact congressional investigations in every case**. 80 Appropriations limitations constrain every government action and activity and, assuming general compliance with legislative prescriptions, **constitute a low-cost vehicle for effective legislative control over executive activity**. Should the Executive choose to ignore congressional declarations of policy, Congress may enact purse-string limitations. 81 Historically, however, Congress has been reluctant to use appropriations control to limit federal activities in certain sensitive areas. 82 Only since World War II has Congress consistently enacted appropriations limitations as a means of controlling some aspects of foreign policy. 83 During [*1361] the Vietnam War, Congress cut off funds for Cambodian operations 84 only after a statutory "declaration of policy" -- not tied to continued funding -- had failed to achieve that end. 85 The "object" limitation used in the Cambodian situation (and used a decade later to constrain United States involvement in support of the armed Nicaraguan opposition, or contras) is especially powerful: the denial of any appropriated funds for a specific purpose. 86 Generally, a complete denial provides that no appropriated funds may be used for an activity that otherwise would be a proper object of expenditure from a lump-sum appropriation for the agency. 87 Where Congress thus denies appropriations, the denial is not merely a determination that the public fisc cannot afford spending any money on that activity. By such appropriations legislation, Congress decides that, under our constitutional scheme, for the duration of the appropriations denial, the specific activity is no longer within the realm of authorized government actions. This legislative action **denies the Executive all means of engaging in the prohibited activity** because employee salaries and other overhead costs are almost invariably paid out of appropriated funds. 88 When government employees act on behalf of the United States, they are subject to every limitation that applies to appropriated funds. In principle, a government employee acting in an official capacity -- including the President -- **may not spend one minute to make one phone call** to solicit private funds (for use [*1362] of the government or directly for a third party) for an activity explicitly denied appropriated funds. 89 Even where Congress grants authority to an agency to spend donations or other receipts not deposited first in the Treasury, 90 that authority is not sufficient to permit continuation of an activity which has been denied all appropriated funds. Pursuant to the terms of the congressional action denying appropriations, an agency may not use donated funds to engage in a prohibited activity if any appropriated funds (including funds for employee salaries) would be expended in administering the donated funds. 91 Quite simply, the letter of the appropriation limitation applies to **every penny of appropriations**. Unless Congress clearly intends to permit continued use of gift funds for an activity explicitly denied "appropriated" funds, an agency has no authority to invoke its gift authority to avoid such object restrictions on its appropriations. This is not an exaltation of form over substance; the form (an appropriations limitation) and the substance (a limitation on executive authority) are entirely congruent. Suppose, for instance, that Congress enacts an appropriation for the Department of Health and Human Services (HHS) which provides that "no funds appropriated herein" may be used for family planning programs or activities. This provision would prohibit HHS employees from administering or otherwise supporting the now-unauthorized family planning activity. 92 Although an employee of HHS perhaps could raise private funds for family planning programs by making a few phone calls, the employee is prohibited from doing these things while acting in his or her official capacity. 93 In sum, there is no de minimis exception to appropriation limitations, just as there is no de minimis exception to the constitutional appropriations requirement. Appropriations for federal agencies, like conditions in [*1363] spending programs for nonfederal entities, 94 are important sources of regulatory authority because the expenditure of any and all monies is conditioned upon compliance with prescribed policy. Where Congress prohibits use of any appropriated funds for an activity, 95 the **Executive simply has no authority to finance the prohibited activity** with either private or public funds. 96 By placing the power of the purse in Congress, the

Constitution makes Congress accountable for the actions of the operating branch of the federal government.

2NC/1NR

2NC—Oversight CP

1. Congressional oversight studies found Congress can be a game-changer in terms of public sway, forcing the executive to change tracks

Kriner 9 (Douglas – Assistant Professor of Political Science at Boston University, "CAN ENHANCED OVERSIGHT REPAIR "THE BROKEN BRANCH"?," in *SYMPOSIUM: THE MOST DISPARAGED BRANCH: THE ROLE OF CONGRESS IN THE TWENTY-FIRST CENTURY*, in 89 B.U.L. Rev. 765, http://www.bu.edu/law/central/jd/organizations/journals/bulr/volume89n2/documents/KRINER.pdf)

IV. Does Oversight Afford a Check on Executive Power? The presumption is widespread that through rigorous oversight of the executive branch Congress can maintain a degree of influence over policymaking, even in an era of expanded presidential powers and broad delegations of authority to the executive branch. Immediately after the Democratic takeover of both houses of Congress in 2006, California Congressman Henry Waxman argued that investigations may be "just as important, if not more important, than legislation." 75 Similarly, in academic circles Thomas Mann spoke for many when he argued that the rise of oversight in the 110th Congress "has been the most important change since the 2006 election in terms of relations between the Congress and the administration." 76 However, the precise mechanisms through which oversight alone can influence executive behavior and the course of policymaking are frequently ignored. Recommendations by oversight committees are nonbinding and have no force of law. Congress does have budgetary control over executive departments and agencies, an important means of leverage. However, as noted [*785] by skeptics of congressional dominance theories in the literature on bureaucratic control, budgetary tools are somewhat clumsy instruments for encouraging greater executive compliance with legislative intent. 77 Moreover, oversight committees themselves normally lack appropriations authority, which diminishes the credibility of any threatened committee sanctions for noncompliance. 78 Indeed, in most situations an oversight committee's only formal recourse is to propose new legislation that would legally compel a change in course. However, such efforts are subject to the collective action dilemma and intricate procedures riddled with transaction costs and super-majoritarian requirements, not to mention a presidential veto. 79 If oversight can only constrain executive branch activities through such formal mechanisms, then there are strong reasons to question whether it can truly serve as a real constraint on the executive's freedom of action. And if it does not, then oversight is merely inconsequential position-taking, not a tool for continued congressional influence over policymaking when legislative options fail. However, there are strong theoretical reasons and growing empirical evidence to suggest that congressional oversight can influence executive branch behavior through more **informal means**. Vigorous congressional oversight can inform policy discourse, influence public opinion and bring popular pressure to bear on the **executive to change course**. In David Mayhew's words, members of Congress can wield considerable influence **not only by legislating**, but also by "making moves" in what he terms the "public sphere." 80 Surveying over **200 years** of congressional history, Mayhew identified more than **2300 "actions"** members of Congress have taken in the public sphere in an attempt to shape the national policy discourse and mobilize popular opinion. 81 Again and again, oversight and investigative committee hearings have served as a critically important forum in which members of Congress take stands, stake out positions in contrast to those of the executive branch, and battle for influence over the attentive public. As a result, Mayhew argues that "the politics involving members of Congress needs to be modeled not just as opinion expression - the custom in political science analysis - but also as opinion formation." 82 [*786] But can congressional oversight really influence public opinion? After all, the vast majority of Americans rarely tune to C-SPAN to catch the latest proceedings from hearing rooms in the Russell or Cannon congressional buildings. However, Congress may have an important ally in the mass media, which aids them in their quest to reach a broader audience. A large literature within political communications suggests that the media "indexes" the scope and tone of its coverage to the political debate in Washington, particularly in Congress. 83 Moreover, many congressional hearings are made-for-television events and are consciously designed to generate conflict. Conflict, according to many journalistic norms, is inherently newsworthy, and thus the press may play an important role in amplifying the congressional challenge to administration policies and actions and in broadening the audience such congressional cues reach. 84 A number of recent studies have found strong empirical evidence that the positions articulated in Congress may indeed have a considerable influence on public opinion, particularly in questions of military policy. 85 Many studies rely on observational data. 86 Matthew Baum and Tim Groeling's research demonstrates strong correlations between media-reported congressional rhetoric surrounding multiple major military missions in the last quarter century and popular support for those endeavors. 87 However, such studies relying exclusively on observational data usually only demonstrate correlations between congressional actions and public opinion. If this relationship is endogenous - that is, if members of Congress respond to public opinion when crafting their rhetoric

and actions even as they seek to lead it - then raw correlations between the two tell us little about the direction of the causal [*787] arrow. 88 Is Congress leading public opinion, or are shifts in public opinion producing changes in congressional positions? To untangle such thorny questions about causality, a number of studies have turned to experimental evidence. For example, research by William Howell and Douglas Kriner explores the influence of various cues for or against the President's military policies by Republican and Democratic members of Congress on popular support for a number of real and hypothetical military ventures. 89 A main critique of experimental evidence, however, is that it lacks external validity. While the experimental design clearly establishes the direction of the causal arrow from the treatment condition (e.g., congressional cues) to the observed change in the dependent variable (e.g., observed differences in popular support for the President's military policies), it remains unclear whether similar effects will be observed in the much more complicated environment of real world politics. A complete investigation of these complicated questions of causality, linking congressional oversight and investigative activity and public opinion, is beyond the scope of this Essay. However, the data analyzed previously - documenting changes in the level of critical oversight of the war in Iraq from 2003 to 2008 - does afford an important opportunity to examine whether congressional oversight patterns have had any influence on levels of popular support for the war. V. Congressional Oversight and Public Support for the War in Iraq Since the invasion of Iraq in March 2003, multiple polling organizations have repeatedly asked the public whether the United States did the "right thing" by invading Iraq. On this metric, support for the war has declined dramatically over time from a high of seventy percent in the opening days of the American invasion to a low of thirty-five percent in March of 2008. This trend in popular support is captured in Figure 2. 90 [*788] Figure 2: Invading Iraq Was the "Right Thing" to Do [SEE FIGURE 2 IN ORIGINAL] When we compare shifts in popular support for the war (Figure 2) and trends in congressional oversight (Figure 1) we see a strong negative correlation (r = -.38). As the intensity of critical congressional oversight increases, support for the war decreases. 91 However, from this raw correlation alone we cannot make any inferences about the direction of causality. Increased congressional critical oversight and the challenges to presidential policies it poses in the public sphere may indeed be driving the observed decreases in popular support for the Iraq War. Alternatively, drops in public war support may compel or embolden members of Congress to speak out against the war as well so that they appear in tune with the preferences of their constituents. To get some leverage on this question of causality, an instrumental variable approach is needed. To assess the causal effect of oversight activity on war support requires the identification of an instrumental variable that strongly predicts oversight activity, but has no relationship with wartime support except through its influence on oversight. Armed with such an instrument, we can use it to calculate predicted values of congressional oversight that are not influenced by [*789] the level of public support for the war. Using these predicted values, we can then obtain an estimate of the independent effect of oversight on changes in support for the Iraq War. In most cases, identifying a proper instrumental variable is exceedingly difficult. However, in the current context one of the variables already examined in the analyses of Table 1 is a strong possibility: the number of days that Congress was in session in a given month. The days in session variable is strongly correlated with monthly counts of critical oversight (r = .42). Of equal importance, it is difficult to conceive of any reason why popular support for the war in Iraq should affect the number of days that Congress is in session in a given month. Thus, the days in session variable meets both of the criteria for a good instrument: it is strongly correlated with the independent variable of interest (congressional oversight), and it has no relationship with the dependent variable (war support) except through its influence on the independent variable. Accordingly, to investigate the influence of oversight on support for the Iraq War, I estimated a two-stage least squares regression modeling monthly war support as a function of: monthly and logged casualties; positive and negative conflict events; and the predicted number of days of critical congressional oversight hearings for that month, obtained from a first stage equation using the same variables plus the instrumental variable, the number of days Congress was in session. Results are presented in Table 2 below. [*790] Table 2: Effect of Congressional Oversight on Public Support for Iraq War 92 Days of oversight .52* (.35) Monthly casualties (10s) .21* (.13) Logged cumulative casualties 8.94*** (.50) Positive events .18 (.94) Negative events .36 (.92) (N) 62 R2 .92 *p < .10 **p < .05 *** p < .01 The coefficient for the predicted values of congressional oversight is negative as expected, and statistically significant. According to the model, a standard deviation increase in days of critical oversight (three days) produces an estimated 1.5% decrease in popular support for the war in Iraq. Popular support for the war also decreases in the wake of spikes in American casualties, and the strong, significant negative coefficient for logged cumulative casualties tracks the downward trend in wartime support over time. 93 Finally, the coefficients for positive and negative events are in the expected direction, though neither is statistically significant. Thus, even after controlling for endogeneity in the relationship, the instrumental variable analysis strongly suggests that critical congressional oversight can cause political problems for the President by eroding popular support for his military policies. If oversight can systematically influence [*791] public opinion on multiple issues, it may well provide an **important check on presidential behavior**, **even when legislative remedies are unavailable**.

2. The consensus of scholars agree oversight is more powerful than legislation

Kriner 9 (Douglas – Assistant Professor of Political Science at Boston University, “CAN ENHANCED OVERSIGHT REPAIR “THE BROKEN BRANCH”?,” in *SYMPOSIUM: THE MOST DISPARAGED BRANCH: THE ROLE OF CONGRESS IN THE TWENTY-FIRST CENTURY*, in 89 B.U.L. Rev. 765, http://www.bu.edu/law/central/jd/organizations/journals/bulr/volume89n2/documents/KRINER.pdf)

At least since Aaron Wildavsky's seminal article declaring that there are two presidencies, the conventional wisdom in presidency scholarship is that while Congress can effectively constrain executive power in the domestic arena, the president enjoys significant advantages in foreign affairs. 46 Throughout American history, Congress has faced significant barriers to using legislation to compel the President to change his preferred policy course and constrain his freedom of action in the international arena. However, even as many legislative initiatives have failed, Congress has repeatedly succeeded in using the oversight and investigative tools at its disposal to offer sharp, politically [*776] damaging critiques of executive foreign policy. From the lengthy inquiry into the Truman policies that allegedly "lost China," to the exposure and condemnation of the Nixon Administration's clandestine war in Cambodia, to the Iran-Contra investigations that threatened to take down the Reagan presidency, committee hearings have proved an invaluable

weapon in Congress's arsenal when dealing with the foreign policy executive. 47 In the assessment of Mann and Ornstein, in foreign affairs, "**oversight, even more than direct legislation, is key to movement**." 48

3. Congress has the authority to curtail surveillance in its responsibility as guarantor of national security policy

Auerswald and Campbell 12 (David P. – Professor of Security Studies at the National War College, and Colton C. – Professor of National Security Strategy at the National War College, "Congress and National Security," in *Congress and the Politics of National Security*, p. 3)

Over the last decade, a growing number of scholars and practitioners have called for a reexamination of our national security system, with much attention devoted to interagency reform (Davidson 2009, Smith 2009, Project on National Security Reform 2008). The structures and processes set in place more than a half-ccnturv ago by the National Security Act of 1947, they argue, are outdated, designed to meet the security challenges of the Cold War era instead of those of the 21st century. This can have potentially sobering outcomes, as the Project on National Security Reform noted in its 2008 study. Accordingly, the U.S. government is unable to "integrate adequately the military and nonmilitary dimensions of a complex war 011 terror" or to "integrate properly the external and homeland dimensions of post-9/11 national security strategy" (Project on National Security Reform 2008, ii).

Any **major reform** of the nation's national security system will **require congressional action**. Indeed, Congress has a constitutional responsibility to weigh issues of national security concerns. Congress has the authority to raise an army and a navy, to regulate the armed forces, and to declare war. It must **authorize new federal policies** and determine the **scope of agency actions and portfolios**. It is Congress that must **appropriate the money** for the federal government. In addition, Congress may influence military strategy directly by legislating war aims or military regulations, or indirectly by altering the end- strength and weapons systems of the different services. If no major reform can occur without congressional action, the obvious question is whether Congress is willing and/or able to execute such a major national security undertaking.

2NC—Heg Internal Net Benefit

1. Congress failing to tackle national security policy weakens the American image abroad

King 10 (Kay – former deputy assistant secretary of state for legislative affairs and vice president for external relations at the Center for Strategic and International Studies, "Congress and National Security," Council Special Report No. 58, November 2010, pub. by the Council on Foreign Relations, http://www.cfr.org/content/publications/attachments/Congress_CSR58.pdf)

Much has been written, blogged, and broadcast in the past several years about the dysfunction of the U.S. Congress. Filibusters, holds, and poison pill amendments have become hot topics, albeit intermittently, as lawmakers on both sides of the aisle have increasingly exploited these tactics in pursuit of partisan or personal ends. Meanwhile, such pressing national issues as deficit reduction, immigration reform, and climate change have gone unresolved. To be fair, the 111th Congress has addressed many significant issues, but those it has addressed, such as health-care reform and economic stimulus, exposed Americans to a flawed process of backroom deals that favors obstruction over deliberation, partisanship over statesmanship, and narrow interests over national concerns. Although partisan politics, deal making, and parliamentary maneuvering are nothing new to Congress, the extent to which they are being deployed today by lawmakers and the degree to which they obstruct the resolution of national problems are **unprecedented**. This may explain why Congress registered a confidence level of only 11 percent in July 2010, marking its lowest rating ever in the annual Gallup institutional confidence survey and ranking it last among sixteen major U.S. institutions.1

Most of the recent attention devoted to Congress's dysfunction has centered on its impact on domestic issues and has overlooked its effect on national security. Yet Congress's inability to tackle tough problems, both domestic and international, has serious national security consequences, in part because it **leads the world to question U.S. global leadership**. Reporting from the World Economic Forum in Davos in January 2010, New York Times columnist Tom Friedman wrote, "'Political instability' was a phrase normally reserved for countries like Russia or Iran or Honduras. But now, an American businessman here remarked to me, 'people ask me about "political instability" in the U.S.' We've become unpredictable to the world."2 Furthermore, when Congress fails to perform, national security suffers thanks to ill-considered policies, delayed or inadequate resources, and insufficient personnel. Without congressional guidance, allies and adversaries alike devalue U.S. policies because they lack the support of the American people that is provided through their representatives in Congress.

2. Reforming and cracking down on surveillance affairs reverses Congress's bad image and strengthens US leadership

King 10 (Kay – former deputy assistant secretary of state for legislative affairs and vice president for external relations at the Center for Strategic and International Studies, "Congress and National Security," Council Special Report No. 58, November 2010, pub. by the Council on Foreign Relations, http://www.cfr.org/content/publications/attachments/Congress_CSR58.pdf)

In a perfect world, Congress would serve as an equal branch of gov-ernment in the national security arena. It would be a fully informed body providing prompt and inclusive action on annual budgets, congressional proposals, and executive branch initiatives; supplying **realistic and effective oversight** of the executive branch; and offering knowledgeable and timely consideration of treaties and nominations. It would devote time and resources to strengthening its own expertise, and it would commit to engaging in a regular consultative process with the executive branch on matters of national security, especially regarding the use of military force.

If such a Congress were to materialize, it could partner with the executive branch to provide the insights and perspectives on defense, diplomacy, development, and intelligence matters that only the most representative branch of government can offer. It could assist in a transition to a comprehensive, integrated approach to national security that utilizes diminishing resources judiciously and guides policies wisely to diminish external threats; prevent conflicts and reduce the need for

military interventions; cultivate new markets for U.S. trade and investment; and improve health, education, and entrepreneurial opportunities in developing states. A revitalized Congress could serve as a proud embodiment of the nation's democratic tradition and values and contribute to maintaining, and, where necessary, **restoring U.S. leadership**, ensuring the admiration of allies and the respect of adversaries worldwide.

2NC—AT: Links to Politics

Oversight doesn't have to result in new legislation

Kriner 9 (Douglas – Assistant Professor of Political Science at Boston University, "CAN ENHANCED OVERSIGHT REPAIR "THE BROKEN BRANCH"?," in *SYMPOSIUM: THE MOST DISPARAGED BRANCH: THE ROLE OF CONGRESS IN THE TWENTY-FIRST CENTURY*, in 89 B.U.L. Rev. 765, http://www.bu.edu/law/central/jd/organizations/journals/bulr/volume89n2/documents/KRINER.pdf)

One means for Congress to become a more responsible branch is for it to wrest back control of legislative powers delegated to the President and to stem the tide of ever-greater delegation to the executive branch. Yet, with the size and scope of government and the ever-increasing complexity of public policy, delegation is unavoidable. Indeed, without it the government would fail to take advantage of the resources and expertise of the permanent bureaucracy in forging and refining public policy. Rather, for Congress to delegate authority responsibly it must maintain some check on power once delegated. When other political actors abuse delegated authority in a way that conflicts with legislative intent, Congress must retain some mechanism to call that actor to account. Of course, Congress always has the ability to pass new legislation when the executive branch interprets and implements a law in a way that is contra legislative intent. However, an extensive literature in political science has laid bare the stark barriers to Congress doing so. Such efforts require that Congress overcome its collective action problems and a legislative process riddled with transaction costs. 35 Any such effort to pass new legislation to undo an executive action must clear super-majoritarian hurdles in the Senate, and even then, it faces a President wielding the veto pen. 36 As a result, legislation will frequently offer little remedy to rectifying perceived abuses of delegated authority. An alternative mechanism, the legislative veto, was ruled unconstitutional by the Supreme Court in 1982. 37 While the legislative veto survives by the mutual consent of both branches in many alternative forms, the court ruling and the sometimes cumbersome provisions for the veto to be exercised limit its usefulness as a widespread check on executive discretion. A third mechanism for Congress to **delegate responsibly is to conduct rigorous, sustained oversight of the executive branch and its use of delegated powers**. Oversight is perhaps the most logical solution for Congress to maintain some **influence over how delegated authority is exercised**; yet in this realm too, Congress all too often appears to be the "broken branch."

2NC—Appropriations CP

1. Congress has an incredible power through the purse which it has used many times to check the executive

Fisher 97 (Louis – Senior Specialist in Separation of Powers, Congressional Research Service, "ARTICLE: Presidential Independence and the Power of the Purse," 3 U.C. Davis J. Int'l L. & Pol'y 107)

II. STATUTORY RESTRICTIONS Through its prerogative to authorize programs and appropriate funds, **Congress can define and limit presidential power by withholding all or part of an appropriation**. 20 It may attach "riders" to appropriations measures to proscribe specific actions. 21 It has become the custom in Congress to admit certain "limitations" in an appropriations bill. Since Congress, under its rules, may decline to appropriate for a purpose authorized by law, "so it may by limitation prohibit the use of the money for part of the purpose while appropriating for the remainder of it." 22 It is sometimes argued that the power of the purse is ineffective in [*111] restraining presidential wars. Senator Jacob Javits said that Congress "can hardly cut off appropriations when 500,000 American troops are fighting for their lives, as in Vietnam." 23 The short answer is that Congress can and has used the power of the purse to **restrict presidential** war **power**. If members of Congress are worried about American troops fighting for their lives in a futile war that is unrelated to American national interests, those lives are not protected by voting for continued funding. The proper and sensible action is to terminate appropriations and bring the troops home. Members need to make that case to their constituents. It can be done. Congress used the power of the purse to **end the war in Vietnam**. 24 In 1976, by adopting the Clark amendment, 25 Congress prohibited the Central Intelligence Agency (**CIA**) **from operating in Angola** other than to gather intelligence. Legislation also prohibited the CIA from conducting military or paramilitary operations in Angola and denied any appropriated funds to finance directly or indirectly any type of military assistance to Angola. 26 Beginning in 1982, Congress drafted **increasingly tighter language** to prohibit the use of appropriated funds to assist the Contras in Nicaragua. In 1986, Congress placed language in an appropriations bill to restrict the President's military role in Central America by stipulating that U.S. personnel "may not provide any training or other service, or otherwise participate directly or indirectly in the provision of any assistance, to the Nicaraguan democratic resistance pursuant to this title within those areas of Honduras and Costa Rica which are within 20 miles of the border with Nicaragua." 27 The statute defined U.S. personnel to mean "any member of the United States Armed Forces who is on active duty or is performing inactive duty training" and any employee of any department, agency, or other component of the executive branch. 28 The clear purpose was to prevent military activities in Honduras and Costa Rica from spilling over into Nicaragua. The Reagan Administration never offered any constitutional objections to this statutory restriction. Statutory restrictions were again used in 1991, when Congress authorized President Bush to use military force against **Iraq.** The statutory authority was explicitly linked to UN Security Council Resolution 678, which was adopted to expel Iraq from Kuwait. 29 Thus, the legislation did not [*112] authorize any wider action, such as using U.S. forces to invade and occupy Iraq, perhaps by reaching as far into the country as Baghdad. Two years later, Congress established a deadline for U.S. troops to leave **Somalia**. No funds could be used for military action after March 31, 1994, unless the President requested an extension from Congress and received express statutory authority. 30 From 1993 to 1995, Congress considered, but discarded, language to prohibit the use of appropriated funds for the invasion of **Haiti** and the deployment of U.S. ground troops to **Bosnia**. 31 Congress has ample authority to **control covert funding**. The CIA uses a contingency fund to initiate covert operations before notifying Congress. If administrations abuse this authority and claim a constitutional right not to notify Congress, even within forty-eight hours or some minimal period, Congress can **abolish the contingency fund** and force the President to seek congressional approval in advance for each covert action. 32 With regard to war powers in general, Congress may pass a concurrent resolution (not subject to the President's veto) stating that it shall not be in order in either House to consider any bill, joint resolution or amendment that provides funding to carry out any military actions inconsistent with an enabling statute, such as the War Powers Resolution. Under the ruling of INS v. Chadha, 33 concurrent resolutions may not direct the President or the executive branch, but they can control the internal procedures of Congress.

2. Appropriations serve as 'red lights' which represent incontrovertible directives to agencies and the executive

Raven-Hansen and Banks 94 (Peter – Glen Earl Weston Professor of Law at the National Law Center at George Washington University, and William – Professor of Law, Syracuse University College of Law,

“Pulling the Purse Strings of the Commander in Chief,” Volume 80, Number 4, May 1994, http://www.jstor.org/stable/1073484)

Not only do national security appropriation measures thus meet most of the objections to the making of customary national security law, but restrictive appropriations can also be **especially effective as "red lights"** against the creation of such law. 115 They may act as **signals to courts** that finding a certain "custom" is inappropriate. For instance, it was crucial to the finding of customary legal authority for executive claims settlements in Dames & Moore that Congress had not "in some way resisted the exercise of Presidential authority." 116 Restrictive appropriations serve as the **strongest and clearest evidence** of such resistance to an executive practice. 117 They are effective, as the Senate Committee on Governmental Operations has noted, "precisely because ... [they] are so **direct**, **unambiguous**, and **virtually self-enforcing**. While agencies are able to bend the more ambiguous language of authorizing legislation to their own purposes, the dollar figures in appropriations bills represent commands which **cannot be bent or ignored except at extreme** [*856] **peril to agency officials**." 118 Moreover, the annual cycle of appropriations affords regular opportunities for Congress to express its disapproval of executive practice. Finally, the history of national security appropriations suggests that resistance to executive national security actions is in part their raison d'etre; they were originally conceived as the ultimate check on executive national security practices. 119

2NC—AT: Pres Power of Purse

1. The President can spend money but will never do it without approval or face impeachment

Rosen 98 (Colonel Richard – Judge Advocate General's Corps in the United States Army, "FUNDING "NON-TRADITIONAL" MILITARY OPERATIONS: THE ALLURING MYTH OF A PRESIDENTIAL POWER OF THE PURSE," 155 Mil. L. Rev. 1, http://www.loc.gov/rr/frd/Military_Law/Military_Law_Review/pdf-files/276C75~1.pdf)

Finally, if a situation is sufficiently grave and an operation is essential to national security, the President has the raw, physical power--but not the legal authority--to spend public funds without congressional approval, after which he or she can either seek congressional approbation or attempt to weather the resulting political storm. To the President's immediate advantage is the fact that the only sure means of directly stopping such unconstitutional conduct is impeachment. 703 Congress could, however, [*149] certainly make a President's life miserable through other means, such as denying requested legislation or appropriations, delaying confirmation of presidential appointments, and conducting public investigations into the President's actions.

2. Congress can exercise the power of the purse in order to prevent executive circumvention

Auerswald and Campbell 12 (David P. – Professor of Security Studies at the National War College, and Colton C. – Professor of National Security Strategy at the National War College, "Congress and National Security," in *Congress and the Politics of National Security*, p. 9-10)

Congress is often dubbed powerless to directly affect presidential power in the areas associated with national security. What is clear, pursuant to the Constitution, is that the underlying relationship between Congress and the executive in national security issues is one of **shared agenda control**. Each branch has the power to affect U.S. policy. While contemporary presidents generally direct this agenda, control occasionally **shifts toward Congress**, as it did in the inter-war period, in the absence of consensus over American grand strategy, and given that absence, during divided government or prolonged mil-itary conflicts.

One reason is that today's legislative branch is armed with resources to **actively engage in national security matters**. The proliferation of congressional support staff and news media have **facilitated congressional activism** and provided individual members an incentive to be involved in major national security legislation. That is a dramatic change from 50 years ago. In the 1950s, national security decisions essentially were made by a handful of powerful committee chairmen. In the late 1960s and early 1970s, in reaction to Vietnam and Watergate and the growth and complexity of the federal government, Congress increased the number of congressional oversight panels and their associated staffs, as well as created various legislative branch research entities. These resources gave members of Congress the means to become assertive on security issues. At the same time, the proliferation of media outlets and the explosion of interest groups gave members of Congress an incentive to speak out. Today's members are adept at harnessing television coverage and interacting with interest groups to get their points across. In short, individual members now have both the means and an incentive to challenge the presi dents security priorities. Indeed, virtually every member of Congress can now become involved to some degree in national security debates.

2NC—AT: Political Will

Congress has the authority and political will to reform surveillance policy.

Bendix and Quirk 15 (William – Assistant Professor of Political Science at Keene State College, and Paul J. – Phil Lind Chair in U.S. Politics and Representation at the University of British Columbia and a former research associate at the Brookings Institution, "Secrecy and negligence: How Congress lost control of domestic surveillance," in *Issues in Governance Studies*, Number 68, March 2015, pub. by the Brookings Institution, http://www.brookings.edu/~/media/research/files/papers/2015/03/02-secrecy-negligence-congres-surveillance-bendix-quirk/ctibendixquirksecrecyv3.pdf)

REFORMING SURVEILLANCE POLICYMAKING

Ideally, in the aftermath of the Snowden scandals, Congress would undertake to **restore order and legal regularity** to surveillance policy by passing new legislation on the metadata program. Conceivably, it could **choose to end bulk collection** of phone records and reaffirm the original requirement of individual orders for the seizure of a target's business records. Given the prevailing sense of urgency about antiterrorism security, however, we think a constructive measure would more likely **sanction metadata collection, subject to conditions** and requirements designed to avoid unnecessary harm to privacy interests.

For the immediate future, however, Congress appears to have gone out of the business of determining policy for antiterrorism surveillance. In the near term, the best hope for privacy interests is for President Obama to make good on his post-Snowden pledge, repeated in his 2015 State of the Union Address, to reform surveillance programs in order to instill "public confidence...that the privacy of ordinary people is not being violated." He promised to work with Congress on the issue. If Congress is not capable of acting, the executive branch can impose its own constraints on surveillance practices. But the maintenance of self-imposed executive-branch constraints would depend entirely on the strength of the administration's commitment—and, in two years' time, on the disposition of the next president. Because of the president's central responsibility for national security, the presidency is hardly a reliable institutional champion for privacy interests.

If over the long run surveillance practices are to afford significant protection to privacy interests, Congress will need to overcome its partisan gridlock and strengthen the institutional framework for surveillance policymaking. We suggest two long-term goals. First, Congress should seek some means of enhancing its capacity for oversight and policymaking on secret surveillance practices. Some reformers have called for abolishing or prohibiting any secret laws or interpretations that control investigations. In his 2011 speech mentioned above, Senator Wyden acknowledged that surveillance activities are necessarily secret. He insisted, however, that the policies governing those activities should be debated and decided openly, through normal democratic processes.

He argued that secret laws, or secretly sanctioned interpretations of laws, are incompatible with democracy.

This position is appealing from the standpoint of democratic principles. But we find it too simple. There will inevitably be intelligence methods that offer major benefits for investigations and that require secrecy—even about general practices or capabilities—to be fully effective. These methods will often raise new issues of policy, or require change in existing policy; but discussing the policy openly will, in itself, reveal the methods and undermine their effectiveness. In such cases, there are only three options for Congress: forego using the new methods, despite the resulting sacrifice of investigative effectiveness; delegate the decisions about them, without legislative guidance, to the intelligence agencies; or adopt secret laws or interpretations to control their use. We believe the last option—acknowledging the need for secret policies—is the preferable course. Instead of abolishing secret laws, amendments, or interpretations, reformers should try to establish processes for making them that help minimize their frequency and provide some degree of accountability to Congress and the public.

Such a process, even if achievable, would be far from fully democratic. But it would provide far more accountability to Congress and the public than do secret executive interpretations reviewed simply by the FISA Court.

2NC—AT: Courts

The Courts ducked checking the executive --- only Congress has the power

Menitove 10 (Jonathan T. – J.D. from Harvard University, "Note: Once More Unto the Breach: American War Power and a Second Legislative Attempt to Ensure Congressional Input," 43 U. Mich. J.L. Reform 773)

III. Mixed Messages: How the Judiciary Has Addressed War Power Notwithstanding a few early Supreme Court decisions defending Congress's predominance over the president in exercising war power, the judiciary has been largely unhelpful in restoring the constitutional Framers' original vision. Initial decisions arising out [*786] of the Quasi-War with France affirmed Congress's authority, but subsequent holdings - most especially the Supreme Court's decisions in The Prize Cases 61 and United States v. Curtiss-Wright 62 - seemed to imbue the president with extra-constitutional war power authority. 63 By the time litigation arose during the Vietnam and Persian Gulf Wars, the courts timidly refused to decide the issue, claiming the issue to be a nonjusticiable political question. 64 As such, **the judiciary does not represent a viable means for mandating** the constitutionally required congressional input in war-making decisions. A. The Earliest Supreme Court Cases Pertaining to War Power Affirmed Congress's Authority The earliest Supreme Court cases pertaining to war power arose out of the Quasi-War with France between 1798 and 1800, which, although authorized by congressional statute, was undeclared. Writing in 1800, the Supreme Court noted in Bas v. Tingy, 65 that regardless of whether hostilities were declared or undeclared, the conflict still constituted "war" in the constitutional sense, with the declared war being "perfect" and "general" war and the undeclared war constituting "imperfect" and "limited" war. 66 While the Court did not expressly identify Congress to be the dominant player in war-making decisions, the Court strongly implied this message: Congress is empowered to declare a general war, or congress may wage a limited war; limited in place, in objects, and in time. If a general war is declared, its extent and operations are only restricted and regulated by the jus belli, forming a part of the law of nations; but if a partial war is waged, its extent and operation depend on our municipal laws [as passed by Congress]. 67 [*787] The Court was far more explicit in Talbot v. Seeman, 68 an 1801 case also with origins in the Quasi-War with France. In Talbot, the newly-sworn Chief Justice John Marshall confronted a dispute between Captain Silas Talbot, whose American warship (the U.S.S. Constitution) libeled the Amelia, a Hamburgh vessel that had been captured by the French. 69 In finding Captain Talbot's seizure of the Amelia lawful, Justice Marshall held that although war had not been declared against France, Congress had authorized the U.S. Navy to capture French vessels, and since the Amelia was carrying eight carriage guns and in possession of the French, there was sufficient probable cause for Captain Talbot to capture the ship. 70 Most notable is Justice Marshall's explicit statement regarding Congress's war power: The whole powers of war being, by the constitution of the United States, vested in congress, the acts of that body can alone be resorted to as our guides in this enquiry. It is not denied, nor in the course of the argument has it been denied, that congress may authorize general hostilities, in which case the general laws of war apply to our situation; or partial hostilities, in which case the laws of war, so far as they actually apply to our situation, must be noticed. To determine the real situation of America in regard to France, the acts of congress are to be inspected. 71 Justice Marshall more precisely defined his views regarding the balance of war power between the legislative and executive branches in Little v. Barreme, 72 an 1804 case also arising out of the Quasi-War. In Little, Justice Marshall held that in authorizing war, Congress may place limits on the president's conduct. The facts of Little relay the story of Congress authorizing President Adams to seize ships sailing to French ports, with President Adams - contrary to Congress's wishes - issuing an order to capture vessels sailing to or from French ports. 73 Captain George Little seized a Danish ship sailing from a French port, and was subsequently sued for damages. Marshall, in deciding the case, held that Captain Little could [*788] be held liable for damages, 74 thus ruling that orders issued by the Commander-in-Chief during wartime are still subject to Congress's restrictions. 75 Such a ruling clearly indicates Justice Marshall's belief that, on war-making decisions, Congress reigned supreme over the president. The Court affirmed the notion of congressional war power supremacy in Martin v. Mott, 76 a controversy arising in 1827 in the aftermath of the War of 1812. While some cite this case as support for broad presidential war power, the Court actually imposed limits on the president's authority. 77 In the decision, Justice Story sustained the delegation by Congress to the president of the authority to call up the militia, but the Court carefully constricted the circumstances in which the president could act, noting the president's power to be "a limited power, confined to cases of actual invasion, or of imminent danger of invasion." 78 Furthermore, the Court confirmed that the president did not hold any inherent war power authority; he could only exercise war power when such power was "confided by Congress to the President." 79 These four decisions illustrate early Supreme Court recognition of Congress's dominant role, thus fulfilling the Framers' original vision for the balance of war power. B. Subsequent Decisions Imbued the President with Extra-constitutional War Power Authority In two decisions - one rendered in 1862 pertaining to President Lincoln's conduct at the start of the Civil War, the other decided in 1936 discussing the president's role in foreign affairs - the Supreme Court expanded presidential war power. The Supreme Court addressed Lincoln's order to blockade southern ports and seize ships without Congress's authorization in The Prize Cases, 80 splitting five to four, with the majority sustaining the Union seizures. 81 According to the Court's opinion, the president's inherent authority as Commander-in-Chief justified his action 82 and, even if [*789] he lacked the constitutional authority to issue the blockade, Congress ratified the blockade via subsequent legislation, thus rendering this military action without Congress's consent a valid exercise of the war power. 83 The Supreme Court further weakened Congress's ability to intervene on the president's foreign affairs activity in United States v. Curtiss-Wright Export Corp. 84 in 1936. Upholding the president's declaration of an arms embargo, the Court noted, "the powers of external sovereignty did not depend upon the affirmative grants of the Constitution" 85 and that "participation [by Congress] in the exercise of the power is significantly limited." 86 Citing "this vast external realm, with its important, complicated, delicate and manifold problems" 87 Justice Sutherland, writing the majority opinion, argued that the president has an inherent power to be "the sole organ of the federal government in the field of international relations." 88 Justice Sutherland further elaborated on this view of presidential supremacy in foreign affairs, focusing specifically on war: He, not Congress, has the better opportunity of knowing the conditions which prevail in foreign countries, and especially is this true in time of war. He has his confidential sources of information. He has his agents in the form of diplomatic, consular and other officials. Secrecy in respect of information gathered by them may be highly necessary, and the premature disclosure of it productive of harmful results. 89 Thus, according to Justice Sutherland's constitutional interpretation, it is the president - and not Congress - who is predominant in exercising war power. In both The Prize Cases and Curtiss-Wright, the Supreme Court has undermined its previous commitment to congressional war power, and provided support to those who support broad presidential war-making authority. [*790] C. Modern Courts Refuse to Rule on War Power, Declaring the Issue a Nonjusticiable Political Question In more recent decisions, the courts have adopted a different approach, refusing to decide cases concerning war power on grounds that the issue is a nonjusticiable political question. During the Vietnam War, Members of Congress sought assistance from the courts in reasserting their constitutionally-provided war power. However, rather than hear these cases, the judiciary sidestepped the issue, declining to hear cases concerning the constitutionality of the continuation of the war on grounds that the political question doctrine prevented the courts from deciding the issue. 90 During the Reagan and Bush Administrations, courts declined to reach the merits in war powers cases relying on other excuses including mootness, 91 ripeness, 92 standing, 93 the doctrines on judicial prudence and **equitable discretion**, 94 and the notion that **Congress would be a better fact-finder** than the courts on this issue. 95 Unlike the early Supreme Court cases, or the subsequent Prize Cases and Curtiss-Wright decisions, the judicial branch over the last thirty years has steered clear of the war powers issue. While the Supreme Court once served as a bulwark in defense of Congress's predominance over the president in administering the war power, subsequent Supreme Court decisions undermined Congress's constitutional authority. The courts have thus revealed themselves as unable to restore the balance of war power to the Framers' original vision. The judiciary's more recent strategy of treating war power as a nonjusticiable political question has unequivocally established that the **courts cannot be trusted** to protect [*791] Congress. For this reason, Congress must seek to help itself, acting to pass a legislative war power reform act to ensure that its input is considered when the United States goes to war.

2NC—AT: Theory

1. best policy option --- debaters can't limit themselves to 1 actor to find the best solution

2. the agent is key to policy education --- different surveillance agencies have different jurisdictions, enforcement agencies and funding which are crucial to understanding policy

3. aff choice of agent is unfair --- if the neg has to use the actor chosen by the AFF the AFF will choose actors that limit out neg CPs

4. no abuse --- the aff chose that agent and thus should be able to defend it

5. CP is core of the topic --- engages in the core topic question of reform versus oversight

Rosenzweig 13 (Paul – Senior Legal Research Fellow in the Center for Legal and Judicial Studies at The Heritage Foundation, "The NSA Doesn't Need Wholesale Reform, Just Greater Oversight," in the New Republic, 10-29-13, http://www.newrepublic.com/article/115392/nsa-reform-not-essential-congressional-oversight)

One final point, more about Congress and its role than the NSA. Since the mid-1970s, with the reforms prompted by the Church and Pike Committee investigations we in America have been engaged in an experiment — an experiment to see whether it is possible for a country like America to have covert operations under law—or, to coin a phrase, whether we can have intelligence collections within the bounds of democracy. To my mind the system of delegated transparency, where Congress stands in for the general public, has worked reasonably well–allowing us to use intelligence capabilities while minimizing the risks of abuse of law. Today, however, thanks to the Snowden disclosures, that system is under assault. Most who challenge the system do so from the best of motives. But there are some whose calls for transparency mask the intention of diminishing American capabilities. And that means that in this post-Snowden era, this House Intelligence Committee (and its Senate counterpart) bear a great responsibility. To them falls the task of defending the integrity of our current system of intelligence oversight. While we have discussed possible reforms to the NSA's programs, both legislative and structural, the **critical insight** is that, **despite the hue and cry**, the system is not badly broken. It can be improved, but in the main it has produced a reasonably effective system of oversight that, if the public record is an accurate reflection, resulted in precious little abuse of the sort we ought to fear. Congress should be proud of that record and of your role in creating it. Can the Intelligence Committees, perhaps, do a better job of oversight? No doubt. But in the end, **notwithstanding the calls for reform and the many plausible reforms you might consider**, this Committee should **defend the essential structure of our current system**. And that, in the end, means rejecting most calls for wholesale reform and complete transparency, and, instead, defending the role of graduated or delegated oversight.

2NC—AT: Perm

The perm severs 'curtail' --- it does not fundamentally alter the NSA's capabilities, just improves the oversight process

Rosenzweig 13 (Paul – Senior Legal Research Fellow in the Center for Legal and Judicial Studies at The Heritage Foundation, "The NSA Doesn't Need Wholesale Reform, Just Greater Oversight," in the New Republic, 10-29-13, http://www.newrepublic.com/article/115392/nsa-reform-not-essential-congressional-oversight)

Structural Changes: Finally, most of the more effective possible changes lie **not in significant legislative tinkering**, but rather in interstitial structural and operational reforms that **improve the audit and oversight process** without **fundamentally altering the capabilities of NSA** or the IC organizations. Here are a few, listed just in bullet point form, that might be worth thinking about:

PCLOB CP

PCLOB CP 1NC Shell

The United States federal government should propose <the plan> to the Privacy and Civil Liberties Oversight Board for review. The board should solicit feedback from all relevant stakeholders. The board should issue a report recommending that the United States federal government do the plan.

PCLOB investigations are key to effective surveillance policymaking – congressional backing, access to classified info, and public interest ensure its recommendations shape policy.

Levy, 2013

(Pema, International Business Times Writer, "NSA Spying Controversy: The New Agency That Could Change Government Surveillance" *IB Times*, July 11, http://www.ibtimes.com/nsa-spying-controversy-new-agency-could-change-government-surveillance-1342409)

You've probably never heard of it, but there is a new agency in Washington that is working to make sure the government's anti-terrorism efforts do not ride roughshod over Americans' civil liberties. These days, when a sharply divided Congress struggles to get nearly anything accomplished, there is little evidence that such an agency, armed only with the mandate to offer advice, can influence lawmakers. But the Privacy and Civil Liberties Oversight Board may have a better chance at reforming the national security apparatus than many assume. In fact, the board is in a unique position to shape the legislative debate over the government's spying abilities -- and has powerful allies to make sure Congress takes up its recommendations. Referred to as the PCLOB (sounds like 'pee-klawb'), the new agency has the job of advising the president, federal agencies and Congress on how to balance the government's national security efforts with civil liberties concerns. Board members have top-secret clearances, and agency heads are expected to turn over any documents the board requests. If the board needs information from the private sector, the attorney general can issue a subpoena on its behalf. Created in 2004 at the recommendation of the 9/11 Commission, the PCLOB did not get off to an auspicious start. It was originally located within the Executive Office of the President, and its first report to Congress was edited by the Bush White House, prompting one Democratic member to resign. In response, in 2007 the new Democratic Congress made the board an independent agency within the executive branch. Then-President George W. Bush clashed with Senate Democrats over board nominees, and ultimately none were confirmed. President Barack Obama dragged his feet in choosing nominees and when they finally did come, Republicans refused to approve them. Four part-time members were finally approved in the last nine months. The board's chairman, David Medine, was not formally installed on until May 29, 2013. One week later, the Guardian newspaper published its first scoop, based on leaked National Security Agency documents, showing the government collected and stored metadata on the phone calls of millions of Americans. Over the next few days, the documents leaked by Edward Snowden revealed that the government went further, collecting and storing metadata on the phone calls of virtually all Americans. The government was also scooping up an untold amount of Americans' electronic communications as part of its foreign surveillance operations. These revelations thrust the board into the middle of the most important debate over privacy and civil liberties in years. Sen. Tom Udall, D-N.M., sent a letter to the board asking it to "make it an urgent priority to investigate the programs" and provide an unclassified report on their legality and whether they take the "necessary precautions to

protect the privacy and civil liberties of American citizens under the Constitution." Twelve additional senators, including two Republicans, signed Udall's letter. On June 21, the board met with Obama. All this before its office space was even ready or emails set up. The full board's first public appearance came Tuesday at a workshop in Washington, D.C., where the five members -- three Democrats and two Republicans -- queried three separate panels of experts on how the surveillance programs might be brought more in line with civil liberties concerns. Civil liberties advocates appear cautiously optimistic about the new board, whose opinion could help determine whether Congress decides to take on the massive surveillance programs. Advocates are also aware of the board's ability to actually move their cause backward and entrench these programs. "If it blesses these programs, they are likely to continue," privacy rights advocate Greg Nojeim, who participated in one of Tuesday's panels, said in an interview Wednesday. Whether the board deems the phone metadata collection is unlawful or not will be "one of the most significant tests of PCLOB," said Nojeim, a lawyer at the Center for Democracy and Technology. But whatever its recommendations ultimately are, the PCLOB is armed by circumstance with the power to shape the laws governing the surveillance state, particularly Section 215 of the USA Patriot Act, also known as the "business records" provision, under which the government claims the authority to collect Americans' call data. During Tuesday's workshop, panelist Michael Davidson, former legal counsel to the Senate Intelligence Committee, hinted at the board's potential for influence. "Can I suggest a focus for the board, and that is the Congress will turn to the many important questions that have been discussed through the day when it has to," Davidson said. "And it will have to when, initially, when the sunset for business records [provision] is reached in the middle of 2015." In other words, the government's authority to carry out the phone metadata collection will expire on June 1, 2015, absent congressional action – a situation the board can use to shape the debate and even push its recommendations. On June 1, 2017, the portion of the Foreign Intelligence Surveillance Act under which the NSA conducts electronic foreign intelligence sweeps that also snag domestic communications will expire without reauthorization, as well. Privacy advocates don't want the board or Congress to wait years to address the surveillance programs they believe are illegal. But at the end of the day, the sunset dates guarantee that a debate over these programs will take place -- and when it does, the PCLOB can have its reports and recommendations ready to shape that conversation. Moreover, because the issues in are so complex from a legal, practical and technological point of view, lawmakers who want to put forward serious reforms may not have the ability to craft adequate proposals before the sunset deadline. The board can help in that practical function to make sure that lawmakers have reforms ready to be implemented when the debate begins. Nojeim also sees this as an "advantage" unique to the PCLOB. "The board has a guaranteed congressional audience that other boards don't have because it's making recommendations on statutes that will expire unless acted on," he said Wednesday. Despite the leverage the PCLOB has in 2015 and 2017, the civil liberties community believes it has a popular mandate to move reforms -- at least more basic changes like releasing more classified materials -- while the public is engaged on the issue. The NSA leaks are "a game-changer," said Michelle Richardson, a legislative counsel at the American Civil Liberties Union, noting that members of Congress on both sides of the aisle have indicated that the NSA's programs need to be reined in. "This certainly seems like our best opportunity yet." Whether or not Congress takes up a range of proposals put forward in the last month to reform the intelligence system, the board has allies in Congress who will have the power to make sure its recommendations are debated, even if it takes until 2015 for that to happen. "There are senators and representatives, including [Vermont Democratic Sen. Patrick] Leahy, who chairs the Senate Judiciary Committee, who struggled and pushed and cajoled until the PCLOB members were nominated and approved," Nojeim said Wednesday. "They are not going to ignore the recommendations of the board they fought for."

Solvency – General Extension

PCLOB oversight key – exposes security establishment abuses and provides policy guidance.

Ball, 2012

(Michael, Director of ACLU's DC Legislative Office, "Letter to PCLOB", 26 October, https://www.pclob.gov/library/20121031-Submission-ACLU.pdf)

Oversight of these new authorities is limited largely to internal controls. Important oversight bodies such as Congress and the President's Intelligence Oversight Board aren't required to be notified, even of "significant" failures to comply with the guidelines.7 **Additional oversight by the PCLOB is essential to protecting Americans' privacy from this invasive new collection authority.** Other programs need additional oversight as well and include: o New or expanding Intelligence Community activities focused on domestic collection of US person information, including new cyber-security programs, the proposed expansion of the DNI Information Sharing Environment to include suspicious activity reporting not related to terrorism, and the increasing number of US persons being placed on watch lists, particularly while travelling abroad, preventing return flights to the United States; o Surveillance and obstruction of activity protected under the First Amendment, including intelligence community and law enforcement surveillance/tracking of protest groups and the FBI's use of aggressive and coordinated raids of activists' homes, and abusing the use of Grand Jury subpoenas to jail activists; o Racial profiling in law enforcement and intelligence activities, such as the FBI's racial and ethnic mapping program and the Transportation Security Agency's behavioral detection programs; o The use of new surveillance technologies by federal law enforcement and national security agencies, such as mobile phone data and other location-tracking technologies, unmanned surveillance drones, and databases maintained by commercial data aggregators. This list should is by no means comprehensive. The pool of programs put in place in the years since 2001 is broad, deep, and alarming. The nation's security establishment has greatly expanded in scope and power in recent years, and the oversight structures created to oversee these vast agencies are small and inadequate. Aside from Japan and South Korea, the United States is the only advanced industrial nation that has no privacy and data protection commissioner to enforce its privacy laws. We hope that the PCLOB will embark on its mission quickly and begin filling this oversight vacuum with vigor and energy. We also hope that the PCLOB will engage in the full spectrum of privacy oversight activities—not only investigating and reviewing government actions to ensure the adequate consideration of privacy and civil liberties interests, but also engaging in pro-active policy leadership, providing broad public guidance on how privacy and other civil liberties interests should be protected as our security agencies make use of new technologies.

Solvency – Awareness

Commissions are more efficient than Congress and solve groupthink

Schwalbe, 2013

(Steve, Auburn University, "Independent Commissions: Their History, Utilization and Effectiveness," March 22, Weather Coalition, http://weathercoalition.org/sites/default/files/documents/2013/independent_commissions.pdf)

There are numerous other reasons for establishing independent commissions. They are created as a symbolic response to a crisis or to satisfy the electorate at home. They have served as trial balloons to test the political waters, or to make political gains with the voters. They can be created to gain public or political consensus. Often, when Congress has exhausted all its other options, a commission serves as an option of last resort.23 Commissions are a relatively impartial way to help resolve problems between the executive and legislative branches of government, especially during periods of congressional gridlock. Wolanin also noted that commissions are "particularly useful for problems and in circumstances marked by federal executive branch incapacity." Federal bureaucracies suffer from many of the same shortcomings attributed to Congress when considering commissions. They often lack the expertise, information, and time to conduct the research and make recommendations to resolve internal problems. They can be afflicted by groupthink, not being able to think outside the box, or by not being able to see the big picture. Commissions offer a non-partisan, neutral option to address bureaucratic policy problems.24 Defense Secretary Donald Rumsfeld has decided to implement the recommendations of the congressionally-chartered Commission on Space, which he chaired prior to being appointed Secretary of Defense!25 One of the more important functions of independent commissions is educating and persuading. Due to the high visibility of most appointed commissioners, a policy issue will automatically tend to gain public attention. According to Wolanin, the prestige and visibility of commissions give them the capability to focus attention on a problem, and to see that thinking about it permeates more rapidly. A recent example of a high-visibility commission chair appointment was Henry Kissinger, selected to chair the commission to look into the perceived intelligence failure regarding the September 11, 2001 terrorist attack on the U.S. .26 Wolanin cited four educational impacts of commissions: 1) educating the general public; 2) educating government officials; 3) serving as intellectual milestones; and, 4) educating the commission members themselves. Regarding education of the general public, he stated that, "Commissions have helped to place broad new issues on the national agenda, to elevate them to a level of legitimate and pressing matters about which government should take affirmative action." Regarding educating government officials, he noted that, "The educational impact of commissions within government…make it safer for congressmen and federal executives to openly discuss or advocate a proposal that has been sanctioned by such an 'august group'." Commission reports have often been so influential that they serve as milestones in affected fields. Such reports have become source material for analysts, commentators, and even students, particularly when commission reports are widely published and disseminated. Finally, by serving on a commission, members also learn much about the issue, and about the process of analyzing a problem and coming up with viable recommendations. Commissioners also learn from one another.27

Solvency – Awareness

PCLOB actions build systems of accountability – squo disclosures are insufficient

Setty, 2015

(Sudha, Professor of Law at Western New England University, "SEARCH FOR MEANINGFUL ACCOUNTABILITY," *Stanford Journal of International Law*, 51:1, Online: http://digitalcommons.law.wne.edu/cgi/viewcontent.cgi?article=1305&context=facschol)

More troubling to proponents of the efficacy of existing legislative and executive accountability mechanisms are the disclosures made by Snowden. These mechanisms were revealed to be either theoretical or passive until significant leaks forced a public discourse that demanded a more active accountability regime. In fact, the federal government exploited the lack of transparency and effective accountability mechanisms until the stim of the Snowden disclosures to secure dismissals like that in Clapper I and to circumvent efforts of criminal defendants to discover whether they had been actually surveilled. 106 Reliance on sporadic leaks to trigger genuine accountability is structurally problematic. 107 Our reliance on leaks thus far should force us to reconsider the extreme secrecy under which intelligence-gathering programs, like the NSA Metadata Program, are administered, and to consider means by which institutional actors can exert meaningful and regular oversight and control over these programs. Such change would force politicians to take ownership over secret counterterrorism programs, weighing their expediency against possible constitutional defects or the judgment of public opinion. An atmosphere in which accountability mechanisms are not merely ersatz pending an illegal leak could provide space for genuine public discourse and at least the possibility of greater protection of civil liberties.

Solvency – External Review

PCLOB key – external review

Fidler, 2015

(David P. Fidler - J.D. at Harvard Law School 1991 and Professor of Law (specifically international law and its relation to cyberspace) at Indiana University, Apr-24-2015, The Snowden Reader, Indiana University Press)

The PCLOB has started to function in the wake of the Snowden leaks, producing reports on the telephone metadata program under Section 215 of the USA PATRIOT Act and surveillance of foreign targets conducted under Section 702 of FISA. These are important – and long overdue – steps that demonstrate the importance of the PCLOB. Subjecting surveillance and intelligence programs to external, independent review inserts more discipline, transparency, critical analysis, and alternative approaches, and shared responsibility into this area of policy and law. The PCLOB must build on this promising start, and the president must take seriously its recommendations.

Solvency – Public Awareness

The PCLOB is ideal for regulating surveillance practices – access to classified documents & government officials + it holds public hearings to expand public knowledge

PCLOB, 2014 The PCLOB consists of David Medine (Chairman), Rachel Brand, Elisebeth Collins Cook, James Dempsey and Patricia Wald. It is a committee within the Executive Branch that was established shortly after the first unauthorized disclosure of classified documents from the NSA by Edward Snowden. The PCLOB's purpose is to conduct reviews of surveillance practices and security measures to ensure that people's civil liberties are, and continue to be, respected by government agencies and make recommendations wherever necessary. (Private Civil Liberties Oversight Committee "Report on the Telephone Records Program Conducted under Section 215 of the USA PATRIOT Act and on the Operations of the Foreign Intelligence Surveillance Court" Pg. 2-7 1/23/14 https://www.pclob.gov/library/215-Report_on_the_Telephone_Records_Program.pdf)//ER

The Board has been provided **access to classified opinions** by the FISC, various inspector general reports**, and** additional classified **documents** relating to the operation and effectiveness of the programs. At **every step of the way, the Board has received the full cooperation of the intelligence agencies.** Board staff have **conducted a detailed analysis of applicable statutory authorities, the First and Fourth Amendments to the Constitution, and privacy and civil liberties policy issues.** As part of its study, and **consistent with our statutory mandate to operate publicly where possible**, the Board held two public forums. The first was a day-long public workshop held in Washington, D.C., on July 9, 2013, comprised of three panels addressing different aspects of the Section 215 and 702 programs.15 The **panelists provided input on the legal, constitutional, technology, and policy issues implicated by the two programs**. The first panel addressed the legality of the programs, and included comments from a former FISC judge regarding the operation of that court. Because technological issues are central to the operations of both programs, the second panel was comprised of technology experts. The third panel included academics and members of the advocacy community; panelists were invited to provide views on the policy implications of the NSA programs and what changes, if any, would be appropriate. As the Board's study of the NSA surveillance programs moved forward, the Board began to consider possible recommendations for program changes. At the same time, the Board wanted to try to identify any unanticipated consequences of reforms it was considering. Accordingly, on November 4, 2013, the Board held a public hearing in Washington, D.C. 16 The hearing began with a panel of current government officials who addressed the value of the programs and the potential impact of proposed changes. The second panel, designed to explore the operation of the FISA court, consisted of another former FISC judge, along with a former government official and a private attorney who both had appeared before the FISC. Finally, the Board heard from a diverse panel of experts on potential Section 215 and 702 reforms. The Board provided its draft description of the operations of the FISA court (but not our recommendations) to court's staff to ensure that this description accurately portrayed the court's operations. The Board also provided draft portions of its analysis regarding the effectiveness of the Section 215 program (but not our conclusions and recommendations) to the U.S. Intelligence Community to ensure that our factual statements were correct and complete. While the Board's Report was subject to classification review, none of the changes resulting from that process affected our analysis or recommendations. There was no outside review of the substance of the Board's analysis and recommendations. During the time the PCLOB has been conducting this study, members of Congress have introduced a variety of legislative proposals to address the Section 215 and 702 programs, the government has engaged in several internal reviews of the programs, and several lawsuits have been filed challenging the programs' legitimacy.

Solvency – Previous Rulings

PCLOB provides valuable insight into surveillance programs - previous research into Section 702 of FISA.

Kwon, 2014

(Max, JD Candidate at Harvard Law, "The PCLOB's Recommendations for a More Reasonable Surveillance Program," July, http://jolt.law.harvard.edu/digest/privacy/the-pclobs-recommendations-for-a-more-reasonable-surveillance-program)

On July 2, 2014, the Privacy and Civil Liberties Oversight Board ("PCLOB") issued a report analyzing the legal and policy implications of Section 702 of the Foreign Intelligence Surveillance Act of 1978 ("FISA"). Section 702 was introduced by Congress through the FISA Amendments Act of 2008 and allows the Attorney General and the Director of National Intelligence to "jointly authorize surveillance targeting persons who are not U.S. persons, and who are reasonably believed to be located outside the United State, with the compelled assistance of electronic communication service providers, in order to acquire foreign intelligence information." Report at 6. The PCLOB concluded that "the core Section 702 program is clearly authorized by Congress, reasonable under the Fourth Amendment, and an extremely valuable and effective intelligence tool," Id. at 15, but noted that "**the applicable rules potentially allow a great deal of private information about U.S. persons to be acquired by the government."** Id. at 11. In order to "ensure that the program remains tied to its constitutionally legitimate core," the PCLOB outlined a set of ten policy proposals **aimed at increasing accountability**, transparency, and efficacy of the surveillance program. Id. at 9. Pursuant to Section 702, the Attorney General and Director of National Intelligence can make annual certifications that identify categories of information to be collected without specifying the particular non-U.S. persons who will be targeted. Id. Although Section 702 requires the government to develop targeting and "minimization" procedures in order minimize "incidental" or "inadvertent" surveillance of U.S. persons, the PCLOB stated that "certain features of the [Section 702] program **implicate privacy concerns**" regarding the scope and usage of U.S. person communications that are collected. Id. at 6–10. Many of the privacy concerns regarding Section 702 surveillance stem from the two methods that the government can use to acquire information, namely, "PRISM" collection and "upstream" collection. In PRISM collection, the government sends a particular "selector," such as an email address or telephone number associated with targeted persons, to a United States-based electronic communications service provider. Id. at 7. The provider is then "compelled to give the communications sent to or from that selector to the government." Id. The National Security Agency ("NSA") receives all of this data and select portions of the data are passed on to the Central Intelligence Agency ("CIA") and the Federal Bureau of Investigation ("FBI"). Id. In upstream collection, the government compels the assistance of telecommunications providers. Id. The information collected includes both Internet communications and telephone calls and is received only by the NSA. Id. Notably, upstream collection also includes the acquisition of (1) "about" communications, information about the targeted person even if the targeted person is not a participant of the communication, and (2) "multiple communications transactions" ("MCTs"), an Internet transaction that is composed multiple parts or communications. Id. The NSA is allowed to obtain the entire MCT so long as a single part is "to, from, or 'about' a tasked selector, and if one end of the transaction is foreign." Id.

Solvency – Previous Rulings

PCLOB solves accountability – previous rulings highlight ability to raise public awareness.

Kayyali, 2015

(Adia, JD from UC Hastings & member of EFF's (Electronic Frontier Foundation) activism team focused on addressing the racial profiling of the Arab, Muslim, Middle Eastern, and South Asian community, "Privacy and Civil Liberties Oversight Board to NSA: Why is Bulk Collection of Telephone Records Still Happening?," *Electronic Frontier Foundation*, 2/4, https://www.eff.org/deeplinks/2015/02/privacy-and-civil-liberties-oversight-board-nsa-why-bulk-collection-telephone)

(PCLOB) exists to ensure that national security does not trump privacy and civil liberties, and it has been especially busy since the publication of the first Snowden leak. Congress and the President asked the Board to review the use of Section 215 of the PATRIOT Act and Section 702 of the FISA Amendments Act, as well as the operations of the Foreign Intelligence Surveillance Court. In 2014, PCLOB published two reports addressing these issues. And last week, the Board published a "Recommendations Assessment Report [pdf]." Section 215 Recommendations The most striking piece of the report is also the first: Recommendation 1: End the NSA's Bulk Telephone Records Program Status: Not implemented (implementing legislation proposed) The NSA uses Section 215 of the Patriot Act to justify its bulk telephone records collection program. But as we have noted repeatedly, there's no evidence that the Section 215 program is necessary for stopping terrorism—something PCLOB, the President's Review Group, and even the administration itself have all admitted. On the other hand, there's plenty of evidence of how the program invades innocent peoples' privacy. And PCLOB's recommendation is very simple here: the program should end. Of course, Section 215 expires on June 1, and Congress will have to vote on whether to reauthorize it. It's important to note that "the Board did not recommend that ending the program be contingent on the passage of legislation that would replicate the program's capabilities." We agree. Congress cannot simply reauthorize Section 215 and ignore the serious civil liberties concerns it creates. PCLOB highlighted another important recommendation: the administration should ensure that the public understands how it is interpreting statutes, especially "if the text of the statute itself is not sufficient to inform the public of the scope of asserted government authority," both "intended uses of broadly worded authorities at the time of enactment" and "novel interpretations of laws already on the books." This recommendation has been partially implemented. But considering the concern about how intelligence reform legislation such as USA FREEDOM could have been interpreted, this recommendation should be at the forefront as discussions about NSA reform legislation continue.

Solvency – Roadmap

PCLOB's recommendations are relevant – assessments form key roadmap for reforms

Bomboy '14 (Scott Bomboy - writer for the National Constitution Center, 1-24-2014, "PCLOB report latest blow to NSA surveillance policies," Constitution Daily, http://blog.constitutioncenter.org/2014/01/pclob-report-latest-blow-to-nsa-surveillance-policies/)

On Thursday, the Privacy and Civil Liberties Oversight Board released its long-awaited report on the NSA's phone-records program. That's the program in which the NSA collects—and stores for five years—a record of virtually every telephone call made every single day in the country. The report is damning, and much attention will rightly focus on its central conclusion: that the program is illegal and should be ended. The report is comprehensive, though, and its principal conclusion is buttressed by a series of other critical findings and recommendations. Here are the three other points from the report that will shape the debate about the NSA and privacy over the coming months: 1. Bulk collection of phone records is unnecessary and has not made the country safer. Since the revelation of the NSA's phone-records program on June 5, 2013, the government's principal talking point has been that the program is essential to keeping the country safe. The PCLOB examined that claim in depth—reviewing "a wealth of classified materials," requesting "follow-up information" from the intelligence agencies, and receiving "a series of classified briefings." The board paid special attention to the "specific cases cited by the government as instances in which telephone records obtained under [the program] were useful." The PCLOB's conclusion: Bulk collection has not made the country safer. The board did not "identif[y] a single instance involving a threat to the United States in which the telephone records program made a concrete difference in the outcome of a counterterrorism investigation." And even when the phone-records program offered additional information, "in nearly all cases the benefits provided have been minimal" and could "have been obtained through traditional, targeted collection of phone records." Here's the bottom line in the PCLOB's words: FT-ACLU1 2. Bulk collection of our metadata poses a serious threat to civil liberties. The PCLOB joined the growing consensus that telephone records—particularly when collected in bulk—are extraordinarily sensitive. In fact, it noted, "the aggregation of numerous calling records over an extended period of time can paint a clear picture of an individual's personal relationships and patterns of behavior. This picture can be at least as revealing of those relationships and habits as the contents of individual conversations—if not more so." Having recognized the sensitivity of our phone records, the PCLOB went on to analyze the impact on civil liberties of allowing the government to collect that information in bulk. As we at the ACLU have argued for years, bulk collection threatens to reshape the relationship between the citizens of this country and their government. The PCLOB agreed. It noted that "[a]llowing [the government] to gather vast quantities of information about the conduct of individuals as a routine matter where those individuals are not suspected of any crimes affects the balance of power between the state and its people." But the PCLOB didn't just stop there. **It cataloged some of the other harms of bulk collection, such as mission creep and the possibility of abuse**. In a crucial passage, the board stated, "Prudence cautions against assuming that abuse of surveillance powers is a problem that will never reoccur, and any decision to invest the government with a broad surveillance power must duly take into account the abuse that this power could enable, whether or not such abuse is evident today." Here's the bottom line in the PCLOB's words: FT-ACLU2 3. Forcing companies to store sensitive data about their customers is not the answer. If the government ultimately embraces the push to end the NSA's phone-records program, the question will remain whether it repackages the program in private hands. Toward that end, some officials have called for new laws forcing the telephone companies to retain their customers' sensitive phone records for years. Others have called for some third party to hold onto all of the records, instead of the NSA. As President Obama recognized in his speech last week, both of those solutions raise serious privacy concerns of their own. The PCLOB agreed. It, too, recognized the privacy implications of compelling companies to keep information against their will or of creating a centralized database of the nation's call records. The board is exactly right on this point. Companies should remain free to offer services to their customers that provide greater privacy protections. And if cybersecurity truly is as serious a threat as the government claims, we are all made less secure by centralizing all of our most sensitive information. After all, it isn't just the NSA that wants access to all of our data, but foreign governments and criminal

hackers. Here's how the PCLOB explained it: FT-ACLU3 In the days to come, the PCLOB's key recommendation that the phone-records program be ended will be the primary focus. But as the debate moves forward, the critical question will be how to protect our privacy in an era of big data. The board's incisive findings provide a necessary roadmap.

Solvency – XO 12333

PCLOB has great potential to approach Executive Order 12333

Greene, 2015

(Robyn, *Comments to the Privacy and Civil Liberties Oversight Board Concerning Activities Under Executive Order 12333,* Open Technology Institute*)*

The first issue we urge PCLOB to review is the NSA's bulk and targeted collection activities under EO 12333. Bulk collection poses a serious threat to privacy, as it inherently results in the large---scale collection of the communications of millions of innocent Americans and people around the world. The procedures governing the NSA's acquisition, retention, search, dissemination, and use of those communications are not public. PCLOB should review the scale of incidental collection of U.S. person communications that results from bulk collection under EO 12333. It should also review and make recommendations to enhance the privacy protections provided by the minimization procedures that are applied to those collections. Additionally, it should review and publicly disclose the number of instances in which those communications have been searched for U.S. person information, and how many times that information has been used in any government proceeding, such as criminal investigations, including instances where parallel construction was employed to obscure the source of the information; judicial proceedings; and other civil, immigration, and regulatory proceedings. PCLOB should make similar inquiries into the NSA's targeted collection practices under EO 12333. Specifically, it should assess the adequacy of and make recommendations for additional safeguards of privacy protections conferred on U.S. person communications by targeting and minimization procedures, and policies governing their retention, use, and dissemination.

Solvency – Drones

PCLOB well equipped to engage drone surveillance.

Medine & Sweren-Becker, 2015

(David, Attorney Fellow for the Security and Exchange Commission & Eliza JD candidate at Harvard Law School and the Kennedy School of Government, 4/23/15, "The United States Needs a Drone Board", Defense One,http://www.defenseone.com/ideas/2015/04/oversight-targeted-killing-americans-overseas-new-model/110926)

In considering whether to create a new entity or have an existing one to carry out the duties of the Drone Board, we recommend that the Privacy and Civil Liberties Oversight Board (PCLOB) serve that role. The PCLOB is an independent agency established by the Implementing Recommendations of the 9/11 Commission Act of 2007. The bipartisan, five-member Board members serving staggered six-year terms, are appointed by the President and confirmed by the Senate. The PCLOB has several advantages over alternative executive branch entities to serve as the body that reviews the targeting of U.S. citizens. First, the PCLOB is already up and running. Neither Congress nor the President would have to create a new body. Second, the targeted killing of U.S. citizens who are affiliated with al Qaeda, ISIL, or other terrorist organizations falls precisely within the PCLOB's counterterrorism mandate. Third, the PCLOB is uniquely positioned as an independent Executive Branch agency, not bound by the President's policy direction, and has demonstrated its willingness to offer neutral and candid recommendations. Fourth, Board members and PCLOB staff already have Top Secret security clearances; the PCLOB regularly handles highly classified information and can review the relevant intelligence without additional bureaucratic hurdles. However, one reform would be necessary: in order to effectively address targeted killing cases, all five PCLOB members, not just the chairman, would need to serve in a full-time capacity.

Solvency – Racial Profiling

Although the TSA may participate in bad practices now, PCLOB reforms can solve

Livingston 14 (Lynne Livingston interviewing Robert McCaw the Government Affairs Department Manager for the Council on American-Islamic Relations, the nation's largest Muslim civil liberties and 15 advocacy organization.)

(7/23/14, PRIVACY AND CIVIL LIBERTIES OVERSIGHT BOARD Public Meeting https://www.pclob.gov/library/20140723-Transcript.pdf)

Concerning profiling guidelines, CAIR recommends that PCLOB review guidelines on the use of race in federal law enforcement and by 6 federal law enforcement and national security agencies. DOJ and DHS guidelines are supposed to prohibit profiling but they've been inappropriately used to target Muslims in counterterrorism investigations and Latinos for immigration investigations. CAIR believes that the DOJ and DHS should revise existing guidelines banning the use of racial profiling to include nationality and religion as protected characteristics, as well as eliminate any loopholes that permit profiling at U.S. borders or for reasons of national security. Such a Board review should also target the Attorney General guidelines for domestic FBI operations, the AGG and FBI's domestic investigations and operation guideline, DIOG, which permit the FBI to engage in racial and ethnic profiling in certain contexts to initiate investigations and to use intrusive investigative techniques, absent of any suspicion or wrongdoing. A Board review should also be completed on how these guidelines in DIOG impact law enforcement practices in Muslim communities and others, and could help the Attorney General to better understand the harmful effects of these policies. Concerning the FBI and NSA spying on Muslim leaders, this past month CAIR joined a broad coalition of 45 organizations led by the ACLU in insisting that President Obama provide a full public accounting of surveillance practices of American Muslim leaders. According to new revelations by Glenn Greenwald and Murtaza Hussain, CAIR's own National Executive Director was among those U.S. Muslim leaders reported to be targeted by the FBI and NSA surveillance under FISA. Also among those leaders spied on was Faisal Gill, an American citizen, U.S. Navy veteran, and former Bush Administration DHS official. Of particular concern, Mr. Gill's nationality was marked unknown on a leaked FISA recapped document. Addressing FBI and NSA targeting of American Muslim leaders, CAIR stated it was an outrageous continuation of civil rights era surveillance of minority community leadership by government elements who see threats in all patriotic dissent. CAIR strongly recommends that PCLOB reviews these allegations to ensure that the government surveillance works within the bounds of law and Constitution.

Solvency – Commissions Expedite Policy Reform

Commissions solve political and issue complexity

Glassman and Straus, 2015 Mathew E. Glassman and Jacob R. Straus are analysts on Congress. (Mathew E. Glassman and Jacob R. Straus, "Congressional Commissions: Overview, Structure, and Legislative Considerations", Pg.7, 1/27/15, Congressional Research Service, https://www.fas.org/sgp/crs/misc/R40076.pdf)//ER

Complex policy issues may cause time management challenges for Congress. Legislators often keep busy schedules and may not have time to deal with intricate or technical policy problems, particularly if the issues require consistent attention over a period of time.24 A commission can devote itself to a particular issue full-time, and can focus on an individual problem without distraction. Complex policy issues may also create institutional problems because they do not fall neatly within the jurisdiction of any particular committee in Congress.26 By virtue of their ad hoc status, commissions may circumvent such issues. Similarly, a commission may allow particular legislation or policy solutions to bypass the traditional development process in Congress, potentially removing some of the impediments inherent in a decentralized legislature.27

A2: Lacks Authority

Existing mandate is sufficient the solve accountability

Grande, 2013

(Allison, senior reporter at Portfolio Media – citing multiple privacy experts, "Restored Privacy Board Lends Crucial Eye To Data Practices," *Law 360*, May 9, Online: http://www.constitutionproject.org/wp-content/uploads/2013/05/5.9.2013_Law360_SBF_PCLOBChair.pdf)

The executive order President Barack Obama signed in February specifically directs DHS to consult with PCLOB in producing an assessment of the privacy and civil liberties risks of the government's sharing of threat data with the private sector, and legislation being mulled in the U.S. Senate and House of Representatives envisions similar oversight roles for the board, according to Franklin. "It's even more important for the board to have this oversight role if we do get legislation, [which] presents an even greater risk to individual liberties because it is likely to exempt the sharing of information from the requirements of existing privacy laws in a way that an executive order can't do," she said. While Congress strengthened the board in 2007 by making it independent of the White House and giving it subpoena powers, experts noted that issues still remain regarding the authority of the fivemember board, which also includes U.S. Chamber of Commerce attorney Rachel Brand, former D.C. Circuit Chief Judge Patricia Wald, WilmerHale counsel Elisebeth Collins Cook and the Center for Democracy & Technology vice president for public policy James Dempsey. "There are legal constraints on what they can do since they are not an executing body," Fisher said. "What they can do is make assessments and insist on accountability, but they can't do it all themselves." But despite limitations, experts remain optimistic that the new oversight board will be both influential and effective in guarding against privacy and civil liberties abuses committed in the name of counterterrorism. "Having an oversight board may give more structure and discipline to some of the national security requests for information, and that's a good thing," Callahan said. "It will push everyone to take a fresh look at what the intelligence community is doing and help to ensure that it is doing the right thing."

A2: Lacks Authority

Commissions have the power to solve - can be authorized to access relevant tools and information and are required to hold public meetings

Glassman and Straus, 2015 Mathew E. Glassman and Jacob R. Straus are analysts on Congress. (Mathew E. Glassman and Jacob R. Straus, "Congressional Commissions: Overview, Structure, and Legislative Considerations", Pg. 17, 1/27/15, Congressional Research Service, https://www.fas.org/sgp/crs/misc/R40076.pdf)//ER

Most **congressional commissions are directed to hold public meetings** to discuss commission matters, usually at the call of the chair or the majority of the commission. In addition, most of these **congressional commissions are statutorily empowered to hold fact-finding hearings and take testimony from witnesses. Commissions are occasionally empowered to subpoena witnesses**. For example, the proposed Hurricane Katrina Disaster Inquiry Commission60 is authorized to issue subpoenas by agreement of the chair and vice chair, or by the affirmative vote of eight commission members.61 Additional statutory language provides for the enforcement of the subpoenas in federal court. Some commissions are empowered to secure information from federal agencies. For example, the proposed Hurricane Katrina Disaster Inquiry Commission would be authorized to secure directly from any executive department, bureau, agency, board, commission, office, independent establishment, or instrumentality of the government, information, suggestions, estimates, and statistics ... [e]ach department, bureau, agency, board, commission, office, independent establishment, or instrumentality shall, to the extent authorized by law, furnish such information ... upon request made by the chairman.62In addition, Congress occasionally directs specific executive branch agencies to assist a commission in the completion of its work. **Commissions may** also **be given the following powers: the authority to contract with public agencies and private firms**, the authority to **use the mail**s **in the same manner as departments and agencies** of the United States, and the authority **to accept gifts and donations**.

A2: Recommendations not enacted

PCLOB will be effective at causing the USFG to curtail surveillance – unique knowledge over policies, top secret clearance, and congressional backing.

Grande, 2013

(Allison, senior reporter at Portfolio Media – citing multiple privacy experts, "Restored Privacy Board Lends Crucial Eye To Data Practices," *Law 360*, May 9, Online: http://www.constitutionproject.org/wp-content/uploads/2013/05/5.9.2013_Law360_SBF_PCLOBChair.pdf)

In finally confirming a long-dormant privacy board's chair Tuesday, the U.S. Senate restored to full strength an oversight mechanism that industry watchers say will change the way both the public and private sectors gather and share information, despite the board's lack of resources and binding authority. Following a nearly two-year delay, the Senate in a 53-45 vote divided along party lines confirmed former WilmerHale partner David Medine to head the Privacy and Civil Liberties Oversight Board, which was last staffed in 2008 and is tasked with providing a check on the government's use and sharing of data for national security purposes. While the Senate had confirmed the four other part-time members in August, Republicans had blocked the critical appointment of Medine — the only full-time member who has the power to appoint and fix compensation for staff that will enable the board to carry out its functions — because of concerns about his views on national security statues like the Patriot Act. But with Tuesday's confirmation, the board can begin to use its subpoena powers to obtain elusive information about how the government is using its statutory authority to investigate national security threats since the 9/11 terrorist attacks. "The PCLOB can now get to full work investigating the rampant secret law of the Obama administration, the government's use of national security letters and many of the other core privacy problems that continue to fester behind closed doors that the administration has been reluctant to open up," Electronic Frontier Foundation policy analyst and legislative assistant Mark M. Jaycox told Law360 on Thursday. At a March meeting, the four active members identified three areas of initial interest: 2008 amendments to the Foreign Intelligence Surveillance Act that allow the government to intercept international communications without individual warrants; authority recently given to the National Counterterrorism Center to request and hold large volumes of data on individuals for up to five years; and an order issued in February that charges the board with assessing the government's information-sharing practices for cybersecurity purposes. "The very existence of many of these national security programs is classified or little is known, so having members of an independent board have the security clearance to look at the privacy and civil liberties issues raised by them and make sure that appropriate safeguards are incorporated is critical," the Constitution Project's senior counsel Sharon Bradford Franklin, who attended the board's March meeting, said. The board's oversight activities are likely to have a significant impact not just on the way that the government uses the troves of data it collects to protect the country from terrorism, but also on how the private sector handles information that is routinely subject to government access requests. "While [the board] was created to have oversight over the federal government's activities, it's likely that some of the information-access questions it deals with will touch the private sector, such as the debate over what the appropriate standard is for accessing emails from third parties, and it's likely that the body could help guide some of the policy decisions of the administration in this area," Jenner & Block LLP privacy and information governance practice group chair and former U.S. Department of Homeland Security Chief Privacy Officer Mary Ellen Callahan said. While privacy professionals who work primarily in the commercial arena may be inclined to pay little attention to PCLOB because of its focus on government surveillance, this approach may be a mistake, according to Daniel Weitzner, director of the Decentralized Information Group at MIT's Computer Science and Artificial Intelligence Laboratory and former White House deputy chief technology officer for Internet policy. "The new PCLOB is in a unique position to examine the internal and classified activities of NCTC and other intelligence agencies to make sure that they are complying with relevant rules," Weitzner said in a post on the International

Association of Privacy Professionals' blog. "And more likely than not, the PCLOB may discover that existing laws are not quite up to the challenge posed by powerful new data analytic tools." A change in the law would not only have an impact on federal agencies, but also on companies that are using similar "big data" practices to discover and link sensitive information about individuals, Weitzner said. "As the PCLOB comes face-to-face with some of the more challenging questions of how to monitor privacy practices in new Big Data environments, the entire privacy community ought to be paying attention," he said.

A2: Recommendations not enacted

Commissions generate public interest – results in policy change.

Glassman and Straus, 2015 Mathew E. Glassman and Jacob R. Straus are analysts on Congress. (Mathew E. Glassman and Jacob R. Straus, "Congressional Commissions: Overview, Structure, and Legislative Considerations", Pg.8-9, 1/27/15, Congressional Research Service, https://www.fas.org/sgp/crs/misc/R40076.pdf)//ER

By establishing a commission, Congress can often provide **a highly visible forum for important issues** that might otherwise receive scant attention from the public.[38] Commissions often are composed of **notable public figures, allowing personal prestige to be transferred to policy solutions**.[39] Meetings and press releases from a commission may receive significantly more attention in the media than corresponding information coming directly from members of congressional committees. Upon completion of a commission's work product, public attention may be temporarily focused on a topic that otherwise would receive scant attention, thus increasing the probability of congressional action within the policy area.[40]

A2: Recommendations Ignored

PCLOB recommendations have historically been adopted so far.

Franklin, 2015

(Sharon Bradford, Executive Director of Privacy and Civil Liberties Oversight Board, 1/29/15, Fact Sheet: PCLOB Recommendations and Their Implementation, https://www.pclob.gov/newsroom/20150129.html)

In January and July of 2014, the Privacy and Civil Liberties Board issued detailed reports on two government intelligence surveillance programs. The first report addressed the NSA's bulk collection of telephone calling records under Section 215 of the USA PATRIOT Act, as well as the operations of the Foreign Intelligence Surveillance Court and transparency regarding surveillance. The second report addressed surveillance under Section 702 of the Foreign Intelligence Surveillance Act, which authorizes collection by the NSA, CIA, and FBI of the contents of communications of non-U.S. persons reasonably believed to be located outside the United States. Between the two reports, the Board made twenty-two recommendations to the President, Congress, and the Foreign Intelligence Surveillance Court to enhance the protection of privacy and civil liberties. The Board has now assessed how fully its recommendations have been adopted to date, and its conclusions are as follows: • Overall, the Administration has been responsive to the Board's input. The Administration has accepted virtually all recommendations in the Board's Section 702 report and has made substantial progress toward implementing many of them, while also accepting most of the recommendations in the Board's Section 215 report. • Most recommendations directed at the Administration are still in the process of being implemented, however, or have only been accepted in principle, without substantial progress yet made toward their implementation. We note that only six months have elapsed since the release of the Section 702 report, so there has been less time for implementation. • However, the Administration has not halted the NSA's Section 215 telephone records program, which it could do at any time without congressional involvement, but instead has continued the program, with modifications. At the same time, the Administration has supported legislation, which has not yet been enacted, to create a new system for government access to telephone records under Section 215. • Congress has not yet enacted legislation that would, consistent with the Board's recommendation, reform the operations of the Foreign Intelligence Surveillance Court. • The Administration has made substantial progress in implementing some of the Board's recommendations regarding transparency. • The Board has established a productive relationship with elements of the Intelligence Community and looks forward to working constructively with them on the implementation of its recommendations.

Accountability NB

1NC Net Benefit: Civic Engagement

Government transparency is key to civic engagement – well informed citizens are better equipped to participate in democratic deliberation about policy.

Schneier, 2013

(Bruce, Fellow at the Berkman Center for Internet & Society at Harvard Law School, "NSA Secrets Kill Our Trust," July 31, https://www.schneier.com/essays/archives/2013/07/nsa_secrets_kill_our.html)

Both government agencies and corporations have cloaked themselves in so much secrecy that it's impossible to verify anything they say; revelation after revelation demonstrates that **they've been lying to us regularly and tell the truth only when there's no alternative.** There's much more to come. Right now, the press has published only a tiny percentage of the documents Snowden took with him. And Snowden's files are only a tiny percentage of the number of secrets our government is keeping, awaiting the next whistle-blower. Ronald Reagan once said "trust but verify." That works only if we can verify. In a world where everyone lies to us all the time, we have no choice but to trust blindly, and we have no reason to believe that anyone is worthy of blind trust. It's no wonder that most people are ignoring the story; it's just too much cognitive dissonance to try to cope with it. This sort of thing can destroy our country. Trust is essential in our society. And if we can't trust either **our government** or the corporations that have intimate access into so much of our lives, society suffers. Study after study demonstrates the value of living in a high-trust society and the costs of living in a low-trust one. Rebuilding trust is not easy, as anyone who has betrayed or been betrayed by a friend or lover knows, but the path involves transparency, oversight and accountability. Transparency first involves coming clean. Not a little bit at a time, not only when you have to, but complete disclosure about everything. Then it involves continuing disclosure. No more secret rulings by secret courts about secret laws. No more secret programs whose costs and benefits remain hidden. Oversight involves meaningful constraints on the NSA, the FBI and others. This will be a combination of things: a court system that acts as a third-party advocate for the rule of law rather than a rubber-stamp organization, a legislature that understands what these organizations are doing and regularly debates requests for increased power, and vibrant public-sector watchdog groups that analyze and debate the government's actions. Accountability means that those who break the law, lie to Congress or deceive the American people are held accountable. The NSA has gone rogue, and while it's probably not possible to prosecute people for what they did under the enormous veil of secrecy it currently enjoys, we need to make it clear that this behavior will not be tolerated in the future. Accountability also means voting, which means voters need to know what our leaders are doing in our name. This is the only way we can restore trust. A market economy doesn't work unless consumers can make intelligent buying decisions based on accurate product information. That's why we have agencies like the FDA, truth-in-packaging laws and prohibitions against false advertising. In the same way, democracy can't work unless voters know what the government is doing in their name. That's why we have open-government laws. Secret courts making secret rulings on secret laws, and companies flagrantly lying to consumers about the insecurity of their products and services, undermine the very foundations of our society.

The impact is extinction – consolidation of political decisionmaking in elite hands increases the risk of every existential threat we face today.

Boggs, 1997

(Carl, "The Great Retreat: Decline of the Public Sphere in Late Twentieth-Century America" *Theory and Society*, Vol. 26, No. 6 (Dec., 1997), pp. 741-780)

The decline of the public sphere in late twentieth-century America poses a series of great dilemmas and challenges. Many ideological currents scrutinized here - localism, metaphysics, spontaneism, postmodernism, Deep Ecology - intersect with and reinforce each other. While these currents have deep origins in popular movements of the 1960s and 1970s, they remain very much alive in the 1990s. Despite their different outlooks and trajectories, they all share one thing in common: a depoliticized expression of struggles to combat and overcome alienation. The false sense of empowerment that comes with such mesmerizing impulses is accompanied by a loss of public engagement, an erosion of citizenship and a depleted capacity of individuals in large groups to work for social change. As this ideological quagmire worsens, urgent problems that are destroying the fabric of American society will go unsolved - perhaps even unrecognized - only to fester more ominously into the future. And such problems (ecological crisis, poverty, urban decay, spread of infectious diseases, technological displacement of workers) cannot be understood outside the larger social and global context of internationalized markets, finance, and communications. Paradoxically, the widespread retreat from politics, often inspired by localist sentiment, comes at a time when agendas that ignore or sidestep these global realities will, more than ever, be reduced to impotence. In his commentary on the state of citizenship today, Wolin refers to the increasing sublimation and dilution of politics, as larger numbers of people turn away from public concerns toward private ones. By diluting the life of common involvements, we negate the very idea of politics as a source of public ideals and visions.74 In the meantime, the fate of the world hangs in the balance. The unyielding truth is that, even as the ethos of anti-politics becomes more compelling and even fashionable in the United States, it is the vagaries of political power that will continue to decide the fate of human societies. This last point demands further elaboration. The shrinkage of politics hardly means that corporate colonization will be less of a reality, that social hierarchies will somehow disappear, or that gigantic state and military structures will lose their hold over people's lives. Far from it: the space abdicated by a broad citizenry, well-informed and ready to participate at many levels, can in fact be filled by authoritarian and reactionary elites - an already familiar dynamic in many lesserdeveloped countries. The fragmentation and chaos of a Hobbesian world, not very far removed from the rampant individualism, social Darwinism, and civic violence that have been so much a part of the American landscape, could be the prelude to a powerful Leviathan designed to impose order in the face of disunity and atomized retreat. In this way the eclipse of politics might set the stage for a reassertion of politics in more virulent guise - or it might help further rationalize the existing power structure. In either case, the state would likely become what Hobbes anticipated: the embodiment of those universal, collective interests that had vanished from civil society.75 The historic goal of recovering politics in the Aristotelian sense, therefore, suggests nothing less than a revitalized citizenry prepared to occupy that immense expanse of public space. Extension of democratic control into every area of social life requires insurgency against the charade of normal politics, since the persistence of normal politics is just another manifestation of anti-politics. If authentic citizenship is to be forged, then information, skills, and attitudes vital to political efficacy need to flourish and be widely distributed throughout the population, without this, "consciousness transformation" is impossible, or at least politically meaningless. A debilitating problem with the culture of anti-politics, however, is that it precisely devalues those very types of information, skills, and attitudes. At the same time, any process of repoliticization will have to be carried out in a context where the whole field of political activity has been fundamentally altered. One of the major effects of corporate colonization is what Ulrich Beck refers to as the "systemic transformation of the political" - the considerable loss of power in the centralized political system itself, severely reducing its capacity to plan, regulate, and intervene in effective ways. As Beck observes: "The concepts, foundations, and instruments of politics (and non-politics) are becoming unclear, open and in need of a historically new determination."76 Where the Hobbesian "solution" to fragmentation or extreme localism does not or cannot work owing to historical and

cultural traditions, the push toward decentralization may be irreversible. Many of the conventional functions of government will be more difficult to perform according to a model where strong leaders exercise more or less unchallenged authority. Hence a truly revitalized politics will have to be more open and collective, more decentralized, and more infused with civic virtues as the conditions favoring a single center of politics erode.

Impact: Poverty/Gender/Gov Accountabilty

Civic engagement key to reduce poverty, secure gender equality, and push back against government overstep.

Sharma, 2008

(Bhavana, "Voice, Accountability, and Civic Engagement: A Conceptual Overview", August 2008, http://www.undp.org/content/dam/undp/documents/partners/civil_society/publications/2008_UNDP_Voice-Accountability-and-Civic-Engagement_EN.pdf)

Civic engagement can be understood as the process whereby citizens or their representatives are able to engage and influence public processes, in order to achieve civic objectives and goals. Civic engagement contains a strong element of participation where stakeholders are active in decision making processes (Malik, and Waglé, 2002) The UNDP Human Development Report 1993 describes civic engagement as "a process, not an event, that closely involves people in the economic social, cultural and political processes that affect their lives." However, civic engagement can be distinguished from participation as it is specifically associated with efforts to establish channels of voice, **representation and accountability at the state level**. Thus, civic engagement is often seen as a tool for deepening democratic governance, through the channels of voice and accountability. Citizens become active participants insome state decision-making processes (and thereby exercising their right to a voice) as well as deepening accountability via a watchdog role by demanding a more transparent and responsive state, and the appropriate justifications for decisions and actions taken. As Korton puts it, "If sovereignty resides ultimately in the citizenry, their engagement is about the right to define the public good, to determine the policies by which they will seek that good, and to reform or replace those institutions that no longer serve." (Korton (1988) quoted in Malik and Waglé, 2002). Thus placing civic engagement in the context of governance highlights its role in deepening state-society relations through the channels of voice and accountability. By deepening democratic governance, civic engagement is seen as instrumental inachieving a range of other development goals, such as the MDGs (see box below) andpoverty reduction. Civic engagement, through increased voice and with a focus on accountability, has the potential to contribute to poverty reduction through more-pro-poor policy design, improved service delivery, and empowerment of groups previously denied a voice. Some accountability mechanisms have specifically been developed for use by poor populations and many focus on issues of priority importance to poor people (such as public health, education, water and sanitation services). However, constant effort is required to ensure that civic engagement effectively serve the priority needs of poor people, include mechanisms to overcome potential barriers to their effective participation and leadership in decision-making processes. Civic engagement and accountability can also have important gender implications.Women are systematically underrepresented in most civil society organisations, stateinstitutions and the government reducing their capacity to promote their own interests. Civic engagement that is focused on promoting the voices of the most marginalized groups in society should be bottom-up, inclusive and demand driven should enhance the ability of women to make their voices heard. A number of accountability tools focus on greater engagement of women, such as gender budgeting and gender disaggregated participatory monitoring and evaluation, have been specifically designed to address gender issues. Particularly in those public sectors of greatest importance to poor people,of which women constitute a significant part. Voice and accountability mechanisms also focus the attention of civic engagement on public sector reforms, by addressing the demand-side aspects of public service delivery,monitoring and accountability. Such mechanisms have proved particularly useful in the context of decentralisation, helping

to strengthen links between citizens and local-level governments and assisting local authorities and service-providers to become more responsive and effective. And finally, by monitoring government performance, demanding and enhancing transparency and exposing government failures and misdeeds, civic engagement can be a valuable tool in fighting corruption. Indeed it has been argued by some that the only true safeguard against public sector corruption is the active and on-going societal monitoring of government actions and the evolution of more open and participatory anticorruption institutions. The two boxes below provide examples of the operationalisation of voice and accountability.

A2: Transparency Insufficient

Transparency activates accountability – it's not just a passive release of information, but a tool that advocates can use to control public dialogue on policy.

Gurría, 2015

(Angel, OECD Secretary-General, "Openness and Transparency - Pillars for Democracy, Trust and Progress", June/24, OECD, http://www.oecd.org/fr/etatsunis/opennessandtransparency-pillarsfordemocracytrustandprogress.htm)

Openness and transparency are key ingredients to build accountability and trust, which are necessary for the functioning of democracies and market economies. Openness is one of the key values that guide the OECD vision for a stronger, cleaner, fairer world. This is why the OECD welcomes the launch of the Open Government Partnership today and the efforts led by Presidents Obama and Rousseff to promote government transparency, fight corruption, empower citizens and maximise the potential of new technologies to strengthen accountability and foster participation in public affairs. For 50 years, Openness has been a cornerstone of our mission to develop the best public policies in order to improve people's lives by promoting open markets and inclusive wealth. In fulfilling this mission we focused on "better policies for better lives" based on empirical evidence for such policies. Evidence is a product of correct and precise information. Our guiding working method is to share evidence-based knowledge, information and policy advice with governmental and non-governmental stakeholders, as well as with the public to prepare the ground for informed public policy decisions. Specific examples of knowledge sharing include, among others, the Global Forum for Transparency and Exchange of Information for Tax Matters, the OECD Anti-Bribery Convention, but also our country reviews as an example of peer learning. The OECD has been at the forefront of efforts to promote and protect the free flow of information. We believe this to be a fundamental human right. We also encourage efforts to protect personal data, the freedom of expression, and other rights. We have underpinned this with leading work on Open and Innovative Government. An "open" government is transparent, accessible to anyone, anytime, anywhere; and responsive to new ideas and demands. Governments and international organisations have to lead by example, aligning disclosure and dissemination procedures with modern information management practices. We are working to meet this imperative in four dimensions: First, the OECD has developed a range of instruments to help governments ensure that openness translates into concrete improvements in key activities of government. Instruments such as the Principles for Integrity in Public Procurement, the Best Practices for Budget Transparency, the Principles for Transparency and Integrity in Lobbying and the Guidelines for Managing Conflict of Interest in the Public Service -- not only help mitigate corruption risks but also improve efficiency and ultimately contribute to public trust. Guidance on support to building and using Public Financial Management systems in developing countries emphasises transparency in budget processes, and our guidance on using national procurement systems also emphasises building transparent systems in developing countries. We also compare public sector performance in health, education and many other policy areas across countries. Our work on the PISA for example, has had significant impact on education policy making by developing cross-country comparable indicators on education performance for the first time. This promotes accountability, discussion and participation of citizens. Second, e-Government, Internet-based technologies and applications will be crucial components for open, transparent and accessible governments. Therefore OECD Ministers adopted the Seoul Declaration at their meeting on the Future of the Internet Economy which highlighted the importance of an open Internet to help bolster the free flow of information, freedom of expression and protection of individual liberties. We also emphasized the need for governments to ensure that public sector information is made widely available. OECD governments have adopted a Recommendation on Public Sector Information which provides policy guidelines designed to improve access and increase use of public sector information through greater transparency, enhanced competition and more competitive pricing. Third, in the area of development co-operation, regular reviews of development partner (donor) countries ensure transparency with regard to their aid policies and practices as well as compliance with their commitments. Aid statistics that can be accessed and used by all provide information on what type of aid development partners provide, to whom and for what purpose. Fourth, on Anti-Corruption matters, we work with our members to promote greater transparency as a means to fight corruption. Currently we are working with partner developing countries to set up web-based reporting systems on corruption at country level. For example, our just released progress report on OECD members' performance with respect to their commitments on Stolen Asset Recovery shows clearly how much funding has been repatriated, how much has been frozen and highlights areas for improvement in this effort. We have also

produced guidelines to help governments fight bid-rigging and other types of collusion. We see our work as a public good and are committed to making information open and accessible. This is consistent with our mission and part of our mandate. We believe that an organisation like ours has a democratic duty to provide citizens with the information that allows them to understand the day's main issues. For us, openness also means that citizens should be able to use that information to shape policy. To put this commitment into practice, we work with multiple civil society actors, with business and trade unions (through BIAC and TUAC, who have an institutionalized advisory role to the OECD), public stakeholders (including in legislative branches), the global media and citizens in member and partner countries. We work to maximise the impact and dissemination of OECD knowledge by translating complex content into easily accessible products. We use new interactive and innovative instruments such as Your Better Life Index (www.oecdbetterlifeindex.org) to engage with citizens on issues of central concern to their lives, and empower them to feedback their opinions to their governments. The OECD wholeheartedly supports efforts to increase openness and transparency through the free flow of information and the sharing of knowledge.

A2: Transparency Insufficient

Transparency drives civic engagement – controversial data releases shape public discourse.

Leahy, 2015

(Patrick, Vermont Senator and long supporter of open government, "Transparency is key to good government," March, Deerfield Valley News, http://www.dvalnews.com/view/full_story/26530715/article-Transparency-is-key-to-good-government?)

Sunshine Week is a time to celebrate one of our nation's most basic values, the public's "right to know." Our very democracy is built on the idea that our government should not operate in secret. James Madison, a staunch defender of open government, whose birthday we celebrate each year during Sunshine Week, wisely noted that for our democracy to succeed, people "must arm themselves with the power knowledge gives." Transparency enables the American people to hold their government accountable. Pulling back the curtain on the workings of government agencies is not always popular and is certainly not without controversy. But it is often those moments of controversy that make clear why an open government is so vital. One of those moments was last year's hard-fought release of the executive summary of the Senate Intelligence Committee's torture report, which detailed the CIA's shocking use of torture during the Bush Administration. The release of this historic report was met with extreme opposition by those who wanted to keep in the dark a grim chapter in our history. But shedding light on the CIA's actions demonstrated to the world that America is different: We acknowledge our mistakes so that we can learn from them. That is why I encouraged and supported Senator Dianne Feinstein in her efforts to release the report's executive summary. And that is why I was appalled to learn of recent efforts to have the full report returned to the Senate, to keep it out of the hands of those in the executive branch who can learn from these mistakes and ensure that this never happens again. There are many partisan fights in the Congress, but one area where I have brokered bipartisan agreement over the years is in passing laws that strengthen and improve the Freedom of Information Act, also known as FOIA. First signed into law in 1966 by President Johnson, FOIA has become the foundation on which all our sunshine and transparency policies rest. It remains an indispensable tool for Americans to obtain information affecting public policy, consumer safety, the environment and public health. It is relied on by journalists, educators and historians to research not only important issues of the day, but significant moments in our history. It helps bring to light controversy and it promotes public discourse.

A2: Transparency Insufficient

Transparency increases public knowledge and democratic participation in policymaking.

PCLOB, 2014

(Privacy and Civil Liberties Oversight Board, "Report on the Telephone Records Program Conducted under Section 215 of the USA PATRIOT Act and on the Operations of the Foreign Intelligence Surveillance Court," *PCLOB Report*, http://fas.org/irp/offdocs/pclob-215.pdf)

Transparency is one of the foundations of democratic governance. Our constitutional system of government relies upon the participation of an informed electorate. This in turn requires public access to information about the activities of the government. **Transparency supports accountability**. It is especially important with regard to activities of the government that affect the rights of individuals, where it is closely interlinked with redress for violations of rights. In the intelligence context, although a certain amount of secrecy is necessary, transparency regarding collection authorities and their exercise can increase public confidence in the intelligence process and in the monumental decisions that our leaders make based on intelligence products. In the aftermath of the Snowden disclosures, the government has released a substantial amount of information on the leaked government surveillance programs. Although there remains a deep well of distrust, these official disclosures have helped foster greater public understanding of government surveillance programs. However, to date the official disclosures relate almost exclusively to specific programs that had already been the subject of leaks, and we must be careful in citing these disclosures as object lessons for what additional transparency might be appropriate in the future.

A2: Government not responsive to civic engagement

Elected officials are susceptible to public opinion – they'll respond to engaged citizens.

Voltmer, 2008

(Katrin, Diploma in Sociology Free University Berlin, Germany, Dr. Phil. in Political Science, Free University Berlin, 14/11/08, Roles of the news media, The media, government accountability, and citizen engagement")

Government accountability. Even though all governments – whether democratic or authoritarian – have to deliver a minimum of public goods in order to avoid widespread social unrest electoral democracy provides strong institutional incentives for political officials to be accountable to their citizens. With periodic elections citizens have a powerful instrument in their hand to reward or punish a government for its performance. Since elections are the main mechanism to allocate power in democratic systems they link the self-interest of politicians with the requirement to act in the interest of the population. Or as the political scientist V.O. Key puts it, "the fear of loss of popular support powerfully disciplines the actions of governments".2 Yet whether or not voting can function as an effective mechanism to enforce government accountability depends on a complex set of both institutional and cultural conditions. Institutionally, the choice of electoral system, professionalism in public administration and the independence of the judiciary are crucial factors that affect the degree to which governments respond to public demands. Culturally, the ability and willingness of the citizens to engage in political life alongside the quality of public communication play an important part in strengthening the link between those in power and the citizenry

A2: Perm solves NB

The permutation codifies legal action before PCLOB findings are released – overshadows the public impact of their recommendations.

Masnick, 2014

(Mike, CEO and Editor of TechDirt + BusinessWeek Contributor, "President Obama Locking In Cosmetic NSA 'Reforms' Before Key Privacy Board Can Even Weigh In," *TechDirt,* Jan 16, Online: https://www.techdirt.com/articles/20140115/18345125891/president-obama-locking-cosmetic-nsa-reforms-before-key-privacy-board-can-even-weigh.shtml)

While so much attention has been paid to the special White House task force that was set up to look at the NSA situation, and the fact that President Obama is planning to announce his almost entirely cosmetic "reforms" for the NSA tomorrow, it seems that almost everyone has forgotten that there is an official Privacy and Civil Liberties Oversight Board (PCLOB) that is planning to give its own recommendations concerning the NSA's programs... only, it's after the President will have already announced his plans. Admittedly, it must be easy to forget about or ignore the PCLOB. As we discussed a year and a half ago, the federal government (under both Presidents Bush and Obama) left it entirely unstaffed for nearly five years. However, it does now exist and has also been investigating the NSA's programs and their impact on privacy and civil liberties. ¶ Earlier this month, the PCLOB announced that it will be releasing its findings... in late January or after February. In other words, the recommendations will be after the President has already announced his plans. It does sound like the PCLOB report will be fairly thorough -- there will be one focused on Section 215 of the PATRIOT Act (the bulk metadata collection), a report on how FISC works, and a final report on Section 702 of the FISA Amendments Act. Basically, three separate looks at the most controversial aspects of the NSA's activities. And all of them coming after the President has already made up his mind. ¶ Of course, while it might seem odd that the President would announce his plans just a few days before the government's official organization in charge of privacy and civil liberties announces its findings... it's not that odd if the whole point is to basically cut off any serious consideration of whatever they actually end up recommending. And, of course, you don't even have to be overly cynical to assume that's exactly what's happening.

Politics

CP Shields Politics

Commissions solve gridlock

Glassman and Straus, 2015 Mathew E. Glassman and Jacob R. Straus are analysts on Congress. (Mathew E. Glassman and Jacob R. Straus, "Congressional Commissions: Overview, Structure, and Legislative Considerations", Pg. 7-8, 1/27/15, Congressional Research Service, https://www.fas.org/sgp/crs/misc/R40076.pdf)//ER

Legislators seeking policy changes may be confronted by an array of political interests, some in favor of proposed changes and some against. When these interests clash, the resulting legislation may encounter gridlock in the highly structured political institution of the modern Congress.28 By creating a commission, Congress can place policy debates in a potentially more flexible environment, where congressional and public attention can be developed over time. Solutions to policy problems produced within the normal legislative process may also suffer politically from charges of partisanship.30 Similar charges may be made against investigations conducted by Congress.31 The **non-partisan or bipartisan character of most congressional commissions** may make **their findings and recommendations** less susceptible to such charges and **more politically acceptable to diverse viewpoints**. The bipartisan or nonpartisan arrangement can potentially **give their recommendations strong credibility**, both in Congress and among the public**, even** when dealing **with divisive issues** of public policy.32 Commissions may also give political factions space to negotiate compromises in good faith**,** bypassing the short-term tactical political maneuvers that accompany public negotiations.33 Similarly, **because commission members are not elected, they may be better suited to suggesting unpopular, but necessary, policy solutions**.34 **A commission may allow legislators to solve collective action problems**, situations in which all legislators individually seek to protect the interests of their own district, despite widespread agreement that the collective result of such interests is something none of them prefer. Legislators can use a commission to jointly "tie their hands" in such circumstances, allowing general consensus about a particular policy solution to avoid being impeded by individual concerns about the effect or implementation of the solution.35For example, in 1988 Congress established the Base Closure and Realignment Commission (BRAC) as a politically and geographically neutral body to make independent decisions about closures of military bases.36 The list of bases slated for closure by the commission was required to be either accepted or rejected as a whole by Congress, bypassing internal congressional politics over which individual bases would be closed, and **protecting individual Members from political charges that they didn't "save" their district**'s base.37

CP Shields Politics

Commissions are respected by the public and shield Congress from politics

Schwalbe, 2013

(Steve, Auburn University, "Independent Commissions: Their History, Utilization and Effectiveness," March 22, Weather Coalition, http://weathercoalition.org/sites/default/files/documents/2013/independent_commissions.pdf)

Commissions serve numerous purposes in the U.S. Government. Campbell cited three primary reasons for the establishment of federal independent commissions. First, they are established to provide expertise the Congress does not have among its own elected officials or their staffs. Next, he noted that the second most frequently cited reason by members of Congress for establishing a commission was to reduce the workload in Congress. Finally, they are formed to provide a convenient scapegoat to deflect the wrath of the electorate; i.e., "blame avoidance."18 Fisher found three advantages of regulatory commissions. First, commission members bring essential expert insights to a commission because the regulated industries are normally "complex and highly technical." Second, appointing commissioners for extended terms of full-time work allows commissioners to become very familiar with the technical aspects of an industry, through periodic contacts that Congress would not be able to accomplish. As a result of their tenure, varied membership, and shared responsibility, commissioners would be resistant to external pressures. Finally, regulatory commissions provide policy continuity essential to the stability of a regulated industry.19 What the taxpayers are primarily looking for from independent commissions are non-partisan solutions to current problems. A good example of establishing a commission to find non-partisan solutions is Congress regulating its own ethical behavior. University of Florida Professor Beth Rosenson researched this issue and concluded that authorizing an ethics commission may be "based on the fear of electoral retaliation if legislators do not take aggressive action to regulate their own ethics."20 Campbell noted that commissions perform several other functions besides providing recommendations to the President and Congress. The most common reason provided by analysts is that members of Congress generally want to avoid making difficult decisions that may adversely affect their chances for reelection. As he noted, "Incentives to avoid blame lead members of Congress to adopt a distinctive set of political strategies, such as 'passing the buck' or 'deflection'…."21 Another technique legislators use to avoid incurring the wrath of the voters is to schedule any controversial independent commissions for after the next election. Establish-ing a commission to research the issue and come up with recommendations after a preset period of time is an effective way to do that. The most clear-cut example demonstrating this technique is the timing of the BRAC commissions in the 1990s — all three made their base closure recommendations in non-election years (1991, 1993, and 1995). Even the next BRAC commission, established by the National Defense Authorization Act for Fiscal Year 2002, is not required to submit its base closure recommendations until 2005. Congress certainly is not the most efficient organization in the U.S.; hence, there are times when an independent commission is the more efficient and effective way to go. Law-makers are almost always short on time and information, which makes the option of delegating authority to a commission very appealing. Oftentimes, the expertise and necessary information is very costly for Congress to acquire. Commissions are generally the most inexpensive way for Congress to solve complex problems. From 1993-1997, Campbell found that 92 congressional offices introduced legislation that included proposals to establish ad hoc commissions.22

CP Shields Politics

PCLOB avoids political dilemma + provides political cover

The Fiscal Seminar, 2009

(The Fiscal Seminar is a group of scholars who discuss federal budget and fiscal policy issues under the auspices of The Brookings Institution and The Heritage Foundation, June, "THE POTENTIAL ROLE OF ENTITLEMENT OR BUDGET COMMISSIONS IN ADDRESSING LONG-TERM BUDGET PROBLEMS")

Unfortunately, the current political environment creates strong disincentives for individual politicians to tackle the tough choices required to put our fiscal house back in order. An appointed commission could offer an alternative mechanism through which to address these thorny but **critical issues by undertaking the heavy lifting of developing options and building the political consensus necessary to enact legislation**. As evidence of the popularity of this idea, over a dozen bills were introduced in the 110th Congress that would have created commissions to find politically and fiscally acceptable solutions for reforming entitlements, taxes, the budgeting process, or some combination of the three. This paper reviews some of the recent history of appointed commissions and discusses the issues surrounding their potential role in long-term federal budgeting. THE ROLE AND STRUCTURE OF COMMISSIONS The use of commissions or advisory councils has a long history in the United States. In the early 1900s, the National Monetary Commission examined the nation's distressed financial system and recommended establishing a central banking structure, a recommendation that was soon translated into the Federal Reserve System. From 1937 to 1996, Social Security policy-making was heavily influenced by the findings and recommendations of periodic advisory councils, including the National Commission on Social Security Reform (the Greenspan Commission) which helped to rescue the program from insolvency in 1983. The 1960s saw the Warren Commission investigate the assassination of President Kennedy and the Kerner Commission examine the causes of civil disorders. The Base Closure and Realignment Commission (BRAC) provided an effective mechanism over the past two decades for overcoming the political hurdles inhibiting the restructuring of U.S. defense facilities across the country. And the recent National Commission on Terrorist Attacks upon the United States (the 9/11 Commission) delved into the numerous facets of the 2001 terrorist attacks and potential changes in homeland security. Commissions can be used for a variety of purposes that suit the needs of the President or the Congress. **The role of some commissions is to develop a knowledge base about certain policies or problems free from the political machinations** that are an unavoidable part of the legislative process. They can also develop policy options that members of Congress and their staff have too little time or expertise to formulate. **They can serve as consensus-building vehicles from which members of Congress may garner political protection while addressing contentious issues**. At other times, commissions appear simply to serve as delaying measures that can be employed to defuse a political issue until a more opportune time for action develops. The best structure for a commission – i.e. its membership, duties, duration, voting rules, etc. – will often vary depending on that commission's purpose, and therefore on the nature of the problem that the commission is addressing, the state of scientific or analytical development of the topic, and the political sensitivity of the subject matter. Those factors may also influence the nature and the standing of the commission's recommendations. For example, in 1988, Congress established the National Commission on Acquired Immune Deficiency Syndrome (AIDS) to determine the dimensions of a new and rapidly spreading communicable disease, assess the degree of understanding about the disease, and lay out steps toward ultimately controlling and treating the disease. The commission focused on the science and largely ignored the potential politics surrounding the issue. In contrast, the Greenspan Commission provided a forum for developing a political compromise on a set of politically unsavory changes. In this case, the political parties shared a deep concern about the impending insolvency of the Social Security system but feared the exposure of promoting their own solutions. **The commission created political cover for the serious background negotiations that resulted in the ultimate compromise.** The structure of the commission reflected these concerns and was composed of fifteen members, with the President, the Senate Majority Leader, and the Speaker of the House each appointing five members to the panel.

CP Bipartisan

Bipartisan support for PCLOB

Ferrer, 2011

(Amy, Executive director of the American Philosophical Association, a bachelor's degree in women's studies and a master's degree in public policy and administration, 8/31/11, Bill of Rights Defensive Committee, http://www.bordc.org/blog/coalition-calls-obama-fill-privacy-and-civil-liberties-oversight-board)

Last week, a coalition of organizations led by the Constitution Project and including the Bill of Rights Defense Committee sent a letter to President Obama and several other high-ranking officials calling for the administration to fill vacancies on the Privacy and Civil Liberties Oversight Board. The letter reads, in part, In November 2009 and March 2010 many of the undersigned organizations wrote to the administration to express our concern over the lack of nominations to the Privacy and Civil Liberties Oversight Board (PCLOB). The urgency of our plea has increased. As you know, the 9/11 Commission recommended creating such a board, and Congress has enacted authorizing legislation. There is broad bipartisan support for this board to carry out its intended mission. However, without nominated and confirmed members to serve on this board, the PCLOB does not currently exist. Now, as we approach the 10th Anniversary of 9/11, it is more important than ever that we implement the 9/11 Commission's recommendation. Our continued fight for the security of our country must include measures to safeguard the liberty of its people. Several government reports, including the 9/11 Commission report and the administration's own Cybersecurity Review, have called for full implementation of the PCLOB to protect American's privacy and civil liberties against government intrusion. It is high time the president step up and follow those recommendations.

CP Popular

Popular with Public because they want increased government transparency

Stendebach, 2015

(Larry, the co-founder of a government transparency website that strives to deliver government data in a way that is useful to the people and help citizens interact with the government, develops the technology needed in modern politics, "Why Government Transparency is Important", United for Missouri, http://www.unitedformissouri.org/news/government-transparency-important-missouri)

The public certainly wants government transparency. In a recent study by the Association of Government Accountants (AGA), approximately 75% of participants surveyed said the availability of government financial management information continues to be very important to the public. The same survey found that 71% of people claimed would use transparent government financial data to make informed choices at the ballot box if it were provided to them. So with costs being low, citizens desiring transparency, and with the Internet as a platform, government has no excuse to keep shielding its fiscal business from public scrutiny. Elected officials and governments are public servants and services; they work for YOU and ME the taxpayer.

CP Generates Political Capital

Commission key to PC - Commissions build political capital through non-partisan consensus

Biggs, 2009

(Andrew, served at the Social Security Administration, as Associate Commissioner for Retirement Policy, Deputy Commissioner for Policy, and Deputy Commissioner of the agency, Feb-17-2009, "Rumors Of Obama Social Security Reform Commission," http://www.frumforum.com/rumors-of-obama-social-security-reform-commission/)
